### Highlighting The Selected Tab

The selected "tab" can be highlighted further by setting the [selection\\_color\(\)](#) of the [Fl\\_Tab](#) itself, e.g.

```

..
tabs = new Fl_Tabs(..);
tabs->selection_color(FL_DARK3);
..

```

The result of the above looks like:

Figure 33.52 Highlighting the selected tab

### Uniform Tab and Panel Appearance

In order to have uniform tab and panel appearance, not only must the [color\(\)](#) and [selection\\_color\(\)](#) for each child group be set, but also the [selection\\_color\(\)](#) of the [Fl\\_Tab](#) itself any time a new "tab" is selected. This can be achieved within the [Fl\\_Tab](#) callback, e.g.

```

void MyTabCallback(Fl_Widget *w, void*) {
 Fl_Tabs *tabs = (Fl_Tabs*)w;
 // When tab changed, make sure it has same color as its group
 tabs->selection_color((tabs->value()->color()));
}
..
int main(..) {
 // Define tabs widget
 tabs = new Fl_Tabs(..);
 tabs->callback(MyTabCallback);
 // Create three tabs each colored differently
 grp1 = new Fl_Group(.. "One");
 grp1->color(9);
 grp1->selection_color(9);
 grp1->end();
 grp2 = new Fl_Group(.. "Two");
 grp2->color(10);
 grp2->selection_color(10);
 grp2->end();
 grp3 = new Fl_Group(.. "Three");
 grp3->color(14);
 grp3->selection_color(14);
 grp3->end();
 ..
 // Make sure default tab has same color as its group

```

```

tabs->selection_color((tab->value())->color());
..
return Fl::run();
}

```

The result of the above looks like:

Figure 33.53 `Fl_Tabs` with uniform colors

If `Fl_Tabs` has no children, the widget will be drawn as a flat rectangle in the background color set by `color()`.

#### Close Button on Tabs

The `Fl_Tabs` widget allows you to specify that a child widget should display a close button in its tab. If the `FL_WHEN_CLOSED` flag is set for the child widget, an "X" symbol will be displayed to the left of the label text in the tab. When the close button is clicked, the child widget's callback function will be called with the `FL_REASON_CLOSED` reason. It is then the responsibility of the child widget to remove itself from the `Fl_Tabs` container.

Tabs that are in a compressed state will not display a close button until they are fully expanded.

#### Overflowing Tabs

When the combined width of the tabs exceeds that of the `Fl_Tabs` widget, the tabs will overflow. `Fl_Tabs` provides four options for managing tabs overflow:

- `Fl_Tabs::OVERFLOW_COMPRESS`: proportionally compress the tabs to the left and right of the selected tab until they all fit within the widget.
- `Fl_Tabs::OVERFLOW_CLIP`: clips any tabs that extend beyond the right edge of the `Fl_Tabs` widget, making some tabs unreachable.
- `Fl_Tabs::OVERFLOW_PULLDOWN`: doesn't compress the tabs but instead generates a pulldown menu at the right end of the tabs area, displaying all available tabs.
- `Fl_Tabs::OVERFLOW_DRAG`: maintains the tabs' original sizes, allowing horizontal dragging of the tabs area using the mouse, a horizontal mouse wheel, or the horizontal scrolling gesture on touchpads.

#### Resizing Caveats

When `Fl_Tabs` is resized vertically, the default behavior scales the tab's height as well as its children. To keep the tab height constant during resizing, set the tab widget's `resizable()` to one of the tab's child groups, i.e.

```

tabs = new Fl_Tabs(..);
grp1 = new Fl_Group(..);
..
grp2 = new Fl_Group(..);
..
tabs->end();
tabs->resizable(grp1); // keeps tab height constant

```

#### Callback's Use Of `when()`

As of FLTK 1.3.3, `Fl_Tabs()` supports the following flags for `when()`:

- `FL_WHEN_NEVER` – callback never invoked (all flags off)
- `FL_WHEN_CHANGED` – if flag set, invokes callback when a tab has been changed (on click or keyboard navigation)
- `FL_WHEN_NOT_CHANGED` – if flag set, invokes callback when the tabs remain unchanged (on click or keyboard navigation)

- [FL\\_WHEN\\_RELEASE](#) – if flag set, invokes callback on RELEASE of mouse button or keyboard navigation

Notes:

1. The above flags can be logically OR-ed (|) or added (+) to combine behaviors.
2. The default value for `when()` is [FL\\_WHEN\\_RELEASE](#) (inherited from [Fl\\_Widget](#)).
3. If [FL\\_WHEN\\_RELEASE](#) is the *only* flag specified, the behavior will be as if ([FL\\_WHEN\\_RELEASE|FL\\_WHEN\\_CHANGED](#)) was specified.
4. The value of `changed()` will be valid during the callback.
5. If both [FL\\_WHEN\\_CHANGED](#) and [FL\\_WHEN\\_NOT\\_CHANGED](#) are specified, the callback is invoked whether the tab has been changed or not. The `changed()` method can be used to determine the cause.
6. [FL\\_WHEN\\_NOT\\_CHANGED](#) can happen if someone clicks on an already selected tab, or if a keyboard navigation attempt results in no change to the tabs, such as using the arrow keys while at the left or right end of the tabs.
7. `Fl::callback_reason()` returns `FL_REASON_SELECTED` or `FL_REASON_RESELECTED`

## 33.141.2 Member Enumeration Documentation

### 33.141.2.1 anonymous enum

anonymous enum

Enumerator

OVERFLOW_COMPRESS	Tabs will be compressed and overlaid on top of each other.
OVERFLOW_CLIP	Only the first tabs that fit will be displayed.
OVERFLOW_PULLDOWN	Tabs that do not fit will be placed in a pull-down menu.
OVERFLOW_DRAG	The tab bar can be dragged horizontally to reveal additional tabs.

## 33.141.3 Constructor & Destructor Documentation

### 33.141.3.1 Fl\_Tabs()

```
Fl_Tabs::Fl_Tabs (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Tabs](#) widget using the given position, size, and label string.

The default boxtype is `FL_THIN_UP_BOX`.

Use `add(Fl_Widget*)` to add each child, which are usually [Fl\\_Group](#) widgets. The children should be sized to stay away from the top or bottom edge of the [Fl\\_Tabs](#) widget, which is where the tabs will be drawn.

All children of [Fl\\_Tabs](#) should have the same size and exactly fit on top of each other. They should only leave space above or below where the tabs will go, but not on the sides. If the first child of [Fl\\_Tabs](#) is set to "resizable()", the riders will not resize when the tabs are resized.

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the [Fl\\_Tabs](#) and all of its children can be automatic (local) variables, but you must declare the [Fl\\_Tabs](#) widget *first* so that it is destroyed last.

### 33.141.4 Member Function Documentation

#### 33.141.4.1 `clear_tab_positions()`

`void Fl_Tabs::clear_tab_positions ( )` [protected], [virtual]  
Clear internal array of tab positions and widths.

See also

[tab\\_positions\(\)](#).

#### 33.141.4.2 `client_area()`

```
void Fl_Tabs::client_area (
 int & rx,
 int & ry,
 int & rw,
 int & rh,
 int tabh = 0)
```

Returns the position and size available to be used by its children.

If there isn't any child yet the `tabh` parameter will be used to calculate the return values. This assumes that the children's labelsize is the same as the `Fl_Tabs`' labelsize and adds a small border.

If there are already children, the values of `child(0)` are returned, and `tabh` is ignored.

Note

Children should always use the same positions and sizes.

`tabh` can be one of

- 0: calculate label size, tabs on top
- -1: calculate label size, tabs on bottom
- > 0: use given `tabh` value, tabs on top (height = `tabh`)
- < -1: use given `tabh` value, tabs on bottom (height = `-tabh`)

Parameters

in	<i>tabh</i>	position and optional height of tabs (see above)
out	<i>rx,ry,rw,rh</i>	(x,y,w,h) of client area for children

Since

FLTK 1.3.0

#### 33.141.4.3 `draw()`

```
void Fl_Tabs::draw (
 void) [protected], [virtual]
```

Draw the tabs area, the optional pulldown button, and all children.

Reimplemented from [Fl\\_Group](#).

**33.141.4.4 draw\_tab()**

```
void Fl_Tabs::draw_tab (
 int x1,
 int x2,
 int W,
 int H,
 Fl_Widget * o,
 int flags,
 int what) [protected], [virtual]
```

Draw a tab in the top or bottom tabs area.

Tabs can be selected, or on the left or right side of the selected tab. If overlapping, left tabs are drawn bottom to top using clipping. The selected tab is then the topmost, followed by the right side tabs drawn top to bottom.

Tabs with the FL\_WHEN\_CLOSE bit set will draw a cross on their left side only if they are not compressed/overlapping.

**Parameters**

in	<i>x1</i>	horizontal position of the left visible edge of the tab
in	<i>x2</i>	horizontal position of the following tab
in	<i>W,H</i>	width and height of the tab
in	<i>o</i>	the child widget that corresponds to this tab
in	<i>flags</i>	if bit 1 is set, this tab is overlapped by another tab
in	<i>what</i>	can be LEFT, SELECTED, or RIGHT to indicate if the tab is to the left side or the right side of the selected tab, or the selected tab itself

**33.141.4.5 handle()**

```
int Fl_Tabs::handle (
 int event) [virtual]
```

Handle all events in the tabs area and forward the rest to the selected child.

**Parameters**

in	<i>event</i>	handle this event
----	--------------	-------------------

**Returns**

1 if the event was handled

Reimplemented from [Fl\\_Group](#).

**33.141.4.6 handle\_overflow()**

```
void Fl_Tabs::handle_overflow (
 int ov)
```

Set a method to handle an overflowing tab bar.

The [Fl\\_Tabs](#) widget allows you to specify how to handle the situation where there are more tabs than can be displayed at once. The available options are:

- `OVERFLOW_COMPRESS`: Tabs will be compressed and overlaid on top of each other.
- `OVERFLOW_CLIP`: Only the first tabs that fit will be displayed.
- `OVERFLOW_PULLDOWN`: Tabs that do not fit will be placed in a pull-down menu.
- `OVERFLOW_DRAG`: The tab bar can be dragged horizontally to reveal additional tabs.

You can set the desired behavior using the `overflow()` method.

#### Parameters

<i>ov</i>	overflow type
-----------	---------------

#### See also

[OVERFLOW\\_COMPRESS](#), [OVERFLOW\\_CLIP](#), [OVERFLOW\\_PULLDOWN](#), [OVERFLOW\\_DRAG](#)

#### 33.141.4.7 `handle_overflow_menu()`

```
void Fl_Tabs::handle_overflow_menu () [protected]
```

This is called when the user clicks the overflow pulldown menu button.

This method creates a menu item array that contains the titles of all tabs in the `Fl_Tabs` group. Visible and invisible tabs are separated by dividers to indicate their state.

The menu is then presented until the user selects an item or cancels. The chosen tab is then selected and made visible.

The menu item array is then deleted.

#### 33.141.4.8 `hit_close()`

```
int Fl_Tabs::hit_close (
 Fl_Widget * o,
 int event_x,
 int event_y) [protected], [virtual]
```

Check whether the coordinates fall within the "close" button area of the tab.

The `Fl_Tabs::hit_close()` method checks whether the given event coordinates fall within the area of the "close" button on the tab of the specified child widget. This method should be called after the `Fl_Tabs::which()` method, which updates a lookup table used to determine the width of each tab.

#### Parameters

<i>o</i>	check the tab of this widget
<i>event_x, event_y</i>	event coordinates

#### Returns

1 if we hit the close button, and 0 otherwise

#### 33.141.4.9 `hit_overflow_menu()`

```
int Fl_Tabs::hit_overflow_menu (
 int event_x,
 int event_y) [protected], [virtual]
```

Determine if the coordinates are in the area of the overflow menu button.

#### Parameters

<i>event_x, event_y</i>	event coordinates
-------------------------	-------------------

**Returns**

1 if we hit the overflow menu button, and 0 otherwise

**33.141.4.10 hit\_tabs\_area()**

```
int Fl_Tabs::hit_tabs_area (
 int event_x,
 int event_y) [protected], [virtual]
```

Determine if the coordinates are within the tabs area.

**Parameters**

<i>event_x, event_y</i>	event coordinates
-------------------------	-------------------

**Returns**

1 if we hit the tabs area, and 0 otherwise

**33.141.4.11 maybe\_do\_callback()**

```
int Fl_Tabs::maybe_do_callback (
 Fl_Widget * o) [protected]
```

Set tab o as selected and call callbacks if needed.

**Parameters**

in	<i>o</i>	the newly selected tab
----	----------	------------------------

**Returns**

0 if o is invalid or was deleted by the callback and must no longer be used

**33.141.4.12 on\_insert()**

```
int Fl_Tabs::on_insert (
 Fl_Widget * candidate,
 int index) [protected], [virtual]
```

Make sure that we redraw all tabs when new children are added.

Reimplemented from [Fl\\_Group](#).

**33.141.4.13 on\_move()**

```
int Fl_Tabs::on_move (
 int a,
 int b) [protected], [virtual]
```

Make sure that we redraw all tabs when children are moved.

Reimplemented from [Fl\\_Group](#).

**33.141.4.14 on\_remove()**

```
void Fl_Tabs::on_remove (
```

```
int index) [protected], [virtual]
```

Make sure that we redraw all tabs when new children are removed.  
Reimplemented from [Fl\\_Group](#).

#### 33.141.4.15 push() [1/2]

```
Fl_Widget * Fl_Tabs::push () const [inline]
```

Returns the tab group for the tab the user has currently down-clicked on and remains over until FL\_RELEASE.  
Otherwise, returns NULL.

While the user is down-clicked on a tab, the return value is the tab group for that tab. But as soon as the user releases, or drags off the tab with the button still down, the return value will be NULL.

See also

[push\(Fl\\_Widget\\*\)](#).

#### 33.141.4.16 push() [2/2]

```
int Fl_Tabs::push (
 Fl_Widget * o)
```

This is called by the tab widget's [handle\(\)](#) method to set the tab group widget the user last FL\_PUSH'ed on.  
Set back to zero on FL\_RELEASE.

As of this writing, the value is mainly used by [draw\\_tab\(\)](#) to determine whether or not to draw a 'down' box for the tab when it's clicked, and to turn it off if the user drags off it.

See also

[push\(\)](#).

#### 33.141.4.17 redraw\_tabs()

```
void Fl_Tabs::redraw_tabs () [protected], [virtual]
```

Redraw all tabs (and only the tabs).

This method sets the Fl\_Tab's damage flags so the tab area is redrawn.

#### 33.141.4.18 resize()

```
void Fl_Tabs::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Make sure that we redraw all tabs when the widget size changes.

Reimplemented from [Fl\\_Group](#).

#### 33.141.4.19 show()

```
void Fl_Tabs::show () [virtual]
```

Ensure proper placement of selected tab.

Reimplemented from [Fl\\_Widget](#).

#### 33.141.4.20 tab\_align() [1/2]

```
Fl_Align Fl_Tabs::tab_align () const [inline]
```

Gets the tab label alignment.

See also

[tab\\_align\(Fl\\_Align\)](#)

#### 33.141.4.21 tab\_align() [2/2]

```
void Fl_Tabs::tab_align (
 Fl_Align a) [inline]
```

Sets the tab label alignment.

The default is FL\_ALIGN\_CENTER so tab labels are centered, but since the label space is measured (per label) to fit the labels, there wouldn't be any difference if labels were aligned left or right.

If you want to show an image (icon) next to the group's label you can set a different label alignment. FL\_ALIGN\_↔ IMAGE\_NEXT\_TO\_TEXT is the recommended alignment to show the icon left of the text.

#### 33.141.4.22 tab\_height()

```
int Fl_Tabs::tab_height () [protected], [virtual]
```

Return space (height) in pixels usable for tabs.

The calculated height is the largest space between all children and the upper and lower widget boundaries, respectively. If the space at the bottom is larger than at the top, the value will be negative and the tabs should be placed at the bottom.

Returns

Vertical space that can be used for the tabs.

Return values

>	0 To put the tabs at the top of the widget.
<	0 To put the tabs on the bottom.
<i>Full</i>	height, if <a href="#">children()</a> == 0.

#### 33.141.4.23 tab\_positions()

```
int Fl_Tabs::tab_positions () [protected], [virtual]
```

Calculate tab positions and widths.

This protected method calculates the horizontal display positions and widths of all tabs. If the number of children 'nc' (see below) is > 0 three internal arrays are allocated, otherwise the arrays are free'd and the pointers are set to NULL. Note that the first array is larger (nc+1).

- `tab_pos[nc+1]` : The left edges of each tab plus a fake left edge for a tab past the right-hand one.
- `tab_width[nc]` : The width of each tab
- `tab_flags[nc]` : Flags, bit 0 is set if the tab is compressed

If needed, these arrays are (re)allocated.

These positions are actually of the left edge of the slope. They are either separated by the correct distance or by EXTRASPACE or by zero.

In OVERFLOW\_COMPRESS mode, tab positions and widths are compressed to make the entire tabs bar fit into the width of [Fl\\_Tabs](#) while keeping the selected tab fully visible.

In other overflow modes, the tabs area may be dragged horizontally using [tab\\_offset](#). The `tab_pos` array is not adjusted to the horizontal offset, but starts at this->x() plus the box's left margin.

The protected variable `tab_count` is set to the currently allocated size, i.e. the number of children (nc).

**Returns**

Index of the selected item

**Return values**

-1	If the number of children is 0 (zero).
----	----------------------------------------

**Note**

Return values in 1.3 were not documented. Return values before Sep 2023 were documented as 1 based index and 0 if there were no children. This was actually never the case. It always returned a 0 based index and the (useless) value of also 0 if there were no children. The current version return -1 if there are no children.

For this method to work, only on single child should be selected. Calling the method [value\(\)](#) before calling [tab\\_positions\(\)](#) will ensure that exactly one child is selected and return a pointer to that child.

**See also**

[clear\\_tab\\_positions\(\)](#)

**33.141.4.24 take\_focus()**

```
void Fl_Tabs::take_focus (
 Fl_Widget * o) [protected]
```

Take keyboard focus if o is not NULL.

**Parameters**

in	o	selected tab
----	---	--------------

**33.141.4.25 value() [1/2]**

```
Fl_Widget * Fl_Tabs::value ()
```

Gets the currently visible widget/tab.

The [Fl\\_Tabs::value\(\)](#) method returns a pointer to the currently visible child widget of the [Fl\\_Tabs](#) container. The visible child is the first child that is currently being displayed, or the last child if none of the children are being displayed.

If child widgets have been added, moved, or deleted, this method ensures that only one tab is visible at a time.

**Returns**

a pointer to the currently visible child

**33.141.4.26 value() [2/2]**

```
int Fl_Tabs::value (
 Fl_Widget * newvalue)
```

Sets the widget to become the current visible widget/tab.

The [Fl\\_Tabs::value\(\)](#) method allows you to set a particular child widget of the [Fl\\_Tabs](#) container to be the currently visible widget. If the specified widget is a child of the [Fl\\_Tabs](#) container, it will be made visible and all other children will be hidden. The method returns 1 if the value was changed, and 0 if the specified value was already set.

## Parameters

in	<i>newvalue</i>	a pointer to a child widget
----	-----------------	-----------------------------

## Returns

- 1 if a different tab was chosen
- 0 if there was no change (new value already set)

**33.141.4.27 which()**

```
Fl_Widget * Fl_Tabs::which (
 int event_x,
 int event_y) [virtual]
```

Return a pointer to the child widget with a tab at the given coordinates.

The `Fl_Tabs::which()` method returns a pointer to the child widget of the `Fl_Tabs` container that corresponds to the tab at the given event coordinates. If the event coordinates are outside the area of the tabs or if the `Fl_Tabs` container has no children, the method returns NULL.

## Parameters

<i>event_x, event_y</i>	event coordinates
-------------------------	-------------------

## Returns

- pointer to the selected child widget, or NULL

**33.141.5 Member Data Documentation****33.141.5.1 overflow\_type**

```
int Fl_Tabs::overflow_type [protected]
```

See also

[OVERFLOW\\_COMPRESS](#), [OVERFLOW\\_CLIP](#), etc.

**33.141.5.2 tab\_count**

```
int Fl_Tabs::tab_count [protected]
```

Array size of tab positions etc.

See also

[tab\\_positions\(\)](#)

**33.141.5.3 tab\_flags**

```
int* Fl_Tabs::tab_flags [protected]
```

Array of tab flag of tabs per child.

*Behavior of scrollbars.*

## Public Member Functions

- void `ansi` (bool val)  
*Enable/disable the ANSI mode flag.*
- bool `ansi` (void) const  
*Return the state of the ANSI flag.*
- void `append` (const char \*s, int len=-1)  
*Appends string `s` to the terminal at the current cursor position using the current text color/attributes.*
- void `append_ascii` (const char \*s)  
*Append NULL terminated ASCII string to terminal, slightly more efficient than `append_utf8()`.*
- void `append_utf8` (const char \*buf, int len=-1)  
*Append NULL terminated UTF-8 string to terminal.*
- void `box` (`FI_Boxtype` val)  
*Sets the box type, updates terminal margins et al.*
- `FI_Boxtype` `box` (void) const  
*Returns the current box type.*
- void `clear` (`FI_Color` val)  
*Clears the screen to a specific color `val` and homes the cursor.*
- void `clear` (void)  
*Clears the screen to the current `textbgcolor()`, and homes the cursor.*
- void `clear_history` (void)  
*Clears the scroll history buffer and adjusts scrollbar, forcing it to `redraw()`.*
- void `clear_screen` (bool scroll\_to\_hist=true)  
*Clear the terminal screen only; does not affect the cursor position.*
- void `clear_screen_home` (bool scroll\_to\_hist=true)  
*Clear the terminal screen and home the cursor.*
- void `color` (`FI_Color` val)  
*Sets the background color for the terminal's `FI_Group::box()`.*
- `FI_Color` `color` (void) const  
*Return base widget `FI_Group`'s `box()` color()*
- int `cursor_col` (void) const  
*Return the cursor's current column position on the screen.*
- void `cursor_home` (void)  
*Move cursor to the home position (top/left).*
- int `cursor_row` (void) const  
*Return the cursor's current row position on the screen.*
- void `cursorbgcolor` (`FI_Color` val)  
*Set the cursor's background color used for the cursor itself.*
- `FI_Color` `cursorbgcolor` (void) const

- Get the cursor's background color used for the cursor itself.*

  - void **cursorfgcolor** ([FI\\_Color](#) val)
- Set the cursor's foreground color used for text under the cursor.*

  - [FI\\_Color](#) **cursorfgcolor** (void) const
- Get the cursor's foreground color used for text under the cursor.*

  - void **display\_columns** (int val)
- Set terminal's display width in columns of text characters.*

  - int **display\_columns** (void) const
- Return terminal's display width in columns of text characters.*

  - void **display\_rows** (int val)
- Set terminal's display height in lines of text (rows).*

  - int **display\_rows** (void) const
- Return terminal's display height in lines of text (rows).*

  - void **draw** (void) [FL\\_OVERRIDE](#)
- Draws the entire [FI\\_Terminal](#).*

  - void **error\_char** (const char \*val)
- Sets the "error character" utf8 string shown for invalid utf8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true.*

  - const char \* **error\_char** (void) const
- Returns the "error character" utf8 string, which is shown for invalid utf8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true.*

  - [FI\\_Terminal](#) (int X, int Y, int W, int H, const char \*L, int rows, int cols, int hist)
- Same as the default [FLTK](#) constructor, but lets the user force the rows, columns and history to specific sizes on creation.*

  - [FI\\_Terminal](#) (int X, int Y, int W, int H, const char \*L=0)
- The constructor for [FI\\_Terminal](#).*

  - int **handle** (int e) [FL\\_OVERRIDE](#)
- Handle [FLTK](#) events.*

  - void **history\_lines** (int val)
- Set the number of lines of screen history.*

  - int **history\_lines** (void) const
- Return the number of lines of screen history.*

  - void **history\_rows** (int val)
- Set terminal's scrollbar history buffer size in lines of text (rows).*

  - int **history\_rows** (void) const
- Return terminal's scrollbar history buffer size in lines of text (rows).*

  - int **history\_use** (void) const
- Returns how many lines are "in use" by the screen history buffer.*

  - void **hscrollbar\_style** ([ScrollbarStyle](#) val)
- Set the horizontal scrollbar behavior style.*

  - [ScrollbarStyle](#) **hscrollbar\_style** (void) const
- Get the horizontal scrollbar behavior style.*

  - void **margin\_bottom** (int val)
- Set the bottom margin; see [Margins](#).*

  - int **margin\_bottom** (void) const
- Return the bottom margin; see [Margins](#).*

  - void **margin\_left** (int val)
- Set the left margin; see [Margins](#).*

  - int **margin\_left** (void) const
- Return the left margin; see [Margins](#).*

  - void **margin\_right** (int val)
- Set the right margin; see [Margins](#).*

- int **margin\_right** (void) const  
*Return the right margin; see [Margins](#).*
- void **margin\_top** (int val)  
*Set the top margin; see [Margins](#).*
- int **margin\_top** (void) const  
*Return the top margin; see [Margins](#).*
- void **output\_translate** (Fl\_Terminal::OutFlags val)  
*Sets the combined output translation flags to `val`.*
- Fl\_Terminal::OutFlags **output\_translate** (void) const  
*Return the current combined output translation flags.*
- void **plot\_char** (char c, int drow, int dcol)  
*Plot the ASCII character `c` at the terminal's display position (`drow,dcol`).*
- void **plot\_char** (const char \*text, int len, int drow, int dcol)  
*Plot the UTF-8 character `text` of length `len` at display position (`drow,dcol`).*
- void **print\_char** (char c)  
*Prints single ASCII char `c` at current cursor position, and advances the cursor.*
- void **print\_char** (const char \*text, int len=-1)  
*Prints single UTF-8 char `text` of optional byte length `len` at current cursor position, and advances the cursor if the character is printable.*
- void **printf** (const char \*fmt,...)  
*Appends printf formatted messages to the terminal.*
- void **redraw\_rate** (float val)  
*Set the maximum rate redraw speed in floating point seconds if [redraw\\_style\(\)](#) is set to RATE\_LIMITED.*
- float **redraw\_rate** (void) const  
*Get max rate redraw speed in floating point seconds.*
- void **redraw\_style** (RedrawStyle val)  
*Set how [Fl\\_Terminal](#) manages screen redrawing.*
- RedrawStyle **redraw\_style** (void) const  
*Get the redraw style.*
- void **reset\_terminal** (void)  
*Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.*
- void **resize** (int X, int Y, int W, int H) **FL\_OVERRIDE**  
*Handle widget resizing, such as if user resizes parent window.*
- int **scrollbar\_actual\_size** (void) const  
*Returns the scrollbar's actual "trough size", which is the width of FL\_VERTICAL scrollbars, or height of FL\_HORIZONTAL scrollbars.*
- void **scrollbar\_size** (int val)  
*Set the pixel size of both horizontal and vertical scrollbar's "trough" to `val`.*
- int **scrollbar\_size** (void) const  
*Get current pixel size of all the scrollbar's troughs for this widget, or zero if the global [Fl::scrollbar\\_size\(\)](#) is being used (default).*
- const char \* **selection\_text** (void) const  
*Return text selection (for copy()/paste() operations)*
- int **selection\_text\_len** (void) const  
*Return byte length of all UTF-8 chars in selection, or 0 if no selection.*
- void **selectionbgcolor** (Fl\_Color val)  
*Set mouse selection background color.*
- Fl\_Color **selectionbgcolor** (void) const  
*Get mouse selection background color.*
- void **selectionfgcolor** (Fl\_Color val)  
*Set mouse selection foreground color.*

- **FI\_Color selectionfgcolor** (void) const  
*Get mouse selection foreground color.*
- void **show\_unknown** (bool val)  
*Set the "show unknown" flag.*
- bool **show\_unknown** (void) const  
*Return the "show unknown" flag.*
- const char \* **text** (bool lines\_below\_cursor=false) const  
*Return a string copy of all lines in the terminal (including history).*
- **uchar textattrib** () const  
*Get text attribute bits (underline, inverse, etc).*
- void **textattrib** (**uchar** val)  
*Set text attribute bits (underline, inverse, etc).*
- void **textbgcolor** (**FI\_Color** val)  
*Set text background color to fltk color *val* used by any new text added.*
- **FI\_Color textbgcolor** (void) const  
*Return text's current background color.*
- void **textbgcolor\_default** (**FI\_Color** val)  
*Set the default text background color used by any new text added after a reset (<ESC>c, <ESC>[0m, or [reset\\_terminal\(\)](#)).*
- **FI\_Color textbgcolor\_default** (void) const  
*Return text's default background color.*
- void **textbgcolor\_xterm** (**uchar** val)  
*Sets the background text color as one of the 8 'xterm color' values.*
- void **textcolor** (**FI\_Color** val)  
*Set the text color for the terminal.*
- **FI\_Color textcolor** (void) const  
*Return [textcolor\(\)](#). This is a convenience method that returns [textfgcolor\\_default\(\)](#)*
- void **textfgcolor** (**FI\_Color** val)  
*Set text foreground drawing color to fltk color *val* used by any new text added.*
- **FI\_Color textfgcolor** (void) const  
*Return text's current foreground color.*
- void **textfgcolor\_default** (**FI\_Color** val)  
*Set the default text foreground color used by <ESC>c, <ESC>[0m, and [reset\\_terminal\(\)](#).*
- **FI\_Color textfgcolor\_default** (void) const  
*Return text's default foreground color.*
- void **textfgcolor\_xterm** (**uchar** val)  
*Sets the foreground text color as one of the 8 'xterm color' values.*
- void **textfont** (**FI\_Font** val)  
*Sets the font used for all text displayed in the terminal.*
- **FI\_Font textfont** (void) const  
*Return text font used to draw all text in the terminal.*
- void **textsize** (**FI\_Fontsize** val)  
*Sets the font size used for all text displayed in the terminal.*
- **FI\_Fontsize textsize** (void) const  
*Return text font size used to draw all text in the terminal.*
- void **vprintf** (const char \*fmt, va\_list ap)  
*Appends printf formatted messages to the terminal.*
- **~FI\_Terminal** (void)  
*The destructor for [FI\\_Terminal](#).*

## Public Attributes

- [Fl\\_Scrollbar](#) \* [hscrollbar](#)  
*Horizontal scrollbar.*
- [Fl\\_Scrollbar](#) \* [scrollbar](#)  
*Vertical scrollbar.*

## Protected Member Functions

- void **clear\_eod** (void)  
*Clear from cursor to End Of Display (EOD), like "<ESC> [J<ESC> [0J".*
- void **clear\_eol** (void)  
*Clear from cursor to End Of Line (EOL), like "<ESC> [K".*
- void **clear\_line** (int row)  
*Clear entire line for specified row.*
- void **clear\_line** (void)  
*Clear entire line cursor is currently on.*
- void **clear\_mouse\_selection** (void)  
*Clear any current mouse selection.*
- void **clear\_sod** (void)  
*Clear from cursor to Start Of Display (EOD), like "<ESC> [1J".*
- void **clear\_sol** (void)  
*Clear from cursor to Start Of Line (SOL), like "<ESC> [1K".*
- void **current\_style** (const [CharStyle](#) &sty)  
*Set current style for rendering text.*
- [CharStyle](#) & **current\_style** (void) const  
*Return reference to internal current style for rendering text.*
- void **cursor\_col** (int col)  
*Move cursor to the specified column *col*.*
- void **cursor\_cr** (void)  
*Move cursor as if a CR (\r) was received.*
- void **cursor\_crlf** (int count=1)  
*Move cursor as if a CR/LF pair (\r\n) was received.*
- void **cursor\_down** (int count=1, bool do\_scroll=false)  
*Moves cursor down *count* lines.*
- void **cursor\_eol** (void)  
*Move cursor to the last column (at the far right) on the current line.*
- void **cursor\_left** (int count=1)  
*Moves cursor left *count* columns, and cursor stops (does not wrap) if it hits screen edge.*
- void **cursor\_right** (int count=1, bool do\_scroll=false)  
*Moves cursor right *count* columns.*
- void **cursor\_row** (int row)  
*Move cursor to the specified row *row*.*
- void **cursor\_sol** (void)  
*Move cursor to the first column (at the far left) on the current line.*
- void **cursor\_tab\_left** (int count=1)  
*Tab left, do not wrap beyond left edge.*
- void **cursor\_tab\_right** (int count=1)  
*Tab right, do not wrap beyond right edge.*
- void **cursor\_up** (int count=1, bool do\_scroll=false)  
*Moves cursor up *count* lines.*
- void **delete\_chars** (int drow, int dcol, int rep)

- Delete char(s) at (drow, dcol) for 'rep' times.*

  - void **delete\_chars** (int rep)
- Delete char(s) at cursor position for 'rep' times.*

  - void **delete\_rows** (int count)
- Delete (count) rows at cursor position.*

  - int **disp\_cols** (void) const
- Return the number of columns in the display area.*

  - int **disp\_erow** (void) const
- Return the ending row# in the display area.*

  - int **disp\_rows** (void) const
- Return the number of rows in the display area.*

  - int **disp\_srow** (void) const
- Return the starting row# in the display area.*

  - void **draw\_buff** (int Y) const
- Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.*

  - void **draw\_row** (int grow, int Y) const
- Draw the specified global row, which is the row in ring\_chars[].*

  - void **draw\_row\_bg** (int grow, int X, int Y) const
- Draw the background for the specified ring\_chars[] global row grow starting at FLTK coords X and Y.*

  - bool **get\_selection** (int &srow, int &scol, int &erow, int &ecol) const
- Return mouse selection's start/end position in the ring buffer, if any.*

  - int **h\_to\_row** (int H) const
- Given a height in pixels, return number of rows that "fits" into that area.*

  - int **handle\_unknown\_char** (int drow, int dcol)
- Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of show\_unknown().*

  - int **handle\_unknown\_char** (void)
- Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of show\_unknown().*

  - int **hist\_cols** (void) const
- Return the number of columns in the scrollbar history.*

  - int **hist\_erow** (void) const
- Return the ending row# of the scrollbar history.*

  - int **hist\_rows** (void) const
- Return the number of rows in the scrollbar history.*

  - int **hist\_srow** (void) const
- Return the starting row# of the scrollbar history.*

  - int **hist\_use** (void) const
- Return number of rows in use by the scrollbar history.*

  - int **hist\_use\_srow** (void) const
- Return the starting row of the "in use" scrollbar history.*

  - void **insert\_char** (char c, int rep)
- Insert char 'c' at the current cursor position for 'rep' times.*

  - void **insert\_char\_eol** (char c, int drow, int dcol, int rep)
- Insert char 'c' for 'rep' times at display row 'drow' and column 'dcol'.*

  - void **insert\_rows** (int count)
- Insert (count) rows at current cursor position.*

  - bool **is\_inside\_selection** (int row, int col) const
- Is global row/column inside the current mouse selection?*

  - bool **is\_selection** (void) const
- Returns true if there's a mouse selection.*

- int **offset** (void) const  
*Returns the current offset into the ring buffer.*
- void **restore\_cursor** (void)  
*Restore previously saved cursor position, if any. Used by ESC [ u.*
- int **ring\_cols** (void) const  
*Return the number of columns in the ring buffer.*
- int **ring\_erow** (void) const  
*Return the ending row# in the ring buffer (Always [ring\\_rows\(\)-1](#))*
- int **ring\_rows** (void) const  
*Return the number of rows in the ring buffer.*
- int **ring\_srow** (void) const  
*Return the starting row# in the ring buffer. (Always 0)*
- void **save\_cursor** (void)  
*Save current cursor position. Used by ESC [ s.*
- void **scroll** (int rows)  
*Scroll the display up(+) or down(-) the specified rows.*
- void **select\_line** (int grow)  
*Select the entire row.*
- void **select\_word** (int grow, int gcol)  
*Select the word around the given row and column.*
- bool **selection\_extend** (int X, int Y)  
*Extend selection to FLTK coords X, Y.*
- [Utf8Char](#) \* **u8c\_cursor** (void)  
*Return the [Utf8Char](#)\* for character under cursor.*
- [Utf8Char](#) \* **u8c\_disp\_row** (int drow)  
*Return pointer to the first [u8c](#) character in row drow of the display.*
- const [Utf8Char](#) \* **u8c\_disp\_row** (int drow) const  
*See docs for non-const version of [u8c\\_disp\\_row\(int\)](#)*
- [Utf8Char](#) \* **u8c\_hist\_row** (int hrow)  
*Return [u8c](#) for beginning of a row inside the scrollbar history.*
- const [Utf8Char](#) \* **u8c\_hist\_row** (int hrow) const  
*See docs for non-const version of [u8c\\_hist\\_row\(int\)](#)*
- const [Utf8Char](#) \* **u8c\_hist\_use\_row** (int hrow) const  
*See docs for non-const version of [u8c\\_hist\\_use\\_row\(int\)](#)*
- [Utf8Char](#) \* **u8c\_hist\_use\_row** (int hurow)  
*Return [u8c](#) for beginning of row hurow inside the 'in use' part of the scrollbar history.*
- [Utf8Char](#) \* **u8c\_ring\_row** (int grow)  
*Return UTF-8 char for row grow in the ring buffer.*
- const [Utf8Char](#) \* **u8c\_ring\_row** (int grow) const  
*See docs for non-const version of [u8c\\_ring\\_row\(int\)](#)*
- int **w\_to\_col** (int W) const  
*Given a width in pixels, return number of columns that "fits" into that area.*
- const [Utf8Char](#) \* **walk\_selection** (const [Utf8Char](#) \*u8c, int &row, int &col) const  
*Walk the mouse selection one character at a time from beginning to end, returning a [Utf8Char](#)\* to the next character in the selection, or NULL if the end was reached, or if there's no selection.*

## Additional Inherited Members

### 33.142.1 Detailed Description

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.

### 33.142.2 FI\_Terminal

```

NAME
 ls - list directory contents

SYNOPSIS
 ls [OPTION]... [FILE]...

DESCRIPTION
 list information about the FILES (the current directory by default). Sort
 entries alphabetically if none of -cftuvSUX nor --sort is specified.
 Mandatory arguments to long options are mandatory for short options too.

 -B, --all do not ignore entries starting with .
 -A, --almost-all do not list implied . and ..
 --author with -l, print the author of each file
 -b, --escape print C-style escapes for nongraphic characters

```

Figure 33.54 FI\_Terminal widget showing a linux manual page

[FI\\_Terminal](#) is an output-only text widget supporting ASCII and UTF-8/Unicode. It supports most terminal text features, such as most VT100/xterm style escape sequences (see [The Escape Codes FI\\_Terminal Supports](#)), text colors/attributes, scrollback history, mouse selection, etc.

It is recommended that accessing features such as setting text colors and cursor positioning is best done with ANSI/XTERM escape sequences. But if one sets `ansi(false)` then this is not possible, so the public API can be used for common operations, e.g.

Public API	ESC code equivalent	Description
<a href="#">clear_screen_home()</a>	ESC [ H ESC [ 2 J	Clear screen, home cursor
<a href="#">cursor_home()</a>	ESC [ H	Home the cursor
<a href="#">clear_history()</a>	ESC [ 3 J	Clear scrollback history
<a href="#">reset_terminal()</a>	ESC [ c	Reset terminal

To access more advanced API calls, one can derive a class from [FI\\_Terminal](#) to access protected methods manipulate the terminal more directly, e.g.

Protected API	ESC code equiv.	Description
<a href="#">current_style()</a>	ESC [ # m	Set text attributes
<a href="#">clear_eod()</a>	ESC [ 0 J	Clear from cursor to end of display
<a href="#">clear_sod()</a>	ESC [ 1 J	Clear from cursor to start of display
<a href="#">clear_eol()</a>	ESC [ 0 K	Clear from cursor to end of line
<a href="#">clear_sol()</a>	ESC [ 1 K	Clear from cursor to start of line
<a href="#">clear_line()</a>	ESC [ 2 K	Clear line cursor is on
<a href="#">scroll(int) // &gt;0 for up</a>	ESC [ 1 S	Scroll up one line
<a href="#">scroll(int) // &lt;0 for down</a>	ESC [ 1 T	Scroll down one line
<a href="#">cursor_left()</a>	ESC [ 1 D	Move cursor left (no wrap)
<a href="#">cursor_right()</a>	ESC [ 1 C	Move cursor right (no wrap)
<a href="#">cursor_up()</a>	ESC [ 1 B	Move cursor up (no scroll or wrap)
<a href="#">cursor_down()</a>	ESC [ 1 A	Move cursor down (no scroll or wrap)
<a href="#">cursor_row() cursor_col()</a>	ESC [ # ; # H	Move cursor to row# / column#
<a href="#">insert_char()</a>	ESC [ # @	Insert a char at cursor position
<a href="#">delete_chars()</a>	ESC [ # P	Delete chars at cursor position
<a href="#">insert_rows()</a>	ESC [ # L	Insert rows at cursor position
<a href="#">delete_rows()</a>	ESC [ # M	Delete rows at cursor position
etc...	etc...	etc...

Many commonly used API functions are public, such as [textfgcolor\(\)](#) for setting text colors. Others, such as [cursor\\_up\(\)](#) are protected to prevent common misuse, and are available only to subclasses.

Some common operations:

- Set the terminal's background color, see [color\(Fl\\_Color\)](#)
- Set the terminal's default text color, see [textfgcolor\\_default\(Fl\\_Color\)](#)
- Printing text to the terminal, see [Fl\\_Terminal::printf\(\)](#) and [Fl\\_Terminal::append\(\)](#)
- Clearing the screen, see [clear\(\)](#)
- Getting the terminal's buffer contents, see [text\(\)](#)
- Getting single utf8 characters by row/col from the terminal display, see [utf8\\_char\\_at\\_disp\(\)](#)
- Getting the text from a text selection, see [get\\_selection\(\)](#)

For applications that need input support, the widget can be subclassed to provide keyboard input, and advanced features like pseudo ttys, termio, serial port I/O, etc., as such features are beyond the scope of FLTK.

### 33.142.2.1 Examples

```
//
// Fl_Terminal: Simple Use
//
Fl_Terminal *tty = new Fl_Terminal(...);
:
tty->append("Hello world.\n"); // simple strings
tty->append("\033[31mThis text is red.\033[0m\n"); // colored text
tty->append("\033[32mThis text is green.\033[0m\n");
tty->printf("The value of x is %.02f\n", x); // printf() formatting
```

There are also public methods for doing what most "\033[" escape codes do, so that if [ansi\(bool\)](#) is set to "false", one can still change text colors or clear the screen via application control, e.g.

```
tty->home(); // home the cursor
tty->clear_screen(); // clear the screen
tty->textfgcolor(0xff0000); // change the text color to RED
tty->textbgcolor(0x0000ff); // change the background color to BLUE
//
// R G B
```

When creating the widget, the width/height determine the default column and row count for the terminal's display based on the current font size. The column width determines where text will wrap.

You can specify wider column sizes than the screen using [display\\_columns\(colwidth\)](#). When this value is larger than the widget's width, text will wrap off-screen, and can be revealed by resizing the widget wider.

### 33.142.2.2 Writing To Terminal From Applications

An application needing terminal output as part of its user interface can instance [Fl\\_Terminal](#), and write text strings with:

- [append\(\)](#) to append strings
- [printf\(\)](#) to append formatted strings

Single character output can be done with:

- `print_char()` to print a single ASCII/UTF-8 char at the cursor
- `plot_char()` to put single ASCII/UTF-8 char at an x,y position

### 33.142.2.3 Text Attributes

The terminal's text supports these attributes:

- Italic - italicized text: `\033[3m`
- Bold - brighter/thicker text: `\033[1m`
- Dim - lower brightness text: `\033[2m`
- Underline - text that is underlined: `\033[4m`
- Strikeout - text that has a line through the text: `\033[9m`
- Inverse - text whose background and foreground colors are swapped: `\033[7m`
- Normal - normal text: `\033[0m`

Figure 33.55 FI\_Terminal screen

### 33.142.2.4 Text and Background Colors

There's at least two ways to specify colors for text and background colors:

- 3 bit / 8 Color Values
- Full 24 bit R/G/B colors

Example of 3 bit colors:

Figure 33.56 FI\_Terminal 3 bit colors

Example application source code using 3 bit colors:

```
//
// Text colors
//
tty->append("\033[31m Red text.\033[0m\n"); // Print red text..
tty->append("\033[32m Green text.\033[0m\n");
:
tty->append("\033[36m Cyan text.\033[0m\n");
tty->append("\033[37m White text.\033[0m\n");
//
// Background colors
//
tty->append("\033[41m Red Background.\033[0m\n"); // background will be red
tty->append("\033[42m Green Background.\033[0m\n");
:
tty->append("\033[46m Cyan Background.\033[0m\n");
tty->append("\033[47m White Background.\033[0m\n");
```

Example of 24 bit colors:

Figure 33.57 FI\_Terminal 24 bit colors

Example application source code using 24 bit colors:

```
//
// 24 bit Text Color
//
tty->append("\033[38;2;0;0;255m Text is BLUE.\033[0m\n"); // RGB: R=0, G=0, B=255
tty->append("\033[38;2;255;0;0m Text is RED.\033[0m\n"); // RGB: R=255, G=0, B=0
tty->append("\033[38;2;127;64;0m Text is DARK ORANGE.\033[0m\n"); // RGB: R=127, G=64, B=0
//
// 24 bit Background Color
//
tty->append("\033[48;2;0;0;255m Background is BLUE.\033[0m\n"); // RGB: R=0, G=0, B=255
tty->append("\033[48;2;255;0;0m Background is RED.\033[0m\n"); // RGB: R=255, G=0, B=0
tty->append("\033[48;2;127;64;0m Background is DARK ORANGE.\033[0m\n"); // RGB: R=127, G=64, B=0
```

For more on the ANSI escape codes, see [The Escape Codes FI\\_Terminal Supports](#).

### 33.142.2.5 Features

Most standard terminal behaviors are supported, e.g.

- ASCII + UTF-8/Unicode
- scrollback history management
- mouse selection + copy/paste (^C, ^A)
- autoscroll during selection

Most popular ANSI/DEC VT100/Xterm escape sequences are supported (see [The Escape Codes Fl\\_Terminal Supports](#)), including:

- per-character colors for text and background
- per-character text attributes: bold/dim, underline, strikeout
- scrolling up/down
- character insert/delete for characters/rows/screen
- clearing characters/rows/screen

Does not (yet) support:

- programmable regions (scroll regions and attribute blocks)
- dynamic line wrap (where resizing display dynamically re-wraps long lines)

Will likely never implement as part of this widget:

- pty/termio management (such features should be *subclassed*)
- Different per-character font family + sizes (font family/size is global only)
- variable width fonts

Regarding the font family+size; the way the terminal is currently designed, the font family and size must not vary within text; rows have to be consistent height. Varying widths are tricky too, esp. when it comes to moving the cursor up/down within a column; varying *widths* are supported (due to Unicode characters sometimes being "wide", but not heights).

### 33.142.2.6 Margins

The margins define the amount of space (in pixels) around the outside of the text display area, the space between the widget's inner edge (inside the `box()`) and the text display area's outer edge. The margins can be inspected and changed with the `margin_left()`, `margin_right()`, `margin_top()` and `margin_bottom()` methods.

```

TERMINAL WIDGET (Fl_Terminal)

TEXT DISPLAY AREA ↑ margin_top
 ↓
 S
 c
display_rows r
 o
 l
 l
display_columns
 B
 a
 r

margin_left ↑ margin_right
 ↓ margin_bottom

 Fl_Terminal Margins

 ::::::::::::::
 ::##:::##:
 ::##:::##:
 ::###:#####
 ::###:##### Fl_Terminal::color()

```

```

::##:##:##:
::##:##:##:
::##:##:##:
::##:##:##:
::##:##:##:
::##:##:##:
Fl_Terminal::textbgcolor()

Fl_Terminal::textfgcolor()

```

### 33.142.2.7 Caveats

- This widget is not a full terminal emulator; it does not do stdio redirection, pseudo ttys/termios/character cooking, keyboard input processing, full curses(3) support. However, such features CAN be implemented with subclassing.
- The `printf()` and `vprintf()` functions are limited to strings no longer than 1024 characters (including NULL). For printing longer strings, use `append()` which has no string limits.
- For background colors `textbgcolor()` and `textbgcolor_default()`, the special color value `0xffffffff` lets the widget's `box()` `color()` show through behind the text.

## 33.142.3 Member Enumeration Documentation

### 33.142.3.1 Attrib

enum `Fl_Terminal::Attrib`

Bits for the per-character attributes, which control text features such as italic, bold, underlined text, etc.

NOTE: enum names with a leading underbar must not be used, and are reserved for future use.

#### Enumerator

NORMAL	all attributes off
BOLD	bold text: uses bold font, color brighter than normal
DIM	dim text; color slightly darker than normal
ITALIC	italic font text
UNDERLINE	underlined text
<code>_RESERVED↔ _1</code>	<i>(reserved for internal future use)</i>
INVERSE	inverse text; fg/bg color are swapped
<code>_RESERVED↔ _2</code>	<i>(reserved for internal future use)</i>
STRIKEOUT	strikeout text

### 33.142.3.2 CharFlags

enum `Fl_Terminal::CharFlags`

Per-character 8 bit flags (uchar) used to manage special states for characters.

#### Enumerator

FG_XTERM	this char's fg color is an XTERM color; can be affected by Dim+Bold
----------	---------------------------------------------------------------------

## Enumerator

BG_XTERM	this char's bg color is an XTERM color; can be affected by Dim+Bold
EOL	TODO: char at EOL, used for line re-wrap during screen resizing.

**33.142.3.3 OutFlags**

enum `Fl_Terminal::OutFlags`

Output translation flags for special control character translations.

## Enumerator

OFF	no output translation
CR_TO_LF	carriage return generates a vertical line-feed ( <code>\r -&gt; \n</code> )
LF_TO_CR	line-feed generates a carriage return ( <code>\n -&gt; \r</code> )
LF_TO_CRLF	line-feed generates a carriage return line-feed ( <code>\n -&gt; \r\n</code> )

**33.142.3.4 RedrawStyle**

enum `Fl_Terminal::RedrawStyle`

Determines when `Fl_Terminal` calls `redraw()` if new text is added.

RATE\_LIMITED is the recommended setting, using `redraw_rate(float)` to determine the maximum rate of redraws.

See also

[redraw\\_style\(\)](#), [redraw\\_rate\(\)](#)

## Enumerator

NO_REDRAW	app must call <code>redraw()</code> as needed to update text to screen
RATE_LIMITED	timer controlled redraws. (DEFAULT)
PER_WRITE	redraw triggered after every <code>append()</code> / <code>printf()</code> / etc. operation

**33.142.3.5 ScrollbarStyle**

enum `Fl_Terminal::ScrollbarStyle`

Behavior of scrollbars.

## Enumerator

SCROLLBAR_OFF	scrollbar always invisible
SCROLLBAR_AUTO	scrollbar visible if widget resized in a way that hides columns (default)
SCROLLBAR_ON	scrollbar always visible

**33.142.4 Constructor & Destructor Documentation**

**33.142.4.1 Fl\_Terminal()** [1/2]

```
Fl_Terminal::Fl_Terminal (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor for [Fl\\_Terminal](#).

This creates an empty terminal with defaults:

- white on black text; see [textfgcolor\(Fl\\_Color\)](#), [textbgcolor\(Fl\\_Color\)](#)
- rows/cols based on the W and H values, see [display\\_rows\(\)](#), [display\\_columns\(\)](#)
- scrollbar history of 100 lines, see [history\\_rows\(\)](#)
- [redraw\\_style\(\)](#) set to RATE\_LIMITED, [redraw\\_rate\(\)](#) set to 0.10 seconds

Note: While [Fl\\_Terminal](#) derives from [Fl\\_Group](#), it's not intended for user code to use it as a parent for other widgets, so [end\(\)](#) is called.

**Parameters**

in	<i>X,Y,W,H</i>	position and size.
in	<i>L</i>	label string (optional), may be NULL.

**33.142.4.2 Fl\_Terminal()** [2/2]

```
Fl_Terminal::Fl_Terminal (
 int X,
 int Y,
 int W,
 int H,
 const char * L,
 int rows,
 int cols,
 int hist)
```

Same as the default FLTK constructor, but lets the user force the rows, columns and history to specific sizes on creation.

Since the row/cols/hist are specified directly, this prevents the widget from auto-calculating the initial text buffer size based on the widget's pixel width/height, bypassing calls to the font system before the widget is displayed.

**Note**

fluid uses this constructor internally to avoid font calculations that opens the display, useful for when running in a headless context. (issue 837)

**33.142.4.3 ~Fl\_Terminal()**

```
Fl_Terminal::~Fl_Terminal (
 void)
```

The destructor for [Fl\\_Terminal](#).

Destroys the terminal display, scroll history, and associated widgets.

**33.142.5 Member Function Documentation**

**33.142.5.1 ansi()** [1/2]

```
void Fl_Terminal::ansi (
 bool val)
```

Enable/disable the ANSI mode flag.

If true, ANSI and VT100/xterm codes will be processed. If false, these codes won't be processed and will either be ignored or print the error character "¿", depending on the value of [show\\_unknown\(\)](#).

See also

[show\\_unknown\(\)](#), [The Escape Codes Fl\\_Terminal Supports](#)

**33.142.5.2 ansi()** [2/2]

```
bool Fl_Terminal::ansi (
 void) const
```

Return the state of the ANSI flag.

See also

[ansi\(bool\)](#)

**33.142.5.3 append()**

```
void Fl_Terminal::append (
 const char * s,
 int len = -1)
```

Appends string *s* to the terminal at the current cursor position using the current text color/attributes.

If *s* is NULL, the UTF-8 character cache is cleared, which is recommended before starting a block reading loop, and again after the block loop has completed.

If *len* is not specified, it's assumed *s* is a NULL terminated string. If *len* IS specified, it can be used for writing strings that aren't NULL terminated, such as block reads on a pipe, network, or other block oriented data source.

Redraws of the terminal widget are by default handled automatically, but can be changed with [redraw\\_rate\(\)](#) and [redraw\\_style\(\)](#).

**Block I/O**

When reading block oriented sources (such as pipes), [append\(\)](#) will handle partial UTF-8 chars straddling the block boundaries. It does this using an internal byte cache, which should be cleared before and after block I/O loops by calling [append\(NULL\)](#) as shown in the example below, to prevent the possibilities of partial UTF-8 characters left behind by an interrupted or incomplete block loop.

```
// Example block reading a command pipe in Unix
// Run command and read as a pipe
FILE *fp = popen("ls -la", "r");
if (!fp) { ..error_handling.. }
// Enable non-blocking I/O
int fd = fileno(fp);
fcntl(fd, F_SETFL, O_NONBLOCK);
// Clear UTF-8 character cache before starting block loop
G_tty->append(NULL); // prevents leftover partial UTF-8 bytes
// Block read loop
while (1) {
 Fl::wait(0.05); // give fltk .05 secs of cpu to manage UI
 ssize_t bytes = read(fd, s, sizeof(s)); // read block from pipe
 if (bytes == -1 && errno == EAGAIN) continue; // no data yet? continue
 if (bytes > 0) G_tty->append(s); // append output to terminal
 else break; // end of pipe?
}
// Flush cache again after block loop completes
G_tty->append(NULL);
// Close pipe, done
pclose(fp);
```

**Note**

- String can contain ASCII or UTF-8 chars
- `len` is optional; if unspecified, expects `s` to be a NULL terminated string
- Handles partial UTF-8 chars split between calls (e.g. block oriented writes)
- If `s` is NULL, this clears the "partial UTF-8" character cache
- Redraws are managed automatically by default; see [redraw\\_style\(\)](#)

**33.142.5.4 append\_ascii()**

```
void Fl_Terminal::append_ascii (
 const char * s)
```

Append NULL terminated ASCII string to terminal, slightly more efficient than [append\\_utf8\(\)](#).

- If `s` is NULL, behavior is to do nothing
- Redraws are triggered automatically, depending on [redraw\\_style\(\)](#)

**33.142.5.5 append\_utf8()**

```
void Fl_Terminal::append_utf8 (
 const char * buf,
 int len = -1)
```

Append NULL terminated UTF-8 string to terminal.

- If `buf` is NULL, UTF-8 cache buffer is cleared
- If optional `len` isn't specified or is -1, `strlen(text)` is used.
- If `len` is 0 or <-1, no changes are made
- Handles UTF-8 chars split across calls (e.g. block writes from pipes, etc)
- Redraws are triggered automatically, depending on [redraw\\_style\(\)](#)

**33.142.5.6 box()**

```
void Fl_Terminal::box (
 Fl_Boxtype val) [inline]
```

Sets the box type, updates terminal margins et al.

Default is `FL_DOWN_FRAME`.

`FL_XXX_FRAME` types are handled in a special way by this widget, and guarantee the background is a flat field.

`FL_XXX_BOX` may draw gradients as inherited by [Fl::scheme\(\)](#).

**33.142.5.7 clear() [1/2]**

```
void Fl_Terminal::clear (
 Fl_Color val)
```

Clears the screen to a specific color `val` and homes the cursor.

**See also**

[clear\\_screen\(\)](#), [clear\\_screen\\_home\(\)](#), [cursor\\_home\(\)](#)

**33.142.5.8 clear()** [2/2]

```
void Fl_Terminal::clear (
 void)
```

Clears the screen to the current [textbgcolor\(\)](#), and homes the cursor.

See also

[clear\\_screen\(\)](#), [clear\\_screen\\_home\(\)](#), [cursor\\_home\(\)](#)

**33.142.5.9 clear\_screen()**

```
void Fl_Terminal::clear_screen (
 bool scroll_to_hist = true)
```

Clear the terminal screen only; does not affect the cursor position.

Also clears the current mouse selection.

If 'scroll\_to\_hist' is true, the screen is cleared by scrolling the contents into the scrollbar history, where it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollbar history is unchanged.

Similar to the escape sequence "<ESC> [2J".

See also

[clear\\_screen\\_home\(\)](#)

**33.142.5.10 clear\_screen\_home()**

```
void Fl_Terminal::clear_screen_home (
 bool scroll_to_hist = true)
```

Clear the terminal screen and home the cursor.

Also clears the current mouse selection.

If 'scroll\_to\_hist' is true, the screen is cleared by scrolling the contents into the scrollbar history, where it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollbar history is unchanged.

Similar to the escape sequence "<ESC> [2J<ESC> [H".

See also

[clear\\_screen\(\)](#)

**33.142.5.11 color()**

```
void Fl_Terminal::color (
 Fl_Color val)
```

Sets the background color for the terminal's [Fl\\_Group::box\(\)](#).

If the [textbgcolor\(\)](#) and [textbgcolor\\_default\(\)](#) are set to the special "see through" color 0xffffffff when any text was added, changing [color\(\)](#) affects the color that shows through behind that existing text.

Otherwise, whatever specific background color was set for existing text will persist after changing [color\(\)](#).

To see the effects of a change to [color\(\)](#), follow up with a call to [redraw\(\)](#).

The default value is 0x0.

**33.142.5.12 cursor\_col()**

```
void Fl_Terminal::cursor_col (
 int col) [protected]
```

Move cursor to the specified column `col`.

This value is clamped to the range (0..[display\\_columns\(\)](#)-1).

**33.142.5.13 cursor\_cr()**

```
void Fl_Terminal::cursor_cr (
 void) [protected]
```

Move cursor as if a CR (\r) was received.  
Same as [cursor\\_sol\(\)](#)

**33.142.5.14 cursor\_down()**

```
void Fl_Terminal::cursor_down (
 int count = 1,
 bool do_scroll = false) [protected]
```

Moves cursor down *count* lines.

If cursor hits screen bottom, it either stops (does not wrap) if *do\_scroll* is false, or wraps and scrolls up if *do\_scroll* is true.

**Parameters**

<i>count</i>	Number of lines to move cursor down
<i>do_scroll</i>	Enable scrolling if set to true

**33.142.5.15 cursor\_right()**

```
void Fl_Terminal::cursor_right (
 int count = 1,
 bool do_scroll = false) [protected]
```

Moves cursor right *count* columns.

If cursor hits right edge of screen, it either stops (does not wrap) if *do\_scroll* is false, or wraps and scrolls up one line if *do\_scroll* is true.

**33.142.5.16 cursor\_row()**

```
void Fl_Terminal::cursor_row (
 int row) [protected]
```

Move cursor to the specified row *row*.

This value is clamped to the range (0..[display\\_rows\(\)](#)-1).

**33.142.5.17 cursor\_up()**

```
void Fl_Terminal::cursor_up (
 int count = 1,
 bool do_scroll = false) [protected]
```

Moves cursor up *count* lines.

If cursor hits screen top, it either stops (does not wrap) if *do\_scroll* is false, or scrolls down if *do\_scroll* is true.

**33.142.5.18 delete\_rows()**

```
void Fl_Terminal::delete_rows (
 int count) [protected]
```

Delete (*count*) rows at cursor position.

Causes rows to scroll up, and empty lines created at bottom of screen. Lines deleted by scroll up are NOT moved into the scroll history.

**33.142.5.19 display\_columns() [1/2]**

```
void Fl_Terminal::display_columns (
 int dcols)
```

Set terminal's display width in columns of text characters.

This value is normally managed automatically by [resize\(\)](#) based on the current font size, and should not be changed. You CAN make the [display\\_columns\(\)](#) larger than the width of the widget; text in the terminal will simply run off the screen edge and be clipped; the only way to reveal that text is if the user enlarges the widget, or the font size made smaller.

To change the display width, it is best to use [resize\(\)](#) instead.

### 33.142.5.20 [display\\_columns\(\)](#) [2/2]

```
int Fl_Terminal::display_columns (
 void) const
```

Return terminal's display width in columns of text characters.

This value is normally managed automatically by [resize\(\)](#) based on the current font size.

### 33.142.5.21 [display\\_rows\(\)](#) [1/2]

```
void Fl_Terminal::display_rows (
 int drows)
```

Set terminal's display height in lines of text (rows).

This value is normally managed automatically by [resize\(\)](#) based on the current font size, and should not be changed.

To change the display height, use [resize\(\)](#) instead.

### 33.142.5.22 [display\\_rows\(\)](#) [2/2]

```
int Fl_Terminal::display_rows (
 void) const
```

Return terminal's display height in lines of text (rows).

This value is normally managed automatically by [resize\(\)](#) based on the current font size.

### 33.142.5.23 [draw\(\)](#)

```
void Fl_Terminal::draw (
 void) [virtual]
```

Draws the entire [Fl\\_Terminal](#).

Lets the group draw itself first (scrollbars should be only members), followed by the terminal's screen contents.

Reimplemented from [Fl\\_Group](#).

### 33.142.5.24 [draw\\_buff\(\)](#)

```
void Fl_Terminal::draw_buff (
 int Y) const [protected]
```

Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.

This can be anywhere in the ring buffer, not just the 'active display'; depends on what position the scrollbar is set to.

Handles attributes, colors, text selections, cursor.

#### Parameters

<code>in</code>	<code>Y</code>	top position of top left character in the window in FLTK coordinates
-----------------	----------------	----------------------------------------------------------------------

### 33.142.5.25 [draw\\_row\(\)](#)

```
void Fl_Terminal::draw_row (
 int grow,
 int Y) const [protected]
```

Draw the specified global row, which is the row in `ring_chars[]`.

The global row includes history + display buffers.

## Parameters

in	<i>grow</i>	row number
in	<i>Y</i>	top position of characters in the row in FLTK coordinates

**33.142.5.26 draw\_row\_bg()**

```
void Fl_Terminal::draw_row_bg (
 int grow,
 int X,
 int Y) const [protected]
```

Draw the background for the specified ring\_chars[] global row *grow* starting at FLTK coords *X* and *Y*. Note we may be called to draw display, or even history if we're scrolled back. If there's any change in bg color, we draw the filled rects here.

If the bg color for a character is the special "see through" color 0xfffffff, no pixels are drawn.

## Parameters

in	<i>grow</i>	row number
in	<i>X,Y</i>	top left corner of the row in FLTK coordinates

**33.142.5.27 error\_char() [1/2]**

```
void Fl_Terminal::error_char (
 const char * val) [inline]
```

Sets the "error character" utf8 string shown for invalid utf8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true. Default: "¿".

See also

[show\\_unknown\(bool\)](#)

**33.142.5.28 error\_char() [2/2]**

```
const char * Fl_Terminal::error_char (
 void) const [inline]
```

Returns the "error character" utf8 string, which is shown for invalid utf8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true.

See also

[show\\_unknown\(bool\)](#)

**33.142.5.29 get\_selection()**

```
bool Fl_Terminal::get_selection (
 int & srow,
 int & scol,
 int & erow,
 int & ecol) const [protected]
```

Return mouse selection's start/end position in the ring buffer, if any.

Ensures (start < end) to allow walking 'forward' thru selection, left-to-right, top-to-bottom. The row/col values are indexes into the entire ring buffer.

Example: walk the characters of the mouse selection:

```

// Get selection
int srow,scol,erow,ecol;
if (get_selection(srow,scol,erow,ecol)) { // mouse selection exists?
// Walk entire selection from start to end
for (int row=srow; row<=erow; row++) { // walk rows of selection
const Utf8Char *u8c = u8c_ring_row(row); // ptr to first character in row
int col_start = (row==srow) ? scol : 0; // start row? start at scol
int col_end = (row==erow) ? ecol : ring_cols(); // end row? end at ecol
u8c += col_start; // include col offset (if any)
for (int col=col_start; col<=col_end; col++,u8c++) { // walk columns
..do something with each char at *u8c..
}
}
}

```

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

See also

[walk\\_selection\(\)](#), [is\\_selection\(\)](#)

Parameters

<i>srow</i>	starting row for selection
<i>scol</i>	starting column for selection
<i>erow</i>	ending row for selection
<i>ecol</i>	ending column for selection

### 33.142.5.30 h\_to\_row()

```

int Fl_Terminal::h_to_row (
 int H) const [protected]

```

Given a height in pixels, return number of rows that "fits" into that area.  
This is used by the constructor to size the row/cols to fit the widget size.

### 33.142.5.31 handle()

```

int Fl_Terminal::handle (
 int e) [virtual]

```

Handle FLTK events.

Reimplemented from [Fl\\_Group](#).

### 33.142.5.32 handle\_unknown\_char() [1/2]

```

int Fl_Terminal::handle_unknown_char (
 int drow,
 int dcol) [protected]

```

Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of [show\\_unknown\(\)](#).

This writes the "unknown" character to the display position (drow,dcol) if [show\\_unknown\(\)](#) is true.

Returns 1 if tty modified, 0 if not.

See also

[show\\_unknown\(\)](#)

**33.142.5.33 handle\_unknown\_char()** [2/2]

```
int Fl_Terminal::handle_unknown_char (
 void) [protected]
```

Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of [show\\_unknown\(\)](#).

This writes the "unknown" character to the output stream if [show\\_unknown\(\)](#) is true.

Returns 1 if tty modified, 0 if not.

See also

[show\\_unknown\(\)](#)

**33.142.5.34 history\_lines()**

```
void Fl_Terminal::history_lines (
 int val)
```

Set the number of lines of screen history.

Large values can be briefly heavy on cpu and memory usage.

**33.142.5.35 history\_use()**

```
int Fl_Terminal::history_use (
 void) const
```

Returns how many lines are "in use" by the screen history buffer.

This value will be 0 if history was recently cleared with e.g. [clear\\_history\(\)](#) or "<ESC>c".

Return value will be in the range 0 .. ([history\\_lines\(\)](#)-1).

**33.142.5.36 hscrollbar\_style()** [1/2]

```
void Fl_Terminal::hscrollbar_style (
 ScrollbarStyle val)
```

Set the horizontal scrollbar behavior style.

This determines when the scrollbar is visible.

ScrollbarStyle enum	Description
<a href="#">SCROLLBAR_ON</a>	Horizontal scrollbar always displayed.
<a href="#">SCROLLBAR_OFF</a>	Horizontal scrollbar never displayed.
<a href="#">SCROLLBAR_AUTO</a>	Horizontal scrollbar displayed whenever widget width hides columns.

The default style is [SCROLLBAR\\_AUTO](#).

See also

[ScrollbarStyle](#)

**33.142.5.37 hscrollbar\_style()** [2/2]

```
Fl_Terminal::ScrollbarStyle Fl_Terminal::hscrollbar_style (
 void) const
```

Get the horizontal scrollbar behavior style.

This determines when the scrollbar is visible.

Value will be one of the [Fl\\_Terminal::ScrollbarStyle](#) enum values.

See also

[hscrollbar\\_style\(Fl\\_Terminal::ScrollbarStyle\)](#)

### 33.142.5.38 insert\_char()

```
void Fl_Terminal::insert_char (
 char c,
 int rep) [protected]
```

Insert char 'c' at the current cursor position for 'rep' times.  
Does not wrap; characters at end of line are lost.

### 33.142.5.39 insert\_rows()

```
void Fl_Terminal::insert_rows (
 int count) [protected]
```

Insert (count) rows at current cursor position.

Causes rows below to scroll down, and empty lines created. Lines deleted by scroll down are NOT moved into the scroll history.

### 33.142.5.40 is\_inside\_selection()

```
bool Fl_Terminal::is_inside_selection (
 int grow,
 int gcol) const [protected]
```

Is global row/column inside the current mouse selection?

Returns

- true – (grow, gcol) is inside a valid selection.
- false – (grow, gcol) is outside, or no valid selection.

### 33.142.5.41 output\_translate()

```
void Fl_Terminal::output_translate (
 Fl_Terminal::OutFlags val)
```

Sets the combined output translation flags to val.

val can be sensible combinations of the OutFlags bit flags.

The default is LF\_TO\_CRLF, so that \n will generate both carriage-return (CR) and line-feed (LF).

For \r and \n to be handled literally, use output\_translate(Fl\_Terminal::OutFlags::OFF);

To disable all output translations, use 0 or Fl\_Terminal::OutFlags::OFF.

### 33.142.5.42 plot\_char() [1/2]

```
void Fl_Terminal::plot_char (
 char c,
 int drow,
 int dcol)
```

Plot the ASCII character c at the terminal's display position (drow,dcol).

The character MUST be printable (in range 0x20 - 0x7e), and is displayed using the current text color/attributes.

Characters outside that range are either ignored or print the error character (¿), depending on [show\\_unknown\(bool\)](#).

This is a very low level method.

No range checking is done on drow,dcol:

- drow must be in range 0..[display\\_rows\(\)](#)-1)
- dcol must be in range 0..[display\\_columns\(\)](#)-1)

- Does not trigger redraws
- Does NOT handle control codes, ANSI or XTERM escape sequences.

See also

[show\\_unknown\(bool\)](#), [handle\\_unknown\\_char\(\)](#), [is\\_printable\(\)](#)

### 33.142.5.43 plot\_char() [2/2]

```
void Fl_Terminal::plot_char (
 const char * text,
 int len,
 int drow,
 int dcol)
```

Plot the UTF-8 character `text` of length `len` at display position (`drow,dcol`).

The character is displayed using the current text color/attributes.

This is a very low level method.

No range checking is done on `drow,dcol`:

- `drow` must be in range `0..(display_rows()-1)`
- `dcol` must be in range `0..(display_columns()-1)`
- Does not trigger redraws
- Does not handle control codes, ANSI or XTERM escape sequences.
- Invalid UTF-8 chars show the error character (`¿`) depending on [show\\_unknown\(bool\)](#).

See also

[handle\\_unknown\\_char\(\)](#)

### 33.142.5.44 print\_char() [1/2]

```
void Fl_Terminal::print_char (
 char c)
```

Prints single ASCII char `c` at current cursor position, and advances the cursor.

The character is displayed at the current cursor position using the current text color/attributes.

- `c` must be ASCII, not utf-8
- Does not trigger redraws

### 33.142.5.45 print\_char() [2/2]

```
void Fl_Terminal::print_char (
 const char * text,
 int len = -1)
```

Prints single UTF-8 char `text` of optional byte length `len` at current cursor position, and advances the cursor if the character is printable.

Handles ASCII and control codes (CR, LF, etc).

The character is displayed at the current cursor position using the current text color/attributes.

Handles control codes and can be used to construct ANSI/XTERM escape sequences.

- If optional `len` isn't specified or `<0`, `strlen(text)` is used.

- `text` must not be `NULL`.
- `len` must not be 0.
- `text` must be a single char only (whether UTF-8 or ASCII)
- `text` can be an ASCII character, though not as efficient as `print_char()`
- Invalid UTF-8 chars show the error character (`¿`) depending on `show_unknown(bool)`.
- Does not trigger redraws

See also

[show\\_unknown\(bool\)](#), [handle\\_unknown\\_char\(\)](#)

### 33.142.5.46 `printf()`

```
void Fl_Terminal::printf (
 const char * fmt,
 ...)
```

Appends `printf` formatted messages to the terminal.

The string can contain UTF-8, `crlf`'s, and ANSI sequences are also supported. Example:

```
#include <FL/Fl_Terminal.H>
int main(..) {
 :
 // Create a terminal, and append some messages to it
 Fl_Terminal *tty = new Fl_Terminal(..);
 :
 // Append three lines of formatted text to the buffer
 tty->printf("The current date is: %s.\nThe time is: %s\n", date_str, time_str);
 tty->printf("The current PID is %ld.\n", (long) getpid());
 :
}
```

Note

The expanded string is currently limited to 1024 characters (including `NULL`). For longer strings use [append\(\)](#) which has no string limits.

### 33.142.5.47 `redraw_rate()`

```
void Fl_Terminal::redraw_rate (
 float val)
```

Set the maximum rate redraw speed in floating point seconds if [redraw\\_style\(\)](#) is set to `RATE_LIMITED`.

When output is sent to the terminal, rather than calling [redraw\(\)](#) right away, a timer is started with this value indicating how long to wait before calling [redraw\(\)](#), causing the output to be shown. 0.10 is recommended (1/10th of a second), to limit redraws to no more than 10 redraws per second.

The value that works best depends on how fast data arrives, and how fast the font system can draw text at runtime. Values too small cause too many redraws to occur, causing the terminal to get backlogged if large bursts of data arrive quickly. Values too large cause realtime output to be too "choppy".

### 33.142.5.48 `redraw_style()` [1/2]

```
void Fl_Terminal::redraw_style (
 RedrawStyle val)
```

Set how [Fl\\_Terminal](#) manages screen redrawing.

This setting is relevant when [Fl\\_Terminal](#) is used for high bandwidth data; too many redraws will slow things down, too few cause redraws to be 'choppy' when realtime data comes in.

Redrawing can be cpu intensive, depending on how many rows/cols are being displayed; worst case: large display + small font. Speed largely depends on the end user's graphics hardware and font drawing system.

RedrawStyle enum	Description
<a href="#">NO_REDRAW</a>	App must call <a href="#">redraw()</a> as needed to update text to screen
<a href="#">RATE_LIMITED</a>	Rate limited, timer controlled redraws. (DEFAULT) See <a href="#">redraw_rate()</a>
<a href="#">PER_WRITE</a>	Redraw triggered <i>every</i> call to <a href="#">append()</a> / <a href="#">printf()</a> / etc.

The default style is RATE\_LIMITED, which is the easiest to use, and automates redrawing to be capped at 10 redraws per second max. See [redraw\\_rate\(float\)](#) to control this automated redraw speed.

See also

[redraw\\_rate\(\)](#), [RedrawStyle](#)

#### 33.142.5.49 [redraw\\_style\(\)](#) [2/2]

```
Fl_Terminal::RedrawStyle Fl_Terminal::redraw_style (
 void) const
```

Get the redraw style.

This determines when the terminal redraws itself while text is being added to it.

Value will be one of the [Fl\\_Terminal::RedrawStyle](#) enum values.

See also

[redraw\\_style\(Fl\\_Terminal::RedrawStyle\)](#)

#### 33.142.5.50 [reset\\_terminal\(\)](#)

```
void Fl_Terminal::reset_terminal (
 void)
```

Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.

Same as "<ESC>c"

#### 33.142.5.51 [resize\(\)](#)

```
void Fl_Terminal::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Handle widget resizing, such as if user resizes parent window.

This may increase the column width of the widget if the width of the widget is made larger than it was.

Note

Resizing currently does not rewrap existing text. Currently enlarging makes room for longer lines, and shrinking the size lets long lines run off the right edge of the display, hidden from view. This behavior may change in the future to rewrap.

Reimplemented from [Fl\\_Group](#).

#### 33.142.5.52 [scroll\(\)](#)

```
void Fl_Terminal::scroll (
 int rows) [protected]
```

Scroll the display up(+) or down(-) the specified rows.

- Negative value scrolls "down", clearing top line, and history unaffected.
- Positive value scrolls "up", clearing bottom line, rotating top line into history.

### 33.142.5.53 scrollbar\_actual\_size()

```
int Fl_Terminal::scrollbar_actual_size (
 void) const
```

Returns the scrollbar's actual "trough size", which is the width of FL\_VERTICAL scrollbars, or height of FL\_↔ HORIZONTAL scrollbars.

If `scrollbar_size()` is zero (default), then the value of the global `Fl::scrollbar_size()` is returned, which is the default global scrollbar size for the entire application.

### 33.142.5.54 scrollbar\_size() [1/2]

```
void Fl_Terminal::scrollbar_size (
 int val)
```

Set the pixel size of both horizontal and vertical scrollbar's "trough" to `val`.

Setting `val` to the special value 0 causes the widget to track the global `Fl::scrollbar_size()`.

Use non-zero values *only* if you need to override the global `Fl::scrollbar_size()` size.

See also

[Fl::scrollbar\\_size\(\)](#), [scrollbar\\_actual\\_size\(\)](#)

### 33.142.5.55 scrollbar\_size() [2/2]

```
int Fl_Terminal::scrollbar_size (
 void) const
```

Get current pixel size of all the scrollbar's troughs for this widget, or zero if the global `Fl::scrollbar_size()` is being used (default).

If this value returns *zero*, this widget's scrollbars are using the global `Fl::scrollbar_size()`, in which case use `scrollbar_actual_size()` to get the actual (effective) pixel scrollbar size being used.

Returns

Scrollbar trough size in pixels, or 0 if the global `Fl::scrollbar_size()` is being used.

See also

[Fl::scrollbar\\_size\(int\)](#), [scrollbar\\_actual\\_size\(\)](#)

### 33.142.5.56 selection\_extend()

```
bool Fl_Terminal::selection_extend (
 int X,
 int Y) [protected]
```

Extend selection to FLTK coords X,Y.

Returns true if extended, false if nothing done (X,Y offscreen)

### 33.142.5.57 selection\_text()

```
const char * Fl_Terminal::selection_text (
 void) const
```

Return text selection (for copy()/paste() operations)

- Returns allocated NULL terminated string for entire selection.

- Caller must free() this memory when done.
- Unicode safe.

### 33.142.5.58 selection\_text\_len()

```
int Fl_Terminal::selection_text_len (
 void) const
```

Return byte length of all UTF-8 chars in selection, or 0 if no selection.

NOTE: Length includes trailing white on each line.

### 33.142.5.59 show\_unknown() [1/2]

```
void Fl_Terminal::show_unknown (
 bool val)
```

Set the "show unknown" flag.

If true, invalid utf8 and invalid ANSI sequences will be shown with the error character "?".

If false, errors characters won't be shown.

See also

[handle\\_unknown\\_char\(\)](#), [error\\_char\(const char\\*\)](#).

### 33.142.5.60 show\_unknown() [2/2]

```
bool Fl_Terminal::show_unknown (
 void) const
```

Return the "show unknown" flag.

See also

[show\\_unknown\(bool\)](#), [error\\_char\(const char\\*\)](#).

### 33.142.5.61 text()

```
const char * Fl_Terminal::text (
 bool lines_below_cursor = false) const
```

Return a string copy of all lines in the terminal (including history).

The returned string is allocated with `strdup(3)`, which the caller must free.

If 'lines\_below\_cursor' is false (default), lines below the cursor on down to the bottom of the display are ignored, and not included in the returned string.

If 'lines\_below\_cursor' is true, then all lines in the display are returned including any below the cursor, even if all are blank.

Example use:

```
Fl_Terminal *tty = new Fl_Terminal(..);
:
const char *s = tty->text(); // get a copy of the terminal's contents
printf("Terminal's contents is:\n%s\n", s);
free((void*)s); // free() the copy when done!
```

#### Parameters

in	<i>lines_below_cursor</i>	include lines below cursor, default: false
----	---------------------------	--------------------------------------------

**Returns**

A string allocated with `strdup(3)` which must be free'd, text is UTF-8.

**33.142.5.62 textattrib() [1/2]**

```
uchar Fl_Terminal::textattrib () const
```

Get text attribute bits (underline, inverse, etc).

This is the default attribute used for all newly printed text.

**See also**

[textattrib\(uchar\)](#), [Fl\\_Terminal::Attrib](#)

**33.142.5.63 textattrib() [2/2]**

```
void Fl_Terminal::textattrib (
 uchar val)
```

Set text attribute bits (underline, inverse, etc).

This will be the default attribute used for all newly printed text.

**See also**

[Fl\\_Terminal::Attrib](#)

**33.142.5.64 textbgcolor()**

```
void Fl_Terminal::textbgcolor (
 Fl_Color val)
```

Set text background color to fltk color `val` used by any new text added.

Use this for temporary color changes, similar to `<ESC>[48;2;<R>;<G>;<B>m`

Colors set this way will NOT be influenced by the xterm Dim/Bold color intensity attributes. For that, use [textbgcolor\\_xterm\(uchar\)](#) instead.

This setting does *not* affect the 'default' text colors used by `<ESC>[0m`, `<ESC>c`, [reset\\_terminal\(\)](#), etc. To set that too, also set [textbgcolor\\_default\(Fl\\_Color\)](#), e.g.

```
// Set both 'current' and 'default' colors
Fl_Color darkamber = 0x20100000;
tty->textbgcolor(darkamber); // set 'current' bg color
tty->textbgcolor_default(darkamber); // set 'default' bg color used by ESC[0m reset
```

The special color value `0xffffffff` (all ff's) is the "see through" color, which lets the widget's own [Fl\\_Group::color\(\)](#) show through behind the text. This special text background color is the *default*, and is what most situations need.

**See also**

[textbgcolor\\_default\(Fl\\_Color\)](#), [textbgcolor\\_xterm\(uchar\)](#)

**33.142.5.65 textbgcolor\_default() [1/2]**

```
void Fl_Terminal::textbgcolor_default (
 Fl_Color val)
```

Set the default text background color used by any new text added after a reset (`<ESC>c`, `<ESC>[0m`, or [reset\\_terminal\(\)](#)).

Does not affect the 'current' text background color; use [textbgcolor\(Fl\\_Color\)](#) to set that.

