Green Woodpecker. Adult. Male (18-IV).

IBERIAN GREEN WOODPECKER (*Picus viridis sharpei*)

IDENTIFICACIÓN

30-32 cm. Green upperparts, with yellow tinge; grey-green underparts; red crown; **male** with red moustachial stripe, **female** with dark moustachial stripe. **Juveniles** similar to **adults** but with white spots on upperparts and dark spots on underparts.

Green Woodpecker. Pattern of upperparts and crown.

SIMILAR SPECIES

This species is unmistakable

SEXING

Adults can be sexed by colour of moustachial stripe: **male** with red moustache edged black; **female** with dark moustache, without red. In **juveniles** only males with red moustachial stripe can be sexed safely; some very young **males** have dark moustachial stripes, so this characteristic in **juveniles** is useful for sexing only when body moult is advanced.

Green Woodpecker. Adult. Sexing. Pattern of moustache: top male; bottom female.

AGEING

3 age groups can be recognized:

Juvenile with white spots on upperparts; underparts with dark spots; tertials with pale tips and pale barring; primary coverts narrow.

1st year autumn/2nd year spring similar to **adult**, but with moult limit between moulted and **juvenile** retained wing feathers; if some tertial moulted then greenish and fresh contrasting with **juvenile** unmoulted paler, worn and with pale barred; if none tertial changed then all feathers worn and pale barred; primary coverts remain **juvenile** (sometimes some changed and then moult limit is easy to see) so are more worn than neighboring feathers.

Adult without moult limits; upper and underparts without spots; tertials plain greenish without pale tips; primary coverts broad and rounded, with similar abrasion than rest of coverts.

Green Woodpecker. Ageing. Pattern of breast: left adult; right juvenile.

Green Woodpecker. Ageing. Pattern of upperparts: left adult; right juvenile.

MOULT

Complete **postbreeding** moult, starting in June and usually finished in November. Partial **postjuvenile** moult involving body feathers, lesser and median coverts, all or part of greater coverts, sometimes one or two tertials, primaries and tail, so primary coverts (sometimes some are moulted) and secondaries remain unmoulted; usually finished in November.

PHENOLOGY

I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII

STATUS IN ARAGON

Resident, widely distributed throughout the Region, absent only from the very deforested areas.

Green Woodpecker. Ageing. Pattern of tertials: left adult; right juvenile.

Green Woodpecker. Adult. Female (30-I).

Green Woodpecker. Ageing. Pattern of primary coverts: top adult; bottom juvenile.

Green Woodpecker. 2nd year. Male (18-IV).
