

$$ReLU(e_i - x) \text{ \& } ReLU(x - s_i)$$

**1. Limit** the basis function to **non-0 regions** by multiplying two ReLU terms.

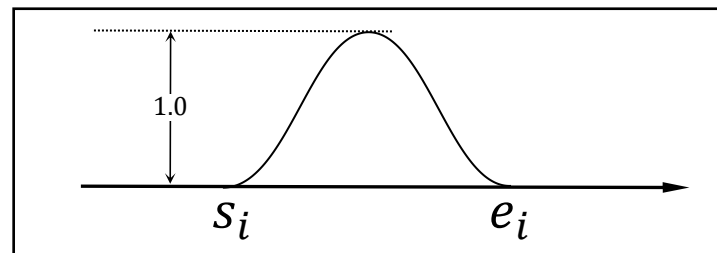

$$ReLU(e_i - x) \times ReLU(x - s_i)$$

**2. Smooth** the basis functions by **squaring**

$$[ReLU(e_i - x) \times ReLU(x - s_i)]^2$$

**3. Normalize** the range of the basis functions by multiplying the coefficients

$$[ReLU(e_i - x) \times ReLU(x - s_i)]^2 \times 16 / (e_i - s_i)^4$$