The special color value `0xffffffff` (all ff's) is the "see through" color, which lets the widget's own [Fl\\_Group::color\(\)](#) show through behind the text. This special text background color is the *default*, and is what most situations need.

See also

[textbgcolor\(Fl\\_Color\)](#)

### 33.142.5.66 textbgcolor\_default() [2/2]

```
Fl_Color Fl_Terminal::textbgcolor_default (
 void) const [inline]
```

Return text's default background color.

See also

[textbgcolor\(\)](#)

### 33.142.5.67 textbgcolor\_xterm()

```
void Fl_Terminal::textbgcolor_xterm (
 uchar val)
```

Sets the background text color as one of the 8 'xterm color' values.

This will be the foreground color used for all newly printed text, similar to the `<ESC>[#m` escape sequence, where `#` is between 40 and 47.

This color will be reset to the default bg color if [reset\\_terminal\(\)](#) is called, or by `<ESC>c`, `<ESC>[0m`, etc.

The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g. `<ESC>[1m`, [textattrib\(\)](#), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all colors except 'Black', which is not influenced by Dim or Bold; Black is always Black.

The 8 color xterm values are:

- 0 = Black
- 1 = Red
- 2 = Green
- 3 = Yellow
- 4 = Blue
- 5 = Magenta
- 6 = Cyan
- 7 = White

See also

[textbgcolor\\_default\(Fl\\_Color\)](#)

### 33.142.5.68 textcolor()

```
void Fl_Terminal::textcolor (
 Fl_Color val)
```

Set the text color for the terminal.

This is a convenience method that sets *both* [textfgcolor\(\)](#) and [textfgcolor\\_default\(\)](#), ensuring both are set to the same value.

Colors set this way will NOT be influenced by the xterm Dim/Bold color intensity attributes. For that, use [textcolor↔\\_xterm\(\)](#) instead.

See also

[textfgcolor\(Fl\\_Color\)](#), [textfgcolor\\_default\(Fl\\_Color\)](#), [textbgcolor\\_xterm\(uchar\)](#)

### 33.142.5.69 textfgcolor()

```
void Fl_Terminal::textfgcolor (
 Fl_Color val)
```

Set text foreground drawing color to fltk color `val` used by any new text added.

Use this for temporary color changes, similar to `<ESC>[38;2;<R>;<G>;<B>m`

Colors set this way will NOT be influenced by the xterm Dim/Bold color intensity attributes. For that, use [textfgcolor\\_xterm\(uchar\)](#) instead.

This setting does *not* affect the 'default' text colors used by `<ESC>[0m`, `<ESC>c`, [reset\\_terminal\(\)](#), etc. To change both the current *and* default fg color, also use [textfgcolor\\_default\(Fl\\_Color\)](#). Example:

```
// Set both 'current' and 'default' colors
Fl_Color amber = 0xd0704000;
tty->textfgcolor(amber); // set 'current' fg color
tty->textfgcolor_default(amber); // set 'default' fg color used by ESC[0m reset
```

See also

[textfgcolor\\_default\(Fl\\_Color\)](#), [textfgcolor\\_xterm\(uchar\)](#)

### 33.142.5.70 textfgcolor\_default() [1/2]

```
void Fl_Terminal::textfgcolor_default (
 Fl_Color val)
```

Set the default text foreground color used by `<ESC>c`, `<ESC>[0m`, and [reset\\_terminal\(\)](#).

Does not affect the 'current' text foreground color; use [textfgcolor\(Fl\\_Color\)](#) to set that.

See also

[textfgcolor\(Fl\\_Color\)](#)

### 33.142.5.71 textfgcolor\_default() [2/2]

```
Fl_Color Fl_Terminal::textfgcolor_default (
 void) const [inline]
```

Return text's default foreground color.

See also

[textfgcolor\(\)](#)

### 33.142.5.72 textfgcolor\_xterm()

```
void Fl_Terminal::textfgcolor_xterm (
 uchar val)
```

Sets the foreground text color as one of the 8 'xterm color' values.

This will be the foreground color used for all newly printed text, similar to the `<ESC>[#m` escape sequence, where `#` is between 30 and 37.

This color will be reset to the default fg color if [reset\\_terminal\(\)](#) is called, or by `<ESC>c`, `<ESC>[0m`, etc.

The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g. `<ESC>[1m`, [textattrib\(\)](#), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all colors except 'Black', which is not influenced by Dim or Bold; Black is always Black.

The 8 color xterm values are:

- 0 = Black
- 1 = Red

- 2 = Green
- 3 = Yellow
- 4 = Blue
- 5 = Magenta
- 6 = Cyan
- 7 = White

See also

[textfgcolor\\_default\(Fl\\_Color\)](#)

### 33.142.5.73 textfont()

```
void Fl_Terminal::textfont (
 Fl_Font val)
```

Sets the font used for all text displayed in the terminal.

This affects all existing text (in display and history) as well as any newly printed text.

Only monospace fonts are recommended, such as FL\_COURIER or FL\_SCREEN. Custom fonts configured with [Fl::set\\_font\(\)](#) will also work, as long as they are monospace.

### 33.142.5.74 textsize()

```
void Fl_Terminal::textsize (
 Fl_Fontsize val)
```

Sets the font size used for all text displayed in the terminal.

This affects all existing text (in display and history) as well as any newly printed text.

Changing this will affect the [display\\_rows\(\)](#) and [display\\_columns\(\)](#).

### 33.142.5.75 u8c\_disp\_row()

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_disp_row (
 int drow) [protected]
```

Return pointer to the first u8c character in row *drow* of the display.

- 'drow' is indexed relative to the beginning of the display buffer.
- This can be used to walk all columns in the specified row, e.g.

```
// Print all chars in first row of display (ASCII and UTF-8)
Utf8Char *u8c = u8c_disp_row(0); // first char of first display row
int scol = 0, ecol = disp_cols(); // start/end for column loop
for (int col=scol; col<ecol; col++,u8c++) { // loop from first char to last
 char *text = u8c->text_utf8(); // text string for char
 int len = u8c->length(); // text string length for char
 ::printf("<%.*s>", len, text); // print potentially multibyte char
}
```

### 33.142.5.76 u8c\_hist\_row()

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_row (
 int hrow) [protected]
```

Return u8c for beginning of a row inside the scrollbar history.

'hrow' is indexed relative to the beginning of the scrollbar history buffer.

See also

[u8c\\_disp\\_row\(int\)](#) for example use.

**33.142.5.77 u8c\_hist\_use\_row()**

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_use_row (
 int hurow) [protected]
```

Return u8c for beginning of row `hurow` inside the 'in use' part of the scrollbar history. 'hurow' is indexed relative to the beginning of the 'in use' part of the scrollbar history buffer. This may be a different from `u8c_hist_row(int)` if the history was recently cleared, and there aren't many (or any) rows in the history buffer that have been populated with scrollbar text yet.

See also

`u8c_disp_row(int)` for example use.

**33.142.5.78 u8c\_ring\_row()**

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_ring_row (
 int grow) [protected]
```

Return UTF-8 char for row `grow` in the ring buffer.

`grow` is globally indexed relative to the beginning of the ring buffer, so this method can access ANY character in the entire ring buffer (hist or disp) by the global index.

Scrolling offset is NOT applied; this is raw access to the ring's rows.

Should really ONLY be used for making a complete copy of the ring.

Example:

```
// Walk ALL rows and cols in the ring buffer..
for (int row=0; row<ring.rows(); row++) {
 Utf8Char *u8c = ring.u8c_ring_row(row);
 for (int col=0; col<ring.cols(); col++,u8c++) {
 ..make use of u8c->xxx() methods..
 }
}
```

**33.142.5.79 vprintf()**

```
void Fl_Terminal::vprintf (
 const char * fmt,
 va_list ap)
```

Appends printf formatted messages to the terminal.

Subclasses can use this to implement their own `printf()` functionality.

The string can contain UTF-8, crlf's, and ANSI sequences are also supported when `ansi(bool)` is set to 'true'.

Note

The expanded string is currently limited to 1024 characters (including NULL). For longer strings use `append()` which has no string limits.

**Parameters**

<i>fmt</i>	is a printf format string for the message text.
<i>ap</i>	is a <code>va_list</code> created by <code>va_start()</code> and closed with <code>va_end()</code> , which the caller is responsible for handling.

**33.142.5.80 w\_to\_col()**

```
int Fl_Terminal::w_to_col (
 int W) const [protected]
```

Given a width in pixels, return number of columns that "fits" into that area.

This is used by the constructor to size the row/cols to fit the widget size.

### 33.142.5.81 walk\_selection()

```
const Fl_Terminal::Utf8Char * Fl_Terminal::walk_selection (
 const Utf8Char * u8c,
 int & row,
 int & col) const [protected]
```

Walk the mouse selection one character at a time from beginning to end, returning a Utf8Char\* to the next character in the selection, or NULL if the end was reached, or if there's no selection.

This is easier to use for walking the selection than [get\\_selection\(\)](#).

`u8c` should start out as NULL, rewinding to the beginning of the selection. If the returned Utf8Char\* is not NULL, `row` and `col` return the character's row/column position in the ring buffer.

```
// EXAMPLE: Walk the entire mouse selection, if any
int row,col; // the returned row/col for each char
Utf8Char *u8c = NULL; // start with NULL to begin walk
while ((u8c = walk_selection(u8c, row, col)) { // loop until end char reached
 ..do something with *u8c..
}
```

See also

[get\\_selection\(\)](#), [is\\_selection\(\)](#)

Parameters

<code>u8c</code>	NULL on first iter
<code>row</code>	returned row#
<code>col</code>	returned col#

## 33.142.6 Member Data Documentation

### 33.142.6.1 hscrollbar

`Fl_Scrollbar*` `Fl_Terminal::hscrollbar`

Horizontal scrollbar.

This is public so it can be accessed directly, e.g.

- `hscrollbar->value(void)` returns the column offset position from the left edge of the display; 0 being the left edge (default).
- `hscrollbar->value(int)` similarly sets the column offset, which should be in the range [0 .. `Fl_Scrollbar::maximum()`].
- `hscrollbar->step(double)` sets the smoothness of scrolling, default is 0.25 for 4 steps of motion per column.

### 33.142.6.2 scrollbar

`Fl_Scrollbar*` `Fl_Terminal::scrollbar`

Vertical scrollbar.

This is public so it can be accessed directly, e.g.

- `scrollbar->value(void)` returns the row offset from the bottom of the display, 0 being the bottom (default).
- `scrollbar->value(int)` similarly sets the row offset, which should be in the range [0 .. `Fl_Scrollbar::maximum()`].
- `scrollbar->step(double)` sets the smoothness of scrolling, default is 0.25 for 4 steps of motion per column.

**Todo** Support scrollbar\_left/right() - See [FI\\_Browser\\_::scrollbar](#) docs  
Support new ScrollbarStyle

The documentation for this class was generated from the following files:

- [FI\\_Terminal.H](#)
- [FI\\_Terminal.cxx](#)

### 33.143 FI\_Text\_Buffer Class Reference

This class manages Unicode text displayed in one or more [FI\\_Text\\_Display](#) widgets.

```
#include <FI_Text_Buffer.H>
```

#### Public Member Functions

- void [add\\_modify\\_callback](#) (FI\_Text\_Modify\_Cb bufModifiedCB, void \*cbArg)  
*Adds a callback function that is called whenever the text buffer is modified.*
- void [add\\_predelete\\_callback](#) (FI\_Text\_Predelete\_Cb bufPreDelCB, void \*cbArg)  
*Adds a callback routine to be called before text is deleted from the buffer.*
- char \* [address](#) (int pos)  
*Convert a byte offset in buffer into a memory address.*
- const char \* [address](#) (int pos) const  
*Convert a byte offset in buffer into a memory address.*
- void [append](#) (const char \*t, int addedLength=-1)  
*Appends the text string to the end of the buffer.*
- int [appendfile](#) (const char \*file, int buflen=128 \*1024)  
*Appends the named file to the end of the buffer.*
- char [byte\\_at](#) (int pos) const  
*Returns the raw byte at the specified position pos in the buffer.*
- void [call\\_modify\\_callbacks](#) ()  
*Calls all modify callbacks that have been registered using the [add\\_modify\\_callback\(\)](#) method.*
- void [call\\_predelete\\_callbacks](#) ()  
*Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.*
- bool [can\\_redo](#) () const  
*Check if undo is enabled and if the last undo action can be redone.*
- bool [can\\_undo](#) () const  
*Check if undo is enabled and if the last action can be undone.*
- void [canUndo](#) (char flag=1)  
*Enable or disable undo actions for this text buffer.*
- unsigned int [char\\_at](#) (int pos) const  
*Returns the character at the specified position pos in the buffer.*
- void [copy](#) (FI\_Text\_Buffer \*fromBuf, int fromStart, int fromEnd, int toPos)  
*Copies text from another FI\_Text\_Buffer to this one.*
- int [count\\_displayed\\_characters](#) (int lineStartPos, int targetPos) const  
*Count the number of displayed characters between buffer position lineStartPos and targetPos.*
- int [count\\_lines](#) (int startPos, int endPos) const  
*Counts the number of newlines between startPos and endPos in buffer.*
- int [estimate\\_lines](#) (int startPos, int endPos, int lineLen) const  
*Estimate the number of newlines between startPos and endPos in buffer.*
- int [findchar\\_backward](#) (int startPos, unsigned int searchChar, int \*foundPos) const  
*Search backwards in buffer buf for character searchChar, starting with the character before startPos, returning the result in foundPos.*

- int **findchar\_forward** (int startPos, unsigned searchChar, int \*foundPos) const  
*Finds the next occurrence of the specified character.*
- **FI\_Text\_Buffer** (int requestedSize=0, int preferredGapSize=1024)  
*Create an empty text buffer of a pre-determined size.*
- int **highlight** ()  
*Returns a non-zero value if text has been highlighted, 0 otherwise.*
- void **highlight** (int start, int end)  
*Highlights the specified text within the buffer.*
- int **highlight\_position** (int \*start, int \*end)  
*Highlights the specified text between *start* and *end* within the buffer.*
- const **FI\_Text\_Selection** \* **highlight\_selection** () const  
*Returns the current highlight selection.*
- char \* **highlight\_text** ()  
*Returns the highlighted text.*
- void **insert** (int pos, const char \*text, int insertedLength=-1)  
*Inserts null-terminated string *text* at position *pos*.*
- int **insertfile** (const char \*file, int pos, int buflen=128 \*1024)  
*Inserts a file at the specified position.*
- bool **is\_word\_separator** (int pos) const  
*Returns whether character at position *pos* is a word separator.*
- int **length** () const  
*Returns the number of bytes in the buffer.*
- int **line\_end** (int pos) const  
*Finds and returns the position of the end of the line containing position *pos* (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).*
- int **line\_start** (int pos) const  
*Returns the position of the start of the line containing position *pos*.*
- char \* **line\_text** (int pos) const  
*Returns the text from the entire line containing the specified character position.*
- int **loadfile** (const char \*file, int buflen=128 \*1024)  
*Loads a text file into the buffer.*
- int **next\_char** (int ix) const  
*Returns the index of the next character.*
- int **next\_char\_clipped** (int ix) const
- int **outpufile** (const char \*file, int start, int end, int buflen=128 \*1024)  
*Writes the specified portions of the text buffer to a file.*
- int **prev\_char** (int ix) const  
*Returns the index of the previous character.*
- int **prev\_char\_clipped** (int ix) const
- **FI\_Text\_Selection** \* **primary\_selection** ()  
*Returns the primary selection.*
- const **FI\_Text\_Selection** \* **primary\_selection** () const  
*Returns the primary selection.*
- void **printf** (const char \*fmt,...)  
*Appends printf formatted messages to the end of the buffer.*
- int **redo** (int \*cp=0)  
*Redo previous undo action.*
- void **remove** (int start, int end)  
*Deletes a range of characters in the buffer.*
- void **remove\_modify\_callback** (FI\_Text\_Modify\_Cb bufModifiedCB, void \*cbArg)  
*Removes a modify callback.*

- void **remove\_predelete\_callback** (FI\_Text\_Predelete\_Cb predelCB, void \*cbArg)  
*Removes a callback routine `bufPreDeleteCB` associated with argument `cbArg` to be called before text is deleted from the buffer.*
- void **remove\_secondary\_selection** ()  
*Removes the text from the buffer corresponding to the secondary text selection object.*
- void **remove\_selection** ()  
*Removes the text in the primary selection.*
- void **replace** (int start, int end, const char \*text, int insertedLength=-1)  
*Deletes the characters between `start` and `end`, and inserts the null-terminated string `text` in their place in the buffer.*
- void **replace\_secondary\_selection** (const char \*text)  
*Replaces the text from the buffer corresponding to the secondary text selection object with the new string `text`.*
- void **replace\_selection** (const char \*text)  
*Replaces the text in the primary selection.*
- int **rewind\_lines** (int startPos, int nLines)  
*Finds and returns the position of the first character of the line `nLines` backwards from `startPos` (not counting the character pointed to by `startpos` if that is a newline) in the buffer.*
- int **savefile** (const char \*file, int buflen=128 \*1024)  
*Saves a text file from the current buffer.*
- int **search\_backward** (int startPos, const char \*searchString, int \*foundPos, int matchCase=0) const  
*Search backwards in buffer for string `searchString`, starting with the character at `startPos`, returning the result in `foundPos`.*
- int **search\_forward** (int startPos, const char \*searchString, int \*foundPos, int matchCase=0) const  
*Search forwards in buffer for string `searchString`, starting with the character `startPos`, and returning the result in `foundPos`.*
- void **secondary\_select** (int start, int end)  
*Selects a range of characters in the secondary selection.*
- int **secondary\_selected** ()  
*Returns a non-zero value if text has been selected in the secondary text selection, 0 otherwise.*
- const FI\_Text\_Selection \* **secondary\_selection** () const  
*Returns the secondary selection.*
- int **secondary\_selection\_position** (int \*start, int \*end)  
*Returns the current selection in the secondary text selection object.*
- char \* **secondary\_selection\_text** ()  
*Returns the text in the secondary selection.*
- void **secondary\_unselect** ()  
*Clears any selection in the secondary text selection object.*
- void **select** (int start, int end)  
*Selects a range of characters in the buffer.*
- int **selected** () const  
*Returns a non-zero value if text has been selected, 0 otherwise.*
- int **selection\_position** (int \*start, int \*end)  
*Gets the selection position.*
- char \* **selection\_text** ()  
*Returns the currently selected text.*
- int **skip\_displayed\_characters** (int lineStartPos, int nChars)  
*Count forward from buffer position `startPos` in displayed characters.*
- int **skip\_lines** (int startPos, int nLines)  
*Finds the first character of the line `nLines` forward from `startPos` in the buffer and returns its position.*
- int **tab\_distance** () const  
*Gets the tab width.*
- void **tab\_distance** (int tabDist)

Set the hardware tab distance (width) used by all displays for this buffer, and used in computing offsets for rectangular selection operations.

- char \* [text](#) () const  
Get a copy of the entire contents of the text buffer.
- void [text](#) (const char \*text)  
Replaces the entire contents of the text buffer.
- char \* [text\\_range](#) (int start, int end) const  
Get a copy of a part of the text buffer.
- int [undo](#) (int \*cp=0)  
Undo text modification according to the undo variables or insert text from the undo buffer.
- void [unhighlight](#) ()  
Unhighlights text in the buffer.
- void [unselect](#) ()  
Cancels any previous selection on the primary text selection object.
- int [utf8\\_align](#) (int) const  
Align an index into the buffer to the current or previous UTF-8 boundary.
- void [vprintf](#) (const char \*fmt, va\_list ap)  
Can be used by subclasses that need their own [printf\(\)](#) style functionality.
- int [word\\_end](#) (int pos) const  
Returns the position corresponding to the end of the word.
- int [word\\_start](#) (int pos) const  
Returns the position corresponding to the start of the word.
- ~[FI\\_Text\\_Buffer](#) ()  
Frees a text buffer.

## Public Attributes

- int [input\\_file\\_was\\_transcoded](#)  
true if the loaded file has been transcoded to UTF-8.
- void(\* [transcoding\\_warning\\_action](#) )(FI\_Text\_Buffer \*)  
Pointer to a function called after reading a non UTF-8 encoded file.

## Static Public Attributes

- static const char \* [file\\_encoding\\_warning\\_message](#)  
This message may be displayed using the [fl\\_alert\(\)](#) function when a file which was not UTF-8 encoded is input.

## Protected Member Functions

- int [apply\\_undo](#) (FI\_Text\_Undo\_Action \*action, int \*cursorPos)  
Apply the current undo/redo operation, called from [undo\(\)](#) or [redo\(\)](#).
- void [call\\_modify\\_callbacks](#) (int pos, int nDeleted, int nInserted, int nRestyled, const char \*deletedText) const  
Calls the stored modify callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.
- void [call\\_predelete\\_callbacks](#) (int pos, int nDeleted) const  
Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.
- int [insert\\_](#) (int pos, const char \*text, int insertedLength=-1)  
Internal (non-redisplaying) version of [insert\(\)](#).
- void [move\\_gap](#) (int pos)  
Move the gap to start at a new position.
- void [reallocate\\_with\\_gap](#) (int newGapStart, int newGapLen)

Reallocates the text storage in the buffer to have a gap starting at `newGapStart` and a gap size of `newGapLen`, preserving the buffer's current contents.

- void **redisplay\_selection** ([FI\\_Text\\_Selection](#) \*oldSelection, [FI\\_Text\\_Selection](#) \*newSelection) const  
Calls the stored redisplay procedure(s) for this buffer to update the screen for a change in a selection.
- void **remove\_** (int start, int end)  
Internal (non-redisplaying) version of [remove\(\)](#).
- void **remove\_selection\_** ([FI\\_Text\\_Selection](#) \*sel)  
Removes the text from the buffer corresponding to `sel`.
- void **replace\_selection\_** ([FI\\_Text\\_Selection](#) \*sel, const char \*text)  
Replaces the `text` in selection `sel`.
- char \* **selection\_text\_** ([FI\\_Text\\_Selection](#) \*sel) const
- void **update\_selections** (int pos, int nDeleted, int nInserted)  
Updates all of the selections in the buffer for changes in the buffer's text.

## Protected Attributes

- char \* **mBuf**  
allocated memory where the text is stored
- char **mCanUndo**  
if this buffer is used for attributes, it must not do any undo calls
- void \*\* **mCbArgs**  
caller arguments for modifyProcs above
- int **mCursorPosHint**  
hint for reasonable cursor position after a buffer modification operation
- int **mGapEnd**  
points to the first character after the gap
- int **mGapStart**  
points to the first character of the gap
- [FI\\_Text\\_Selection](#) **mHighlight**  
highlighted areas
- int **mLength**  
length of the text in the buffer (the length of the buffer itself must be calculated: `gapEnd - gapStart + length`)
- [FI\\_Text\\_Modify\\_Cb](#) \* **mModifyProcs**  
procedures to call when buffer is modified to redisplay contents
- int **mNModifyProcs**  
number of modify-redisplay procs attached
- int **mNPredeleteProcs**  
number of pre-delete procs attached
- void \*\* **mPredeleteCbArgs**  
caller argument for pre-delete proc above
- [FI\\_Text\\_Predelete\\_Cb](#) \* **mPredeleteProcs**  
procedure to call before text is deleted from the buffer; at most one is supported.
- int **mPreferredGapSize**  
the default allocation for the text gap is 1024 bytes and should only be increased if frequent and large changes in buffer size are expected
- [FI\\_Text\\_Selection](#) **mPrimary**  
highlighted areas
- [FI\\_Text\\_Undo\\_Action\\_List](#) \* **mRedoList**  
List of redo event.
- [FI\\_Text\\_Selection](#) **mSecondary**  
highlighted areas
- int **mTabDist**

- equiv.*
- `Fl_Text_Undo_Action * mUndo`  
*local undo event*
- `Fl_Text_Undo_Action_List * mUndoList`  
*List of undo event.*

### 33.143.1 Detailed Description

This class manages Unicode text displayed in one or more [Fl\\_Text\\_Display](#) widgets.

All text in [Fl\\_Text\\_Buffer](#) must be encoded in UTF-8. All indices used in the function calls must be aligned to the start of a UTF-8 sequence. All indices and pointers returned will be aligned. All functions that return a single character will return that in an unsigned int in UCS-4 encoding.

The [Fl\\_Text\\_Buffer](#) class is used by the [Fl\\_Text\\_Display](#) and [Fl\\_Text\\_Editor](#) to manage complex text data and is based upon the excellent NEdit text editor engine - see <https://sourceforge.net/projects/ncedit/>.

### 33.143.2 Constructor & Destructor Documentation

#### 33.143.2.1 Fl\_Text\_Buffer()

```
Fl_Text_Buffer::Fl_Text_Buffer (
 int requestedSize = 0,
 int preferredGapSize = 1024)
```

Create an empty text buffer of a pre-determined size.

#### Parameters

<i>requestedSize</i>	use this to avoid unnecessary re-allocation if you know exactly how much the buffer will need to hold
<i>preferredGapSize</i>	Initial size for the buffer gap (empty space in the buffer where text might be inserted if the user is typing sequential characters)

### 33.143.3 Member Function Documentation

#### 33.143.3.1 add\_modify\_callback()

```
void Fl_Text_Buffer::add_modify_callback (
 Fl_Text_Modify_Cb bufModifiedCB,
 void * cbArg)
```

Adds a callback function that is called whenever the text buffer is modified.

The callback function is declared as follows:

```
typedef void (*Fl_Text_Modify_Cb)(int pos, int nInserted, int nDeleted,
 int nRestyled, const char* deletedText,
 void* cbArg);
```

#### 33.143.3.2 address() [1/2]

```
char * Fl_Text_Buffer::address (
 int pos) [inline]
```

Convert a byte offset in buffer into a memory address.

## Parameters

<i>pos</i>	byte offset into buffer
------------	-------------------------

## Returns

byte offset converted to a memory address

**33.143.3.3 address()** [2/2]

```
const char * Fl_Text_Buffer::address (
 int pos) const [inline]
```

Convert a byte offset in buffer into a memory address.

## Parameters

<i>pos</i>	byte offset into buffer
------------	-------------------------

## Returns

byte offset converted to a memory address

**33.143.3.4 append()**

```
void Fl_Text_Buffer::append (
 const char * t,
 int addedLength = -1) [inline]
```

Appends the text string to the end of the buffer.

## Parameters

<i>t</i>	UTF-8 encoded text
<i>addedLength</i>	number of bytes to append, or -1 to indicate <i>t</i> is null-terminated

**33.143.3.5 appendfile()**

```
int Fl_Text_Buffer::appendfile (
 const char * file,
 int buflen = 128*1024) [inline]
```

Appends the named file to the end of the buffer.

See also [insertfile\(\)](#).

**33.143.3.6 byte\_at()**

```
char Fl_Text_Buffer::byte_at (
 int pos) const
```

Returns the raw byte at the specified position *pos* in the buffer.

Positions start at 0.

## Parameters

<i>pos</i>	byte offset into buffer
------------	-------------------------

**Returns**

unencoded raw byte

**33.143.3.7 can\_redo()**

```
bool Fl_Text_Buffer::can_redo () const
```

Check if undo is enabled and if the last undo action can be redone.

Check if undo is enabled and if the last undo action can be redone.

**See also**

[canUndo\(\)](#)

**33.143.3.8 can\_undo()**

```
bool Fl_Text_Buffer::can_undo () const
```

Check if undo is enabled and if the last action can be undone.

**See also**

[canUndo\(\)](#)

**33.143.3.9 canUndo()**

```
void Fl_Text_Buffer::canUndo (
 char flag = 1)
```

Enable or disable undo actions for this text buffer.

Undo actions are enable for text buffer by default. If used as a style buffer in [Fl\\_Text\\_Display](#), undo actions are disabled as they are handled by the text buffer.

**See also**

[can\\_undo\(\)](#)

**33.143.3.10 char\_at()**

```
unsigned int Fl_Text_Buffer::char_at (
 int pos) const
```

Returns the character at the specified position *pos* in the buffer.

Positions start at 0.

**Parameters**

<i>pos</i>	byte offset into buffer, <i>pos</i> must be at a UTF-8 character boundary
------------	---------------------------------------------------------------------------

**Returns**

Unicode UCS-4 encoded character

**33.143.3.11 copy()**

```
void Fl_Text_Buffer::copy (
 Fl_Text_Buffer * fromBuf,
```

```

 int fromStart,
 int fromEnd,
 int toPos)

```

Copies text from another [Fl\\_Text\\_Buffer](#) to this one.

#### Parameters

<i>fromBuf</i>	source text buffer, may be the same as this
<i>fromStart</i>	byte offset into buffer
<i>fromEnd</i>	byte offset into buffer
<i>toPos</i>	destination byte offset into buffer

#### 33.143.3.12 count\_displayed\_characters()

```

int Fl_Text_Buffer::count_displayed_characters (
 int lineStartPos,
 int targetPos) const

```

Count the number of displayed characters between buffer position `lineStartPos` and `targetPos`. Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

#### 33.143.3.13 count\_lines()

```

int Fl_Text_Buffer::count_lines (
 int startPos,
 int endPos) const

```

Counts the number of newlines between `startPos` and `endPos` in buffer. The character at position `endPos` is not counted.

#### 33.143.3.14 estimate\_lines()

```

int Fl_Text_Buffer::estimate_lines (
 int startPos,
 int endPos,
 int lineLen) const

```

Estimate the number of newlines between `startPos` and `endPos` in buffer. This call takes line wrapping into account. It assumes a line break at every `lineLen` characters after the beginning of a line.

#### 33.143.3.15 findchar\_backward()

```

int Fl_Text_Buffer::findchar_backward (
 int startPos,
 unsigned int searchChar,
 int * foundPos) const

```

Search backwards in buffer `buf` for character `searchChar`, starting with the character *before* `startPos`, returning the result in `foundPos`.

Returns 1 if found, 0 if not. The difference between this and [search\\_backward\(\)](#) is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

#### Parameters

<i>startPos</i>	byte offset to start position
<i>searchChar</i>	UCS-4 character that we want to find
<i>foundPos</i>	byte offset where the character was found

**Returns**

1 if found, 0 if not

**33.143.3.16 findchar\_forward()**

```
int Fl_Text_Buffer::findchar_forward (
 int startPos,
 unsigned searchChar,
 int * foundPos) const
```

Finds the next occurrence of the specified character.

Search forwards in buffer for character `searchChar`, starting with the character `startPos`, and returning the result in `foundPos`. Returns 1 if found, 0 if not. The difference between this and [search\\_forward\(\)](#) is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: `newline`.

**Parameters**

<i>startPos</i>	byte offset to start position
<i>searchChar</i>	UCS-4 character that we want to find
<i>foundPos</i>	byte offset where the character was found

**Returns**

1 if found, 0 if not

**33.143.3.17 highlight\_text()**

```
char * Fl_Text_Buffer::highlight_text ()
```

Returns the highlighted text.

When you are done with the text, free it using the `free()` function.

**33.143.3.18 insert()**

```
void Fl_Text_Buffer::insert (
 int pos,
 const char * text,
 int insertedLength = -1)
```

Inserts null-terminated string `text` at position `pos`.

**Parameters**

<i>pos</i>	insertion position as byte offset (must be UTF-8 character aligned)
<i>text</i>	UTF-8 encoded text
<i>insertedLength</i>	number of bytes to insert, or -1 to indicate <code>text</code> is null-terminated

**33.143.3.19 insert\_()**

```
int Fl_Text_Buffer::insert_ (
 int pos,
 const char * text,
 int insertedLength = -1) [protected]
```

Internal (non-redisplaying) version of [insert\(\)](#).

Returns the length of text inserted (this is just `strlen(text)` if `insertedLength == -1`, however this calculation can be expensive and the length will be required by any caller who will continue on to call `redisplay`). `pos` must be contiguous with the existing text in the buffer (i.e. not past the end).

#### Returns

the number of bytes inserted

#### 33.143.3.20 `insertfile()`

```
int Fl_Text_Buffer::insertfile (
 const char * file,
 int pos,
 int buflen = 128*1024)
```

Inserts a file at the specified position.

#### Returns

- 0 on success
- non-zero on error (`strerror()` contains reason)
- 1 indicates open for read failed (no data loaded)
- 2 indicates error occurred while reading data (data was partially loaded)

File can be UTF-8 or CP1252 encoded. If the input file is not UTF-8 encoded, the `Fl_Text_Buffer` widget will contain data transcoded to UTF-8. By default, the message `Fl_Text_Buffer::file_encoding_warning_message` will warn the user about this.

#### See also

[input\\_file\\_was\\_transcoded](#) and [transcoding\\_warning\\_action](#).

#### 33.143.3.21 `is_word_separator()`

```
bool Fl_Text_Buffer::is_word_separator (
 int pos) const
```

Returns whether character at position `pos` is a word separator.  
Pos must be at a character boundary.

#### 33.143.3.22 `length()`

```
int Fl_Text_Buffer::length (
 void) const [inline]
```

Returns the number of bytes in the buffer.

#### Returns

size of text in bytes

#### 33.143.3.23 `line_end()`

```
int Fl_Text_Buffer::line_end (
 int pos) const
```

Finds and returns the position of the end of the line containing position `pos` (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to line end

**33.143.3.24 line\_start()**

```
int Fl_Text_Buffer::line_start (
 int pos) const
```

Returns the position of the start of the line containing position *pos*.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to line start

**33.143.3.25 line\_text()**

```
char * Fl_Text_Buffer::line_text (
 int pos) const
```

Returns the text from the entire line containing the specified character position. When you are done with the text, free it using the `free()` function.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

copy of UTF-8 text, must be free'd

**33.143.3.26 loadfile()**

```
int Fl_Text_Buffer::loadfile (
 const char * file,
 int buflen = 128*1024) [inline]
```

Loads a text file into the buffer.

See also [insertfile\(\)](#).

**33.143.3.27 next\_char()**

```
int Fl_Text_Buffer::next_char (
 int ix) const
```

Returns the index of the next character.

## Parameters

<i>ix</i>	index to the current character
-----------	--------------------------------

**33.143.3.28 outputfile()**

```
int Fl_Text_Buffer::outputfile (
 const char * file,
 int start,
 int end,
 int buflen = 128*1024)
```

Writes the specified portions of the text buffer to a file.

Returns

- 0 on success
- non-zero on error (strerror() contains reason)
- 1 indicates open for write failed (no data saved)
- 2 indicates error occurred while writing data (data was partially saved)

See also

[savefile\(const char \\*file, int buflen\)](#)

**33.143.3.29 prev\_char()**

```
int Fl_Text_Buffer::prev_char (
 int ix) const
```

Returns the index of the previous character.

## Parameters

<i>ix</i>	index to the current character
-----------	--------------------------------

**33.143.3.30 printf()**

```
void Fl_Text_Buffer::printf (
 const char * fmt,
 ...)
```

Appends printf formatted messages to the end of the buffer.

Example:

```
#include <FL/Fl_Text_Display.H>
int main(..) {
 :
 // Create a text display widget and assign it a text buffer
 Fl_Text_Display *tdsp = new Fl_Text_Display(..);
 Fl_Text_Buffer *tbuf = new Fl_Text_Buffer();
 tdsp->buffer(tbuf);
 :
 // Append three lines of formatted text to the buffer
 tbuf->printf("The current date is: %s.\nThe time is: %s\n", date_str, time_str);
 tbuf->printf("The current PID is %ld.\n", (long) getpid());
 :
}
```

**Note**

The expanded string is currently limited to 1024 characters.

**Parameters**

<i>in</i>	<i>fmt</i>	is a printf format string for the message text.
-----------	------------	-------------------------------------------------

**33.143.3.31 remove()**

```
void Fl_Text_Buffer::remove (
 int start,
 int end)
```

Deletes a range of characters in the buffer.

**Parameters**

<i>start</i>	byte offset to first character to be removed
<i>end</i>	byte offset to character after last character to be removed

**33.143.3.32 remove\_()**

```
void Fl_Text_Buffer::remove_ (
 int start,
 int end) [protected]
```

Internal (non-redisplaying) version of [remove\(\)](#).

Removes the contents of the buffer between *start* and *end* (and moves the gap to the site of the delete).

**33.143.3.33 replace()**

```
void Fl_Text_Buffer::replace (
 int start,
 int end,
 const char * text,
 int insertedLength = -1)
```

Deletes the characters between *start* and *end*, and inserts the null-terminated string *text* in their place in the buffer.

**Parameters**

<i>start</i>	byte offset to first character to be removed and new insert position
<i>end</i>	byte offset to character after last character to be removed
<i>text</i>	UTF-8 encoded text
<i>insertedLength</i>	number of bytes to insert, or -1 to indicate <i>text</i> is null-terminated

**33.143.3.34 rewind\_lines()**

```
int Fl_Text_Buffer::rewind_lines (
 int startPos,
 int nLines)
```

Finds and returns the position of the first character of the line *nLines* backwards from *startPos* (not counting

the character pointed to by `startpos` if that is a newline) in the buffer.  
`nLines == 0` means find the beginning of the line.

### 33.143.3.35 `savefile()`

```
int Fl_Text_Buffer::savefile (
 const char * file,
 int buflen = 128*1024) [inline]
```

Saves a text file from the current buffer.

Returns

- 0 on success
- non-zero on error (`strerror()` contains reason)
- 1 indicates open for write failed (no data saved)
- 2 indicates error occurred while writing data (data was partially saved)

See also

[outputfile\(const char \\*file, int start, int end, int buflen\)](#)

### 33.143.3.36 `search_backward()`

```
int Fl_Text_Buffer::search_backward (
 int startPos,
 const char * searchString,
 int * foundPos,
 int matchCase = 0) const
```

Search backwards in buffer for string `searchString`, starting with the character *at* `startPos`, returning the result in `foundPos`.

Returns 1 if found, 0 if not.

Parameters

<i>startPos</i>	byte offset to start position
<i>searchString</i>	UTF-8 string that we want to find
<i>foundPos</i>	byte offset where the string was found
<i>matchCase</i>	if set, match character case

Returns

1 if found, 0 if not

### 33.143.3.37 `search_forward()`

```
int Fl_Text_Buffer::search_forward (
 int startPos,
 const char * searchString,
 int * foundPos,
 int matchCase = 0) const
```

Search forwards in buffer for string `searchString`, starting with the character `startPos`, and returning the result in `foundPos`.

Returns 1 if found, 0 if not.

## Parameters

<i>startPos</i>	byte offset to start position
<i>searchString</i>	UTF-8 string that we want to find
<i>foundPos</i>	byte offset where the string was found
<i>matchCase</i>	if set, match character case

## Returns

1 if found, 0 if not

**33.143.3.38 secondary\_selection\_text()**

```
char * Fl_Text_Buffer::secondary_selection_text ()
```

Returns the text in the secondary selection.

When you are done with the text, free it using the free() function.

**33.143.3.39 selection\_text()**

```
char * Fl_Text_Buffer::selection_text (
 void)
```

Returns the currently selected text.

When you are done with the text, free it using the free() function.

**33.143.3.40 skip\_displayed\_characters()**

```
int Fl_Text_Buffer::skip_displayed_characters (
 int lineStartPos,
 int nChars)
```

Count forward from buffer position *startPos* in displayed characters.

Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

## Parameters

<i>lineStartPos</i>	byte offset into buffer
<i>nChars</i>	number of bytes that are sent to the display

## Returns

byte offset in input after all output bytes are sent

**33.143.3.41 tab\_distance()**

```
int Fl_Text_Buffer::tab_distance () const [inline]
```

Gets the tab width.

The tab width is measured in characters. The pixel position is calculated using an average character width.

**33.143.3.42 text() [1/2]**

```
char * Fl_Text_Buffer::text () const
```

Get a copy of the entire contents of the text buffer.

Memory is allocated to contain the returned string, which the caller must free.

**Returns**

newly allocated text buffer - must be free'd, text is UTF-8

**33.143.3.43 text()** [2/2]

```
void Fl_Text_Buffer::text (
 const char * text)
```

Replaces the entire contents of the text buffer.

**Parameters**

<i>text</i>	Text must be valid UTF-8. If null, an empty string is substituted.
-------------	--------------------------------------------------------------------

**33.143.3.44 text\_range()**

```
char * Fl_Text_Buffer::text_range (
 int start,
 int end) const
```

Get a copy of a part of the text buffer.

Return a copy of the text between *start* and *end* character positions from text buffer *buf*. Positions start at 0, and the range does not include the character pointed to by *end*. When you are done with the text, free it using the `free()` function.

**Parameters**

<i>start</i>	byte offset to first character
<i>end</i>	byte offset after last character in range

**Returns**

newly allocated text buffer - must be free'd, text is UTF-8

**33.143.3.45 undo()**

```
int Fl_Text_Buffer::undo (
 int * cursorPos = 0)
```

Undo text modification according to the undo variables or insert text from the undo buffer.

Take the previous changes and undo them.

Return the previous cursor position in *cursorPos*. Returns 1 if the undo was applied. *CursorPos* will be at a character boundary.

**33.143.3.46 vprintf()**

```
void Fl_Text_Buffer::vprintf (
 const char * fmt,
 va_list ap)
```

Can be used by subclasses that need their own `printf()` style functionality.

**Note**

The expanded string is currently limited to 1024 characters.

## Parameters

in	<i>fmt</i>	is a printf format string for the message text.
in	<i>ap</i>	is a va_list created by va_start() and closed with va_end(), which the caller is responsible for handling.

**33.143.3.47 word\_end()**

```
int Fl_Text_Buffer::word_end (
 int pos) const
```

Returns the position corresponding to the end of the word.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to word end

**33.143.3.48 word\_start()**

```
int Fl_Text_Buffer::word_start (
 int pos) const
```

Returns the position corresponding to the start of the word.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to word start

**33.143.4 Member Data Documentation****33.143.4.1 file\_encoding\_warning\_message**

```
const char * Fl_Text_Buffer::file_encoding_warning_message [static]
```

**Initial value:**

```
=
"Displayed text contains the UTF-8 transcoding\n"
"of the input file which was not UTF-8 encoded.\n"
"Some changes may have occurred."
```

This message may be displayed using the [fl\\_alert\(\)](#) function when a file which was not UTF-8 encoded is input.

**33.143.4.2 mTabDist**

```
int Fl_Text_Buffer::mTabDist [protected]
```

equiv.

number of characters in a tab

### 33.143.4.3 transcoding\_warning\_action

```
void(* Fl_Text_Buffer::transcoding_warning_action) (Fl_Text_Buffer *)
```

Pointer to a function called after reading a non UTF-8 encoded file.

This function is called after reading a file if the file content was transcoded to UTF-8. Its default implementation calls `fl_alert()` with the text of `file_encoding_warning_message`. No warning message is displayed if this pointer is set to NULL. Use `input_file_was_transcoded` to be informed if file input required transcoding to UTF-8.

The documentation for this class was generated from the following files:

- `Fl_Text_Buffer.H`
- `Fl_Text_Buffer.cxx`

## 33.144 Fl\_Text\_Display Class Reference

Rich text display widget.

```
#include <Fl_Text_Display.H>
```

Inheritance diagram for `Fl_Text_Display`:

### Classes

- struct `Style_Table_Entry`

*This structure associates the color, font, and font size of a string to draw with an attribute mask matching `attr`.*

### Public Types

- enum {  
`NORMAL_CURSOR`, `CARET_CURSOR`, `DIM_CURSOR`, `BLOCK_CURSOR`,  
`HEAVY_CURSOR`, `SIMPLE_CURSOR` }  
*text display cursor shapes enumeration*
- enum { `CURSOR_POS`, `CHARACTER_POS` }  
*the character position is the left edge of a character, whereas the cursor is thought to be between the centers of two consecutive characters.*
- enum {  
`DRAG_NONE` = -2, `DRAG_START_DND` = -1, `DRAG_CHAR` = 0, `DRAG_WORD` = 1,  
`DRAG_LINE` = 2 }  
*drag types - they match `Fl::event_clicks()` so that single clicking to start a collection selects by character, double clicking selects by word and triple clicking selects by line.*
- enum { `WRAP_NONE`, `WRAP_AT_COLUMN`, `WRAP_AT_PIXEL`, `WRAP_AT_BOUNDS` }  
*wrap types - used in `wrap_mode()`*
- enum {  
`ATTR_BGCOLOR` = 0x0001, `ATTR_BGCOLOR_EXT_` = 0x0002, `ATTR_BGCOLOR_EXT` = 0x0003,  
`ATTR_UNDERLINE` = 0x0004,  
`ATTR_GRAMMAR` = 0x0008, `ATTR_SPELLING` = 0x000C, `ATTR_STRIKE_THROUGH` = 0x0010,  
`ATTR_LINES_MASK` = 0x001C }  
*attribute flags in `Style_Table_Entry.attr`*
- typedef void(\* `Unfinished_Style_Cb`) (int, void \*)

## Public Member Functions

- [FI\\_Text\\_Buffer](#) \* [buffer](#) () const  
*Gets the current text buffer associated with the text widget.*
- void [buffer](#) ([FI\\_Text\\_Buffer](#) &buf)  
*Sets the current text buffer associated with the text widget.*
- void [buffer](#) ([FI\\_Text\\_Buffer](#) \*buf)  
*Attach a text buffer to display, replacing the current buffer (if any).*
- double [col\\_to\\_x](#) (double col) const  
*Convert a column number into an x pixel position.*
- int [count\\_lines](#) (int start, int end, bool start\_pos\_is\_line\_start) const  
*Count the number of lines between two positions.*
- [FI\\_Color](#) [cursor\\_color](#) () const  
*Gets the text cursor color.*
- void [cursor\\_color](#) ([FI\\_Color](#) n)  
*Sets the text cursor color.*
- int [cursor\\_style](#) () const
- void [cursor\\_style](#) (int style)  
*Sets the text cursor style.*
- virtual void [display\\_needs\\_recalc](#) ()  
*Schedule a [recalc\\_display\(\)](#) to be done on next [draw\(\)](#).*
- [FI\\_Text\\_Display](#) (int X, int Y, int W, int H, const char \*!|=0)  
*Creates a new text display widget.*
- [FI\\_Color](#) [grammar\\_underline\\_color](#) () const  
*Gets the underline color for style attribute ATTR\_GRAMMAR.*
- void [grammar\\_underline\\_color](#) ([FI\\_Color](#) color)  
*Sets the underline color for style attribute ATTR\_GRAMMAR.*
- int [handle](#) (int e) [FL\\_OVERRIDE](#)  
*Event handling.*
- void [hide\\_cursor](#) ()  
*Hides the text cursor.*
- void [highlight\\_data](#) ([FI\\_Text\\_Buffer](#) \*styleBuffer, const [Style\\_Table\\_Entry](#) \*styleTable, int nStyles, char unfinishedStyle, Unfinished\_Style\_Cb unfinishedHighlightCB, void \*cbArg)  
*Attach (or remove) highlight information in text display and redisplay.*
- int [in\\_selection](#) (int x, int y) const  
*Check if a pixel position is within the primary selection.*
- void [insert](#) (const char \*text)  
*Inserts "text" at the current cursor location.*
- int [insert\\_position](#) () const  
*Gets the position of the text insertion cursor for text display.*
- void [insert\\_position](#) (int newPos)  
*Sets the position of the text insertion cursor for text display.*
- int [line\\_end](#) (int startPos, bool startPosIsLineStart) const  
*Returns the end of a line.*
- int [line\\_start](#) (int pos) const  
*Return the beginning of a line.*
- [FI\\_Align](#) [linenumber\\_align](#) () const  
*Returns the alignment used for line numbers (if enabled).*
- void [linenumber\\_align](#) ([FI\\_Align](#) val)  
*Set alignment for line numbers (if enabled).*
- [FI\\_Color](#) [linenumber\\_bgcolor](#) () const

- Returns the background color used for line numbers (if enabled).*

  - void `linenumber_bgcolor` (`FI_Color` val)

*Set the background color used for line numbers (if enabled).*
- `FI_Color linenumber_fgcolor` () const

*Return the foreground color used for line numbers (if enabled).*
- void `linenumber_fgcolor` (`FI_Color` val)

*Set the foreground color used for line numbers (if enabled).*
- `FI_Font linenumber_font` () const

*Return the font used for line numbers (if enabled).*
- void `linenumber_font` (`FI_Font` val)

*Set the font used for line numbers (if enabled).*
- const char \* `linenumber_format` () const

*Returns the line number printf() format string.*
- void `linenumber_format` (const char \*val)

*Sets the printf() style format string used for line numbers.*
- `FI_Fontsize linenumber_size` () const

*Return the font size used for line numbers (if enabled).*
- void `linenumber_size` (`FI_Fontsize` val)

*Set the font size used for line numbers (if enabled).*
- int `linenumber_width` () const

*Return the screen area width provided for line numbers.*
- void `linenumber_width` (int width)

*Set width of screen area for line numbers.*
- int `move_down` ()

*Moves the current insert position down one line.*
- int `move_left` ()

*Moves the current insert position left one character.*
- int `move_right` ()

*Moves the current insert position right one character.*
- int `move_up` ()

*Moves the current insert position up one line.*
- void `next_word` (void)

*Moves the current insert position right one word.*
- void `overstrike` (const char \*text)

*Replaces text at the current insert position.*
- int `position_style` (int lineStartPos, int lineLen, int lineIndex) const

*Find the correct style for a character.*
- int `position_to_xy` (int pos, int \*x, int \*y) const

*Convert a character index into a pixel position.*
- void `previous_word` (void)

*Moves the current insert position left one word.*
- virtual void `recalc_display` ()

*Recalculate the display's visible lines and scrollbar sizes.*
- void `redisplay_range` (int start, int end)

*Marks text from start to end as needing a redraw.*
- void `resize` (int X, int Y, int W, int H) `FL_OVERRIDE`

*Change the size of the displayed text area.*
- int `rewind_lines` (int startPos, int nLines)

*Skip a number of lines back.*
- void `scroll` (int topLineNum, int horizOffset)

*Scrolls the current buffer to start at the specified line and column.*

- [Fl\\_Align scrollbar\\_align](#) () const  
*Gets the scrollbar alignment type.*
- void [scrollbar\\_align](#) (Fl\_Align a)  
*Sets the scrollbar alignment type.*
- int [scrollbar\\_size](#) () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
- void [scrollbar\\_size](#) (int newSize)  
*Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
- int [scrollbar\\_width](#) () const  
*Returns the global value `Fl::scrollbar_size()` unless a specific scrollbar\_width\_ has been set.*
- void [scrollbar\\_width](#) (int width)  
*Sets the global `Fl::scrollbar_size()`, and forces this instance of the widget to use it.*
- [Fl\\_Color secondary\\_selection\\_color](#) () const  
*Gets the background color for the secondary selection block.*
- void [secondary\\_selection\\_color](#) (Fl\_Color color)  
*Sets the background color for the secondary selection block.*
- int [shortcut](#) () const
- void [shortcut](#) (int s)
- void [show\\_cursor](#) (int b=1)  
*Shows the text cursor.*
- void [show\\_insert\\_position](#) ()  
*Scrolls the text buffer to show the current insert position.*
- int [skip\\_lines](#) (int startPos, int nLines, bool startPosIsLineStart)  
*Skip a number of lines forward.*
- [Fl\\_Color spelling\\_underline\\_color](#) () const  
*Gets the underline color for style attribute ATTR\_SPELLING.*
- void [spelling\\_underline\\_color](#) (Fl\_Color color)  
*Sets the underline color for style attribute ATTR\_SPELLING.*
- [Fl\\_Text\\_Buffer \\* style\\_buffer](#) () const  
*Gets the current style buffer associated with the text widget.*
- [Fl\\_Color textcolor](#) () const  
*Gets the default color of text in the widget.*
- void [textcolor](#) (Fl\_Color n)  
*Sets the default color of text in the widget.*
- [Fl\\_Font textfont](#) () const  
*Gets the default font used when drawing text in the widget.*
- void [textfont](#) (Fl\_Font s)  
*Sets the default font used when drawing text in the widget.*
- [Fl\\_Fontsize textsize](#) () const  
*Gets the default size of text in the widget.*
- void [textsize](#) (Fl\_Fontsize s)  
*Sets the default size of text in the widget.*
- int [word\\_end](#) (int pos) const  
*Moves the insert position to the end of the current word.*
- int [word\\_start](#) (int pos) const  
*Moves the insert position to the beginning of the current word.*
- void [wrap\\_mode](#) (int wrap, int wrap\_margin)  
*Set the new text wrap mode.*
- int [wrapped\\_column](#) (int row, int column) const  
*Nobody knows what this function does.*
- int [wrapped\\_row](#) (int row) const

*Nobody knows what this function does.*

- double `x_to_col` (double x) const  
*Convert an x pixel position into a column number.*
- `~Fl_Text_Display` ()  
*Free a text display and release its associated memory.*

## Protected Types

- enum {  
`DRAW_LINE` , `FIND_INDEX` , `FIND_INDEX_FROM_ZERO` , `GET_WIDTH` ,  
`FIND_CURSOR_INDEX` }

## Protected Member Functions

- void `absolute_top_line_number` (int oldFirstChar)  
*Re-calculate absolute top line number for a change in scroll position.*
- void `calc_last_char` ()  
*Update last display character index.*
- void `calc_line_starts` (int startLine, int endLine)  
*Update the line starts array.*
- void `clear_rect` (int style, int x, int y, int width, int height) const  
*Clear a rectangle with the appropriate background color for `style`.*
- void `display_insert` ()  
*Scroll the display to bring insertion cursor into view.*
- void `draw` () `FL_OVERRIDE`  
*Draw the widget.*
- void `draw_cursor` (int, int)  
*Draw a cursor with top center at X, Y.*
- void `draw_line_numbers` (bool clearAll)  
*Refresh the line number area.*
- void `draw_range` (int start, int end)  
*Draw a range of text.*
- void `draw_string` (int style, int x, int y, int toX, const char \*string, int nChars) const  
*Draw a text segment in a single style.*
- void `draw_text` (int X, int Y, int W, int H)  
*Refresh a rectangle of the text display.*
- void `draw_vline` (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)  
*Draw a single line of text.*
- int `empty_vlines` () const  
*Return true if there are lines visible with no corresponding buffer text.*
- void `extend_range_for_styles` (int \*start, int \*end)  
*I don't know what this does!*
- void `find_line_end` (int pos, bool start\_pos\_is\_line\_start, int \*lineEnd, int \*nextLineStart) const  
*Finds both the end of the current line and the start of the next line.*
- void `find_wrap_range` (const char \*deletedText, int pos, int nInserted, int nDeleted, int \*modRangeStart, int \*modRangeEnd, int \*linesInserted, int \*linesDeleted)  
*Wrapping calculations.*
- int `find_x` (const char \*s, int len, int style, int x) const  
*Find the index of the character that lies at the given x position / closest cursor position.*
- int `get_absolute_top_line_number` () const  
*Returns the absolute (non-wrapped) line number of the first line displayed.*
- int `handle_rmb` (int readonly)

- Handle right mouse button down events.*

  - int [handle\\_vline](#) (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const
- Universal pixel machine.*

  - int [longest\\_vline](#) () const
- Find the longest line of all visible lines.*

  - void [maintain\\_absolute\\_top\\_line\\_number](#) (int state)
- Line numbering stuff, currently unused.*

  - int [maintaining\\_absolute\\_top\\_line\\_number](#) () const
- Returns true if a separate absolute top line number is being maintained.*

  - void [measure\\_deleted\\_lines](#) (int pos, int nDeleted)
- Wrapping calculations.*

  - double [measure\\_proportional\\_character](#) (const char \*s, int colNum, int pos) const
- Wrapping calculations.*

  - int [measure\\_vline](#) (int visLineNum) const
- Returns the width in pixels of the displayed line pointed to by "visLineNum".*

  - void [offset\\_line\\_starts](#) (int newTopLineNum)
- Offset line start counters for a new vertical scroll position.*

  - int [position\\_to\\_line](#) (int pos, int \*lineNum) const
- Convert a position index into a line number offset.*

  - int [position\\_to\\_linecol](#) (int pos, int \*lineNum, int \*column) const
- Find the line and column number of position pos.*

  - void [reset\\_absolute\\_top\\_line\\_number](#) ()
- Reestablish the absolute (non-wrapped) top line number.*

  - int [scroll\\_](#) (int topLineNum, int horizOffset)
- Scrolls the current buffer to start at the specified line and column.*

  - double [string\\_width](#) (const char \*string, int length, int style) const
- Find the width of a string in the font of a particular style.*

  - void [update\\_h\\_scrollbar](#) ()
- Update horizontal scrollbar.*

  - void [update\\_line\\_starts](#) (int pos, int charsInserted, int charsDeleted, int linesInserted, int linesDeleted, int \*scrolled)
- Update line start arrays and variables.*

  - void [update\\_v\\_scrollbar](#) ()
- Update vertical scrollbar.*

  - int [vline\\_length](#) (int visLineNum) const
- Count number of bytes in a visible line.*

  - int [wrap\\_uses\\_character](#) (int lineEndPos) const
- Check if the line break is caused by a newline or by line wrapping.*

  - void [wrapped\\_line\\_counter](#) (Fl\_Text\_Buffer \*buf, int startPos, int maxPos, int maxLines, bool startPosIs↵LineStart, int styleBufOffset, int \*retPos, int \*retLines, int \*retLineStart, int \*retLineEnd, bool countLast↵LineMissingNewLine=true) const
- Wrapping calculations.*

  - int [xy\\_to\\_position](#) (int x, int y, int PosType=CHARACTER\_POS) const
- Translate a pixel position into a character index.*

  - void [xy\\_to\\_rowcol](#) (int x, int y, int \*row, int \*column, int PosType=CHARACTER\_POS) const
- Translate pixel coordinates into row and column.*

## Static Protected Member Functions

- static void [buffer\\_modified\\_cb](#) (int pos, int nInserted, int nDeleted, int nRestyled, const char \*deletedText, void \*cbArg)  
*This is called whenever the buffer is modified.*
- static void [buffer\\_predelete\\_cb](#) (int pos, int nDeleted, void \*cbArg)  
*This is called before any characters are deleted.*
- static void [h\\_scrollbar\\_cb](#) ([FI\\_Scrollbar](#) \*w, [FI\\_Text\\_Display](#) \*d)  
*Callback for drag or valueChanged on horizontal scrollbar.*
- static void [scroll\\_timer\\_cb](#) (void \*)  
*Timer callback for scroll events.*
- static void [v\\_scrollbar\\_cb](#) ([FI\\_Scrollbar](#) \*w, [FI\\_Text\\_Display](#) \*d)  
*Callback for drag or valueChanged on vertical scrollbar.*

## Additional Inherited Members

### 33.144.1 Detailed Description

Rich text display widget.

This is the FLTK text display widget. It allows the user to view multiple lines of text and supports highlighting, word wrap, mixes of font faces and colors, line numbers and scrolling. The buffer that is displayed in the widget is managed by the [FI\\_Text\\_Buffer](#) class. A single Text Buffer can be displayed by multiple Text Displays.

Figure 33.59 Fl\_Text\_Display widget with line numbers enabled

### Example Use

```

#include <FL/Fl_Text_Display.H>
..
int main() {
..
 Fl_Text_Buffer *buff = new Fl_Text_Buffer();
 Fl_Text_Display *disp = new Fl_Text_Display(10, 10, 640, 480);
 disp->buffer(buff); // attach text buffer to display widget
 buff->text("line one\nline two"); // add some text to buffer
..
}

```

### Features

- Word wrap: [wrap\\_mode\(\)](#), [wrapped\\_column\(\)](#), [wrapped\\_row\(\)](#)
- Font control: [textfont\(\)](#), [textsize\(\)](#), [textcolor\(\)](#)

- Font styling: [highlight\\_data\(\)](#)
- Cursor: [cursor\\_style\(\)](#), [show\\_cursor\(\)](#), [hide\\_cursor\(\)](#), [cursor\\_color\(\)](#)
- Line numbers: [linenumber\\_width\(\)](#), [linenumber\\_font\(\)](#), [linenumber\\_size\(\)](#), [linenumber\\_fgcolor\(\)](#), [linenumber\\_bgcolor\(\)](#), [linenumber\\_align\(\)](#), [linenumber\\_format\(\)](#)

Note that other features may be available via [FI\\_Text\\_Editor](#) and [FI\\_Text\\_Buffer](#) classes.

#### Note

Line numbers were added in FLTK 1.3.3.

#### See also

[FI\\_Widget::shortcut\\_label\(int\)](#)

## 33.144.2 Member Enumeration Documentation

### 33.144.2.1 anonymous enum

anonymous enum

text display cursor shapes enumeration

#### Enumerator

NORMAL_CURSOR	I-beam.
CARET_CURSOR	caret under the text
DIM_CURSOR	dim I-beam
BLOCK_CURSOR	unfill box under the current character
HEAVY_CURSOR	thick I-beam
SIMPLE_CURSOR	as cursor as <a href="#">FI_Input</a> cursor

### 33.144.2.2 anonymous enum

anonymous enum

wrap types - used in [wrap\\_mode\(\)](#)

#### Enumerator

WRAP_NONE	don't wrap text at all
WRAP_AT_COLUMN	wrap text at the given text column
WRAP_AT_PIXEL	wrap text at a pixel position
WRAP_AT_BOUNDS	wrap text so that it fits into the widget width

### 33.144.2.3 anonymous enum

anonymous enum

attribute flags in [Style\\_Table\\_Entry.attr](#)

#### Enumerator

ATTR_BGCOLOR	use the background color in the <code>bgcolor</code> field
--------------	------------------------------------------------------------

## Enumerator

ATTR_BGCOLOR_EXT_	(internal use)
ATTR_BGCOLOR_EXT	extend background color to the end of the line
ATTR_UNDERLINE	a single underline, underline types are mutually exclusive
ATTR_GRAMMAR	grammar suggestion (blue dotted underline)
ATTR_SPELLING	spelling suggestion (red dotted underline)
ATTR_STRIKE_THROUGH	line through the middle of the text
ATTR_LINES_MASK	the mask for all underline and strike through types

### 33.144.3 Constructor & Destructor Documentation

#### 33.144.3.1 Fl\_Text\_Display()

```
Fl_Text_Display::Fl_Text_Display (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new text display widget.

## Parameters

<i>X,Y,W,H</i>	position and size of widget
<i>l</i>	label text, defaults to none

#### 33.144.3.2 ~Fl\_Text\_Display()

```
Fl_Text_Display::~Fl_Text_Display ()
```

Free a text display and release its associated memory.

## Note

The text buffer that the text display displays is a separate entity and is not freed, nor are the style buffer or style table.

## See also

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer\\* buf\)](#)

### 33.144.4 Member Function Documentation

#### 33.144.4.1 absolute\_top\_line\_number()

```
void Fl_Text_Display::absolute_top_line_number (
 int oldFirstChar) [protected]
```

Re-calculate absolute top line number for a change in scroll position.  
Does nothing if the absolute top line number is not being maintained.

#### 33.144.4.2 `buffer()` [1/3]

```
Fl_Text_Buffer * Fl_Text_Display::buffer () const [inline]
```

Gets the current text buffer associated with the text widget.

Multiple text widgets can be associated with the same text buffer.

##### Returns

current text buffer

##### See also

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer\\* buf\)](#)

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer& buf\)](#)

#### 33.144.4.3 `buffer()` [2/3]

```
void Fl_Text_Display::buffer (
 Fl_Text_Buffer & buf) [inline]
```

Sets the current text buffer associated with the text widget.

Multiple text widgets can be associated with the same text buffer.

##### Parameters

<i>buf</i>	new text buffer
------------	-----------------

##### See also

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer\\* buf\)](#)

#### 33.144.4.4 `buffer()` [3/3]

```
void Fl_Text_Display::buffer (
 Fl_Text_Buffer * buf)
```

Attach a text buffer to display, replacing the current buffer (if any).

Multiple text widgets can be associated with the same text buffer.

##### Note

The caller is responsible for the old (replaced) buffer (if any). This method does not delete the old buffer.

##### Parameters

<i>buf</i>	attach this text buffer
------------	-------------------------

#### 33.144.4.5 `buffer_modified_cb()`

```
void Fl_Text_Display::buffer_modified_cb (
 int pos,
 int nInserted,
 int nDeleted,
 int nRestyled,
 const char * deletedText,
 void * cbArg) [static], [protected]
```

This is called whenever the buffer is modified.

Callback attached to the text buffer to receive modification information.

This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

#### Parameters

<i>pos</i>	starting index of modification
<i>nInserted</i>	number of bytes we inserted (must be UTF-8 aligned!)
<i>nDeleted</i>	number of bytes deleted (must be UTF-8 aligned!)
<i>nRestyled</i>	??
<i>deletedText</i>	this is what was removed, must not be NULL if nDeleted is set
<i>cbArg</i>	"this" pointer for static callback function

#### 33.144.4.6 `buffer_predelete_cb()`

```
void Fl_Text_Display::buffer_predelete_cb (
 int pos,
 int nDeleted,
 void * cbArg) [static], [protected]
```

This is called before any characters are deleted.

Callback attached to the text buffer to receive delete information before the modifications are actually made.

This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

#### Parameters

<i>pos</i>	starting index of deletion
<i>nDeleted</i>	number of bytes we will delete (must be UTF-8 aligned!)
<i>cbArg</i>	"this" pointer for static callback function

#### 33.144.4.7 `calc_last_char()`

```
void Fl_Text_Display::calc_last_char () [protected]
```

Update last display character index.

Given a [Fl\\_Text\\_Display](#) with a complete, up-to-date lineStarts array, update the lastChar entry to point to the last buffer position displayed.

#### 33.144.4.8 `calc_line_starts()`

```
void Fl_Text_Display::calc_line_starts (
 int startLine,
 int endLine) [protected]
```

Update the line starts array.

Scan through the text in the Text Display's buffer and recalculate the line starts array values beginning at index "startLine" and continuing through (including) "endLine". It assumes that the line starts entry preceding "startLine" (or mFirstChar if startLine is 0) is good, and re-counts newlines to fill in the requested entries. Out of range values for "startLine" and "endLine" are acceptable.

#### Parameters

<i>startLine,endLine</i>	range of lines to scan as line numbers
--------------------------	----------------------------------------

**33.144.4.9 clear\_rect()**

```
void Fl_Text_Display::clear_rect (
 int style,
 int X,
 int Y,
 int width,
 int height) const [protected]
```

Clear a rectangle with the appropriate background color for `style`.

**Parameters**

<i>style</i>	index into style table
<i>X,Y,width,height</i>	size and position of background area

**33.144.4.10 col\_to\_x()**

```
double Fl_Text_Display::col_to_x (
 double col) const
```

Convert a column number into an x pixel position.

**Parameters**

<i>col</i>	an approximate column number based on the main font
------------	-----------------------------------------------------

**Returns**

number of pixels from the left margin to the left of an average sized character

**See also**

[x\\_to\\_col\(\)](#)

**33.144.4.11 count\_lines()**

```
int Fl_Text_Display::count_lines (
 int startPos,
 int endPos,
 bool startPosIsLineStart) const
```

Count the number of lines between two positions.

Same as [Fl\\_Text\\_Buffer::count\\_lines\(\)](#), but takes into account wrapping if wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as `True` to make the call more efficient by avoiding the additional step of scanning back to the last newline.

**Parameters**

<i>startPos</i>	index to first character
<i>endPos</i>	index after last character
<i>startPosIsLineStart</i>	avoid scanning back to the line start

**Returns**

number of lines

**33.144.4.12 cursor\_color()** [1/2]

```
Fl_Color Fl_Text_Display::cursor_color () const [inline]
```

Gets the text cursor color.

**Returns**

cursor color

**33.144.4.13 cursor\_color()** [2/2]

```
void Fl_Text_Display::cursor_color (
 Fl_Color n) [inline]
```

Sets the text cursor color.

**Parameters**

<i>n</i>	new cursor color
----------	------------------

**33.144.4.14 cursor\_style()**

```
void Fl_Text_Display::cursor_style (
 int style)
```

Sets the text cursor style.

Sets the text cursor style to one of the following:

- [Fl\\_Text\\_Display::NORMAL\\_CURSOR](#) - Shows an I beam.
- [Fl\\_Text\\_Display::CARET\\_CURSOR](#) - Shows a caret under the text.
- [Fl\\_Text\\_Display::DIM\\_CURSOR](#) - Shows a dimmed I beam.
- [Fl\\_Text\\_Display::BLOCK\\_CURSOR](#) - Shows an unfilled box around the current character.
- [Fl\\_Text\\_Display::HEAVY\\_CURSOR](#) - Shows a thick I beam.

This call also switches the cursor on and may trigger a redraw.

**Parameters**

<i>style</i>	new cursor style
--------------	------------------

**33.144.4.15 display\_insert()**

```
void Fl_Text_Display::display_insert () [protected]
```

Scroll the display to bring insertion cursor into view.

Note: it would be nice to be able to do this without counting lines twice ([scroll\\_\(\)](#) counts them too) and/or to count from the most efficient starting point, but the efficiency of this routine is not as important to the overall performance of the text display.

**33.144.4.16 display\_needs\_recalc()**

```
void Fl_Text_Display::display_needs_recalc () [virtual]
```

Schedule a [recalc\\_display\(\)](#) to be done on next [draw\(\)](#).

Call this from methods that might be called repeatedly, to defers potentially CPU intensive [recalc\\_display\(\)](#) until it's actually needed just before [draw\(\)](#).

**33.144.4.17 draw()**

```
void Fl_Text_Display::draw (
 void) [protected], [virtual]
```

Draw the widget.

This function tries to limit drawing to smaller areas if possible.

Reimplemented from [Fl\\_Group](#).

**33.144.4.18 draw\_cursor()**

```
void Fl_Text_Display::draw_cursor (
 int X,
 int Y) [protected]
```

Draw a cursor with top center at X, Y.

**Parameters**

X, Y	cursor position in pixels
------	---------------------------

**33.144.4.19 draw\_line\_numbers()**

```
void Fl_Text_Display::draw_line_numbers (
 bool clearAll) [protected]
```

Refresh the line number area.

**Parameters**

<i>clearAll</i>	– (currently unused) If False, only draws the line number text, does not clear the area behind it. If True, clears the area and redraws the text. Use False to avoid a 'flash' for single buffered windows.
-----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**33.144.4.20 draw\_range()**

```
void Fl_Text_Display::draw_range (
 int startpos,
 int endpos) [protected]
```

Draw a range of text.

Refresh all of the text between buffer positions *startpos* and *endpos* not including the character at the position *endpos*.

If *endpos* points beyond the end of the buffer, refresh the whole display after *startpos*, including blank lines which are not technically part of any range of characters.

**Parameters**

<i>startpos</i>	index of first character to draw
<i>endpos</i>	index after last character to draw

**33.144.4.21 draw\_string()**

```
void Fl_Text_Display::draw_string (
 int style,
 int X,
 int Y,
 int toX,
 const char * string,
 int nChars) const [protected]
```

Draw a text segment in a single style.

Draw a string or blank area according to parameter *style*, using the appropriate colors and drawing method for that style, with top left corner at *X*, *Y*. If *style* says to draw text, use *string* as source of characters, and draw *nChars*, if *style* is FILL, erase rectangle where text would have drawn from *X* to *toX* and from *Y* to the maximum *y* extent of the current font(s).

**Parameters**

<i>style</i>	index into style lookup table
<i>X,Y</i>	drawing origin
<i>toX</i>	rightmost position if this is a fill operation
<i>string</i>	text if this is a drawing operation
<i>nChars</i>	number of characters to draw

**33.144.4.22 draw\_text()**

```
void Fl_Text_Display::draw_text (
 int left,
 int top,
 int width,
 int height) [protected]
```

Refresh a rectangle of the text display.

**Parameters**

<i>left,top</i>	are in coordinates of the text drawing window.
<i>width,height</i>	size in pixels

**33.144.4.23 draw\_vline()**

```
void Fl_Text_Display::draw_vline (
 int visLineNum,
 int leftClip,
 int rightClip,
 int leftCharIndex,
 int rightCharIndex) [protected]
```

Draw a single line of text.

Draw the text on a single line represented by *visLineNum* (the number of lines down from the top of the display), limited by *leftClip* and *rightClip* window coordinates and *leftCharIndex* and *rightCharIndex* character positions (not including the character at position *rightCharIndex*).

## Parameters

<i>visLineNum</i>	index of line in the visible line number lookup
<i>leftClip, rightClip</i>	pixel position of clipped area
<i>leftCharIndex, rightCharIndex</i>	index into line of segment that we want to draw

**33.144.4.24 empty\_vlines()**

```
int Fl_Text_Display::empty_vlines () const [protected]
```

Return true if there are lines visible with no corresponding buffer text.

## Returns

1 if there are empty lines

**33.144.4.25 extend\_range\_for\_styles()**

```
void Fl_Text_Display::extend_range_for_styles (
 int * startpos,
 int * endpos) [protected]
```

I don't know what this does!

Extend the range of a redraw request (from \*start to \*end) with additional redraw requests resulting from changes to the attached style buffer (which contains auxiliary information for coloring or styling text).

## Parameters

<i>startpos</i>	??
<i>endpos</i>	??

**Todo** Unicode?

**33.144.4.26 find\_line\_end()**

```
void Fl_Text_Display::find_line_end (
 int startPos,
 bool startPosIsLineStart,
 int * lineEnd,
 int * nextLineStart) const [protected]
```

Finds both the end of the current line and the start of the next line.

Why? In continuous wrap mode, if you need to know both, figuring out one from the other can be expensive or error prone. The problem comes when there's a trailing space or tab just before the end of the buffer. To translate an end of line value to or from the next lines start value, you need to know whether the trailing space or tab is being used as a line break or just a normal character, and to find that out would otherwise require counting all the way back to the beginning of the line.

## Parameters

	<i>startPos</i>	
	<i>startPosIsLineStart</i>	
out	<i>lineEnd</i>	
out	<i>nextLineStart</i>	

**33.144.4.27 find\_wrap\_range()**

```
void Fl_Text_Display::find_wrap_range (
 const char * deletedText,
 int pos,
 int nInserted,
 int nDeleted,
 int * modRangeStart,
 int * modRangeEnd,
 int * linesInserted,
 int * linesDeleted) [protected]
```

Wrapping calculations.

When continuous wrap is on, and the user inserts or deletes characters, wrapping can happen before and beyond the changed position. This routine finds the extent of the changes, and counts the deleted and inserted lines over that range. It also attempts to minimize the size of the range to what has to be counted and re-displayed, so the results can be useful both for delimiting where the line starts need to be recalculated, and for deciding what part of the text to redisplay.

**Parameters**

<i>deletedText</i>	
<i>pos</i>	
<i>nInserted</i>	
<i>nDeleted</i>	
<i>modRangeStart</i>	
<i>modRangeEnd</i>	
<i>linesInserted</i>	
<i>linesDeleted</i>	

**33.144.4.28 find\_x()**

```
int Fl_Text_Display::find_x (
 const char * s,
 int len,
 int style,
 int x) const [protected]
```

Find the index of the character that lies at the given x position / closest cursor position.

**Parameters**

<i>s</i>	UTF-8 text string
<i>len</i>	length of string
<i>style</i>	index into style lookup table
<i>x</i>	position in pixels - negative returns closest cursor position

**Returns**

index into buffer

**33.144.4.29 get\_absolute\_top\_line\_number()**

```
int Fl_Text_Display::get_absolute_top_line_number () const [protected]
```

Returns the absolute (non-wrapped) line number of the first line displayed.  
Returns 0 if the absolute top line number is not being maintained.

#### 33.144.4.30 grammar\_underline\_color() [1/2]

```
Fl_Color Fl_Text_Display::grammar_underline_color () const [inline]
```

Gets the underline color for style attribute ATTR\_GRAMMAR.

##### Returns

underline color

#### 33.144.4.31 grammar\_underline\_color() [2/2]

```
void Fl_Text_Display::grammar_underline_color (
 Fl_Color color) [inline]
```

Sets the underline color for style attribute ATTR\_GRAMMAR.

##### Parameters

<i>color</i>	underline color
--------------	-----------------

#### 33.144.4.32 handle()

```
int Fl_Text_Display::handle (
 int e) [virtual]
```

Event handling.

Reimplemented from [Fl\\_Group](#).

Reimplemented in [Fl\\_Text\\_Editor](#).

#### 33.144.4.33 handle\_rmb()

```
int Fl_Text_Display::handle_rmb (
 int readonly) [protected]
```

Handle right mouse button down events.

##### Returns

0 for no op, 1 to cut, 2 to copy, 3 to paste

#### 33.144.4.34 handle\_vline()

```
int Fl_Text_Display::handle_vline (
 int mode,
 int lineStartPos,
 int lineLen,
 int leftChar,
 int rightChar,
 int Y,
 int bottomClip,
 int leftClip,
 int rightClip) const [protected]
```

Universal pixel machine.

We use a single function that handles all line layout, measuring, and drawing

- draw a text range
- return the width of a text range in pixels
- return the index of a character that is at a pixel position

#### Parameters

in	<i>mode</i>	DRAW_LINE, GET_WIDTH, FIND_INDEX, FIND_INDEX_FROM_ZERO, or FIND_CURSOR_INDEX
in	<i>lineStartPos</i>	index of first character
in	<i>lineLen</i>	size of string in bytes
in	<i>leftChar, rightChar</i>	
in	<i>Y</i>	drawing position
in	<i>bottomClip, leftClip, rightClip</i>	stop work when we reach the clipped area. rightClip is the X position that we search in FIND_INDEX.

#### Return values

<i>DRAW_LINE</i>	index of last drawn character
<i>GET_WIDTH</i>	width in pixels of text segment if we would draw it
<i>FIND_INDEX</i>	index of character at given x position in window coordinates
<i>FIND_INDEX_FROM_ZERO</i>	index of character at given x position without scrolling and widget offsets

**Todo** we need to handle hidden hyphens and tabs here!

we handle all styles and selections

we must provide code to get pixel positions of the middle of a character as well

#### 33.144.4.35 highlight\_data()

```
void Fl_Text_Display::highlight_data (
 Fl_Text_Buffer * styleBuffer,
 const Style_Table_Entry * styleTable,
 int nStyles,
 char unfinishedStyle,
 Unfinished_Style_Cb unfinishedHighlightCB,
 void * cbArg)
```

Attach (or remove) highlight information in text display and redisplay.

Highlighting information consists of a style buffer which parallels the normal text buffer, but codes font and color information for the display; a style table which translates style buffer codes (indexed by buffer character - 'A') into fonts and colors; and a callback mechanism for as-needed highlighting, triggered by a style buffer entry of "unfinished↔ Style". Style buffer can trigger additional redisplay during a normal buffer modification if the buffer contains a primary [Fl\\_Text\\_Selection](#) (see [extend\\_range\\_for\\_styles\(\)](#) for more information on this protocol).

Style buffers, tables and their associated memory are managed by the caller.

Styles are ranged from 65 ('A') to 126.

#### Note

Style information in the style buffer must have the same byte offset as the corresponding character in the text buffer. UTF-8 characters can have a maximum length of four bytes. Style information must take this into account and fill the unused bytes with 0. See [fl\\_utf8len\(\)](#).

Text: "*\*g\* r ü \*n\**", where normal style is 'A', and bold is 'B'

```
Text Buffer(hex): 67 72 c3 bc 6e : gr..n
Style Buffer(hex): 42 41 41 00 42 : BAA.B
```

## Parameters

<i>styleBuffer</i>	this buffer works in parallel to the text buffer. For every character in the text buffer, the style buffer has a byte at the same offset that contains an index into an array of possible styles.
<i>styleTable</i>	a list of styles indexed by the style buffer
<i>nStyles</i>	number of styles in the style table
<i>unfinishedStyle</i>	if this style is found, the callback below is called
<i>unfinishedHighlightCB</i>	if a character with an unfinished style is found, this callback will be called
<i>cbArg</i>	an optional argument for the callback above, usually a pointer to the Text Display.

## See also

[Fl\\_Text\\_Display::style\\_buffer\(\)](#)

**33.144.4.36 in\_selection()**

```
int Fl_Text_Display::in_selection (
 int X,
 int Y) const
```

Check if a pixel position is within the primary selection.

## Parameters

<i>X, Y</i>	pixel position to test
-------------	------------------------

## Returns

1 if position (X, Y) is inside of the primary [Fl\\_Text\\_Selection](#)

**33.144.4.37 insert()**

```
void Fl_Text_Display::insert (
 const char * text)
```

Inserts "text" at the current cursor location.

This has the same effect as inserting the text into the buffer using `insert(insert_position(),text)` and then moving the insert position after the newly inserted text, except that it's optimized to do less redrawing.

## Parameters

<i>text</i>	new text in UTF-8 encoding.
-------------	-----------------------------

**33.144.4.38 insert\_position()** [1/2]

```
int Fl_Text_Display::insert_position () const [inline]
```

Gets the position of the text insertion cursor for text display.

The insert position is the byte count (offset) from the beginning of the text buffer (starting with 0). Returns 0 (zero) if no buffer is associated to the text display. Returns `buffer()->length()` if the insert position is at the end of the buffer.

**Returns**

insert position index into text buffer

**See also**

[insert\\_position\(int\)](#)

**33.144.4.39 insert\_position()** [2/2]

```
void Fl_Text_Display::insert_position (
 int newPos)
```

Sets the position of the text insertion cursor for text display.

Moves the insertion cursor in front of the character at `newPos`. This function may trigger a redraw.

**Parameters**

<code>newPos</code>	new caret position
---------------------	--------------------

**33.144.4.40 line\_end()**

```
int Fl_Text_Display::line_end (
 int startPos,
 bool startPosIsLineStart) const
```

Returns the end of a line.

Same as `buffer()->line_end(startPos)`, but takes into account line breaks when wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as `True` to make the call more efficient by avoiding the additional step of scanning back to the last newline.

Note that the definition of the end of a line is less clear when continuous wrap is on. With continuous wrap off, it's just a pointer to the newline that ends the line. When it's on, it's the character beyond the last **displayable** character on the line, where a whitespace character which has been "converted" to a newline for wrapping is not considered displayable. Also note that a line can be wrapped at a non-whitespace character if the line had no whitespace. In this case, this routine returns a pointer to the start of the next line. This is also consistent with the model used by `visLineLength`.

**Parameters**

<code>startPos</code>	index to starting character
<code>startPosIsLineStart</code>	avoid scanning back to the line start

**Returns**

new position as index

**33.144.4.41 line\_start()**

```
int Fl_Text_Display::line_start (
 int pos) const
```

Return the beginning of a line.

Same as `buffer()->line_start(pos)`, but returns the character after last wrap point rather than the last newline.

**Parameters**

<code>pos</code>	index to starting character
------------------	-----------------------------

**Returns**

new position as index

**33.144.4.42 `linenumber_align()`**

```
void Fl_Text_Display::linenumber_align (
 Fl_Align val)
```

Set alignment for line numbers (if enabled).

Valid values are FL\_ALIGN\_LEFT, FL\_ALIGN\_CENTER or FL\_ALIGN\_RIGHT.

**Version**

1.3.3

**33.144.4.43 `linenumber_bgcolor()`**

```
void Fl_Text_Display::linenumber_bgcolor (
 Fl_Color val)
```

Set the background color used for line numbers (if enabled).

**Version**

1.3.3

**33.144.4.44 `linenumber_fgcolor()`**

```
void Fl_Text_Display::linenumber_fgcolor (
 Fl_Color val)
```

Set the foreground color used for line numbers (if enabled).

**Version**

1.3.3

**33.144.4.45 `linenumber_font()`**

```
void Fl_Text_Display::linenumber_font (
 Fl_Font val)
```

Set the font used for line numbers (if enabled).

**Version**

1.3.3

**33.144.4.46 `linenumber_format()`**

```
void Fl_Text_Display::linenumber_format (
 const char * val)
```

Sets the printf() style format string used for line numbers.

Default is "%d" for normal unpadded decimal integers.

An internal copy of `val` is allocated and managed; it is automatically freed whenever a new value is assigned, or when the widget is destroyed.

The value of `val` must *not* be NULL.

Example values:

```
- "%d" -- For normal line numbers without padding (Default)
- "%03d" -- For 000 padding
- "%x" -- For hexadecimal line numbers
- "%o" -- For octal line numbers
```

#### Version

1.3.3

#### 33.144.4.47 `linenumber_size()`

```
void Fl_Text_Display::linenumber_size (
 Fl_Fontsize val)
```

Set the font size used for line numbers (if enabled).

#### Version

1.3.3

#### 33.144.4.48 `linenumber_width()`

```
void Fl_Text_Display::linenumber_width (
 int width)
```

Set width of screen area for line numbers.

Use to also enable/disable line numbers. A value of 0 disables line numbering, values >0 enable the line number display.

#### Parameters

<i>width</i>	The new width of the area for line numbers to appear, in pixels. 0 disables line numbers (default)
--------------	----------------------------------------------------------------------------------------------------

#### 33.144.4.49 `longest_vline()`

```
int Fl_Text_Display::longest_vline () const [protected]
```

Find the longest line of all visible lines.

#### Returns

the width of the longest visible line in pixels

#### 33.144.4.50 `maintain_absolute_top_line_number()`

```
void Fl_Text_Display::maintain_absolute_top_line_number (
 int state) [protected]
```

Line numbering stuff, currently unused.

In continuous wrap mode, internal line numbers are calculated after wrapping. A separate non-wrapped line count is maintained when line numbering is turned on. There is some performance cost to maintaining this line count, so normally absolute line numbers are not tracked if line numbering is off. This routine allows callers to specify that they still want this line count maintained (for use via `Fl_Text_Display::position_to_linecol()`). More specifically, this allows the line number reported in the statistics line to be calibrated in absolute lines, rather than post-wrapped lines.

#### 33.144.4.51 `maintaining_absolute_top_line_number()`

```
int Fl_Text_Display::maintaining_absolute_top_line_number () const [protected]
```

Returns true if a separate absolute top line number is being maintained.

The absolute top line number is used for displaying line numbers in continuous wrap mode or showing in the statistics line (the latter is currently not available in FLTK).

#### 33.144.4.52 `measure_deleted_lines()`

```
void Fl_Text_Display::measure_deleted_lines (
 int pos,
 int nDeleted) [protected]
```

Wrapping calculations.

This is a stripped-down version of the `findWrapRange()` function above, intended to be used to calculate the number of "deleted" lines during a buffer modification. It is called *before* the modification takes place.

This function should only be called in continuous wrap mode with a non-fixed font width. In that case, it is impossible to calculate the number of deleted lines, because the necessary style information is no longer available *after* the modification. In other cases, we can still perform the calculation afterwards (possibly even more efficiently).

##### Parameters

<i>pos</i>	
<i>nDeleted</i>	

#### 33.144.4.53 `measure_proportional_character()`

```
double Fl_Text_Display::measure_proportional_character (
 const char * s,
 int xPix,
 int pos) const [protected]
```

Wrapping calculations.

Measure the width in pixels of the first character of string "s" at a particular column "colNum" and buffer position "pos". This is for measuring characters in proportional or mixed-width highlighting fonts.

A note about proportional and mixed-width fonts: the mixed width and proportional font code in `nedit` does not get much use in general editing, because `nedit` doesn't allow per-language-mode fonts, and editing programs in a proportional font is usually a bad idea, so very few users would choose a proportional font as a default. There are still probably mixed-width syntax highlighting cases where things don't redraw properly for insertion/deletion, though static display and wrapping and resizing should now be solid because they are now used for online help display.

##### Parameters

<i>s</i>	text string
<i>xPix</i>	x pixel position needed for calculating tab widths
<i>pos</i>	offset within string

##### Returns

width of character in pixels

#### 33.144.4.54 `measure_vline()`

```
int Fl_Text_Display::measure_vline (
 int visLineNum) const [protected]
```

Returns the width in pixels of the displayed line pointed to by "visLineNum".

## Parameters

<i>visLineNum</i>	index into visible lines array
-------------------	--------------------------------

## Returns

width of line in pixels

**33.144.4.55 move\_down()**

```
int Fl_Text_Display::move_down ()
```

Moves the current insert position down one line.

## Returns

1 if the cursor moved, 0 if the beginning of the text was reached

**33.144.4.56 move\_left()**

```
int Fl_Text_Display::move_left ()
```

Moves the current insert position left one character.

## Returns

1 if the cursor moved, 0 if the beginning of the text was reached

**33.144.4.57 move\_right()**

```
int Fl_Text_Display::move_right ()
```

Moves the current insert position right one character.

## Returns

1 if the cursor moved, 0 if the end of the text was reached

**33.144.4.58 move\_up()**

```
int Fl_Text_Display::move_up ()
```

Moves the current insert position up one line.

## Returns

1 if the cursor moved, 0 if the beginning of the text was reached

**33.144.4.59 offset\_line\_starts()**

```
void Fl_Text_Display::offset_line_starts (
 int newTopLineNum) [protected]
```

Offset line start counters for a new vertical scroll position.

Offset the line starts array, mTopLineNum, mFirstChar and lastChar, for a new vertical scroll position given by new↔TopLineNum. If any currently displayed lines will still be visible, salvage the line starts values, otherwise, count lines from the nearest known line start (start or end of buffer, or the closest value in the mLineStarts array)

## Parameters

<i>newTopLineNum</i>	index into buffer
----------------------	-------------------

**33.144.4.60 overstrike()**

```
void Fl_Text_Display::overstrike (
 const char * text)
```

Replaces text at the current insert position.

## Parameters

<i>text</i>	new text in UTF-8 encoding
-------------	----------------------------

**Todo** Unicode? Find out exactly what we do here and simplify.

**33.144.4.61 position\_style()**

```
int Fl_Text_Display::position_style (
 int lineStartPos,
 int lineLen,
 int lineIndex) const
```

Find the correct style for a character.

Determine the drawing method to use to draw a specific character from "buf".

*lineStartPos* gives the character index where the line begins, *lineIndex*, the number of characters past the beginning of the line, and *lineLen* the number of displayed characters past the beginning of the line. Passing *lineStartPos* of -1 returns the drawing style for "no text".

Why not just: *position\_style(pos)*? Because style applies to blank areas of the window beyond the text boundaries, and because this routine must also decide whether a position is inside of a rectangular [Fl\\_Text\\_Selection](#), and do so efficiently, without re-counting character positions from the start of the line.

Note that style is a somewhat incorrect name, drawing method would be more appropriate.

If *lineIndex* is pointing to the last character in a line, and the second to last character has the `ATTR_BGCOLOR_EXT` set, the background color will extend into the remaining line.

## Parameters

<i>lineStartPos</i>	beginning of this line
<i>lineLen</i>	number of bytes in line
<i>lineIndex</i>	position of character within line

## Returns

style for the given character

**33.144.4.62 position\_to\_line()**

```
int Fl_Text_Display::position_to_line (
 int pos,
 int * lineNum) const [protected]
```

Convert a position index into a line number offset.

Find the line number of position *pos* relative to the first line of displayed text, counting from 0 to *visible lines - 1*. The line number is returned in *lineNum*.

Returns 0 if the line is not displayed. In this case `lineNum` is 0 as well.  
Returns 1 if the line is displayed. In this case `lineNum` is the relative line number.

#### Parameters

in	<i>pos</i>	byte position in buffer
out	<i>lineNum</i>	relative line number of byte <code>pos</code> in buffer

#### Returns

whether the character at byte position `pos` is currently displayed

#### Return values

0	<code>pos</code> is not displayed; <code>lineNum</code> is invalid (zero)
1	<code>pos</code> is displayed; <code>lineNum</code> is valid

### 33.144.4.63 `position_to_linecol()`

```
int Fl_Text_Display::position_to_linecol (
 int pos,
 int * lineNum,
 int * column) const [protected]
```

Find the line and column number of position `pos`.

This only works for displayed lines. If the line is not displayed, the function returns 0 (without the `mLineStarts` array it could turn in to very long calculation involving scanning large amounts of text in the buffer). If continuous wrap mode is on, returns the absolute line number (as opposed to the wrapped line number which is used for scrolling).

#### Parameters

	<i>pos</i>	character index
out	<i>lineNum</i>	absolute (unwrapped) line number
out	<i>column</i>	character offset to the beginning of the line

#### Returns

0 if `pos` is off screen, line number otherwise

**Todo** a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.

### 33.144.4.64 `position_to_xy()`

```
int Fl_Text_Display::position_to_xy (
 int pos,
 int * X,
 int * Y) const
```

Convert a character index into a pixel position.

Translate a buffer text position to the XY location where the top left of the cursor would be positioned to point to that character. Returns 0 if the position is not displayed because it is **vertically out** of view. If the position is horizontally out of view, returns the X coordinate where the position would be if it were visible.

## Parameters

	<i>pos</i>	character index
out	<i>X, Y</i>	pixel position of character on screen

## Returns

0 if character vertically out of view, X & Y positions otherwise

**33.144.4.65 recalc\_display()**

```
void Fl_Text_Display::recalc_display () [virtual]
```

Recalculate the display's visible lines and scrollbar sizes.

Beware calling this directly may cause a lot of CPU if called repeatedly (issue 300). Better to call [display\\_needs\\_recalc\(\)](#) to flag a recalc to be done during next [draw\(\)](#).

**33.144.4.66 redisplay\_range()**

```
void Fl_Text_Display::redisplay_range (
 int startpos,
 int endpos)
```

Marks text from start to end as needing a redraw.

This function will trigger a damage event and later a redraw of parts of the widget.

## Parameters

<i>startpos</i>	index of first character needing redraw
<i>endpos</i>	index after last character needing redraw

**33.144.4.67 reset\_absolute\_top\_line\_number()**

```
void Fl_Text_Display::reset_absolute_top_line_number () [protected]
```

Reestablish the absolute (non-wrapped) top line number.

Count lines from the beginning of the buffer to reestablish the absolute (non-wrapped) top line number. If mode is not continuous wrap, or the number is not being maintained, does nothing.

**33.144.4.68 resize()**

```
void Fl_Text_Display::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Change the size of the displayed text area.

Calling this function will trigger a recalculation of all visible lines and of all scrollbar sizes.

## Parameters

<i>X, Y, W, H</i>	new position and size of this widget
-------------------	--------------------------------------

Reimplemented from [Fl\\_Group](#).

**33.144.4.69 rewind\_lines()**

```
int Fl_Text_Display::rewind_lines (
 int startPos,
 int nLines)
```

Skip a number of lines back.

Same as [buffer\(\)](#)->rewind\_lines(startPos, nLines), but takes into account line breaks when wrapping is turned on.

**Parameters**

<i>startPos</i>	index to starting character
<i>nLines</i>	number of lines to skip back

**Returns**

new position as index

**33.144.4.70 scroll()**

```
void Fl_Text_Display::scroll (
 int topLineNum,
 int horizOffset)
```

Scrolls the current buffer to start at the specified line and column.

**Parameters**

<i>topLineNum</i>	top line number
<i>horizOffset</i>	column number

**Todo** Column numbers make little sense here.

**33.144.4.71 scroll\_()**

```
int Fl_Text_Display::scroll_ (
 int topLineNum,
 int horizOffset) [protected]
```

Scrolls the current buffer to start at the specified line and column.

**Parameters**

<i>topLineNum</i>	top line number
<i>horizOffset</i>	in pixels

**Returns**

0 if nothing changed, 1 if we scrolled

**33.144.4.72 scroll\_timer\_cb()**

```
void Fl_Text_Display::scroll_timer_cb (
 void * user_data) [static], [protected]
```

Timer callback for scroll events.

This timer event scrolls the text view proportionally to how far the mouse pointer has left the text area. This allows for smooth scrolling without "wiggeling" the mouse.

#### 33.144.4.73 scrollbar\_align() [1/2]

```
Fl_Align Fl_Text_Display::scrollbar_align () const [inline]
```

Gets the scrollbar alignment type.

##### Returns

scrollbar alignment

#### 33.144.4.74 scrollbar\_align() [2/2]

```
void Fl_Text_Display::scrollbar_align (
 Fl_Align a) [inline]
```

Sets the scrollbar alignment type.

##### Parameters

<i>a</i>	new scrollbar alignment
----------	-------------------------

#### 33.144.4.75 scrollbar\_size() [1/2]

```
int Fl_Text_Display::scrollbar_size (
 void) const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

##### Returns

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

##### See also

[Fl::scrollbar\\_size\(int\)](#)

#### 33.144.4.76 scrollbar\_size() [2/2]

```
void Fl_Text_Display::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to *newSize*, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting *newSize* to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

##### Parameters

<i>in</i>	<i>newSize</i>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
-----------	----------------	-----------------------------------------------------------------------------------------------------------------------------

See also

[Fl::scrollbar\\_size\(\)](#)

#### 33.144.4.77 scrollbar\_width() [1/2]

```
int Fl_Text_Display::scrollbar_width () const [inline]
```

Returns the global value [Fl::scrollbar\\_size\(\)](#) unless a specific `scrollbar_width_` has been set.

**Deprecated** Use [scrollbar\\_size\(\)](#) instead.

**Todo** This method should eventually be removed.

#### 33.144.4.78 scrollbar\_width() [2/2]

```
void Fl_Text_Display::scrollbar_width (
 int width) [inline]
```

Sets the global [Fl::scrollbar\\_size\(\)](#), and forces this instance of the widget to use it.

**Deprecated** Use [scrollbar\\_size\(\)](#) instead.

**Todo** This method should eventually be removed

#### 33.144.4.79 secondary\_selection\_color() [1/2]

```
Fl_Color Fl_Text_Display::secondary_selection_color () const [inline]
```

Gets the background color for the secondary selection block.

Returns

background color color

#### 33.144.4.80 secondary\_selection\_color() [2/2]

```
void Fl_Text_Display::secondary_selection_color (
 Fl_Color color) [inline]
```

Sets the background color for the secondary selection block.

Parameters

<i>color</i>	background color
--------------	------------------

#### 33.144.4.81 shortcut() [1/2]

```
int Fl_Text_Display::shortcut () const [inline]
```

**Todo** FIXME : get set methods pointing on `shortcut_` have no effects as `shortcut_` is unused in this class and derived!

Returns

the current shortcut key

**33.144.4.82 shortcut()** [2/2]

```
void Fl_Text_Display::shortcut (
 int s) [inline]
```

**Todo** FIXME : get set methods pointing on shortcut\_ have no effects as shortcut\_ is unused in this class and derived!

**Parameters**

<i>s</i>	the new shortcut key
----------	----------------------

**33.144.4.83 show\_cursor()**

```
void Fl_Text_Display::show_cursor (
 int b = 1)
```

Shows the text cursor.

This function may trigger a redraw.

**Parameters**

<i>b</i>	show(1) or hide(0) the text cursor (caret).
----------	---------------------------------------------

**33.144.4.84 show\_insert\_position()**

```
void Fl_Text_Display::show_insert_position ()
```

Scrolls the text buffer to show the current insert position.

This function triggers a complete recalculation, ending in a call to [Fl\\_Text\\_Display::display\\_insert\(\)](#)

**33.144.4.85 skip\_lines()**

```
int Fl_Text_Display::skip_lines (
 int startPos,
 int nLines,
 bool startPosIsLineStart)
```

Skip a number of lines forward.

Same as [Fl\\_Text\\_Buffer::skip\\_lines\(startPos, nLines\)](#), but takes into account line breaks when wrapping is turned on. If the caller knows that *startPos* is at a line start, it can pass *startPosIsLineStart* as `True` to make the call more efficient by avoiding the additional step of scanning back to the last newline.

**Parameters**

<i>startPos</i>	index to starting character
<i>nLines</i>	number of lines to skip ahead
<i>startPosIsLineStart</i>	avoid scanning back to the line start

**Returns**

new position as index

**33.144.4.86 spelling\_underline\_color()** [1/2]

```
Fl_Color Fl_Text_Display::spelling_underline_color () const [inline]
```

Gets the underline color for style attribute ATTR\_SPELLING.

Returns

underline color

### 33.144.4.87 spelling\_underline\_color() [2/2]

```
void Fl_Text_Display::spelling_underline_color (
 Fl_Color color) [inline]
```

Sets the underline color for style attribute ATTR\_SPELLING.

Parameters

<i>color</i>	underline color
--------------	-----------------

### 33.144.4.88 string\_width()

```
double Fl_Text_Display::string_width (
 const char * string,
 int length,
 int style) const [protected]
```

Find the width of a string in the font of a particular style.

Parameters

<i>string</i>	the text
<i>length</i>	number of bytes in string
<i>style</i>	index into style table

Returns

width of text segment in pixels

### 33.144.4.89 style\_buffer()

```
Fl_Text_Buffer * Fl_Text_Display::style_buffer () const [inline]
```

Gets the current style buffer associated with the text widget.

Multiple text widgets can be associated with the same style buffer.

Returns

current style buffer

See also

[Fl\\_Text\\_Display::highlight\\_data\(\)](#)

### 33.144.4.90 textcolor() [1/2]

```
Fl_Color Fl_Text_Display::textcolor (
 void) const [inline]
```

Gets the default color of text in the widget.

**Returns**

text color unless overridden by a style

**33.144.4.91 textcolor() [2/2]**

```
void Fl_Text_Display::textcolor (
 Fl_Color n) [inline]
```

Sets the default color of text in the widget.

**Parameters**

<i>n</i>	new text color
----------	----------------

**33.144.4.92 textfont() [1/2]**

```
Fl_Font Fl_Text_Display::textfont (
 void) const [inline]
```

Gets the default font used when drawing text in the widget.

**Returns**

current text font face unless overridden by a style

**33.144.4.93 textfont() [2/2]**

```
void Fl_Text_Display::textfont (
 Fl_Font s) [inline]
```

Sets the default font used when drawing text in the widget.

**Parameters**

<i>s</i>	default text font face
----------	------------------------

**33.144.4.94 textsize() [1/2]**

```
Fl_Fontsize Fl_Text_Display::textsize (
 void) const [inline]
```

Gets the default size of text in the widget.

**Returns**

current text height unless overridden by a style

**33.144.4.95 textsize() [2/2]**

```
void Fl_Text_Display::textsize (
 Fl_Fontsize s) [inline]
```

Sets the default size of text in the widget.

**Parameters**

<i>s</i>	new text size
----------	---------------

**33.144.4.96 update\_h\_scrollbar()**

```
void Fl_Text_Display::update_h_scrollbar () [protected]
```

Update horizontal scrollbar.

Update the minimum, maximum, slider size, page increment, and value for the horizontal scrollbar.

**33.144.4.97 update\_line\_starts()**

```
void Fl_Text_Display::update_line_starts (
 int pos,
 int charsInserted,
 int charsDeleted,
 int linesInserted,
 int linesDeleted,
 int * scrolled) [protected]
```

Update line start arrays and variables.

Update the line starts array, mTopLineNum, mFirstChar and lastChar for this text display after a modification to the text buffer, given by the position `pos` where the change began, and the numbers of characters and lines inserted and deleted.

**Parameters**

	<i>pos</i>	index into buffer of recent changes
	<i>charsInserted</i>	number of bytes(!) inserted
	<i>charsDeleted</i>	number of bytes(!) deleted
	<i>linesInserted</i>	number of lines
	<i>linesDeleted</i>	number of lines
out	<i>scrolled</i>	set to 1 if the text display needs to be scrolled

**33.144.4.98 update\_v\_scrollbar()**

```
void Fl_Text_Display::update_v_scrollbar () [protected]
```

Update vertical scrollbar.

Update the minimum, maximum, slider size, page increment, and value for the vertical scrollbar.

**33.144.4.99 vline\_length()**

```
int Fl_Text_Display::vline_length (
 int visLineNum) const [protected]
```

Count number of bytes in a visible line.

Return the length of a line (number of bytes) by examining entries in the line starts array rather than by scanning for newlines.

**Parameters**

<i>visLineNum</i>	index of line in visible line array
-------------------	-------------------------------------

**Returns**

number of bytes in this line

**33.144.4.100 word\_end()**

```
int Fl_Text_Display::word_end (
 int pos) const [inline]
```

Moves the insert position to the end of the current word.

**Parameters**

<i>pos</i>	start calculation at this index
------------	---------------------------------

**Returns**

index of first character after the end of the word

**33.144.4.101 word\_start()**

```
int Fl_Text_Display::word_start (
 int pos) const [inline]
```

Moves the insert position to the beginning of the current word.

**Parameters**

<i>pos</i>	start calculation at this index
------------	---------------------------------

**Returns**

beginning of the words

**33.144.4.102 wrap\_mode()**

```
void Fl_Text_Display::wrap_mode (
 int wrap,
 int wrapMargin)
```

Set the new text wrap mode.

If `wrap` mode is not zero, this call enables automatic word wrapping at column `wrapMargin`. Word-wrapping does not change the text buffer itself, only the way the text is displayed. Different Text Displays can have different wrap modes, even if they share the same Text Buffer.

Valid wrap modes are:

- `WRAP_NONE` : don't wrap text at all
- `WRAP_AT_COLUMN` : wrap text at the given text column
- `WRAP_AT_PIXEL` : wrap text at a pixel position
- `WRAP_AT_BOUNDS` : wrap text so that it fits into the widget width

**Parameters**

<i>wrap</i>	new wrap mode (see above)
-------------	---------------------------

## Parameters

<i>wrapMargin</i>	in WRAP_AT_COLUMN mode, text will wrap at the n'th character. For variable width fonts, an average character width is calculated. The column width is calculated using the current textfont or the first style when this function is called. If the font size changes, this function must be called again. In WRAP_AT_PIXEL mode, this is the pixel position.
-------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**33.144.4.103 wrap\_uses\_character()**

```
int Fl_Text_Display::wrap_uses_character (
 int lineEndPos) const [protected]
```

Check if the line break is caused by a newline or by line wrapping.

Line breaks in continuous wrap mode usually happen at newlines (\n) or whitespace. This line-terminating character is not included in line width measurements and has a special status as a non-visible character. However, lines with no whitespace are wrapped without the benefit of a line terminating character, and this distinction causes endless trouble with all of the text display code which was originally written without continuous wrap mode and always expects to wrap at a newline character.

Given the position of the end of the line, as returned by [Fl\\_Text\\_Display::line\\_end\(\)](#) or [Fl\\_Text\\_Buffer::line\\_end\(\)](#), this returns true if there is a line terminating character, and false if there's not. On the last character in the buffer, this function can't tell for certain whether a trailing space was used as a wrap point, and just guesses that it wasn't. So if an exact accounting is necessary, don't use this function.

## Parameters

<i>lineEndPos</i>	index of character where the line wraps
-------------------	-----------------------------------------

## Returns

1 if a \n character causes the line wrap

**33.144.4.104 wrapped\_column()**

```
int Fl_Text_Display::wrapped_column (
 int row,
 int column) const
```

Nobody knows what this function does.

Correct a column number based on an unconstrained position (as returned by [TextDXYToUnconstrainedPosition](#)) to be relative to the last actual newline in the buffer before the row and column position given, rather than the last line start created by line wrapping. This is an adapter for rectangular selections and code written before continuous wrap mode, which thinks that the unconstrained column is the number of characters from the last newline. Obviously this is time consuming, because it involves character re-counting.

## Parameters

<i>row</i>	
<i>column</i>	

## Returns

something unknown

**Todo** What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function [TextDXYToUnconstrainedPosition](#) does not exist (nedit port?)

**Todo** Unicode?

**33.144.4.105 wrapped\_line\_counter()**

```
void Fl_Text_Display::wrapped_line_counter (
 Fl_Text_Buffer * buf,
 int startPos,
 int maxPos,
 int maxLines,
 bool startPosIsLineStart,
 int styleBufOffset,
 int * retPos,
 int * retLines,
 int * retLineStart,
 int * retLineEnd,
 bool countLastLineMissingNewLine = true) const [protected]
```

Wrapping calculations.

Count forward from startPos to either maxPos or maxLines (whichever is reached first), and return all relevant positions and line count. The provided textBuffer may differ from the actual text buffer of the widget. In that case it must be a (partial) copy of the actual text buffer and the styleBufOffset argument must indicate the starting position of the copy, to take into account the correct style information.

**Parameters**

in	<i>buf</i>	The text buffer to operate on
in	<i>startPos</i>	Starting index position into the buffer
in	<i>maxPos</i>	Maximum index position into the buffer we'll reach
in	<i>maxLines</i>	Maximum number of lines we'll reach
in	<i>startPosIsLineStart</i>	Flag indicating if startPos is start of line. (If set, prevents our having to find the line start)
in	<i>styleBufOffset</i>	Offset index position into style buffer.
out	<i>retPos</i>	Position where counting ended. When counting lines, the position returned is the start of the line "maxLines" lines beyond "startPos".
out	<i>retLines</i>	Number of line breaks counted
out	<i>retLineStart</i>	Start of the line where counting ended
out	<i>retLineEnd</i>	End position of the last line traversed
out	<i>countLastLineMissingNewLine</i>	

**33.144.4.106 wrapped\_row()**

```
int Fl_Text_Display::wrapped_row (
 int row) const
```

Nobody knows what this function does.

Correct a row number from an unconstrained position (as returned by TextDXYToUnconstrainedPosition) to a straight number of newlines from the top line of the display. Because rectangular selections are based on newlines, rather than display wrapping, and anywhere a rectangular selection needs a row, it needs it in terms of un-wrapped lines.

**Parameters**

<i>row</i>	
------------	--

**Returns**

something unknown

**Todo** What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function `TextDXYToUnconstrainedPosition` does not exist (nedit port?)

**33.144.4.107 x\_to\_col()**

```
double Fl_Text_Display::x_to_col (
 double x) const
```

Convert an x pixel position into a column number.

**Parameters**

x	number of pixels from the left margin
---	---------------------------------------

**Returns**

an approximate column number based on the main font

**33.144.4.108 xy\_to\_position()**

```
int Fl_Text_Display::xy_to_position (
 int X,
 int Y,
 int posType = CHARACTER_POS) const [protected]
```

Translate a pixel position into a character index.

Translate window coordinates to the nearest (insert cursor or character cell) text position. The parameter `posType` specifies how to interpret the position: `CURSOR_POS` means translate the coordinates to the nearest cursor position, and `CHARACTER_POS` means return the position of the character closest to (X, Y).

**Parameters**

X,Y	pixel position
posType	CURSOR_POS or CHARACTER_POS

**Returns**

index into text buffer

**33.144.4.109 xy\_to\_rowcol()**

```
void Fl_Text_Display::xy_to_rowcol (
 int X,
 int Y,
 int * row,
 int * column,
 int posType = CHARACTER_POS) const [protected]
```

Translate pixel coordinates into row and column.

Translate window coordinates to the nearest row and column number for positioning the cursor. This, of course, makes no sense when the font is proportional, since there are no absolute columns. The parameter `posType` specifies how to interpret the position: `CURSOR_POS` means translate the coordinates to the nearest position between characters, and `CHARACTER_POS` means translate the position to the nearest character cell.

## Parameters

	<i>X, Y</i>	pixel coordinates
out	<i>row, column</i>	nearest row and column
	<i>posType</i>	CURSOR_POS or CHARACTER_POS

The documentation for this class was generated from the following files:

- Fl\_Text\_Display.H
- Fl\_Text\_Display.cxx

## 33.145 Fl\_Text\_Editor Class Reference

This is the FLTK text editor widget.

```
#include <Fl_Text_Editor.H>
```

Inheritance diagram for Fl\_Text\_Editor:

### Classes

- struct [Key\\_Binding](#)  
*Simple linked list item associating a key/state to a function.*

### Public Types

- typedef int(\* [Key\\_Func](#)) (int key, [Fl\\_Text\\_Editor](#) \*editor)  
*Key function binding callback type.*

### Public Member Functions

- void [add\\_default\\_key\\_bindings](#) ([Key\\_Binding](#) \*\*list)  
*Adds all of the default editor key bindings to the specified key binding list.*
- void [add\\_key\\_binding](#) (int key, int state, [Key\\_Func](#) f)  
*Adds a key of state state with the function f.*
- void [add\\_key\\_binding](#) (int key, int state, [Key\\_Func](#) f, [Key\\_Binding](#) \*\*list)  
*Adds a key of state state with the function function to an arbitrary key binding list list.*
- [Key\\_Func](#) [bound\\_key\\_function](#) (int key, int state) const  
*Returns the function associated with a key binding.*
- [Key\\_Func](#) [bound\\_key\\_function](#) (int key, int state, [Key\\_Binding](#) \*list) const  
*Returns the function associated with a key binding.*
- void [default\\_key\\_function](#) ([Key\\_Func](#) f)  
*Sets the default key function for unassigned keys.*
- [Fl\\_Text\\_Editor](#) (int X, int Y, int W, int H, const char \*l=0)  
*The constructor creates a new text editor widget.*

- int [handle](#) (int e) [FL\\_OVERRIDE](#)  
*Event handling.*
- int [insert\\_mode](#) ()  
*Gets the current insert mode; if non-zero, new text is inserted before the current cursor position.*
- void [insert\\_mode](#) (int b)  
*Sets the current insert mode; if non-zero, new text is inserted before the current cursor position.*
- void [remove\\_all\\_key\\_bindings](#) ()  
*Removes all of the key bindings associated with the text editor or list.*
- void [remove\\_all\\_key\\_bindings](#) ([Key\\_Binding](#) \*\*list)  
*Removes all of the key bindings associated with the text editor or list.*
- void [remove\\_key\\_binding](#) (int key, int state)  
*Removes the key binding associated with the key "key" of state "state".*
- void [remove\\_key\\_binding](#) (int key, int state, [Key\\_Binding](#) \*\*list)  
*Removes the key binding associated with the key key of state state from the [Key\\_Binding](#) list list.*
- int [tab\\_nav](#) () const  
*Check if Tab focus navigation is enabled.*
- void [tab\\_nav](#) (int val)  
*Enables or disables Tab key focus navigation.*

## Static Public Member Functions

- static int [kf\\_backspace](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Does a backspace for key 'c' in the current buffer of editor 'e'.*
- static int [kf\\_c\\_s\\_move](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Extends the current selection in the direction indicated by control key 'c' in editor 'e'.*
- static int [kf\\_copy](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Does a copy of selected text or the current character in the current buffer of editor 'e'.*
- static int [kf\\_ctrl\\_move](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.*
- static int [kf\\_cut](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Does a cut of selected text in the current buffer of editor 'e'.*
- static int [kf\\_default](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Inserts the text associated with key 'c' in editor 'e'.*
- static int [kf\\_delete](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Does a delete of selected text or the current character in the current buffer of editor 'e'.*
- static int [kf\\_down](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor one line down for editor 'e'.*
- static int [kf\\_end](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor to the end of the current line in editor 'e'.*
- static int [kf\\_enter](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Inserts a newline for key 'c' at the current cursor position in editor 'e'.*
- static int [kf\\_home](#) (int, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor to the beginning of the current line in editor 'e'.*
- static int [kf\\_ignore](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Ignores the key 'c' in editor 'e'.*
- static int [kf\\_insert](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Toggles the insert mode for editor 'e'.*
- static int [kf\\_left](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor one character to the left in editor 'e'.*
- static int [kf\\_m\\_s\\_move](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.*

- static int [kf\\_meta\\_move](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.*
- static int [kf\\_move](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Moves the text cursor in the direction indicated by key 'c' in editor 'e'.*
- static int [kf\\_page\\_down](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Moves the text cursor down one page for editor 'e'.*
- static int [kf\\_page\\_up](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Moves the text cursor up one page for editor 'e'.*
- static int [kf\\_paste](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Does a paste of selected text in the current buffer of editor 'e'.*
- static int [kf\\_redo](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Redo last undo action.*
- static int [kf\\_right](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Moves the text cursor one character to the right for editor 'e'.*
- static int [kf\\_select\\_all](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Selects all text in the current buffer in editor 'e'.*
- static int [kf\\_shift\\_move](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Extends the current selection in the direction of key 'c' in editor 'e'.*
- static int [kf\\_undo](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Undo last edit in the current buffer of editor 'e'.*
- static int [kf\\_up](#) (int c, [Fl\\_Text\\_Editor](#) \*e)  
*Moves the text cursor one line up for editor 'e'.*

### Protected Member Functions

- int [handle\\_key](#) ()  
*Handles a key press in the editor.*
- void [maybe\\_do\\_callback](#) ([Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_CHANGED](#))  
*does or does not a callback according to [changed\(\)](#) and [when\(\)](#) settings*

### Static Protected Attributes

- static [Key\\_Binding](#) \* [global\\_key\\_bindings](#)  
*Global key binding list.*

### Additional Inherited Members

#### 33.145.1 Detailed Description

This is the FLTK text editor widget.

It allows the user to edit multiple lines of text and supports highlighting and scrolling. The buffer that is displayed in the widget is managed by the [Fl\\_Text\\_Buffer](#) class.

#### 33.145.2 Member Function Documentation

##### 33.145.2.1 [add\\_key\\_binding\(\)](#)

```
void Fl_Text_Editor::add_key_binding (
 int key,
 int state,
 Key_Func function,
 Key_Binding ** list)
```

Adds a key of state `state` with the function `function` to an arbitrary key binding list `list`.

This can be used in derived classes to add global key bindings by using the global (static) [Key\\_Binding](#) list [Fl\\_Text\\_Editor::global\\_key\\_bindings](#).

**33.145.2.2 handle()**

```
int Fl_Text_Editor::handle (
 int e) [virtual]
```

Event handling.

Reimplemented from [Fl\\_Text\\_Display](#).

**33.145.2.3 insert\_mode() [1/2]**

```
int Fl_Text_Editor::insert_mode () [inline]
```

Gets the current insert mode; if non-zero, new text is inserted before the current cursor position. Otherwise, new text replaces text at the current cursor position.

**33.145.2.4 insert\_mode() [2/2]**

```
void Fl_Text_Editor::insert_mode (
 int b) [inline]
```

Sets the current insert mode; if non-zero, new text is inserted before the current cursor position. Otherwise, new text replaces text at the current cursor position.

**33.145.2.5 kf\_backspace()**

```
int Fl_Text_Editor::kf_backspace (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a backspace for key 'c' in the current buffer of editor 'e'.

Any current selection is deleted. Otherwise, the character left is deleted and the cursor moved. The key value 'c' is currently unused.

**33.145.2.6 kf\_c\_s\_move()**

```
int Fl_Text_Editor::kf_c_s_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Extends the current selection in the direction indicated by control key 'c' in editor 'e'.

See also

[kf\\_ctrl\\_move\(\)](#).

**33.145.2.7 kf\_copy()**

```
int Fl_Text_Editor::kf_copy (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a copy of selected text or the current character in the current buffer of editor 'e'. The key value 'c' is currently unused.

**33.145.2.8 kf\_ctrl\_move()**

```
int Fl_Text_Editor::kf_ctrl_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.

Supported values for 'c' are currently:

```
FL_Home -- moves the cursor to the beginning of the document
FL_End -- moves the cursor to the end of the document
FL_Left -- moves the cursor left one word
FL_Right -- moves the cursor right one word
```

```
FL_Up -- scrolls up one line, without moving cursor
FL_Down -- scrolls down one line, without moving cursor
FL_Page_Up -- moves the cursor to the beginning of the top line on the current page
FL_Page_Down -- moves the cursor to the beginning of the last line on the current page
```

### 33.145.2.9 kf\_cut()

```
int Fl_Text_Editor::kf_cut (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a cut of selected text in the current buffer of editor 'e'.  
The key value 'c' is currently unused.

### 33.145.2.10 kf\_default()

```
int Fl_Text_Editor::kf_default (
 int c,
 Fl_Text_Editor * e) [static]
```

Inserts the text associated with key 'c' in editor 'e'.  
Honors the current selection and insert/overstrike mode.

### 33.145.2.11 kf\_delete()

```
int Fl_Text_Editor::kf_delete (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a delete of selected text or the current character in the current buffer of editor 'e'.  
The key value 'c' is currently unused.

### 33.145.2.12 kf\_down()

```
int Fl_Text_Editor::kf_down (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor one line down for editor 'e'.  
Same as `kf_move(FL_Down, e)`. The key value 'c' is currently unused.

### 33.145.2.13 kf\_end()

```
int Fl_Text_Editor::kf_end (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor to the end of the current line in editor 'e'.  
Same as `kf_move(FL_End, e)`. The key value 'c' is currently unused.

### 33.145.2.14 kf\_enter()

```
int Fl_Text_Editor::kf_enter (
 int c,
 Fl_Text_Editor * e) [static]
```

Inserts a newline for key 'c' at the current cursor position in editor 'e'.  
The key value 'c' is currently unused.

### 33.145.2.15 kf\_home()

```
int Fl_Text_Editor::kf_home (
 int ,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor to the beginning of the current line in editor 'e'.  
Same as `kf_move(FL_Home, e)`. The key value 'c' is currently unused.

**33.145.2.16 kf\_ignore()**

```
int Fl_Text_Editor::kf_ignore (
 int c,
 Fl_Text_Editor * e) [static]
```

Ignores the key 'c' in editor 'e'.

This method can be used as a keyboard binding to disable a key that might otherwise be handled or entered as text. An example would be disabling FL\_Escape, so that it isn't added to the buffer when invoked by the user.

**33.145.2.17 kf\_insert()**

```
int Fl_Text_Editor::kf_insert (
 int c,
 Fl_Text_Editor * e) [static]
```

Toggles the insert mode for editor 'e'.

The key value 'c' is currently unused.

**33.145.2.18 kf\_left()**

```
int Fl_Text_Editor::kf_left (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor one character to the left in editor 'e'.

Same as kf\_move(FL\_Left, e). The key value 'c' is currently unused.

**33.145.2.19 kf\_m\_s\_move()**

```
int Fl_Text_Editor::kf_m_s_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.

See also

[kf\\_meta\\_move\(\)](#).

**33.145.2.20 kf\_meta\_move()**

```
int Fl_Text_Editor::kf_meta_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.

Supported values for 'c' are currently:

```
FL_Up -- moves cursor to the beginning of the current document
FL_Down -- moves cursor to the end of the current document
FL_Left -- moves the cursor to the beginning of the current line
FL_Right -- moves the cursor to the end of the current line
```

**33.145.2.21 kf\_move()**

```
int Fl_Text_Editor::kf_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor in the direction indicated by key 'c' in editor 'e'.

Supported values for 'c' are currently:

```
FL_Home -- moves the cursor to the beginning of the current line
FL_End -- moves the cursor to the end of the current line
FL_Left -- moves the cursor left one character
FL_Right -- moves the cursor right one character
FL_Up -- moves the cursor up one line
FL_Down -- moves the cursor down one line
```

```
FL_Page_Up -- moves the cursor up one page
FL_Page_Down -- moves the cursor down one page
```

### 33.145.2.22 kf\_page\_down()

```
int Fl_Text_Editor::kf_page_down (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor down one page for editor 'e'.

Same as `kf_move(FL_Page_Down, e)`. The key value 'c' is currently unused.

### 33.145.2.23 kf\_page\_up()

```
int Fl_Text_Editor::kf_page_up (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor up one page for editor 'e'.

Same as `kf_move(FL_Page_Up, e)`. The key value 'c' is currently unused.

### 33.145.2.24 kf\_paste()

```
int Fl_Text_Editor::kf_paste (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a paste of selected text in the current buffer of editor 'e'.

Any current selection is replaced with the pasted content. The key value 'c' is currently unused.

### 33.145.2.25 kf\_redo()

```
int Fl_Text_Editor::kf_redo (
 int c,
 Fl_Text_Editor * e) [static]
```

Redo last undo action.

Also deselects previous selection. The key value 'c' is currently unused.

### 33.145.2.26 kf\_right()

```
int Fl_Text_Editor::kf_right (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor one character to the right for editor 'e'.

Same as `kf_move(FL_Right, e)`. The key value 'c' is currently unused.

### 33.145.2.27 kf\_select\_all()

```
int Fl_Text_Editor::kf_select_all (
 int c,
 Fl_Text_Editor * e) [static]
```

Selects all text in the current buffer in editor 'e'.

The key value 'c' is currently unused.

### 33.145.2.28 kf\_shift\_move()

```
int Fl_Text_Editor::kf_shift_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Extends the current selection in the direction of key 'c' in editor 'e'.

See also

[kf\\_move\(\)](#)

### 33.145.2.29 kf\_undo()

```
int Fl_Text_Editor::kf_undo (
 int c,
 Fl_Text_Editor * e) [static]
```

Undo last edit in the current buffer of editor 'e'.

Also deselects previous selection. The key value 'c' is currently unused.

### 33.145.2.30 kf\_up()

```
int Fl_Text_Editor::kf_up (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor one line up for editor 'e'.

Same as `kf_move(FL_Up, e)`. The key value 'c' is currently unused.

### 33.145.2.31 remove\_key\_binding()

```
void Fl_Text_Editor::remove_key_binding (
 int key,
 int state,
 Key_Binding ** list)
```

Removes the key binding associated with the key `key` of state `state` from the [Key\\_Binding](#) list `list`.

This can be used in derived classes to remove global key bindings by using the global (static) [Key\\_Binding](#) list `Fl_Text_Editor::global_key_bindings`.

### 33.145.2.32 tab\_nav() [1/2]

```
int Fl_Text_Editor::tab_nav () const
```

Check if Tab focus navigation is enabled.

If disabled (default), hitting Tab inserts a tab character into the editor buffer.

If enabled, hitting Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget.

Returns

if Tab inserts tab characters or moves the focus

Return values

0	Tab inserts tab characters (default)
1	Tab navigation is enabled.

See also

[tab\\_nav\(int\)](#), `Fl::OPTION_ARROW_FOCUS`.

Version

1.3.4 ABI feature

### 33.145.2.33 tab\_nav() [2/2]

```
void Fl_Text_Editor::tab_nav (
 int val)
```

Enables or disables Tab key focus navigation.

When disabled (default), tab characters are inserted into [Fl\\_Text\\_Editor](#). Only the mouse can change focus. This behavior is desirable when [Fl\\_Text\\_Editor](#) is used, e.g. in a source code editor.

When enabled, Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget. This behavior is desirable when [Fl\\_Text\\_Editor](#) is used e.g. in a database input form.

Currently, this method is implemented as a convenience method that adjusts the key bindings for the Tab key. This implementation detail may change in the future. Know that changing the editor's key bindings for Tab and Shift-Tab may affect tab navigation.

#### Parameters

in	val	If val is 0, Tab inserts a tab character (default). If val is 1, Tab navigates widget focus.
----	-----	-------------------------------------------------------------------------------------------------

#### See also

[tab\\_nav\(\)](#), [Fl::OPTION\\_ARROW\\_FOCUS](#).

#### Version

1.3.4 ABI feature

## 33.145.3 Member Data Documentation

### 33.145.3.1 global\_key\_bindings

`Key_Binding* Fl_Text_Editor::global_key_bindings` [static], [protected]

Global key binding list.

Derived classes can add key bindings for all [Fl\\_Text\\_Editor](#) widgets by adding a [Key\\_Binding](#) to this list.

#### See also

[add\\_key\\_binding\(int key, int state, Key\\_Func f, Key\\_Binding\\*\\* list\);](#)

The documentation for this class was generated from the following files:

- [Fl\\_Text\\_Editor.H](#)
- [Fl\\_Text\\_Editor.cxx](#)

## 33.146 Fl\_Text\_Selection Class Reference

This is an internal class for [Fl\\_Text\\_Buffer](#) to manage text selections.

```
#include <Fl_Text_Buffer.H>
```

### Public Member Functions

- int [end](#) () const  
*Returns the byte offset to the character after the last selected character.*
- int [includes](#) (int pos) const  
*Returns true if position pos is in the [Fl\\_Text\\_Selection](#).*
- int [length](#) () const  
*Returns the size in bytes of the selection.*
- int [position](#) (int \*startpos, int \*endpos) const
- bool [selected](#) () const  
*Returns true if any text is selected.*
- void [selected](#) (bool b)

- Modifies the 'selected' flag.*

  - int `selected` (int \*startpos, int \*endpos) const
 

*Returns the status and the positions of this selection.*
  - void `set` (int startpos, int endpos)
 

*Sets the selection range.*
  - int `start` () const
 

*Returns the byte offset to the first selected character.*
  - void `update` (int pos, int nDeleted, int nInserted)
 

*Updates a selection after text was modified.*

## Protected Attributes

- int `mEnd`

*byte offset to the character after the last selected character*
- bool `mSelected`

*this flag is set if any text is selected*
- int `mStart`

*byte offset to the first selected character*

## Friends

- class `Fl_Text_Buffer`

### 33.146.1 Detailed Description

This is an internal class for `Fl_Text_Buffer` to manage text selections.

All methods use byte (not UTF-8 character) offsets and start at 0. This class works correctly with UTF-8 strings assuming that the parameters for all calls are on character boundaries.

If the selection is inactive (not currently used), then `selected()` returns `false` and `start()` and `end()` return 0 (zero).

The stored offsets are in ascending order, hence the following conditions are true (pseudo code):

```
if (!selected()) : (start() == 0) && (end() == 0) && (start() == end())
if (selected()) : start() < end()
always : 0 <= start() <= end()
always : length() == end() - start()
```

The selection size in bytes can always (unconditionally) be computed by

```
int size = sel->end() - sel->start();
```

See also

[length\(\)](#)

Note

The **protected** member variables `mStart` and `mEnd` are not necessarily 0 (zero) if `mSelected == false` because they are not cleared when `selected(false)` is called (as of Jul 2017). This may be changed in the future.

### 33.146.2 Member Function Documentation

#### 33.146.2.1 end()

```
int Fl_Text_Selection::end (
 void) const [inline]
```

Returns the byte offset to the character after the last selected character.

The returned offset is only valid if `selected()` returns true (non-zero). The offset is 0 if no text is selected (since FLTK 1.4.0).

**Note**

In FLTK 1.3.x the returned offset could be non-zero even if `selected()` would have returned 0.

**Returns**

byte offset or 0 if not selected.

**33.146.2.2 includes()**

```
int Fl_Text_Selection::includes (
 int pos) const
```

Returns true if position `pos` is in the `Fl_Text_Selection`.  
`pos` must be at a character boundary.

**33.146.2.3 length()**

```
int Fl_Text_Selection::length (
 void) const [inline]
```

Returns the size in bytes of the selection.  
This is a convenience method. It always returns the same as  
`end() - start()`  
and it returns 0 if `selected() == false`.

**Returns**

size in bytes or 0 if not selected.

**Since**

FLTK 1.4.0

**33.146.2.4 position()**

```
int Fl_Text_Selection::position (
 int * startpos,
 int * endpos) const [inline]
```

**Deprecated** "in 1.4.0 - use `selected(startpos, endpos)` instead"

**33.146.2.5 selected() [1/3]**

```
bool Fl_Text_Selection::selected () const [inline]
```

Returns true if any text is selected.

**Returns**

`true` if any text has been selected, or `false` if no text is selected.

**33.146.2.6 selected() [2/3]**

```
void Fl_Text_Selection::selected (
 bool b) [inline]
```

Modifies the 'selected' flag.

## Parameters

<i>b</i>	new flag
----------	----------

**33.146.2.7 selected()** [3/3]

```
int Fl_Text_Selection::selected (
 int * startpos,
 int * endpos) const
```

Returns the status and the positions of this selection.

This method returns the same as [selected\(\)](#) as an `int` (0 or 1) in its return value and the offsets to the start of the selection in `startpos` and to the byte after the last selected character in `endpos`, if [selected\(\)](#) is `true`. If [selected\(\)](#) is `false`, both offsets are set to 0.

## Note

In FLTK 1.3.x `startpos` and `endpos` were **not modified** if [selected\(\)](#) was `false`.

## Parameters

<i>startpos</i>	return byte offset to first selected character
<i>endpos</i>	return byte offset pointing after last selected character

## Returns

whether the selection is active ([selected\(\)](#)) or not

## Return values

<i>0</i>	if not selected
<i>1</i>	if selected

## See also

[selected\(\)](#), [start\(\)](#), [end\(\)](#)

**33.146.2.8 set()**

```
void Fl_Text_Selection::set (
 int startpos,
 int endpos)
```

Sets the selection range.

`startpos` and `endpos` must be at a character boundary.

If `startpos != endpos` [selected\(\)](#) is set to `true`, else to `false`.

If `startpos` is greater than `endpos` they are swapped so that `startpos <= endpos`.

## Parameters

in	<i>startpos</i>	byte offset to first selected character
in	<i>endpos</i>	byte offset pointing after last selected character

### 33.146.2.9 start()

```
int Fl_Text_Selection::start () const [inline]
```

Returns the byte offset to the first selected character.

The returned offset is only valid if [selected\(\)](#) returns true. If the selection is not valid the returned offset is 0 since FLTK 1.4.0.

#### Note

In FLTK 1.3.x the returned offset could be non-zero even if [selected\(\)](#) would have returned 0.

#### Returns

byte offset or 0 if not selected.

### 33.146.2.10 update()

```
void Fl_Text_Selection::update (
 int pos,
 int nDeleted,
 int nInserted)
```

Updates a selection after text was modified.

Updates an individual selection for changes in the corresponding text.

#### Parameters

<i>pos</i>	byte offset into text buffer at which the change occurred
<i>nDeleted</i>	number of bytes deleted from the buffer
<i>nInserted</i>	number of bytes inserted into the buffer

The documentation for this class was generated from the following files:

## Additional Inherited Members

### 33.147.1 Detailed Description

The `FI_Tile` class lets you resize its children by dragging the border between them.

Figure 33.60 `FI_Tile`

For the tiling to work correctly, the children of an `FI_Tile` **must** cover the entire area of the widget, but **must not** overlap. This means that all children must touch each other at their edges, and no gaps can be left inside the `FI_Tile`.

`FI_Tile` does not normally draw any graphics of its own. The "borders" which can be seen in the snapshot above are actually part of the children. Their boxtypes have been set to `FL_DOWN_BOX` creating the impression of "ridges" where the boxes touch. What you see are actually two adjacent `FL_DOWN_BOX`'s drawn next to each other. All neighboring widgets share the same edge - the widget's thick borders make it appear as though the widgets aren't actually touching, but they are. If the edges of adjacent widgets do not touch, then it will be impossible to drag the corresponding edges.

#### Note

`FI_Tile` works in two distinctive modes. In classic mode, the range of motion for edges and intersections is controlled using an invisible child that is marked as the `resizable()` widget of the tile group. Classic mode is described in detail a few paragraphs down.

#### `FI_Tile` `size_range` mode

By assigning a default minimum size to all children with `FI_Tile::init_size_range(int default_minimum_width,` or by assigning minimal sizes to individual children with `size_range(FI_Widget *child, int minimum_width, int` the tile group is put into `size_range` operation mode.

In this mode, the child that is marked `resizable()` will behave as it would in a regular `FI_Group` widget. When dragging edges or intersections with the mouse, `FI_Tile` will ensure that none of the children shrinks to a size that is smaller than requested. When resizing the `FI_Tile` group, size ranges are not enforced by the tile. Instead, the size range of the enclosing window should be limited to a valid range.

Tile does not differentiate between visible and invisible children. If children are created smaller than their assigned minimum size, dragging intersections may cause unexpected jumps in size. Zero width or height widget are not harmful, but should be avoided.

Example for a center document tile and two tool boxes on the left and right

```
Fl_Window win(400, 300, "My App");
Fl_Tile tile(0, 0, 400, 300);
Fl_Box left_tool_box(0, 0, 100, 300, "Tools");
left_tool_box.box(FL_DOWN_BOX);
tile.size_range(&left_tool_box, 50, 50);
Fl_Box document(100, 0, 200, 300, "Document");
document.box(FL_DOWN_BOX);
tile.size_range(&document, 100, 50);
Fl_Box right_tool_box(300, 0, 100, 300, "More\nTools");
right_tool_box.box(FL_DOWN_BOX);
tile.size_range(&right_tool_box, 50, 50);
tile.end();
tile.resizable(document);
win.end();
win.resizable(tile);
win.show(argc, argv);
win.size_range(200, 50);
```

### Fl\_Tile classic mode

[Fl\\_Tile](#) allows objects to be resized to zero dimensions. To prevent this you can use the [resizable\(\)](#) to limit where corners can be dragged to. For more information see note below.

Even though objects can be resized to zero sizes, they must initially have non-zero sizes so the [Fl\\_Tile](#) can figure out their layout. If desired, call [position\(\)](#) after creating the children but before displaying the window to set the borders where you want.

**Note on [resizable\(Fl\\_Widget &w\)](#):** The "resizable" child widget (which should be invisible) limits where the borders can be dragged to. All dragging will be limited inside the resizable widget's borders. If you don't set it, it will be possible to drag the borders right to the edges of the [Fl\\_Tile](#) widget, and thus resize objects on the edges to zero width or height. When the entire [Fl\\_Tile](#) widget is resized, the [resizable\(\)](#) widget will keep its border distance to all borders the same (this is normal resize behavior), so that you can effectively set a border width that will never change. To ensure correct event delivery to all child widgets the [resizable\(\)](#) widget must be the first child of the [Fl\\_Tile](#) widget group. Otherwise some events (e.g. [FL\\_MOVE](#) and [FL\\_ENTER](#)) might be consumed by the [resizable\(\)](#) widget so that they are lost for widgets covered (overlapped) by the [resizable\(\)](#) widget.

#### Note

You can still resize widgets **inside** the [resizable\(\)](#) to zero width and/or height, i.e. box **2b** above to zero width and box **3a** to zero height.

#### See also

[void Fl\\_Group::resizable\(Fl\\_Widget &w\)](#)

Example for resizable with 20 pixel border distance:

```
int dx = 20, dy = dx;
Fl_Tile tile(50, 50, 300, 300);
// create resizable() box first
Fl_Box r(tile.x()+dx, tile.y()+dy, tile.w()-2*dx, tile.h()-2*dy);
tile.resizable(r);
// ... create widgets inside tile (see test/tile.cxx) ...
tile.end();
```

See also the complete example program in [test/tile.cxx](#).

## 33.147.2 Constructor & Destructor Documentation

### 33.147.2.1 Fl\_Tile()

```
Fl_Tile::Fl_Tile (
 int X,
 int Y,
 int W,
```

```
int H,
const char * L = 0)
```

Creates a new [Fl\\_Tile](#) widget using the given position, size, and label string. The default boxtype is `FL_NO_BOX`.

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the [Fl\\_Tile](#) and all of its children can be automatic (local) variables, but you must declare the [Fl\\_Tile](#) *first*, so that it is destroyed last.

See also

class [Fl\\_Group](#)

### 33.147.3 Member Function Documentation

#### 33.147.3.1 cursor()

```
Fl_Cursor Fl_Tile::cursor (
 int n) [inline], [protected]
```

Returns the cursor for cursor index n.

See also

[Fl\\_Tile::set\\_cursor\(int\)](#)

#### 33.147.3.2 drag\_intersection()

```
void Fl_Tile::drag_intersection (
 int oldx,
 int oldy,
 int newx,
 int newy) [virtual]
```

Drags the intersection at (oldx,oldy) to (newx,newy).

See also

[Fl\\_Tile::move\\_intersection\(int oldx, int oldy, int newx, int newy\)](#) , but this method does not call [init\\_sizes\(\)](#) and is used for interactive [children](#) layout using the mouse.

#### Parameters

in	<i>oldx,oldy</i>	move the intersection at this coordinate, pass zero to disable drag in that direction.
in	<i>newx,newy</i>	move the intersection as close to this new coordinate as possible

#### 33.147.3.3 handle()

```
int Fl_Tile::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Group](#).

#### 33.147.3.4 [init\\_size\\_range\(\)](#)

```
void Fl_Tile::init_size_range (
 int default_min_w = -1,
 int default_min_h = -1)
```

Initialize the size range mode of [Fl\\_Tile](#) and set the default minimum width and height.

The default minimum width and height is the size of the mouse pointer grab area at about 4 pixel units.

#### Parameters

in	<i>default_min_w, default_min_h</i>	default size range for widgets that don't have an individual range assigned
----	-------------------------------------	-----------------------------------------------------------------------------

#### 33.147.3.5 [move\\_intersection\(\)](#)

```
void Fl_Tile::move_intersection (
 int oldx,
 int oldy,
 int newx,
 int newy) [virtual]
```

Drags the intersection at (*oldx,oldy*) to (*newx,newy*).

This redraws all the necessary children.

If no size ranges are set, the new intersection position is limited to the size of the tile group. The [resizable\(\)](#) option is not taken into account here.

If size ranges are set, the actual new position of the intersection will depend on the size range of every individual child. No child will be smaller than their minw and minh. After the new position is found, [move\\_intersection\(\)](#) will call [init\\_sizes\(\)](#). The [resizable\(\)](#) range is ignored.

#### Parameters

in	<i>oldx,oldy</i>	move the intersection at this coordinate, pass zero to disable drag in that direction.
in	<i>newx,newy</i>	move the intersection as close to this new coordinate as possible

**33.147.3.6 on\_insert()**

```
int Fl_Tile::on_insert (
 Fl_Widget * candidate,
 int index) [protected], [virtual]
```

Insert a new entry in the size range list.

Reimplemented from [Fl\\_Group](#).

**33.147.3.7 on\_move()**

```
int Fl_Tile::on_move (
 int oldIndex,
 int newIndex) [protected], [virtual]
```

Move the entry in the size range list.

Reimplemented from [Fl\\_Group](#).

**33.147.3.8 on\_remove()**

```
void Fl_Tile::on_remove (
 int index) [protected], [virtual]
```

Remove the entry from the size range list.

Reimplemented from [Fl\\_Group](#).

**33.147.3.9 position()**

```
void Fl_Tile::position (
 int oldx,
 int oldy,
 int newx,
 int newy) [inline]
```

**Deprecated** "in 1.4.0 - use `move_intersection(p)` instead"

**33.147.3.10 request\_grow\_b()**

```
void Fl_Tile::request_grow_b (
 int old_b,
 int & new_b,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

**Parameters**

<code>in</code>	<code>old_b</code>	grow all children with this current bottom edge toward the bottom edge of this tile
<code>in, out</code>	<code>new_b</code>	try to grow to this coordinate, return the maximum possible growth (currently maxh is ignored, so we always grow to <code>new_b</code> )
<code>in, out</code>	<code>final_size</code>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

**33.147.3.11 request\_grow\_l()**

```
void Fl_Tile::request_grow_l (
 int old_l,
 int & new_l,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

**Parameters**

in	<i>old_l</i>	grow all children with this current left edge toward the left edge of this tile
in, out	<i>new_l</i>	try to grow to this coordinate, return the maximum possible growth (currently maxw is ignored, so we always grow to new_l)
in, out	<i>final_size</i>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

**33.147.3.12 request\_grow\_r()**

```
void Fl_Tile::request_grow_r (
 int old_r,
 int & new_r,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

**Parameters**

in	<i>old_r</i>	grow all children with this current right edge toward the right edge of this tile
in, out	<i>new_r</i>	try to grow to this coordinate, return the maximum possible growth (currently maxw is ignored, so we always grow to new_r)
in, out	<i>final_size</i>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

**33.147.3.13 request\_grow\_t()**

```
void Fl_Tile::request_grow_t (
 int old_t,
 int & new_t,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

**Parameters**

in	<i>old_t</i>	grow all children with this current top edge toward the top edge of this tile
in, out	<i>new_t</i>	try to grow to this coordinate, return the maximum possible growth (currently maxh is ignored, so we always grow to new_t)
in, out	<i>final_size</i>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

**33.147.3.14 request\_shrink\_b()**

```
void Fl_Tile::request_shrink_b (
 int old_b,
 int & new_b,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

See also

[Fl\\_Tile::request\\_shrink\\_l\(int old\\_l, int &new\\_l, Fl\\_Rect \\*final\\_size\)](#)

#### Parameters

in	<i>old_b</i>	shrink all children with this current bottom edge toward the top edge of this tile
in, out	<i>new_b</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

#### 33.147.3.15 request\_shrink\_l()

```
void Fl_Tile::request_shrink_l (
 int old_l,
 int & new_l,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

`drag_intersection` requests that all children with the left edge at `old_l` to shrink to `new_l` towards the right side of the tile. If the child can not shrink by that amount, it will ask all other children that touch its right side to shrink by the remainder (recursion). `new_l` will return the the maximum possible value while maintaining minimum width for all children involved.

`request_shrink_r` asks children to shrink toward the left, so that their right edge is as close as possible to `new_r`.

`request_shrink_t` and `request_shrink_b` provide the same functionality for vertical resizing.

#### Parameters

in	<i>old_l</i>	shrink all children with this current left edge
in, out	<i>new_l</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

#### 33.147.3.16 request\_shrink\_r()

```
void Fl_Tile::request_shrink_r (
 int old_r,
 int & new_r,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

See also

[Fl\\_Tile::request\\_shrink\\_l\(int old\\_l, int &new\\_l, Fl\\_Rect \\*final\\_size\)](#)

#### Parameters

in	<i>old_r</i>	shrink all children with this current right edge toward the left edge of this tile
in, out	<i>new_r</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

**33.147.3.17 request\_shrink\_t()**

```
void Fl_Tile::request_shrink_t (
 int old_t,
 int & new_t,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

See also

[Fl\\_Tile::request\\_shrink\\_l\(int old\\_l, int &new\\_l, Fl\\_Rect \\*final\\_size\)](#)

**Parameters**

in	<i>old_t</i>	shrink all children with this current top edge toward the bottom edge of this tile
in, out	<i>new_t</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

**33.147.3.18 resize()**

```
void Fl_Tile::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Resizes the [Fl\\_Tile](#) widget and its children.

[Fl\\_Tile](#) implements its own [resize\(\)](#) method. It does not use [Fl\\_Group::resize\(\)](#) to resize itself and its children.

In `size_range` mode, the child marked [resizable\(\)](#) is resized first. Only if its minimum size is reached, other widgets in the tile will resize too.

In classic mode or when no resizable child is set, enlarging works by moving the lower-right corner and resizing the bottom and right border widgets accordingly.

Shrinking the [Fl\\_Tile](#) works in the opposite way by shrinking the bottom and right border widgets, unless they are reduced to zero width or height, resp. or to their minimal sizes defined by the [resizable\(\)](#) widget. In this case other widgets will be shrunk as well.

See the [Fl\\_Tile](#) class documentation about how the [resizable\(\)](#) works.

Reimplemented from [Fl\\_Group](#).

**33.147.3.19 set\_cursor()**

```
void Fl_Tile::set_cursor (
 int n) [protected]
```

Set one of four cursors used for dragging etc...

[Fl\\_Tile](#) uses an array of four cursors that are set depending on user actions:

- 0: normal cursor
- 1: horizontal dragging
- 2: vertical dragging
- 3: dragging an intersection

This method sets the window cursor for the given index `n`.

**33.147.3.20 size\_range() [1/2]**

```
void Fl_Tile::size_range (
 Fl_Widget * w,
```

```

 int minw,
 int minh,
 int maxw = 0x7FFFFFFF,
 int maxh = 0x7FFFFFFF)

```

Set the allowed size range for the give child widget.

[Fl\\_Tile](#) currently supports only the minimal width and height setting.

#### Parameters

in	<i>w</i>	set the range for this child widget
in	<i>minw,minh</i>	minimum width and height for that child
in	<i>maxw,maxh</i>	maximum size, defaults to infinite, currently ignored

#### 33.147.3.21 size\_range() [2/2]

```

void Fl_Tile::size_range (
 int index,
 int minw,
 int minh,
 int maxw = 0x7FFFFFFF,
 int maxh = 0x7FFFFFFF)

```

Set the allowed size range for the child at the given index.

[Fl\\_Tile](#) currently supports only the minimal width and height setting.

#### Parameters

in	<i>index</i>	set the range for the child at this index
in	<i>minw,minh</i>	minimum width and height for that child
in	<i>maxw,maxh</i>	maximum size, defaults to infinite, currently ignored

The documentation for this class was generated from the following files:

- [Fl\\_Tile.H](#)
- [Fl\\_Tile.cxx](#)

## 33.148 Fl\_Tiled\_Image Class Reference

This class supports tiling of images over a specified area.

```
#include <Fl_Tiled_Image.H>
```

Inheritance diagram for [Fl\\_Tiled\\_Image](#):

### 33.148.1 Detailed Description

This class supports tiling of images over a specified area.

The source (tile) image is **not** copied unless you call the `color_average()`, `desaturate()`, or `inactive()` methods.

### 33.148.2 Constructor & Destructor Documentation

#### 33.148.2.1 Fl\_Tiled\_Image()

```
Fl_Tiled_Image::Fl_Tiled_Image (
 Fl_Image * i,
 int W = 0,
 int H = 0)
```

The constructors create a new tiled image containing the specified image.

Use a width and height of 0 to tile the whole window/widget.

#### Note

Due to implementation constraints in FLTK 1.3.3 and later width and height of 0 may not work as expected when used as background image in widgets other than windows. You may need to center and clip the image (label) and set the label type to `FL_NORMAL_LABEL`. Doing so will let the tiled image fill the whole widget as its background image. Other combinations of label flags may or may not work.

```
#include "bg.xpm"
Fl_Pixmap *bg_xpm = new Fl_Pixmap(bg_xpm);
Fl_Tiled_Image *bg_tiled = new Fl_Tiled_Image(bg_xpm,0,0);
Fl_Box *box = new Fl_Box(40,40,300,100,"");
box->box(FL_UP_BOX);
box->labeltype(FL_NORMAL_LABEL);
box->align(FL_ALIGN_INSIDE | FL_ALIGN_CENTER | FL_ALIGN_CLIP);
box->image(bg_tiled);
```

#### Note

Setting an image (label) for a window may not work as expected due to implementation constraints in FLTK 1.3.x and maybe later. The reason is the way `Fl::scheme()` initializes the window's label type and image. A possible workaround is to use another `Fl_Group` as the only child widget and to set the background image for this group as described above.

**Todo** Fix `Fl_Tiled_Image` as background image for widgets and windows and fix the implementation of `Fl::scheme(const char *)`.

### 33.148.3 Member Function Documentation

#### 33.148.3.1 color\_average()

```
void Fl_Tiled_Image::color_average (
 Fl_Color c,
 float i) [virtual]
```

The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

#### 33.148.3.2 copy()

```
Fl_Image * Fl_Tiled_Image::copy (
 int W,
 int H) const [virtual]
```

Creates a resized copy of the image.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator *delete* for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- $w() == data\_w() == \bar{W}$
- $h() == data\_h() == H$

#### Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_Image](#).

#### 33.148.3.3 desaturate()

```
void Fl_Tiled_Image::desaturate () [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

### 33.148.3.4 draw()

```
void Fl_Tiled_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draws a tiled image.

Tiled images can be used as background images for widgets and windows. However, due to implementation constraints, you must take care when setting label types and alignment flags. Only certain combinations work as expected, others may yield unexpected results and undefined behavior.

This draw method can draw multiple copies of one image in an area given by X, Y, W, H.

The optional arguments cx and cy can be used to crop the image starting at offsets (cx, cy). cx and cy must be >= 0 (negative values are ignored). If one of the values is greater than the image width or height resp. (cx >= [image\(\)->w\(\)](#) or cy >= [image\(\)->h\(\)](#)) nothing is drawn, because the resulting image would be empty.

After calculating the resulting image size the image is drawn as often as necessary to fill the given area, starting at the top left corner.

If both W and H are 0 the image is repeated as often as necessary to fill the entire window, unless there is a valid clip region. If you want to fill only one particular widget's background, then you should either set a clip region in your [draw\(\)](#) method or use the label alignment flags `FL_ALIGN_INSIDE|FL_ALIGN_CLIP` to make sure the image is clipped.

This may be improved in a later version of the library.

Reimplemented from [Fl\\_Image](#).

The documentation for this class was generated from the following files:

- [Fl\\_Tiled\\_Image.H](#)
- [Fl\\_Tiled\\_Image.cxx](#)

## 33.149 Fl\_Timeout Class Reference

The internal class [Fl\\_Timeout](#) handles all timeout related functions.

```
#include <Fl_Timeout.h>
```

### 33.149.1 Detailed Description

The internal class [FI\\_Timeout](#) handles all timeout related functions.

All code is platform independent except retrieving a timestamp which requires calling a system driver function and potentially results in different timer resolutions (from milliseconds to microseconds).

Related user documentation:

- [FI\\_Timeout\\_Handler](#)
- [FI::add\\_timeout\(double time, FI\\_Timeout\\_Handler cb, void \\*data\)](#)
- [FI::repeat\\_timeout\(double time, FI\\_Timeout\\_Handler cb, void \\*data\)](#)

- [FI::remove\\_timeout\(FI\\_Timeout\\_Handler cb, void \\*data\)](#)
- [FI::remove\\_next\\_timeout\(FI\\_Timeout\\_Handler cb, void \\*data, void \\*\\*data\\_return\)](#)

## 33.149.2 Member Function Documentation

### 33.149.2.1 add\_timeout()

```
void Fl_Timeout::add_timeout (
 double time,
 Fl_Timeout_Handler cb,
 void * data) [static]
```

Adds a one-shot timeout callback.

The callback function `cb` will be called by [Fl::wait\(\)](#) at `time` seconds after this function is called.

#### Parameters

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: NULL)

#### Implements:

```
void Fl::add_timeout(double time, Fl_Timeout_Handler cb, void *data)
```

#### See also

[Fl::add\\_timeout\(double time, Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

### 33.149.2.2 current()

```
Fl_Timeout * Fl_Timeout::current () [static], [protected]
```

Returns the first (top-most) timeout from the current timeout stack.

This returns a pointer to the timeout but does not remove it from the list of current timeouts. This should be the timeout that is currently executing its callback.

#### Returns

`Fl_Timeout*` The current timeout whose callback is running.

#### Return values

<code>NULL</code>	if no callback is currently running.
-------------------	--------------------------------------

### 33.149.2.3 elapse\_timeouts()

```
void Fl_Timeout::elapse_timeouts () [static]
```

Elapse all timers w/o calling their callbacks.

All timer values are adjusted by the delta time since the last call. This method does **NOT** call timer callbacks if timers are expired.

This must be called before new timers are added to the timer queue to make sure that the next timer decrement does not count down too much time.

#### See also

[Fl\\_Timeout::do\\_timeouts\(\)](#)

### 33.149.2.4 get()

```
FI_Timeout * FI_Timeout::get (
 double time,
 FI_Timeout_Handler cb,
 void * data) [static], [protected]
```

Get an [FI\\_Timeout](#) instance for further handling.

The timer object will be initialized with the input parameters as given by [FI::add\\_timeout\(\)](#) or [FI::repeat\\_timeout\(\)](#).

[FI\\_Timeout](#) objects are maintained in three queues:

- active timer queue
- list (stack, i.e. LIFO) of currently executing timer callbacks
- free timer entries.

When the FLTK program is launched all queues are empty. Whenever a new timer object is required the [get\(\)](#) method is called and a timer object is either found in the queue of free timer entries or a new timer object is created (operator new).

Active timer entries are inserted into the "active timer queue" until they expire and their callback is called.

Before the callback is called the timer entry is inserted into the list of current timers, i.e. it becomes the [FI\\_Timeout::current\(\)](#) timeout. This can be used in [FI::repeat\\_timeout\(\)](#) to find out if and how long the current timeout has been delayed.

When a timer is no longer used it is popped from the `current` list and inserted into the "free timer" list so it can be reused later.

Timer queue entries are never returned to the system, there's no garbage collection. The total number of timer objects is determined by the largest number of concurrently active timers.

#### Parameters

in	<i>time</i>	requested delta time
in	<i>cb</i>	timer callback
in	<i>data</i>	userdata for timer callback

#### Returns

`FI_Timeout*` Timer entry

#### See also

[FI::add\\_timeout\(\)](#), [FI::repeat\\_timeout\(\)](#)

### 33.149.2.5 has\_timeout()

```
int FI_Timeout::has_timeout (
 FI_Timeout_Handler cb,
 void * data) [static]
```

Returns true if the timeout exists and has not been called yet.

#### Parameters

in	<i>cb</i>	Timer callback (must match)
in	<i>data</i>	Callback user data (must match)

#### Returns

whether the timer was found in the queue

## Return values

0	not found
1	found

## Implements:

```
int Fl::has_timeout(Fl_Timeout_Handler cb, void *data)
```

## See also

[Fl::has\\_timeout\(Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

**33.149.2.6 insert()**

```
void Fl_Timeout::insert () [protected]
```

Insert this timer entry into the active timer queue.

The timer is inserted at the required position so the timer queue is always ordered by due time.

**33.149.2.7 make\_current()**

```
void Fl_Timeout::make_current () [protected]
```

Remove the timeout from the active timer queue and push it onto the stack of currently running callbacks.

This becomes the [current\(\)](#) timeout which can be used in [Fl::repeat\\_timeout\(\)](#).

## See also

[Fl\\_Timeout::current\(\)](#)

**33.149.2.8 release()**

```
void Fl_Timeout::release () [protected]
```

Remove the top-most timeout from the stack of currently running timeout callbacks and insert it into the list of free timers.

Typical code in the library would look like:

```
// The timeout \p Fl_Timeout *t has expired, run its callback
t->make_current();
(t->callback)(t->data);
t->release();
```

**33.149.2.9 remove\_next\_timeout()**

```
int Fl_Timeout::remove_next_timeout (
 Fl_Timeout_Handler cb,
 void * data = NULL,
 void ** data_return = NULL) [static]
```

Remove the next matching timeout callback and return its data pointer.

## Implements:

```
int Fl::remove_next_timeout(Fl_Timeout_Handler cb, void *data, void **data_return)
```

## Parameters

in	<i>cb</i>	Timer callback to be removed (must match)
in	<i>data</i>	Wildcard if NULL, must match otherwise
in, out	<i>data_return</i>	pointer to void * to receive the data value

**Returns**

non-zero if a timer was found and removed

**Return values**

<i>0</i>	no matching timer was found
<i>1</i>	the last matching timeout was found and removed
<i>N &gt; 1</i>	a matching timeout was removed and there are (N - 1) matching timeouts pending

For details

**See also**

[FI::remove\\_next\\_timeout\(FI\\_Timeout\\_Handler cb, void \\*data, void \\*\\*data\\_return\)](#)

**33.149.2.10 remove\_timeout()**

```
void FI_Timeout::remove_timeout (
 FI_Timeout_Handler cb,
 void * data) [static]
```

Remove a timeout callback.

This method removes all matching timeouts, not just the first one. This may change in the future.

**Parameters**

in	<i>cb</i>	Timer callback to be removed (must match)
in	<i>data</i>	Wildcard if NULL, must match otherwise

**Implements:**

```
void FI::remove_timeout(FI_Timeout_Handler cb, void *data)
```

**See also**

[FI::remove\\_timeout\(FI\\_Timeout\\_Handler cb, void \\*data\)](#)

**33.149.2.11 repeat\_timeout()**

```
void FI_Timeout::repeat_timeout (
 double time,
 FI_Timeout_Handler cb,
 void * data) [static]
```

Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.

**Parameters**

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: NULL)

**Implements:**

```
void FI::repeat_timeout(double time, FI_Timeout_Handler cb, void *data)
```

See also

[Fl::repeat\\_timeout\(double time, Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

### 33.149.2.12 time\_to\_wait()

```
double Fl_Timeout::time_to_wait (
 double ttw) [static]
```

Returns the delay in seconds until the next timer expires, limited by `ttw`.

This function calculates the time to wait for the FLTK event queue processing, depending on the given value `ttw`.

If at least one timer is active and its timeout value is smaller than `ttw` then this value is returned. [Fl::wait\(\)](#) will wait no longer than until the next timer expires.

If no timer is active this returns the input value `ttw` unchanged.

If at least one timer is expired this returns 0.0 so the event processing does not wait.

#### Parameters

<code>in</code>	<code>ttw</code>	time to wait from <a href="#">Fl::wait()</a> etc. (upper limit)
-----------------	------------------	-----------------------------------------------------------------

#### Returns

delay until next timeout or 0.0 (see description)

## 33.149.3 Member Data Documentation

### 33.149.3.1 current\_timeout

```
Fl_Timeout * Fl_Timeout::current_timeout = 0 [static], [protected]
```

The list of current timeouts is used to store the timeout whose callback is called while the callback is executed.

This is used like a stack, the current timeout is pushed to the front of the list and once the callback is finished, that timeout is removed and entered into the free list.

Background: [Fl::repeat\\_timeout\(\)](#) needs to know which timeout triggered it and the exact schedule time and/or the delay of that timeout, i.e. how long the scheduled time was missed before the callback was called. A static, global variable is not sufficient since the user code can call other functions, e.g. dialogs, that run a nested event loop which can run another timeout callback. Hence this list of "current" timeouts is used like a stack (last in, first out).

See also

[Fl\\_Timeout::push\(\)](#) Member function (method)

### 33.149.3.2 first\_timeout

```
Fl_Timeout * Fl_Timeout::first_timeout = 0 [static], [protected]
```

List of active timeouts.

These timeouts can be triggered when due, which calls their callbacks. The lifetime of a timeout:

- active, in this queue
- callback running, in queue `current_timeout`
- done, in list of free timeouts, ready to be reused.

### 33.149.3.3 free\_timeout

```
Fl_Timeout * Fl_Timeout::free_timeout = 0 [static], [protected]
```

List of free timeouts after use.

Timeouts can be reused many times.

The documentation for this class was generated from the following files:

- [Fl\\_Timeout.h](#)
- [Fl\\_Timeout.cxx](#)

## 33.150 FL\_Timer Class Reference

This is provided only to emulate the Forms Timer widget.

```
#include <Fl_Timer.H>
```

*Draws the widget.*

### Additional Inherited Members

#### 33.150.1 Detailed Description

This is provided only to emulate the Forms Timer widget.

It works by making a timeout callback every 1/5 second. This is wasteful and inaccurate if you just want something to happen a fixed time in the future. You should directly call [Fl::add\\_timeout\(\)](#) instead.

## 33.150.2 Constructor & Destructor Documentation

### 33.150.2.1 Fl\_Timer()

```
Fl_Timer::Fl_Timer (
 uchar t,
 int X,
 int Y,
 int W,
 int H,
 const char * l)
```

Creates a new [Fl\\_Timer](#) widget using the given type, position, size, and label string.

The type parameter can be any of the following symbolic constants:

- `FL_NORMAL_TIMER` - The timer just does the callback and displays the string "Timer" in the widget.
- `FL_VALUE_TIMER` - The timer does the callback and displays the current timer value in the widget.
- `FL_HIDDEN_TIMER` - The timer just does the callback and does not display anything.

## 33.150.3 Member Function Documentation

### 33.150.3.1 direction() [1/2]

```
char Fl_Timer::direction () const [inline]
```

Gets or sets the direction of the timer.

If the direction is zero then the timer will count up, otherwise it will count down from the initial [value\(\)](#).

### 33.150.3.2 direction() [2/2]

```
void Fl_Timer::direction (
 char d) [inline]
```

Gets or sets the direction of the timer.

If the direction is zero then the timer will count up, otherwise it will count down from the initial [value\(\)](#).

### 33.150.3.3 draw()

```
void Fl_Timer::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 33.150.3.4 handle()

```
int Fl_Timer::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

#### 33.150.3.5 suspended()

```
char Fl_Timer::suspended () const [inline]
```

Gets or sets whether the timer is suspended.

The documentation for this class was generated from the following files:

- `Fl_Timer.H`
- `forms_timer.cxx`

## 33.151 Fl\_Toggle\_Button Class Reference

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off.

```
#include <Fl_Toggle_Button.H>
```

Inheritance diagram for `Fl_Toggle_Button`:

#### Public Member Functions

- [Fl\\_Toggle\\_Button](#) (int X, int Y, int W, int H, const char \*l=0)

*Creates a new `Fl_Toggle_Button` widget using the given position, size, and label string.*

## Additional Inherited Members

### 33.151.1 Detailed Description

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off.

The [FL\\_Toggle\\_Button](#) subclass displays the "on" state by drawing a pushed-in button.

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for [type\(\)](#) and [when\(\)](#).

### 33.151.2 Constructor & Destructor Documentation

#### 33.151.2.1 FL\_Toggle\_Button()

```
FL_Toggle_Button::FL_Toggle_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [FL\\_Toggle\\_Button](#) widget using the given position, size, and label string.

The constructor creates the button using the given position, size, and label.

The inherited destructor deletes the toggle button.

The Button [type\(\)](#) is set to FL\_TOGGLE\_BUTTON.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

## 33.152 FL\_Tooltip Class Reference

The [FL\\_Tooltip](#) class provides tooltip support for all FLTK widgets.

```
#include <FL_Tooltip.H>
```

### Static Public Member Functions

- static [FL\\_Color](#) [color](#) ()  
*Gets the background color for tooltips.*
- static void [color](#) ([FL\\_Color](#) c)  
*Sets the background color for tooltips.*
- static [FL\\_Widget](#) \* [current](#) ()  
*Gets the current widget target.*
- static void [current](#) ([FL\\_Widget](#) \*)  
*Sets the current widget target.*
- static [FL\\_Window](#) \* [current\\_window](#) (void)  
*Returns the window that is used for tooltips.*
- static float [delay](#) ()  
*Gets the tooltip delay.*
- static void [delay](#) (float f)

- Sets the tooltip delay.*

  - static void `disable` ()

*Same as `enable(0)`, disables tooltips on all widgets.*
- static void `enable` (int b=1)

*Enables tooltips on all widgets (or disables if b is false).*
- static int `enabled` ()

*Returns non-zero if tooltips are enabled.*
- static void `enter_area` (Fl\_Widget \*w, int X, int Y, int W, int H, const char \*tip)

*You may be able to use this to provide tooltips for internal pieces of your widget.*
- static Fl\_Font `font` ()

*Gets the typeface for the tooltip text.*
- static void `font` (Fl\_Font i)

*Sets the typeface for the tooltip text.*
- static float `hidedelay` ()

*Gets the time until an open tooltip hides again.*
- static void `hidedelay` (float f)

*Sets the time until an open tooltip hides again.*
- static float `hoverdelay` ()

*Gets the tooltip hover delay, the delay between tooltips.*
- static void `hoverdelay` (float f)

*Sets the tooltip hover delay, the delay between tooltips.*
- static int `margin_height` ()

*Gets the amount of extra space above and below the tooltip's text.*
- static void `margin_height` (int v)

*Sets the amount of extra space above and below the tooltip's text.*
- static int `margin_width` ()

*Gets the amount of extra space left/right of the tooltip's text.*
- static void `margin_width` (int v)

*Sets the amount of extra space left/right of the tooltip's text.*
- static Fl\_Fontsize `size` ()

*Gets the size of the tooltip text.*
- static void `size` (Fl\_Fontsize s)

*Sets the size of the tooltip text.*
- static Fl\_Color `textcolor` ()

*Gets the color of the text in the tooltip.*
- static void `textcolor` (Fl\_Color c)

*Sets the color of the text in the tooltip.*
- static int `wrap_width` ()

*Gets the maximum width for tooltip's text before it word wraps.*
- static void `wrap_width` (int v)

*Sets the maximum width for tooltip's text before it word wraps.*

## Static Public Attributes

- void `Fl_Widget::copy_tooltip` (const char \*)
- void `Fl_Widget::tooltip` (const char \*)

### 33.152.1 Detailed Description

The `Fl_Tooltip` class provides tooltip support for all FLTK widgets. It contains only static methods.

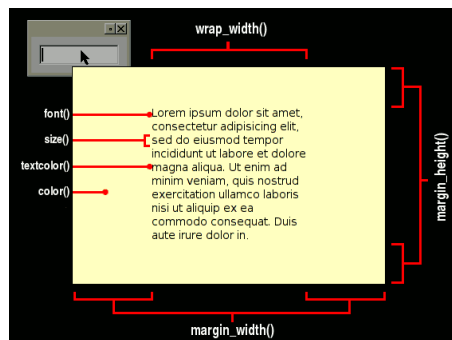

Figure 33.61 `Fl_Tooltip` Options

### 33.152.2 Member Function Documentation

#### 33.152.2.1 `color()` [1/2]

```
static Fl_Color Fl_Tooltip::color (
 void) [inline], [static]
```

Gets the background color for tooltips.

The default background color is a pale yellow.

#### 33.152.2.2 `color()` [2/2]

```
static void Fl_Tooltip::color (
 Fl_Color c) [inline], [static]
```

Sets the background color for tooltips.

The default background color is a pale yellow.

#### 33.152.2.3 `current()`

```
void Fl_Tooltip::current (
 Fl_Widget * w) [static]
```

Sets the current widget target.

Acts as though `enter(widget)` was done but does not pop up a tooltip. This is useful to prevent a tooltip from reappearing when a modal overlapping window is deleted. FLTK does this automatically when you click the mouse button.

#### 33.152.2.4 `delay()` [1/2]

```
static float Fl_Tooltip::delay () [inline], [static]
```

Gets the tooltip delay.

The default delay is 1.0 seconds.

#### 33.152.2.5 `delay()` [2/2]

```
static void Fl_Tooltip::delay (
 float f) [inline], [static]
```

Sets the tooltip delay.

The default delay is 1.0 seconds.

#### 33.152.2.6 disable()

```
static void Fl_Tooltip::disable () [inline], [static]
```

Same as enable(0), disables tooltips on all widgets.

#### 33.152.2.7 enable()

```
static void Fl_Tooltip::enable (
 int b = 1) [inline], [static]
```

Enables tooltips on all widgets (or disables if *b* is false).

#### 33.152.2.8 enabled()

```
static int Fl_Tooltip::enabled () [inline], [static]
```

Returns non-zero if tooltips are enabled.

#### 33.152.2.9 enter\_area()

```
void Fl_Tooltip::enter_area (
 Fl_Widget * wid,
 int x,
 int y,
 int w,
 int h,
 const char * t) [static]
```

You may be able to use this to provide tooltips for internal pieces of your widget.

Call this after setting [Fl::belowmouse\(\)](#) to your widget (because that calls the above enter() method). Then figure out what thing the mouse is pointing at, and call this with the widget (this pointer is used to remove the tooltip if the widget is deleted or hidden, and to locate the tooltip), the rectangle surrounding the area, relative to the top-left corner of the widget (used to calculate where to put the tooltip), and the text of the tooltip (which must be a pointer to static data as it is not copied).

#### 33.152.2.10 font() [1/2]

```
static Fl_Font Fl_Tooltip::font () [inline], [static]
```

Gets the typeface for the tooltip text.

#### 33.152.2.11 font() [2/2]

```
static void Fl_Tooltip::font (
 Fl_Font i) [inline], [static]
```

Sets the typeface for the tooltip text.

#### 33.152.2.12 hidedelay() [1/2]

```
static float Fl_Tooltip::hidedelay () [inline], [static]
```

Gets the time until an open tooltip hides again.  
The default delay is 12.0 seconds.

### 33.152.2.13 `hidedelay()` [2/2]

```
static void Fl_Tooltip::hidedelay (
 float f) [inline], [static]
```

Sets the time until an open tooltip hides again.  
The default delay is 12.0 seconds.

### 33.152.2.14 `hoverdelay()` [1/2]

```
static float Fl_Tooltip::hoverdelay () [inline], [static]
```

Gets the tooltip hover delay, the delay between tooltips.  
The default delay is 0.2 seconds.

### 33.152.2.15 `hoverdelay()` [2/2]

```
static void Fl_Tooltip::hoverdelay (
 float f) [inline], [static]
```

Sets the tooltip hover delay, the delay between tooltips.  
The default delay is 0.2 seconds.

### 33.152.2.16 `margin_height()` [1/2]

```
static int Fl_Tooltip::margin_height () [inline], [static]
```

Gets the amount of extra space above and below the tooltip's text.  
Default is 3.

### 33.152.2.17 `margin_height()` [2/2]

```
static void Fl_Tooltip::margin_height (
 int v) [inline], [static]
```

Sets the amount of extra space above and below the tooltip's text.  
Default is 3.

### 33.152.2.18 `margin_width()` [1/2]

```
static int Fl_Tooltip::margin_width () [inline], [static]
```

Gets the amount of extra space left/right of the tooltip's text.  
Default is 3.

### 33.152.2.19 `margin_width()` [2/2]

```
static void Fl_Tooltip::margin_width (
 int v) [inline], [static]
```

Sets the amount of extra space left/right of the tooltip's text.  
Default is 3.

### 33.152.2.20 `size()` [1/2]

```
static Fl_Fontsize Fl_Tooltip::size () [inline], [static]
```

Gets the size of the tooltip text.

**33.152.2.21 size()** [2/2]

```
static void Fl_Tooltip::size (
 Fl_Fontsize s) [inline], [static]
```

Sets the size of the tooltip text.

**33.152.2.22 textcolor()** [1/2]

```
static Fl_Color Fl_Tooltip::textcolor (
 void) [inline], [static]
```

Gets the color of the text in the tooltip.

The default is black.

**33.152.2.23 textcolor()** [2/2]

```
static void Fl_Tooltip::textcolor (
 Fl_Color c) [inline], [static]
```

Sets the color of the text in the tooltip.

The default is black.

**33.152.2.24 wrap\_width()** [1/2]

```
static int Fl_Tooltip::wrap_width () [inline], [static]
```

Gets the maximum width for tooltip's text before it word wraps.

Default is 400.

**33.152.2.25 wrap\_width()** [2/2]

```
static void Fl_Tooltip::wrap_width (
 int v) [inline], [static]
```

Sets the maximum width for tooltip's text before it word wraps.

Default is 400.

The documentation for this class was generated from the following files:

- Fl\_Tooltip.H

- Fl\_Tooltip.cxx

**33.153 Fl\_Tree Class Reference**

Tree widget.

```
#include <Fl_Tree.H>
```

Inheritance diagram for Fl\_Tree:

**Public Member Functions**

- [Fl\\_Tree\\_Item](#) \* [add](#) (const char \*path, [Fl\\_Tree\\_Item](#) \*newitem=0)

- Adds a new item, given a menu style 'path'.*

  - `FI_Tree_Item * add (FI_Tree_Item *parent_item, const char *name)`  
*Add a new child item labeled 'name' to the specified 'parent\_item'.*
- `void calc_dimensions ()`  
*Recalculate widget dimensions and scrollbar visibility, normally managed automatically.*
- `void calc_tree ()`  
*Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.*
- `FI_Tree_Item * callback_item ()`  
*Gets the item that caused the callback.*
- `void callback_item (FI_Tree_Item *item)`  
*Sets the item that was changed for this callback.*
- `FI_Tree_Reason callback_reason () const`  
*Gets the reason for this callback.*
- `void callback_reason (FI_Tree_Reason reason)`  
*Sets the reason for this callback.*
- `void clear ()`  
*Clear the entire tree's children, including the root.*
- `void clear_children (FI_Tree_Item *item)`  
*Clear all the children for 'item'.*
- `int close (const char *path, int docallback=1)`  
*Closes the item specified by 'path'.*
- `int close (FI_Tree_Item *item, int docallback=1)`  
*Closes the specified 'item'.*
- `FI_Image * closeicon () const`  
*Returns the icon to be used as the 'close' icon.*
- `void closeicon (FI_Image *val)`  
*Sets the icon to be used as the 'close' icon.*
- `FI_Color connectorcolor () const`  
*Get the connector color used for tree connection lines.*
- `void connectorcolor (FI_Color val)`  
*Set the connector color used for tree connection lines.*
- `FI_Tree_Connector connectorstyle () const`  
*Returns the line drawing style for inter-connecting items.*
- `void connectorstyle (FI_Tree_Connector val)`  
*Sets the line drawing style for inter-connecting items.*
- `int connectorwidth () const`  
*Gets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.*
- `void connectorwidth (int val)`  
*Sets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.*
- `int deselect (const char *path, int docallback=1)`  
*Deselect an item specified by 'path'.*
- `int deselect (FI_Tree_Item *item, int docallback=1)`  
*Deselect the specified item.*
- `int deselect_all (FI_Tree_Item *item=0, int docallback=1)`  
*Deselect 'item' and all its children.*
- `void display (FI_Tree_Item *item)`  
*Displays 'item', scrolling the tree as necessary.*
- `int displayed (FI_Tree_Item *item)`  
*See if 'item' is currently displayed on-screen (visible within the widget).*
- `int extend_selection (FI_Tree_Item *from, FI_Tree_Item *to, int val=1, bool visible=false)`  
*Extend a selection between 'from' and 'to' depending on 'visible'.*

- int [extend\\_selection\\_dir](#) (FL\_Tree\_Item \*from, FL\_Tree\_Item \*to, int dir, int val, bool visible)
 

*Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.*
- FL\_Tree\_Item \* [find\\_clicked](#) (int yonly=0)
 

*Non-const version of `FL_Tree::find_clicked(int yonly)` const.*
- const FL\_Tree\_Item \* [find\\_clicked](#) (int yonly=0) const
 

*Find the item that was last clicked on.*
- FL\_Tree\_Item \* [find\\_item](#) (const char \*path)
 

*Non-const version of `FL_Tree::find_item(const char *path)` const.*
- const FL\_Tree\_Item \* [find\\_item](#) (const char \*path) const
 

*Find the item, given a menu style path, e.g.*
- FL\_Tree\_Item \* [first](#) ()
 

*Returns the first item in the tree, or 0 if none.*
- FL\_Tree\_Item \* [first\\_selected\\_item](#) ()
 

*Returns the first selected item in the tree.*
- FL\_Tree\_Item \* [first\\_visible](#) ()
 

*Returns the first `open()`, visible item in the tree, or 0 if none.*
- FL\_Tree\_Item \* [first\\_visible\\_item](#) ()
 

*Returns the first `open()`, visible item in the tree, or 0 if none.*
- **FL\_Tree** (int X, int Y, int W, int H, const char \*L=0)
 

*Constructor.*
- FL\_Tree\_Item \* [get\\_item\\_focus](#) () const
 

*Get the item that currently has keyboard focus.*
- int [get\\_selected\\_items](#) (FL\_Tree\_Item\_Array &items)
 

*Returns the currently selected items as an array of 'ret\_items'.*
- int [handle](#) (int e) **FL\_OVERRIDE**

*Standard FLTK event handler for this widget.*
- int [hposition](#) () const
 

*Returns the horizontal scroll position as a pixel offset.*
- void [hposition](#) (int pos)
 

*Sets the horizontal scroll offset to position 'pos'.*
- FL\_Tree\_Item \* [insert](#) (FL\_Tree\_Item \*item, const char \*name, int pos)
 

*Insert a new item 'name' into 'item's children at position 'pos'.*
- FL\_Tree\_Item \* [insert\\_above](#) (FL\_Tree\_Item \*above, const char \*name)
 

*Inserts a new item 'name' above the specified FL\_Tree\_Item 'above'.*
- int [is\\_close](#) (const char \*path) const
 

*See if item specified by 'path' is closed.*
- int [is\\_close](#) (FL\_Tree\_Item \*item) const
 

*See if the specified 'item' is closed.*
- int [is\\_hscroll\\_visible](#) () const
 

*See if the horizontal scrollbar is currently visible.*
- int [is\\_open](#) (const char \*path) const
 

*See if item specified by 'path' is open.*
- int [is\\_open](#) (FL\_Tree\_Item \*item) const
 

*See if 'item' is open.*
- int [is\\_scrollbar](#) (FL\_Widget \*w)
 

*See if widget 'w' is one of the FL\_Tree widget's scrollbars.*
- int [is\\_selected](#) (const char \*path)
 

*See if item specified by 'path' is selected.*
- int [is\\_selected](#) (FL\_Tree\_Item \*item) const
 

*See if the specified 'item' is selected.*

- int `is_vscroll_visible` () const  
*See if the vertical scrollbar is currently visible.*
- `FI_Tree_Item * item_clicked` ()  
*Return the item that was last clicked.*
- `FI_Tree_Item_Draw_Mode item_draw_mode` () const  
*Get the 'item draw mode' used for the tree.*
- void `item_draw_mode` (`FI_Tree_Item_Draw_Mode mode`)  
*Set the 'item draw mode' used for the tree to 'mode'.*
- void `item_draw_mode` (int mode)  
*Set the 'item draw mode' used for the tree to integer 'mode'.*
- void `item_labelbgcolor` (`FI_Color val`)  
*Set the default label background color used for creating new items.*
- `FI_Color item_labelbgcolor` (void) const  
*Get the default label background color used for creating new items.*
- void `item_labelfgcolor` (`FI_Color val`)  
*Set the default label foreground color used for creating new items.*
- `FI_Color item_labelfgcolor` (void) const  
*Get the default label foreground color used for creating new items.*
- `FI_Font item_labelfont` () const  
*Get the default font face used for creating new items.*
- void `item_labelfont` (`FI_Font val`)  
*Set the default font face used for creating new items.*
- `FI_Fontsize item_labelsize` () const  
*Get the default label fontsize used for creating new items.*
- void `item_labelsize` (`FI_Fontsize val`)  
*Set the default label font size used for creating new items.*
- int `item_pathname` (char \*pathname, int pathnamelen, const `FI_Tree_Item *item`) const  
*Return 'pathname' of size 'pathnamelen' for the specified 'item'.*
- `FI_Tree_Item_Reselect_Mode item_reselect_mode` () const  
*Returns the current item re/selection mode.*
- void `item_reselect_mode` (`FI_Tree_Item_Reselect_Mode mode`)  
*Sets the item re/selection mode.*
- int `labelmarginleft` () const  
*Get the amount of white space (in pixels) that should appear to the left of the label text.*
- void `labelmarginleft` (int val)  
*Set the amount of white space (in pixels) that should appear to the left of the label text.*
- `FI_Tree_Item * last` ()  
*Returns the last item in the tree.*
- `FI_Tree_Item * last_selected_item` ()  
*Returns the last selected item in the tree.*
- `FI_Tree_Item * last_visible` ()  
*Returns the last `open()`, visible item in the tree.*
- `FI_Tree_Item * last_visible_item` ()  
*Returns the last `open()`, visible item in the tree.*
- int `linespacing` () const  
*Get the amount of white space (in pixels) that should appear between items in the tree.*
- void `linespacing` (int val)  
*Sets the amount of white space (in pixels) that should appear between items in the tree.*
- void `load` (class `FI_Preferences &`)  
*Load FLTK preferences.*
- int `marginbottom` () const

- Get the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.
- void **marginbottom** (int val)
 

Sets the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.
  - int **marginleft** () const
 

Get the amount of white space (in pixels) that should appear between the widget's left border and the tree's contents.
  - void **marginleft** (int val)
 

Set the amount of white space (in pixels) that should appear between the widget's left border and the left side of the tree's contents.
  - int **margin**top () const
 

Get the amount of white space (in pixels) that should appear between the widget's top border and the top of the tree's contents.
  - void **margin**top (int val)
 

Sets the amount of white space (in pixels) that should appear between the widget's top border and the top of the tree's contents.
  - [Fl\\_Tree\\_Item](#) \* **next** ([Fl\\_Tree\\_Item](#) \*item=0)
 

Return the next item after 'item', or 0 if no more items.
  - [Fl\\_Tree\\_Item](#) \* **next\_item** ([Fl\\_Tree\\_Item](#) \*item, int dir=[FL\\_Down](#), bool visible=false)
 

Returns next item after 'item' in direction 'dir' depending on 'visible'.
  - [Fl\\_Tree\\_Item](#) \* **next\_selected\_item** ([Fl\\_Tree\\_Item](#) \*item=0, int dir=[FL\\_Down](#))
 

Returns the next selected item above or below 'item', depending on 'dir'.
  - [Fl\\_Tree\\_Item](#) \* **next\_visible\_item** ([Fl\\_Tree\\_Item](#) \*start, int dir)
 

Returns next [open\(\)](#), visible item above (dir==[FL\\_Up](#)) or below (dir==[FL\\_Down](#)) the specified 'item', or 0 if no more items.
  - int **open** (const char \*path, int docallback=1)
 

Opens the item specified by 'path'.
  - int **open** ([Fl\\_Tree\\_Item](#) \*item, int docallback=1)
 

Open the specified 'item'.
  - void **open\_toggle** ([Fl\\_Tree\\_Item](#) \*item, int docallback=1)
 

Toggle the open state of 'item'.
  - int **openchild\_marginbottom** () const
 

Get the amount of white space (in pixels) that should appear below an open child tree's contents.
  - void **openchild\_marginbottom** (int val)
 

Set the amount of white space (in pixels) that should appear below an open child tree's contents.
  - [Fl\\_Image](#) \* **openicon** () const
 

Returns the icon to be used as the 'open' icon.
  - void **openicon** ([Fl\\_Image](#) \*val)
 

Sets the icon to be used as the 'open' icon.
  - const [Fl\\_Tree\\_Prefs](#) & **prefs** () const
  - [Fl\\_Tree\\_Item](#) \* **prev** ([Fl\\_Tree\\_Item](#) \*item=0)
 

Return the previous item before 'item', or 0 if no more items.
  - void **recalc\_tree** ()
 

Schedule tree to recalc the entire tree size.
  - int **remove** ([Fl\\_Tree\\_Item](#) \*item)
 

Remove the specified 'item' from the tree.
  - void **resize** (int, int, int, int) [FL\\_OVERRIDE](#)

Resizes the [Fl\\_Group](#) widget and all of its children.
  - [Fl\\_Tree\\_Item](#) \* **root** ()
 

Returns the root item.
  - void **root** ([Fl\\_Tree\\_Item](#) \*newitem)
 

Sets the root item to 'newitem'.

- void `root_label` (const char \*new\_label)  
*Set the label for the root item to 'new\_label'.*
- int `scrollbar_size` () const  
*Gets the default size of scrollbars' troughs for this widget in pixels.*
- void `scrollbar_size` (int size)  
*Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.*
- int `select` (const char \*path, int docallback=1)  
*Select the item specified by 'path'.*
- int `select` (FI\_Tree\_Item \*item, int docallback=1)  
*Select the specified 'item'.*
- int `select_all` (FI\_Tree\_Item \*item=0, int docallback=1)  
*Select 'item' and all its children.*
- int `select_only` (FI\_Tree\_Item \*selitem, int docallback=1)  
*Select only the specified item, deselecting all others that might be selected.*
- void `select_toggle` (FI\_Tree\_Item \*item, int docallback=1)  
*Toggle the select state of the specified 'item'.*
- FI\_Boxtype `selectbox` () const  
*Sets the style of box used to draw selected items.*
- void `selectbox` (FI\_Boxtype val)  
*Gets the style of box used to draw selected items.*
- FI\_Tree\_Select `selectmode` () const  
*Gets the tree's current selection mode.*
- void `selectmode` (FI\_Tree\_Select val)  
*Sets the tree's selection mode.*
- void `set_item_focus` (FI\_Tree\_Item \*item)  
*Set the item that currently should have keyboard focus.*
- void `show_item` (FI\_Tree\_Item \*item)  
*Adjust the vertical scrollbar to show 'item' at the top of the display IF it is currently off-screen (for instance `show_item_top()`).*
- void `show_item` (FI\_Tree\_Item \*item, int yoff)  
*Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the FI\_Tree widget's display.*
- void `show_item_bottom` (FI\_Tree\_Item \*item)  
*Adjust the vertical scrollbar so that 'item' is at the bottom of the display.*
- void `show_item_middle` (FI\_Tree\_Item \*item)  
*Adjust the vertical scrollbar so that 'item' is in the middle of the display.*
- void `show_item_top` (FI\_Tree\_Item \*item)  
*Adjust the vertical scrollbar so that 'item' is at the top of the display.*
- void `show_self` ()  
*Print the tree as 'ascii art' to stdout.*
- int `showcollapse` () const  
*Returns 1 if the collapse icon is enabled, 0 if not.*
- void `showcollapse` (int val)  
*Set if we should show the collapse icon or not.*
- int `showroot` () const  
*Returns 1 if the root item is to be shown, or 0 if not.*
- void `showroot` (int val)  
*Set if the root item should be shown or not.*
- FI\_Tree\_Sort `sortorder` () const  
*Set the default sort order used when items are added to the tree.*
- void `sortorder` (FI\_Tree\_Sort val)  
*Gets the sort order used to add items to the tree.*

- [FI\\_Image](#) \* [usericon](#) () const  
*Returns the [FI\\_Image](#) being used as the default user icon for all newly created items.*
- void [usericon](#) ([FI\\_Image](#) \*val)  
*Sets the [FI\\_Image](#) to be used as the default user icon for all newly created items.*
- int [usericonmarginleft](#) () const  
*Get the amount of white space (in pixels) that should appear to the left of the usericon.*
- void [usericonmarginleft](#) (int val)  
*Set the amount of white space (in pixels) that should appear to the left of the usericon.*
- int [vposition](#) () const  
*Returns the vertical scroll position as a pixel offset.*
- void [vposition](#) (int pos)  
*Sets the vertical scroll offset to position 'pos'.*
- int [widgetmarginleft](#) () const  
*Get the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).*
- void [widgetmarginleft](#) (int val)  
*Set the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).*
- ~[FI\\_Tree](#) ()  
*Destructor.*

## Additional Inherited Members

### 33.153.1 Detailed Description

Tree widget.

Figure 33.62 FI\_Tree example program

```
Fl_Tree // Top level widget
|--- Fl_Tree_Item // Items in the tree
|--- Fl_Tree_Prefs // Preferences for the tree
 |--- Fl_Tree_Connector (enum) // Connection modes
 |--- Fl_Tree_Select (enum) // Selection modes
 |--- Fl_Tree_Sort (enum) // Sort behavior
```

Similar to `Fl_Browser`, `Fl_Tree` is a browser of `Fl_Tree_Item`'s arranged in a parented hierarchy, or 'tree'. Subtrees can be expanded or closed. Items can be added, deleted, inserted, sorted and re-ordered.

The tree items may also contain other FLTK widgets, like buttons, input fields, or even "custom" widgets.

The `callback()` is invoked depending on the value of `when()`:

- `FL_WHEN_RELEASE` – callback invoked when left mouse button is released on an item
- `FL_WHEN_CHANGED` – callback invoked when left mouse changes selection state

The simple way to define a tree:

```
#include <FL/Fl_Tree.H>
[...]
Fl_Tree tree(X,Y,W,H);
tree.begin();
tree.add("Flintstones/Fred");
tree.add("Flintstones/Wilma");
tree.add("Flintstones/Pebbles");
tree.add("Simpsons/Homer");
tree.add("Simpsons/Marge");
tree.add("Simpsons/Bart");
tree.add("Simpsons/Lisa");
tree.end();
```

## FEATURES

Items can be added with `add()`, removed with `remove()`, completely cleared with `clear()`, inserted with `insert()` and `insert_above()`, selected/deselected with `select()` and `deselect()`, open/closed with `open()` and `close()`, positioned on the screen with `show_item_top()`, `show_item_middle()` and `show_item_bottom()`, item children can be swapped around with `Fl_Tree_Item::swap_children()`, items can be moved around with `Fl_Tree_Item::move()`, an item's children can be walked with `Fl_Tree_Item::first()` and `Fl_Tree_Item::next()`, an item's children can be indexed directly with `Fl_Tree_Item::child()` and `Fl_Tree_Item::children()`, items can be moved from one subtree to another with `Fl_Tree_Item::deparent()` and `Fl_Tree_Item::reparent()`,

sorting can be controlled when items are `add()`ed via `sortorder()`.

You can walk the entire tree with `first()` and `next()`.

You can walk visible items with `first_visible_item()` and `next_visible_item()`.

You can walk selected items with `first_selected_item()` and `next_selected_item()`.

Items can be found by their pathname using `find_item(const char*)`, and an item's pathname can be found with `item_pathname()`.

The selected items' colors are controlled by `selection_color()` (inherited from `FL_Widget`).

A hook is provided to allow you to redefine how item's labels are drawn via `FL_Tree::item_draw_callback()`.

Items can be interactively dragged using `FL_TREE_SELECT_SINGLE_DRAGGABLE`.

## SELECTION OF ITEMS

The tree can have different selection behaviors controlled by `selectmode()`. The background color used for selected items is the `FL_Tree::selection_color()`. The foreground color for selected items is controlled internally with `fl_contrast()`.

## CHILD WIDGETS

FLTK widgets (including custom widgets) can be assigned to tree items via `FL_Tree_Item::widget()`.

When an `FL_Tree_Item::widget()` is defined, the default behavior is for the `widget()` to be shown in place of the item's label (if it has one). Only the `widget()`'s width will be used; the `widget()`'s `x()` and `y()` position will be managed by the tree, and the `h()` will track the item's height. This default behavior can be altered (ABI 1.3.1): Setting `FL_Tree::item_draw_mode()`'s `FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET` flag causes the label + widget to be displayed together in that order, and adding the `FL_TREE_ITEM_HEIGHT_FROM_WIDGET` flag causes widget's height to define the `widget()`'s height.

## ICONS

The tree's open/close icons can be redefined with `FL_Tree::openicon()`, `FL_Tree::closeicon()`. User icons can either be changed globally with `FL_Tree::usericon()`, or on a per-item basis with `FL_Tree_Item::usericon()`.

Various default preferences can be globally manipulated via `FL_Tree_Prefs`, including colors, margins, icons, connection lines, etc.

## FONTS AND COLORS

When adding new items to the tree, the new items get the defaults for fonts and colors from:

- `FL_Tree::item_labelfont()` – The default item label font (default: `FL_HELVETICA`)
- `FL_Tree::item_labelsize()` – The default item label size (default: `FL_NORMAL_SIZE`)
- `FL_Tree::item_labelfgcolor()` – The default item label foreground color (default: `FL_FOREGROUND_↔ COLOR`)
- `FL_Tree::item_labelbgcolor()` – The default item label background color (default: `0xffffffff`, which tree uses as 'transparent')

Each item (`FL_Tree_Item`) inherits a copy of these font/color attributes when created, and each item has its own methods to let the app change these values on a per-item basis using methods of the same name:

- `Fl_Tree_Item::labelfont()` – The item's label font (default: FL\_HELVETICA)
- `Fl_Tree_Item::labelsize()` – The item's label size (default: FL\_NORMAL\_SIZE)
- `Fl_Tree_Item::labelfgcolor()` – The item's label foreground color (default: FL\_FOREGROUND\_COLOR)
- `Fl_Tree_Item::labelbgcolor()` – The item's label background color (default: 0xffffffff, which uses the tree's own bg color)

## CALLBACKS

The tree's `callback()` will be invoked when items change state or are open/closed. `when()` controls when mouse/keyboard events invoke the callback. `callback_item()` and `callback_reason()` can be used to determine the cause of the callback. e.g.

```
void MyTreeCallback(Fl_Widget *w, void *data) {
 Fl_Tree *tree = (Fl_Tree*)w;
 Fl_Tree_Item *item = (Fl_Tree_Item*)tree->callback_item(); // get selected item
 switch (tree->callback_reason()) {
 case FL_TREE_REASON_SELECTED: [..]
 case FL_TREE_REASON_DESELECTED: [..]
 case FL_TREE_REASON_RESELECTED: [..]
 case FL_TREE_REASON_OPENED: [..]
 case FL_TREE_REASON_CLOSED: [..]
 }
 :
}
```

## SIMPLE EXAMPLES

To find all the selected items:

```
for (Fl_Tree_Item *i=first_selected_item(); i; i=next_selected_item(i))
 printf("Item %s is selected\n", i->label());
```

To get an item's full menu pathname, use `Fl_Tree::item_pathname()`, e.g.

```
[..]
char pathname[256] = "???";
tree->item_pathname(pathname, sizeof(pathname), item); // eg. "Parent/Child/Item"
[..]
```

To walk all the items of the tree from top to bottom:

```
// Walk all the items in the tree, and print their labels
for (Fl_Tree_Item *item = tree->first(); item; item = tree->next(item)) {
 printf("Item: %s\n", item->label());
}
```

To recursively walk all the children of a particular item, define a function that uses recursion:

```
// Find all of the item's children and print an indented report of their labels
void my_print_all_children(Fl_Tree_Item *item, int indent=0) {
 for (int t=0; t<item->children(); t++) {
 printf("%*s Item: %s\n", indent, "", item->child(t)->label());
 my_print_all_children(item->child(t), indent+4); // recurse
 }
}
```

To change the default label font and color when creating new items:

```
tree = new Fl_Tree(..);
tree->item_labelfont(FL_COURIER); // Use Courier font for all new items
tree->item_labelfgcolor(FL_RED); // Use red color for labels of all new items
[...]
```

// Now create the items in the tree using the above defaults.

```
tree->add("Aaa");
tree->add("Bbb");
```

To change the font and color of all existing items in the tree:

```
// Change the font and color of all items currently in the tree
for (Fl_Tree_Item *item = tree->first(); item; item = tree->next(item)) {
 item->labelfont(FL_COURIER);
 item->labelcolor(FL_RED);
}
```

## DISPLAY DESCRIPTION

The following image shows the tree's various visual elements and the methods that control them:

Figure 33.63 Fl\_Tree elements

The following shows the protected dimension variables 'tree inner' (tix..) and 'tree outer' (tox..):

Figure 33.64 Fl\_Tree inner/outer dimensions

## KEYBOARD BINDINGS

The following table lists keyboard bindings for navigating the tree:

Keyboard	FL_TREE_SELECT↔ _MULTI	FL_TREE_SELECT↔ _SINGLE	FL_TREE_SELECT↔ _NONE
Ctrl-A (Linux/Windows)	Select all items	N/A	N/A
Command-A (Mac)	Select all items	N/A	N/A
Space	Selects item	Selects item	N/A
Ctrl-Space	Toggle item	Toggle item	N/A
Shift-Space	Extends selection	Selects item	N/A
Enter	Toggles open/close	Toggles open/close	Toggles open/close
Ctrl-Enter	Toggles open/close	Toggles open/close	Toggles open/close
Shift-Enter	Toggles open/close	Toggles open/close	Toggles open/close
Right / Left	Open/Close item	Open/Close item	Open/Close item
Up / Down	Move focus box up/down	Move focus box up/down	N/A
Shift-Up / Shift-Down	Extend selection up/down	Move focus up/down	N/A
Home / End	Move to top/bottom of tree	Move to top/bottom of tree	Move to top/bottom of tree
PageUp / PageDown	Page up/down	Page up/down	Page up/down

## 33.153.2 Member Function Documentation

## 33.153.2.1 add() [1/2]

```
Fl_Tree_Item * Fl_Tree::add (
 const char * path,
 Fl_Tree_Item * item = 0)
```

Adds a new item, given a menu style 'path'.

Any parent nodes that don't already exist are created automatically. Adds the item based on the value of [sortorder\(\)](#).

If 'item' is NULL, a new item is created.

To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
:
tree->add("/Holidays/Photos/12\\25\\2010"); // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\\\Program Files\\\\MyApp"); // Adds item "c:\Program Files\MyApp"
:
```

## Parameters

in	<i>path</i>	The path to the item, e.g. "Flintstone/Fred".
in	<i>item</i>	The new item to be added. If NULL, a new item is created with a name that is the last element in 'path'.

## Returns

The new item added, or 0 on error.

**Version**

1.3.3

**33.153.2.2 add()** [2/2]

```
Fl_Tree_Item * Fl_Tree::add (
 Fl_Tree_Item * parent_item,
 const char * name)
```

Add a new child item labeled 'name' to the specified 'parent\_item'.

**Parameters**

in	<i>parent_item</i>	The parent item the new child item will be added to. Must not be NULL.
in	<i>name</i>	The label for the new item

**Returns**

The new item added.

**Version**

1.3.0 release

**33.153.2.3 calc\_dimensions()**

```
void Fl_Tree::calc_dimensions ()
```

Recalculate widget dimensions and scrollbar visibility, normally managed automatically.

Low overhead way to update the tree widget's outer/inner dimensions and re-determine scrollbar visibility based on these changes without recalculating the entire size of the tree data.

Assumes that either the tree's size in `_tree_w/_tree_h` are correct so that scrollbar visibility can be calculated easily, or are both zero indicating scrollbar visibility can't be calculated yet.

This method is called when the widget is [resize\(\)](#)ed or if the scrollbar's sizes are changed (affects tree widget's inner dimensions `tix/y/w/h`), and also used by [calc\\_tree\(\)](#).

**Version**

1.3.3 ABI feature

**33.153.2.4 calc\_tree()**

```
void Fl_Tree::calc_tree ()
```

Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.

On return:

- `_tree_w` will be the overall pixel width of the entire viewable tree
- `_tree_h` will be the overall pixel height ""
- scrollbar visibility and pan sizes are updated
- internal `_tix/_tiy/_tiw/_tih` dimensions are updated

`_tree_w/_tree_h` include the tree's margins (e.g. [marginleft\(\)](#)), whether items are open or closed, label contents and font sizes, etc.

The tree hierarchy's size is managed separately from the widget's size as an optimization; this way [resize\(\)](#) on the widget doesn't involve recalculating the tree's hierarchy needlessly, as widget size has no bearing on the tree hierarchy.

The tree hierarchy's size only changes when items are added/removed, open/closed, label contents or font sizes changed, margins changed, etc.

This calculation involves walking the *entire* tree from top to bottom, potentially a slow calculation if the tree has many items (potentially hundreds of thousands), and should therefore be called sparingly.

For this reason, `recalc_tree()` is used as a way to /schedule/ calculation when changes affect the tree hierarchy's size.

Apps may want to call this method directly if the app makes changes to the tree's geometry, then immediately needs to work with the tree's new dimensions before an actual redraw (and recalc) occurs. (This use by an app should only rarely be needed)

### 33.153.2.5 `callback_item()` [1/2]

```
Fl_Tree_Item * Fl_Tree::callback_item ()
```

Gets the item that caused the callback.

The `callback()` can use this value to see which item changed.

### 33.153.2.6 `callback_item()` [2/2]

```
void Fl_Tree::callback_item (
 Fl_Tree_Item * item)
```

Sets the item that was changed for this callback.

Used internally to pass the item that invoked the callback.

### 33.153.2.7 `callback_reason()` [1/2]

```
Fl_Tree_Reason Fl_Tree::callback_reason () const
```

Gets the reason for this callback.

The `callback()` can use this value to see why it was called. Example:

```

:
void MyTreeCallback(Fl_Widget *w, void *userdata) {
 Fl_Tree *tree = (Fl_Tree*)w;
 Fl_Tree_Item *item = tree->callback_item(); // the item changed (can be NULL if more than one
item was changed!)
 switch (tree->callback_reason()) { // reason callback was invoked
 case FL_TREE_REASON_OPENED: ..item was opened..
 case FL_TREE_REASON_CLOSED: ..item was closed..
 case FL_TREE_REASON_SELECTED: ..item was selected..
 case FL_TREE_REASON_RESELECTED: ..item was reselected (double-clicked, etc)..
 case FL_TREE_REASON_DESELECTED: ..item was deselected..
 }
}
:

```

See also

`item_reselect_mode()` – enables `FL_TREE_REASON_RESELECTED` events

### 33.153.2.8 `callback_reason()` [2/2]

```
void Fl_Tree::callback_reason (
 Fl_Tree_Reason reason)
```

Sets the reason for this callback.

Used internally to pass the reason the callback was invoked.

### 33.153.2.9 `clear()`

```
void Fl_Tree::clear (
 void)
```

Clear the entire tree's children, including the root.

The tree will be left completely empty.

**33.153.2.10 clear\_children()**

```
void Fl_Tree::clear_children (
 Fl_Tree_Item * item)
```

Clear all the children for 'item'.  
Item may not be NULL.

**33.153.2.11 close() [1/2]**

```
int Fl_Tree::close (
 const char * path,
 int docallback = 1)
```

Closes the item specified by 'path'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `close("Holidays/12\25\2010")`.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

**Parameters**

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - <a href="#">callback()</a> is not invoked</li> <li>• 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be <code>FL_TREE_REASON_CLOSED</code></li> </ul>

**Returns**

- 1 – OK: item closed
- 0 – OK: item was already closed, no change
- -1 – ERROR: item was not found

**See also**

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

**33.153.2.12 close() [2/2]**

```
int Fl_Tree::close (
 Fl_Tree_Item * item,
 int docallback = 1)
```

Closes the specified 'item'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

**Parameters**

in	<i>item</i>	– the item to be closed. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - <a href="#">callback()</a> is not invoked</li> <li>• 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be <code>FL_TREE_REASON_CLOSED</code></li> </ul>

**Returns**

- 1 – item was closed
- 0 – item was already closed, no change

**See also**

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

**33.153.2.13 closeicon() [1/2]**

```
Fl_Image * Fl_Tree::closeicon () const
```

Returns the icon to be used as the 'close' icon.

If none was set, the internal default is returned, a simple '[-]' icon.

**33.153.2.14 closeicon() [2/2]**

```
void Fl_Tree::closeicon (
 Fl_Image * val)
```

Sets the icon to be used as the 'close' icon.

This overrides the built in default '[-]' icon.

**Parameters**

in	<i>val</i>	– The new image, or zero to use the default '[-]' icon.
----	------------	---------------------------------------------------------

**33.153.2.15 connectorstyle()**

```
void Fl_Tree::connectorstyle (
 Fl_Tree_Connector val)
```

Sets the line drawing style for inter-connecting items.

See [Fl\\_Tree\\_Connector](#) for possible values.

**33.153.2.16 deselect() [1/2]**

```
int Fl_Tree::deselect (
 const char * path,
 int docalback = 1)
```

Deselect an item specified by 'path'.

Invokes the callback depending on the value of optional parameter 'docalback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `deselect("← Holidays/12\25\2010")`.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

**Parameters**

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>docalback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - the <a href="#">callback()</a> is not invoked</li> <li>• 1 - the <a href="#">callback()</a> is invoked if item changed state (default), <a href="#">callback_reason()</a> will be <code>FL_TREE_REASON_DESELECTED</code></li> </ul>

## Returns

- 1 - OK: item's state was changed
- 0 - OK: item was already deselected, no change was made
- -1 - ERROR: item was not found

**33.153.2.17** `deselect()` [2/2]

```
int Fl_Tree::deselect (
 Fl_Tree_Item * item,
 int dcallback = 1)
```

Deselect the specified `item`.

Invokes the callback depending on the value of optional parameter '`dcallback`'.

Handles calling `redraw()` if anything changed.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	– the item to be deselected. Must not be NULL.
in	<i>dcallback</i>	– A flag that determines if the <code>callback()</code> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - the <code>callback()</code> is not invoked</li> <li>• 1 - the <code>callback()</code> is invoked if item changed state (default), <code>callback_reason()</code> will be <code>FL_TREE_REASON_DESELECTED</code></li> </ul>

## Returns

- 0 - item was already deselected, no change was made
- 1 - item's state was changed

**33.153.2.18** `deselect_all()`

```
int Fl_Tree::deselect_all (
 Fl_Tree_Item * item = 0,
 int dcallback = 1)
```

Deselect '`item`' and all its children.

If `item` is NULL, `first()` is used.

Invokes the callback depending on the value of optional parameter '`dcallback`'.

Handles calling `redraw()` if anything changed.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	The item that will be deselected (along with all its children). If NULL, <code>first()</code> is used.
in	<i>dcallback</i>	– A flag that determines if the <code>callback()</code> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - the <code>callback()</code> is not invoked</li> <li>• 1 - the <code>callback()</code> is invoked for each item that changed state (default), <code>callback_reason()</code> will be <code>FL_TREE_REASON_DESELECTED</code></li> </ul>

**Returns**

Count of how many items were actually changed to the deselected state.

**33.153.2.19 display()**

```
void Fl_Tree::display (
 Fl_Tree_Item * item)
```

Displays 'item', scrolling the tree as necessary.

**Parameters**

in	<i>item</i>	The item to be displayed. If NULL, <a href="#">first()</a> is used.
----	-------------	---------------------------------------------------------------------

**33.153.2.20 displayed()**

```
int Fl_Tree::displayed (
 Fl_Tree_Item * item)
```

See if 'item' is currently displayed on-screen (visible within the widget).

This can be used to detect if the item is scrolled off-screen. Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the [hide\(\)](#) / [show\(\)](#) or [open\(\)](#) / [close\(\)](#) status of the item.

**Parameters**

in	<i>item</i>	The item to be checked. If NULL, <a href="#">first()</a> is used.
----	-------------	-------------------------------------------------------------------

**Returns**

1 if displayed, 0 if scrolled off screen or no items are in tree.

**33.153.2.21 draw()**

```
void Fl_Tree::draw (
 void) [protected], [virtual]
```

Standard FLTK [draw\(\)](#) method, handles drawing the tree widget.

Reimplemented from [Fl\\_Group](#).

**33.153.2.22 extend\_selection()**

```
int Fl_Tree::extend_selection (
 Fl_Tree_Item * from,
 Fl_Tree_Item * to,
 int val = 1,
 bool visible = false)
```

Extend a selection between 'from' and 'to' depending on 'visible'.

Similar to the more efficient [extend\\_selection\\_dir\(Fl\\_Tree\\_Item\\*,Fl\\_Tree\\_Item\\*,int dir,int val,bool vis\)](#) method, but direction (up or down) doesn't need to be known.

We're less efficient because we search the tree for to/from, then operate on items in between. The more efficient method avoids the "search", but necessitates a direction to be specified to find 'to'.

Used by SHIFT-click to extend a selection between two items inclusive.

Handles calling [redraw\(\)](#) if anything changed.

## Parameters

in	<i>from</i>	Starting item
in	<i>to</i>	Ending item
in	<i>val</i>	Select or deselect items (0=deselect, 1=select, 2=toggle)
in	<i>visible</i>	true=affect only <a href="#">open()</a> , visible items, false=affect open or closed items (default)

## Returns

The number of items whose selection states were changed, if any.

## Version

1.3.3 ABI feature

**33.153.2.23 extend\_selection\_dir()**

```
int Fl_Tree::extend_selection_dir (
 Fl_Tree_Item * from,
 Fl_Tree_Item * to,
 int dir,
 int val,
 bool visible)
```

Extend the selection between and including '*from*' and '*to*' depending on direction '*dir*', '*val*', and '*visible*'.

Efficient: does not walk entire tree; starts with '*from*' and stops at '*to*' while moving in direction '*dir*'. *Dir* must be specified though.

If *dir* cannot be known in advance, such as during SHIFT-click operations, the method [extend\\_selection\(Fl\\_Tree\\_Item\\*,Fl\\_Tree\\_Item\\*,int\)](#) should be used.

Handles calling [redraw\(\)](#) if anything changed.

## Parameters

in	<i>from</i>	Starting item
in	<i>to</i>	Ending item
in	<i>dir</i>	Direction to extend selection (FL_Up or FL_Down)
in	<i>val</i>	0=deselect, 1=select, 2=toggle
in	<i>visible</i>	true=affect only <a href="#">open()</a> , visible items, false=affect open or closed items (default)

## Returns

The number of items whose selection states were changed, if any.

## Version

1.3.3

**33.153.2.24 find\_clicked()**

```
const Fl_Tree_Item * Fl_Tree::find_clicked (
 int yonly = 0) const
```

Find the item that was last clicked on.

You should use [callback\\_item\(\)](#) instead, which is fast, and is meant to be used within a callback to determine the item clicked.

This method walks the entire tree looking for the first item that is under the mouse. (The value of the 'yonly' flag affects whether both x and y events are checked, or just y)

Use this method /only/ if you've subclassed [Fl\\_Tree](#), and are receiving events before [Fl\\_Tree](#) has been able to process and update [callback\\_item\(\)](#).

#### Parameters

in	<i>yonly</i>	– 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.
----	--------------	----------------------------------------------------------------------------------------------

#### Returns

The item clicked, or NULL if no item was under the current event.

#### Version

1.3.0

1.3.3 ABI feature: added yonly parameter

### 33.153.2.25 find\_item()

```
const Fl_Tree_Item * Fl_Tree::find_item (
 const char * path) const
```

Find the item, given a menu style path, e.g.

"/Parent/Child/item". There is both a const and non-const version of this method. Const version allows pure const methods to use this method to do lookups without causing compiler errors.

To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
:
tree->add("/Holidays/Photos/12\\25\\2010"); // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\\\Program Files\\\\MyApp"); // Adds item "c:\Program Files\MyApp"
:
```

#### Parameters

in	<i>path</i>	– the tree item's pathname to be found (e.g. "Flintstones/Fred")
----	-------------	------------------------------------------------------------------

#### Returns

The item, or NULL if not found.

#### See also

[item\\_pathname\(\)](#)

### 33.153.2.26 first()

```
Fl_Tree_Item * Fl_Tree::first ()
```

Returns the first item in the tree, or 0 if none.

Use this to walk the tree in the forward direction, e.g.

```
:
for (Fl_Tree_Item *item = tree->first(); item; item = tree->next(item))
 printf("Item: %s\n", item->label());
:
```

#### Returns

First item in tree, or 0 if none (tree empty).

#### See also

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

### 33.153.2.27 first\_selected\_item()

```
Fl_Tree_Item * Fl_Tree::first_selected_item ()
```

Returns the first selected item in the tree.

Use this to walk the tree from top to bottom looking for all the selected items, e.g.

```
:
// Walk tree forward, from top to bottom
for (Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i))
 printf("Selected item: %s\n", i->label());
:
```

#### Returns

The first selected item, or 0 if none.

#### See also

[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

### 33.153.2.28 first\_visible()

```
Fl_Tree_Item * Fl_Tree::first_visible ()
```

Returns the first [open\(\)](#), visible item in the tree, or 0 if none.

**Deprecated** in 1.3.3 ABI – use [first\\_visible\\_item\(\)](#) instead.

### 33.153.2.29 first\_visible\_item()

```
Fl_Tree_Item * Fl_Tree::first_visible_item ()
```

Returns the first [open\(\)](#), visible item in the tree, or 0 if none.

#### Returns

First visible item in tree, or 0 if none.

#### See also

[first\\_visible\\_item\(\)](#), [last\\_visible\\_item\(\)](#), [next\\_visible\\_item\(\)](#)

#### Version

1.3.3

**33.153.2.30 get\_selected\_items()**

```
int Fl_Tree::get_selected_items (
 Fl_Tree_Item_Array & ret_items)
```

Returns the currently selected items as an array of 'ret\_items'.

Example:

```
:
// Get selected items as an array
Fl_Tree_Item_Array items;
tree->get_selected_items(items);
// Manipulate the returned array
for (int t=0; t<items.total(); t++) {
 Fl_Tree_Item &item = items[t];
 ..do stuff with each selected item..
}
:
```

**Parameters**

out	<i>ret_items</i>	The returned array of selected items.
-----	------------------	---------------------------------------

**Returns**

The number of items in the returned array.

**See also**

[first\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

**Version**

1.3.3 ABI feature

**33.153.2.31 handle()**

```
int Fl_Tree::handle (
 int e) [virtual]
```

Standard FLTK event handler for this widget.

**Todo** add [Fl\\_Widget\\_Tracker](#) (see [Fl\\_Browser\\_cxx::handle\(\)](#))

Reimplemented from [Fl\\_Group](#).

**33.153.2.32 hposition() [1/2]**

```
int Fl_Tree::hposition () const
```

Returns the horizontal scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the left edge of the screen.

**See also**

[hposition\(int\)](#), [vposition\(\)](#), [vposition\(int\)](#)

**Note**

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

**33.153.2.33** `hposition()` [2/2]

```
void Fl_Tree::hposition (
 int pos)
```

Sets the horizontal scroll offset to position 'pos'.

The position is how many pixels of the tree are scrolled off the left edge of the screen.

**Parameters**

in	<i>pos</i>	The vertical position (in pixels) to scroll the tree to.
----	------------	----------------------------------------------------------

**See also**

[hposition\(\)](#), [vposition\(\)](#), [vposition\(int\)](#)

**Note**

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

**33.153.2.34** `insert()`

```
Fl_Tree_Item * Fl_Tree::insert (
 Fl_Tree_Item * item,
 const char * name,
 int pos)
```

Insert a new item 'name' into 'item's children at position 'pos'.

If pos is out of range the new item is

- prepended if `pos < 0` or
- appended if `pos > item->children()`.

Note: `pos == children()` is not considered out of range: the item is appended to the child list.

Example:

```
:
tree->add("Aaa/000"); // "000" is index 0 in Aaa's children
tree->add("Aaa/111"); // "111" is index 1 in Aaa's children
tree->add("Aaa/222"); // "222" is index 2 in Aaa's children
:
// How to use insert() to insert a new item between Aaa/111 + Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa"); // get parent item Aaa
if (item) tree->insert(item, "New item", 2); // insert as a child of Aaa at index #2
:
```

**Parameters**

in	<i>item</i>	The existing item to insert new child into. Must not be NULL.
in	<i>name</i>	The label for the new item
in	<i>pos</i>	The position of the new item in the child list

**Returns**

The new item added.

**See also**

[insert\\_above\(\)](#)

**33.153.2.35 insert\_above()**

```
Fl_Tree_Item * Fl_Tree::insert_above (
 Fl_Tree_Item * above,
 const char * name)
```

Inserts a new item 'name' above the specified [Fl\\_Tree\\_Item](#) 'above'.

Example:

```
:
tree->add("Aaa/000"); // "000" is index 0 in Aaa's children
tree->add("Aaa/111"); // "111" is index 1 in Aaa's children
tree->add("Aaa/222"); // "222" is index 2 in Aaa's children
..
// How to use insert_above() to insert a new item above Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa/222"); // get item Aaa/222
if (item) tree->insert_above(item, "New item"); // insert new item above it
:
```

**Parameters**

in	<i>above</i>	– the item above which to insert the new item. Must not be NULL.
in	<i>name</i>	– the name of the new item

**Returns**

The new item added, or 0 if 'above' could not be found.

**See also**

[insert\(\)](#)

**33.153.2.36 is\_close() [1/2]**

```
int Fl_Tree::is_close (
 const char * path) const
```

See if item specified by 'path' is closed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_close("← Holidays/12\25\2010")`.

**Parameters**

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
----	-------------	------------------------------------------------------

**Returns**

- 1 - OK: item is closed
- 0 - OK: item is open
- -1 - ERROR: item was not found

**33.153.2.37 is\_close() [2/2]**

```
int Fl_Tree::is_close (
 Fl_Tree_Item * item) const
```

See if the specified 'item' is closed.

## Parameters

<code>in</code>	<code>item</code>	– the item to be tested. Must not be NULL.
-----------------	-------------------	--------------------------------------------

## Returns

- 1 : item is closed
- 0 : item is open

**33.153.2.38 is\_hscroll\_visible()**

```
int Fl_Tree::is_hscroll_visible () const
```

See if the horizontal scrollbar is currently visible.

## Returns

1 if scrollbar visible, 0 if not.

## Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

**33.153.2.39 is\_open() [1/2]**

```
int Fl_Tree::is_open (
 const char * path) const
```

See if item specified by 'path' is open.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_open("← Holidays/12\25\2010")`.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

## Parameters

<code>in</code>	<code>path</code>	– the tree item's pathname (e.g. "Flintstones/Fred")
-----------------	-------------------	------------------------------------------------------

## Returns

- 1 - OK: item is open
- 0 - OK: item is closed
- -1 - ERROR: item was not found

## See also

[Fl\\_Tree\\_Item::visible\\_r\(\)](#)

**33.153.2.40 is\_open() [2/2]**

```
int Fl_Tree::is_open (
 Fl_Tree_Item * item) const
```

See if 'item' is open.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

## Parameters

in	<i>item</i>	– the item to be tested. Must not be NULL.
----	-------------	--------------------------------------------

## Returns

- 1 : item is open
- 0 : item is closed

**33.153.2.41 is\_scrollbar()**

```
int Fl_Tree::is_scrollbar (
 Fl_Widget * w)
```

See if widget 'w' is one of the [FL\\_Tree](#) widget's scrollbars.

Use this to skip over the scrollbars when walking the [child\(\)](#) array. Example:

```

:
for (int i=0; i<tree->children(); i++) { // walk children
 Fl_Widget *w = tree->child(i);
 if (tree->is_scrollbar(w)) continue; // skip scrollbars
 ..do work here..
}
:
```

## Parameters

in	<i>w</i>	Widget to test
----	----------	----------------

## Returns

1 if w is a scrollbar, 0 if not.

**Todo** should be const

**33.153.2.42 is\_selected() [1/2]**

```
int Fl_Tree::is_selected (
 const char * path)
```

See if item specified by 'path' is selected.

Items or submenus that themselves contain slashes (/ or \) should be escaped, e.g. `is_selected("← Holidays/12\25\2010")`.

## Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
----	-------------	------------------------------------------------------

## Returns

- 1 : item selected
- 0 : item deselected
- -1 : item was not found

**33.153.2.43 is\_selected()** [2/2]

```
int Fl_Tree::is_selected (
 Fl_Tree_Item * item) const
```

See if the specified 'item' is selected.

**Parameters**

<i>in</i>	<i>item</i>	– the item to be tested. Must not be NULL.
-----------	-------------	--------------------------------------------

**Returns**

- 1 : item selected
- 0 : item deselected

**33.153.2.44 is\_vscroll\_visible()**

```
int Fl_Tree::is_vscroll_visible () const
```

See if the vertical scrollbar is currently visible.

**Returns**

1 if scrollbar visible, 0 if not.

**33.153.2.45 item\_clicked()** [1/2]

```
Fl_Tree_Item * Fl_Tree::item_clicked ()
```

Return the item that was last clicked.

Valid only from within the [callback\(\)](#).

**Returns**

The item clicked, or 0 if none. 0 may also be used to indicate several items were clicked/changed.

**Deprecated** in 1.3.3 ABI – use [callback\\_item\(\)](#) instead.

**33.153.2.46 item\_clicked()** [2/2]

```
void Fl_Tree::item_clicked (
 Fl_Tree_Item * item) [protected]
```

Set the item that was last clicked.

Should only be used by subclasses needing to change this value. Normally [Fl\\_Tree](#) manages this value.

**Deprecated** in 1.3.3 ABI – use [callback\\_item\(\)](#) instead.

**33.153.2.47 item\_draw\_mode()** [1/3]

```
Fl_Tree_Item_Draw_Mode Fl_Tree::item_draw_mode () const
```

Get the 'item draw mode' used for the tree.

**Version**

1.3.1 ABI feature

**33.153.2.48 item\_draw\_mode()** [2/3]

```
void Fl_Tree::item_draw_mode (
 Fl_Tree_Item_Draw_Mode mode)
```

Set the 'item draw mode' used for the tree to 'mode'.

This affects how items in the tree are drawn, such as when a widget() is defined. See [Fl\\_Tree\\_Item\\_Draw\\_Mode](#) for possible values.

**Version**

1.3.1 ABI feature

**33.153.2.49 item\_draw\_mode()** [3/3]

```
void Fl_Tree::item_draw_mode (
 int mode)
```

Set the 'item draw mode' used for the tree to integer 'mode'.

This affects how items in the tree are drawn, such as when a widget() is defined. See [Fl\\_Tree\\_Item\\_Draw\\_Mode](#) for possible values.

**Version**

1.3.1 ABI feature

**33.153.2.50 item\_labelbgcolor()** [1/2]

```
void Fl_Tree::item_labelbgcolor (
 Fl_Color val)
```

Set the default label background color used for creating new items.

A special case is made for color 0xffffffff (default) which is treated as 'transparent'. To change the background color on a per-item basis, use [Fl\\_Tree\\_Item::labelbgcolor\(Fl\\_Color\)](#)

**33.153.2.51 item\_labelbgcolor()** [2/2]

```
Fl_Color Fl_Tree::item_labelbgcolor (
 void) const
```

Get the default label background color used for creating new items.

If the color is 0xffffffff, it is 'transparent'.

**33.153.2.52 item\_labelfgcolor()**

```
void Fl_Tree::item_labelfgcolor (
 Fl_Color val)
```

Set the default label foreground color used for creating new items.

To change the foreground color on a per-item basis, use [Fl\\_Tree\\_Item::labelfgcolor\(Fl\\_Color\)](#)

**33.153.2.53 item\_labelfont()**

```
void Fl_Tree::item_labelfont (
 Fl_Font val)
```

Set the default font face used for creating new items.

To change the font face on a per-item basis, use [Fl\\_Tree\\_Item::labelfont\(Fl\\_Font\)](#)

**33.153.2.54 item\_labelsize()**

```
void Fl_Tree::item_labelsize (
 Fl_Fontsize val)
```

Set the default label font size used for creating new items.

To change the font size on a per-item basis, use [Fl\\_Tree\\_Item::labelsize\(Fl\\_Fontsize\)](#)

**33.153.2.55 item\_pathname()**

```
int Fl_Tree::item_pathname (
 char * pathname,
 int pathnamelen,
 const Fl_Tree_Item * item) const
```

Return '*pathname*' of size '*pathnamelen*' for the specified '*item*'.

If '*item*' is NULL, [root\(\)](#) is used.

The tree's root will be included in the pathname if [showroot\(\)](#) is on.

Menu items or submenus that contain slashes ('/' or '\') in their names will be escaped with a backslash. This is symmetrical with the [add\(\)](#) function which uses the same escape pattern to set names.

**Parameters**

out	<i>pathname</i>	The string to use to return the pathname
in	<i>pathnamelen</i>	The maximum length of the string (including NULL). Must not be zero.
in	<i>item</i>	The item whose pathname is to be returned.

**Returns**

- 0 : OK (*pathname* returns the item's pathname)
- -1 : item not found (*pathname*="")
- -2 : *pathname* not large enough (*pathname*="")

**See also**

[find\\_item\(\)](#)

**33.153.2.56 item\_reselect\_mode()** [1/2]

```
Fl_Tree_Item_Reselect_Mode Fl_Tree::item_reselect_mode () const
```

Returns the current item re/selection mode.

**Version**

1.3.1 ABI feature

**33.153.2.57 item\_reselect\_mode()** [2/2]

```
void Fl_Tree::item_reselect_mode (
 Fl_Tree_Item_Reselect_Mode mode)
```

Sets the item re/selection mode.

See [Fl\\_Tree\\_Item\\_Reselect\\_Mode](#) for possible values.

**Version**

1.3.1 ABI feature

**33.153.2.58 last()**

```
Fl_Tree_Item * Fl_Tree::last ()
```

Returns the last item in the tree.

This can be used to walk the tree in reverse, e.g.

```
for (Fl_Tree_Item *item = tree->last(); item; item = tree->prev())
 printf("Item: %s\n", item->label());
```

**Returns**

Last item in the tree, or 0 if none (tree empty).

**See also**

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

**33.153.2.59 last\_selected\_item()**

```
Fl_Tree_Item * Fl_Tree::last_selected_item ()
```

Returns the last selected item in the tree.

Use this to walk the tree in reverse from bottom to top looking for all the selected items, e.g.

```
:
// Walk tree in reverse, from bottom to top
for (Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up))
 printf("Selected item: %s\n", i->label());
:
```

**Returns**

The last selected item, or 0 if none.

**See also**

[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

**Version**

1.3.3

**33.153.2.60 last\_visible()**

```
Fl_Tree_Item * Fl_Tree::last_visible ()
```

Returns the last [open\(\)](#), visible item in the tree.

**Deprecated** in 1.3.3 – use [last\\_visible\\_item\(\)](#) instead.

**33.153.2.61 last\_visible\_item()**

```
Fl_Tree_Item * Fl_Tree::last_visible_item ()
```

Returns the last [open\(\)](#), visible item in the tree.

**Returns**

Last visible item in the tree, or 0 if none.

**See also**

[first\\_visible\\_item\(\)](#), [last\\_visible\\_item\(\)](#), [next\\_visible\\_item\(\)](#)

**Version**

1.3.3

**33.153.2.62 load()**

```
void Fl_Tree::load (
 class Fl_Preferences & prefs)
```

Load FLTK preferences.

Read a preferences database into the tree widget.

A preferences database is a hierarchical collection of data which can be directly loaded into the tree view for inspection.

**Parameters**

in	<i>prefs</i>	the <a href="#">Fl_Preferences</a> database
----	--------------	---------------------------------------------

**33.153.2.63 next()**

```
Fl_Tree_Item * Fl_Tree::next (
 Fl_Tree_Item * item = 0)
```

Return the next item after 'item', or 0 if no more items.

Use this code to walk the entire tree:

```
:
for (Fl_Tree_Item *i = tree->first(); i; i = tree->next(i))
 printf("Item: %s\n", i->label());
:
```

**Parameters**

in	<i>item</i>	The item to use to find the next item. If NULL, returns 0.
----	-------------	------------------------------------------------------------

**Returns**

Next item in tree, or 0 if at last item.

**See also**

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

**33.153.2.64 next\_item()**

```
Fl_Tree_Item * Fl_Tree::next_item (
 Fl_Tree_Item * item,
 int dir = FL_Down,
 bool visible = false)
```

Returns next item after 'item' in direction 'dir' depending on 'visible'.

Next item will be above (if dir==FL\_Up) or below (if dir==FL\_Down). If 'visible' is true, only items whose parents are [open\(\)](#) will be returned. If 'visible' is false, even items whose parents are [close\(\)](#)ed will be returned.

If item is 0, the return value will be the result of this truth table:

	visible=true	visible=false
dir=FL_Up:	<a href="#">last_visible_item()</a>	<a href="#">last()</a>
dir=FL_Down:	<a href="#">first_visible_item()</a>	<a href="#">first()</a>

Example use:

```

:
// Walk down the tree showing open(), visible items
for (Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_item(i, FL_Down, true))
 printf("Item: %s\n", i->label());
// Walk up the tree showing open(), visible items
for (Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_item(i, FL_Up, true))
 printf("Item: %s\n", i->label());
// Walk down the tree showing all items (open or closed)
for (Fl_Tree_Item *i=tree->first(); i; i=tree->next_item(i, FL_Down, false))
 printf("Item: %s\n", i->label());
// Walk up the tree showing all items (open or closed)
for (Fl_Tree_Item *i=tree->last(); i; i=tree->next_item(i, FL_Up, false))
 printf("Item: %s\n", i->label());
:

```

### Parameters

in	<i>item</i>	The item to use to find the next item. If NULL, returns 0.
in	<i>dir</i>	Can be FL_Up or FL_Down (default=FL_Down or 'next')
in	<i>visible</i>	true=return only <a href="#">open()</a> , visible items, false=return open or closed items (default)

### Returns

Next item in tree in the direction and visibility specified, or 0 if no more items of specified visibility in that direction.

### See also

[first\(\)](#), [last\(\)](#), [next\(\)](#),  
[first\\_visible\\_item\(\)](#), [last\\_visible\\_item\(\)](#), [next\\_visible\\_item\(\)](#),  
[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

### Version

1.3.3

### 33.153.2.65 next\_selected\_item()

```

Fl_Tree_Item * Fl_Tree::next_selected_item (
 Fl_Tree_Item * item = 0,
 int dir = FL_Down)

```

Returns the next selected item above or below 'item', depending on 'dir'.

If 'item' is 0, search starts at either [first\(\)](#) or [last\(\)](#), depending on 'dir': [first\(\)](#) if 'dir' is FL\_Down (default), [last\(\)](#) if 'dir' is FL\_Up.

Use this to walk the tree looking for all the selected items, e.g.

```

:
// Walk down the tree (forwards)
for (Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i, FL_Down))
 printf("Item: %s\n", i->label());
// Walk up the tree (backwards)
for (Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up))
 printf("Item: %s\n", i->label());
:

```

### Parameters

in	<i>item</i>	The item above or below which we'll find the next selected item. If NULL, <a href="#">first()</a> is used if FL_Down, <a href="#">last()</a> if FL_Up. (default=NULL)
in	<i>dir</i>	The direction to go. FL_Up for moving up the tree, FL_Down for down the tree (default)

**Returns**

The next selected item, or 0 if there are no more selected items.

**See also**

[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

**Version**

1.3.3

**33.153.2.66 next\_visible\_item()**

```
Fl_Tree_Item * Fl_Tree::next_visible_item (
 Fl_Tree_Item * item,
 int dir)
```

Returns next [open\(\)](#), visible item above (`dir==FL_Up`) or below (`dir==FL_Down`) the specified 'item', or 0 if no more items.

If 'item' is 0, returns [last\(\)](#) if 'dir' is FL\_Up, or [first\(\)](#) if dir is FL\_Down.

```
:
// Walk down the tree (forwards)
for (Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_visible_item(i, FL_Down))
 printf("Item: %s\n", i->label());
// Walk up the tree (backwards)
for (Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_visible_item(i, FL_Up))
 printf("Item: %s\n", i->label());
:
```

**Parameters**

in	<i>item</i>	The item above/below which we'll find the next visible item
in	<i>dir</i>	The direction to search. Can be FL_Up or FL_Down.

**Returns**

The item found, or 0 if there's no visible items above/below the specified item.

**Version**

1.3.3

**33.153.2.67 open() [1/2]**

```
int Fl_Tree::open (
 const char * path,
 int docallback = 1)
```

Opens the item specified by 'path'.

This causes the item's children (if any) to be shown.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `open("Holidays/12\25\2010")`.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - <a href="#">callback()</a> is not invoked</li> <li>• 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be <code>FL_TREE_REASON_OPENED</code></li> </ul>

## Returns

- 1 – OK: item opened
- 0 – OK: item was already open, no change
- -1 – ERROR: item was not found

## See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

**33.153.2.68 open()** [2/2]

```
int Fl_Tree::open (
 Fl_Tree_Item * item,
 int docallback = 1)
```

Open the specified '*item*'.

This causes the item's children (if any) to be shown.

Invokes the callback depending on the value of optional parameter '*docallback*'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	– the item to be opened. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - <a href="#">callback()</a> is not invoked</li> <li>• 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be <code>FL_TREE_REASON_OPENED</code></li> </ul>

## Returns

- 1 – item was opened
- 0 – item was already open, no change

## See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

**33.153.2.69 open\_toggle()**

```
void Fl_Tree::open_toggle (
```

```

 Fl_Tree_Item * item,
 int docallback = 1)

```

Toggle the open state of 'item'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

#### Parameters

in	<i>item</i>	– the item whose open state is to be toggled. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - <a href="#">callback()</a> is not invoked</li> <li>• 1 - <a href="#">callback()</a> is invoked (default), <a href="#">callback_reason()</a> will be either FL_TREE_REASON_OPENED or FL_TREE_REASON_CLOSED</li> </ul>

#### See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

#### 33.153.2.70 openicon() [1/2]

```

Fl_Image * Fl_Tree::openicon () const

```

Returns the icon to be used as the 'open' icon.

If none was set, the internal default is returned, a simple '[+]' icon.

#### 33.153.2.71 openicon() [2/2]

```

void Fl_Tree::openicon (
 Fl_Image * val)

```

Sets the icon to be used as the 'open' icon.

This overrides the built in default '[+]' icon.

#### Parameters

in	<i>val</i>	– The new image, or zero to use the default '[+]' icon.
----	------------	---------------------------------------------------------

#### 33.153.2.72 prev()

```

Fl_Tree_Item * Fl_Tree::prev (
 Fl_Tree_Item * item = 0)

```

Return the previous item before 'item', or 0 if no more items.

This can be used to walk the tree in reverse, e.g.

```

:
for (Fl_Tree_Item *item = tree->first(); item; item = tree->prev(item))
 printf("Item: %s\n", item->label());
:

```

#### Parameters

in	<i>item</i>	The item to use to find the previous item. If NULL, returns 0.
----	-------------	----------------------------------------------------------------

**Returns**

Previous item in tree, or 0 if at first item.

**See also**

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

**33.153.2.73 recalc\_tree()**

```
void Fl_Tree::recalc_tree ()
```

Schedule tree to recalc the entire tree size.

**Note**

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

**33.153.2.74 remove()**

```
int Fl_Tree::remove (
 Fl_Tree_Item * item)
```

Remove the specified 'item' from the tree.

item may not be NULL. If it has children, all those are removed too. If item being removed has focus, no item will have focus.

**Returns**

0 if done, -1 if 'item' not found.

**33.153.2.75 resize()**

```
void Fl_Tree::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Resizes the [Fl\\_Group](#) widget and all of its children.

The [Fl\\_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

**See also**

[Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

[Fl\\_Group::resizable\(\)](#)

[Fl\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [Fl\\_Group](#).

**33.153.2.76 root()**

```
void Fl_Tree::root (
 Fl_Tree_Item * newitem)
```

Sets the root item to 'newitem'.

If a root item already exists, [clear\(\)](#) is called first to clear it before replacing it with newitem.

Use this to install a custom item (derived from [Fl\\_Tree\\_Item](#)) as the root of the tree. This allows the derived class to implement custom drawing by overriding [Fl\\_Tree\\_Item::draw\\_item\\_content\(\)](#).

**Version**

1.3.3

**33.153.2.77 root\_label()**

```
void Fl_Tree::root_label (
 const char * new_label)
```

Set the label for the root item to 'new\_label'.  
Makes an internally managed copy of 'new\_label'.

**33.153.2.78 scrollbar\_size()** [1/2]

```
int Fl_Tree::scrollbar_size (
 void) const
```

Gets the default size of scrollbars' troughs for this widget in pixels.  
If this value is zero (default), this widget will use the global [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

**Returns**

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

**See also**

[Fl::scrollbar\\_size\(int\)](#)

**33.153.2.79 scrollbar\_size()** [2/2]

```
void Fl_Tree::scrollbar_size (
 int size)
```

Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.  
Normally you should not need this method, and should use the global [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, and is the default behavior. Normally this is what you want.  
Only use this method if you really need to override just THIS instance of the widget's scrollbar size. (This need should be rare.)  
Setting *size* to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

**Parameters**

in	<i>size</i>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
----	-------------	-----------------------------------------------------------------------------------------------------------------------------

**See also**

[Fl::scrollbar\\_size\(\)](#)

**33.153.2.80 select()** [1/2]

```
int Fl_Tree::select (
 const char * path,
 int docallback = 1)
```

Select the item specified by 'path'.  
Invokes the callback depending on the value of optional parameter 'docallback'.  
Handles calling [redraw\(\)](#) if anything changed.  
Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `select("← Holidays/12\25\2010")`.  
The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - the <a href="#">callback()</a> is not invoked</li> <li>• 1 - the <a href="#">callback()</a> is invoked if item changed state (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_SELECTED</li> </ul>

## Returns

- 1 : OK: item's state was changed
- 0 : OK: item was already selected, no change was made
- -1 : ERROR: item was not found

**33.153.2.81 select()** [2/2]

```
int Fl_Tree::select (
 Fl_Tree_Item * item,
 int docallback = 1)
```

Select the specified 'item'.

Use '[deselect\(\)](#)' to deselect it.

Invokes the callback depending on the value of optional parameter *docallback*.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	– the item to be selected. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - the <a href="#">callback()</a> is not invoked</li> <li>• 1 - the <a href="#">callback()</a> is invoked if item changed state, <a href="#">callback_reason()</a> will be FL_TREE_REASON_SELECTED</li> </ul>

## Returns

- 1 - item's state was changed
- 0 - item was already selected, no change was made

**33.153.2.82 select\_all()**

```
int Fl_Tree::select_all (
 Fl_Tree_Item * item = 0,
 int docallback = 1)
```

Select 'item' and all its children.

If item is NULL, [first\(\)](#) is used.

Invokes the callback depending on the value of optional parameter '*docallback*'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	The item that will be selected (along with all its children). If NULL, <a href="#">first()</a> is used.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - the <a href="#">callback()</a> is not invoked</li> <li>• 1 - the <a href="#">callback()</a> is invoked for each item that changed state (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_SELECTED</li> </ul>

## Returns

Count of how many items were actually changed to the selected state.

**33.153.2.83 select\_only()**

```
int Fl_Tree::select_only (
 Fl_Tree_Item * selitem,
 int docallback = 1)
```

Select only the specified item, deselecting all others that might be selected.

If 'selitem' is 0, [first\(\)](#) is used.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>selitem</i>	The item to be selected. If NULL, <a href="#">first()</a> is used.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not: <ul style="list-style-type: none"> <li>• 0 - the <a href="#">callback()</a> is not invoked</li> <li>• 1 - the <a href="#">callback()</a> is invoked for each item that changed state (default), <a href="#">callback_reason()</a> will be either FL_TREE_REASON_SELECTED or FL_TREE_REASON_DESELECTED</li> </ul>

## Returns

The number of items whose selection states were changed, if any.

**33.153.2.84 select\_toggle()**

```
void Fl_Tree::select_toggle (
 Fl_Tree_Item * item,
 int docallback = 1)
```

Toggle the select state of the specified 'item'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	– the item to be selected. Must not be NULL.
----	-------------	----------------------------------------------

## Parameters

in	<i>docalldback</i>	<p>– A flag that determines if the <a href="#">callback()</a> is invoked or not:</p> <ul style="list-style-type: none"> <li>• 0 - the <a href="#">callback()</a> is not invoked</li> <li>• 1 - the <a href="#">callback()</a> is invoked (default), <a href="#">callback_reason()</a> will be either <code>FL_TREE_REASON_SELECTED</code> or <code>FL_TREE_REASON_DESELECTED</code></li> </ul>
----	--------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**33.153.2.85 selectbox()** [1/2]

```
Fl_Boxtype Fl_Tree::selectbox () const
```

Sets the style of box used to draw selected items.

This is an fltk [Fl\\_Boxtype](#). The default is influenced by FLTK's current [Fl::scheme\(\)](#)

**33.153.2.86 selectbox()** [2/2]

```
void Fl_Tree::selectbox (
 Fl_Boxtype val)
```

Gets the style of box used to draw selected items.

This is an fltk [Fl\\_Boxtype](#). The default is influenced by FLTK's current [Fl::scheme\(\)](#)

**33.153.2.87 selectmode()** [1/2]

```
Fl_Tree_Select Fl_Tree::selectmode () const
```

Gets the tree's current selection mode.

See [Fl\\_Tree\\_Select](#) for possible values.

**33.153.2.88 selectmode()** [2/2]

```
void Fl_Tree::selectmode (
 Fl_Tree_Select val)
```

Sets the tree's selection mode.

See [Fl\\_Tree\\_Select](#) for possible values.

**33.153.2.89 set\_item\_focus()**

```
void Fl_Tree::set_item_focus (
 Fl_Tree_Item * item)
```

Set the item that currently should have keyboard focus.

Handles calling [redraw\(\)](#) to update the focus box (if it is visible).

## Parameters

in	<i>item</i>	The item that should take focus. If NULL, none will have focus.
----	-------------	-----------------------------------------------------------------

**33.153.2.90 show\_item()** [1/2]

```
void Fl_Tree::show_item (
 Fl_Tree_Item * item)
```

Adjust the vertical scrollbar to show '*item*' at the top of the display IF it is currently off-screen (for instance [show\\_item\\_top\(\)](#)).

If it is already on-screen, no change is made.

## Parameters

in	<i>item</i>	The item to be shown. If NULL, <a href="#">first()</a> is used.
----	-------------	-----------------------------------------------------------------

## See also

[show\\_item\\_top\(\)](#), [show\\_item\\_middle\(\)](#), [show\\_item\\_bottom\(\)](#)

**33.153.2.91 show\_item()** [2/2]

```
void Fl_Tree::show_item (
 Fl_Tree_Item * item,
 int yoff)
```

Adjust the vertical scrollbar so that '*item*' is visible '*yoff*' pixels from the top of the [Fl\\_Tree](#) widget's display. For instance, *yoff*=0 will position the item at the top.

If *yoff* is larger than the vertical scrollbar's limit, the value will be clipped. So if *yoff*=100, but scrollbar's max is 50, then 50 will be used.

## Parameters

in	<i>item</i>	The item to be shown. If NULL, <a href="#">first()</a> is used.
in	<i>yoff</i>	The pixel offset from the top for the displayed position.

## See also

[show\\_item\\_top\(\)](#), [show\\_item\\_middle\(\)](#), [show\\_item\\_bottom\(\)](#)

**33.153.2.92 show\_item\_bottom()**

```
void Fl_Tree::show_item_bottom (
 Fl_Tree_Item * item)
```

Adjust the vertical scrollbar so that '*item*' is at the bottom of the display.

## Parameters

in	<i>item</i>	The item to be shown. If NULL, <a href="#">first()</a> is used.
----	-------------	-----------------------------------------------------------------

**33.153.2.93 show\_item\_middle()**

```
void Fl_Tree::show_item_middle (
 Fl_Tree_Item * item)
```

Adjust the vertical scrollbar so that '*item*' is in the middle of the display.

## Parameters

in	<i>item</i>	The item to be shown. If NULL, <a href="#">first()</a> is used.
----	-------------	-----------------------------------------------------------------

**33.153.2.94 show\_item\_top()**

```
void Fl_Tree::show_item_top (
```

```
Fl_Tree_Item * item)
```

Adjust the vertical scrollbar so that 'item' is at the top of the display.

#### Parameters

in	<i>item</i>	The item to be shown. If NULL, <a href="#">first()</a> is used.
----	-------------	-----------------------------------------------------------------

#### 33.153.2.95 show\_self()

```
void Fl_Tree::show_self ()
```

Print the tree as 'ascii art' to stdout.

Used mainly for debugging.

**Todo** should be const

#### Version

1.3.0

#### 33.153.2.96 showcollapse() [1/2]

```
int Fl_Tree::showcollapse () const
```

Returns 1 if the collapse icon is enabled, 0 if not.

#### See also

[showcollapse\(int\)](#)

#### 33.153.2.97 showcollapse() [2/2]

```
void Fl_Tree::showcollapse (
 int val)
```

Set if we should show the collapse icon or not.

If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via [open\(\)](#) and [close\(\)](#).

#### Parameters

in	<i>val</i>	1: shows collapse icons (default), 0: hides collapse icons.
----	------------	----------------------------------------------------------------

#### 33.153.2.98 showroot()

```
void Fl_Tree::showroot (
 int val)
```

Set if the root item should be shown or not.

#### Parameters

in	<i>val</i>	1 – show the root item (default) 0 – hide the root item.
----	------------	-------------------------------------------------------------

**33.153.2.99 sortorder()**

```
Fl_Tree_Sort Fl_Tree::sortorder () const
```

Set the default sort order used when items are added to the tree.

See [Fl\\_Tree\\_Sort](#) for possible values.

**33.153.2.100 usericon() [1/2]**

```
Fl_Image * Fl_Tree::usericon () const
```

Returns the [Fl\\_Image](#) being used as the default user icon for all newly created items.

Returns zero if no icon has been set, which is the default.

**33.153.2.101 usericon() [2/2]**

```
void Fl_Tree::usericon (
 Fl_Image * val)
```

Sets the [Fl\\_Image](#) to be used as the default user icon for all newly created items.

If you want to specify user icons on a per-item basis, use [Fl\\_Tree\\_Item::usericon\(\)](#) instead.

**Parameters**

in	<i>val</i>	– The new image to be used, or zero to disable user icons.
----	------------	------------------------------------------------------------

**33.153.2.102 vposition() [1/2]**

```
int Fl_Tree::vposition () const
```

Returns the vertical scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the top edge of the screen.

**See also**

[vposition\(int\)](#), [hposition\(\)](#), [hposition\(int\)](#)

**33.153.2.103 vposition() [2/2]**

```
void Fl_Tree::vposition (
 int pos)
```

Sets the vertical scroll offset to position '*pos*'.

The position is how many pixels of the tree are scrolled off the top edge of the screen.

**Parameters**

in	<i>pos</i>	The vertical position (in pixels) to scroll the tree to.
----	------------	----------------------------------------------------------

**See also**

[vposition\(\)](#), [hposition\(\)](#), [hposition\(int\)](#)

*The item's height.*
  - `int has_children () const`  
*See if this item has children.*
  - `FI_Tree_Item * insert (const FI_Tree_Prefs &prefs, const char *new_label, int pos=0)`  
*Insert a new item named 'new\_label' into current item's children at a specified position 'pos'.*
  - `FI_Tree_Item * insert_above (const FI_Tree_Prefs &prefs, const char *new_label)`  
*Insert a new item named 'new\_label' above this item.*
  - `char is_activated () const`  
*See if the item is activated.*
  - `char is_active () const`  
*See if the item is activated. Alias for `is_activated()`.*
  - `int is_close () const`  
*See if the item is 'closed'.*
  - `int is_open () const`  
*See if the item is 'open'.*
  - `int is_root () const`  
*Is this item the root of the tree?*
  - `char is_selected () const`  
*See if the item is selected.*
  - `int is_visible () const`  
*See if the item is visible.*
  - `int is_visible_r () const`  
*See if item and all its parents are `open()` and `visible()`.*
  - `const char * label () const`  
*Return the label.*
  - `void label (const char *val)`  
*Set the label to 'name'.*

- int `label_h` () const  
*The item's label height.*
- int `label_w` () const  
*The item's maximum label width to right edge of `FI_Tree`'s inner width within scrollbars.*
- int `label_x` () const  
*The item's label x position relative to the window.*
- int `label_y` () const  
*The item's label y position relative to the window.*
- `FI_Color` `labelbgcolor` () const  
*Return item's label background text color.*
- void `labelbgcolor` (`FI_Color` val)  
*Set item's label background color.*
- `FI_Color` `labelcolor` () const  
*Return item's label text color. Alias for `labelfgcolor()` const).*
- void `labelcolor` (`FI_Color` val)  
*Set item's label text color. Alias for `labelfgcolor(FI_Color)`.*
- `FI_Color` `labelfgcolor` () const  
*Return item's label foreground text color.*
- void `labelfgcolor` (`FI_Color` val)  
*Set item's label foreground text color.*
- `FI_Font` `labelfont` () const  
*Get item's label font face.*
- void `labelfont` (`FI_Font` val)  
*Set item's label font face.*
- `FI_Fontsize` `labelsize` () const  
*Get item's label font size.*
- void `labelsize` (`FI_Fontsize` val)  
*Set item's label font size.*
- int `move` (`FI_Tree_Item` \*item, int op=0, int pos=0)  
*Move the current item above/below/into the specified 'item', where 'op' determines the type of move:*
- int `move` (int to, int from)  
*Move an item within its parent using index numbers.*
- int `move_above` (`FI_Tree_Item` \*item)  
*Move the current item above the specified 'item'.*
- int `move_below` (`FI_Tree_Item` \*item)  
*Move the current item below the specified 'item'.*
- int `move_into` (`FI_Tree_Item` \*item, int pos=0)  
*Parent the current item as a child of the specified 'item'.*
- `FI_Tree_Item` \* `next` ()  
*Return the next item in the tree.*
- `FI_Tree_Item` \* `next_displayed` (`FI_Tree_Prefs` &prefs)  
*Same as `next_visible()`.*
- `FI_Tree_Item` \* `next_sibling` ()  
*Return this item's next sibling.*
- `FI_Tree_Item` \* `next_visible` (`FI_Tree_Prefs` &prefs)  
*Return the next `open()`, `visible()` item.*
- void `open` ()  
*Open this item and all its children.*
- void `open_toggle` ()  
*Toggle the item's open/closed state.*
- `FI_Tree_Item` \* `parent` ()

- Return the parent for this item. Returns NULL if we are the root.*

  - const [FI\\_Tree\\_Item](#) \* **parent** () const
- Return the const parent for this item. Returns NULL if we are the root.*

  - void [parent](#) ([FI\\_Tree\\_Item](#) \*val)
- Set the parent for this item.*

  - const [FI\\_Tree\\_Prefs](#) & **prefs** () const
- Return the parent tree's prefs.*

  - [FI\\_Tree\\_Item](#) \* **prev** ()
- Return the previous item in the tree.*

  - [FI\\_Tree\\_Item](#) \* **prev\_displayed** ([FI\\_Tree\\_Prefs](#) &prefs)
- Same as [prev\\_visible\(\)](#).*

  - [FI\\_Tree\\_Item](#) \* **prev\_sibling** ()
- Return this item's previous sibling.*

  - [FI\\_Tree\\_Item](#) \* **prev\_visible** ([FI\\_Tree\\_Prefs](#) &prefs)
- Return the previous [open\(\)](#), [visible\(\)](#) item.*

  - int **remove\_child** (const char \*new\_label)
- Remove immediate child (and its children) by its label 'name'.*

  - int **remove\_child** ([FI\\_Tree\\_Item](#) \*item)
- Remove 'item' from the current item's children.*

  - int **reparent** ([FI\\_Tree\\_Item](#) \*newchild, int index)
- Reparent specified item as a child of ourself at position 'pos'.*

  - [FI\\_Tree\\_Item](#) \* **replace** ([FI\\_Tree\\_Item](#) \*new\_item)
- Replace the current item with a new item.*

  - [FI\\_Tree\\_Item](#) \* **replace\_child** ([FI\\_Tree\\_Item](#) \*olditem, [FI\\_Tree\\_Item](#) \*newitem)
- Replace existing child 'olditem' with 'newitem'.*

  - void **select** (int val=1)
- Change the item's selection state to the optionally specified 'val'.*

  - int **select\_all** ()
- Select item and all its children.*

  - void **select\_toggle** ()
- Toggle the item's selection state.*

  - void **show\_self** (const char \*indent="") const
- Print the tree as 'ascii art' to stdout.*

  - int **swap\_children** ([FI\\_Tree\\_Item](#) \*a, [FI\\_Tree\\_Item](#) \*b)
- Swap two of our immediate children, given item pointers.*

  - void **swap\_children** (int ax, int bx)
- Swap two of our children, given two child index values 'ax' and 'bx'.*

  - [FI\\_Tree](#) \* **tree** ()
- Return the tree for this item.*

  - const [FI\\_Tree](#) \* **tree** () const
- Return the tree for this item.*

  - void **update\_prev\_next** (int index)
- Update our [\\_prev\\_sibling](#) and [\\_next\\_sibling](#) pointers to point to neighbors given *index* as being our current position in the parent's item array.*

  - void \* **user\_data** () const
- Retrieve the user-data value that has been assigned to the item.*

  - void **user\_data** (void \*data)
- Set a user-data value for the item.*

  - [FI\\_Image](#) \* **userdeicon** () const
- Return the deactivated version of the user icon, if any.*

  - void **userdeicon** ([FI\\_Image](#) \*val)

- Set the usericon to draw when the item is deactivated.*

  - `FI_Image * usericon ()` const
 

*Get the item's user icon as an `FI_Image`. Returns '0' if disabled.*
  - `void usericon (FI_Image *val)`

*Set the item's user icon to an `FI_Image`.*
  - `int visible ()` const
 

*See if the item is visible. Alias for `is_visible()`.*
  - `int visible_r ()` const
 

*See if item and all its parents are `open()` and `visible()`.*
  - `int w ()` const
 

*The entire item's width to right edge of `FI_Tree`'s inner width within scrollbars.*
  - `FI_Widget * widget ()` const
 

*Return FLTK widget assigned to this item.*
  - `void widget (FI_Widget *val)`

*Assign an FLTK widget to this item.*
  - `int x ()` const
 

*The item's x position relative to the window.*
  - `int y ()` const
 

*The item's y position relative to the window.*

## Protected Member Functions

- `void _Init (const FI_Tree_Prefs &prefs, FI_Tree *tree)`
- `int calc_item_height (const FI_Tree_Prefs &prefs)` const
 

*Return the item's 'visible' height.*
- `void draw_horizontal_connector (int x1, int x2, int y, const FI_Tree_Prefs &prefs)`

*Internal: Horizontal connector line based on preference settings.*
- `void draw_vertical_connector (int x, int y1, int y2, const FI_Tree_Prefs &prefs)`

*Internal: Vertical connector line based on preference settings.*
- `FI_Color drawbgcolor ()` const
 

*Returns the recommended background color used for drawing this item.*
- `FI_Color drawfgcolor ()` const
 

*Returns the recommended foreground color used for drawing this item.*
- `void hide_widgets ()`

*Internal: Hide the FLTK `widget()` for this item and all children.*
- `int is_flag (unsigned short val)` const
 

*See if flag set. Returns 0 or 1.*
- `void recalc_tree ()`

*Call this when our geometry is changed.*
- `void set_flag (unsigned short flag, int val)`

*Set a flag to an on or off value. val is 0 or 1.*
- `void show_widgets ()`

*Internal: Show the FLTK `widget()` for this item and all children.*

### 33.154.1 Detailed Description

Tree widget item.

This class is a single tree item, and manages all of the item's attributes. `Fl_Tree_Item` is used by `Fl_Tree`, which is comprised of many instances of `Fl_Tree_Item`.

`Fl_Tree_Item` is hierarchical; it dynamically manages an `Fl_Tree_Item_Array` of children that are themselves instances of `Fl_Tree_Item`. Each item can have zero or more children. When an item has children, `close()` and `open()` can be used to hide or show them.

Items have their own attributes; font size, face, color. Items maintain their own hierarchy of children.

When you make changes to items, you'll need to tell the tree to `redraw()` for the changes to show up.

New 1.3.3 ABI feature: You can define custom items by either adding a custom widget to the item with `Fl_Tree_Item::widget()`, or override the `draw_item_content()` method if you want to just redefine how the label is drawn.

The following shows the `Fl_Tree_Item`'s dimensions, useful when overriding the `draw_item_content()` method:

Figure 33.65 `Fl_Tree_Item`'s internal dimensions.

### 33.154.2 Constructor & Destructor Documentation

#### 33.154.2.1 `Fl_Tree_Item()` [1/2]

```
Fl_Tree_Item::Fl_Tree_Item (
 const Fl_Tree_Prefs & prefs)
```

Constructor.

Makes a new instance of `Fl_Tree_Item` using defaults from 'prefs'.

**Deprecated** in 1.3.3 ABI – you must use `Fl_Tree_Item(Fl_Tree*)` for proper horizontal scrollbar behavior.

#### 33.154.2.2 `Fl_Tree_Item()` [2/2]

```
Fl_Tree_Item::Fl_Tree_Item (
 Fl_Tree * tree)
```

Constructor.

Makes a new instance of `Fl_Tree_Item` for 'tree'.

This must be used instead of the older, deprecated `Fl_Tree_Item(Fl_Tree_Prefs)` constructor for proper horizontal scrollbar calculation.

Version

1.3.3 ABI feature

### 33.154.3 Member Function Documentation

#### 33.154.3.1 `activate()`

```
void Fl_Tree_Item::activate (
 int val = 1) [inline]
```

Change the item's activation state to the optionally specified 'val'.

When deactivated, the item will be 'grayed out'; the callback() won't be invoked if the user clicks on the label. If a [widget\(\)](#) is associated with the item, its activation state will be changed as well.

If 'val' is not specified, the item will be activated.

### 33.154.3.2 add() [1/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 char ** arr)
```

Descend into the path specified by 'arr', and add a new child there.

Should be used only by [Fl\\_Tree](#)'s internals. Adds the item based on the value of prefs.sortorder().

#### Returns

the item added.

#### Version

1.3.0 release

### 33.154.3.3 add() [2/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 char ** arr,
 Fl_Tree_Item * newitem)
```

Descend into path specified by 'arr' and add 'newitem' there.

Should be used only by [Fl\\_Tree](#)'s internals. If item is NULL, a new item is created. Adds the item based on the value of prefs.sortorder().

#### Returns

the item added.

#### Version

1.3.3 ABI feature

### 33.154.3.4 add() [3/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 const char * new_label)
```

Add a new child to this item with the name 'new\_label' and defaults from 'prefs'.

An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

#### Returns

the item added

#### Version

1.3.0 release

**33.154.3.5 add()** [4/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 const char * new_label,
 Fl_Tree_Item * item)
```

Add 'item' as immediate child with 'new\_label' and defaults from 'prefs'.

If 'item' is NULL, a new item is created. An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

**Returns**

the item added

**Version**

1.3.3

**33.154.3.6 calc\_item\_height()**

```
int Fl_Tree_Item::calc_item_height (
 const Fl_Tree_Prefs & prefs) const [protected]
```

Return the item's 'visible' height.

Takes into account the item's:

- visibility (if lis\_visible(), returns 0)
- [labelfont\(\)](#) height: if [label\(\)](#) != NULL
- [widget\(\)](#) height: if [widget\(\)](#) != NULL
- [openicon\(\)](#) height (if has children)
- [usericon\(\)](#) height (if not NULL) Does NOT include [Fl\\_Tree::linespacing\(\)](#);

**Returns**

maximum pixel height

**33.154.3.7 child()**

```
const Fl_Tree_Item * Fl_Tree_Item::child (
 int t) const
```

Return the const child item for the given 'index'.

Return const child item for the specified 'index'.

**33.154.3.8 deactivate()**

```
void Fl_Tree_Item::deactivate () [inline]
```

Deactivate the item; the callback() won't be invoked when clicked.

Same as activate(0)

**33.154.3.9 deparent()**

```
Fl_Tree_Item * Fl_Tree_Item::deparent (
 int pos)
```

Deparent child at index position 'pos'.

This creates an "orphaned" item that is still allocated, but has no parent or siblings. Normally the caller would want to immediately reparent the orphan elsewhere.

A successfully orphaned item will have its [parent\(\)](#) and [prev\\_sibling\(\)/next\\_sibling\(\)](#) set to NULL.

**Returns**

- pointer to orphaned item on success
- NULL on error (could not deparent the item)

**See also**

[reparent\(\)](#)

**33.154.3.10 depth()**

```
int Fl_Tree_Item::depth () const
```

Returns how many levels deep this item is in the hierarchy.

For instance; root has a depth of zero, and its immediate children would have a depth of 1, and so on. Use e.g. for determining the horizontal indent of this item during drawing.

**33.154.3.11 deselect\_all()**

```
int Fl_Tree_Item::deselect_all () [inline]
```

Deselect item and all its children.

Returns count of how many items were in the 'selected' state, ie. how many items were "changed".

**33.154.3.12 draw()**

```
void Fl_Tree_Item::draw (
 int X,
 int & Y,
 int W,
 Fl_Tree_Item * itemfocus,
 int & tree_item_xmax,
 int lastchild = 1,
 int render = 1)
```

Draw this item and its children.

**Parameters**

in	<i>X</i>	Horizontal position for item being drawn
in, out	<i>Y</i>	Vertical position for item being drawn, returns new position for next item
in	<i>W</i>	Recommended width for item
in	<i>itemfocus</i>	The tree's current focus item (if any)
in, out	<i>tree_item_xmax</i>	The tree's running xmax (right-most edge so far). Mainly used by parent tree when <code>render==0</code> to calculate tree's max width.
in	<i>lastchild</i>	Is this item the last child in a subtree?
in	<i>render</i>	Whether or not to render the item: 0: no rendering, just calculate size w/out drawing. 1: render item as well as size calc

**Version**

1.3.3 ABI feature: modified parameters

**33.154.3.13 draw\_horizontal\_connector()**

```
void Fl_Tree_Item::draw_horizontal_connector (
 int x1,
 int x2,
```

```
int y,
 const Fl_Tree_Prefs & prefs) [protected]
```

Internal: Horizontal connector line based on preference settings.

#### Parameters

in	<i>x1</i>	The left hand X position of the horizontal connector
in	<i>x2</i>	The right hand X position of the horizontal connector
in	<i>y</i>	The vertical position of the horizontal connector
in	<i>prefs</i>	The <a href="#">Fl_Tree</a> prefs

#### 33.154.3.14 draw\_item\_content()

```
int Fl_Tree_Item::draw_item_content (
 int render) [virtual]
```

Draw the item content.

This method can be overridden to implement custom drawing by filling the `label_[xywh]()` area with content.

A minimal example of how to override `draw_item_content()` and draw just a normal item's background and label ourselves:

```
class MyTreeItem : public Fl_Tree_Item {
public:
 MyTreeItem() { }
 ~MyTreeItem() { }
 // DRAW OUR CUSTOM CONTENT FOR THE ITEM
 int draw_item_content(int render) {
 // Our item's dimensions + text content
 int X=label_x(), Y=label_y(), W=label_w(), H=label_h();
 const char *text = label() ? label() : "";
 // Rendering? Do any drawing that's needed
 if (render) {
 // Draw bg -- a filled rectangle
 fl_color(drawbgcolor()); fl_rectf(X,Y,W,H);
 // Draw label
 fl_font(labelfont(), labelsize()); // use item's label font/size
 fl_color(drawfgcolor()); // use recommended fg color
 fl_draw(text, X,Y,W,H, FL_ALIGN_LEFT); // draw the item's label
 }
 // Rendered or not, we must calculate content's max X position
 int lw=0, lh=0;
 fl_measure(text, lw, lh); // get width of label text
 return X + lw; // return X + label width
 }
};
```

You can draw anything you want inside `draw_item_content()` using any of the `fl_draw.H` functions, as long as it's within the label's `xywh` area.

To add instances of your custom item to the tree, you can use:

```
// Example #1: using add()
MyTreeItem *bart = new MyTreeItem(..); // class derived from Fl_Tree_Item
tree->add("/Simpsons/Bart", bart); // Add item as /Simpsons/Bart

..or you can insert or replace existing items:
// Example #2: using replace()
MyTreeItem *marge = new MyTreeItem(..); // class derived from Fl_Tree_Item
item = tree->add("/Simpsons/Marge"); // create item
item->replace(mi); // replace it with our own
```

#### Parameters

in	<i>render</i>	Whether we should render content (1), or just tally the geometry (0). <a href="#">Fl_Tree</a> may want only to find the widest item in the tree for scrollbar calculations.
----	---------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

the right-most X coordinate, or 'xmax' of content we drew, i.e. the "scrollable" content. The tree uses the largest xmax to determine the maximum width of the tree's content (needed for e.g. computing the horizontal scrollbar's size).

## Version

1.3.3 ABI feature

**33.154.3.15 draw\_vertical\_connector()**

```
void Fl_Tree_Item::draw_vertical_connector (
 int x,
 int y1,
 int y2,
 const Fl_Tree_Prefs & prefs) [protected]
```

Internal: Vertical connector line based on preference settings.

## Parameters

in	<i>x</i>	The x position of the vertical connector
in	<i>y1</i>	The top of the vertical connector
in	<i>y2</i>	The bottom of the vertical connector
in	<i>prefs</i>	The <a href="#">Fl_Tree</a> prefs

**33.154.3.16 drawbgcolor()**

```
Fl_Color Fl_Tree_Item::drawbgcolor () const [protected]
```

Returns the recommended background color used for drawing this item.

## See also

[draw\\_item\\_content\(\)](#)

## Version

1.3.3 ABI

**33.154.3.17 drawfgcolor()**

```
Fl_Color Fl_Tree_Item::drawfgcolor () const [protected]
```

Returns the recommended foreground color used for drawing this item.

## See also

[draw\\_item\\_content\(\)](#)

## Version

1.3.3 ABI ABI

**33.154.3.18 find\_child()** [1/2]

```
int Fl_Tree_Item::find_child (
 const char * name)
```

Return the index of the immediate child of this item that has the label 'name'.

**Returns**

index of found item, or -1 if not found.

**Version**

1.3.0 release

**33.154.3.19 find\_child() [2/2]**

```
int Fl_Tree_Item::find_child (
 Fl_Tree_Item * item)
```

Find the index number for the specified 'item' in the current item's list of children.

**Returns**

the index, or -1 if not found.

**33.154.3.20 find\_child\_item() [1/2]**

```
const Fl_Tree_Item * Fl_Tree_Item::find_child_item (
 char ** arr) const
```

Find child item by descending array 'arr' of names.

Does not include self in search. Only [Fl\\_Tree](#) should need this method.

**Returns**

item, or 0 if not found

**Version**

1.3.0 release

**33.154.3.21 find\_child\_item() [2/2]**

```
const Fl_Tree_Item * Fl_Tree_Item::find_child_item (
 const char * name) const
```

Return the /immediate/ child of current item that has the label 'name'.

**Returns**

const found item, or 0 if not found.

**Version**

1.3.3

**33.154.3.22 find\_clicked()**

```
const Fl_Tree_Item * Fl_Tree_Item::find_clicked (
 const Fl_Tree_Prefs & prefs,
 int yonly = 0) const
```

Find the item that the last event was over.

If 'yonly' is 1, only check event's y value, don't care about x.

## Parameters

in	<i>prefs</i>	The parent tree's <a href="#">Fl_Tree_Prefs</a>
in	<i>ynonly</i>	– 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.

## Returns

pointer to clicked item, or NULL if none found

## Version

1.3.3 ABI feature

**33.154.3.23 find\_item()**

```
const Fl_Tree_Item * Fl_Tree_Item::find_item (
 char ** names) const
```

Find item by descending array of 'names'.

Includes self in search. Only [Fl\\_Tree](#) should need this method. Use [Fl\\_Tree::find\\_item\(\)](#) instead.

## Returns

const item, or 0 if not found

**33.154.3.24 hide\_widgets()**

```
void Fl_Tree_Item::hide_widgets () [protected]
```

Internal: Hide the FLTK [widget\(\)](#) for this item and all children.

Used by [close\(\)](#) to hide widgets.

**33.154.3.25 insert()**

```
Fl_Tree_Item * Fl_Tree_Item::insert (
 const Fl_Tree_Prefs & prefs,
 const char * new_label,
 int pos = 0)
```

Insert a new item named 'new\_label' into current item's children at a specified position 'pos'.

If pos is out of range the new item is

- prepended if pos < 0 or
- appended if pos > item->[children\(\)](#).

## Returns

the new item inserted

## See also

[Fl\\_Tree::insert\(\)](#)

### 33.154.3.26 insert\_above()

```
Fl_Tree_Item * Fl_Tree_Item::insert_above (
 const Fl_Tree_Prefs & prefs,
 const char * new_label)
```

Insert a new item named 'new\_label' above this item.

#### Returns

the new item inserted, or 0 if an error occurred.

### 33.154.3.27 is\_visible\_r()

```
int Fl_Tree_Item::is_visible_r () const
```

See if item and all its parents are [open\(\)](#) and [visible\(\)](#).

#### Returns

1 – item and its parents are [open\(\)](#) and [visible\(\)](#) 0 – item or one of its parents are either not [visible\(\)](#) or [close\(\)](#)ed.

### 33.154.3.28 label()

```
void Fl_Tree_Item::label (
 const char * name)
```

Set the label to 'name'.

Makes and manages an internal copy of 'name'.

### 33.154.3.29 label\_h()

```
int Fl_Tree_Item::label_h () const [inline]
```

The item's label height.

#### Version

1.3.3

### 33.154.3.30 label\_w()

```
int Fl_Tree_Item::label_w () const [inline]
```

The item's maximum label width to right edge of [Fl\\_Tree](#)'s inner width within scrollbars.

#### Version

1.3.3

### 33.154.3.31 label\_x()

```
int Fl_Tree_Item::label_x () const [inline]
```

The item's label x position relative to the window.

#### Version

1.3.3

**33.154.3.32 label\_y()**

```
int Fl_Tree_Item::label_y () const [inline]
```

The item's label y position relative to the window.

**Version**

1.3.3

**33.154.3.33 labelbgcolor() [1/2]**

```
Fl_Color Fl_Tree_Item::labelbgcolor () const [inline]
```

Return item's label background text color.

If the color is 0xffffffff, the default behavior is the parent tree's bg color will be used. (An overloaded [draw\\_item\\_content\(\)](#) can override this behavior.)

**33.154.3.34 labelbgcolor() [2/2]**

```
void Fl_Tree_Item::labelbgcolor (
 Fl_Color val) [inline]
```

Set item's label background color.

A special case is made for color 0xffffffff which uses the parent tree's bg color.

**33.154.3.35 move() [1/2]**

```
int Fl_Tree_Item::move (
 Fl_Tree_Item * item,
 int op = 0,
 int pos = 0)
```

Move the current item above/below/into the specified 'item', where 'op' determines the type of move:

- 0: move above 'item' ('pos' ignored)
- 1: move below 'item' ('pos' ignored)
- 2: move into 'item' as a child (at optional position 'pos')

..and 'pos' determines an optional index position after the move.

**Returns**

0 on success. a negative number on error:

- -1: one of the items has no parent
- -2: item's index could not be determined
- -3: bad 'op'
- -4: index range error
- -5: could not deparent
- -6: could not reparent at 'pos'
- (Other return values reserved for future use.)

**See also**

[move\\_above\(\)](#), [move\\_below\(\)](#), [move\\_into\(\)](#), [move\(int,int\)](#)

### 33.154.3.36 move() [2/2]

```
int Fl_Tree_Item::move (
 int to,
 int from)
```

Move an item within its parent using index numbers.  
Item is moved 'to' its new position 'from' its old position.

#### Returns

- 0: Success
- -1: range error (e.g. if 'to' or 'from' out of range).
- (Other return values reserved for future use)

#### See also

[move\\_above\(\)](#), [move\\_below\(\)](#), [move\\_into\(\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

### 33.154.3.37 move\_above()

```
int Fl_Tree_Item::move_above (
 Fl_Tree_Item * item)
```

Move the current item above the specified 'item'.  
This is the equivalent of calling `move(item,0,0)`.

#### Returns

- 0 on success.
- On error returns a negative value; see [move\(Fl\\_Tree\\_Item\\*,int,int\)](#) for possible error codes.

#### See also

[move\\_below\(\)](#), [move\\_into\(\)](#), [move\(int,int\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

### 33.154.3.38 move\_below()

```
int Fl_Tree_Item::move_below (
 Fl_Tree_Item * item)
```

Move the current item below the specified 'item'.  
This is the equivalent of calling `move(item,1,0)`.

#### Returns

- 0 on success.
- On error returns a negative value; see [move\(Fl\\_Tree\\_Item\\*,int,int\)](#) for possible error codes.

#### See also

[move\\_above\(\)](#), [move\\_into\(\)](#), [move\(int,int\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

### 33.154.3.39 move\_into()

```
int Fl_Tree_Item::move_into (
 Fl_Tree_Item * item,
 int pos = 0)
```

Parent the current item as a child of the specified 'item'.  
This is the equivalent of calling `move(item,2,pos)`.

**Returns**

0 on success.  
On error returns a negative value; see [move\(Fl\\_Tree\\_Item\\*,int,int\)](#) for possible error codes.

**See also**

[move\\_above\(\)](#), [move\\_below\(\)](#), [move\(int,int\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

**33.154.3.40 next()**

```
Fl_Tree_Item * Fl_Tree_Item::next ()
```

Return the next item in the tree.

This method can be used to walk the tree forward. For an example of how to use this method, see [Fl\\_Tree::first\(\)](#).

**Returns**

the next item in the tree, or 0 if there's no more items.

**33.154.3.41 next\_displayed()**

```
Fl_Tree_Item * Fl_Tree_Item::next_displayed (
 Fl_Tree_Prefs & prefs)
```

Same as [next\\_visible\(\)](#).

**Deprecated** in 1.3.3 for confusing name, use [next\\_visible\(\)](#) instead

**33.154.3.42 next\_sibling()**

```
Fl_Tree_Item * Fl_Tree_Item::next_sibling ()
```

Return this item's next sibling.

Moves to the next item below us at the same level (sibling). Use this to move down the tree without changing [depth\(\)](#). effectively skipping over this item's children/descendants.

**Returns**

item's next sibling, or 0 if none.

**33.154.3.43 next\_visible()**

```
Fl_Tree_Item * Fl_Tree_Item::next_visible (
 Fl_Tree_Prefs & prefs)
```

Return the next [open\(\)](#), [visible\(\)](#) item.

(If this item has children and is closed, children are skipped)

This method can be used to walk the tree forward, skipping items that are not currently open/visible to the user.

**Returns**

the next [open\(\)](#) [visible\(\)](#) item below us, or 0 if there's no more items.

**Version**

1.3.3

#### 33.154.3.44 parent()

```
void Fl_Tree_Item::parent (
 Fl_Tree_Item * val) [inline]
```

Set the parent for this item.  
Should only be used by [Fl\\_Tree](#)'s internals.

#### 33.154.3.45 prefs()

```
const Fl_Tree_Prefs & Fl_Tree_Item::prefs () const
```

Return the parent tree's prefs.

##### Returns

a reference to the parent tree's [Fl\\_Tree\\_Prefs](#)

##### Version

1.3.3 ABI feature

#### 33.154.3.46 prev()

```
Fl_Tree_Item * Fl_Tree_Item::prev ()
```

Return the previous item in the tree.  
This method can be used to walk the tree backwards. For an example of how to use this method, see [Fl\\_Tree::last\(\)](#).

##### Returns

the previous item in the tree, or 0 if there's no item above this one (hit the root).

#### 33.154.3.47 prev\_displayed()

```
Fl_Tree_Item * Fl_Tree_Item::prev_displayed (
 Fl_Tree_Prefs & prefs)
```

Same as [prev\\_visible\(\)](#).

**Deprecated** in 1.3.3 for confusing name, use [prev\\_visible\(\)](#)

#### 33.154.3.48 prev\_sibling()

```
Fl_Tree_Item * Fl_Tree_Item::prev_sibling ()
```

Return this item's previous sibling.  
Moves to the previous item above us at the same level (sibling). Use this to move up the tree without changing [depth\(\)](#).

##### Returns

This item's previous sibling, or 0 if none.

#### 33.154.3.49 prev\_visible()

```
Fl_Tree_Item * Fl_Tree_Item::prev_visible (
 Fl_Tree_Prefs & prefs)
```

Return the previous [open\(\)](#), [visible\(\)](#) item.  
(If this item above us has children and is closed, its children are skipped)  
This method can be used to walk the tree backward, skipping items that are not currently open/visible to the user.

**Returns**

the previous [open\(\)](#) [visible\(\)](#) item above us, or 0 if there's no more items.

**33.154.3.50 recalc\_tree()**

```
void Fl_Tree_Item::recalc_tree () [protected]
```

Call this when our geometry is changed.

(Font size, label contents, etc) Schedules tree to recalculate itself, as changes to us may affect tree widget's scrollbar visibility and tab sizes.

**Version**

1.3.3 ABI

**33.154.3.51 remove\_child() [1/2]**

```
int Fl_Tree_Item::remove_child (
 const char * name)
```

Remove immediate child (and its children) by its label 'name'.

If more than one item matches 'name', only the first matching item is removed.

**Parameters**

in	<i>name</i>	The label name of the immediate child to remove
----	-------------	-------------------------------------------------

**Returns**

0 if removed, -1 if not found.

**Version**

1.3.3

**33.154.3.52 remove\_child() [2/2]**

```
int Fl_Tree_Item::remove_child (
 Fl_Tree_Item * item)
```

Remove 'item' from the current item's children.

**Returns**

0 if removed, -1 if item not an immediate child.

**33.154.3.53 reparent()**

```
int Fl_Tree_Item::reparent (
 Fl_Tree_Item * newchild,
 int pos)
```

Reparent specified item as a child of ourself at position 'pos'.

Typically 'newchild' was recently orphaned with [deparent\(\)](#).

**Returns**

- 0: on success
- -1: on error (e.g. if 'pos' out of range) with no changes made.

See also

[deparent\(\)](#)

### 33.154.3.54 replace()

```
Fl_Tree_Item * Fl_Tree_Item::replace (
 Fl_Tree_Item * newitem)
```

Replace the current item with a new item.

The current item is destroyed if successful. No checks are made to see if an item with the same name exists.

This method can be used to, for example, install 'custom' items into the tree derived from [Fl\\_Tree\\_Item](#); see [draw\\_item\\_content\(\)](#).

#### Parameters

in	<i>newitem</i>	The new item to replace the current item
----	----------------	------------------------------------------

#### Returns

*newitem* on success, NULL if could not be replaced.

See also

[Fl\\_Tree\\_Item::draw\\_item\\_content\(\)](#), [Fl\\_Tree::root\(Fl\\_Tree\\_Item\\*\)](#)

#### Version

1.3.3 ABI feature

### 33.154.3.55 replace\_child()

```
Fl_Tree_Item * Fl_Tree_Item::replace_child (
 Fl_Tree_Item * olditem,
 Fl_Tree_Item * newitem)
```

Replace existing child 'olditem' with 'newitem'.

The 'olditem' is destroyed if successful. Can be used to put custom items (derived from [Fl\\_Tree\\_Item](#)) into the tree. No checks are made to see if an item with the same name exists.

#### Parameters

in	<i>olditem</i>	The item to be found and replaced
in	<i>newitem</i>	The new item to take the place of 'olditem'

#### Returns

*newitem* on success and 'olditem' is destroyed. NULL on error if 'olditem' was not found as an immediate child.

See also

[replace\(\)](#), [Fl\\_Tree\\_Item::draw\(\)](#)

#### Version

1.3.3 ABI feature

**33.154.3.56 select()**

```
void Fl_Tree_Item::select (
 int val = 1) [inline]
```

Change the item's selection state to the optionally specified 'val'.  
If 'val' is not specified, the item will be selected.

**33.154.3.57 select\_all()**

```
int Fl_Tree_Item::select_all () [inline]
```

Select item and all its children.

Returns count of how many items were in the 'deselected' state, ie. how many items were "changed".

**33.154.3.58 show\_self()**

```
void Fl_Tree_Item::show_self (
 const char * indent = "") const
```

Print the tree as 'ascii art' to stdout.

Used mainly for debugging.

**33.154.3.59 show\_widgets()**

```
void Fl_Tree_Item::show_widgets () [protected]
```

Internal: Show the FLTK [widget\(\)](#) for this item and all children.

Used by [open\(\)](#) to re-show widgets that were hidden by a previous [close\(\)](#)

**33.154.3.60 swap\_children() [1/2]**

```
int Fl_Tree_Item::swap_children (
 Fl_Tree_Item * a,
 Fl_Tree_Item * b)
```

Swap two of our immediate children, given item pointers.

Use e.g. for sorting.

This method is SLOW because it involves linear lookups.

For speed, use [swap\\_children\(int,int\)](#) instead.

**Parameters**

in	<i>a,b</i>	The item ptrs of the two items to swap. Both must be immediate children of the current item.
----	------------	----------------------------------------------------------------------------------------------

**Returns**

- 0 : OK
- -1 : failed: item 'a' or 'b' is not our child.

**33.154.3.61 swap\_children() [2/2]**

```
void Fl_Tree_Item::swap_children (
 int ax,
 int bx)
```

Swap two of our children, given two child index values 'ax' and 'bx'.

Use e.g. for sorting.

This method is FAST, and does not involve lookups.

No range checking is done on either index value.

**Parameters**

in	<i>ax,bx</i>	the index of the items to swap
----	--------------	--------------------------------

**33.154.3.62 tree()** [1/2]

```
Fl_Tree * Fl_Tree_Item::tree () [inline]
```

Return the tree for this item.

**Version**

1.3.4

**33.154.3.63 tree()** [2/2]

```
const Fl_Tree * Fl_Tree_Item::tree () const [inline]
```

Return the tree for this item.

**Version**

1.3.3

**33.154.3.64 update\_prev\_next()**

```
void Fl_Tree_Item::update_prev_next (
 int index)
```

Update our `_prev_sibling` and `_next_sibling` pointers to point to neighbors given `index` as being our current position in the parent's item array.

Call this whenever items in the array are added/removed/moved/swapped/etc.

**Parameters**

<code>in</code>	<code>index</code>	Our index# in the parent. Special case if <code>index=-1</code> : become an orphan; null out all parent/sibling associations.
-----------------	--------------------	----------------------------------------------------------------------------------------------------------------------------------

**33.154.3.65 userdeicon()** [1/2]

```
Fl_Image * Fl_Tree_Item::userdeicon () const [inline]
```

Return the deactivated version of the user icon, if any.

Returns 0 if none.

**33.154.3.66 userdeicon()** [2/2]

```
void Fl_Tree_Item::userdeicon (
 Fl_Image * val) [inline]
```

Set the usericon to draw when the item is deactivated.

Use '0' to disable. No internal copy is made; caller must manage icon's memory.

To create a typical 'grayed out' version of your usericon image, you can do the following:

```
// Create tree + usericon for items
Fl_Tree *tree = new Fl_Tree(..);
Fl_Image *usr_icon = new Fl_Pixmap(..); // your usericon
Fl_Image *de_icon = usr_icon->copy(); // make a copy, and..
de_icon->inactive(); // make it 'grayed out'
...
for (..) { // item loop..
 item = tree->add("..."); // create new item
 item->usericon(usr_icon); // assign usericon to items
 item->userdeicon(de_icon); // assign userdeicon to items
 ..
}
```

In the above example, the app should 'delete' the two icons when they're no longer needed (e.g. after the tree is destroyed)

#### Version

1.3.4

### 33.154.3.67 `usericon()`

```
void Fl_Tree_Item::usericon (
 Fl_Image * val) [inline]
```

Set the item's user icon to an [Fl\\_Image](#).

Use '0' to disable. No internal copy is made, caller must manage icon's memory.

Note, if you expect your items to be deactivated(), use [userdeicon\(Fl\\_Image\\*\)](#) to set up a 'grayed out' version of your icon to be used for display.

#### See also

[userdeicon\(Fl\\_Image\\*\)](#)

### 33.154.3.68 `visible_r()`

```
int Fl_Tree_Item::visible_r () const [inline]
```

See if item and all its parents are [open\(\)](#) and [visible\(\)](#).

Alias for [is\\_visible\\_r\(\)](#).

#### Returns

1 – item and its parents are [open\(\)](#) and [visible\(\)](#) 0 – item (or one of its parents) are not visible or [close\(\)](#)ed.

The documentation for this class was generated from the following files:

- [Fl\\_Tree\\_Item.H](#)
- [Fl\\_Tree\\_Item.cxx](#)

## 33.155 `Fl_Tree_Item_Array` Class Reference

Manages an array of [Fl\\_Tree\\_Item](#) pointers.

```
#include <Fl_Tree_Item_Array.H>
```

### Public Member Functions

- void [add](#) ([Fl\\_Tree\\_Item](#) \*val)
  - Add an item\* to the end of the array.*
- void [clear](#) ()
  - Clear the entire array.*
- int [deparent](#) (int pos)
  - Deparent item at 'pos' from our list of children.*
- [Fl\\_Tree\\_Item\\_Array](#) (const [Fl\\_Tree\\_Item\\_Array](#) \*o)
  - Copy constructor. Makes new copy of array, with new instances of each item.*
- [Fl\\_Tree\\_Item\\_Array](#) (int new\_chunksize=10)
  - Constructor; creates an empty array.*
- void [insert](#) (int pos, [Fl\\_Tree\\_Item](#) \*new\_item)
  - Insert an item at index position pos.*
- int [manage\\_item\\_destroy](#) () const
- void [manage\\_item\\_destroy](#) (int val)

- Option to control if *Fl\_Tree\_Item\_Array*'s destructor will also destroy the *Fl\_Tree\_Item*'s.
- int **move** (int to, int from)
  - Move item at 'from' to new position 'to' in the array.
- *Fl\_Tree\_Item* \* **operator[]** (int i)
  - Return the item and index *i*.
- const *Fl\_Tree\_Item* \* **operator[]** (int i) const
  - Const version of *operator[]*(int i)
- int **remove** (*Fl\_Tree\_Item* \*item)
  - Remove the item from the array.
- void **remove** (int index)
  - Remove the item at.
- int **reparent** (*Fl\_Tree\_Item* \*item, *Fl\_Tree\_Item* \*newparent, int pos)
  - Reparent specified item as a child of ourself.
- void **replace** (int pos, *Fl\_Tree\_Item* \*new\_item)
  - Replace the item at *index* with *newitem*.
- void **swap** (int ax, int bx)
  - Swap the two items at index positions *ax* and *bx*.
- int **total** () const
  - Return the total items in the array, or 0 if empty.
- ~*Fl\_Tree\_Item\_Array* ()
  - Destructor. Calls each item's destructor, destroys internal *\_items* array.

### 33.155.1 Detailed Description

Manages an array of *Fl\_Tree\_Item* pointers.

Because FLTK 1.x.x. has mandated that templates and STL not be used, we use this class to dynamically manage the arrays.

None of the methods do range checking on index values; the caller must be sure that index values are within the range  $0 < \text{index} < \text{total}()$  (unless otherwise noted).

### 33.155.2 Constructor & Destructor Documentation

#### 33.155.2.1 Fl\_Tree\_Item\_Array()

```
Fl_Tree_Item_Array::Fl_Tree_Item_Array (
 int new_chunksize = 10)
```

Constructor; creates an empty array.

The optional 'chunksize' can be specified to optimize memory allocation for potentially large arrays. Default chunksize is 10.

### 33.155.3 Member Function Documentation

#### 33.155.3.1 add()

```
void Fl_Tree_Item_Array::add (
 Fl_Tree_Item * val)
```

Add an item\* to the end of the array.

Assumes the item was created with 'new', and will remain allocated.. *Fl\_Tree\_Item\_Array* will handle calling the item's destructor when the array is cleared or the item *remove()*'ed.

### 33.155.3.2 clear()

```
void Fl_Tree_Item_Array::clear (
 void)
```

Clear the entire array.

Each item will be deleted (destructors will be called), and the array will be cleared. `total()` will return 0.

### 33.155.3.3 deparent()

```
int Fl_Tree_Item_Array::deparent (
 int pos)
```

Deparent item at '`pos`' from our list of children.

Similar to a [remove\(\)](#) without the destruction of the item. This creates an orphaned item (still allocated, has no parent) which soon after is typically reparented elsewhere.

\returns 0 on success, -1 on error (e.g. if \p '`pos`' out of range)

### 33.155.3.4 insert()

```
void Fl_Tree_Item_Array::insert (
 int pos,
 Fl_Tree_Item * new_item)
```

Insert an item at index position `pos`.

Handles enlarging array if needed, total increased by 1.

If \p `pos`  $\geq$  `total()`, the item is appended to the array.

If \p `pos`  $<$  0, the item is prepended (works like `pos == 0`).

### 33.155.3.5 manage\_item\_destroy()

```
void Fl_Tree_Item_Array::manage_item_destroy (
 int val) [inline]
```

Option to control if [Fl\\_Tree\\_Item\\_Array](#)'s destructor will also destroy the [Fl\\_Tree\\_Item](#)'s.

If set: items and item array is destroyed. If clear: only the item array is destroyed, not items themselves.

### 33.155.3.6 move()

```
int Fl_Tree_Item_Array::move (
 int to,
 int from)
```

Move item at 'from' to new position 'to' in the array.

Due to how the moving an item shuffles the array around, a positional 'move' implies things that may not be obvious:

- When 'from' moved lower in tree, appears BELOW item that was at 'to'.
- When 'from' moved higher in tree, appears ABOVE item that was at 'to'.

#### Returns

0 on success, -1 on range error (e.g. if 'to' or 'from' out of range)

**33.155.3.7 remove()** [1/2]

```
int Fl_Tree_Item_Array::remove (
 Fl_Tree_Item * item)
```

Remove the item from the array.

\returns 0 if removed, or -1 if the item was not in the array.

**33.155.3.8 remove()** [2/2]

```
void Fl_Tree_Item_Array::remove (
 int index)
```

Remove the item at.

**Parameters**

in	<i>index</i>	from the array.  The item will be delete'd (if non-NULL), so its destructor will be called.
----	--------------	---------------------------------------------------------------------------------------------------

**33.155.3.9 reparent()**

```
int Fl_Tree_Item_Array::reparent (
 Fl_Tree_Item * item,
 Fl_Tree_Item * newparent,
 int pos)
```

Reparent specified item as a child of ourself.

Typically 'newchild' was recently orphaned with [deparent\(\)](#).

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

**33.155.3.10 replace()**

```
void Fl_Tree_Item_Array::replace (
 int index,
 Fl_Tree_Item * newitem)
```

Replace the item at *index* with *newitem*.

Old item at *index* position will be destroyed, and the new item will take it's place, and stitched into the linked list.

The documentation for this class was generated from the following files:

- [Fl\\_Tree\\_Item\\_Array.H](#)
- [Fl\\_Tree\\_Item\\_Array.cxx](#)

**33.156 Fl\_Tree\_Prefs Class Reference**

Tree widget's preferences.

```
#include <Fl_Tree_Prefs.H>
```

**Public Member Functions**

- [Fl\\_Image \\* closedeicon](#) () const  
*Return the deactivated version of the close icon, if any.*
- [Fl\\_Image \\* closeicon](#) () const

- Gets the default 'close' icon Returns the FI\_Image\* of the icon, or 0 if none.*

  - void **closeicon** (FI\_Image \*val)

### 33.156.1 Detailed Description

Tree widget's preferences.

`Fl_Tree`'s Preferences class.

This class manages the `Fl_Tree`'s defaults. You should probably be using the methods in `Fl_Tree` instead of trying to accessing tree's preferences settings directly.

### 33.156.2 Member Function Documentation

#### 33.156.2.1 `closedeicon()`

```
Fl_Image * Fl_Tree_Prefs::closedeicon () const [inline]
```

Return the deactivated version of the close icon, if any.

Returns 0 if none.

#### 33.156.2.2 `closeicon()`

```
void Fl_Tree_Prefs::closeicon (
 Fl_Image * val)
```

Sets the icon to be used as the 'close' icon.

This overrides the built in default '['-]' icon.

## Parameters

<code>in</code>	<code>val</code>	– The new image, or zero to use the default [-] icon.
-----------------	------------------	-------------------------------------------------------

**33.156.2.3 item\_draw\_mode()**

```
void Fl_Tree_Prefs::item_draw_mode (
 Fl_Tree_Item_Draw_Mode val) [inline]
```

Set the 'item draw mode' used for the tree to `val`.

This affects how items in the tree are drawn, such as when a `widget()` is defined. See `Fl_Tree_Item_Draw_Mode` for possible values.

**33.156.2.4 item\_labelbgcolor() [1/2]**

```
Fl_Color Fl_Tree_Prefs::item_labelbgcolor (
 void) const [inline]
```

Get the default label background color.

This returns the `Fl_Tree::color()` unless `item_labelbgcolor()` has been set explicitly.

**33.156.2.5 item\_labelbgcolor() [2/2]**

```
void Fl_Tree_Prefs::item_labelbgcolor (
 Fl_Color val) [inline]
```

Set the default label background color.

Once set, overrides the default behavior of using `Fl_Tree::color()`.

**33.156.2.6 marginbottom()**

```
int Fl_Tree_Prefs::marginbottom () const [inline]
```

Get the bottom margin's value in pixels.

This is the extra distance the vertical scroller lets you travel.

**33.156.2.7 opendeicon()**

```
Fl_Image * Fl_Tree_Prefs::opendeicon () const [inline]
```

Return the deactivated version of the open icon, if any.

Returns 0 if none.

**33.156.2.8 openicon() [1/2]**

```
Fl_Image * Fl_Tree_Prefs::openicon () const [inline]
```

Get the current default 'open' icon.

Returns the `Fl_Image*` of the icon, or 0 if none.

**33.156.2.9 openicon() [2/2]**

```
void Fl_Tree_Prefs::openicon (
 Fl_Image * val)
```

Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.

This overrides the built in default '[+]' icon.

## Parameters

<code>in</code>	<code>val</code>	– The new image, or zero to use the default [+] icon.
-----------------	------------------	-------------------------------------------------------

**33.156.2.10 selectmode()**

```
void Fl_Tree_Prefs::selectmode (
 Fl_Tree_Select val) [inline]
```

Set the selection mode used for the tree to `val`.

This affects how items in the tree are selected when clicked on and dragged over by the mouse. See `Fl_Tree_Select` for possible values.

**33.156.2.11 showcollapse()**

```
void Fl_Tree_Prefs::showcollapse (
 int val) [inline]
```

Set if we should show the collapse icon or not.

If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via `open()` and `close()`.

**Parameters**

<i>in</i>	<i>val</i>	1: shows collapse icons (default), 0: hides collapse icons.
-----------	------------	----------------------------------------------------------------

**33.156.2.12 showroot()**

```
void Fl_Tree_Prefs::showroot (
 int val) [inline]
```

Set if the root item should be shown or not.

**Parameters**

<i>in</i>	<i>val</i>	1 – show the root item (default) 0 – hide the root item.
-----------	------------	-------------------------------------------------------------

**33.156.2.13 sortorder()**

```
void Fl_Tree_Prefs::sortorder (
 Fl_Tree_Sort val) [inline]
```

Set the default sort order value.

Defines the order new items appear when `add()`ed to the tree. See `Fl_Tree_Sort` for possible values.

**33.156.2.14 userdeicon()**

```
Fl_Image * Fl_Tree_Prefs::userdeicon () const [inline]
```

Return the deactivated version of the user icon, if any.

Returns 0 if none.

The documentation for this class was generated from the following files:

- [Fl\\_Tree\\_Prefs.H](#)
- [Fl\\_Tree\\_Prefs.cxx](#)

**33.157 FI\_Valuator Class Reference**

The `Fl_Valuator` class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

```
#include <Fl_Valuator.H>
```

## Protected Member Functions

- `FL_Valuator` (int X, int Y, int W, int H, const char \*L)  
Creates a new `FL_Valuator` widget using the given position, size, and label string.
- void `handle_drag` (double newvalue)  
Called during a drag operation, after an `FL_WHEN_CHANGED` event is received and before the callback.
- void `handle_push` ()  
Stores the current value in the previous value.
- void `handle_release` ()  
Called after an `FL_WHEN_RELEASE` event is received and before the callback.
- int `horizontal` () const  
Tells if the valuator is an `FL_HORIZONTAL` one.
- double `previous_value` () const  
Gets the previous floating point value before an event changed it.
- void `set_value` (double v)  
Sets the current floating point value.
- double `softclamp` (double)  
Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void `value_damage` ()  
Asks for partial redraw.

## Additional Inherited Members

### 33.157.1 Detailed Description

The `FL_Valuator` class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object. There are probably more of these classes in FLTK than any others:

Figure 33.66 Valuator derived from `FL_Valuator`s

In the above diagram each box surrounds an actual subclass. These are further differentiated by setting the `type()` of the widget to the symbolic value labeling the widget. The ones labelled "0" are the default versions with a `type(0)`. For consistency the symbol `FL_VERTICAL` is defined as zero.

## 33.157.2 Constructor & Destructor Documentation

### 33.157.2.1 Fl\_Valuator()

```
Fl_Valuator::Fl_Valuator (
 int X,
 int Y,
 int W,
 int H,
 const char * L) [protected]
```

Creates a new [Fl\\_Valuator](#) widget using the given position, size, and label string. The default boxtype is FL\_NO\_BOX.

## 33.157.3 Member Function Documentation

### 33.157.3.1 format()

```
int Fl_Valuator::format (
 char * buffer) [virtual]
```

Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter. The actual format used depends on the current step value. If the step value has been set to zero then a %g format is used. If the step value is non-zero, then a %.\*f format is used, where the precision is calculated to show sufficient digits for the current step value. An integer step value, such as 1 or 1.0, gives a precision of 0, so the formatted value will appear as an integer.

This method is used by the Fl\_Valuator\_... group of widgets to format the current value into a text string. The return value is the length of the formatted text. The formatted value is written into *buffer*. *buffer* should have space for at least 128 bytes.

You may override this function to create your own text formatting.

### 33.157.3.2 increment()

```
double Fl_Valuator::increment (
 double v,
 int n)
```

Adds *n* times the step value to the passed value.

If step was set to zero it uses `fabs(maximum() - minimum()) / 100`.

### 33.157.3.3 maximum() [1/2]

```
double Fl_Valuator::maximum () const [inline]
```

Gets the maximum value for the valuator.

### 33.157.3.4 maximum() [2/2]

```
void Fl_Valuator::maximum (
 double a) [inline]
```

Sets the maximum value for the valuator.

### 33.157.3.5 minimum() [1/2]

```
double Fl_Valuator::minimum () const [inline]
```

Gets the minimum value for the valuator.

### 33.157.3.6 minimum() [2/2]

```
void Fl_Valuator::minimum (
 double a) [inline]
```

Sets the minimum value for the valuator.

### 33.157.3.7 precision()

```
void Fl_Valuator::precision (
 int digits)
```

Sets the step value to  $1.0 / 10^{\text{digits}}$ .

Precision `digits` is limited to 0...9 to avoid internal overflow errors. Values outside this range are clamped.

#### Note

For negative values of `digits` the step value is set to  $A = 1.0$  and  $B = 1$ , i.e.  $1.0/1 = 1$ .

### 33.157.3.8 range()

```
void Fl_Valuator::range (
 double a,
 double b) [inline]
```

Sets the minimum and maximum values for the valuator.

When the user manipulates the widget, the value is limited to this range. This clamping is done *after* rounding to the step value (this makes a difference if the range is not a multiple of the step).

The minimum may be greater than the maximum. This has the effect of "reversing" the object so the larger values are in the opposite direction. This also switches which end of the filled sliders is filled.

Some widgets consider this a "soft" range. This means they will stop at the range, but if the user releases and grabs the control again and tries to move it further, it is allowed.

The range may affect the display. You must [redraw\(\)](#) the widget after changing the range.

### 33.157.3.9 round()

```
double Fl_Valuator::round (
 double v)
```

Round the passed value to the nearest step increment.

Does nothing if step is zero.

### 33.157.3.10 step()

```
double Fl_Valuator::step () const [inline]
```

Gets or sets the step value.

As the user moves the mouse the value is rounded to the nearest multiple of the step value. This is done *before* clamping it to the range. For most widgets the default step is zero.

For precision the step is stored as the ratio of a double  $A$  and an integer  $B = A/B$ . You can set these values directly. Currently setting a floating point value sets the nearest  $A/1$  or  $1/B$  value possible.

### 33.157.3.11 value() [1/2]

```
double Fl_Valuator::value (
 void) const [inline]
```

Gets the floating point(double) value.

See int [value\(double\)](#)

**33.157.3.12 value()** [2/2]

```
int Fl_Valuator::value (
 double v)
```

Sets the current value.

The new value is *not* clamped or otherwise changed before storing it. Use [clamp\(\)](#) or [round\(\)](#) to modify the value before calling [value\(\)](#). The widget is redrawn if the new value is different than the current one. The initial value is zero.

[changed\(\)](#) will return true if the user has moved the slider, but it will be turned off by [value\(x\)](#) and just before doing a callback (the callback can turn it back on if desired).

**33.157.3.13 value\_damage()**

```
void Fl_Valuator::value_damage () [protected], [virtual]
```

Asks for partial redraw.

Reimplemented in [Fl\\_Adjuster](#).

The documentation for this class was generated from the following files:

- [Fl\\_Valuator.H](#)
- [Fl\\_Valuator.cxx](#)

**33.158 Fl\_Value\_Input Class Reference**

## Protected Member Functions

- void `draw ()` [FL\\_OVERRIDE](#)  
*Draws the widget.*

## Additional Inherited Members

### 33.158.1 Detailed Description

The [FL\\_Value\\_Input](#) widget displays a numeric value.

The user can click in the text field and edit it - there is in fact a hidden [FL\\_Input](#) widget with type(`FL_FLOAT_INPUT`) or type(`FL_INT_INPUT`) in there - and when they hit return or tab the value updates to what they typed and the callback is done.

If `step()` is non-zero and integral, then the range of numbers is limited to integers instead of floating point numbers. As well as displaying the value as an integer, typed input is also limited to integer values, even if the hidden [FL\\_Input](#) widget is of type(`FL_FLOAT_INPUT`).

If `step()` is non-zero, the user can also drag the mouse across the object and thus slide the value. The left button moves one `step()` per pixel, the middle by 10 `step()`, and the right button by 100 \* `step()`. It is therefore impossible to select text by dragging across it, although clicking can still move the insertion cursor.

If `step()` is non-zero and integral, then the range of numbers are limited to integers instead of floating point values.

Figure 33.67 `FL_Value_Input`

[FL\\_Widget::shortcut\\_label\(int\)](#)

### 33.158.2 Constructor & Destructor Documentation

### 33.158.2.1 Fl\_Value\_Input()

```
Fl_Value_Input::Fl_Value_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * I = 0)
```

Creates a new [Fl\\_Value\\_Input](#) widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`.

## 33.158.3 Member Function Documentation

### 33.158.3.1 cursor\_color() [1/2]

```
Fl_Color Fl_Value_Input::cursor_color () const [inline]
```

Gets the color of the text cursor.

The text cursor is black by default.

### 33.158.3.2 cursor\_color() [2/2]

```
void Fl_Value_Input::cursor_color (
 Fl_Color n) [inline]
```

Sets the color of the text cursor.

The text cursor is black by default.

### 33.158.3.3 draw()

```
void Fl_Value_Input::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 33.158.3.4 handle()

```
int Fl_Value_Input::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[FI\\_Event](#)

Reimplemented from [FI\\_Widget](#).

**33.158.3.5** `resize()`

```
void Fl_Value_Input::resize (
 int x,
 int y,
 int w,
 int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the `redraw()` method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call `resize()` a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

`position(X, Y)` is a shortcut for `resize(X, Y, w(), h())`, and `size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

## Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

## See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [FI\\_Widget](#).

**33.158.3.6** `shortcut()` [1/2]

```
int Fl_Value_Input::shortcut () const [inline]
```

Returns the current shortcut key for the Input.

## See also

[Fl\\_Value\\_Input::shortcut\(int\)](#)

**33.158.3.7** `shortcut()` [2/2]

```
void Fl_Value_Input::shortcut (
 int s) [inline]
```

Sets the shortcut key to `s`.

Setting this overrides the use of '&' in the [label\(\)](#). The value is a bitwise OR of a key and a set of shift flags, for example `FL_ALT | 'a'`, `FL_ALT | (FL_F + 10)`, or just `'a'`. A value of 0 disables the shortcut.

The key can be any value returned by [Fl::event\\_key\(\)](#), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.

The shift flags can be any set of values accepted by [Fl::event\\_state\(\)](#). If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

### 33.158.3.8 `soft()`

```
char Fl_Value_Input::soft () const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. The default is true.

### 33.158.3.9 `textcolor()`

```
Fl_Color Fl_Value_Input::textcolor (
 void) const [inline]
```

Gets the color of the text in the value box.

### 33.158.3.10 `textfont()` [1/2]

```
Fl_Font Fl_Value_Input::textfont (
 void) const [inline]
```

Gets the typeface of the text in the value box.

### 33.158.3.11 `textfont()` [2/2]

```
void Fl_Value_Input::textfont (
 Fl_Font s) [inline]
```

Sets the typeface of the text in the value box.

### 33.158.3.12 `textsize()` [1/2]

```
Fl_Fontsize Fl_Value_Input::textsize (
 void) const [inline]
```

Gets the size of the text in the value box.

### 33.158.3.13 `textsize()` [2/2]

```
void Fl_Value_Input::textsize (
 Fl_Fontsize s) [inline]
```

Sets the size of the text in the value box.

The documentation for this class was generated from the following files:

- `Fl_Value_Input.H`
- `Fl_Value_Input.cxx`

## 33.159 FI\_Value\_Output Class Reference

The [FI\\_Value\\_Output](#) widget displays a floating point value.

#### 33.159.1 Detailed Description

The [FI\\_Value\\_Output](#) widget displays a floating point value.

If [step\(\)](#) is not zero, the user can adjust the value by dragging the mouse left and right. The left button moves one [step\(\)](#) per pixel, the middle by  $10 * \text{step}()$ , and the right button by  $100 * \text{step}()$ .

This is much lighter-weight than [FI\\_Value\\_Input](#) because it contains no text editing code or character buffer.

Figure 33.68 [FI\\_Value\\_Output](#)

## 33.159.2 Constructor & Destructor Documentation

### 33.159.2.1 FI\_Value\_Output()

```
Fl_Value_Output::Fl_Value_Output (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [FI\\_Value\\_Output](#) widget using the given position, size, and label string.

The default boxtype is FL\_NO\_BOX.

Inherited destructor destroys the Valuator.

## 33.159.3 Member Function Documentation

### 33.159.3.1 draw()

```
void Fl_Value_Output::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [FI\\_Widget](#).

### 33.159.3.2 handle()

```
int Fl_Value_Output::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

### 33.159.3.3 `soft()` [1/2]

```
uchar Fl_Value_Output::soft () const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.

Default is one.

### 33.159.3.4 `soft()` [2/2]

```
void Fl_Value_Output::soft (
 uchar s) [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value.

Default is one.

### 33.159.3.5 `textcolor()` [1/2]

```
Fl_Color Fl_Value_Output::textcolor (
 void) const [inline]
```

Sets the color of the text in the value box.

### 33.159.3.6 `textcolor()` [2/2]

```
void Fl_Value_Output::textcolor (
 Fl_Color s) [inline]
```

Gets the color of the text in the value box.

### 33.159.3.7 `textfont()` [1/2]

```
Fl_Font Fl_Value_Output::textfont (
 void) const [inline]
```

Gets the typeface of the text in the value box.

### 33.159.3.8 `textfont()` [2/2]

```
void Fl_Value_Output::textfont (
 Fl_Font s) [inline]
```

Sets the typeface of the text in the value box.

### 33.159.3.9 `textsize()`

```
Fl_Fontsize Fl_Value_Output::textsize (
 void) const [inline]
```

Gets the size of the text in the value box.

The documentation for this class was generated from the following files:

- FI\_Value\_Output.H
- FI\_Value\_Output.cxx

## 33.160 FI\_Value\_Slider Class Reference

The `FI_Value_Slider` widget is a `FI_Slider` widget with a box displaying the current value.

```
#include <FI_Value_Slider.H>
```

*Draws the widget.*

## Additional Inherited Members

### 33.160.1 Detailed Description

The `Fl_Value_Slider` widget is a `Fl_Slider` widget with a box displaying the current value.

Figure 33.69 `Fl_Value_Slider`

### 33.160.2 Constructor & Destructor Documentation

#### 33.160.2.1 `Fl_Value_Slider()`

```
Fl_Value_Slider::Fl_Value_Slider (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Value_Slider` widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`.

### 33.160.3 Member Function Documentation

#### 33.160.3.1 `draw()`

```
void Fl_Value_Slider::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from `Fl_Slider`.

#### 33.160.3.2 `handle()`

```
int Fl_Value_Slider::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Slider](#).

#### 33.160.3.3 value\_height() [1/2]

```
int Fl_Value_Slider::value_height () const [inline]
```

Gets the height of the value box in pixels (vertical mode only).

#### Since

1.4.0

#### 33.160.3.4 value\_height() [2/2]

```
void Fl_Value_Slider::value_height (
 int s) [inline]
```

Sets the height of the value box in pixels (vertical mode only).

Limited range checking is applied but drawing errors may occur if the size *s* is set too high or too low, particularly if the widget is resized (later).

The programmer is responsible for setting sensible values and widget sizes.

The default value set by the constructor is 25.

#### Parameters

in	<i>s</i>	new height of the value box
----	----------	-----------------------------

Since

1.4.0

### 33.160.3.5 value\_width() [1/2]

```
int Fl_Value_Slider::value_width () const [inline]
```

Gets the width of the value box in pixels (horizontal mode only).

Since

1.4.0

### 33.160.3.6 value\_width() [2/2]

```
void Fl_Value_Slider::value_width (
 int s) [inline]
```

Sets the width of the value box in pixels (horizontal mode only).

Limited range checking is applied but drawing errors may occur if the size *s* is set too high or too low, particularly if the widget is resized (later).

The programmer is responsible for setting sensible values and widget sizes.

The default value set by the constructor is 35.

Parameters

in	s	new width of the value box
----	---	----------------------------

Since

1.4.0

The documentation for this class was generated from the following files:

- Fl\_Value\_Slider.H
- Fl\_Value\_Slider.cxx

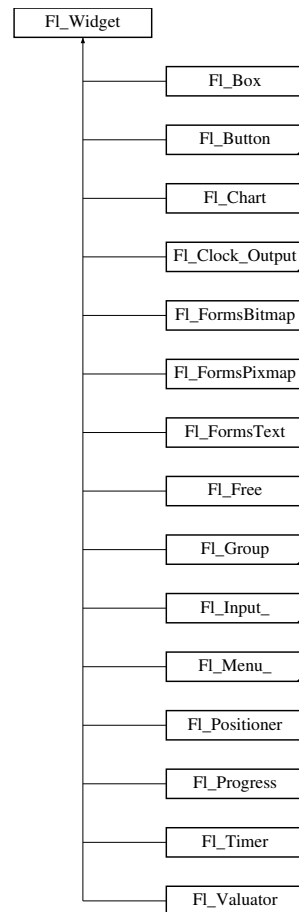

## 33.161 FI\_Widget Class Reference

[Fl\\_Widget](#) is the base class for all widgets in FLTK.

```
#include <Fl_Widget.H>
```

Inheritance diagram for Fl\_Widget:

## Public Member Functions

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()  
*Activates the widget.*
- unsigned int `active` () const  
*Returns whether the widget is active.*
- int `active_r` () const  
*Returns whether the widget and all of its parents are active.*
- `Fl_Align` `align` () const  
*Gets the label alignment.*
- void `align` (`Fl_Align` alignment)
- long `argument` () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void `argument` (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class `Fl_Gl_Window` \* `as_gl_window` ()  
*Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.*
- virtual class `Fl_Gl_Window` const \* `as_gl_window` () const
- virtual `Fl_Group` \* `as_group` ()  
*Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.*
- virtual `Fl_Group` const \* `as_group` () const
- virtual `Fl_Window` \* `as_window` ()

- Returns an `FI_Window` pointer if this widget is an `FI_Window`.*
- virtual `FI_Window` const \* **as\_window** () const
- void **bind\_deimage** (`FI_Image` \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (`FI_Image` \*img)
  - Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `FI_Boxtype` **box** () const
  - Gets the box type of the widget.*
- void **box** (`FI_Boxtype` new\_box)
  - Sets the box type for the widget.*
- `FI_Callback_p` **callback** () const
  - Gets the current callback function for the widget.*
- void **callback** (`FI_Callback` \*cb)
  - Sets the current callback function for the widget.*
- void **callback** (`FI_Callback` \*cb, `FI_Callback_User_Data` \*p, bool auto\_free)
  - Sets the current callback function and managed user data for the widget.*
- void **callback** (`FI_Callback` \*cb, void \*p)
  - Sets the current callback function and data for the widget.*
- void **callback** (`FI_Callback0` \*cb)
  - Sets the current callback function for the widget.*
- void **callback** (`FI_Callback1` \*cb, long p=0)
  - Sets the current callback function for the widget.*
- unsigned int **changed** () const
  - Checks if the widget value changed since the last callback.*
- void **clear\_active** ()
  - Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()
  - Marks the value of the widget as unchanged.*
- void **clear\_damage** (`uchar` c=0)
  - Clears or sets the damage flags.*
- void **clear\_output** ()
  - Sets a widget to accept input.*
- void **clear\_visible** ()
  - Hides the widget.*
- void **clear\_visible\_focus** ()
  - Disables keyboard focus navigation with this widget.*
- `FI_Color` **color** () const
  - Gets the background color of the widget.*
- void **color** (`FI_Color` bg)
  - Sets the background color of the widget.*
- void **color** (`FI_Color` bg, `FI_Color` sel)
  - Sets the background and selection color of the widget.*
- `FI_Color` **color2** () const
  - For back compatibility only.*
- void **color2** (unsigned a)
  - For back compatibility only.*
- int **contains** (const `FI_Widget` \*w) const

- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*
- [uchar damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)

*Internal use only.*
- void [deactivate](#) ()

*Deactivates the widget.*
- [Fl\\_Image \\* deimage](#) ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const [Fl\\_Image \\* deimage](#) () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, long arg, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*arg=0, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- virtual void [draw](#) ()=0

*Draws the widget.*
- void [draw\\_label](#) (int, int, int, int, [Fl\\_Align](#)) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const

*Gets the widget height.*
- virtual int [handle](#) (int event)

*Handles the specified event.*
- virtual void [hide](#) ()

*Makes a widget invisible.*
- [Fl\\_Image \\* image](#) ()

*Gets the image that is used as part of the widget label when in the active state.*
- const [Fl\\_Image \\* image](#) () const

*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const

*Returns whether the image is managed by the widget.*

- int `inside` (const `FI_Widget` \*wgt) const  
*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const  
*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const  
*Gets the current label text.*
- void `label` (const char \*text)  
*Sets the current label pointer.*
- void `label` (`FI_Labeltype` a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()  
*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)  
*Set the gap between the label and the image in pixels.*
- `FI_Color` `labelcolor` () const  
*Gets the label color.*
- void `labelcolor` (`FI_Color` c)  
*Sets the label color.*
- `FI_Font` `labelfont` () const  
*Gets the font to use.*
- void `labelfont` (`FI_Font` f)  
*Sets the font to use.*
- `FI_Fontsize` `labelsize` () const  
*Gets the font size in pixels.*
- void `labelsize` (`FI_Fontsize` pix)  
*Sets the font size in pixels.*
- `FI_Labeltype` `labeltype` () const  
*Gets the label type.*
- void `labeltype` (`FI_Labeltype` a)  
*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const  
*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const  
*Returns if a widget is used for output only.*
- `FI_Group` \* `parent` () const  
*Returns a pointer to the parent widget.*
- void `parent` (`FI_Group` \*p)  
*Internal use only - "for hacks only".*
- void `position` (int X, int Y)  
*Repositions the window or widget.*
- void `redraw` ()  
*Schedules the drawing of the widget.*
- void `redraw_label` ()  
*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- `FI_Color` `selection_color` () const

- Gets the selection color.*

  - void `selection_color` (`Fl_Color` a)

*Sets the selection color.*

  - void `set_active` ()

*Marks the widget as active without sending events or changing focus.*

  - void `set_changed` ()

*Marks the value of the widget as changed.*

  - void `set_output` ()

*Sets a widget to output only.*

  - void `set_visible` ()

*Makes the widget visible.*

  - void `set_visible_focus` ()

*Enables keyboard focus navigation with this widget.*

  - int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void `show` ()

*Makes a widget visible.*

  - void `size` (int W, int H)

*Changes the size of the widget.*

  - int `take_focus` ()

*Gives the widget the keyboard focus.*

  - unsigned int `takeevents` () const

*Returns if the widget is able to take events.*

  - int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* `tooltip` () const

*Gets the current tooltip text.*

  - void `tooltip` (const char \*text)

*Sets the current tooltip text.*

  - `Fl_Window` \* `top_window` () const

*Returns a pointer to the top-level window for the widget.*

  - `Fl_Window` \* `top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*

  - `uchar` `type` () const

*Gets the widget type.*

  - void `type` (`uchar` t)

*Sets the widget type.*

  - int `use_accents_menu` ()

*Returns non zero if `MAC_USE_ACCENTS_MENU` flag is set, 0 otherwise.*

  - void \* `user_data` () const

*Gets the user data for this widget.*

  - void `user_data` (`Fl_Callback_User_Data` \*v, bool auto\_free)

*Sets the user data for this widget.*

  - void `user_data` (void \*v)

*Sets the user data for this widget.*

  - unsigned int `visible` () const

*Returns whether a widget is visible.*

  - unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*

- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `Fl_When when` () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `Fl_Window * window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()  
*Destroys the widget.*

### Static Public Member Functions

- static void `default_callback` (`Fl_Widget *widget`, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types

*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

## Friends

- class **FI\_Group**

### 33.161.1 Detailed Description

**FI\_Widget** is the base class for all widgets in FLTK.

You can't create one of these because the constructor is not public. However you can subclass it.

All "property" accessing methods, such as [color\(\)](#), [parent\(\)](#), or [argument\(\)](#) are implemented as trivial inline functions and thus are as fast and small as accessing fields in a structure. Unless otherwise noted, the property setting methods such as [color\(n\)](#) or [label\(s\)](#) are also trivial inline functions, even if they change the widget's appearance. It is up to the user code to call [redraw\(\)](#) after these.

### 33.161.2 Member Enumeration Documentation

#### 33.161.2.1 anonymous enum

anonymous enum [protected]

flags possible values enumeration.

See [activate\(\)](#), [output\(\)](#), [visible\(\)](#), [changed\(\)](#), [set\\_visible\\_focus\(\)](#)

#### Enumerator

INACTIVE	the widget can't receive focus, and is disabled but potentially visible
----------	-------------------------------------------------------------------------

## Enumerator

INVISIBLE	the widget is not drawn, but can receive a few special events
OUTPUT	for output only
NOBORDER	don't draw a decoration ( <a href="#">FI_Window</a> )
FORCE_POSITION	don't let the window manager position the window ( <a href="#">FI_Window</a> )
NON_MODAL	this is a hovering toolbar window ( <a href="#">FI_Window</a> )
SHORTCUT_LABEL	the label contains a shortcut we need to draw
CHANGED	the widget value changed
OVERRIDE	position window on top ( <a href="#">FI_Window</a> )
VISIBLE_FOCUS	accepts keyboard focus navigation if the widget can have the focus
COPIED_LABEL	the widget label is internally copied, its destruction is handled by the widget
CLIP_CHILDREN	all drawing within this widget will be clipped ( <a href="#">FI_Group</a> )
MENU_WINDOW	a temporary popup window, dismissed by clicking outside ( <a href="#">FI_Window</a> )
TOOLTIP_WINDOW	a temporary popup, transparent to events, and dismissed easily ( <a href="#">FI_Window</a> )
MODAL	a window blocking input to all other windows ( <a href="#">FI_Window</a> )
NO_OVERLAY	window not using a hardware overlay plane ( <a href="#">FI_Menu_Window</a> )
GROUP_RELATIVE	Reserved, not implemented. DO NOT USE.
COPIED_TOOLTIP	the widget tooltip is internally copied, its destruction is handled by the widget
FULLSCREEN	a fullscreen window ( <a href="#">FI_Window</a> )
MAC_USE_ACCENTS_MENU	On the macOS platform, pressing and holding a key on the keyboard opens an accented-character menu window ( <a href="#">FI_Input_</a> , <a href="#">FI_Text_Editor</a> )
NEEDS_KEYBOARD	set on touch screen devices if a widget needs a keyboard when it gets the focus. Reserved, not yet used in 1.4.0.  See also  <a href="#">FI_Widget::needs_keyboard()</a>
IMAGE_BOUND	binding the image to the widget will transfer ownership, so that the widget will delete the image when it is no longer needed
DEIMAGE_BOUND	bind the inactive image to the widget, so the widget deletes the image when it is no longer needed
AUTO_DELETE_USER_DATA	automatically call <code>delete</code> on the <code>user_data</code> pointer when destroying this widget; if set, <code>user_data</code> must point to a class derived from the class <a href="#">FI_Callback_User_Data</a>
MAXIMIZED	a maximized <a href="#">FI_Window</a>
POPUP	popup window (i.e., positioned relatively to another mapped window)
USERFLAG3	reserved for 3rd party extensions
USERFLAG2	reserved for 3rd party extensions
USERFLAG1	reserved for 3rd party extensions

### 33.161.3 Constructor & Destructor Documentation

#### 33.161.3.1 [FI\\_Widget\(\)](#)

```
Fl_Widget::Fl_Widget (
 int x,
 int y,
 int w,
```

```
int h,
const char * label = 0L) [protected]
```

Creates a widget at the given position and size.

The `Fl_Widget` is a protected constructor, but all derived widgets have a matching public constructor. It takes a value for `x()`, `y()`, `w()`, `h()`, and an optional value for `label()`.

#### Parameters

in	<code>x,y</code>	the position of the widget relative to the enclosing window
in	<code>w,h</code>	size of the widget in pixels
in	<code>label</code>	optional text for the widget label

#### 33.161.3.2 ~Fl\_Widget()

```
Fl_Widget::~Fl_Widget () [virtual]
```

Destroys the widget.

Destroys the widget, taking care of throwing focus before if any.

Destroying single widgets is not very common. You almost always want to destroy the parent group instead, which will destroy all of the child widgets and groups in that group.

#### Since

FLTK 1.3, the widget's destructor removes the widget from its parent group, if it is member of a group.

Destruction removes the widget from any parent group! And groups when destroyed destroy all their children. This is convenient and fast.

### 33.161.4 Member Function Documentation

#### 33.161.4.1 activate()

```
void Fl_Widget::activate ()
```

Activates the widget.

Changing this value will send `FL_ACTIVATE` to the widget if `active_r()` is true.

#### See also

[active\(\)](#), [active\\_r\(\)](#), [deactivate\(\)](#)

#### 33.161.4.2 active()

```
unsigned int Fl_Widget::active () const [inline]
```

Returns whether the widget is active.

#### Return values

0	if the widget is inactive
---	---------------------------

#### See also

[active\\_r\(\)](#), [activate\(\)](#), [deactivate\(\)](#)

**33.161.4.3 active\_r()**

```
int Fl_Widget::active_r () const
```

Returns whether the widget and all of its parents are active.

**Return values**

0	if this or any of the parent widgets are inactive
---	---------------------------------------------------

**See also**

[active\(\)](#), [activate\(\)](#), [deactivate\(\)](#)

**33.161.4.4 align() [1/2]**

```
Fl_Align Fl_Widget::align () const [inline]
```

Gets the label alignment.

**Returns**

label alignment

**See also**

[label\(\)](#), [align\(Fl\\_Align\)](#), [Fl\\_Align](#)

**33.161.4.5 align() [2/2]**

```
void Fl_Widget::align (
 Fl_Align alignment) [inline]
```

Sets the label alignment.

This controls how the label is displayed next to or inside the widget. The default value is `FL_ALIGN_CENTER`, which centers the label inside the widget.

**Parameters**

in	<i>alignment</i>	new label alignment
----	------------------	---------------------

**See also**

[align\(\)](#), [Fl\\_Align](#)

**33.161.4.6 argument() [1/2]**

```
long Fl_Widget::argument () const [inline]
```

Gets the current user data (long) argument that is passed to the callback function.

**Note**

On platforms with `sizeof(long) < sizeof(void*)`, particularly on Windows 64-bit platforms, this method can truncate stored addresses (void\*) to the size of a long value. Use with care and only if you are sure that the stored user\_data value fits in a long value because it was stored with [argument\(long\)](#) or another method using only long values. You may want to use [user\\_data\(\)](#) instead.

See also

[user\\_data\(\)](#)

#### 33.161.4.7 argument() [2/2]

```
void Fl_Widget::argument (
 long v) [inline]
```

Sets the current user data (long) argument that is passed to the callback function.

See also

[argument\(\)](#)

#### 33.161.4.8 as\_gl\_window()

```
virtual class Fl_Gl_Window * Fl_Widget::as_gl_window () [inline], [virtual]
```

Returns an [Fl\\_Gl\\_Window](#) pointer if this widget is an [Fl\\_Gl\\_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Gl\\_Window](#).

If it returns non-NULL, then the widget in question is derived from [Fl\\_Gl\\_Window](#).

Return values

NULL	if this widget is not derived from <a href="#">Fl_Gl_Window</a> .
------	-------------------------------------------------------------------

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl\\_Widget::as\\_group\(\)](#), [Fl\\_Widget::as\\_window\(\)](#)

Reimplemented in [Fl\\_Gl\\_Window](#).

#### 33.161.4.9 as\_group()

```
virtual Fl_Group * Fl_Widget::as_group () [inline], [virtual]
```

Returns an [Fl\\_Group](#) pointer if this widget is an [Fl\\_Group](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Group](#). If it returns non-NULL, then the widget in question is derived from [Fl\\_Group](#), and you can use the returned pointer to access its children or other [Fl\\_Group](#)-specific methods.

Example:

```
void my_callback (Fl_Widget *w, void *) {
 Fl_Group *g = w->as_group();
 if (g)
 printf ("This group has %d children\n", g->children());
 else
 printf ("This widget is not a group!\n");
}
```

Return values

NULL	if this widget is not derived from <a href="#">Fl_Group</a> .
------	---------------------------------------------------------------

**Note**

This method is provided to avoid `dynamic_cast`.

**See also**

[Fl\\_Widget::as\\_window\(\)](#), [Fl\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented in [Fl\\_Group](#).

**33.161.4.10 as\_window()**

```
virtual Fl_Window * Fl_Widget::as_window () [inline], [virtual]
```

Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl\\_Window](#), and you can use the returned pointer to access its children or other [Fl\\_Window](#)-specific methods.

**Return values**

<code>NULL</code>	if this widget is not derived from <a href="#">Fl_Window</a> .
-------------------	----------------------------------------------------------------

**Note**

This method is provided to avoid `dynamic_cast`.

**See also**

[Fl\\_Widget::as\\_group\(\)](#), [Fl\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented in [Fl\\_Window](#).

**33.161.4.11 bind\_deimage() [1/2]**

```
void Fl_Widget::bind_deimage (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the inactive state.

**Parameters**

<code>in</code>	<code>img</code>	the new image for the deactivated widget
-----------------	------------------	------------------------------------------

**Note**

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

**See also**

void [deimage\(Fl\\_Image\\* img\)](#)

**33.161.4.12 bind\_deimage() [2/2]**

```
void Fl_Widget::bind_deimage (
 int f) [inline]
```

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

## Parameters

<i>f</i>	1: mark the image as bound, 0: mark the image as managed by the user
----------	----------------------------------------------------------------------

## See also

[deimage\\_bound\(\)](#), [bind\\_image\(\)](#)

**33.161.4.13 bind\_image()** [1/2]

```
void Fl_Widget::bind_image (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the active state.

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

Calling [bind\\_image\(\)](#) with a new image will delete the old image if it was bound, and then set the new image, and bind that. If old and new image are the same, nothing happens.

Calling [bind\\_image\(\)](#) with NULL will delete the old image if it was bound and not set a new image.

## Parameters

<i>in</i>	<i>img</i>	the new image for the label
-----------	------------	-----------------------------

## See also

[void image\(Fl\\_Image\\* img\)](#)

**33.161.4.14 bind\_image()** [2/2]

```
void Fl_Widget::bind_image (
 int f) [inline]
```

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

## Parameters

<i>f</i>	1: mark the image as bound, 0: mark the image as managed by the user
----------	----------------------------------------------------------------------

## See also

[image\\_bound\(\)](#), [bind\\_deimage\(\)](#)

**33.161.4.15 box()** [1/2]

```
Fl_Boxtype Fl_Widget::box (
 void) const [inline]
```

Gets the box type of the widget.

## Returns

the current box type

## See also

[box\(Fl\\_Boxtype\)](#), [Fl\\_Boxtype](#)

**33.161.4.16 box()** [2/2]

```
void Fl_Widget::box (
 Fl_Boxtype new_box) [inline]
```

Sets the box type for the widget.

This identifies a routine that draws the background of the widget. See [Fl\\_Boxtype](#) for the available types. The default depends on the widget, but is usually `FL_NO_BOX` or `FL_UP_BOX`.

**Parameters**

in	<i>new_box</i>	the new box type
----	----------------	------------------

**See also**

[box\(\)](#), [Fl\\_Boxtype](#)

**33.161.4.17 callback()** [1/6]

```
Fl_Callback_p Fl_Widget::callback () const [inline]
```

Gets the current callback function for the widget.

Each widget has a single callback.

**Returns**

current callback

**33.161.4.18 callback()** [2/6]

```
void Fl_Widget::callback (
 Fl_Callback * cb) [inline]
```

Sets the current callback function for the widget.

Each widget has a single callback.

**Parameters**

in	<i>cb</i>	new callback
----	-----------	--------------

**33.161.4.19 callback()** [3/6]

```
void Fl_Widget::callback (
 Fl_Callback * cb,
 Fl_Callback_User_Data * p,
 bool auto_free) [inline]
```

Sets the current callback function and managed user data for the widget.

Setting `auto_free` will transfer ownership of the callback user data to the widget. Deleting the widget will then also delete the user data.

**Parameters**

in	<i>cb</i>	new callback
in	<i>p</i>	user data
in	<i>auto_free</i>	if set, the widget will free user data when destroyed

**33.161.4.20 callback()** [4/6]

```
void Fl_Widget::callback (
 Fl_Callback * cb,
 void * p) [inline]
```

Sets the current callback function and data for the widget. Each widget has a single callback.

**Parameters**

in	<i>cb</i>	new callback
in	<i>p</i>	user data

**33.161.4.21 callback()** [5/6]

```
void Fl_Widget::callback (
 Fl_Callback0 * cb) [inline]
```

Sets the current callback function for the widget. Each widget has a single callback.

**Parameters**

in	<i>cb</i>	new callback
----	-----------	--------------

**33.161.4.22 callback()** [6/6]

```
void Fl_Widget::callback (
 Fl_Callback1 * cb,
 long p = 0) [inline]
```

Sets the current callback function for the widget. Each widget has a single callback.

**Parameters**

in	<i>cb</i>	new callback
in	<i>p</i>	user data

**33.161.4.23 changed()**

```
unsigned int Fl_Widget::changed () const [inline]
```

Checks if the widget value changed since the last callback.

"Changed" is a flag that is turned on when the user changes the value stored in the widget. This is only used by subclasses of [Fl\\_Widget](#) that store values, but is in the base class so it is easier to scan all the widgets in a panel and [do\\_callback\(\)](#) on the changed ones in response to an "OK" button.

Most widgets turn this flag off when they do the callback, and when the program sets the stored value.

**Note**

[do\\_callback\(\)](#) turns this flag off after the callback.

## Return values

0	if the value did not change
---	-----------------------------

## See also

[set\\_changed\(\)](#), [clear\\_changed\(\)](#)  
[do\\_callback\(Fl\\_Widget \\*widget, void \\*data\)](#)

**33.161.4.24 clear\_active()**

```
void Fl_Widget::clear_active () [inline]
```

Marks the widget as inactive without sending events or changing focus. This is mainly for specialized use, for normal cases you want [deactivate\(\)](#).

## See also

[deactivate\(\)](#)

**33.161.4.25 clear\_changed()**

```
void Fl_Widget::clear_changed () [inline]
```

Marks the value of the widget as unchanged.

## See also

[changed\(\)](#), [set\\_changed\(\)](#)

**33.161.4.26 clear\_damage()**

```
void Fl_Widget::clear_damage (
 uchar c = 0) [inline]
```

Clears or sets the damage flags.

Damage flags are cleared when parts of the widget drawing is repaired.

The optional argument `c` specifies the bits that **are set** after the call (default: 0) and **not** the bits that are cleared!

## Note

Therefore it is possible to set damage bits with this method, but this should be avoided. Use [damage\(uchar\)](#) instead.

## Parameters

in	c	new bitmask of damage flags (default: 0)
----	---	------------------------------------------

## See also

[damage\(uchar\)](#), [damage\(\)](#)

**33.161.4.27 clear\_output()**

```
void Fl_Widget::clear_output () [inline]
```

Sets a widget to accept input.

See also

[set\\_output\(\)](#), [output\(\)](#)

#### 33.161.4.28 clear\_visible()

```
void Fl_Widget::clear_visible () [inline]
```

Hides the widget.

You must still redraw the parent to see a change in the window. Normally you want to use the [hide\(\)](#) method instead.

#### 33.161.4.29 clear\_visible\_focus()

```
void Fl_Widget::clear_visible_focus () [inline]
```

Disables keyboard focus navigation with this widget.

Normally, all widgets participate in keyboard focus navigation.

See also

[set\\_visible\\_focus\(\)](#), [visible\\_focus\(\)](#), [visible\\_focus\(int\)](#)

#### 33.161.4.30 color() [1/3]

```
Fl_Color Fl_Widget::color (
 void) const [inline]
```

Gets the background color of the widget.

Returns

current background color

See also

[color\(Fl\\_Color\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#)

#### 33.161.4.31 color() [2/3]

```
void Fl_Widget::color (
 Fl_Color bg) [inline]
```

Sets the background color of the widget.

The color is passed to the box routine. The color is either an index into an internal table of RGB colors or an RGB color value generated using [fl\\_rgb\\_color\(\)](#).

The default for most widgets is FL\_BACKGROUND\_COLOR. Use [Fl::set\\_color\(\)](#) to redefine colors in the color map.

Parameters

<i>in</i>	<i>bg</i>	background color
-----------	-----------	------------------

See also

[color\(\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#), [selection\\_color\(Fl\\_Color\)](#)

#### 33.161.4.32 color() [3/3]

```
void Fl_Widget::color (
```

```

 Fl_Color bg,
 Fl_Color sel) [inline]

```

Sets the background and selection color of the widget.  
The two color form sets both the background and selection colors.

#### Parameters

in	<i>bg</i>	background color
in	<i>sel</i>	selection color

#### See also

`color(unsigned)`, `selection_color(unsigned)`

#### 33.161.4.33 `color2()` [1/2]

```

Fl_Color Fl_Widget::color2 () const [inline]

```

For back compatibility only.

**Deprecated** Use `selection_color()` instead.

#### 33.161.4.34 `color2()` [2/2]

```

void Fl_Widget::color2 (
 unsigned a) [inline]

```

For back compatibility only.

**Deprecated** Use `selection_color(unsigned)` instead.

#### 33.161.4.35 `contains()`

```

int Fl_Widget::contains (
 const Fl_Widget * w) const

```

Checks if *w* is a child of this widget.

#### Parameters

in	<i>w</i>	potential child widget
----	----------	------------------------

#### Returns

Returns 1 if *w* is a child of this widget, or is equal to this widget. Returns 0 if *w* is NULL.

#### 33.161.4.36 `copy_label()`

```

void Fl_Widget::copy_label (
 const char * new_label)

```

Sets the current label.

Unlike `label()`, this method allocates a copy of the label string instead of using the original string pointer. The internal copy will automatically be freed whenever you assign a new label or when the widget is destroyed.

## Parameters

in	<i>new_label</i>	the new label text
----	------------------	--------------------

## See also

[label\(\)](#)

**33.161.4.37 copy\_tooltip()**

```
void Fl_Widget::copy_tooltip (
 const char * text)
```

Sets the current tooltip text.

Unlike [tooltip\(\)](#), this method allocates a copy of the tooltip string instead of using the original string pointer.

The internal copy will automatically be freed whenever you assign a new tooltip or when the widget is destroyed.

If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string ("").

## Parameters

in	<i>text</i>	New tooltip text (an internal copy is made and managed)
----	-------------	---------------------------------------------------------

## See also

[tooltip\(const char\\*\)](#), [tooltip\(\)](#)

**33.161.4.38 damage() [1/3]**

```
uchar Fl_Widget::damage () const [inline]
```

Returns non-zero if [draw\(\)](#) needs to be called.

The damage value is actually a bit field that the widget subclass can use to figure out what parts to draw.

## Returns

a bitmap of flags describing the kind of damage to the widget

## See also

[damage\(uchar\)](#), [clear\\_damage\(uchar\)](#)

**33.161.4.39 damage() [2/3]**

```
void Fl_Widget::damage (
 uchar c)
```

Sets the damage bits for the widget.

Setting damage bits will schedule the widget for the next redraw.

## Parameters

in	<i>c</i>	bitmask of flags to set
----	----------	-------------------------

See also

[damage\(\)](#), [clear\\_damage\(uchar\)](#)

### 33.161.4.40 damage() [3/3]

```
void Fl_Widget::damage (
 uchar c,
 int x,
 int y,
 int w,
 int h)
```

Sets the damage bits for an area inside the widget.  
Setting damage bits will schedule the widget for the next redraw.

Parameters

in	<i>c</i>	bitmask of flags to set
in	<i>x,y,w,h</i>	size of damaged area

See also

[damage\(\)](#), [clear\\_damage\(uchar\)](#)

### 33.161.4.41 deactivate()

```
void Fl_Widget::deactivate ()
```

Deactivates the widget.

Inactive widgets will be drawn "grayed out", e.g. with less contrast than the active widget. Inactive widgets will not receive any keyboard or mouse button events. Other events (including `FL_ENTER`, `FL_MOVE`, `FL_LEAVE`, `FL_SHORTCUT`, and others) will still be sent. A widget is only active if [active\(\)](#) is true on it *and all of its parents*. Changing this value will send `FL_DEACTIVATE` to the widget if [active\\_r\(\)](#) is true. Currently you cannot deactivate `Fl_Window` widgets.

See also

[activate\(\)](#), [active\(\)](#), [active\\_r\(\)](#)

### 33.161.4.42 default\_callback()

```
void Fl_Widget::default_callback (
 Fl_Widget * widget,
 void * data) [static]
```

The default callback for all widgets that don't set a callback.

This callback function puts a pointer to the widget on the queue returned by [Fl::readqueue\(\)](#). This is the default for all widgets if you don't set a callback.

You can avoid the overhead of this default handling if you set the callback to `NULL` explicitly.

Relying on the default callback and reading the callback queue with [Fl::readqueue\(\)](#) is not recommended. If you need a callback, you should set one with [Fl\\_Widget::callback\(Fl\\_Callback \\*cb, void \\*data\)](#) or one of its variants.

Parameters

in	<i>widget</i>	the <code>Fl_Widget</code> given to the callback
in	<i>data</i>	user data associated with that callback

## See also

[callback\(\)](#), [Fl::readqueue\(\)](#)  
[do\\_callback\(Fl\\_Widget \\*widget, void \\*data\)](#)

**33.161.4.43 deimage() [1/4]**

```
Fl_Image * Fl_Widget::deimage () [inline]
```

Gets the image that is used as part of the widget label when in the inactive state.

## Returns

the current image for the deactivated widget

**33.161.4.44 deimage() [2/4]**

```
const Fl_Image * Fl_Widget::deimage () const [inline]
```

Gets the image that is used as part of the widget label when in the inactive state.

## Returns

the current image for the deactivated widget

**33.161.4.45 deimage() [3/4]**

```
void Fl_Widget::deimage (
 Fl_Image & img)
```

Sets the image to use as part of the widget label when in the inactive state.

## Parameters

in	<i>img</i>	the new image for the deactivated widget
----	------------	------------------------------------------

## See also

void [deimage\(Fl\\_Image\\* img\)](#)

**33.161.4.46 deimage() [4/4]**

```
void Fl_Widget::deimage (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the inactive state.

## Parameters

in	<i>img</i>	the new image for the deactivated widget
----	------------	------------------------------------------

## Note

The caller is responsible for making sure *img* is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.

See also

[void bind\\_deimage\(Fl\\_Image\\* img\)](#)

### 33.161.4.47 deimage\_bound()

```
int Fl_Widget::deimage_bound () const [inline]
```

Returns whether the inactive image is managed by the widget.

Return values

0	if the image is not bound to the widget
1	if the image will be deleted when the widget is deleted

See also

[image\\_bound\(\)](#), [bind\\_deimage\(\)](#)

### 33.161.4.48 do\_callback() [1/3]

```
void Fl_Widget::do_callback (
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN) [inline]
```

Calls the widget callback function with default arguments.

This is the same as calling

```
do_callback(this, user_data(), reason);
```

Parameters

in	<i>reason</i>	give a reason to why this callback was called, defaults to <a href="#">FL_REASON_UNKNOWN</a>
----	---------------	----------------------------------------------------------------------------------------------

See also

[callback\(\)](#)

[do\\_callback\(Fl\\_Widget \\*widget, void \\*data, Fl\\_Callback\\_Reason reason\), Fl\\_Callback\\_Reason](#)

### 33.161.4.49 do\_callback() [2/3]

```
void Fl_Widget::do_callback (
 Fl_Widget * widget,
 long arg,
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN) [inline]
```

Calls the widget callback function with arbitrary arguments.

Parameters

in	<i>widget</i>	call the callback with <i>widget</i> as the first argument
in	<i>arg</i>	call the callback with <i>arg</i> as the user data (second) argument
in	<i>reason</i>	give a reason to why this callback was called, defaults to <a href="#">FL_REASON_UNKNOWN</a>

## See also

[callback\(\)](#)  
[do\\_callback\(Fl\\_Widget \\*widget, void \\*data\), \[Fl\\\_Callback\\\_Reason\]\(#\)](#)

**33.161.4.50 do\_callback()** [3/3]

```
void Fl_Widget::do_callback (
 Fl_Widget * widget,
 void * arg = 0,
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN)
```

Calls the widget callback function with arbitrary arguments.

All overloads of [do\\_callback\(\)](#) call this method. It does nothing if the widget's [callback\(\)](#) is NULL. It clears the widget's *changed* flag **after** the callback was called unless the callback is the default callback. Hence it is not necessary to call [clear\\_changed\(\)](#) after calling [do\\_callback\(\)](#) in your own widget's [handle\(\)](#) method.

A *reason* must be set for widgets if different actions can trigger the same callback.

## Note

It is legal to delete the widget in the callback (i.e. in user code), but you must not access the widget in the [handle\(\)](#) method after calling [do\\_callback\(\)](#) if the widget was deleted in the callback. We recommend to use [Fl\\_Widget\\_Tracker](#) to check whether the widget was deleted in the callback.

## Parameters

in	<i>widget</i>	call the callback with <i>widget</i> as the first argument
in	<i>arg</i>	use <i>arg</i> as the user data (second) argument
in	<i>reason</i>	give a reason to why this callback was called, defaults to <a href="#">FL_REASON_UNKNOWN</a>

## See also

[default\\_callback\(\)](#)  
[callback\(\)](#)  
class [Fl\\_Widget\\_Tracker](#)  
[Fl::callback\\_reason\(\)](#)

**33.161.4.51 draw()**

```
virtual void Fl_Widget::draw () [pure virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implemented in [Fl\\_Adjuster](#), [Fl\\_Box](#), [Fl\\_Browser\\_](#), [Fl\\_Button](#), [Fl\\_Cairo\\_Window](#), [Fl\\_Chart](#), [Fl\\_Choice](#), [Fl\\_Clock\\_Output](#), [Fl\\_Counter](#), [Fl\\_Dial](#), [Fl\\_File\\_Input](#), [Fl\\_Flex](#), [Fl\\_FormsBitmap](#), [Fl\\_FormsPixmap](#), [Fl\\_Free](#), [Fl\\_Gl\\_Window](#), [Fl\\_Grid](#), [Fl\\_Group](#), [Fl\\_Help\\_View](#), [Fl\\_Input](#), [Fl\\_Input\\_Choice](#), [Fl\\_Light\\_Button](#), [Fl\\_Menu\\_Bar](#), [Fl\\_Menu\\_Button](#), [Fl\\_Pack](#), [Fl\\_Positioner](#), [Fl\\_Progress](#), [Fl\\_Return\\_Button](#), [Fl\\_Roller](#), [Fl\\_Scroll](#), [Fl\\_Scrollbar](#), [Fl\\_Shortcut\\_Button](#), [Fl\\_Slider](#), [Fl\\_Spinner](#), [Fl\\_Sys\\_Menu\\_Bar](#), [Fl\\_Table](#), [Fl\\_Tabs](#), [Fl\\_Text\\_Display](#), [Fl\\_Timer](#), [Fl\\_Tree](#), [Fl\\_Value\\_Input](#), [Fl\\_Value\\_Output](#), [Fl\\_Value\\_Slider](#), [Fl\\_Window](#), [Fl\\_Wizard](#), [Fl\\_FormsText](#), [Fl\\_Glut\\_Window](#), and [Fl\\_Terminal](#).

**33.161.4.52 draw\_focus()** [1/3]

```
void Fl_Widget::draw_focus () const [inline], [protected]
```

Draws a focus rectangle around the widget.

This method uses the widget's boxtype and coordinates and its background color [color\(\)](#).

See also

[Fl\\_Widget::draw\\_focus\(Fl\\_Boxtype, int, int, int, int, Fl\\_Color\) const](#)

**33.161.4.53 draw\_focus()** [2/3]

```
void Fl_Widget::draw_focus (
 Fl_Boxtype t,
 int X,
 int Y,
 int W,
 int H) const [inline], [protected]
```

Draws a focus rectangle around the widget.

This method uses the given boxtype and coordinates and the widget's background color [color\(\)](#).

See also

[Fl\\_Widget::draw\\_focus\(Fl\\_Boxtype, int, int, int, int, Fl\\_Color\) const](#)

**33.161.4.54 draw\_focus()** [3/3]

```
void Fl_Widget::draw_focus (
 Fl_Boxtype bt,
 int X,
 int Y,
 int W,
 int H,
 Fl_Color bg) const [protected]
```

Draws a focus box for the widget at the given position and size.

This method does nothing if

- the global option [Fl::visible\\_focus\(\)](#) or
- the per-widget option [visible\\_focus\(\)](#) is false (off).

This means that [Fl\\_Widget::draw\\_focus\(\)](#) or one of the more specialized methods can be called without checking these visible focus options.

Note

This method must only be called if the widget has the focus. This is not tested internally.

The boxtype `bt` is used to calculate the inset so the focus box is drawn inside the box borders.

The default focus box drawing color is black. The background color `bg` is used to determine a better visible color if necessary by using [fl\\_contrast\(\)](#) with the given background color.

Parameters

in	<i>bt</i>	Boxtype that needs to be considered (frame width)
in	<i>X,Y,W,H</i>	Bounding box
in	<i>bg</i>	Background color

See also

[Fl\\_Widget::draw\\_focus\(\)](#)

[Fl\\_Widget::draw\\_focus\(Fl\\_Boxtype, int, int, int, int\) const](#)

#### 33.161.4.55 draw\_label() [1/3]

```
void Fl_Widget::draw_label () const [protected]
```

Draws the widget's label at the defined label position.

This is the normal call for a widget's [draw\(\)](#) method.

#### 33.161.4.56 draw\_label() [2/3]

```
void Fl_Widget::draw_label (
 int X,
 int Y,
 int W,
 int H) const [protected]
```

Draws the label in an arbitrary bounding box.

[draw\(\)](#) can use this instead of [draw\\_label\(void\)](#) to change the bounding box

#### 33.161.4.57 draw\_label() [3/3]

```
void Fl_Widget::draw_label (
 int X,
 int Y,
 int W,
 int H,
 Fl_Align a) const
```

Draws the label in an arbitrary bounding box with an arbitrary alignment.

Anybody can call this to force the label to draw anywhere.

#### 33.161.4.58 h() [1/2]

```
int Fl_Widget::h (
 void) const [inline]
```

Gets the widget height.

Returns

the height of the widget in pixels.

#### 33.161.4.59 h() [2/2]

```
void Fl_Widget::h (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

#### 33.161.4.60 handle()

```
int Fl_Widget::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented in [Fl\\_Color\\_Chooser](#), [Fl\\_Free](#), [Fl\\_Table](#), [Fl\\_Terminal](#), [Fl\\_Text\\_Display](#), [Fl\\_Text\\_Editor](#), [Fl\\_Tree](#), [Fl\\_Browser\\_](#), [Fl\\_File\\_Input](#), [Fl\\_Scheme\\_Choice](#), [Fl\\_Spinner::Fl\\_Spinner\\_Input](#), [Fl\\_Spinner](#), [Fl\\_Table\\_Row](#), [Fl\\_Tile](#), [Fl\\_Adjuster](#), [Fl\\_Box](#), [Fl\\_Button](#), [Fl\\_Check\\_Browser](#), [Fl\\_Choice](#), [Fl\\_Clock](#), [Fl\\_Counter](#), [Fl\\_Dial](#), [Fl\\_Gl\\_Window](#), [Fl\\_Group](#), [Fl\\_Help\\_View](#), [Fl\\_Input](#), [Fl\\_Light\\_Button](#), [Fl\\_Menu\\_Bar](#), [Fl\\_Menu\\_Button](#), [Fl\\_Positioner](#), [Fl\\_Repeat\\_Button](#), [Fl\\_Return\\_Button](#), [Fl\\_Roller](#), [Fl\\_Scroll](#), [Fl\\_Scrollbar](#), [Fl\\_Secret\\_Input](#), [Fl\\_Shortcut\\_Button](#), [Fl\\_Slider](#), [Fl\\_Tabs](#), [Fl\\_Timer](#), [Fl\\_Value\\_Input](#), [Fl\\_Value\\_Output](#), [Fl\\_Value\\_Slider](#), [Fl\\_Window](#), and [Fl\\_Glut\\_Window](#).

#### 33.161.4.61 [hide\(\)](#)

```
void Fl_Widget::hide () [virtual]
```

Makes a widget invisible.

#### See also

[show\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented in [Fl\\_Browser](#), [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), [Fl\\_Overlay\\_Window](#), and [Fl\\_Window](#).

#### 33.161.4.62 [image\(\)](#) [1/4]

```
Fl_Image * Fl_Widget::image () [inline]
```

Gets the image that is used as part of the widget label when in the active state.

#### Returns

the current image

#### 33.161.4.63 [image\(\)](#) [2/4]

```
const Fl_Image * Fl_Widget::image () const [inline]
```

Gets the image that is used as part of the widget label when in the active state.

#### Returns

the current image

**33.161.4.64 image()** [3/4]

```
void Fl_Widget::image (
 Fl_Image & img)
```

Sets the image to use as part of the widget label when in the active state.

**Parameters**

in	<i>img</i>	the new image for the label
----	------------	-----------------------------

**See also**

[void image\(Fl\\_Image\\* img\)](#)

**33.161.4.65 image()** [4/4]

```
void Fl_Widget::image (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the active state.

The caller is responsible for making sure *img* is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.

Calling [image\(\)](#) with a new image will delete the old image if it was bound, and set the new image without binding it. If old and new are the same, the image will not be deleted, but it will be unbound.

Calling [image\(\)](#) with NULL will delete the old image if it was bound and not set a new image.

**Parameters**

in	<i>img</i>	the new image for the label
----	------------	-----------------------------

**See also**

[bind\\_image\(Fl\\_Image\\* img\)](#)

**33.161.4.66 image\_bound()**

```
int Fl_Widget::image_bound () const [inline]
```

Returns whether the image is managed by the widget.

**Return values**

0	if the image is not bound to the widget
1	if the image will be deleted when the widget is deleted

**See also**

[deimage\\_bound\(\)](#), [bind\\_image\(\)](#)

**33.161.4.67 inside()**

```
int Fl_Widget::inside (
 const Fl_Widget * wgt) const [inline]
```

Checks if this widget is a child of *wgt*.

Returns 1 if this widget is a child of *wgt*, or is equal to *wgt*. Returns 0 if *wgt* is NULL.

## Parameters

in	<i>wgt</i>	the possible parent widget.
----	------------	-----------------------------

## See also

[contains\(\)](#)

**33.161.4.68 is\_label\_copied()**

```
int Fl_Widget::is_label_copied () const [inline]
```

Returns whether the current label was assigned with [copy\\_label\(\)](#).

This can be useful for temporarily overwriting the widget's label and restoring it later.

## Return values

0	current label was assigned with <a href="#">label()</a> .
1	current label was assigned with <a href="#">copy_label()</a> .

**33.161.4.69 label()** [1/3]

```
const char * Fl_Widget::label () const [inline]
```

Gets the current label text.

## Returns

a pointer to the current label text

## See also

[label\(const char \\*\)](#), [copy\\_label\(const char \\*\)](#)

**33.161.4.70 label()** [2/3]

```
void Fl_Widget::label (
 const char * text)
```

Sets the current label pointer.

The label is shown somewhere on or next to the widget. See [Labels and Label Types](#) for details about what can be put in a label. The passed pointer is stored unchanged in the widget (the string is *not* copied), so if you need to set the label to a formatted value, make sure the buffer is static, global, or allocated. The [copy\\_label\(\)](#) method can be used to make a copy of the label string automatically.

## Parameters

in	<i>text</i>	pointer to new label text
----	-------------	---------------------------

See also

[copy\\_label\(\)](#)

#### 33.161.4.71 label() [3/3]

```
void Fl_Widget::label (
 Fl_Labeltype a,
 const char * b) [inline]
```

Shortcut to set the label text and type in one call.

See also

[label\(const char \\*\)](#), [labeltype\(Fl\\_Labeltype\)](#)

#### 33.161.4.72 label\_image\_spacing() [1/2]

```
int Fl_Widget::label_image_spacing () [inline]
```

Return the gap size between the label and the image.

Returns

spacing in pixels

#### 33.161.4.73 label\_image\_spacing() [2/2]

```
void Fl_Widget::label_image_spacing (
 int gap) [inline]
```

Set the gap between the label and the image in pixels.

This value is limited to 0..255.

Parameters

<i>in</i>	<i>gap</i>	spacing in pixels
-----------	------------	-------------------

#### 33.161.4.74 label\_shortcut()

```
unsigned int Fl_Widget::label_shortcut (
 const char * t) [static]
```

Returns the Unicode value of the '&x' shortcut in a given text.

The given text *t* (usually a widget's label or a menu text) is searched for a '&x' shortcut label, and if found, the Unicode value (code point) of the '&x' shortcut is returned.

Parameters

<i>t</i>	text or label to search for '&x' shortcut.
----------	--------------------------------------------

Returns

Unicode (UCS-4) value of shortcut in *t* or 0.

Note

Internal use only.

**33.161.4.75 labelcolor()** [1/2]

```
Fl_Color Fl_Widget::labelcolor () const [inline]
```

Gets the label color.

The default color is FL\_FOREGROUND\_COLOR.

**Returns**

the current label color

**33.161.4.76 labelcolor()** [2/2]

```
void Fl_Widget::labelcolor (
 Fl_Color c) [inline]
```

Sets the label color.

The default color is FL\_FOREGROUND\_COLOR.

**Parameters**

in	c	the new label color
----	---	---------------------

**33.161.4.77 labelfont()** [1/2]

```
Fl_Font Fl_Widget::labelfont () const [inline]
```

Gets the font to use.

Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function [Fl::set\\_font\(\)](#) can define new typefaces.

**Returns**

current font used by the label

**See also**

[Fl\\_Font](#)

**33.161.4.78 labelfont()** [2/2]

```
void Fl_Widget::labelfont (
 Fl_Font f) [inline]
```

Sets the font to use.

Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function [Fl::set\\_font\(\)](#) can define new typefaces.

**Parameters**

in	f	the new font for the label
----	---	----------------------------

See also

[Fl\\_Font](#)

### 33.161.4.79 labelsize() [1/2]

```
Fl_Fontsize Fl_Widget::labelsize () const [inline]
```

Gets the font size in pixels.

The default size is 14 pixels.

Returns

the current font size

### 33.161.4.80 labelsize() [2/2]

```
void Fl_Widget::labelsize (
 Fl_Fontsize pix) [inline]
```

Sets the font size in pixels.

Parameters

in	<i>pix</i>	the new font size
----	------------	-------------------

See also

[Fl\\_Fontsize labelsize\(\)](#)

### 33.161.4.81 labeltype() [1/2]

```
Fl_Labeltype Fl_Widget::labeltype () const [inline]
```

Gets the label type.

Returns

the current label type.

See also

[Fl\\_Labeltype](#)

### 33.161.4.82 labeltype() [2/2]

```
void Fl_Widget::labeltype (
 Fl_Labeltype a) [inline]
```

Sets the label type.

The label type identifies the function that draws the label of the widget. This is generally used for special effects such as embossing or for using the [label\(\)](#) pointer as another form of data such as an icon. The value `FL_NORMAL_LABEL` prints the label as plain text.

Parameters

in	<i>a</i>	new label type
----	----------	----------------

See also

[Fl\\_Labeltype](#)

### 33.161.4.83 `measure_label()`

```
void Fl_Widget::measure_label (
 int & ww,
 int & hh) const [inline]
```

Sets width `ww` and height `hh` accordingly with the label size.

Labels with images will return `w()` and `h()` of the image.

This calls `fl_measure()` internally. For more information about the arguments `ww` and `hh` and word wrapping

See also

[fl\\_measure\(const char\\*, int&, int&, int\)](#)

### 33.161.4.84 `needs_keyboard()` [1/2]

```
bool Fl_Widget::needs_keyboard () const [inline]
```

Returns whether this widget needs a keyboard.

Returns

true or false

See also

[needs\\_keyboard\(bool\)](#)

### 33.161.4.85 `needs_keyboard()` [2/2]

```
void Fl_Widget::needs_keyboard (
 bool needs) [inline]
```

Sets whether this widget needs a keyboard.

Set this on touch screen devices if a widget needs a keyboard when it gets the focus.

Note

This flag can be set but is not yet **used** in FLTK 1.4.0. It is intended to be used in the future on real touch devices.

Parameters

<code>in</code>	<code>needs</code>	Set this to true or false
-----------------	--------------------	---------------------------

### 33.161.4.86 `output()`

```
unsigned int Fl_Widget::output () const [inline]
```

Returns if a widget is used for output only.

`output()` means the same as `lactive()` except it does not change how the widget is drawn. The widget will not receive any events. This is useful for making scrollbars or buttons that work as displays rather than input devices.

## Return values

0	if the widget is used for input and output
---	--------------------------------------------

## See also

[set\\_output\(\)](#), [clear\\_output\(\)](#)

**33.161.4.87 parent()** [1/2]

```
Fl_Group * Fl_Widget::parent () const [inline]
```

Returns a pointer to the parent widget.

Usually this is a [Fl\\_Group](#) or [Fl\\_Window](#).

## Return values

NULL	if the widget has no parent
------	-----------------------------

## See also

[Fl\\_Group::add\(Fl\\_Widget\\*\)](#)

**33.161.4.88 parent()** [2/2]

```
void Fl_Widget::parent (
 Fl_Group * p) [inline]
```

Internal use only - "for hacks only".

It is **STRONGLY recommended** not to use this method, because it short-circuits [Fl\\_Group](#)'s normal widget adding and removing methods, if the widget is already a child widget of another [Fl\\_Group](#).

Use [Fl\\_Group::add\(Fl\\_Widget\\*\)](#) and/or [Fl\\_Group::remove\(Fl\\_Widget\\*\)](#) instead.

**33.161.4.89 position()**

```
void Fl_Widget::position (
 int X,
 int Y) [inline]
```

Repositions the window or widget.

`position(X, Y)` is a shortcut for `resize(X, Y, w\(\), h\(\))`.

## Parameters

in	X, Y	new position relative to the parent window
----	------	--------------------------------------------

## See also

[resize\(int,int,int,int\)](#), [size\(int,int\)](#)

**33.161.4.90 redraw()**

```
void Fl_Widget::redraw ()
```

Schedules the drawing of the widget.

Marks the widget as needing its [draw\(\)](#) routine called.

**33.161.4.91 redraw\_label()**

```
void Fl_Widget::redraw_label ()
```

Schedules the drawing of the label.

Marks the widget or the parent as needing a redraw for the label area of a widget.

**33.161.4.92 resize()**

```
void Fl_Widget::resize (
 int x,
 int y,
 int w,
 int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#), and size(W, H) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

**Parameters**

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

**See also**

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented in [Fl\\_Browser\\_](#), [Fl\\_Flex](#), [Fl\\_Grid](#), [Fl\\_Input\\_Choice](#), [Fl\\_Pack](#), [Fl\\_Scroll](#), [Fl\\_Spinner](#), [Fl\\_Table](#), [Fl\\_Terminal](#), [Fl\\_Text\\_Display](#), [Fl\\_Tile](#), [Fl\\_Window](#), [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), [Fl\\_Group](#), [Fl\\_Help\\_View](#), [Fl\\_Input\\_](#), [Fl\\_Overlay\\_Window](#), [Fl\\_Tabs](#), [Fl\\_Tree](#), and [Fl\\_Value\\_Input](#).

**33.161.4.93 selection\_color()** [1/2]

```
Fl_Color Fl_Widget::selection_color () const [inline]
```

Gets the selection color.

**Returns**

the current selection color

**See also**

[selection\\_color\(Fl\\_Color\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#)

**33.161.4.94 selection\_color()** [2/2]

```
void Fl_Widget::selection_color (
 Fl_Color a) [inline]
```

Sets the selection color.

The selection color is defined for Forms compatibility and is usually used to color the widget when it is selected, although some widgets use this color for other purposes. You can set both colors at once with [color\(Fl\\_Color bg, Fl\\_Color sel\)](#).

## Parameters

in	a	the new selection color
----	---	-------------------------

## See also

[selection\\_color\(\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#)

**33.161.4.95 set\_active()**

```
void Fl_Widget::set_active () [inline]
```

Marks the widget as active without sending events or changing focus.

This is mainly for specialized use, for normal cases you want [activate\(\)](#).

## See also

[activate\(\)](#)

**33.161.4.96 set\_changed()**

```
void Fl_Widget::set_changed () [inline]
```

Marks the value of the widget as changed.

## See also

[changed\(\)](#), [clear\\_changed\(\)](#)

**33.161.4.97 set\_output()**

```
void Fl_Widget::set_output () [inline]
```

Sets a widget to output only.

## See also

[output\(\)](#), [clear\\_output\(\)](#)

**33.161.4.98 set\_visible()**

```
void Fl_Widget::set_visible () [inline]
```

Makes the widget visible.

You must still redraw the parent widget to see a change in the window. Normally you want to use the [show\(\)](#) method instead.

**33.161.4.99 set\_visible\_focus()**

```
void Fl_Widget::set_visible_focus () [inline]
```

Enables keyboard focus navigation with this widget.

Note, however, that this will not necessarily mean that the widget will accept focus, but for widgets that can accept focus, this method enables it if it has been disabled.

## See also

[visible\\_focus\(\)](#), [clear\\_visible\\_focus\(\)](#), [visible\\_focus\(int\)](#)

**33.161.4.100 shortcut\_label()** [1/2]

```
int Fl_Widget::shortcut_label () const [inline]
```

Returns whether the widget's label uses '&' to indicate shortcuts.

See also

void [shortcut\\_label\(int value\)](#)

**33.161.4.101 shortcut\_label()** [2/2]

```
void Fl_Widget::shortcut_label (
 int value) [inline]
```

Sets whether the widget's label uses '&' to indicate shortcuts.

By default, all objects of classes [Fl\\_Menu\\_](#) (and derivatives), [Fl\\_Button](#) (and derivatives), [Fl\\_Text\\_Display](#), [Fl\\_Value\\_Input](#), and [Fl\\_Input\\_](#) (and derivatives) use character '&' in their label, unless '&' is repeated, to indicate shortcuts: '&' does not appear in the drawn label, the next character after '&' in the label is drawn underlined, and typing this character triggers the corresponding menu window, button, or other widget. If the label contains 2 consecutive '&', only one is drawn and the next character is not underlined and not used as a shortcut. If `value` is set to 0, all these labels don't process character '&' as indicating a shortcut: '&' is drawn in the label, the next character is not underlined and does not define a shortcut.

**33.161.4.102 show()**

```
void Fl_Widget::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like `FL_SHOW`.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send `FL_SHOW` or `FL_HIDE` events to the widget. *Do not change it if the parent is not visible, as this will send false `FL_SHOW` or `FL_HIDE` events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented in [Fl\\_Browser](#), [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), [Fl\\_Overlay\\_Window](#), [Fl\\_Single\\_Window](#), [Fl\\_Tabs](#), and [Fl\\_Window](#).

**33.161.4.103 size()**

```
void Fl_Widget::size (
 int W,
 int H) [inline]
```

Changes the size of the widget.

`size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

Parameters

in	<i>W,H</i>	new size
----	------------	----------

See also

[position\(int,int\)](#), [resize\(int,int,int,int\)](#)

#### 33.161.4.104 take\_focus()

```
int Fl_Widget::take_focus ()
```

Gives the widget the keyboard focus.

Tries to make this widget be the [Fl::focus\(\)](#) widget, by first sending it an FL\_FOCUS event, and if it returns non-zero, setting [Fl::focus\(\)](#) to this widget. You should use this method to assign the focus to a widget.

Returns

true if the widget accepted the focus.

#### 33.161.4.105 takeevents()

```
unsigned int Fl_Widget::takeevents () const [inline]
```

Returns if the widget is able to take events.

This is the same as ([active\(\)](#) && ![output\(\)](#) && [visible\(\)](#)) but is faster.

Return values

0	if the widget takes no events
---	-------------------------------

#### 33.161.4.106 test\_shortcut() [1/2]

```
int Fl_Widget::test_shortcut ()
```

Returns true if the widget's label contains the entered '&x' shortcut.

This method must only be called in [handle\(\)](#) methods or callbacks after a keypress event (usually FL\_KEYDOWN or FL\_SHORTCUT). The widget's label is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

[Fl::event\\_text\(\)](#) is used to get the entered key value.

Returns

true, if the entered text matches the widget's '&x' shortcut, false (0) otherwise.

Note

Useful when a widget's [handle\(int\)](#) method needs dedicated processing of FL\_SHORTCUT.

#### 33.161.4.107 test\_shortcut() [2/2]

```
int Fl_Widget::test_shortcut (
 const char * t,
 const bool require_alt = false) [static]
```

Returns true if the given text *t* contains the entered '&x' shortcut.

This method must only be called in [handle\(\)](#) methods or callbacks after a keypress event (usually FL\_KEYDOWN or FL\_SHORTCUT). The given text *t* (usually a widget's label or menu text) is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

[Fl::event\\_text\(\)](#) is used to get the entered key value. [Fl::event\\_state\(\)](#) is used to get the Alt modifier, if `require_↵_alt` is true.

## Parameters

<i>t</i>	text or label to search for '&x' shortcut.
<i>require_alt</i>	if true: match only if Alt key is pressed.

## Returns

true, if the entered text matches the '&x' shortcut in *t* false (0) otherwise.

## Note

Useful when a widget's [handle\(int\)](#) method needs dedicated processing of FL\_SHORTCUT.

**33.161.4.108 tooltip()** [1/2]

```
const char * Fl_Widget::tooltip () const [inline]
```

Gets the current tooltip text.

## Returns

a pointer to the tooltip text or NULL

## See also

[tooltip\(const char\\*\)](#), [copy\\_tooltip\(const char\\*\)](#)

**33.161.4.109 tooltip()** [2/2]

```
void Fl_Widget::tooltip (
 const char * text)
```

Sets the current tooltip text.

Sets a string of text to display in a popup tooltip window when the user hovers the mouse over the widget. The string is *not* copied, so make sure any formatted string is stored in a static, global, or allocated buffer. If you want a copy made and managed for you, use the [copy\\_tooltip\(\)](#) method, which will manage the tooltip string automatically. If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string ("").

## Parameters

<i>in</i>	<i>text</i>	New tooltip text (no copy is made)
-----------	-------------	------------------------------------

## See also

[copy\\_tooltip\(const char\\*\)](#), [tooltip\(\)](#)

**33.161.4.110 top\_window()**

```
Fl_Window * Fl_Widget::top_window () const
```

Returns a pointer to the top-level window for the widget.

In other words, the 'window manager window' that contains this widget. This method differs from [window\(\)](#) in that it won't return sub-windows (if there are any).

**Returns**

the top-level window, or NULL if no top-level window is associated with this widget.

**See also**

[window\(\)](#)

**33.161.4.111 top\_window\_offset()**

```
Fl_Window * Fl_Widget::top_window_offset (
 int & xoff,
 int & yoff) const
```

Finds the x/y offset of the current widget relative to the top-level window.

**Parameters**

out	<i>xoff,yoff</i>	Returns the x/y offset
-----	------------------	------------------------

**Returns**

the top-level window (or NULL for a widget that's not in any window)

**33.161.4.112 type() [1/2]**

```
uchar Fl_Widget::type () const [inline]
```

Gets the widget type.

Returns the widget type value, which gives some information about the derived widget class to which the object belongs. Noticeably, the condition `type() >= FL_WINDOW` indicates a widget is an [Fl\\_Window](#) or derived object.

**33.161.4.113 type() [2/2]**

```
void Fl_Widget::type (
 uchar t) [inline]
```

Sets the widget type.

**See also**

[type\(\)](#)

**33.161.4.114 user\_data()**

```
void * Fl_Widget::user_data () const [inline]
```

Gets the user data for this widget.

Gets the current user data (void \*) argument that is passed to the callback function.

**Returns**

user data as a pointer

**33.161.4.115 visible()**

```
unsigned int Fl_Widget::visible () const [inline]
```

Returns whether a widget is visible.

## Return values

0	if the widget is not drawn and hence invisible.
---	-------------------------------------------------

## See also

[show\(\)](#), [hide\(\)](#), [visible\\_r\(\)](#)

**33.161.4.116 visible\_focus() [1/2]**

```
unsigned int Fl_Widget::visible_focus () const [inline]
```

Checks whether this widget has a visible focus.

## Return values

0	if this widget has no visible focus.
---	--------------------------------------

## See also

[visible\\_focus\(int\)](#), [set\\_visible\\_focus\(\)](#), [clear\\_visible\\_focus\(\)](#)

**33.161.4.117 visible\_focus() [2/2]**

```
void Fl_Widget::visible_focus (
 int v) [inline]
```

Modifies keyboard focus navigation.

## Parameters

in	v	set or clear visible focus
----	---	----------------------------

## See also

[set\\_visible\\_focus\(\)](#), [clear\\_visible\\_focus\(\)](#), [visible\\_focus\(\)](#)

**33.161.4.118 visible\_r()**

```
int Fl_Widget::visible_r () const
```

Returns whether a widget and all its parents are visible.

## Return values

0	if the widget or any of its parents are invisible.
---	----------------------------------------------------

## See also

[show\(\)](#), [hide\(\)](#), [visible\(\)](#)

**33.161.4.119 w() [1/2]**

```
int Fl_Widget::w () const [inline]
```

Gets the widget width.

#### Returns

the width of the widget in pixels.

#### 33.161.4.120 w() [2/2]

```
void Fl_Widget::w (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

#### 33.161.4.121 when() [1/2]

```
Fl_When Fl_Widget::when () const [inline]
```

Returns the conditions under which the callback is called.

You can set the flags with [when\(uchar\)](#), the default value is FL\_WHEN\_RELEASE.

#### Returns

set of flags

#### See also

[when\(uchar\)](#), [Fl\\_When](#), [do\\_callback\(\)](#), [Fl::callback\\_reason\(\)](#)

#### 33.161.4.122 when() [2/2]

```
void Fl_Widget::when (
 uchar i) [inline]
```

Sets the flags used to decide when a callback is called.

This controls when callbacks are done. The following values are useful, the default value is FL\_WHEN\_RELEASE:

- 0: The callback is not done, but [changed\(\)](#) is turned on.
- FL\_WHEN\_CHANGED: The callback is done each time the text is changed by the user.
- FL\_WHEN\_RELEASE: The callback will be done when this widget loses the focus, including when the window is unmapped. This is a useful value for text fields in a panel where doing the callback on every change is wasteful. However the callback will also happen if the mouse is moved out of the window, which means it should not do anything visible (like pop up an error message). You might do better setting this to zero, and scanning all the items for [changed\(\)](#) when the OK button on a panel is pressed.
- FL\_WHEN\_ENTER\_KEY: If the user types the Enter key, the entire text is selected, and the callback is done if the text has changed. Normally the Enter key will navigate to the next field (or insert a newline for a [Fl\\_Multiline\\_Input](#)) - this changes the behavior.
- FL\_WHEN\_ENTER\_KEY|FL\_WHEN\_NOT\_CHANGED: The Enter key will do the callback even if the text has not changed. Useful for command fields.
- [FL\\_WHEN\\_CLOSED](#) : If the user requests that the widget is closed, the callback is called with [FL\\_REASON\\_CLOSED](#). The [Fl\\_Tabs](#) widget checks this flag on its children to determine whether to display a close button on the tab of that widget.

[Fl\\_Widget::when\(\)](#) is a set of bitflags used by subclasses of [Fl\\_Widget](#) to decide when to do the callback.

If the value is zero then the callback is never done. Other values are described in the individual widgets. This field is in the base class so that you can scan a panel and [do\\_callback\(\)](#) on all the ones that don't do their own callbacks in response to an "OK" button.

## Parameters

in	<i>i</i>	set of flags
----	----------	--------------

## See also

[Fl\\_When](#), [do\\_callback\(\)](#), [Fl::callback\\_reason\(\)](#)

**33.161.4.123 window()**

```
Fl_Window * Fl_Widget::window () const
```

Returns a pointer to the nearest parent window up the widget hierarchy.

This will return sub-windows if there are any, or the parent window if there's no sub-windows. If this widget IS the top-level window, NULL is returned.

## Return values

NULL	if no window is associated with this widget.
------	----------------------------------------------

## Note

for an [Fl\\_Window](#) widget, this returns its *parent* window (if any), not *this* window.

## See also

[top\\_window\(\)](#)

**33.161.4.124 x()** [1/2]

```
int Fl_Widget::x () const [inline]
```

Gets the widget position in its window.

## Returns

the x position relative to the window

**33.161.4.125 x()** [2/2]

```
void Fl_Widget::x (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

**33.161.4.126 y()** [1/2]

```
int Fl_Widget::y () const [inline]
```

Gets the widget position in its window.

## Returns

the y position relative to the window

**33.161.4.127 y()** [2/2]

```
void Fl_Widget::y (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

## Additional Inherited Members

### 33.162.1 Detailed Description

A surface on which any FLTK widget can be drawn.

### 33.162.2 Constructor & Destructor Documentation

#### 33.162.2.1 Fl\_Widget\_Surface()

```
Fl_Widget_Surface::Fl_Widget_Surface (
 Fl_Graphics_Driver * d) [protected]
```

The constructor.

#### Parameters

<code>d</code>	can be nul.
----------------	-------------

### 33.162.3 Member Function Documentation

#### 33.162.3.1 draw()

```
void Fl_Widget_Surface::draw (
 Fl_Widget * widget,
 int delta_x = 0,
 int delta_y = 0)
```

Draws the widget on the drawing surface.

The widget's position on the surface is determined by the last call to `origin()` and by the optional `delta_x` and `delta_y` arguments. Its dimensions are in points unless there was a previous call to `scale()`.

#### Parameters

in	<code>widget</code>	Any FLTK widget (e.g., standard, custom, window).
in	<code>delta_x, delta_y</code>	Optional horizontal and vertical offsets for positioning the widget top left relatively to the current origin of graphics.

#### 33.162.3.2 draw\_decorated\_window()

```
void Fl_Widget_Surface::draw_decorated_window (
 Fl_Window * win,
 int win_offset_x = 0,
 int win_offset_y = 0)
```

Draws a window with its title bar and frame if any.

`win_offset_x` and `win_offset_y` are optional coordinates of where to position the window top

left. Equivalent to [draw\(\)](#) if `win` is a subwindow or has no border. Use [Fl\\_Window::decorated\\_w\(\)](#) and [Fl\\_Window::decorated\\_h\(\)](#) to get the size of the framed window.

### 33.162.3.3 origin() [1/2]

```
void Fl_Widget_Surface::origin (
 int * x,
 int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

#### Parameters

out	<i>x,y</i>	If non-null, * <i>x</i> and * <i>y</i> are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	-------------------------------------------------------------------------------------------------------------------

Reimplemented in [Fl\\_EPS\\_File\\_Surface](#), [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), [Fl\\_Printer](#), and [Fl\\_SVG\\_File\\_Surface](#).

### 33.162.3.4 origin() [2/2]

```
void Fl_Widget_Surface::origin (
 int x,
 int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. [Origin\(\)](#) calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

#### Parameters

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	------------	---------------------------------------------------------------------------------------------

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), [Fl\\_EPS\\_File\\_Surface](#), [Fl\\_Printer](#), and [Fl\\_SVG\\_File\\_Surface](#).

### 33.162.3.5 print\_window\_part()

```
void Fl_Widget_Surface::print_window_part (
 Fl_Window * win,
 int x,
 int y,
 int w,
 int h,
 int delta_x = 0,
 int delta_y = 0)
```

Draws a rectangular part of an on-screen window.

#### Parameters

<i>win</i>	The window from where to capture. Can be an <a href="#">Fl_Gl_Window</a> . Sub-windows that intersect the rectangle are also captured.
<i>x</i>	The rectangle left
<i>y</i>	The rectangle top
<i>w</i>	The rectangle width
<i>h</i>	The rectangle height

## Parameters

<code>delta_x, delta_y</code>	Optional horizontal and vertical offsets from current graphics origin where to draw the top left of the captured rectangle.
-------------------------------	-----------------------------------------------------------------------------------------------------------------------------

**33.162.3.6 printable\_rect()**

```
int Fl_Widget_Surface::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

## Returns

0 if OK, non-zero if any error

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), [Fl\\_EPS\\_File\\_Surface](#), [Fl\\_Printer](#), and [Fl\\_SVG\\_File\\_Surface](#).

**33.162.3.7 translate()**

```
void Fl_Widget_Surface::translate (
 int x,
 int y) [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), [Fl\\_EPS\\_File\\_Surface](#), [Fl\\_Printer](#), and [Fl\\_SVG\\_File\\_Surface](#).

**33.162.3.8 untranslate()**

```
void Fl_Widget_Surface::untranslate (
 void) [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_EPS\\_File\\_Surface](#), [Fl\\_SVG\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

The documentation for this class was generated from the following files:

- [Fl\\_Widget\\_Surface.H](#)
- [Fl\\_Widget\\_Surface.cxx](#)

**33.163 Fl\_Widget\_Tracker Class Reference**

This class should be used to control safe widget deletion.

```
#include <Fl.H>
```

**Public Member Functions**

- int [deleted](#) ()  
*Returns 1, if the watched widget has been deleted.*
- int [exists](#) ()  
*Returns 1, if the watched widget exists (has not been deleted).*

- [Fl\\_Widget\\_Tracker](#) ([Fl\\_Widget](#) \*wi)  
*The constructor adds a widget to the watch list.*
- [Fl\\_Widget](#) \* widget ()  
*Returns a pointer to the watched widget.*
- [~Fl\\_Widget\\_Tracker](#) ()  
*The destructor removes a widget from the watch list.*

### 33.163.1 Detailed Description

This class should be used to control safe widget deletion.

You can use an [Fl\\_Widget\\_Tracker](#) object to watch another widget, if you need to know whether this widget has been deleted during a callback.

This simplifies the use of the "safe widget deletion" methods [Fl::watch\\_widget\\_pointer\(\)](#) and [Fl::release\\_widget\\_pointer\(\)](#) and makes their use more reliable, because the destructor automatically releases the widget pointer from the widget watch list.

[Fl\\_Widget\\_Tracker](#) is intended to be used as an automatic (local/stack) variable, such that its destructor is called when the object's scope is left. This ensures that no stale widget pointers are left in the widget watch list (see example below).

You can also create [Fl\\_Widget\\_Tracker](#) objects with `new`, but then it is your responsibility to delete the object (and thus remove the widget pointer from the watch list) when it is no longer needed.

Example:

```
int MyClass::handle (int event) {
 if (...) {
 Fl_Widget_Tracker wp(this); // watch myself
 do_callback(); // call the callback
 if (wp.deleted()) return 1; // exit, if deleted
 // Now we are sure that the widget has not been deleted,
 // and it is safe to access the widget:
 box(FL_FLAT_BOX);
 color(FL_WHITE);
 redraw();
 }
}
```

### 33.163.2 Member Function Documentation

#### 33.163.2.1 deleted()

```
int Fl_Widget_Tracker::deleted () [inline]
```

Returns 1, if the watched widget has been deleted.

This is a convenience method. You can also use something like

```
if (wp.widget() == 0) // ...
```

where `wp` is an [Fl\\_Widget\\_Tracker](#) object.

#### 33.163.2.2 exists()

```
int Fl_Widget_Tracker::exists () [inline]
```

Returns 1, if the watched widget exists (has not been deleted).

This is a convenience method. You can also use something like

```
if (wp.widget() != 0) // ...
```

where `wp` is an [Fl\\_Widget\\_Tracker](#) object.

#### 33.163.2.3 widget()

```
Fl_Widget * Fl_Widget_Tracker::widget () [inline]
```

Returns a pointer to the watched widget.

This pointer is NULL, if the widget has been deleted.

The documentation for this class was generated from the following files:

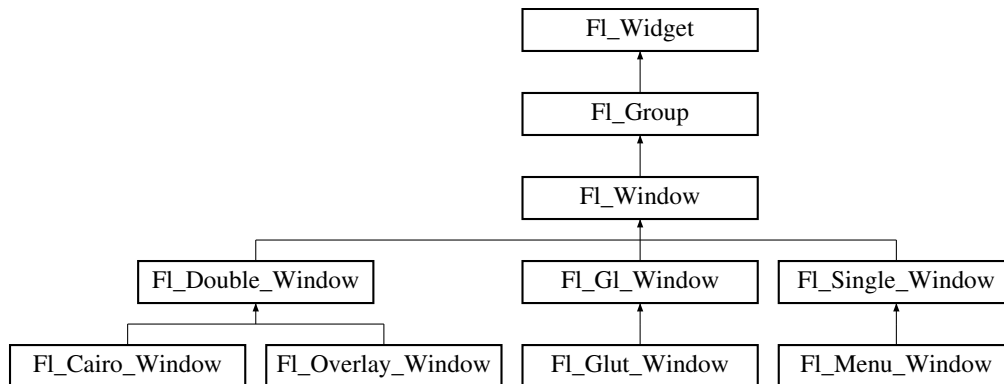

- [Fl.H](#)
- [Fl.cxx](#)

## 33.164 FL\_Window Class Reference

This widget produces an actual window.

```
#include <Fl_Window.H>
```

Inheritance diagram for FL\_Window:

### Public Types

- typedef struct HICON\_\_ \* **HICON**

### Public Member Functions

- void [allow\\_expand\\_outside\\_parent](#) ()
  - Allow this subwindow to expand outside the area of its parent window.*
- virtual class [FL\\_Double\\_Window](#) \* [as\\_double\\_window](#) ()
  - Return non-null if this is an [FL\\_Double\\_Window](#) object.*
- virtual class [FL\\_Overlay\\_Window](#) \* [as\\_overlay\\_window](#) ()
  - Return non-null if this is an [FL\\_Overlay\\_Window](#) object.*
- [FL\\_Window](#) const \* [as\\_window](#) () const **FL\_OVERRIDE**
- [FL\\_Window](#) \* [as\\_window](#) () **FL\_OVERRIDE**
  - Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- unsigned int **border** () const
  - Returns whether the window possesses a border.*
- void [border](#) (int b)
  - Sets whether or not the window manager border is around the window.*
- void [clear\\_border](#) ()
  - Fast inline function to turn the window manager border off.*
- void [clear\\_modal\\_states](#) ()
  - Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.*
- void **copy\_label** (const char \*a)
  - Sets the window titlebar label to a copy of a character string.*
- void [cursor](#) (const [FL\\_RGB\\_Image](#) \*, int, int)
  - Changes the cursor for this window using the provided image as cursor's shape.*
- void [cursor](#) ([FL\\_Cursor](#) c, [FL\\_Color](#), [FL\\_Color](#)=**FL\_WHITE**)
  - For back compatibility only.*
- void [cursor](#) ([FL\\_Cursor](#))
  - Changes the cursor for this window.*
- int [decorated\\_h](#) () const
  - Returns the window height including any window title bar and any frame added by the window manager.*
- int [decorated\\_w](#) () const

- Returns the window width including any frame added by the window manager.*

  - void **default\_cursor** (FI\_Cursor c, FI\_Color, FI\_Color=FL\_WHITE)

*For back compatibility only.*
- void **default\_cursor** (FI\_Cursor)

*Sets the default window cursor.*
- void **draw\_backdrop** ()

*Draw the background image if one is set and is aligned inside.*
- **Fl\_Window** (int w, int h, const char \*title=0)

*Creates a window from the given width w, height h, and title.*
- **Fl\_Window** (int x, int y, int w, int h, const char \*title=0)

*Creates a window from the given position (x, y), size (w, h) and title.*
- void **free\_position** ()

*Undoes the effect of a previous **resize()** or **show()** so that the next time **show()** is called the window manager is free to position the window.*
- void **fullscreen** ()

*Makes the window completely fill one or more screens, without any window manager border visible.*
- unsigned int **fullscreen\_active** () const

*Returns non zero if FULLSCREEN flag is set, 0 otherwise.*
- void **fullscreen\_off** ()

*Turns off any side effects of **fullscreen()***
- void **fullscreen\_off** (int X, int Y, int W, int H)

*Turns off any side effects of **fullscreen()** and does **resize(x,y,w,h)**.*
- void **fullscreen\_screens** (int top, int bottom, int left, int right)

*Sets which screens should be used when this window is in fullscreen mode.*
- **uchar get\_size\_range** (int \*minw, int \*minh, int \*maxw=NULL, int \*maxh=NULL, int \*dw=NULL, int \*dh=NULL, int \*aspect=NULL)

*Gets the allowable range to which the user can resize this window.*
- int **handle** (int) **FL\_OVERRIDE**

*Handles the specified event.*
- void **hide** () **FL\_OVERRIDE**

*Removes the window from the screen.*
- void **hotspot** (const **Fl\_Widget** &p, int offscreen=0)

*See void **Fl\_Window::hotspot**(int x, int y, int offscreen = 0)*
- void **hotspot** (const **Fl\_Widget** \*, int offscreen=0)

*See void **Fl\_Window::hotspot**(int x, int y, int offscreen = 0)*
- void **hotspot** (int x, int y, int offscreen=0)

*Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.*
- const void \* **icon** () const

*Gets the current icon window target dependent data.*
- void **icon** (const **Fl\_RGB\_Image** \*)

*Sets or resets a single window icon.*
- void **icon** (const void \*ic)

*Platform-specific method to set the window icon usable on Windows and X11 only.*
- void **iconize** ()

*Iconifies the window.*
- const char \* **iconlabel** () const

*See void **Fl\_Window::iconlabel**(const char\*)*
- void **iconlabel** (const char \*)

*Sets the icon label.*

- void [icons](#) (const [FL\\_RGB\\_Image](#) \*[], int)
  - Sets the window icons.*
- void [icons](#) (HICON big\_icon, HICON small\_icon)
  - Sets the window icons using HICON handles (Windows platform only).*
- const char \* [label](#) () const
  - See void [FL\\_Window::label\(const char\\*\)](#)*
- void [label](#) (const char \*)
  - Sets the window title bar label.*

  - Sets the icon label.*
- void [make\\_current](#) ()
  - Sets things up so that the drawing functions in [<FL/fl\\_draw.H>](#) will go into this window.*
- void [maximize](#) ()
  - Maximizes a top-level window to its current screen.*
- unsigned int [maximize\\_active](#) () const
  - Returns whether the window is currently maximized.*
- unsigned int [menu\\_window](#) () const
  - Returns true if this window is a menu window.*
- unsigned int [modal](#) () const
  - Returns true if this window is modal.*
- unsigned int [non\\_modal](#) () const
  - Returns true if this window is modal or non-modal.*
- [fl\\_uintptr\\_t os\\_id](#) ()
  - Returns a platform-specific identification of a shown window, or 0 if not shown.*
- unsigned int [override](#) () const
  - Returns non zero if `OVERRIDE` flag is set, 0 otherwise.*
- void [resize](#) (int X, int Y, int W, int H) [FL\\_OVERRIDE](#)
  - Changes the size and position of the window.*
- int [screen\\_num](#) ()
  - The number of the screen containing the mapped window.*
- void [screen\\_num](#) (int screen\_num)
  - Set the number of the screen where to map the window.*
- void [set\\_menu\\_window](#) ()
  - Marks the window as a menu window.*
- void [set\\_modal](#) ()
  - A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).*
- void [set\\_non\\_modal](#) ()
  - A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.*
- void [set\\_override](#) ()
  - Activates the flags `NOBORDER|OVERRIDE`.*
- void [set\\_tooltip\\_window](#) ()
  - Marks the window as a tooltip window.*
- const [FL\\_Image](#) \* [shape](#) ()
  - Returns the image controlling the window shape or `NULL`.*
- void [shape](#) (const [FL\\_Image](#) &b)
  - Set the window's shape with an [FL\\_Image](#).*
- void [shape](#) (const [FL\\_Image](#) \*img)
  - Assigns a non-rectangular shape to the window.*

- void `show ()` `FL_OVERRIDE`  
*Puts the window on the screen.*
- void `show (int argc, char **argv)`  
*Puts the window on the screen with `show()` and parses command-line arguments.*
- int `shown ()`  
*Returns non-zero if `show()` has been called (but not `hide()`).*
- void `size_range (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)`  
*Sets the allowable range to which the user can resize this window.*
- unsigned int `tooltip_window ()` const  
*Returns true if this window is a tooltip window.*
- void `un_maximize ()`  
*Returns a previously maximized top-level window to its previous size.*
- void `wait_for_expose ()`  
*Waits for the window to be displayed after calling `show()`.*
- int `x_root ()` const  
*Gets the x position of the window on the screen.*
- const char \* `xclass ()` const  
*Returns the xclass for this window, or a default.*
- void `xclass (const char *c)`  
*Sets the xclass for this window.*
- int `y_root ()` const  
*Gets the y position of the window on the screen.*
- virtual `~Fl_Window ()`  
*The destructor also deletes all the children.*

### Static Public Member Functions

- static `Fl_Window * current ()`  
*Returns the last window that was made current.*
- static void `default_callback (Fl_Window *, void *v)`  
*Back compatibility: Sets the default callback v for win to call on close event.*
- static void `default_icon (const Fl_RGB_Image *)`  
*Sets a single default window icon.*
- static void `default_icons (const Fl_RGB_Image *[], int)`  
*Sets the default window icons.*
- static void `default_icons (HICON big_icon, HICON small_icon)`  
*Sets the default window icons (Windows platform only).*
- static const char \* `default_xclass ()`  
*Returns the default xclass.*
- static void `default_xclass (const char *)`  
*Sets the default window xclass.*
- static bool `is_a_rescale ()`  
*Returns true when a window is being rescaled.*
- static char `show_next_window_iconic ()`  
*Returns the static flag whether the next window should be opened iconified.*
- static void `show_next_window_iconic (char stat)`  
*Sets a static flag whether the next window should be opened iconified.*

## Protected Member Functions

- void [default\\_size\\_range](#) ()  
*Protected method to calculate the default size range of a window.*
- void [draw](#) () [FL\\_OVERRIDE](#)  
*Draws the widget.*
- virtual void [flush](#) ()  
*Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).*
- int [force\\_position](#) () const  
*Returns the internal state of the window's [FORCE\\_POSITION](#) flag.*
- void [force\\_position](#) (int force)  
*Sets an internal flag that tells FLTK and the window manager to honor position requests.*
- void [free\\_icons](#) ()  
*Deletes all icons previously attached to the window.*
- int [is\\_resizable](#) ()  
*Protected method to determine whether a window is resizable.*

## Static Protected Attributes

- static [Fl\\_Window](#) \* [current\\_](#)  
*Stores the last window that was made current.*

## Friends

- class [Fl\\_Window\\_Driver](#)
- class [Fl\\_X](#)

## Additional Inherited Members

### 33.164.1 Detailed Description

This widget produces an actual window.

This can either be a main window, with a border and title and all the window management controls, or a "subwindow" inside a window. This is controlled by whether or not the window has a [parent\(\)](#).

Once you create a window, you usually add children [Fl\\_Widget](#)'s to it by using `window->add(child)` for each new widget. See [Fl\\_Group](#) for more information on how to add and remove children.

There are several subclasses of [Fl\\_Window](#) that provide double-buffering, overlay, menu, and OpenGL support.

The window's callback is done if the user tries to close a window using the window manager and [Fl::modal\(\)](#) is zero or equal to the window. [Fl\\_Window](#) has a default callback that calls [Fl\\_Window::hide\(\)](#). Callback reasons can be [FL\\_REASON\\_CANCELLED](#) if the Escape key was pressed, or [FL\\_REASON\\_CLOSED](#) when the close button is clicked. [FL\\_WHEN\\_...](#) flags are ignored.

### 33.164.2 Constructor & Destructor Documentation

#### 33.164.2.1 [Fl\\_Window\(\)](#) [1/2]

```
Fl_Window::Fl_Window (
 int w,
 int h,
 const char * title = 0)
```

Creates a window from the given width `w`, height `h`, and `title`.

If [Fl\\_Group::current\(\)](#) is not NULL, the window is created as a subwindow of the parent window.

The `(w, h)` form of the constructor creates a top-level window and asks the window manager to position the window. The `(x, y, w, h)` form of the constructor either creates a subwindow or a top-level window at the specified location `(x, y)`, subject to window manager configuration. If you do not specify the position of the window, the window manager

will pick a place to show the window or allow the user to pick a location. Use `position(x, y)` or `hotspot()` before calling `show()` to request a position on the screen. See `Fl_Window::resize()` for some more details on positioning windows. Top-level windows initially have `visible()` set to 0 and `parent()` set to NULL. Subwindows initially have `visible()` set to 1 and `parent()` set to the parent window pointer.

`Fl_Widget::box()` defaults to `FL_FLAT_BOX`. If you plan to completely fill the window with children widgets you should change this to `FL_NO_BOX`. If you turn the window border off you may want to change this to `FL_UP_BOX`.

See also

[Fl\\_Window\(int x, int y, int w, int h, const char \\*title\)](#)

### 33.164.2.2 Fl\_Window() [2/2]

```
Fl_Window::Fl_Window (
 int x,
 int y,
 int w,
 int h,
 const char * title = 0)
```

Creates a window from the given position (x, y), size (w, h) and title.

On a multi-screen system, the values computed by `Fl::screen_xywh(int &X, int &Y, int &W, int &H, int n)` can be used to discover the coordinates of the area of screen #n. When these screens have various scale factor values, an (x, y) pair may not be enough to specify the targeted screen for the window, because the same (x,y) pair can belong to several screens. In that situation, a call to `Fl_Window::screen_num(int)` is to be used to identify unambiguously the targeted screen.

See also

[Fl\\_Window\(int w, int h, const char \\*title\)](#)

[Fl::screen\\_xywh\(int &X, int &Y, int &W, int &H, int n\)](#)

Note

Under Wayland, it's generally not possible for the client app to control the position of a window in the system. It's possible to specify on what screen should the compositor place a fullscreen window. It's also possible to make an `Fl_Window` the child of another window or group and control with `x` and `y` its screen position relatively to the enclosing window. Apply member function `Fl_Window::allow_expand_outside_parent()` to the child window to allow it to expand partially or totally outside its parent.

### 33.164.2.3 ~Fl\_Window()

```
Fl_Window::~Fl_Window () [virtual]
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the `Fl_Window` and all of its children can be automatic (local) variables, but you must declare the `Fl_Window` *first* so that it is destroyed last.

## 33.164.3 Member Function Documentation

### 33.164.3.1 allow\_expand\_outside\_parent()

```
void Fl_Window::allow_expand_outside_parent ()
```

Allow this subwindow to expand outside the area of its parent window.

This is presently implemented only for the Wayland platform to help support window docking.

Since

1.4.0

### 33.164.3.2 as\_double\_window()

```
virtual class Fl_Double_Window * Fl_Window::as_double_window () [inline], [virtual]
```

Return non-null if this is an [Fl\\_Double\\_Window](#) object.

Reimplemented in [Fl\\_Double\\_Window](#).

### 33.164.3.3 as\_overlay\_window()

```
virtual class Fl_Overlay_Window * Fl_Window::as_overlay_window () [inline], [virtual]
```

Return non-null if this is an [Fl\\_Overlay\\_Window](#) object.

Reimplemented in [Fl\\_Overlay\\_Window](#).

### 33.164.3.4 as\_window() [1/2]

```
Fl_Window const * Fl_Window::as_window () const [inline], [virtual]
```

Reimplemented from [Fl\\_Widget](#).

### 33.164.3.5 as\_window() [2/2]

```
Fl_Window * Fl_Window::as_window () [inline], [virtual]
```

Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl\\_Window](#), and you can use the returned pointer to access its children or other [Fl\\_Window](#)-specific methods.

Return values

NULL	if this widget is not derived from <a href="#">Fl_Window</a> .
------	----------------------------------------------------------------

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl\\_Widget::as\\_group\(\)](#), [Fl\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented from [Fl\\_Widget](#).

### 33.164.3.6 border()

```
void Fl_Window::border (
 int b)
```

Sets whether or not the window manager border is around the window.

The default value is true. *With some X window managers, this does not work after [show\(\)](#) has been called.*

### 33.164.3.7 clear\_border()

```
void Fl_Window::clear_border () [inline]
```

Fast inline function to turn the window manager border off.

It only works before [show\(\)](#) is called.

### 33.164.3.8 clear\_modal\_states()

```
void Fl_Window::clear_modal_states () [inline]
```

Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

Note that there are *three* states for a window: modal, non-modal, and normal.

You can not change the "modality" of a window whilst it is shown, so it is necessary to first [hide\(\)](#) the window, change its "modality" as required, then re-show the window for the new state to take effect.

This method can also be used to change a "modal" window into a "non-modal" one. On several supported platforms, the "modal" state over-rides the "non-modal" state, so the "modal" state must be cleared before the window can be set into the "non-modal" state. In general, the following sequence should work:

```
win->hide();
win->clear_modal_states();
// Set win to new state as desired, or leave "normal", e.g...
win->set_non_modal();
win->show();
```

#### Note

Under some window managers, the sequence of hiding the window and changing its modality will often cause it to be re-displayed at a different position when it is subsequently shown. This is an irritating feature but appears to be unavoidable at present. As a result we would advise to use this method only when absolutely necessary.

#### See also

void [set\\_modal\(\)](#), void [set\\_non\\_modal\(\)](#)

### 33.164.3.9 current()

```
Fl_Window * Fl_Window::current () [static]
```

Returns the last window that was made current.

#### See also

[Fl\\_Window::make\\_current\(\)](#)

### 33.164.3.10 cursor() [1/3]

```
void Fl_Window::cursor (
 const Fl_RGB_Image * image,
 int hotx,
 int hoty)
```

Changes the cursor for this window using the provided image as cursor's shape.

The window must be [show\(\)](#)'n for this function to have any effect. This always calls the system. If you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The default cursor will be used if the provided image cannot be used as a cursor.

#### Parameters

<i>image</i>	Sets the cursor size and shape
<i>hotx,hoty</i>	Sets the cursor's active location relatively to top-left of <i>image</i> when clicking

#### See also

[cursor\(Fl\\_Cursor\)](#), [default\\_cursor\(\)](#)

**33.164.3.11 cursor()** [2/3]

```
void Fl_Window::cursor (
 Fl_Cursor c,
 Fl_Color ,
 Fl_Color = FL_WHITE)
```

For back compatibility only.

Same as [Fl\\_Window::cursor\(Fl\\_Cursor\)](#)

**33.164.3.12 cursor()** [3/3]

```
void Fl_Window::cursor (
 Fl_Cursor c)
```

Changes the cursor for this window.

The window must be [show\(\)](#) for this function to have any effect. This always calls the system. If you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The type `Fl_Cursor` is an enumeration defined in [<FL/Enumerations.H>](#).

See also

[cursor\(const Fl\\_RGB\\_Image\\*, int, int\), default\\_cursor\(\)](#)

**33.164.3.13 decorated\_h()**

```
int Fl_Window::decorated_h () const
```

Returns the window height including any window title bar and any frame added by the window manager.

Same as [h\(\)](#) if applied to a subwindow, or if window is not yet mapped.

Note

Under X11, FLTK is able to compute the size of window titlebars and borders only if these decoration elements are strictly X11-based. When that's not the case, [decorated\\_h\(\)](#) returns the same value as [h\(\)](#) and [decorated\\_w\(\)](#) as [w\(\)](#), and FLTK cannot access window decorations.

Under X11 again, the values returned by [decorated\\_h\(\)](#) and [decorated\\_w\(\)](#) may not be reliable **during a resize operation**. The size of decoration elements of a window is best computed when the window is first mapped.

**33.164.3.14 decorated\_w()**

```
int Fl_Window::decorated_w () const
```

Returns the window width including any frame added by the window manager.

Same as [w\(\)](#) if applied to a subwindow, or if window is not yet mapped.

See also

[decorated\\_h\(\)](#).

**33.164.3.15 default\_cursor()** [1/2]

```
void Fl_Window::default_cursor (
 Fl_Cursor c,
 Fl_Color ,
 Fl_Color = FL_WHITE)
```

For back compatibility only.

same as [Fl\\_Window::default\\_cursor\(Fl\\_Cursor\)](#)

**33.164.3.16 default\_cursor()** [2/2]

```
void Fl_Window::default_cursor (
 Fl_Cursor c)
```

Sets the default window cursor.

This is the cursor that will be used after the mouse pointer leaves a widget with a custom cursor set.

See also

[cursor\(const Fl\\_RGB\\_Image\\*, int, int\), default\\_cursor\(\)](#)

**33.164.3.17 default\_icon()**

```
void Fl_Window::default_icon (
 const Fl_RGB_Image * icon) [static]
```

Sets a single default window icon.

If `icon` is NULL the current default icons are removed.

Parameters

in	<i>icon</i>	default icon for all windows subsequently created or NULL
----	-------------	-----------------------------------------------------------

See also

[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

Note

See [Window icons](#) for the Wayland platform.

**33.164.3.18 default\_icons()** [1/2]

```
void Fl_Window::default_icons (
 const Fl_RGB_Image * icons[],
 int count) [static]
```

Sets the default window icons.

The default icons are used for all windows that don't have their own icons set before [show\(\)](#) is called. You can change the default icons whenever you want, but this only affects windows that are created (and shown) after this call.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call.

Parameters

in	<i>icons</i>	default icons for all windows subsequently created
in	<i>count</i>	number of images in <code>icons</code> . Set to 0 to remove the current default icons

See also

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

## Note

See [Window icons](#) for the Wayland platform.

**33.164.3.19 default\_icons()** [2/2]

```
static void Fl_Window::default_icons (
 HICON big_icon,
 HICON small_icon) [static]
```

Sets the default window icons (Windows platform only).

Convenience function to set the default icons using Windows' native HICON icon handles.

The given icons are copied. You can free the icons immediately after this call.

## Parameters

in	<i>big_icon</i>	default large icon for all windows subsequently created
in	<i>small_icon</i>	default small icon for all windows subsequently created

## See also

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)  
[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)  
[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)  
[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)  
[Fl\\_Window::icons\(HICON, HICON\)](#)

**33.164.3.20 default\_size\_range()**

```
void Fl_Window::default_size_range () [protected]
```

Protected method to calculate the default size range of a window.

This method is called internally prior to showing a window to ensure that the window's size range values are calculated if a [resizable\(\)](#) widget has been set but [size\\_range\(\)](#) has not been called explicitly.

This method does nothing if [size\\_range\(\)](#) has been called before.

Otherwise FLTK tries to figure out the window's size range from the setting of the window's [resizable\(\)](#) widget as follows and roughly in the given order.

1. If [resizable\(\)](#) is NULL (this is the default) then the window cannot be resized and the resize border and max-size control will not be displayed for the window.
2. If either dimension of [resizable\(\)](#) is zero, then the window cannot resize in that direction.
3. The [resizable\(\)](#) widget is clipped to the window area.
4. The non-resizable portion of the window is calculated as the difference of the window's size and the clipped [resizable\(\)](#) widget's size.
5. If either dimension of the clipped [resizable\(\)](#) widget is greater than 100, then 100 is considered its minimum width/height. This allows the resizable widget to shrink below its original size.
6. Finally the minimum width/height of the window is set to the non-resizable portion plus the width/height of the [resizable\(\)](#) widget as calculated above.

In simple words:

- It is assumed that the [resizable\(\)](#) widget can be indefinitely enlarged and/or shrunk to a minimum width/height of 100 unless it is smaller than that, which is then considered the minimum.

- The window's `size_range()` minimum values are set to the sum of the non-resizable portion of the window and the previously calculated minimum size of the `resizable()` widget.

**Examples:**

```
Fl_Window win(400, 400);
win.resizable(win);
// win.size_range(100, 100, 0, 0);
```

The minimum size of the resizable is 100, hence the minimum size of the total window is also 100 in both directions.

```
Fl_Window win(400, 400);
Fl_Box box(20, 20, 360, 360);
win.resizable(box);
// win.size_range(140, 140, 0, 0);
```

The calculated minimum width and height would be 20 + 100 + 20 in both dimensions.

```
Fl_Window win(400, 400);
Fl_Box box(200, 0, 500, 300); // note: width 500 too large: clipped
win.resizable(box);
// win.size_range(300, 200, 0, 0);
```

The width of the resizable is clipped to 200, hence the minimum size of the total window is also 200 (fix) + 100 (min. resizable) in x direction. The minimum value in y direction is 100 (resizable) + 100 (fixed part).

The calculation is based on clipping the resizable widget to the window area to prevent programming errors and the assumption that the resizable widget can be shrunk to 100x100 or its original size, whichever is smaller.

If this is not what you want, please use `Fl_Window::size_range()` explicitly so you can set any appropriate range.

**33.164.3.21 default\_xclass() [1/2]**

```
const char * Fl_Window::default_xclass () [static]
```

Returns the default xclass.

**See also**

[Fl\\_Window::default\\_xclass\(const char \\*\)](#)

**33.164.3.22 default\_xclass() [2/2]**

```
void Fl_Window::default_xclass (
 const char * xc) [static]
```

Sets the default window xclass.

The default xclass is used for all windows that don't have their own xclass set before `show()` is called. You can change the default xclass whenever you want, but this only affects windows that are created (and shown) after this call.

The given string `xc` is copied. You can use a local variable or free the string immediately after this call.

If you don't call this, the default xclass for all windows will be "FLTK". You can reset the default xclass by specifying NULL for `xc`.

If you call `Fl_Window::xclass(const char *)` for any window, then this also sets the default xclass, unless it has been set before.

**Parameters**

in	xc	default xclass for all windows subsequently created
----	----	-----------------------------------------------------

**See also**

[Fl\\_Window::xclass\(const char \\*\)](#)

**33.164.3.23 draw()**

```
void Fl_Window::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

Reimplemented in [Fl\\_Glut\\_Window](#).

### 33.164.3.24 flush()

```
void Fl_Window::flush () [protected], [virtual]
```

Forces the window to be drawn, this window is also made current and calls `draw()`.

Reimplemented in [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), and [Fl\\_Overlay\\_Window](#).

### 33.164.3.25 force\_position() [1/2]

```
int Fl_Window::force_position () const [inline], [protected]
```

Returns the internal state of the window's FORCE\_POSITION flag.

Return values

1	if flag is set
0	otherwise

See also

[force\\_position\(int\)](#)

### 33.164.3.26 force\_position() [2/2]

```
void Fl_Window::force_position (
 int force) [inline], [protected]
```

Sets an internal flag that tells FLTK and the window manager to honor position requests.

This is used internally and should not be needed by user code.

Parameters

in	<i>force</i>	1 to set the FORCE_POSITION flag, 0 to clear it
----	--------------	-------------------------------------------------

### 33.164.3.27 free\_icons()

```
void Fl_Window::free_icons () [protected]
```

Deletes all icons previously attached to the window.

See also

[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*icons\[\], int count\)](#)

### 33.164.3.28 free\_position()

```
void Fl_Window::free_position () [inline]
```

Undoes the effect of a previous `resize()` or `show()` so that the next time `show()` is called the window manager is free to position the window.

This is for Forms compatibility only.

**Deprecated** please use `force_position(0)` instead

### 33.164.3.29 fullscreen()

```
void Fl_Window::fullscreen ()
```

Makes the window completely fill one or more screens, without any window manager border visible.

You must use `fullscreen_off()` to undo this.

#### Note

On some platforms, this can result in the keyboard being grabbed. The window may also be recreated, meaning `hide()` and `show()` will be called.

#### See also

void `Fl_Window::fullscreen_screens()`

### 33.164.3.30 fullscreen\_screens()

```
void Fl_Window::fullscreen_screens (
 int top,
 int bottom,
 int left,
 int right)
```

Sets which screens should be used when this window is in fullscreen mode.

The window will be resized to the top of the screen with index `top`, the bottom of the screen with index `bottom`, etc.

If this method is never called, or if any argument is  $< 0$ , then the window will be resized to fill the screen it is currently on.

#### See also

void `Fl_Window::fullscreen()`

### 33.164.3.31 get\_size\_range()

```
uchar Fl_Window::get_size_range (
 int * minWidth,
 int * minHeight,
 int * maxWidth = NULL,
 int * maxHeight = NULL,
 int * deltaX = NULL,
 int * deltaY = NULL,
 int * aspectRatio = NULL)
```

Gets the allowable range to which the user can resize this window.

#### Parameters

out	<i>minWidth, minHeight, maxWidth, maxHeight, deltaX, deltaY, aspectRatio</i>	are all pointers to integers that will receive the current respective value during the call. Every pointer can be NULL if that value is not needed.
-----	------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------

## Return values

0	if size range not set
1	if the size range was explicitly set by a call to <a href="#">Fl_Window::size_range()</a> or has been calculated

## See also

[Fl\\_Window::size\\_range\(int minWidth, int minHeight, int maxWidth, int maxHeight, int deltaX, int deltaY, int aspectRatio\)](#)

**33.164.3.32 handle()**

```
int Fl_Window::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Group](#).

Reimplemented in [Fl\\_Glut\\_Window](#).

**33.164.3.33 hide()**

```
void Fl_Window::hide () [virtual]
```

Removes the window from the screen.

If the window is already hidden or has not been shown then this does nothing and is harmless.

Reimplemented from [Fl\\_Widget](#).

**33.164.3.34 hotspot()**

```
void Fl_Window::hotspot (
 int x,
```

```
int y,
int offscreen = 0)
```

Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

If the optional offscreen parameter is non-zero, then the window is allowed to extend off the screen (this does not work with some X window managers).

See also

[position\(\)](#)

### 33.164.3.35 icon() [1/3]

```
const void * Fl_Window::icon () const
```

Gets the current icon window target dependent data.

**Deprecated** in 1.3.3

### 33.164.3.36 icon() [2/3]

```
void Fl_Window::icon (
 const Fl_RGB_Image * icon)
```

Sets or resets a single window icon.

A window icon *can* be changed while the window is shown, but this *may* be platform and/or window manager dependent. To be sure that the window displays the correct window icon you should always set the icon before the window is shown.

If a window icon has not been set for a particular window, then the default window icon (see links below) or the system default icon will be used.

This method makes an internal copy of the `icon` pixel buffer, so once set, the `Fl_RGB_Image` instance can be freed by the caller.

Parameters

<code>in</code>	<code>icon</code>	icon for this window, NULL to reset window icon.
-----------------	-------------------	--------------------------------------------------

See also

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

Note

See [Window icons](#) for the Wayland platform.

### 33.164.3.37 icon() [3/3]

```
void Fl_Window::icon (
 const void * ic)
```

Platform-specific method to set the window icon usable on Windows and X11 only.

See [Setting the Icon of a Window](#) for its use under X11, and [Setting the Icon of a Window](#) under Windows.

**Deprecated** in 1.3.3 in favor of platform-independent methods [Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*icon\)](#) and [Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*icons\[\], int count\)](#).

**33.164.3.38 iconize()**

```
void Fl_Window::iconize ()
```

Iconifies the window.

If you call this when [shown\(\)](#) is false it will [show\(\)](#) it as an icon. If the window is already iconified this does nothing. Call [show\(\)](#) to restore the window.

When a window is iconified/restored (either by these calls or by the user) the [handle\(\)](#) method is called with FL\_HIDE and FL\_SHOW events and [visible\(\)](#) is turned on and off.

There is no way to control what is drawn in the icon except with the string passed to [Fl\\_Window::xclass\(\)](#). You should not rely on window managers displaying the icons.

**33.164.3.39 icons() [1/2]**

```
void Fl_Window::icons (
 const Fl_RGB_Image * icons[],
 int count)
```

Sets the window icons.

You may set multiple window icons with different sizes. Dependent on the platform and system settings the best (or the first) icon will be chosen.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call. If `count` is zero, current icons are removed. If `count` is greater than zero (must not be negative), then `icons[]` must contain at least `count` valid image pointers (not NULL). Otherwise the behavior is undefined.

**Parameters**

in	<i>icons</i>	icons for this window
in	<i>count</i>	number of images in <code>icons</code> . Set to 0 to remove the current icons

**See also**

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)

**Note**

See [Window icons](#) for the Wayland platform.

**33.164.3.40 icons() [2/2]**

```
void Fl_Window::icons (
 HICON big_icon,
 HICON small_icon)
```

Sets the window icons using HICON handles (Windows platform only).

The given icons are copied. You can free the icons immediately after this call.

**Parameters**

in	<i>big_icon</i>	large window icon
in	<i>small_icon</i>	small window icon

**33.164.3.41 is\_resizable()**

```
int Fl_Window::is_resizable () [protected]
```

Protected method to determine whether a window is resizable.

If `size_range()` has not yet been called this method calculates the default size range values by calling `default_size_range()`.

This method is for internal use only. The returned value is a bit mask and non-zero if the window is resizable in at least one direction.

#### Returns

non-zero if the window is resizable

#### Return values

0	the window is not resizable
1	the window is resizable in horizontal direction (w)
2	the window is resizable in vertical direction (h)
3	the window is resizable in both directions (w and h)

#### See also

[default\\_size\\_range\(\)](#)

#### 33.164.3.42 make\_current()

```
void Fl_Window::make_current ()
```

Sets things up so that the drawing functions in [<FL/fl\\_draw.H>](#) will go into this window.

This is useful for incremental update of windows, such as in an idle callback, which will make your program behave much better if it draws a slow graphic. **Danger: incremental update is very hard to debug and maintain!**

This method only works for the [Fl\\_Window](#) and [Fl\\_Gl\\_Window](#) derived classes.

#### 33.164.3.43 maximize()

```
void Fl_Window::maximize ()
```

Maximizes a top-level window to its current screen.

This function is effective only with a `show()`'n, resizable, top-level window. Bordered and borderless windows can be used.

#### See also

[Fl\\_Window::un\\_maximize\(\)](#), [Fl\\_Window::maximize\\_active\(\)](#)

#### 33.164.3.44 modal()

```
unsigned int Fl_Window::modal () const [inline]
```

Returns true if this window is modal.

#### 33.164.3.45 os\_id()

```
fl_uintptr_t Fl_Window::os_id ()
```

Returns a platform-specific identification of a shown window, or 0 if not shown.

**Note**

This identification may differ from the platform-specific reference of an [Fl\\_Window](#) object used by functions [fl\\_x11\\_xid\(\)](#), [fl\\_mac\\_xid\(\)](#), [fl\\_x11\\_find\(\)](#), and [fl\\_mac\\_find\(\)](#).

- X11 platform: the window's XID.
- macOS platform: The window number of the window's window device.
- other platforms: 0.

**33.164.3.46 resize()**

```
void Fl_Window::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Changes the size and position of the window.

If [shown\(\)](#) is true, these changes are communicated to the window server (which may refuse that size and cause a further resize). If [shown\(\)](#) is false, the size and position are used when [show\(\)](#) is called. See [Fl\\_Group](#) for the effect of resizing on the child widgets.

You can also call the [Fl\\_Widget](#) methods [size\(x,y\)](#) and [position\(w,h\)](#), which are inline wrappers for this virtual function.

A top-level window can not force, but merely suggest a position and size to the operating system. The window manager may not be willing or able to display a window at the desired position or with the given dimensions. It is up to the application developer to verify window parameters after the resize request.

Reimplemented from [Fl\\_Group](#).

**33.164.3.47 screen\_num()**

```
void Fl_Window::screen_num (
 int screen_num)
```

Set the number of the screen where to map the window.

Call this and set also the window's desired position before [show\(\)](#)ing the window. This can be necessary when a system has several screens with distinct scaling factor values because the window's [x\(\)](#) and [y\(\)](#) may not suffice to uniquely identify one screen. To see that, consider a system with two screens where the screen at left is A pixel-wide and has a scale factor of 1 whereas the screen at right has a scale factor of 2. For the sake of simplicity, consider only the X coordinates of windows. FLTK coordinates translate directly to pixel coordinates on the left screen, whereas FLTK coordinates multiplied by 2 correspond to pixel coordinates on the right screen. Consequently, FLTK coordinates between  $A/2 + 1$  and  $A-1$  can map to both screens. Both window coordinates and screen number are necessary to uniquely identify where a window is to be mapped.

**33.164.3.48 set\_menu\_window()**

```
void Fl_Window::set_menu_window () [inline]
```

Marks the window as a menu window.

This is intended for internal use, but it can also be used if you write your own menu handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

**33.164.3.49 set\_modal()**

```
void Fl_Window::set_modal () [inline]
```

A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

Several modal windows may be shown at once, in which case only the last one shown gets events. You can see which window (if any) is modal by calling `Fl::modal()`.

### 33.164.3.50 `set_non_modal()`

```
void Fl_Window::set_non_modal () [inline]
```

A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a `modal()` one in that it remains on top, but it has no effect on event delivery.

There are *three* states for a window: modal, non-modal, and normal.

### 33.164.3.51 `set_tooltip_window()`

```
void Fl_Window::set_tooltip_window () [inline]
```

Marks the window as a tooltip window.

This is intended for internal use, but it can also be used if you write your own tooltip handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

#### Note

Since `Fl_Tooltip_Window` is derived from `Fl_Menu_Window`, this also **clears** the `menu_window()` state.

### 33.164.3.52 `shape()` [1/2]

```
void Fl_Window::shape (
 const Fl_Image & img)
```

Set the window's shape with an `Fl_Image`.

#### See also

```
void shape(const Fl_Image* img)
```

### 33.164.3.53 `shape()` [2/2]

```
void Fl_Window::shape (
 const Fl_Image * img)
```

Assigns a non-rectangular shape to the window.

This function gives an arbitrary shape (not just a rectangular region) to an `Fl_Window`. An `Fl_Image` of any dimension can be used as mask; it is rescaled to the window's dimension as needed.

The layout and widgets inside are unaware of the mask shape, and most will act as though the window's rectangular bounding box is available to them. It is up to you to make sure they adhere to the bounds of their masking shape.

The `img` argument can be an `Fl_Bitmap`, `Fl_Pixmap`, `Fl_RGB_Image` or `Fl_Shared_Image`:

- With `Fl_Bitmap` or `Fl_Pixmap`, the shaped window covers the image part where bitmap bits equal one, or where the pixmap is not fully transparent.
- With an `Fl_RGB_Image` with an alpha channel (depths 2 or 4), the shaped window covers the image part that is not fully transparent.
- With an `Fl_RGB_Image` of depth 1 (gray-scale) or 3 (RGB), the shaped window covers the non-black image part.
- With an `Fl_Shared_Image`, the shape is determined by rules above applied to the underlying image. The shared image should not have been scaled through `Fl_Image::scale()`.

Platform details:

- On the unix/linux platform, the SHAPE extension of the X server is required. This function does control the shape of [Fl\\_Gl\\_Window](#) instances.
- On the Windows platform, this function does nothing with class [Fl\\_Gl\\_Window](#).
- On the Mac platform, OS version 10.4 or above is required. An 8-bit shape-mask is used when `img` is an [Fl\\_RGB\\_Image](#): with depths 2 or 4, the image alpha channel becomes the shape mask such that areas with alpha = 0 are out of the shaped window; with depths 1 or 3, white and black are in and out of the shaped window, respectively, and other colors give intermediate masking scores. This function does nothing with class [Fl\\_Gl\\_Window](#).

The window borders and caption created by the window system are turned off by default. They can be re-enabled by calling `Fl_Window::border(1)`.

A usage example is found at `example/shapedwindow.cxx`.

#### Version

1.3.3

### 33.164.3.54 `show()` [1/2]

```
void Fl_Window::show () [virtual]
```

Puts the window on the screen.

This has the side effect of opening the display, if not done before.

If the window is already shown then it is restored and raised to the top. This is really convenient because your program can call `show()` at any time, even if the window is already up. It also means that `show()` serves the purpose of `raise()` in other toolkits.

`Fl_Window::show(int argc, char **argv)` is used for top-level windows and allows standard arguments to be parsed from the command-line.

#### Note

For some obscure reasons `Fl_Window::show()` resets the current group by calling `Fl_Group::current(0)`. The comments in the code say "get rid of very common user bug: forgot end()". Although this is true it may have unwanted side effects if you `show()` an unrelated window (maybe for an error message or warning) while building a window or any other group widget.

**Todo** Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

#### See also

[Fl\\_Window::show\(int argc, char \\*\\*argv\)](#)

Reimplemented from [Fl\\_Widget](#).

### 33.164.3.55 `show()` [2/2]

```
void Fl_Window::show (
 int argc,
 char ** argv)
```

Puts the window on the screen with `show()` and parses command-line arguments.

This call should be used for top-level windows, at least for the first (main) window. It allows standard arguments to be parsed, as done by `Fl::args(int, char **)`, from the command-line. You can use `argc` and `argv` from `main(int argc, char **argv)` for this call.

This call also sets up some system-specific internal variables, that is, it sets `FL_SELECTION_COLOR` and calls `Fl::background()`, `Fl::background2()`, `Fl::foreground()` with default or X resources-given values, and calls `Fl::scheme(const char *)` for the current scheme. On X11, it also calls `Fl::dnd_text_ops(int)`, `Fl_Tooltip::enable(int)`, `Fl::visible_focus(int)` with X resources-given values.

## Parameters

<i>argc</i>	command-line argument count, usually from main()
<i>argv</i>	command-line argument vector, usually from main()

## See also

virtual void [Fl\\_Window::show\(\)](#)  
[Fl::args\(int, char \\*\\*\)](#)

**33.164.3.56 show\_next\_window\_iconic()** [1/2]

```
static char Fl_Window::show_next_window_iconic () [inline], [static]
```

Returns the static flag whether the next window should be opened iconified.

## Note

This is an **internal function**, you should not use this in user code.

Please use [Fl\\_Window::iconize\(\)](#) to iconify a window.

**33.164.3.57 show\_next\_window\_iconic()** [2/2]

```
static void Fl_Window::show_next_window_iconic (
 char stat) [inline], [static]
```

Sets a static flag whether the next window should be opened iconified.

## Note

This is an **internal function**, you should not use this in user code.

Please use [Fl\\_Window::iconize\(\)](#) instead.

**33.164.3.58 shown()**

```
int Fl_Window::shown () [inline]
```

Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#) ).

You can tell if a window is iconified with (w->[shown\(\)](#) && !w->[visible\(\)](#)).

**33.164.3.59 size\_range()**

```
void Fl_Window::size_range (
 int minWidth,
 int minHeight,
 int maxWidth = 0,
 int maxHeight = 0,
 int deltaX = 0,
 int deltaY = 0,
 int aspectRatio = 0)
```

Sets the allowable range to which the user can resize this window.

We recommend to call [size\\_range\(\)](#) if you have a [resizable\(\)](#) widget in a main window, and to call it after setting the [resizable\(\)](#) and before [show\(\)](#)'ing the window for best cross platform compatibility.

If this function is **not** called, FLTK tries to figure out the range when the window is shown. Please see the protected method [default\\_size\\_range\(\)](#) for details.

It is undefined what happens if the current window size does not fit in the constraints passed to [size\\_range\(\)](#).

**Note**

This only works for top-level windows and the exact behavior can be platform specific. To work correctly across all platforms `size_range()` must be called after setting the `resizable()` widget of the window and before the window is `show()`'n.

Calling `size_range()` after the window has been shown may work on some but not all platforms. If you need to change the `size_range()` after the window has been shown, then you should consider to `hide()` and `show()` the window again, i.e. call `hide()`, `size_range()`, and `show()` in this order.

Typical usage: call

```
size_range(minWidth, minHeight);
```

after setting the resizable widget and before calling `show()`. This ensures that the window cannot be resized smaller than the given values by user interaction.

`maxWidth` and `maxHeight` might be useful in some special cases but less frequently used.

The other optional parameters `deltaX`, `deltaY`, and `aspectRatio` are not recommended because they may not work on all platforms and may even under X11 not be supported by all Window Managers.

**Parameters**

in	<i>minWidth,minHeight</i>	The smallest the window can be. Either value must be greater than 0.
in	<i>maxWidth,maxHeight</i>	The largest the window can be. If either is equal to the minimum then you cannot resize in that direction. If either is zero then FLTK picks a maximum size in that direction such that the window will fill the screen.
in	<i>deltaX,deltaY</i>	These are size increments. The window will be constrained to widths of $minWidth + N * deltaX$ , where N is any non-negative integer. If these are less or equal to 1 they are ignored (this is always ignored on Windows).
in	<i>aspectRatio</i>	A flag that indicates that the window should preserve its aspect ratio. This only works if both the maximum and minimum have the same aspect ratio (ignored on Windows and by many X window managers).

**33.164.3.60 un\_maximize()**

```
void Fl_Window::un_maximize ()
```

Returns a previously maximized top-level window to its previous size.

See also

[Fl\\_Window::maximize\(\)](#)

**33.164.3.61 wait\_for\_expose()**

```
void Fl_Window::wait_for_expose ()
```

Waits for the window to be displayed after calling `show()`.

`Fl_Window::show()` is not guaranteed to show and draw the window on all platforms immediately. Instead this is done in the background; particularly on X11 it will take a few messages (client server roundtrips) to display the window. Usually this small delay doesn't matter, but in some cases you may want to have the window instantiated and displayed synchronously.

Currently (as of FLTK 1.3.4) this method has an effect on X11 and Mac OS. On Windows, `show()` is always synchronous. The effect of `show()` varies with versions of Mac OS X: early versions have the window appear on the screen when `show()` returns, later versions don't. If you want to write portable code and need this synchronous `show()` feature, add `win->wait_for_expose()` on all platforms, and FLTK will just do the right thing.

This method can be used for displaying splash screens before calling `Fl::run()` or for having exact control over which window has the focus after calling `show()`.

If the window is not `shown()`, this method does nothing.

**Note**

Depending on the platform and window manager `wait_for_expose()` may not guarantee that the window is fully drawn when it is called. Under X11 it may only make sure that the window is **mapped**, i.e. the internal (OS dependent) window object was created (and maybe shown on the desktop as an empty frame or something like that). You may need to call `Fl::flush()` after `wait_for_expose()` to make sure the window and all its widgets are drawn and thus visible.

FLTK does the best it can do to make sure that all widgets get drawn if you call `wait_for_expose()` and `Fl::flush()`. However, dependent on the window manager it can not be guaranteed that this does always happen synchronously. The only guaranteed behavior that all widgets are eventually drawn is if the FLTK event loop is run continuously, for instance with `Fl::run()`.

**See also**

virtual void [Fl\\_Window::show\(\)](#)

Example code for displaying a window before calling `Fl::run()`

```
Fl_Double_Window win = new Fl_Double_Window(...);
// do more window initialization here ...
win->show(); // show window
win->wait_for_expose(); // wait, until displayed
Fl::flush(); // make sure everything gets drawn
// do more initialization work that needs some time here ...
Fl::run(); // start FLTK event loop
```

Note that the window will not be responsive until the event loop is started with `Fl::run()`.

**33.164.3.62 xclass() [1/2]**

```
const char * Fl_Window::xclass () const
```

Returns the xclass for this window, or a default.

**See also**

[Fl\\_Window::default\\_xclass\(const char \\*\)](#)

[Fl\\_Window::xclass\(const char \\*\)](#)

**33.164.3.63 xclass() [2/2]**

```
void Fl_Window::xclass (
 const char * xc)
```

Sets the xclass for this window.

A string used to tell the system what type of window this is. Mostly this identifies the picture to draw in the icon. This only works if called *before* calling `show()`.

*Under X*, this is turned into a XA\_WM\_CLASS pair by truncating at the first non-alphanumeric character and capitalizing the first character, and the second one if the first is 'x'. Thus "foo" turns into "foo, Foo", and "xprog.1" turns into "xprog, XProg".

*Under Microsoft Windows*, this string is used as the name of the WNDCLASS structure, though it is not clear if this can have any visible effect.

**Since**

FLTK 1.3 the passed string is copied. You can use a local variable or free the string immediately after this call. Note that FLTK 1.1 stores the *pointer* without copying the string.

If the default xclass has not yet been set, this also sets the default xclass for all windows created subsequently.

**See also**

[Fl\\_Window::default\\_xclass\(const char \\*\)](#)

**33.164.4 Member Data Documentation**

### 33.164.4.1 current\_

```
Fl_Window * Fl_Window::current_ [static], [protected]
```

Stores the last window that was made current.

See `current() const`

The documentation for this class was generated from the following files:

- [Fl\\_Window.H](#)
- [Fl\\_arg.cxx](#)
- [fl\\_cursor.cxx](#)
- [Fl\\_Window.cxx](#)
- [Fl\\_Window\\_fullscreen.cxx](#)
- [Fl\\_Window\\_hotspot.cxx](#)
- [Fl\\_Window\\_iconize.cxx](#)

## 33.165 Fl\_Wizard Class Reference

This widget is based off the [Fl\\_Tabs](#) widget, but instead of displaying tabs it only changes "tabs" under program control.

```
#include <Fl_Wizard.H>
```

Inheritance diagram for `Fl_Wizard`:

### Public Member Functions

- [Fl\\_Wizard](#) (int, int, int, int, const char \*=0)
  - The constructor creates the [Fl\\_Wizard](#) widget at the specified position and size.*
- void [next](#) ()
  - This method shows the next child of the wizard.*
- void [prev](#) ()
  - Shows the previous child.*
- [Fl\\_Widget \\* value](#) ()
  - Gets the current visible child widget.*
- void [value](#) ([Fl\\_Widget \\*](#))
  - Sets the child widget that is visible.*

### Protected Member Functions

- void [draw](#) () [FL\\_OVERRIDE](#)
  - Draws the wizard border and visible child.*

### Additional Inherited Members

#### 33.165.1 Detailed Description

This widget is based off the [Fl\\_Tabs](#) widget, but instead of displaying tabs it only changes "tabs" under program control.

Its primary purpose is to support "wizards" that step a user through configuration or troubleshooting tasks.

As with [Fl\\_Tabs](#), wizard panes are composed of child (usually [Fl\\_Group](#)) widgets. Navigation buttons must be added separately.

## 33.165.2 Constructor & Destructor Documentation

### 33.165.2.1 FI\_Wizard()

```
Fl_Wizard::Fl_Wizard (
 int xx,
 int yy,
 int ww,
 int hh,
 const char * l = 0)
```

The constructor creates the [FI\\_Wizard](#) widget at the specified position and size. The inherited destructor destroys the widget and its children.

## 33.165.3 Member Function Documentation

### 33.165.3.1 draw()

```
void Fl_Wizard::draw (
 void) [protected], [virtual]
```

Draws the wizard border and visible child.

Reimplemented from [FI\\_Group](#).

### 33.165.3.2 next()

```
void Fl_Wizard::next ()
```

This method shows the next child of the wizard.

If the last child is already visible, this function does nothing.

The documentation for this class was generated from the following files:

- [FI\\_Wizard.H](#)
- [FI\\_Wizard.cxx](#)

## 33.166 FI\_XBM\_Image Class Reference

The [FI\\_XBM\\_Image](#) class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

```
#include <FI_XBM_Image.H>
```

Inheritance diagram for [FI\\_XBM\\_Image](#):

### Public Member Functions

- [FI\\_XBM\\_Image](#) (const char \*filename)

*The constructor loads the named XBM file from the given name filename.*

## Additional Inherited Members

### 33.166.1 Detailed Description

The [Fl\\_XBM\\_Image](#) class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

### 33.166.2 Constructor & Destructor Documentation

#### 33.166.2.1 Fl\_XBM\_Image()

```
Fl_XBM_Image::Fl_XBM_Image (
 const char * name)
```

The constructor loads the named XBM file from the given name filename.

The destructor frees all memory and server resources that are used by the image.

The documentation for this class was generated from the following files:

- Fl\_XBM\_Image.H
- Fl\_XBM\_Image.cxx

## 33.167 Fl\_XPM\_Image Class Reference

The [Fl\\_XPM\\_Image](#) class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

```
#include <Fl_XPM_Image.H>
```

Inheritance diagram for Fl\_XPM\_Image:

## Public Member Functions

- [Fl\\_XPM\\_Image](#) (const char \*filename)  
*The constructor loads the XPM image from the name filename.*

## Additional Inherited Members

### 33.167.1 Detailed Description

The [Fl\\_XPM\\_Image](#) class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

### 33.167.2 Constructor & Destructor Documentation

#### 33.167.2.1 Fl\_XPM\_Image()

```
Fl_XPM_Image::Fl_XPM_Image (
 const char * name)
```

The constructor loads the XPM image from the name filename.

The destructor frees all memory and server resources that are used by the image.

The documentation for this class was generated from the following files:

- FI\_XPM\_Image.H
- FI\_XPM\_Image.cxx

## 33.168 FI\_GIF\_Image::GIF\_FRAME Struct Reference

### Classes

- struct [CPAL](#)

### Public Member Functions

- void **colors** (int nclrs, int bg, int tp)
- void **disposal** (int mode, int time)
- **GIF\_FRAME** (int frame, int W, int H, int fx, int fy, int fw, int fh, [uchar](#) \*data)
- **GIF\_FRAME** (int frame, [uchar](#) \*data)

### Public Attributes

- int **bkgd**
- const [uchar](#) \* **bptr**
- int **clrs**
- const struct [FI\\_GIF\\_Image::GIF\\_FRAME::CPAL](#) \* **cpal**
- int **delay**
- int **dispose**
- int **h**
- int **height**
- int **ifrm**
- int **trans**
- int **w**
- int **width**
- int **x**
- int **y**

The documentation for this struct was generated from the following file:

- FI\_GIF\_Image.H

## 33.169 FI\_ICO\_Image::IconDirEntry Struct Reference

Windows ICONDIRENTRY structure

```
#include <FI_ICO_Image.H>
```

### Public Attributes

- int **bColorCount**  
*Number of colors (0 if 8bpp)*
- int **bHeight**  
*Image height.*
- int **bReserved**  
*Reserved.*
- int **bWidth**  
*Image width.*
- int **dwBytesInRes**

- *Resource size in bytes.*
- int **dwImageOffset**  
*Offset to the image.*
- int **wBitCount**  
*Bits per pixel.*
- int **wPlanes**  
*Color Planes.*

### 33.169.1 Detailed Description

Windows ICONDIRENTRY structure

The documentation for this struct was generated from the following file:

- [FI\\_ICO\\_Image.H](#)

## 33.170 FI\_Text\_Editor::Key\_Binding Struct Reference

Simple linked list item associating a key/state to a function.

```
#include <FI_Text_Editor.H>
```

### Public Attributes

- [Key\\_Func](#) function  
*associated function*
- int **key**  
*the key pressed*
- [Key\\_Binding](#) \* **next**  
*next key binding in the list*
- int **state**  
*the state of key modifiers*

### 33.170.1 Detailed Description

Simple linked list item associating a key/state to a function.

The documentation for this struct was generated from the following file:

- [FI\\_Text\\_Editor.H](#)

## 33.171 FI\_Terminal::Margin Class Reference

### Public Member Functions

- void **bottom** (int val)
- int **bottom** (void) const
- void **left** (int val)
- int **left** (void) const
- void **right** (int val)
- int **right** (void) const
- void **top** (int val)
- int **top** (void) const

The documentation for this class was generated from the following file:

- [FI\\_Terminal.H](#)

## 33.172 Fl\_Preferences::Name Class Reference

'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

```
#include <Fl_Preferences.H>
```

### Public Member Functions

- [Name](#) (const char \*format,...)  
*Creates a group name or entry name on the fly.*
- [Name](#) (unsigned int n)  
*Creates a group name or entry name on the fly.*
- **operator const char \* ()**  
*Return the [Name](#) as a "C" string.*

### 33.172.1 Detailed Description

'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

Example: `prefs.set(Fl_Preferences::Name("File%d",i),file[i]);`

See `test/preferences.cxx` as a sample for writing arrays into preferences.

'Name' is actually implemented as a class inside [Fl\\_Preferences](#). It casts into `const char*` and gets automatically destroyed after the enclosing call ends.

### 33.172.2 Constructor & Destructor Documentation

#### 33.172.2.1 Name() [1/2]

```
Fl_Preferences::Name::Name (
 unsigned int n)
```

Creates a group name or entry name on the fly.

This version creates a simple unsigned integer as an entry name.

```
int n, i;
Fl_Preferences prefs(appPrefs, "PreviousFiles");
prefs.get("n", 0);
for (i=0; i<n; i++)
 prefs.get(Fl_Preferences::Name(i), prevFile[i], "");
```

#### 33.172.2.2 Name() [2/2]

```
Fl_Preferences::Name::Name (
 const char * format,
 ...)
```

Creates a group name or entry name on the fly.

This version creates entry names as in 'printf'.

```
int n, i;
Fl_Preferences prefs(USER, "matthiasm.com", "test");
prefs.get("nFiles", 0);
for (i=0; i<n; i++)
 prefs.get(Fl_Preferences::Name("File%d", i), prevFile[i], "");
```

The documentation for this class was generated from the following files:

- `Fl_Preferences.H`
- `Fl_Preferences.cxx`

### 33.173 FI\_Preferences::Node Class Reference

#### Public Member Functions

- void **add** (const char \*line)
- [Node](#) \* **addChild** (const char \*path)
- const char \* **child** (int ix)
- [Node](#) \* **childNodes** (int ix)
- void **clearDirtyFlags** ()
- void **deleteAllChildren** ()
- void **deleteAllEntries** ()
- char **deleteEntry** (const char \*name)
- char **dirty** ()
- [Entry](#) & **entry** (int i)
- [Node](#) \* **find** (const char \*path)
- [RootNode](#) \* **findRoot** ()
- const char \* **get** (const char \*name)
- int **getEntry** (const char \*name)
- const char \* **name** ()
- int **nChildren** ()
- int **nEntry** ()
- [Node](#) (const char \*path)
- [Node](#) \* **parent** ()
- const char \* **path** ()
- char **remove** ()
- [Node](#) \* **search** (const char \*path, int offset=0)
- void **set** (const char \*line)
- void **set** (const char \*name, const char \*value)
- void **setParent** ([Node](#) \*parent)
- void **setRoot** ([RootNode](#) \*r)
- int **write** (FILE \*f)

#### Static Public Attributes

- static int **lastEntrySet** = -1

The documentation for this class was generated from the following files:

- FI\_Preferences.H
- FI\_Preferences.cxx

### 33.174 FI\_Paged\_Device::page\_format Struct Reference

width, height and name of a page format

```
#include <FI_Paged_Device.H>
```

#### Public Attributes

- int **height**  
*height in points*
- const char \* **name**  
*format name*
- int **width**  
*width in points*

### 33.174.1 Detailed Description

width, height and name of a page format

The documentation for this struct was generated from the following file:

- [FI\\_Paged\\_Device.H](#)

## 33.175 FI\_Terminal::PartialUtf8Buf Class Reference

### Public Member Functions

- bool **append** (const char \*p, int len)
- const char \* **buf** (void) const
- int **buflen** (void) const
- void **clear** (void)
- bool **is\_complete** (void) const
- bool **is\_continuation** (char c)

The documentation for this class was generated from the following file:

- [FI\\_Terminal.H](#)

## 33.176 FI\_Terminal::RingBuffer Class Reference

### Public Member Functions

- int **write** ()

The documentation for this class was generated from the following files:

- [FI\\_Preferences.H](#)
- [FI\\_Preferences.cxx](#)

### 33.178 [FI\\_Scroll::ScrollInfo](#) Struct Reference

Structure to manage scrollbar and widget interior sizes.

```
#include <FI_Scroll.H>
```

#### Public Attributes

- [FI\\_Region\\_LRTB](#) **child**  
*child bounding box: left/right/top/bottom*
- int **hneeded**  
*horizontal scrollbar visibility*
- [FI\\_Scrollbar\\_Data](#) **hscroll**  
*horizontal scrollbar region + values*
- [FI\\_Region\\_XYWH](#) **innerbox**  
*widget's inner box, excluding scrollbars*
- [FI\\_Region\\_XYWH](#) **innerchild**  
*widget's inner box, including scrollbars*
- int **scrollsize**  
*the effective scrollbar thickness (local or global)*
- int **vneeded**  
*vertical scrollbar visibility*
- [FI\\_Scrollbar\\_Data](#) **vscroll**  
*vertical scrollbar region + values*

### 33.178.1 Detailed Description

Structure to manage scrollbar and widget interior sizes.

This is filled out by `recalc_scrollbars()` for use in calculations that need to know the visible scroll area size, etc.

Version

1.3.3

The documentation for this struct was generated from the following file:

- `FI_Scroll.H`

## 33.179 FI\_Terminal::Selection Class Reference

### Public Member Functions

- `bool clear` (void)
- `bool dragged_off` (int row, int col, bool char\_right)
- `int ecol` (void) const
- `void end` (void)
- `int erow` (void) const
- `bool extend` (int row, int col, bool char\_right)
- `bool get_selection` (int &srow, int &scol, int &erow, int &ecol) const  
*Return selection start/end.*
- `bool is_selection` (void) const
- `void push_clear` ()
- `void push_rowcol` (int row, int col, bool char\_right)
- `int scol` (void) const
- `void scroll` (int nrows)
- `void select` (int srow, int scol, int erow, int ecol)
- `Selection` (`FI_Terminal` \*terminal)
- `void selectionbgcolor` (`FI_Color` val)
- `FI_Color selectionbgcolor` (void) const
- `void selectionfgcolor` (`FI_Color` val)
- `FI_Color selectionfgcolor` (void) const
- `int srow` (void) const
- `bool start` (int row, int col, bool char\_right)
- `void start_push` ()
- `int state` (void) const

### 33.179.1 Member Function Documentation

#### 33.179.1.1 `get_selection()`

```
bool FI_Terminal::Selection::get_selection (
 int & srow,
 int & scol,
 int & erow,
 int & ecol) const
```

Return selection start/end.

Ensures (start < end) to allow walking 'forward' thru selection, left-to-right, top-to-bottom.

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

The documentation for this class was generated from the following files:

- [FI\\_Terminal.H](#)
- [FI\\_Terminal.cxx](#)

## 33.180 FI\_Tile::Size\_Range Struct Reference

### Public Attributes

- int **maxh**
- int **maxw**
- int **minh**
- int **minw**

The documentation for this struct was generated from the following file:

- [FI\\_Tile.H](#)

## 33.181 FI\_Text\_Display::Style\_Table\_Entry Struct Reference

This structure associates the color, font, and font size of a string to draw with an attribute mask matching `attr`.

```
#include <FI_Text_Display.H>
```

### Public Attributes

- unsigned **attr**  
*further attributes for the text style (see ATTR\_BGCOLOR, etc.)*
- [FI\\_Color](#) **bgcolor**  
*text background color if ATTR\_BGCOLOR or ATTR\_BGCOLOR\_EXT is set*
- [FI\\_Color](#) **color**  
*text color*
- [FI\\_Font](#) **font**  
*text font*
- [FI\\_Fontsize](#) **size**  
*text font size*

### 33.181.1 Detailed Description

This structure associates the color, font, and font size of a string to draw with an attribute mask matching `attr`.

There must be one entry for each style that can be used in an [FI\\_Text\\_Display](#) for displaying text. The style table is an array of struct [Style\\_Table\\_Entry](#).

The style table is associated with an [FI\\_Text\\_Display](#) by using [FI\\_Text\\_Display::highlight\\_data\(\)](#).

See also

[FI\\_Text\\_Display::highlight\\_data\(\)](#)

The documentation for this struct was generated from the following file:

- [FI\\_Text\\_Display.H](#)

# Chapter 34

## File Documentation

### 34.1 Enumerations.H File Reference

This file contains type definitions and general enumerations.

```
#include <FL/fl_config.h>
#include "Fl_Export.H"
#include "fl_types.h"
#include <FL/platform_types.h>
```

#### Macros

- #define **FL\_IMAGE\_WITH\_ALPHA** 0x40000000

#### Version Numbers

FLTK defines some constants to help the programmer to find out, for which FLTK version a program is compiled.

The following constants are defined:

- #define **FL\_ABI\_VERSION** **FL\_API\_VERSION**  
*The FLTK ABI (Application Binary Interface) version number as an int.*
- #define **FL\_API\_VERSION** (**FL\_MAJOR\_VERSION**\*10000 + **FL\_MINOR\_VERSION**\*100 + **FL\_PATCH\_VERSION**)  
*The FLTK API version number as an int.*
- #define **FL\_MAJOR\_VERSION** 1  
*The major release version of this FLTK library.*
- #define **FL\_MINOR\_VERSION** 4  
*The minor release version for this library.*
- #define **FL\_PATCH\_VERSION** 0  
*The patch version for this library.*
- #define **FL\_VERSION**  
*The FLTK version number as a double.*

#### Names of Non-ASCII keys and mouse buttons

The following constants define the names of non-ASCII keys on the keyboard and of mouse buttons for **FL\_KEYBOARD** and **FL\_SHORTCUT** events.

See also

[Fl::event\\_key\(\)](#) and [Fl::get\\_key\(int\)](#) (use ASCII letters for all other keys):

- #define **FL\_Alt\_Gr** 0xfe03  
*The AltGr key on some international keyboards.*
- #define **FL\_Alt\_L** 0xffe9  
*The left alt key.*
- #define **FL\_Alt\_R** 0xffea  
*The right alt key.*

- **#define FL\_Back** 0xEF26  
*Like back on a browser.*
- **#define FL\_BackSpace** 0xff08  
*The backspace key.*
- **#define FL\_Button** 0xfe8  
*A mouse button; use FL\_Button + n for mouse button n.*
- **#define FL\_Caps\_Lock** 0xfe5  
*The caps lock key.*
- **#define FL\_Control\_L** 0xfe3  
*The lefthand control key.*
- **#define FL\_Control\_R** 0xfe4  
*The righthand control key.*
- **#define FL\_Delete** 0xffff  
*The delete key.*
- **#define FL\_Down** 0xff54  
*The down arrow key.*
- **#define FL\_Eisu** 0xff2f  
*The Eisu key of JIS keyboards.*
- **#define FL\_End** 0xff57  
*The end key.*
- **#define FL\_Enter** 0xff0d  
*The enter key.*
- **#define FL\_Escape** 0xff1b  
*The escape key.*
- **#define FL\_F** 0xffbd  
*One of the function keys; use FL\_F + n for function key n.*
- **#define FL\_F\_Last** 0xfe0  
*The last function key; use to range-check function keys.*
- **#define FL\_Favorites** 0xEF30  
*Show favorite locations.*
- **#define FL\_Forward** 0xEF27  
*Like forward on a browser.*
- **#define FL\_Help** 0xff68  
*The 'help' key on Mac keyboards.*
- **#define FL\_Home** 0xff50  
*The home key.*
- **#define FL\_Home\_Page** 0xEF18  
*Display user's home page.*
- **#define FL\_Insert** 0xff63  
*The insert key.*
- **#define FL\_Iso\_Key** 0xff0c  
*The additional key of ISO keyboards.*
- **#define FL\_JIS\_Underscore** 0xff31  
*The underscore key of JIS keyboards.*
- **#define FL\_Kana** 0xff2e  
*The Kana key of JIS keyboards.*
- **#define FL\_KP** 0xff80  
*One of the keypad numbers; use FL\_KP + 'n' for digit n.*
- **#define FL\_KP\_Enter** 0xff8d  
*The enter key on the keypad, same as FL\_KP+'r'.*
- **#define FL\_KP\_Last** 0xffbd  
*The last keypad key; use to range-check keypad.*
- **#define FL\_Left** 0xff51  
*The left arrow key.*
- **#define FL\_Mail** 0xEF19  
*Invoke user's mail program.*
- **#define FL\_Media\_Next** 0xEF17  
*Next track.*
- **#define FL\_Media\_Play** 0xEF14

- *Start playing of audio.*  
• #define **FL\_Media\_Prev** 0xEF16  
*Previous track.*
- #define **FL\_Media\_Stop** 0xEF15  
*Stop playing audio.*
- #define **FL\_Menu** 0xff67  
*The menu key.*
- #define **FL\_Meta\_L** 0xffe7  
*The left meta/Windows key.*
- #define **FL\_Meta\_R** 0xffe8  
*The right meta/Windows key.*
- #define **FL\_Num\_Lock** 0xff7f  
*The num lock key.*
- #define **FL\_Page\_Down** 0xff56  
*The page-down key.*
- #define **FL\_Page\_Up** 0xff55  
*The page-up key.*
- #define **FL\_Pause** 0xff13  
*The pause key.*
- #define **FL\_Print** 0xff61  
*The print (or print-screen) key.*
- #define **FL\_Refresh** 0xEF29  
*Refresh the page.*
- #define **FL\_Right** 0xff53  
*The right arrow key.*
- #define **FL\_Scroll\_Lock** 0xff14  
*The scroll lock key.*
- #define **FL\_Search** 0xEF1B  
*Search.*
- #define **FL\_Shift\_L** 0xffe1  
*The lefthand shift key.*
- #define **FL\_Shift\_R** 0xffe2  
*The righthand shift key.*
- #define **FL\_Sleep** 0xEF2F  
*Put system to sleep.*
- #define **FL\_Stop** 0xEF28  
*Stop current operation.*
- #define **FL\_Tab** 0xff09  
*The tab key.*
- #define **FL\_Up** 0xff52  
*The up arrow key.*
- #define **FL\_Volume\_Down** 0xEF11  
*Volume control down.*
- #define **FL\_Volume\_Mute** 0xEF12  
*Mute sound from the system.*
- #define **FL\_Volume\_Up** 0xEF13  
*Volume control up.*
- #define **FL\_Yen** 0xff30  
*The Yen key of JIS keyboards.*

### Mouse Buttons

*These constants define the button numbers for FL\_PUSH and FL\_RELEASE events.*

See also

[Fl::event\\_button\(\)](#)

- #define **FL\_LEFT\_MOUSE** 1  
*The left mouse button.*
- #define **FL\_MIDDLE\_MOUSE** 2  
*The middle mouse button.*
- #define **FL\_RIGHT\_MOUSE** 3  
*The right mouse button.*

## Event States

The following constants define bits in the `Fl::event_state()` value.

- #define **FL\_ALT** 0x00080000  
*One of the alt keys is down.*
- #define **FL\_BUTTON**(n) (0x00800000<<(n))  
*Mouse button n (n > 0) is pushed.*
- #define **FL\_BUTTON1** 0x01000000  
*Mouse button 1 is pushed (L)*
- #define **FL\_BUTTON2** 0x02000000  
*Mouse button 2 is pushed (M)*
- #define **FL\_BUTTON3** 0x04000000  
*Mouse button 3 is pushed (R)*
- #define **FL\_BUTTONS** 0x07000000  
*Any mouse button (1-3) is pushed.*
- #define **FL\_CAPS\_LOCK** 0x00020000  
*The caps lock is on.*
- #define **FL\_CTRL** 0x00040000  
*One of the ctrl keys is down.*
- #define **FL\_KEY\_MASK** 0x0000ffff  
*All keys are 16 bit for now.*
- #define **FL\_META** 0x00400000  
*One of the meta/Windows keys is down.*
- #define **FL\_NUM\_LOCK** 0x00100000  
*The num lock is on.*
- #define **FL\_SCROLL\_LOCK** 0x00800000  
*The scroll lock is on.*
- #define **FL\_SHIFT** 0x00010000  
*One of the shift keys is down.*

## Typedefs

- typedef int **Fl\_Fontsize**  
*Size of a font in pixels.*

## Enumerations

- enum { **FL\_READ** = 1 , **FL\_WRITE** = 4 , **FL\_EXCEPT** = 8 }  
*FD "when" conditions.*
- enum **Fl\_Arrow\_Type** { **FL\_ARROW\_SINGLE** = 0x01 , **FL\_ARROW\_DOUBLE** = 0x02 , **FL\_ARROW\_CHOICE** = 0x03 , **FL\_ARROW\_RETURN** = 0x04 }  
*Arrow types define the type of arrow drawing function.*
- enum **Fl\_Damage** {  
**FL\_DAMAGE\_CHILD** = 0x01 , **FL\_DAMAGE\_EXPOSE** = 0x02 , **FL\_DAMAGE\_SCROLL** = 0x04 ,  
**FL\_DAMAGE\_OVERLAY** = 0x08 ,  
**FL\_DAMAGE\_USER1** = 0x10 , **FL\_DAMAGE\_USER2** = 0x20 , **FL\_DAMAGE\_ALL** = 0x80 }  
*Damage masks.*

- enum `Fl_Event` {  
`FL_NO_EVENT` = 0 , `FL_PUSH` = 1 , `FL_RELEASE` = 2 , `FL_ENTER` = 3 ,  
`FL_LEAVE` = 4 , `FL_DRAG` = 5 , `FL_FOCUS` = 6 , `FL_UNFOCUS` = 7 ,

FL_CURSOR_S = 9 , FL_CURSOR_SW = 7 , FL_CURSOR_W = 36 , FL_CURSOR_NW = 68 ,
FL_CURSOR_NONE = 255 }

```

The following constants define the mouse cursors that are available in FLTK.

## Variables

- `FL_Fontsize FL_NORMAL_SIZE`

normal font size

## Box Types

FLTK standard box types

This enum defines the standard box types included with FLTK.

### Note

The documented enum `Fl_Boxtype` contains some values (names) with leading underscores, e.g. `_FL_SHADOW_BOX`. This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

`FL_NO_BOX` means nothing is drawn at all, so whatever is already on the screen remains. The `FL_..._FRAME` types only draw their edges, leaving the interior unchanged. The blue color in the image below is the area that is not drawn by the frame types.

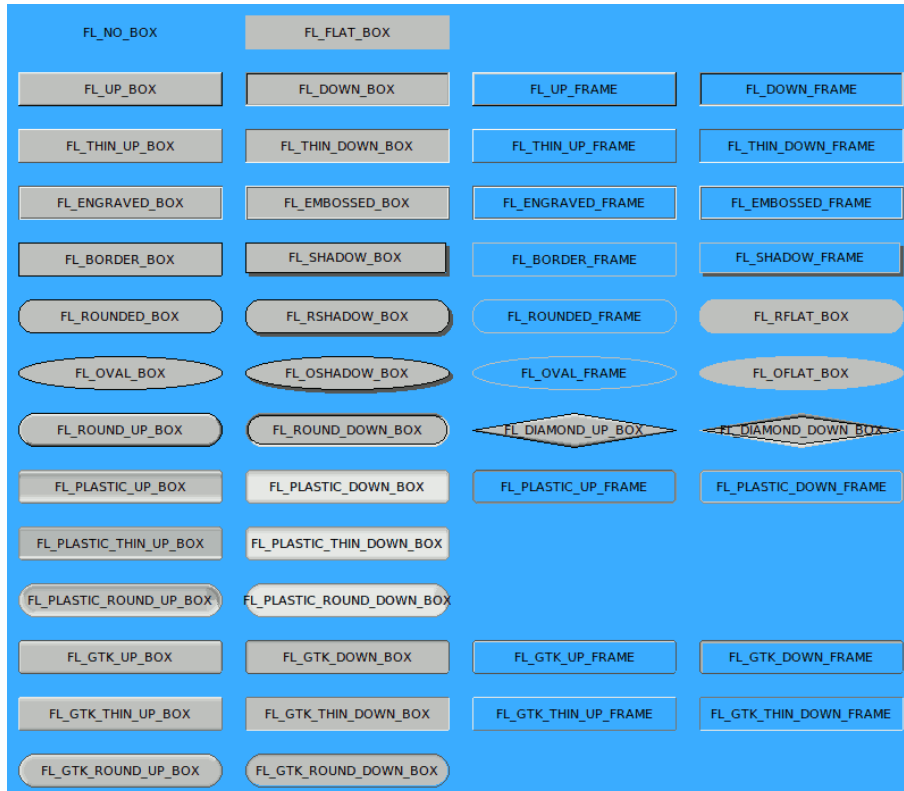

Figure 34.1 FLTK Standard Box Types

## Note

Not all box types are depicted in the figure above. See enum [FI\\_Boxtype](#) below for the complete list of box types.

*FLTK standard box types.*

- `#define FL_CIRCLE_BOX FL_ROUND_DOWN_BOX`
- `#define FL_DIAMOND_BOX FL_DIAMOND_DOWN_BOX`
- [FI\\_Boxtype fl\\_down](#) ([FI\\_Boxtype](#) b)  
*Get the "pressed" or "down" version of a box.*
- [FI\\_Boxtype fl\\_frame](#) ([FI\\_Boxtype](#) b)  
*Get the unfilled, frame only version of a box.*
- `#define FL_FRAME FL_ENGRAVED_FRAME`
- `#define FL_FRAME_BOX FL_ENGRAVED_BOX`
- [FI\\_Labeltype fl\\_define\\_FL\\_EMBOSSSED\\_LABEL](#) ()  
*Initializes the internal table entry for `FL_EMBOSSSED_LABEL` and returns its internal value.*
- [FI\\_Labeltype fl\\_define\\_FL\\_ENGRAVED\\_LABEL](#) ()  
*Initializes the internal table entry for `FL_ENGRAVED_LABEL` and returns its internal value.*
- [FI\\_Labeltype fl\\_define\\_FL\\_ICON\\_LABEL](#) ()  
*Initializes the internal table entry for `FL_ICON_LABEL` and returns its internal value.*
- [FI\\_Labeltype fl\\_define\\_FL\\_IMAGE\\_LABEL](#) ()  
*Initializes the internal table entry for `FL_IMAGE_LABEL` and returns its internal value.*
- [FI\\_Labeltype fl\\_define\\_FL\\_MULTI\\_LABEL](#) ()

- Initializes the internal table entry for FL\_MULTI\_LABEL and returns its internal value.*

  - [FI\\_Labeltype fl\\_define\\_FL\\_SHADOW\\_LABEL \(\)](#)

*Initializes the internal table entry for FL\_SHADOW\_LABEL and returns its internal value.*

  - `#define FL_EMBOSSSED_LABEL fl_define_FL_EMBOSSSED_LABEL()`

*Draws a label with embossed text.*

  - `#define FL_ENGRAVED_LABEL fl_define_FL_ENGRAVED_LABEL()`

*Draws a label with engraved text.*

  - `#define FL_ICON_LABEL fl_define_FL_ICON_LABEL()`

*Draws an icon as the label.*

  - `#define FL_IMAGE_LABEL fl_define_FL_IMAGE_LABEL()`

*Draws an image ([FI\\_Image](#)) as the label.*

  - `#define FL_MULTI_LABEL fl_define_FL_MULTI_LABEL()`

*Draws a label that can comprise several parts like text and images.*

  - `#define FL_SHADOW_LABEL fl_define_FL_SHADOW_LABEL()`

*Draws a label with shadows behind the text.*

  - `#define FL_SYMBOL_LABEL FL_NORMAL_LABEL`

*Sets the current label type and returns its corresponding [FI\\_Labeltype](#) value.*

## Colors

The `FI_Color` type holds an FLTK color value.

Colors are either 8-bit indexes into a `virtual colormap` or 24-bit RGB color values. (See [Colors](#) for the default FLTK colormap)

Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

```

FI_Color => 0xrrgbbii
 | | | |
 | | | +---- index between 0 and 255
 | | +----- blue color component (8 bit)
 | +----- green component (8 bit)
 +----- red component (8 bit)

```

A color can have either an index or an rgb value. Colors with rgb set and an index >0 are reserved for special use.

- `const FI\_Color FL_BACKGROUND2_COLOR = 7`
- the default background color for text, list, and valuator widgets*
- `const FI\_Color FL_BACKGROUND_COLOR = 49`
- Default background color.*
- `const FI\_Color FL_BLACK = 56`
  - `const FI\_Color FL_BLUE = 216`
  - `typedef unsigned int FI_Color`
- An FLTK color value; see also [Colors](#)*
- `FI\_Color fl_color_average (FI\_Color c1, FI\_Color c2, float weight)`
- Returns the weighted average color between the two given colors.*
- `#define FL_COLOR_CUBE (FI\_Color)56`
  - `FI\_Color fl_color_cube (int r, int g, int b)`
- Returns a color out of the color cube.*
- `FI\_Color fl_contrast (FI\_Color fg, FI\_Color bg, int context=0, int size=0)`
- Returns a color that contrasts with the background color.*
- `typedef FI\_Color() FI_Contrast_Function(FI\_Color, FI\_Color, int, int)`
- Type of a custom `fl_contrast()` function.*
- `void fl_contrast_function (FI\_Contrast\_Function *f)`

- Register a custom contrast function.*
- int `fl_contrast_level` ()
  - Get the contrast level (sensitivity) of the `fl_contrast()` method.*
- void `fl_contrast_level` (int level)
  - Set the contrast level (sensitivity) of the `fl_contrast()` method.*
- enum `FI_Contrast_Mode` {
  - `FL_CONTRAST_NONE = 0`, `FL_CONTRAST_LEGACY`, `FL_CONTRAST_CIELAB`, `FL_CONTRAST_CUSTOM`
  - ,
  - `FL_CONTRAST_LAST` }
  - Define the possible modes to calculate `fl_contrast()`.*
- int `fl_contrast_mode` ()
  - Return the current contrast algorithm (mode).*
- void `fl_contrast_mode` (int mode)
  - Set the contrast algorithm (mode).*
- const `FI_Color` `FL_CYAN` = 223
- const `FI_Color` `FL_DARK1` = 47
- const `FI_Color` `FL_DARK2` = 45
- const `FI_Color` `FL_DARK3` = 39
- const `FI_Color` `FL_DARK_BLUE` = 136
- const `FI_Color` `FL_DARK_CYAN` = 140
- const `FI_Color` `FL_DARK_GREEN` = 60
- const `FI_Color` `FL_DARK_MAGENTA` = 152
- const `FI_Color` `FL_DARK_RED` = 72
- const `FI_Color` `FL_DARK_YELLOW` = 76
- `FI_Color` `fl_darker` (`FI_Color` c)
  - Returns a darker version of the specified color.*
- const `FI_Color` `FL_FOREGROUND_COLOR` = 0
  - the default foreground color (0) used for labels and text*
- #define `FL_FREE_COLOR` (`FI_Color`)16
  - Colors numbered between `FL_FREE_COLOR` and `FL_FREE_COLOR + FL_NUM_FREE_COLOR - 1` are free for the user to be given any value using `FI::set_color()`.*
- #define `FL_GRAY FL_BACKGROUND_COLOR`
- const `FI_Color` `FL_GRAY0` = 32
- #define `FL_GRAY_RAMP` (`FI_Color`)32
- `FI_Color` `fl_gray_ramp` (int i)
  - Returns a gray color value from black (i == 0) to white (i == `FL_NUM_GRAY - 1`).*
- const `FI_Color` `FL_GREEN` = 63
- `FI_Color` `fl_inactive` (`FI_Color` c)
  - Returns the inactive, dimmed version of the given color.*
- const `FI_Color` `FL_INACTIVE_COLOR` = 8
  - the inactive foreground color*
- const `FI_Color` `FL_LIGHT1` = 50
- const `FI_Color` `FL_LIGHT2` = 52
- const `FI_Color` `FL_LIGHT3` = 54
- `FI_Color` `fl_lighter` (`FI_Color` c)
  - Returns a lighter version of the specified color.*
- double `fl_lightness` (`FI_Color` color)
  - Return the perceived lightness of a color.*
- double `fl_luminance` (`FI_Color` color)
  - Return the raw / physical luminance of a color.*
- const `FI_Color` `FL_MAGENTA` = 248
- #define `FL_NUM_BLUE` 5
- #define `FL_NUM_FREE_COLOR` 16

- `#define FL_NUM_GRAY 24`
- `#define FL_NUM_GREEN 8`
- `#define FL_NUM_RED 5`
- `const Fl_Color FL_RED = 88`
- `Fl_Color fl_rgb_color (uchar g)`  
Returns the 24-bit color value closest to *g* (grayscale).
- `Fl_Color fl_rgb_color (uchar r, uchar g, uchar b)`  
Returns the 24-bit color value closest to *r*, *g*, *b*.
- `const Fl_Color FL_SELECTION_COLOR = 15`  
the default selection/highlight color
- `const Fl_Color FL_WHITE = 255`
- `const Fl_Color FL_YELLOW = 95`

## Alignment Flags

Flags to control the label alignment.

This controls how the label is displayed next to or inside the widget. The default value is `FL_ALIGN_CENTER` (0) for most widgets, which centers the label inside the widget.

All alignment flags use the common prefix "`FL_ALIGN_`". In the following descriptions this prefix is sometimes omitted for brevity.

Flags can be or'd to achieve a combination of alignments, but there are some "magic values" (e.g. combinations of TOP and BOTTOM and of LEFT and RIGHT) that have special meanings (see below). For instance:

`FL_ALIGN_TOP_LEFT == (FL_ALIGN_TOP | FL_ALIGN_LEFT) != FL_ALIGN_LEFT_TOP.`

Outside alignments (`FL_ALIGN_INSIDE` is not set):

```

TOP_LEFT TOP TOP_RIGHT
+-----+
LEFT_TOP | | RIGHT_TOP
| | |
LEFT | CENTER | RIGHT
| | |
LEFT_BOTTOM | | RIGHT_BOTTOM
+-----+

```

Inside alignments (`FL_ALIGN_INSIDE` is set):

```

+-----+
|TOP_LEFT TOP TOP_RIGHT|
| | | |
|LEFT | CENTER | RIGHT|
| | |
|BOTTOM_LEFT BOTTOM BOTTOM_RIGHT|
+-----+

```

### See also

[Fl\\_Align](#), [FL\\_ALIGN\\_CENTER](#), etc.

### Note

1. Bit positions not defined in the following constants of type `Fl_Align` are reserved for future extensions. Do not use.
2. The "magic values" (`FL_ALIGN_`)`LEFT_TOP`, `RIGHT_TOP`, `LEFT_BOTTOM`, and `RIGHT_BOTTOM` must not be used together with `FL_ALIGN_INSIDE`. Use `TOP_LEFT`, `TOP_RIGHT`, `BOTTOM_LEFT`, or `BOTTOM_RIGHT` instead.
3. Although bits can be or'd together there are some unused/illegal combinations, for instance:
  - setting both `FL_ALIGN_TOP` and `FL_ALIGN_BOTTOM` in combinations other than those given in the `Fl_Align` constants below (magic values)
  - setting both `FL_ALIGN_LEFT` and `FL_ALIGN_RIGHT` in combinations other than those given in the `Fl_Align` constants below (magic values)
  - using one of the "magic values" (2) together with `FL_ALIGN_INSIDE`

Using illegal bit combinations or undefined bits may yield unexpected behavior, and this behavior may be changed without notice in future FLTK versions.

- typedef unsigned **Fl\_Align**

- FLTK type for alignment control.*

  - const `FI_Align FL_ALIGN_BOTTOM` = 0x0002

*Align the label at the bottom of the widget.*
- const `FI_Align FL_ALIGN_BOTTOM_LEFT` = `FL_ALIGN_BOTTOM` | `FL_ALIGN_LEFT`
  - const `FI_Align FL_ALIGN_BOTTOM_RIGHT` = `FL_ALIGN_BOTTOM` | `FL_ALIGN_RIGHT`
- const `FI_Align FL_ALIGN_CENTER` = 0x0000

*Align the label horizontally in the middle.*
- const `FI_Align FL_ALIGN_CLIP` = 0x0040

*All parts of the label that are larger than the widget will not be drawn.*
- const `FI_Align FL_ALIGN_IMAGE_BACKDROP` = 0x0200

*If the label contains an image, draw the image or deimage in the background.*
- const `FI_Align FL_ALIGN_IMAGE_MASK` = 0x0320

*Mask value to test for image alignment flags.*
- const `FI_Align FL_ALIGN_IMAGE_NEXT_TO_TEXT` = 0x0100

*If the label contains an image, draw the text to the right of the image.*
- const `FI_Align FL_ALIGN_IMAGE_OVER_TEXT` = 0x0000

*If the label contains an image, draw the text below the image.*
- const `FI_Align FL_ALIGN_INSIDE` = 0x0010

*Draw the label inside of the widget.*
- const `FI_Align FL_ALIGN_LEFT` = 0x0004

*Align the label at the left of the widget.*
- const `FI_Align FL_ALIGN_LEFT_BOTTOM` = 0x000d

*Outside only, left of widget, bottom position, magic value: TOP | LEFT | RIGHT.*
- const `FI_Align FL_ALIGN_LEFT_TOP` = 0x0007

*Outside only, left of widget, top position, magic value: TOP | BOTTOM | LEFT.*
- const `FI_Align FL_ALIGN_NOWRAP` = 0x0000

*Nothing, same as FL\_ALIGN\_CENTER, for back compatibility.*
- const `FI_Align FL_ALIGN_POSITION_MASK` = 0x000f

*Mask value to test for TOP, BOTTOM, LEFT, and RIGHT flags.*
- const `FI_Align FL_ALIGN_RIGHT` = 0x0008

*Align the label to the right of the widget.*
- const `FI_Align FL_ALIGN_RIGHT_BOTTOM` = 0x000e

*Outside only, right of widget, bottom position, magic value: BOTTOM | LEFT | RIGHT.*
- const `FI_Align FL_ALIGN_RIGHT_TOP` = 0x000b

*Outside only, right of widget, top position, magic value: TOP | BOTTOM | RIGHT.*
- const `FI_Align FL_ALIGN_TEXT_NEXT_TO_IMAGE` = 0x0120

*If the label contains an image, draw the text to the left of the image.*
- const `FI_Align FL_ALIGN_TEXT_OVER_IMAGE` = 0x0020

*If the label contains an image, draw the text on top of the image.*
- const `FI_Align FL_ALIGN_TOP` = 0x0001

*Align the label at the top of the widget.*
- const `FI_Align FL_ALIGN_TOP_LEFT` = `FL_ALIGN_TOP` | `FL_ALIGN_LEFT`
  - const `FI_Align FL_ALIGN_TOP_RIGHT` = `FL_ALIGN_TOP` | `FL_ALIGN_RIGHT`
- const `FI_Align FL_ALIGN_WRAP` = 0x0080

*Wrap text that does not fit the width of the widget.*

## Font Numbers

The following constants define the standard FLTK fonts:

- const `Fl_Font FL_BOLD` = 1  
*add this to Helvetica, Courier, or Times*
- const `Fl_Font FL_BOLD_ITALIC` = 3  
*add this to Helvetica, Courier, or Times*
- const `Fl_Font FL_COURIER` = 4  
*Courier normal.*
- const `Fl_Font FL_COURIER_BOLD` = 5  
*Courier bold.*
- const `Fl_Font FL_COURIER_BOLD_ITALIC` = 7  
*Courier bold-italic.*
- const `Fl_Font FL_COURIER_ITALIC` = 6  
*Courier italic.*
- typedef int `Fl_Font`  
*A font number is an index into the internal font table.*
- const `Fl_Font FL_FREE_FONT` = 16  
*first one to allocate*
- const `Fl_Font FL_HELVETICA` = 0  
*Helvetica (or Arial) normal (0)*
- const `Fl_Font FL_HELVETICA_BOLD` = 1  
*Helvetica (or Arial) bold.*
- const `Fl_Font FL_HELVETICA_BOLD_ITALIC` = 3  
*Helvetica (or Arial) bold-oblique.*
- const `Fl_Font FL_HELVETICA_ITALIC` = 2  
*Helvetica (or Arial) oblique.*
- const `Fl_Font FL_ITALIC` = 2  
*add this to Helvetica, Courier, or Times*
- const `Fl_Font FL_SCREEN` = 13  
*Default monospaced screen font.*
- const `Fl_Font FL_SCREEN_BOLD` = 14  
*Default monospaced bold screen font.*
- const `Fl_Font FL_SYMBOL` = 12  
*Standard symbol font.*
- const `Fl_Font FL_TIMES` = 8  
*Times roman.*
- const `Fl_Font FL_TIMES_BOLD` = 9  
*Times roman bold.*
- const `Fl_Font FL_TIMES_BOLD_ITALIC` = 11  
*Times roman bold-italic.*
- const `Fl_Font FL_TIMES_ITALIC` = 10  
*Times roman italic.*
- const `Fl_Font FL_ZAPF_DINGBATS` = 15  
*Zapf-dingbats font.*

### 34.1.1 Detailed Description

This file contains type definitions and general enumerations.

## 34.1.2 Macro Definition Documentation

### 34.1.2.1 FL\_ABI\_VERSION

```
#define FL_ABI_VERSION FL_API_VERSION
```

The FLTK ABI (Application Binary Interface) version number as an *int*.

FL\_ABI\_VERSION is an *int* that describes the major, minor, and patch ABI version numbers in the same format as FL\_API\_VERSION.

The ABI version number FL\_ABI\_VERSION is usually the same as the API version FL\_API\_VERSION with the last two digits set to '00'.

FLTK retains the ABI (Application Binary Interface) during patch releases of the same major and minor versions. Examples:

FLTK Version	FL_API_VERSION	FL_ABI_VERSION	FL_VERSION (deprecated)
1.3.0	10300	10300	1.0300
1.3.4	10304	10300	1.0304

Version 1.2.3 is actually stored as 10203 to allow for more than 9 minor and patch releases.

The FL\_MAJOR\_VERSION, FL\_MINOR\_VERSION, and FL\_PATCH\_VERSION constants give the integral values for the major, minor, and patch releases respectively.

To enable new ABI-breaking features in patch releases you can configure FLTK to use a higher FL\_ABI\_VERSION.

See also

[README.abi-version.txt](#)

### 34.1.2.2 FL\_API\_VERSION

```
#define FL_API_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100 + FL_PATCH_VERSION)
```

The FLTK API version number as an *int*.

FL\_API\_VERSION is an *int* that describes the major, minor, and patch version numbers.

Version 1.2.3 is actually stored as 10203 to allow for more than 9 minor and patch releases.

The FL\_MAJOR\_VERSION, FL\_MINOR\_VERSION, and FL\_PATCH\_VERSION constants give the integral values for the major, minor, and patch releases respectively.

Note

FL\_API\_VERSION is intended to replace the deprecated *double* FL\_VERSION.

See also

[Fl::api\\_version\(\)](#)

### 34.1.2.3 FL\_IMAGE\_LABEL

```
#define FL_IMAGE_LABEL fl_define_FL_IMAGE_LABEL()
```

Draws an image ([Fl\\_Image](#)) as the label.

This is useful for one particular part of an [Fl\\_Multi\\_Label](#). Use [Fl\\_Widget::image\(\)](#) and/or [Fl\\_Widget::deimage\(\)](#) for normal widgets with images as labels.

### 34.1.2.4 FL\_MAJOR\_VERSION

```
#define FL_MAJOR_VERSION 1
```

The major release version of this FLTK library.

See also

[FL\\_VERSION](#)

### 34.1.2.5 FL\_MINOR\_VERSION

```
#define FL_MINOR_VERSION 4
```

The minor release version for this library.

FLTK remains mostly source-code compatible between minor version changes.

### 34.1.2.6 FL\_MULTI\_LABEL

```
#define FL_MULTI_LABEL fl_define_FL_MULTI_LABEL()
```

Draws a label that can comprise several parts like text and images.

See also

[Fl\\_Multi\\_Label](#)

### 34.1.2.7 FL\_PATCH\_VERSION

```
#define FL_PATCH_VERSION 0
```

The patch version for this library.

FLTK remains binary compatible between patches.

### 34.1.2.8 FL\_SYMBOL\_LABEL

```
#define FL_SYMBOL_LABEL FL_NORMAL_LABEL
```

Sets the current label type and returns its corresponding Fl\_Labeltype value.

FL\_SYMBOL\_LABEL is an alias for FL\_NORMAL\_LABEL.

'@' symbols can be drawn with normal labels as well.

This definition is for historical reasons only (forms compatibility). You should use FL\_NORMAL\_LABEL instead.

### 34.1.2.9 FL\_VERSION

```
#define FL_VERSION
```

**Value:**

```
((double)FL_MAJOR_VERSION + \
(double)FL_MINOR_VERSION * 0.01 + \
(double)FL_PATCH_VERSION * 0.0001)
```

The FLTK version number as a *double*.

FL\_VERSION is a *double* that describes the major, minor, and patch version numbers.

Version 1.2.3 is actually stored as 1.0203 to allow for more than 9 minor and patch releases.

**Deprecated** This `double` version number is retained for compatibility with existing program code. New code should use `int` FL\_API\_VERSION instead. FL\_VERSION is deprecated because comparisons of floating point values may fail due to rounding errors. However, there are currently no plans to remove this deprecated constant.

FL\_VERSION is equivalent to  $(double)FL\_API\_VERSION / 10000$ .

See also

[Fl::version\(\)](#) (deprecated as well)

[FL\\_API\\_VERSION](#)

[Fl::api\\_version\(\)](#)

## 34.1.3 Typedef Documentation

### 34.1.3.1 Fl\_Contrast\_Function

```
typedef Fl_Color() Fl_Contrast_Function(Fl_Color, Fl_Color, int, int)
```

Type of a custom `fl_contrast()` function.

Use this signature to define your own custom `fl_contrast()` function together with `fl_contrast_mode(FL_↔ CONTRAST_CUSTOM)`. Example:

```
Fl_Color my_contrast(Fl_Color fg, Fl_Color bg, int context, int size) {
 // calculate contrast and ...
 return color;
}
// call this early in your main() program:
fl_contrast_function(my_contrast);
fl_contrast_mode(FL_CONTRAST_CUSTOM);
fl_contrast_level(50); // optional, must be called after fl_contrast_mode()
```

For parameters and types see `fl_contrast(Fl_Color, Fl_Color, int, int)`.

See also

[fl\\_contrast\(Fl\\_Color, Fl\\_Color, int, int\)](#)

[fl\\_contrast\\_mode\(int\)](#)

### 34.1.3.2 Fl\_Fontsize

```
typedef int Fl_Fontsize
```

Size of a font in pixels.

This is the approximate height of a font in pixels.

## 34.1.4 Enumeration Type Documentation

### 34.1.4.1 anonymous enum

```
anonymous enum
```

FD "when" conditions.

Enumerator

FL_READ	Call the callback when there is data to be read.
FL_WRITE	Call the callback when data can be written without blocking.
FL_EXCEPT	Call the callback if an exception occurs on the file.

### 34.1.4.2 Fl\_Arrow\_Type

```
enum Fl_Arrow_Type
```

Arrow types define the type of arrow drawing function.

FLTK schemes can draw several graphical elements in their particular way. One of these elements is an arrow type that can be in different GUI elements like scrollbars, choice buttons, and FLTK's [Fl\\_Return\\_Button](#).

Note

This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

Since

1.4.0

## Enumerator

FL_ARROW_SINGLE	Single arrow, e.g. in <a href="#">Fl_Scrollbar</a> .
FL_ARROW_DOUBLE	Double arrow, e.g. in <a href="#">Fl_Counter</a> .
FL_ARROW_CHOICE	Dropdown box, e.g. in <a href="#">Fl_Choice</a> .
FL_ARROW_RETURN	Return arrow, e.g. in <a href="#">Fl_Return_Button</a> .

## 34.1.4.3 Fl\_Boxtype

enum [Fl\\_Boxtype](#)

FLTK standard box types.

This enum defines the standard box types included with FLTK.

## Note

The documented enum [Fl\\_Boxtype](#) contains some values (names) with leading underscores, e.g. `_FL_SHADOW_BOX`. This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

## Enumerator

FL_NO_BOX	nothing is drawn at all, this box is invisible
FL_FLAT_BOX	a flat box
FL_UP_BOX	see figure <a href="#">Standard Box Types</a>
FL_DOWN_BOX	see figure <a href="#">Standard Box Types</a>
FL_UP_FRAME	see figure <a href="#">Standard Box Types</a>
FL_DOWN_FRAME	see figure <a href="#">Standard Box Types</a>
FL_THIN_UP_BOX	see figure <a href="#">Standard Box Types</a>
FL_THIN_DOWN_BOX	see figure <a href="#">Standard Box Types</a>
FL_THIN_UP_FRAME	see figure <a href="#">Standard Box Types</a>
FL_THIN_DOWN_FRAME	see figure <a href="#">Standard Box Types</a>
FL_ENGRAVED_BOX	see figure <a href="#">Standard Box Types</a>
FL_EMBOSSSED_BOX	see figure <a href="#">Standard Box Types</a>
FL_ENGRAVED_FRAME	see figure <a href="#">Standard Box Types</a>
FL_EMBOSSSED_FRAME	see figure <a href="#">Standard Box Types</a>
FL_BORDER_BOX	see figure <a href="#">Standard Box Types</a>
_FL_SHADOW_BOX	see figure <a href="#">Standard Box Types</a> , use FL_SHADOW_BOX
FL_BORDER_FRAME	see figure <a href="#">Standard Box Types</a>
_FL_SHADOW_FRAME	see figure <a href="#">Standard Box Types</a> , use FL_SHADOW_FRAME
_FL_ROUNDED_BOX	see figure <a href="#">Standard Box Types</a> , use FL_ROUNDED_BOX
_FL_RSHADOW_BOX	see figure <a href="#">Standard Box Types</a> , use FL_RSHADOW_BOX
_FL_ROUNDED_FRAME	see figure <a href="#">Standard Box Types</a> , use FL_ROUNDED_FRAME
_FL_RFLAT_BOX	see figure <a href="#">Standard Box Types</a> , use FL_RFLAT_BOX
_FL_ROUND_UP_BOX	see figure <a href="#">Standard Box Types</a> , use FL_ROUND_UP_BOX
_FL_ROUND_DOWN_BOX	see figure <a href="#">Standard Box Types</a> , use FL_ROUND_DOWN_BOX
_FL_DIAMOND_UP_BOX	see figure <a href="#">Standard Box Types</a> , use FL_DIAMOND_UP_BOX
_FL_DIAMOND_DOWN_BOX	see figure <a href="#">Standard Box Types</a> , use FL_DIAMOND_DOWN_BOX
_FL_OVAL_BOX	see figure <a href="#">Standard Box Types</a> , use FL_OVAL_BOX
_FL_OSHADOW_BOX	see figure <a href="#">Standard Box Types</a> , use FL_OSHADOW_BOX

## Enumerator

_FL_OVAL_FRAME	see figure <a href="#">Standard Box Types</a> , use FL_OVAL_FRAME
_FL_OFLAT_BOX	see figure <a href="#">Standard Box Types</a> , use FL_OFLAT_BOX
_FL_PLASTIC_UP_BOX	plastic version of FL_UP_BOX, use FL_PLASTIC_UP_BOX
_FL_PLASTIC_DOWN_BOX	plastic version of FL_DOWN_BOX, use FL_PLASTIC_DOWN_BOX
_FL_PLASTIC_UP_FRAME	plastic version of FL_UP_FRAME, use FL_PLASTIC_UP_FRAME
_FL_PLASTIC_DOWN_FRAME	plastic version of FL_DOWN_FRAME, use FL_PLASTIC_DOWN_FRAME
_FL_PLASTIC_THIN_UP_BOX	plastic version of FL_THIN_UP_BOX, use FL_PLASTIC_THIN_UP_BOX
_FL_PLASTIC_THIN_DOWN_BOX	plastic version of FL_THIN_DOWN_BOX, use FL_PLASTIC_THIN_DOWN_BOX
_FL_PLASTIC_ROUND_UP_BOX	plastic version of FL_ROUND_UP_BOX, use FL_PLASTIC_ROUND_UP_BOX
_FL_PLASTIC_ROUND_DOWN_BOX	plastic version of FL_ROUND_DOWN_BOX, use FL_PLASTIC_ROUND_DOWN_BOX
_FL_GTK_UP_BOX	gtk+ version of FL_UP_BOX, use FL_GTK_UP_BOX
_FL_GTK_DOWN_BOX	gtk+ version of FL_DOWN_BOX, use FL_GTK_DOWN_BOX
_FL_GTK_UP_FRAME	gtk+ version of FL_UP_FRAME, use FL_GTK_UP_FRAME
_FL_GTK_DOWN_FRAME	gtk+ version of FL_DOWN_FRAME, use FL_GTK_DOWN_FRAME
_FL_GTK_THIN_UP_BOX	gtk+ version of FL_THIN_UP_BOX, use FL_GTK_THIN_UP_BOX
_FL_GTK_THIN_DOWN_BOX	gtk+ version of FL_THIN_DOWN_BOX, use FL_GTK_THIN_DOWN_BOX
_FL_GTK_THIN_UP_FRAME	gtk+ version of FL_THIN_UP_FRAME, use FL_GTK_THIN_UP_FRAME
_FL_GTK_THIN_DOWN_FRAME	gtk+ version of FL_THIN_DOWN_FRAME, use FL_GTK_THIN_DOWN_FRAME
_FL_GTK_ROUND_UP_BOX	gtk+ version of FL_ROUND_UP_BOX, use FL_GTK_ROUND_UP_BOX
_FL_GTK_ROUND_DOWN_BOX	gtk+ version of FL_ROUND_DOWN_BOX, use FL_GTK_ROUND_DOWN_BOX
_FL_GLEAM_UP_BOX	gleam version of FL_UP_BOX, use FL_GLEAM_UP_BOX
_FL_GLEAM_DOWN_BOX	gleam version of FL_DOWN_BOX, use FL_GLEAM_DOWN_BOX
_FL_GLEAM_UP_FRAME	gleam version of FL_UP_FRAME, use FL_GLEAM_UP_FRAME
_FL_GLEAM_DOWN_FRAME	gleam version of FL_DOWN_FRAME, use FL_GLEAM_DOWN_FRAME
_FL_GLEAM_THIN_UP_BOX	gleam version of FL_THIN_UP_BOX, use FL_GLEAM_THIN_UP_BOX
_FL_GLEAM_THIN_DOWN_BOX	gleam version of FL_THIN_DOWN_BOX, use FL_GLEAM_THIN_DOWN_BOX
_FL_GLEAM_ROUND_UP_BOX	gleam version of FL_ROUND_UP_BOX, use FL_GLEAM_ROUND_UP_BOX
_FL_GLEAM_ROUND_DOWN_BOX	gleam version of FL_ROUND_DOWN_BOX, use FL_GLEAM_ROUND_DOWN_BOX
_FL_OXY_UP_BOX	oxy version of FL_UP_BOX, use FL_OXY_UP_BOX
_FL_OXY_DOWN_BOX	oxy version of FL_DOWN_BOX, use FL_OXY_DOWN_BOX
_FL_OXY_UP_FRAME	oxy version of FL_UP_FRAME, use FL_OXY_UP_FRAME
_FL_OXY_DOWN_FRAME	oxy version of FL_DOWN_FRAME, use FL_OXY_DOWN_FRAME
_FL_OXY_THIN_UP_BOX	oxy version of FL_THIN_UP_BOX, use FL_OXY_THIN_UP_BOX
_FL_OXY_THIN_DOWN_BOX	oxy version of FL_THIN_DOWN_BOX, use FL_OXY_THIN_DOWN_BOX

## Enumerator

<code>_FL_OXY_THIN_UP_FRAME</code>	oxy version of <code>FL_THIN_UP_FRAME</code> , use <code>FL_OXY_THIN_UP_FRAME</code>
<code>_FL_OXY_THIN_DOWN_FRAME</code>	oxy version of <code>FL_THIN_DOWN_FRAME</code> , use <code>FL_OXY_THIN_DOWN_FRAME</code>
<code>_FL_OXY_ROUND_UP_BOX</code>	oxy version of <code>FL_ROUND_UP_BOX</code> , use <code>FL_OXY_ROUND_UP_BOX</code>
<code>_FL_OXY_ROUND_DOWN_BOX</code>	oxy version of <code>FL_ROUND_DOWN_BOX</code> , use <code>FL_OXY_ROUND_DOWN_BOX</code>
<code>_FL_OXY_BUTTON_UP_BOX</code>	<code>FL_OXY_BUTTON_UP_BOX</code> (new boxtype ?), use <code>FL_OXY_BUTTON_UP_BOX</code> .
<code>_FL_OXY_BUTTON_DOWN_BOX</code>	<code>FL_OXY_BUTTON_DOWN_BOX</code> (new boxtype ?), use <code>FL_OXY_BUTTON_DOWN_BOX</code> .
<code>FL_FREE_BOXTYPE</code>	the first free box type for creation of new box types
<code>FL_MAX_BOXTYPE</code>	highest legal index for a box type

**34.1.4.4 FI\_Callback\_Reason**

enum [Fl\\_Callback\\_Reason](#)

These constants describe why a callback is performed.

See also

[Fl::callback\\_reason\(\)](#), [Fl\\_Widget::when\(\)](#), [Fl\\_When](#)

## Enumerator

<code>FL_REASON_UNKNOWN</code>	unknown or unset reason
<code>FL_REASON_SELECTED</code>	an item was selected
<code>FL_REASON_DESELECTED</code>	an item was de-selected
<code>FL_REASON_RESELECTED</code>	an item was re-selected (double-clicked).
<code>FL_REASON_OPENED</code>	an item was opened
<code>FL_REASON_CLOSED</code>	an item was closed
<code>FL_REASON_DRAGGED</code>	an item was dragged into a new place
<code>FL_REASON_CANCELLED</code>	a dialog was cancelled
<code>FL_REASON_CHANGED</code>	the value of the widget was modified
<code>FL_REASON_GOT_FOCUS</code>	a widget received focus
<code>FL_REASON_LOST_FOCUS</code>	a widget lost focus
<code>FL_REASON_RELEASED</code>	the mouse button was released
<code>FL_REASON_ENTER_KEY</code>	user finished input pressing Enter
<code>FL_REASON_USER</code>	user defined callback reasons

**34.1.4.5 FI\_Contrast\_Mode**

enum [Fl\\_Contrast\\_Mode](#)

Define the possible modes to calculate [fl\\_contrast\(\)](#).

## Enumerator

<code>FL_CONTRAST_NONE</code>	always return foreground color
-------------------------------	--------------------------------

## Enumerator

FL_CONTRAST_LEGACY	legacy (FLTK 1.3.x) contrast function
FL_CONTRAST_CIELAB	new (FLTK 1.4.0) default function
FL_CONTRAST_CUSTOM	optional custom contrast function
FL_CONTRAST_LAST	internal use only (invalid contrast mode)

**34.1.4.6 Fl\_Cursor**enum [Fl\\_Cursor](#)

The following constants define the mouse cursors that are available in FLTK.

Cursors are provided by the system when available, or bitmaps built into FLTK as a fallback.

## Enumerator

FL_CURSOR_DEFAULT	the default cursor, usually an arrow:
FL_CURSOR_ARROW	an arrow pointer:
FL_CURSOR_CROSS	crosshair:
FL_CURSOR_WAIT	busy indicator (for instance hourglass): ,
FL_CURSOR_INSERT	I-beam:
FL_CURSOR_HAND	pointing hand:
FL_CURSOR_HELP	question mark pointer: ?
FL_CURSOR_MOVE	4-pointed arrow or hand: ,
FL_CURSOR_NS	up/down resize:
FL_CURSOR_WE	left/right resize:
FL_CURSOR_NWSE	diagonal resize:
FL_CURSOR_NESW	diagonal resize:
FL_CURSOR_N	upwards resize:
FL_CURSOR_NE	upwards, right resize:
FL_CURSOR_E	rightwards resize:
FL_CURSOR_SE	downwards, right resize:
FL_CURSOR_S	downwards resize:
FL_CURSOR_SW	downwards, left resize:
FL_CURSOR_W	leftwards resize:
FL_CURSOR_NW	upwards, left resize:
FL_CURSOR_NONE	invisible.

**34.1.4.7 Fl\_Damage**enum [Fl\\_Damage](#)

Damage masks.

## Enumerator

FL_DAMAGE_CHILD	A child needs to be redrawn.
FL_DAMAGE_EXPOSE	The window was exposed.
FL_DAMAGE_SCROLL	The <a href="#">Fl_Scroll</a> widget was scrolled. Used by other widgets for other widget specific damages.
FL_DAMAGE_OVERLAY	The overlay planes need to be redrawn.

## Enumerator

FL_DAMAGE_USER1	First user-defined damage bit.
FL_DAMAGE_USER2	Second user-defined damage bit.
FL_DAMAGE_ALL	Everything needs to be redrawn.

## 34.1.4.8 FI\_Event

enum [Fl\\_Event](#)

Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.

Events can also come from other programs like the window manager.

Events are identified by the integer argument passed to the [Fl\\_Widget::handle\(\)](#) virtual method. Other information about the most recent event is stored in static locations and acquired by calling the [Fl::event\\_\\*](#)() methods. This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the [handle\(\)](#) method.

Event numbers can be converted to their actual names using the [fl\\_eventnames\[\]](#) array defined in `#include <FL/names.h>`

See also

[Fl::event\\_text\(\)](#), [Fl::event\\_key\(\)](#), class [Fl::](#)

## Enumerator

FL_NO_EVENT	No event.
FL_PUSH	A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling <a href="#">Fl::event_button()</a> . You find out the mouse position by calling <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a> . A widget indicates that it "wants" the mouse click by returning non-zero from its <a href="#">Fl_Widget::handle()</a> method. It will then become the <a href="#">Fl::pushed()</a> widget and will get FL_DRAG and the matching FL_RELEASE events. If <a href="#">Fl_Widget::handle()</a> returns zero then FLTK will try sending the FL_PUSH to another widget.
FL_RELEASE	A mouse button has been released. You can find out what button by calling <a href="#">Fl::event_button()</a> . In order to receive the FL_RELEASE event, the widget must return non-zero when handling FL_PUSH.
FL_ENTER	The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its <a href="#">handle()</a> method. It then becomes the <a href="#">Fl::belowmouse()</a> widget and will receive FL_MOVE and FL_LEAVE events.
FL_LEAVE	The mouse has moved out of the widget. In order to receive the FL_LEAVE event, the widget must return non-zero when handling FL_ENTER.
FL_DRAG	The mouse has moved with a button held down. The current button state is in <a href="#">Fl::event_state()</a> . The mouse position is in <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a> . In order to receive FL_DRAG events, the widget must return non-zero when handling FL_PUSH.

## Enumerator

FL_FOCUS	This indicates an <i>attempt</i> to give a widget the keyboard focus. If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its <code>handle()</code> method. It then becomes the <code>Fl::focus()</code> widget and gets <code>FL_KEYDOWN</code> , <code>FL_KEYUP</code> , and <code>FL_UNFOCUS</code> events. The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check <code>Fl::event_key()</code> to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero.
FL_UNFOCUS	This event is sent to the previous <code>Fl::focus()</code> widget when another widget gets the focus or the window loses focus.
FL_KEYDOWN	A key was pressed ( <code>FL_KEYDOWN</code> ) or released ( <code>FL_KEYUP</code> ). <code>FL_KEYBOARD</code> is a synonym for <code>FL_KEYDOWN</code> . The key can be found in <code>Fl::event_key()</code> . The text that the key should insert can be found with <code>Fl::event_text()</code> and its length is in <code>Fl::event_length()</code> . If you use the key <code>handle()</code> should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a <code>FL_SHORTCUT</code> event. To receive <code>FL_KEYBOARD</code> events you must also respond to the <code>FL_FOCUS</code> and <code>FL_UNFOCUS</code> events. If you are writing a text-editing widget you may also want to call the <code>Fl::compose()</code> function to translate individual keystrokes into non-ASCII characters. <code>FL_KEYUP</code> events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding <code>FL_KEYDOWN</code> event because focus may have changed between events.
FL_KEYBOARD	Equivalent to <code>FL_KEYDOWN</code> .  See also  <a href="#">FL_KEYDOWN</a>
FL_KEYUP	Key release event.  See also  <a href="#">FL_KEYDOWN</a>
FL_CLOSE	The user clicked the close button of a window. This event is used internally only to trigger the callback of <code>Fl_Window</code> derived classed. The default callback closes the window calling <code>Fl_Window::hide()</code> .
FL_MOVE	The mouse has moved without any mouse buttons held down. This event is sent to the <code>Fl::belowmouse()</code> widget. In order to receive <code>FL_MOVE</code> events, the widget must return non-zero when handling <code>FL_ENTER</code> .

## Enumerator

FL_SHORTCUT	<p>If the <a href="#">Fl::focus()</a> widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the <a href="#">Fl::belowmouse()</a> widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes!</p> <p>You can also make "global" shortcuts by using <a href="#">Fl::add_handler()</a>. A global shortcut will work no matter what windows are displayed or which one has the focus.</p>
FL_DEACTIVATE	<p>This widget is no longer active, due to <a href="#">Fl_Widget::deactivate()</a> being called on it or one of its parents. <a href="#">Fl_Widget::active()</a> may still be true after this, the widget is only active if <a href="#">Fl_Widget::active()</a> is true on it and all its parents (use <a href="#">Fl_Widget::active_r()</a> to check this).</p>
FL_ACTIVATE	<p>This widget is now active, due to <a href="#">Fl_Widget::activate()</a> being called on it or one of its parents.</p>
FL_HIDE	<p>This widget is no longer visible, due to <a href="#">Fl_Widget::hide()</a> being called on it or one of its parents, or due to a parent window being minimized. <a href="#">Fl_Widget::visible()</a> may still be true after this, but the widget is visible only if <a href="#">visible()</a> is true for it and all its parents (use <a href="#">Fl_Widget::visible_r()</a> to check this).</p>
FL_SHOW	<p>This widget is visible again, due to <a href="#">Fl_Widget::show()</a> being called on it or one of its parents, or due to a parent window being restored. Child Fl_Windows respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass FL_SHOW to the base class <a href="#">Fl_Widget::handle()</a> method!</p>
FL_PASTE	<p>You should get this event some time after you call <a href="#">Fl::paste()</a>. The contents of <a href="#">Fl::event_text()</a> is the text to insert and the number of characters is in <a href="#">Fl::event_length()</a>.</p>
FL_SELECTIONCLEAR	<p>The <a href="#">Fl::selection_owner()</a> will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.</p>
FL_MOUSEWHEEL	<p>The user has moved the mouse wheel. The <a href="#">Fl::event_dx()</a> and <a href="#">Fl::event_dy()</a> methods can be used to find the amount to scroll horizontally and vertically.</p>
FL_DND_ENTER	<p>The mouse has been moved to point at this widget. A widget that is interested in receiving drag'n'drop data must return 1 to receive FL_DND_DRAG, FL_DND_LEAVE and FL_DND_RELEASE events.</p>
FL_DND_DRAG	<p>The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag'n'drop data should indicate the possible drop position.</p>
FL_DND_LEAVE	<p>The mouse has moved out of the widget.</p>
FL_DND_RELEASE	<p>The user has released the mouse button dropping data into the widget. If the widget returns 1, it will receive the data in the immediately following FL_PASTE event.</p>
FL_SCREEN_CONFIGURATION_CHANGED	<p>The screen configuration (number, positions) was changed. Use <a href="#">Fl::add_handler()</a> to be notified of this event.</p>
FL_FULLSCREEN	<p>The fullscreen state of the window has changed. This event is sent to the window's handle method.</p>

## Enumerator

FL_ZOOM_GESTURE	The user has made a zoom/pinch/magnification gesture (Mac OS platform only). The <a href="#">Fl::event_dy()</a> method can be used to find magnification amount, <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a> are set as well. This event is sent to the window's handle method.
FL_ZOOM_EVENT	A zoom event (ctrl/+/-/0/ or cmd/+/-/0/) was processed. Use <a href="#">Fl::add_handler()</a> to be notified of this event.

**34.1.4.9 Fl\_Labeltype**

enum [Fl\\_Labeltype](#)

The [labeltype\(\)](#) method sets the type of the label.

## Note

The documented enum [Fl\\_Labeltype](#) contains some values (names) with leading underscores, e.g. `↔` [\\_FL\\_IMAGE\\_LABEL](#). This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

The following standard label types are included:

## Enumerator

FL_NORMAL_LABEL	draws the text (0)
FL_NO_LABEL	does nothing
_FL_SHADOW_LABEL	draws a drop shadow under the text
_FL_ENGRAVED_LABEL	draws edges as though the text is engraved
_FL_EMBOSSED_LABEL	draws edges as though the text is raised
_FL_MULTI_LABEL	draws a composite label  See also  <a href="#">Fl_Multi_Label</a>
_FL_ICON_LABEL	draws the icon associated with the text
_FL_IMAGE_LABEL	the label displays an "icon" based on a <a href="#">Fl_Image</a>
FL_FREE_LABELTYPE	first free labeltype to use for creating own labeltypes

**34.1.4.10 Fl\_Orientation**

enum [Fl\\_Orientation](#)

[Fl\\_Orientation](#) describes the orientation of a GUI element.

FLTK schemes can draw several graphical elements, for instance arrows, pointing at different directions. This enum defines the direction to use for drawing a particular GUI element.

The definition of this enum was chosen such that the enum value can be multiplied by 45 to get a rotation angle in degrees starting at the horizontal axis (0 = right, 1 = NE, 2 = up, ...) that can be used with [fl\\_rotate\(\)](#). Note: angle is counter-clockwise in degrees.

The 'unspecified' value **FL\_ORIENT\_NONE** shall be used for elements that would usually not be rotated, like the return arrow of the [Fl\\_Return\\_Button](#). It can still be used as an angle though since it is the same value as `FL_↔` [ORIENT\\_RIGHT](#) (0 degrees).

**Note**

This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

**Since**

1.4.0

**Enumerator**

FL_ORIENT_NONE	GUI element direction is unspecified.
FL_ORIENT_RIGHT	GUI element pointing right ( 0°)
FL_ORIENT_NE	GUI element pointing NE ( 45°)
FL_ORIENT_UP	GUI element pointing up ( 90°)
FL_ORIENT_NW	GUI element pointing NW (135°)
FL_ORIENT_LEFT	GUI element pointing left (180°)
FL_ORIENT_SW	GUI element pointing SW (225°)
FL_ORIENT_DOWN	GUI element pointing down (270°)
FL_ORIENT_SE	GUI element pointing SE (315°)

**34.1.4.11 Fl\_When**

enum [Fl\\_When](#)

These constants determine when a callback is performed.

Fl\_When is a bit field. Some values are merely shortcuts for common bit combinations. New flags may be added in the future, so it's important to mask the required bit when reading via `when()`.

**Note**

Some widgets may not fully support FL\_WHEN\_... flags.

**See also**

[Fl\\_Widget::when\(\)](#), [Fl::callback\\_reason\(\)](#), [Fl\\_Callback\\_Reason](#), [Fl\\_Widget::do\\_callback\(\)](#)

**Enumerator**

FL_WHEN_NEVER	Never call the callback.
FL_WHEN_CHANGED	Do the callback only when the widget value changes.
FL_WHEN_NOT_CHANGED	Do the callback whenever the user interacts with the widget.
FL_WHEN_RELEASE	Do the callback when the button or key is released and the value changes.
FL_WHEN_RELEASE_ALWAYS	Do the callback when the button or key is released, even if the value doesn't change.
FL_WHEN_ENTER_KEY	Do the callback when the user presses the ENTER key and the value changes.
FL_WHEN_ENTER_KEY_ALWAYS	Do the callback when the user presses the ENTER key, even if the value doesn't change.
FL_WHEN_ENTER_KEY_CHANGED	Do callbacks whether the value changed or not, and when the ENTER key is pressed.
FL_WHEN_CLOSED	Do the callback when a child of <a href="#">Fl_Tabs</a> is closed.

## 34.1.5 Function Documentation

### 34.1.5.1 fl\_box()

```
Fl_Boxtype fl_box (
 Fl_Boxtype b) [inline]
```

Get the filled version of a frame.

If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame is returned.

### 34.1.5.2 fl\_color\_cube()

```
Fl_Color fl_color_cube (
 int r,
 int g,
 int b) [inline]
```

Returns a color out of the color cube.

$r$  must be in the range 0 to FL\_NUM\_RED (5) minus 1,  $g$  must be in the range 0 to FL\_NUM\_GREEN (8) minus 1,  $b$  must be in the range 0 to FL\_NUM\_BLUE (5) minus 1.

To get the closest color to a 8-bit set of R,G,B values use:

```
fl_color_cube(R * (FL_NUM_RED - 1) / 255,
 G * (FL_NUM_GREEN - 1) / 255,
 B * (FL_NUM_BLUE - 1) / 255);
```

### 34.1.5.3 fl\_define\_FL\_EMBOSED\_LABEL()

```
Fl_Labeltype fl_define_FL_EMBOSED_LABEL ()
```

Initializes the internal table entry for FL\_EMBOSED\_LABEL and returns its internal value.

Internal use only.

### 34.1.5.4 fl\_define\_FL\_ENGRAVED\_LABEL()

```
Fl_Labeltype fl_define_FL_ENGRAVED_LABEL ()
```

Initializes the internal table entry for FL\_ENGRAVED\_LABEL and returns its internal value.

Internal use only.

### 34.1.5.5 fl\_define\_FL\_ICON\_LABEL()

```
Fl_Labeltype fl_define_FL_ICON_LABEL ()
```

Initializes the internal table entry for FL\_ICON\_LABEL and returns its internal value.

Internal use only.

### 34.1.5.6 fl\_define\_FL\_IMAGE\_LABEL()

```
Fl_Labeltype fl_define_FL_IMAGE_LABEL ()
```

Initializes the internal table entry for FL\_IMAGE\_LABEL and returns its internal value.

Internal use only.

### 34.1.5.7 fl\_define\_FL\_MULTI\_LABEL()

```
Fl_Labeltype fl_define_FL_MULTI_LABEL ()
```

Initializes the internal table entry for FL\_MULTI\_LABEL and returns its internal value.

Internal use only.

### 34.1.5.8 fl\_define\_FL\_SHADOW\_LABEL()

```
Fl_Labeltype fl_define_FL_SHADOW_LABEL ()
```

Initializes the internal table entry for FL\_SHADOW\_LABEL and returns its internal value.

Internal use only.

### 34.1.5.9 fl\_down()

```
Fl_Boxtype fl_down (
 Fl_Boxtype b) [inline]
```

Get the "pressed" or "down" version of a box.

If no "down" version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

### 34.1.5.10 fl\_frame()

```
Fl_Boxtype fl_frame (
 Fl_Boxtype b) [inline]
```

Get the unfilled, frame only version of a box.

If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

### 34.1.5.11 fl\_gray\_ramp()

```
Fl_Color fl_gray_ramp (
 int i) [inline]
```

Returns a gray color value from black (i == 0) to white (i == FL\_NUM\_GRAY - 1).

FL\_NUM\_GRAY is defined to be 24 in the current FLTK release. To get the closest FLTK gray value to an 8-bit grayscale color 'l' use:

```
fl_gray_ramp(I * (FL_NUM_GRAY - 1) / 255)
```

## 34.1.6 Variable Documentation

### 34.1.6.1 FL\_ALIGN\_LEFT

```
const Fl_Align FL_ALIGN_LEFT = 0x0004
```

Align the label at the left of the widget.

Inside labels appear left-justified starting at the left side of the widget, outside labels are right-justified and drawn to the left of the widget.

### 34.1.6.2 FL\_ALIGN\_TOP

```
const Fl_Align FL_ALIGN_TOP = 0x0001
```

Align the label at the top of the widget.

Inside labels appear below the top, outside labels are drawn on top of the widget.

### 34.1.6.3 FL\_NORMAL\_SIZE

```
Fl_Fontsize FL_NORMAL_SIZE [extern]
```

normal font size

normal font size

## 34.2 Enumerations.H

[Go to the documentation of this file.](#)

```

File names and URI utility functions.

```

#include "Fl_Export.H"
#include <FL/platform_types.h>

```

### Macros

- `#define FL_PATH_MAX 2048`  
*all path buffers should use this length*

### Typedefs

- typedef int() `Fl_File_Sort_F`(struct dirent \*\*, struct dirent \*\*)  
*File sorting function.*

### Functions

- void `fl_decode_uri` (char \*uri)  
*Decodes a URL-encoded string.*
- int `fl_filename_absolute` (char \*to, int tolen, const char \*from)  
*Makes a filename absolute from a relative filename to the current working directory.*
- int `fl_filename_absolute` (char \*to, int tolen, const char \*from, const char \*cwd)  
*Concatenate the absolute path base with from to form the new absolute path in to.*
- int `fl_filename_expand` (char \*to, int tolen, const char \*from)  
*Expands a filename containing shell variables and tilde (~).*
- const char \* `fl_filename_ext` (const char \*buf)  
*Gets the extension of a filename.*
- void `fl_filename_free_list` (struct dirent \*\*l, int n)  
*Free the list of filenames that is generated by fl\_filename\_list().*
- int `fl_filename_jsdir` (const char \*name)  
*Determines if a file exists and is a directory from its filename.*
- int `fl_filename_list` (const char \*d, struct dirent \*\*l, `Fl_File_Sort_F` \*s=`fl_numeric_sort`)  
*Portable and const-correct wrapper for the scandir() function.*
- int `fl_filename_match` (const char \*name, const char \*pattern)  
*Checks if a string s matches a pattern p.*
- const char \* `fl_filename_name` (const char \*filename)  
*Gets the file name from a path.*
- int `fl_filename_relative` (char \*to, int tolen, const char \*from)  
*Makes a filename relative to the current working directory.*
- int `fl_filename_relative` (char \*to, int tolen, const char \*from, const char \*cwd)

*Makes a filename relative to any other directory.*

- char \* `fl_filename_setext` (char \*to, int tolen, const char \*ext)

*Replaces the extension in buf of max.*

- int `fl_open_uri` (const char \*uri, char \*msg, int msglen)

*Opens the specified Uniform Resource Identifier (URI).*

### 34.3.1 Detailed Description

File names and URI utility functions.

## 34.4 filename.H

## 34.5 Fl.H File Reference

**Fl** static class.

```

#include <FL/fl_config.h>
#include <FL/Fl_Export.H>
#include <FL/platform_types.h>
#include <FL/fl_casts.H>
#include <FL/Fl_Cairo.H>
#include "fl_utf8.h"
#include "Enumerations.H"
#include <string.h>

```

### Classes

- class **Fl**

The *Fl* is the FLTK global (static) class containing state information and global methods for the current application.

- class [FI\\_Widget\\_Tracker](#)  
*This class should be used to control safe widget deletion.*

## Macros

- `#define FI_Object FI\_Widget`  
*for back compatibility - use [FI\\_Widget](#)!*

## Typedefs

- typedef void(\* **FI\_Abort\_Handler**) (const char \*format,...)  
*Signature of `set_abort` functions passed as parameters.*
- typedef int(\* **FI\_Args\_Handler**) (int argc, char \*\*argv, int &i)  
*Signature of `args` functions passed as parameters.*
- typedef void(\* **FI\_Atclose\_Handler**) ([FI\\_Window](#) \*window, void \*data)  
*Signature of `set_atclose` functions passed as parameters.*
- typedef void(\* **FI\_Awake\_Handler**) (void \*data)  
*Signature of some wakeup callback functions passed as parameters.*
- typedef void() **FI\_Box\_Draw\_F**(int x, int y, int w, int h, [FI\\_Color](#) color)  
*Signature of some box drawing functions passed as parameters.*
- typedef void() **FI\_Box\_Draw\_Focus\_F**([FI\\_Boxtype](#) bt, int x, int y, int w, int h, [FI\\_Color](#) fg, [FI\\_Color](#) bg)  
*Signature of box focus frame drawing functions.*
- typedef void(\* **FI\_Clipboard\_Notify\_Handler**) (int source, void \*data)  
*Signature of `add_clipboard_notify` functions passed as parameters.*
- typedef int(\* [FI\\_Event\\_Dispatch](#)) (int event, [FI\\_Window](#) \*w)  
*Signature of `event_dispatch` functions passed as parameters.*
- typedef int(\* **FI\_Event\_Handler**) (int event)  
*Signature of `add_handler` functions passed as parameters.*
- typedef void(\* **FI\_FD\_Handler**) ([FL\\_SOCKET](#) fd, void \*data)  
*Signature of `add_fd` functions passed as parameters.*
- typedef void(\* **FI\_Idle\_Handler**) (void \*data)  
*Signature of `add_idle` callback functions passed as parameters.*
- typedef void() **FI\_Label\_Draw\_F**(const [FI\\_Label](#) \*label, int x, int y, int w, int h, [FI\\_Align](#) align)  
*Signature of some label drawing functions passed as parameters.*
- typedef void() **FI\_Label\_Measure\_F**(const [FI\\_Label](#) \*label, int &width, int &height)  
*Signature of some label measurement functions passed as parameters.*
- typedef void(\* **FI\_Old\_Idle\_Handler**) ()  
*Signature of `set_idle` callback functions passed as parameters.*
- typedef int(\* **FI\_System\_Handler**) (void \*event, void \*data)  
*Signature of `add_system_handler` functions passed as parameters.*
- typedef void(\* [FI\\_Timeout\\_Handler](#)) (void \*data)  
*Signature of `timeout` callback functions passed as parameters.*

## Variables

- const char \* **fl\_local\_alt**  
*string pointer used in shortcuts, you can change it to another language*
- const char \* **fl\_local\_ctrl**  
*string pointer used in shortcuts, you can change it to another language*
- const char \* **fl\_local\_meta**  
*string pointer used in shortcuts, you can change it to another language*
- const char \* **fl\_local\_shift**  
*string pointer used in shortcuts, you can change it to another language*

### 34.5.1 Detailed Description

Fl static class.

## 34.6 Fl.H

## 34.9 fl\_ask.H File Reference

API for common dialogs.

```

#include <FL/Enumerations.H>
#include <FL/fl_attr.h>

```

### Enumerations

- enum `Fl_Beep` {  
`FL_BEEP_DEFAULT` = 0, `FL_BEEP_MESSAGE`, `FL_BEEP_ERROR`, `FL_BEEP_QUESTION`,  
`FL_BEEP_PASSWORD`, `FL_BEEP_NOTIFICATION` }

*Defines the different system beeps available.*

## Functions

- void void **fl\_alert** (const char \*,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- void void int **fl\_ask** (const char \*,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- void **fl\_beep** (int type=FL\_BEEP\_DEFAULT)
 

*Emits a system beep.*
- int **fl\_choice** (const char \*q, const char \*b0, const char \*b1, const char \*b2,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- int const char const char int **fl\_choice\_n** (const char \*q, const char \*b0, const char \*b1, const char \*b2,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- int const char \* **fl\_input** (const char \*label, const char \*deflt=0,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- int const char const char int const char \* **fl\_input** (int maxchar, const char \*label, const char \*deflt=0,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- void **fl\_message** (const char \*,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- void **fl\_message\_font** (FL\_Font f, FL\_Fontsize s)
- void **fl\_message\_hotspot** (int enable)
 

*Sets whether or not to move the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#) to follow the mouse pointer.*
- int **fl\_message\_hotspot** (void)
 

*Gets whether or not to move the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#) to follow the mouse pointer.*
- int const char const char int const char const char FL\_Widget \* **fl\_message\_icon** ()
 

*Gets the [FL\\_Box](#) icon container of the current default dialog used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- void **fl\_message\_icon\_label** (const char \*str)
 

*Sets the icon label of the dialog window used in many common dialogs.*
- void **fl\_message\_position** (const int x, const int y, const int center=0)
 

*Sets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- void **fl\_message\_position** (FL\_Widget &widget)
- void **fl\_message\_position** (FL\_Widget \*widget)
 

*Sets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- int **fl\_message\_position** (int \*x=0, int \*y=0)
 

*Gets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- void **fl\_message\_title** (const char \*title)
 

*Sets the title of the dialog window used in many common dialogs.*
- void **fl\_message\_title\_default** (const char \*title)
 

*Sets the default title of the dialog window used in many common dialogs.*
- int const char const char \* **fl\_password** (const char \*label, const char \*deflt=0,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))
- int const char const char int const char const char \* **fl\_password** (int maxchar, const char \*label, const char \*deflt=0,...) [\\_\\_fl\\_attr](#)([\\_\\_format](#) [\\_\\_printf](#) [\\_\\_](#))

  - const char \* **fl\_ok**

*string pointer used in common dialogs, you can change it to another language*

  - const char \* **fl\_yes**

*string pointer used in common dialogs, you can change it to another language*

### 34.9.1 Detailed Description

API for common dialogs.

### 34.9.2 Enumeration Type Documentation

#### 34.9.2.1 Fl\_Beep

enum [Fl\\_Beep](#)

Defines the different system beeps available.

Some systems may play different sounds or use different sound volume depending on the Fl\_Beep value. The implementation is platform dependent.

See also

[fl\\_beep\(int\)](#)

Enumerator

FL_BEEP_DEFAULT	Default beep.
FL_BEEP_MESSAGE	Message beep.
FL_BEEP_ERROR	Error beep.
FL_BEEP_QUESTION	Question beep.
FL_BEEP_PASSWORD	Password beep.
FL_BEEP_NOTIFICATION	Notification beep.

### 34.9.3 Function Documentation

#### 34.9.3.1 fl\_message\_position()

```
void fl_message_position (
 Fl_Widget & widget) [inline]
```

## 34.11 fl\_attr.h File Reference

This file defines compiler-specific macros.

### Macros

- #define `__fl_attr(x)`  
*This section lists macros for Doxygen documentation only.*
- #define `FL_DEPRECATED(msg, func)`  
*Enclosing a function or method in `FL_DEPRECATED` marks it as no longer recommended.*
- #define `FL_OVERRIDE` override  
*This macro makes it safe to use the C++11 keyword `override` with older compilers.*

### 34.11.1 Detailed Description

This file defines compiler-specific macros.

### 34.11.2 Macro Definition Documentation

#### 34.11.2.1 `__fl_attr`

```
#define __fl_attr(
 x)
```

This section lists macros for Doxygen documentation only.

The next section will define the actual macros based on the compiler used and based on the capabilities of the version of that compiler. To be used in prototypes with a variable list of arguments. This macro helps detection of mismatches between format string and argument list at compilation time.

Usage example: [FL/fl\\_ask.H](#)

#### 34.11.2.2 `FL_DEPRECATED`

```
#define FL_DEPRECATED(
 msg,
 func)
```

**Value:**

```

/##### \deprecated msg *##/ \
func

```

Enclosing a function or method in `FL_DEPRECATED` marks it as no longer recommended.

This macro syntax can not be used if the return type contains a comma, which is not the case in FLTK.

```

FL_DEPRECATED("Outdated, don't use", int position()) { return position_; }

```

## 34.12 fl\_attr.h

80 Declare macros specific to Visual Studio.
81
82 Visual Studio defines __cplusplus = '199711L' in all its versions which is
83 not helpful for us here. For VS version number encoding see:
84 https://learn.microsoft.com/en-us/cpp/preprocessor/predefined-macros
85
86 This document specifies that the macro _MSVC_LANG is defined since
87 "Visual Studio 2015 Update 3" as 201402L (default) and undefined in
88 earlier versions. It can be used to determine the C++ standard as
89 specified by the /std:c++ compiler option:
90
91 - /std:c++14 201402L (also if /std:c++ is not used)
92 - /std:c++17 201703L
93 - /std:c++20 202002L
94 - /std:c++latest a "higher, unspecified value" (docs of VS 2022)
95
96 As of this writing (02/2023) _MSVC_LANG is not yet used in this file
97 but it is documented for future use.

## 34.20 Fl\_Cairo.H File Reference

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).

```

#include <FL/Fl.H>
#include <cairo.h>

```

## Classes

- class [Fl\\_Cairo\\_State](#)

*Contains all the necessary info on the current cairo context.*

### 34.20.1 Detailed Description

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).

#### Note

In FLTK 1.3.x this header file ([Fl\\_Cairo.H](#)) included the platform specific Cairo headers. This is no longer true since 1.4.0.

This header file is platform agnostic. If you need platform specific Cairo headers you need to `#include` them in your source file.

To use FLTK's builtin Cairo support you need to `#include <FL/Fl.H>` **before** you include any other FLTK header which is officially required anyway. Since FLTK 1.4.0 the preprocessor constants `FLTK_HAVE_CAIRO` and/or `FLTK_HAVE_CAIROEXT` are defined in `<FL/Fl.H>` by including `<FL/fl_config.h>`.

## 34.24 fl\_callback\_macros.H File Reference

This file provides macros for easy function and method callbacks with multiple type safe arguments.

```
#include <stdlib.h>
```

### Macros

- #define [FL\\_FUNCTION\\_CALLBACK\\_3](#)(WIDGET, FUNC, TYPE0, VALUE0, TYPE1, VALUE1, TYPE2, VALUE2)  
*Declare a C function callback with custom parameters.*
- #define [FL\\_INLINE\\_CALLBACK\\_2](#)(WIDGET, TYPE0, NAME0, VALUE0, TYPE1, NAME1, VALUE1, LAMBDA)  
*Creates code to declare a callback function in line with instantiating a widget.*
- #define [FL\\_METHOD\\_CALLBACK\\_1](#)(WIDGET, CLASS, SELF, METH, TYPE0, VALUE0)  
*Declare a non-static class method callback with custom parameters.*

### 34.24.1 Detailed Description

This file provides macros for easy function and method callbacks with multiple type safe arguments.

### 34.24.2 Macro Definition Documentation

#### 34.24.2.1 FL\_FUNCTION\_CALLBACK\_3

```

#define FL_FUNCTION_CALLBACK_3(
 WIDGET,
 FUNC,
 TYPE0,
 VALUE0,
 TYPE1,
 VALUE1,
 TYPE2,
 VALUE2)

```

Declare a C function callback with custom parameters.

You can declare a plain C function callback or a static method callback with custom parameters using this macro. It simplifies the process of calling arbitrary functions with up to five custom parameters. The macro generates code that ensures type safety and expands FLTK's standard callbacks, which are limited to a single `void*` or `long` argument.

To use the macro, you provide the widget that will handle the callback as the first argument. The second argument can be either a regular function or a static method in any class.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5)

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>
...
Fl_Button *btn1 = new Fl_Button(10, 10, 100, 20, "Beep");
FL_FUNCTION_CALLBACK_0(btn1, fl_beep);
...
Fl_Button *btn2 = new Fl_Button(10, 40, 100, 20, "Hello");
FL_FUNCTION_CALLBACK_5(btn2,
 fl_message,
 const char *, "Hello\n%d %d %d %d",
 int, 1, int, 2, int, 3, int, 4
);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

#### Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>FUNC</i>	a C/C++ function or a static class method
<i>TYPE0,VALUE0,TYPE1,VALUE1,TYPE2,VALUE2</i>	a list of zero to five type/value pairs, all separated by commas

#### See also

[FL\\_METHOD\\_CALLBACK\\_1](#), [FL\\_INLINE\\_CALLBACK\\_2](#)

#### 34.24.2.2 FL\_INLINE\_CALLBACK\_2

```
#define FL_INLINE_CALLBACK_2(
 WIDGET,
 TYPE0,
 NAME0,
 VALUE0,
 TYPE1,
 NAME1,
 VALUE1,
 LAMBDA)
```

Creates code to declare a callback function in line with instantiating a widget.

You can use this macro to create a function as a callback, allowing you to define the callback function right where the widget and callback are declared, similar to a Lambda function.

The first argument of the macro specifies the widget that will handle the callback. Next, you can include up to five triplets, where each triplet consists of a type, a parameter name, and a value. For example, `int, x, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two triplets, such as `int, x, 3, int, y, 4`. The last digit of the macro name must be the same as the number of triplets (0..5).

The last argument is the actual function body itself.

The function body is limited to a syntax that the macro preprocessor can handle. It should include the leading '{' and trailing '}' and may contain local variable declarations, use global variables and functions, and use also the variables listed and initialized in the argument triples of the macro. Very large function bodies should be avoided because they may exceed the admissible size of a macro argument.

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>
...
Fl_Button *btn = new Fl_Button(10, 10, 100, 20, "Test");
FL_INLINE_CALLBACK_1(btn,
 const char *, name, btn->label(),
 {
 fl_message("Greetings from the %s button", name);
 }
);
```

```
);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

#### Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>TYPE0</i>	the type of the first parameter in the function call
<i>NAME0</i>	an arbitrary variable name that can be used as a parameter in the function body
<i>VALUE0</i>	a constant value or a variable; the value of the variable is copied when the callback is created
<i>TYPE1,NAME1,VALUE1</i>	as above; there are six macros that support 0 to 5 parameters
<i>LAMBDA</i>	the function body within the limits of the C macro preprocessor

#### 34.24.2.3 FL\_METHOD\_CALLBACK\_1

```
#define FL_METHOD_CALLBACK_1(
 WIDGET,
 CLASS,
 SELF,
 METH,
 TYPE0,
 VALUE0)
```

Declare a non-static class method callback with custom parameters.

You can declare a callback for a non-static class method with custom parameters using this macro. It provides a convenient way to call arbitrary methods in any class, overcoming FLTK's limitation of passing only a single `void*` or `long` argument. Furthermore, it ensures type safety.

The first argument of the macro specifies the widget that will handle the callback. The second argument indicates the class type to be called. The third argument must be a pointer to an instance of that class. The fourth argument is the name of the method within the class. That method must be public and should not be static.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5)

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>
...
Fl_Button *btn = new Fl_Button(10, 10, 100, 20, "Test");
FL_METHOD_CALLBACK_1(btn, Fl_Button, btn, color, Fl_Color, FL_GREEN);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

#### Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>CLASS</i>	the class type
<i>SELF</i>	a pointer to an instance of the class
<i>METH</i>	a C++ class method that must be public and not static
<i>TYPE0,VALUE0</i>	a list of zero to five type/value pairs, all separated by commas

## 34.42 fl\_draw.H File Reference

utility header to pull drawing functions together

```

#include <FL/Enumerations.H>
#include <FL/Fl_Graphics_Driver.H>
#include <FL/Fl_Rect.H>

```

### Enumerations

- enum {
  - FL\_SOLID = 0 , FL\_DASH = 1 , FL\_DOT = 2 , FL\_DASHDOT = 3 ,
  - FL\_DASHDOTDOT = 4 , FL\_CAP\_FLAT = 0x100 , FL\_CAP\_ROUND = 0x200 , FL\_CAP\_SQUARE = 0x300 ,
  - FL\_JOIN\_MITER = 0x1000 , FL\_JOIN\_ROUND = 0x2000 , FL\_JOIN\_BEVEL = 0x3000 }

### Functions

- int [fl\\_add\\_symbol](#) (const char \*name, void(\*drawit)(FL\_Color), int scalable)
  - Adds a symbol to the system.*
- int [fl\\_antialias](#) ()
  - Return whether line drawings are currently antialiased.*
- void [fl\\_antialias](#) (int state)
  - Turn antialiased line drawings ON or OFF, if supported by platform.*
- void [fl\\_arc](#) (double x, double y, double r, double start, double end)
  - Add a series of points to the current path on the arc of a circle.*
- void [fl\\_arc](#) (int x, int y, int w, int h, double a1, double a2)
  - Draw ellipse sections using integer coordinates.*

- void [fl\\_begin\\_complex\\_polygon](#) ()  
*Start drawing a complex filled polygon.*
- void [fl\\_begin\\_line](#) ()  
*Start drawing a list of lines.*
- void [fl\\_begin\\_loop](#) ()  
*Start drawing a closed sequence of lines.*
- void [fl\\_begin\\_offscreen](#) ([FI\\_Offscreen](#) ctx)  
*Send all subsequent drawing commands to this offscreen buffer.*
- void [fl\\_begin\\_points](#) ()  
*Start drawing a list of points.*
- void [fl\\_begin\\_polygon](#) ()  
*Start drawing a convex filled polygon.*
- char [fl\\_can\\_do\\_alpha\\_blending](#) ()  
*Check whether platform supports true alpha blending for RGBA images.*
- [FI\\_RGB\\_Image](#) \* [fl\\_capture\\_window](#) ([FI\\_Window](#) \*win, int x, int y, int w, int h)  
*Captures the content of a rectangular zone of a mapped window.*
- void [fl\\_chord](#) (int x, int y, int w, int h, double a1, double a2)  
*fl\_chord declaration is a place holder - the function does not yet exist*
- void [fl\\_circle](#) (double x, double y, double r)  
*fl\_circle(x,y,r) is equivalent to fl\_arc(x,y,r,0,360), but may be faster.*
- void [fl\\_clip](#) (int x, int y, int w, int h)  
*Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).*
- int [fl\\_clip\\_box](#) (int x, int y, int w, int h, int &X, int &Y, int &W, int &H)  
*Intersect a rectangle with the current clip region and return the bounding box of the result.*
- [FI\\_Region](#) [fl\\_clip\\_region](#) ()  
*Return the current clipping region.*
- void [fl\\_clip\\_region](#) ([FI\\_Region](#) r)  
*Replace the top of the clipping stack with a clipping region of any shape.*
- [FI\\_Color](#) [fl\\_color](#) ()  
*Return the last fl\_color() that was set.*
- void [fl\\_color](#) ([FI\\_Color](#) c)  
*Set the color for all subsequent drawing operations.*
- void [fl\\_color](#) (int c)  
*for back compatibility - use fl\_color(FI\_Color c) instead*
- void [fl\\_color](#) (uchar r, uchar g, uchar b)  
*Set the color for all subsequent drawing operations.*
- void [fl\\_copy\\_offscreen](#) (int x, int y, int w, int h, [FI\\_Offscreen](#) pixmap, int srcx, int srcy)  
*Copy a rectangular area of the given offscreen buffer into the current drawing destination.*
- [FI\\_Offscreen](#) [fl\\_create\\_offscreen](#) (int w, int h)  
*Creation of an offscreen graphics buffer.*
- void [fl\\_cursor](#) ([FI\\_Cursor](#))  
*Sets the cursor for the current window to the specified shape and colors.*
- void [fl\\_cursor](#) ([FI\\_Cursor](#), [FI\\_Color](#) fg, [FI\\_Color](#) bg=FL\_WHITE)
- void [fl\\_curve](#) (double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)  
*Add a series of points on a Bézier curve to the path.*
- void [fl\\_delete\\_offscreen](#) ([FI\\_Offscreen](#) ctx)  
*Deletion of an offscreen graphics buffer.*
- int [fl\\_descent](#) ()  
*Return the recommended distance above the bottom of a fl\_height() tall box to draw the text at so it looks centered vertically in that box.*
- void [fl\\_draw](#) (const char \*str, int n, int x, int y)

- Draws starting at the given  $x$ ,  $y$  location a UTF-8 string of length  $n$  bytes.*

  - void **fl\_draw** (const char \*str, int x, int y)

*Draw a nul-terminated UTF-8 string starting at the given  $x$ ,  $y$  location.*

  - void **fl\_draw** (const char \*str, int x, int y, int w, int h, **FI\_Align** align, **FI\_Image** \*img=0, int draw\_symbols=1, int spacing=0)

*Fancy string drawing function which is used to draw all the labels.*

  - void **fl\_draw** (const char \*str, int x, int y, int w, int h, **FI\_Align** align, void(\*callthis)(const char \*, int, int, int), **FI\_Image** \*img=0, int draw\_symbols=1, int spacing=0)

*The same as fl\_draw(const char\*,int,int,int,int,FI\_Align,FI\_Image\*,int) with the addition of the callthis parameter, which is a pointer to a text drawing function such as fl\_draw(const char\*, int, int, int) to do the real work.*

  - void **fl\_draw** (int angle, const char \*str, int n, int x, int y)

*Draw at the given  $x$ ,  $y$  location a UTF-8 string of length  $n$  bytes rotating  $angle$  degrees counter-clockwise.*

  - void **fl\_draw** (int angle, const char \*str, int x, int y)

*Draw a nul-terminated UTF-8 string starting at the given  $x$ ,  $y$  location and rotating  $angle$  degrees counter-clockwise.*

  - void **fl\_draw\_arrow** (**FI\_Rect** bb, **FI\_Arrow\_Type** t, **FI\_Orientation** o, **FI\_Color** color)

*Draw an "arrow like" GUI element for the selected scheme.*

  - void **fl\_draw\_box** (**FI\_Boxtype**, int x, int y, int w, int h, **FI\_Color**)

*Draws a box using given type, position, size and color.*

  - void **fl\_draw\_box\_focus** (**FI\_Boxtype**, int x, int y, int w, int h, **FI\_Color**, **FI\_Color**)

*Draws the focus rectangle inside a box using given type, position, size and color.*

  - void **fl\_draw\_check** (**FI\_Rect** bb, **FI\_Color** col)

*Draw a check mark inside the given bounding box.*

  - void **fl\_draw\_circle** (int x, int y, int d, **FI\_Color** color)

*Draw a potentially small, filled circle using a given color.*

  - void **fl\_draw\_image** (const uchar \*buf, int X, int Y, int W, int H, int D=3, int L=0)

*Draw an 8-bit per color RGB or luminance image.*

  - void **fl\_draw\_image** (**FI\_Draw\_Image\_Cb** cb, void \*data, int X, int Y, int W, int H, int D=3)

*Draw an image using a callback function to generate image data.*

  - void **fl\_draw\_image\_mono** (const uchar \*buf, int X, int Y, int W, int H, int D=1, int L=0)

*Draw a gray-scale (1 channel) image.*

  - void **fl\_draw\_image\_mono** (**FI\_Draw\_Image\_Cb** cb, void \*data, int X, int Y, int W, int H, int D=1)

*Draw a gray-scale image using a callback function to generate image data.*

  - int **fl\_draw\_pixmap** (char \*const \*data, int x, int y, **FI\_Color** bg=FL\_GRAY)

*Draw XPM image data, with the top-left corner at the given position.*

  - int **fl\_draw\_pixmap** (const char \*const \*data, int x, int y, **FI\_Color** bg=FL\_GRAY)

*Draw XPM image data, with the top-left corner at the given position.*

  - void **fl\_draw\_radio** (int x, int y, int d, **FI\_Color** color)

*Draw a round check mark (circle) of a radio button.*

  - int **fl\_draw\_symbol** (const char \*label, int x, int y, int w, int h, **FI\_Color**)

*Draw the named symbol in the given rectangle using the given color.*

  - void **fl\_end\_complex\_polygon** ()

*End complex filled polygon, and draw.*

  - void **fl\_end\_line** ()

*End list of lines, and draw.*

  - void **fl\_end\_loop** ()

*End closed sequence of lines, and draw.*

  - void **fl\_end\_offscreen** ()

*Quit sending drawing commands to the current offscreen buffer.*

  - void **fl\_end\_points** ()

*End list of points, and draw.*

  - void **fl\_end\_polygon** ()

- End convex filled polygon, and draw.*
- `const char * fl_expand_text` (const char \*from, char \*buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw\_symbols=0)
 

*Copy from to buf, replacing control characters with ^X.*
  - `void fl_focus_rect` (int x, int y, int w, int h)
 

*Draw a dotted rectangle, used to indicate keyboard focus on a widget.*
  - `Fl_Font fl_font` ()
 

*Return the face set by the most recent call to fl\_font().*
  - `void fl_font` (Fl\_Font face, Fl\_Fontsize fsize)
 

*Sets the current font, which is then used in various drawing routines.*
  - `void fl_frame` (const char \*s, int x, int y, int w, int h)
 

*Draws a series of line segments around the given box.*
  - `void fl_frame2` (const char \*s, int x, int y, int w, int h)
 

*Draws a series of line segments around the given box.*
  - `void fl_gap` ()
 

*Separate loops of the path.*
  - `int fl_height` ()
 

*Return the recommended minimum line spacing for the current font.*
  - `int fl_height` (int font, int size)
 

*This function returns the actual height of the specified font and size.*
  - `const char * fl_latin1_to_local` (const char \*t, int n=-1)
 

*Convert text from Windows/X11 latin1 character set to local encoding.*
  - `void fl_line` (int x, int y, int x1, int y1)
 

*Draw a line from (x,y) to (x1,y1)*
  - `void fl_line` (int x, int y, int x1, int y1, int x2, int y2)
 

*Draw a line from (x,y) to (x1,y1) and another from (x1,y1) to (x2,y2)*
  - `void fl_line_style` (int style, int width=0, char \*dashes=0)
 

*Set how to draw lines (the "pen").*
  - `void fl_load_identity` ()
 

*Set the transformation matrix to identity.*
  - `void fl_load_matrix` (double a, double b, double c, double d, double x, double y)
 

*Set the current transformation matrix.*
  - `const char * fl_local_to_latin1` (const char \*t, int n=-1)
 

*Convert text from local encoding to Windows/X11 latin1 character set.*
  - `const char * fl_local_to_mac_roman` (const char \*t, int n=-1)
 

*Convert text from local encoding to Mac Roman character set.*
  - `void fl_loop` (int x, int y, int x1, int y1, int x2, int y2)
 

*Outline a 3-sided polygon with lines.*
  - `void fl_loop` (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
 

*Outline a 4-sided polygon with lines.*
  - `const char * fl_mac_roman_to_local` (const char \*t, int n=-1)
 

*Convert text from Mac Roman character set to local encoding.*
  - `void fl_measure` (const char \*str, int &x, int &y, int draw\_symbols=1)
 

*Measure how wide and tall the string will be when printed by the fl\_draw() function with align parameter.*
  - `int fl_measure_pixmap` (char \*const \*data, int &w, int &h)
 

*Get the dimensions of a pixmap.*
  - `int fl_measure_pixmap` (const char \*const \*cdata, int &w, int &h)
 

*Get the dimensions of a pixmap.*
  - `void fl_mult_matrix` (double a, double b, double c, double d, double x, double y)
 

*Concatenate another transformation onto the current one.*
  - `int fl_not_clipped` (int x, int y, int w, int h)

- Does the rectangle intersect the current clip region?*

  - unsigned int `fl_old_shortcut` (const char \*s)  
*Emulation of XForms named shortcuts.*
- void `fl_overlay_clear` ()  
*Erase a selection rectangle without drawing a new one.*
- void `fl_overlay_rect` (int x, int y, int w, int h)  
*Draw a transient dotted selection rectangle.*
- float `fl_override_scale` ()  
*Removes any GUI scaling factor in subsequent drawing operations.*
- void `fl_pie` (int x, int y, int w, int h, double a1, double a2)  
*Draw filled ellipse sections using integer coordinates.*
- void `fl_point` (int x, int y)  
*Draw a single pixel at the given coordinates.*
- void `fl_polygon` (int x, int y, int x1, int y1, int x2, int y2)  
*Fill a 3-sided polygon.*
- void `fl_polygon` (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)  
*Fill a 4-sided polygon.*
- void `fl_pop_clip` ()  
*Restore the previous clip region.*
- void `fl_pop_matrix` ()  
*Restore the current transformation matrix from the stack.*
- void `fl_push_clip` (int x, int y, int w, int h)  
*Intersect the current clip region with a rectangle and push this new region onto the stack.*
- void `fl_push_matrix` ()  
*Save the current transformation matrix on the stack.*
- void `fl_push_no_clip` ()  
*Push an empty clip region onto the stack so nothing will be clipped.*
- `uchar * fl_read_image` (`uchar *p`, int X, int Y, int W, int H, int alpha=0)  
*Reads an RGB(A) image from the current window or off-screen buffer.*
- void `fl_rect` (`FI_Rect` r)  
*Draw a border inside the given bounding box.*
- void `fl_rect` (int x, int y, int w, int h)  
*Draw a border inside the given bounding box.*
- void `fl_rect` (int x, int y, int w, int h, `FI_Color` c)  
*Draw with passed color a border inside the given bounding box.*
- void `fl_rectf` (`FI_Rect` bb, `uchar` r, `uchar` g, `uchar` b)  
*Color a rectangle with "exactly" the passed r, g, b color.*
- void `fl_rectf` (`FI_Rect` r)  
*Color with current color a rectangle that exactly fills the given bounding box.*
- void `fl_rectf` (`FI_Rect` r, `FI_Color` c)  
*Color with passed color a rectangle that exactly fills the given bounding box.*
- void `fl_rectf` (int x, int y, int w, int h)  
*Color with current color a rectangle that exactly fills the given bounding box.*
- void `fl_rectf` (int x, int y, int w, int h, `FI_Color` c)  
*Color with passed color a rectangle that exactly fills the given bounding box.*
- void `fl_rectf` (int x, int y, int w, int h, `uchar` r, `uchar` g, `uchar` b)  
*Color a rectangle with "exactly" the passed r, g, b color.*
- void `fl_rescale_offscreen` (`FI_Offscreen` &ctx)  
*Adapts an offscreen buffer to a changed value of the scale factor.*
- void `fl_reset_spot` (void)  
*Resets marked text.*

- void **fl\_restore\_clip** ()  
*Undo any clobbering of the clip region done by your program.*
- void **fl\_restore\_scale** (float s)  
*Restores the GUI scaling factor and the clipping region in subsequent drawing operations.*
- void **fl\_rotate** (double d)  
*Concatenate rotation transformation onto the current one.*
- void **fl\_rounded\_rect** (int x, int y, int w, int h, int r)  
*Draw a rounded border inside the given bounding box.*
- void **fl\_rounded\_rectf** (int x, int y, int w, int h, int r)  
*Color with current color a rounded rectangle that exactly fills the given bounding box.*
- void **fl\_rtl\_draw** (const char \*str, int n, int x, int y)  
*Draw a UTF-8 string of length n bytes right to left starting at the given x, y location.*
- void **fl\_scale** (double x)  
*Concatenate scaling transformation onto the current one.*
- void **fl\_scale** (double x, double y)  
*Concatenate scaling transformation onto the current one.*
- void **fl\_scroll** (int X, int Y, int W, int H, int dx, int dy, void(\*draw\_area)(void \*, int, int, int, int), void \*data)  
*Scroll a rectangle and draw the newly exposed portions.*
- void **fl\_set\_spot** (int font, int size, int X, int Y, int W, int H, **FL\_Window** \*win=0)  
*Inform text input methods about the current text insertion cursor.*
- void **fl\_set\_status** (int X, int Y, int W, int H)  
*Related to text input methods under X11.*
- const char \* **fl\_shortcut\_label** (unsigned int shortcut)  
*Get a human-readable string from a shortcut value.*
- const char \* **fl\_shortcut\_label** (unsigned int shortcut, const char \*\*eom)  
*Get a human-readable string from a shortcut value.*
- **Fl\_Fontsize** **fl\_size** ()  
*Return the size set by the most recent call to fl\_font().*
- void **fl\_text\_extents** (const char \*, int &dx, int &dy, int &w, int &h)  
*Determine the minimum pixel dimensions of a nul-terminated string using the current fl\_font().*
- void **fl\_text\_extents** (const char \*t, int n, int &dx, int &dy, int &w, int &h)  
*Determine the minimum pixel dimensions of a sequence of n characters (bytes) using the current fl\_font().*
- double **fl\_transform\_dx** (double x, double y)  
*Transform distance using current transformation matrix.*
- double **fl\_transform\_dy** (double x, double y)  
*Transform distance using current transformation matrix.*
- double **fl\_transform\_x** (double x, double y)  
*Transform coordinate using the current transformation matrix.*
- double **fl\_transform\_y** (double x, double y)  
*Transform coordinate using the current transformation matrix.*
- void **fl\_transformed\_vertex** (double xf, double yf)  
*Add coordinate pair to the vertex list without further transformations.*
- void **fl\_translate** (double x, double y)  
*Concatenate translation transformation onto the current one.*
- void **fl\_vertex** (double x, double y)  
*Add a single vertex to the current path.*
- double **fl\_width** (const char \*txt)  
*Return the typographical width of a nul-terminated string using the current font face and size.*
- double **fl\_width** (const char \*txt, int n)  
*Return the typographical width of a sequence of n characters using the current font face and size.*
- double **fl\_width** (unsigned int c)

*Return the typographical width of a single character using the current font face and size.*

- void **fl\_xyline** (int x, int y, int x1)

*Draw a horizontal line from (x,y) to (x1,y).*

- void **fl\_xyline** (int x, int y, int x1, int y2)

*Draw a horizontal line from (x,y) to (x1,y), then vertical from (x1,y) to (x1,y2).*

- void **fl\_xyline** (int x, int y, int x1, int y2, int x3)

*Draw a horizontal line from (x,y) to (x1,y), then a vertical from (x1,y) to (x1,y2) and then another horizontal from (x1,y2) to (x3,y2).*

- void **fl\_yxline** (int x, int y, int y1)

*Draw a vertical line from (x,y) to (x,y1)*

- void **fl\_yxline** (int x, int y, int y1, int x2)

*Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1).*

- void **fl\_yxline** (int x, int y, int y1, int x2, int y3)

*Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1), then another vertical from (x2,y1) to (x2,y3).*

## Variables

- char **fl\_draw\_shortcut**

### 34.42.1 Detailed Description

utility header to pull drawing functions together

## 34.43 fl\_draw.H

88 friend FL_EXPORT void gl_start();
89 /* ===== Implementation note about image drawing =====
90 A graphics driver can implement up to 6 virtual member functions to draw images:
91 virtual void draw_pixmap(Fl_Pixmap *pxm,int XP, int YP, int WP, int HP, int cx, int cy)
92 virtual void draw_bitmap(Fl_Bitmap *bm,int XP, int YP, int WP, int HP, int cx, int cy)
93 virtual void draw_rgb(Fl_RGB_Image *rgb,int XP, int YP, int WP, int HP, int cx, int cy)
94 and
95 virtual void draw_fixed(Fl_Pixmap *pxm,int XP, int YP, int WP, int HP, int cx, int cy)
96 virtual void draw_fixed(Fl_Bitmap *bm,int XP, int YP, int WP, int HP, int cx, int cy)
97 virtual void draw_fixed(Fl_RGB_Image *rgb,int XP, int YP, int WP, int HP, int cx, int cy)
98 - The 1st group of functions is used when the driver can directly map the image data,
99 sized at data_w() x data_h(), to the image drawing area, sized at w()*scale x h()*scale
100 where scale is the current GUI scale factor.
101 - If the driver does not support such scale-and-draw operation for a given image type,
102 it should implement the draw_fixed() function which is called by the library after the
103 image has been internally resized to the drawing size and cached.
104 - The platform-independent Fl_Graphics_Driver class implements the 1st group of functions.
105 Each resizes the image, caches it, and calls the platform-specific implementation of
106 draw_fixed(image-class *,...) with the cached image.
107 - Consider an image object, say from class Fl_RGB_Image. Fl_RGB_Image::draw()
108 calls the virtual member function draw_rgb(Fl_RGB_Image *,...). If Fl_XXX_Graphics_Driver
109 re-implements this function, this code runs and is expected to draw the image
110 adequately scaled to its drawing size. If Fl_XXX_Graphics_Driver does not re-implement
111 this function, Fl_Graphics_Driver::draw_rgb(Fl_RGB_Image *,...) runs. It internally
112 resizes the image, caches it, and calls Fl_XXX_Graphics_Driver::draw_fixed(Fl_RGB_Image *,...)
113 that draws the image from its cached form which already has the adequate size.
114 - Some drivers implement, for a given image class, only the function of the 1st group or
115 only draw_fixed() as in these examples:
116 - Fl_Quartz_Graphics_Driver implements only draw_rgb(Fl_RGB_Image *,...) because it
117 can perform the scale-and-draw operation whatever the RGB image and the required scaling.
118 - Fl_Xlib_Graphics_Driver implements only draw_fixed(Fl_Pixmap *,...). The library
119 takes care of resizing and caching the Pixmap to the adequate drawing size.
120 - Some drivers implement, for a given image class, the function of both groups, e.g. :
121 Fl_GDI_Graphics_Driver implements both draw_rgb(Fl_RGB_Image *,...) and
122 draw_fixed(Fl_RGB_Image *,...) because scale-and-draw may require function Alphablend()
123 from MSIMG32.DLL. In the absence of that, the draw_rgb() implementation calls
124 Fl_Graphics_Driver::draw_rgb() which runs Fl_GDI_Graphics_Driver::draw_fixed(Fl_RGB_Image*,...).
125
126 Graphics drivers also implement cache(Fl_Pixmap*), cache(Fl_Bitmap*) and cache(Fl_RGB_Image*)
127 to compute the cached form of all image types, and uncache(Fl_RGB_Image *,...),
128 uncache_pixmap(fl_uintptr_t) and delete_bitmask(fl_uintptr_t) to destroy cached image forms.
129 Graphics drivers that use the mask_ variable of class Fl_Pixmap to cache an Fl_Pixmap
130 object also reimplement the uchar **Fl_Graphics_Driver::mask_bitmap() member function.

## 34.59 Fl\_Grid.H File Reference

[Fl\\_Grid](#) container widget.

```
#include <FL/Fl_Group.H>
#include <FL/Fl_Rect.H>
```

### Classes

- class [Fl\\_Grid::Cell](#)
- class [Fl\\_Grid](#)

*Fl\_Grid* is a container (layout) widget with multiple columns and rows.

### Typedefs

- typedef unsigned short [Fl\\_Grid\\_Align](#)  
*Fl\_Grid* type for child widget alignment control.

### Variables

- const [Fl\\_Grid\\_Align](#) [FL\\_GRID\\_BOTTOM](#) = 0x0002

- Align the widget at the bottom of the cell.*
- const `Fl_Grid_Align FL_GRID_BOTTOM_LEFT` = `FL_GRID_BOTTOM` | `FL_GRID_LEFT`
- const `Fl_Grid_Align FL_GRID_BOTTOM_RIGHT` = `FL_GRID_BOTTOM` | `FL_GRID_RIGHT`
- const `Fl_Grid_Align FL_GRID_CENTER` = `0x0000`
- Align the widget in the middle of the cell (default).*
- const `Fl_Grid_Align FL_GRID_FILL` = `0x0030`
- Stretch the widget in both directions to fill the cell.*
- const `Fl_Grid_Align FL_GRID_HORIZONTAL` = `0x0010`
- Stretch the widget horizontally to fill the cell.*
- const `Fl_Grid_Align FL_GRID_LEFT` = `0x0004`
- Align the widget at the left side of the cell.*
- const `Fl_Grid_Align FL_GRID_PROPORTIONAL` = `0x0040`
- Stretch the widget proportionally.*
- const `Fl_Grid_Align FL_GRID_RIGHT` = `0x0008`
- Align the widget at the right side of the cell.*
- const `Fl_Grid_Align FL_GRID_TOP` = `0x0001`
- Align the widget at the top of the cell.*
- const `Fl_Grid_Align FL_GRID_TOP_LEFT` = `FL_GRID_TOP` | `FL_GRID_LEFT`
- const `Fl_Grid_Align FL_GRID_TOP_RIGHT` = `FL_GRID_TOP` | `FL_GRID_RIGHT`
- const `Fl_Grid_Align FL_GRID_VERTICAL` = `0x0020`
- Stretch the widget vertically to fill the cell.*

### 34.59.1 Detailed Description

`Fl_Grid` container widget.

## 34.60 `Fl_Grid.H`

## 34.71 Fl\_Image.H File Reference

[Fl\\_Image](#), [Fl\\_RGB\\_Image](#) classes.

```

#include "Enumerations.H"
#include "Fl_Widget.H"

```

## Classes

- class [Fl\\_Image](#)  
Base class for image caching, scaling and drawing.
- class [Fl\\_RGB\\_Image](#)  
The [Fl\\_RGB\\_Image](#) class supports caching and drawing of full-color images with 1 to 4 channels of color information.

## Enumerations

- enum [Fl\\_RGB\\_Scaling](#) { [FL\\_RGB\\_SCALING\\_NEAREST](#) = 0 , [FL\\_RGB\\_SCALING\\_BILINEAR](#) }  
The scaling algorithm to use for RGB images.

### 34.71.1 Detailed Description

[Fl\\_Image](#), [Fl\\_RGB\\_Image](#) classes.

### 34.71.2 Enumeration Type Documentation

#### 34.71.2.1 Fl\_RGB\_Scaling

enum [Fl\\_RGB\\_Scaling](#)

The scaling algorithm to use for RGB images.

#### Enumerator

<a href="#">FL_RGB_SCALING_NEAREST</a>	default RGB image scaling algorithm
<a href="#">FL_RGB_SCALING_BILINEAR</a>	more accurate, but slower RGB image scaling algorithm

#include <FL/Fl_Image.H>
#include <FL/Fl_Multi_Label.H>
#include <FL/platform_types.h>

```

### Classes

- struct [Fl\\_Menu\\_Item](#)

The [Fl\\_Menu\\_Item](#) structure defines a single menu item that is used by the [Fl\\_Menu\\_](#) class.

### Typedefs

- typedef [Fl\\_Menu\\_Item](#) [Fl\\_Menu](#)

## Enumerations

- enum {  
[FL\\_MENU\\_INACTIVE](#) = 1 , [FL\\_MENU\\_TOGGLE](#) = 2 , [FL\\_MENU\\_VALUE](#) = 4 , [FL\\_MENU\\_RADIO](#) = 8 ,  
[FL\\_MENU\\_INVISIBLE](#) = 0x10 , [FL\\_SUBMENU\\_POINTER](#) = 0x20 , [FL\\_SUBMENU](#) = 0x40 , [FL\\_MENU\\_DIVIDER](#)  
= 0x80 ,  
[FL\\_MENU\\_HORIZONTAL](#) = 0x100 , [FL\\_MENU\\_RESERVED](#) = 0xfffff00 }
- enum {  
**FL\_PUP\_NONE** = 0 , **FL\_PUP\_GREY** = [FL\\_MENU\\_INACTIVE](#) , **FL\_PUP\_GRAY** = [FL\\_MENU\\_INACTIVE](#) ,  
**FL\_MENU\_BOX** = [FL\\_MENU\\_TOGGLE](#) ,  
**FL\_PUP\_BOX** = [FL\\_MENU\\_TOGGLE](#) , **FL\_MENU\_CHECK** = [FL\\_MENU\\_VALUE](#) , **FL\_PUP\_CHECK** = [FL\\_MENU\\_VALUE](#) ,  
**FL\_PUP\_RADIO** = [FL\\_MENU\\_RADIO](#) ,  
**FL\_PUP\_INVISIBLE** = [FL\\_MENU\\_INVISIBLE](#) , **FL\_PUP\_SUBMENU** = [FL\\_SUBMENU\\_POINTER](#) }

## Functions

- [Fl\\_Shortcut fl\\_old\\_shortcut](#) (const char \*)  
*Emulation of XForms named shortcuts.*

## 34.85.1 Enumeration Type Documentation

### 34.85.1.1 anonymous enum

anonymous enum

#### Enumerator

<a href="#">FL_MENU_INACTIVE</a>	Deactivate menu item (gray out)
<a href="#">FL_MENU_TOGGLE</a>	Item is a checkbox toggle (shows checkbox for on/off state)
<a href="#">FL_MENU_VALUE</a>	The on/off state for checkbox/radio buttons (if set, state is 'on')
<a href="#">FL_MENU_RADIO</a>	Item is a radio button (one checkbox of many can be on)
<a href="#">FL_MENU_INVISIBLE</a>	Item will not show up (shortcut will work)
<a href="#">FL_SUBMENU_POINTER</a>	Indicates user_data() is a pointer to another menu array.
<a href="#">FL_SUBMENU</a>	Item is a submenu to other items.
<a href="#">FL_MENU_DIVIDER</a>	Creates divider line below this item. Also ends a group of radio buttons.
<a href="#">FL_MENU_HORIZONTAL</a>	??? – reserved, internal (do not use)
<a href="#">FL_MENU_RESERVED</a>	These bits are reserved for internal or future usage (do not use)

## 34.93 Fl\_Native\_File\_Chooser.H File Reference

[Fl\\_Native\\_File\\_Chooser](#) widget.

```
#include <FL/Fl_Export.H>
```

```
#include <FL/Fl_File_Chooser.H>
```

### Classes

- class [Fl\\_Native\\_File\\_Chooser](#)

*This class lets an FLTK application easily and consistently access the operating system's native file chooser.*

### 34.93.1 Detailed Description

[Fl\\_Native\\_File\\_Chooser](#) widget.

## 34.94 Fl\_Native\_File\_Chooser.H

[Go to the documentation of this file.](#)

```

1 //
2 // FLTK native OS file chooser widget
3 //
4 // Copyright 2004 Greg Ercolano.
5 // Copyright 2005-2024 by Bill Spitzak and others.
6 //
7 // This library is free software. Distribution and use rights are outlined in
8 // the file "COPYING" which should have been included with this file. If this
9 // file is missing or damaged, see the license at:

16 //
17
21 /* Implementation note:
22
23 class Fl_Native_File_Chooser <== public API used by applications
24
25 class Fl_Native_File_Chooser_Driver <== virtual API that a platform may implement
26 this API has a do-nothing default implementation
27
28 class Fl_Native_File_Chooser_FLTK_Driver <== this API implementation is the default FLTK file chooser
29 class Fl_GTK_Native_File_Chooser_Driver <== this API implementation runs a GTK file chooser
30 class Fl_Kdialog_Native_File_Chooser_Driver <== this API implementation runs a KDE file chooser
31 it is determined at run-time if the GTK dynamic libraries are available
32 and the KDE file chooser runs under the KDE desktop
33
34 class Fl_Quartz_Native_File_Chooser_Driver <== this API implementation runs a Mac OS X file chooser
35
36 class Fl_WinAPI_Native_File_Chooser_Driver <== this API implementation runs a Windows file chooser
37
38
39 Each platform must implement the constructor of the Fl_Native_File_Chooser class.
40 This particular implementation:
41
42 Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
43 platform_fnfc = new Fl_Native_File_Chooser_FLTK_Driver(val);
44 }
45
46 can be used by any platform.
47 No more code is required. The cross-platform Fl_Native_File_Chooser_FLTK.cxx file must be compiled in
48 libfltk,
49 and the default FLTK file chooser will be used.
50
51 This other implementation:
52 Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
53 platform_fnfc = 0;
54 }
55 can be used by a platform that needs no file chooser.
56 */

## 34.108 FI\_PostScript.H File Reference

declaration of classes [FI\\_PostScript\\_File\\_Device](#) and [FI\\_EPS\\_File\\_Surface](#).

```

#include <FL/Fl_Paged_Device.H>
#include <FL/fl_draw.H>
#include <stdarg.h>

```

### Classes

- class [FI\\_EPS\\_File\\_Surface](#)  
*Encapsulated PostScript drawing surface.*
- class [FI\\_PostScript\\_File\\_Device](#)  
*To send graphical output to a PostScript file.*

### Typedefs

- typedef int(\* [FI\\_PostScript\\_Close\\_Command](#)) (FILE \*)  
*Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.*

### 34.108.1 Detailed Description

declaration of classes [FI\\_PostScript\\_File\\_Device](#) and [FI\\_EPS\\_File\\_Surface](#).

### 34.108.2 Typedef Documentation

#### 34.108.2.1 FI\_PostScript\_Close\_Command

```
typedef int(* Fl_PostScript_Close_Command) (FILE *)
```

Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.

A non-null return value indicates output error.

See also

[FI\\_PostScript\\_File\\_Device::close\\_command\(\)](#) and [FI\\_EPS\\_File\\_Surface::FI\\_EPS\\_File\\_Surface\(\)](#).

## 34.130 Fl\_Shared\_Image.H File Reference

[Fl\\_Shared\\_Image](#) class.

```
#include "Fl_Image.H"
```

### Classes

- class [Fl\\_Shared\\_Image](#)

*This class supports caching, loading, and drawing of image files.*

## Typedefs

- typedef [Fl\\_Image](#) \*(\* [Fl\\_Shared\\_Handler](#)) (const char \*name, [uchar](#) \*header, int headerlen)  
*Test function (typedef) for adding new shared image formats.*

## Functions

- void [fl\\_register\\_images](#) ()  
*Register the known image formats.*

### 34.130.1 Detailed Description

[Fl\\_Shared\\_Image](#) class.

### 34.130.2 Typedef Documentation

#### 34.130.2.1 Fl\_Shared\_Handler

```
typedef Fl_Image *(* Fl_Shared_Handler) (const char *name, uchar *header, int headerlen)
```

Test function (typedef) for adding new shared image formats.

This defines the function type you can use to add a handler for unknown image formats that can be opened and loaded as an [Fl\\_Shared\\_Image](#).

[fl\\_register\\_images](#)() adds all image formats known to FLTK. Call [Fl\\_Shared\\_Image::add\\_handler\(\)](#) to add your own check function to the list of known image formats.

Your function will be passed the filename (*name*), some *header* bytes already read from the image file and the size *headerlen* of the data read. The max value of size is implementation dependent. If your handler function needs to check more bytes you must open the image file yourself.

The provided buffer *header* must not be overwritten.

If your handler function can identify the file type you must open the file and return a valid [Fl\\_Image](#) or derived type, otherwise you must return NULL. Example:

```
static Fl_Image *check_my_image(const char *name,
 uchar *header,
 int headerlen) {
 // (test image type using header and headerlen)
 if (known) {
 // (load image data from file \p name)
 return new Fl_RGB_Image(data, ...);
 } else
 return 0;
}
// add your handler:
Fl_Shared_Image::add_handler(check_my_image);
```

#### Parameters

in	<i>name</i>	filename to be checked and opened if applicable
in	<i>header</i>	portion of the file that has already been read
in	<i>headerlen</i>	length of provided <i>header</i> data

#### Returns

valid [Fl\\_Image](#) or NULL.

#### See also

[Fl\\_Shared\\_Image::add\\_handler\(\)](#)

### 34.130.3 Function Documentation

### 34.130.3.1 fl\_register\_images()

void fl\_register\_images ( )

Register the known image formats.

This function is provided in the fltk\_images library and registers all of the "extra" image file formats known to FLTK that are not part of the core FLTK library.

You may add your own image formats with [Fl\\_Shared\\_Image::add\\_handler\(\)](#).

39
40 /*
41 "character size" is the size of a UTF-8 character in bytes
42 "character width" is the width of a Unicode character in pixels
43 "column" was originally defined as a character offset from the left margin.
44 It was identical to the byte offset. In UTF-8, we have neither a byte offset
45 nor truly fixed width fonts (*). Column could be a pixel value multiplied with
46 an average character width (which is a bearable approximation).
47
48 * in Unicode, there are no fixed width fonts! Even if the ASCII characters may
49 happen to be all the same width in pixels, Chinese characters surely are not.
50 There are plenty of exceptions, like ligatures, that make special handling of
51 "fixed" character widths a nightmare. I decided to remove all references to
52 fixed fonts and see "columns" as a multiple of the average width of a
53 character in the main font.

## 34.161 FL\_Tree.H File Reference

This file contains the definitions of the [FL\\_Tree](#) class.

```

#include <FL/Fl.H>
#include <FL/Fl_Group.H>
#include <FL/Fl_Scrollbar.H>
#include <FL/fl_draw.H>
#include <FL/Fl_Tree_Item.H>
#include <FL/Fl_Tree_Prefs.H>

```

### Classes

- class [FL\\_Tree](#)  
*Tree widget.*

### Enumerations

- enum [FL\\_Tree\\_Reason](#) {  
[FL\\_TREE\\_REASON\\_NONE](#) = FL\_REASON\_UNKNOWN , [FL\\_TREE\\_REASON\\_SELECTED](#) = FL\_↔

```

REASON_SELECTED , FL_TREE_REASON_DESELECTED = FL_REASON_DESELECTED , FL_TREE_REASON_RESELE
= FL_REASON_RESELECTED ,
FL_TREE_REASON_OPENED = FL_REASON_OPENED , FL_TREE_REASON_CLOSED = FL_↔
REASON_CLOSED , FL_TREE_REASON_DRAGGED = FL_REASON_DRAGGED }

```

The reason the callback was invoked.

### 34.161.1 Detailed Description

This file contains the definitions of the `Fl_Tree` class.

### 34.161.2 Enumeration Type Documentation

#### 34.161.2.1 Fl\_Tree\_Reason

```
enum Fl_Tree_Reason
```

The reason the callback was invoked.

Enumerator

FL_TREE_REASON_NONE	unknown reason
FL_TREE_REASON_SELECTED	an item was selected
FL_TREE_REASON_DESELECTED	an item was de-selected
FL_TREE_REASON_RESELECTED	an item was re-selected (double-clicked). See <a href="#">Fl_Tree_Item_Reselect_Mode</a> to enable this.
FL_TREE_REASON_OPENED	an item was opened
FL_TREE_REASON_CLOSED	an item was closed
FL_TREE_REASON_DRAGGED	an item was dragged into a new place

### 34.167.1 Detailed Description

This file contains the definitions for `Fl_Tree`'s preferences.

```
Fl_Tree_Prefs
:
.....:.....
:
Fl_Tree :
|_____ Fl_Tree_Item
```

### 34.167.2 Enumeration Type Documentation

#### 34.167.2.1 Fl\_Tree\_Connector

enum `Fl_Tree_Connector`

Defines the style of connection lines between items.

Enumerator

<code>FL_TREE_CONNECTOR_NONE</code>	Use no lines connecting items.
<code>FL_TREE_CONNECTOR_DOTTED</code>	Use dotted lines connecting items (default)
<code>FL_TREE_CONNECTOR_SOLID</code>	Use solid lines connecting items.

#### 34.167.2.2 Fl\_Tree\_Item\_Draw\_Mode

enum `Fl_Tree_Item_Draw_Mode`

Bit flags that control how item's labels and widget(s) are drawn in the tree via `item_draw_mode()`.

Enumerator

<code>FL_TREE_ITEM_DRAW_DEFAULT</code>	If <code>widget()</code> defined, draw in place of label, and <code>widget()</code> tracks item height (default)
<code>FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET</code>	If <code>widget()</code> defined, include label to the left of the widget.
<code>FL_TREE_ITEM_HEIGHT_FROM_WIDGET</code>	If <code>widget()</code> defined, <code>widget()</code> 's height controls item's height.

#### 34.167.2.3 Fl\_Tree\_Item\_Reselect\_Mode

enum `Fl_Tree_Item_Reselect_Mode`

Defines the ways an item can be (re) selected via `item_reselect_mode()`.

#### Enumerator

FL_TREE_SELECTABLE_ONCE	Item can only be selected once (default)
FL_TREE_SELECTABLE_ALWAYS	Enables FL_TREE_REASON_RESELECTED events for callbacks.

### 34.167.2.4 Fl\_Tree\_Select

enum `Fl_Tree_Select`

Tree selection style.

#### Enumerator

FL_TREE_SELECT_NONE	Nothing selected when items are clicked.
FL_TREE_SELECT_SINGLE	Single item selected when item is clicked (default)
FL_TREE_SELECT_MULTI	Multiple items can be selected by clicking with SHIFT, CTRL or mouse drags.
FL_TREE_SELECT_SINGLE_DRAGGABLE	Single items may be selected, and they may be reordered by mouse drag.

### 34.167.2.5 Fl\_Tree\_Sort

enum `Fl_Tree_Sort`

Sort order options for items added to the tree.

#### Enumerator

FL_TREE_SORT_NONE	No sorting; items are added in the order defined (default).
FL_TREE_SORT_ASCENDING	Add items in ascending sort order.
FL_TREE_SORT_DESCENDING	Add items in descending sort order.

## 34.169 fl\_types.h File Reference

This file contains simple "C"-style type definitions.

```
#include "fl_attr.h"
```

### Typedefs

#### Miscellaneous

- typedef unsigned int [Fl\\_Shortcut](#)  
*16-bit Unicode character + 8-bit indicator for keyboard flags.*
- typedef unsigned char **uchar**  
*unsigned char*
- typedef unsigned long **ulong**  
*unsigned long*

### 34.169.1 Detailed Description

This file contains simple "C"-style type definitions.

### 34.169.2 Typedef Documentation

#### 34.169.2.1 Fl\_Shortcut

```
typedef unsigned int Fl_Shortcut
16-bit Unicode character + 8-bit indicator for keyboard flags.
```

#### Note

This **should** be 24-bit Unicode character + 8-bit indicator for keyboard flags. The upper 8 bits are currently unused but reserved.

Due to compatibility issues this type and all FLTK **shortcuts** can only be used with 16-bit Unicode characters (U+0000 .. U+FFFF) and not with the full range of unicode characters (U+0000 .. U+10FFFF).

This is caused by the bit flags `FL_SHIFT`, `FL_CTRL`, `FL_ALT`, and `FL_META` being all in the range 0x010000 .. 0x400000.

**Todo** Discuss and decide whether we can "shift" these special keyboard flags to the upper byte to enable full 21-bit Unicode characters (U+0000 .. U+10FFFF) plus the keyboard indicator bits as this was originally intended. This would be possible if we could rely on **all** programs being coded with symbolic names and not hard coded bit values.

#include <stdio.h>
#include <sys/stat.h>

```

### Functions

- `int fl_access` (const char \*f, int mode)
 

*Cross-platform function to test a files access() with a UTF-8 encoded name or value.*
- `int fl_chdir` (const char \*path)
 

*Cross-platform function to change the current working directory, given as a UTF-8 encoded string.*
- `int fl_chmod` (const char \*f, int mode)
 

*Cross-platform function to set a files mode() with a UTF-8 encoded name or value.*
- `int fl_close_fd` (int fd)
 

*Cross-platform function to close a file descriptor.*
- `int fl_execvp` (const char \*file, char \*const \*argv)
- `FILE * fl_fopen` (const char \*f, const char \*mode)
 

*Cross-platform function to open files with a UTF-8 encoded name.*
- `char * fl_getcwd` (char \*buf, int len)
 

*Cross-platform function to get the current working directory as a UTF-8 encoded value.*
- `char * fl_getenv` (const char \*v)
 

*Cross-platform function to get environment variables with a UTF-8 encoded name or value.*
- `char fl_make_path` (const char \*path)
 

*Cross-platform function to recursively create a path in the file system.*
- `void fl_make_path_for_file` (const char \*path)
 

*Cross-platform function to create a path for the file in the file system.*
- `int fl_mkdir` (const char \*f, int mode)
 

*Cross-platform function to create a directory with a UTF-8 encoded name.*
- `unsigned int fl_nonspacing` (unsigned int ucs)
 

*Returns true if the Unicode character ucs is non-spacing.*
- `int fl_open` (const char \*fname, int oflags,...)
 

*Cross-platform function to open files with a UTF-8 encoded name.*
- `int fl_open_ext` (const char \*fname, int binary, int oflags,...)
 

*Cross-platform function to open files with a UTF-8 encoded name.*
- `int fl_putenv` (const char \*var)
 

*Cross-platform function to write environment variables with a UTF-8 encoded name or value.*

- `int fl_rename` (const char \*f, const char \*n)  
*Cross-platform function to rename a filesystem object using UTF-8 encoded names.*
- `int fl_rmdir` (const char \*f)  
*Cross-platform function to remove a directory with a UTF-8 encoded name.*
- `int fl_stat` (const char \*f, struct stat \*b)  
*Cross-platform function to stat() a file using a UTF-8 encoded name or value.*
- `int fl_system` (const char \*cmd)  
*Cross-platform function to run a system command with a UTF-8 encoded string.*
- `int fl_tolower` (unsigned int ucs)  
*Returns the Unicode lower case value of ucs.*
- `int fl_toupper` (unsigned int ucs)  
*Returns the Unicode upper case value of ucs.*
- `unsigned fl_ucs_to_Utf16` (const unsigned ucs, unsigned short \*dst, const unsigned dstlen)  
*Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.*
- `int fl_unlink` (const char \*fname)  
*Cross-platform function to unlink() (that is, delete) a file using a UTF-8 encoded filename.*
- `char * fl_utf2mbs` (const char \*s)  
*Converts UTF-8 string s to a local multi-byte character string.*
- `const char * fl_utf8back` (const char \*p, const char \*start, const char \*end)  
*Move p backward until it points to the start of a UTF-8 character.*
- `int fl_utf8bytes` (unsigned ucs)  
*Return the number of bytes needed to encode the given UCS4 character in UTF-8.*
- `unsigned fl_utf8decode` (const char \*p, const char \*end, int \*len)  
*Decode a single UTF-8 encoded character starting at p.*
- `int fl_utf8encode` (unsigned ucs, char \*buf)  
*Write the UTF-8 encoding of ucs into buf and return the number of bytes written.*
- `unsigned fl_utf8from_mb` (char \*dst, unsigned dstlen, const char \*src, unsigned srclen)  
*Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.*
- `unsigned fl_utf8froma` (char \*dst, unsigned dstlen, const char \*src, unsigned srclen)  
*Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.*
- `unsigned fl_utf8fromw` (char \*dst, unsigned dstlen, const wchar\_t \*src, unsigned srclen)  
*Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.*
- `const char * fl_utf8fwd` (const char \*p, const char \*start, const char \*end)  
*Move p forward until it points to the start of a UTF-8 character.*
- `int fl_utf8len` (char c)  
*Returns the byte length of the UTF-8 sequence with first byte c, or -1 if c is not valid.*
- `int fl_utf8len1` (char c)  
*Returns the byte length of the UTF-8 sequence with first byte c, or 1 if c is not valid.*
- `int fl_utf8locale` ()  
*Return true if the "locale" seems to indicate that UTF-8 encoding is used.*
- `int fl_utf8strlen` (const char \*text, int len)  
*Return the length in bytes of a UTF-8 string.*
- `int fl_utf8test` (const char \*src, unsigned srclen)  
*Examines the first srclen bytes in src and returns a verdict on whether it is UTF-8 or not.*
- `unsigned fl_utf8to_mb` (const char \*src, unsigned srclen, char \*dst, unsigned dstlen)  
*Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).*
- `unsigned fl_utf8toa` (const char \*src, unsigned srclen, char \*dst, unsigned dstlen)  
*Convert a UTF-8 sequence into an array of 1-byte characters.*
- `unsigned fl_utf8toUtf16` (const char \*src, unsigned srclen, unsigned short \*dst, unsigned dstlen)  
*Convert a UTF-8 sequence into an array of 16-bit characters.*

- unsigned [fl\\_utf8towc](#) (const char \*src, unsigned srclen, wchar\_t \*dst, unsigned dstlen)  
*Converts a UTF-8 string into a wide character string.*
- int [fl\\_utf\\_nb\\_char](#) (const unsigned char \*buf, int len)  
*Returns the number of Unicode chars in the UTF-8 string.*
- int [fl\\_utf\\_strcasecmp](#) (const char \*s1, const char \*s2)  
*UTF-8 aware strcasecmp - converts to Unicode and tests.*
- int [fl\\_utf\\_strncasecmp](#) (const char \*s1, const char \*s2, int n)  
*UTF-8 aware strncasecmp - converts to lower case Unicode and tests.*
- int [fl\\_utf\\_tolower](#) (const unsigned char \*str, int len, char \*buf)  
*Converts the string str to its lower case equivalent into buf.*
- int [fl\\_utf\\_toupper](#) (const unsigned char \*str, int len, char \*buf)  
*Converts the string str to its upper case equivalent into buf.*
- int [fl\\_wcwidth](#) (const char \*src)  
*extended wrapper around [fl\\_wcwidth\\_\(unsigned int ucs\)](#) function.*
- int [fl\\_wcwidth\\_](#) (unsigned int ucs)  
*Wrapper to adapt Markus Kuhn's implementation of wcwidth() for FLTK.*

### 34.171.1 Detailed Description

## 34.177 FI\_Widget.H File Reference

[FI\\_Widget](#) and [FI\\_Label](#) classes.

```
#include "Fl.H"
```

### Classes

- class [FI\\_Callback\\_User\\_Data](#)  
*A class prototype that allows for additional data in callbacks.*
- struct [FI\\_Label](#)  
*This struct stores all information for a text or mixed graphics label.*
- class [FI\\_Widget](#)  
*FI\_Widget is the base class for all widgets in FLTK.*

### Macros

- `#define FL\_RESERVED\_TYPE 100`  
*Reserved type numbers (necessary for my cheapo RTTI) start here.*

### Typedefs

- typedef void() [FI\\_Callback](#)([FI\\_Widget](#) \*, void \*)  
*Default callback type definition for all fltk widgets (by far the most used)*
- typedef void() [FI\\_Callback0](#)([FI\\_Widget](#) \*)  
*One parameter callback type definition passing only the widget.*
- typedef void() [FI\\_Callback1](#)([FI\\_Widget](#) \*, long)  
*Callback type definition passing the widget and a long data value.*
- typedef [FI\\_Callback](#) \* [FI\\_Callback\\_p](#)  
*Default callback type pointer definition for all fltk widgets.*

### 34.177.1 Detailed Description

[FI\\_Widget](#) and [FI\\_Label](#) classes.

### 34.177.2 Macro Definition Documentation

#### 34.177.2.1 FL\_RESERVED\_TYPE

```
#define FL_RESERVED_TYPE 100
```

Reserved type numbers (necessary for my cheapo RTTI) start here.

Grep the header files for "RESERVED\_TYPE" to find the next available number.

## 34.180 Fl\_Window.H File Reference

[Fl\\_Window](#) widget .

```

#include <FL/Fl.H>
#include <FL/Fl_Group.H>
#include <FL/Fl_Bitmap.H>

```

### Classes

- class [Fl\\_Window](#)

*This widget produces an actual window.*

### Macros

- #define **FL\_DOUBLE\_WINDOW** 0xF1  
*double window type id*
- #define **FL\_WINDOW** 0xF0  
*window type id: all subclasses have type() >= this*

### 34.180.1 Detailed Description

[Fl\\_Window](#) widget .

## 34.186 gl.h File Reference

This file defines wrapper functions for OpenGL in FLTK.

```

#include "Enumerations.H"
#include <GL/gl.h>

```

### Functions

- void [gl\\_color](#) (Fl\_Color i)
  - Sets the current OpenGL color to an FLTK color.*
- void [gl\\_color](#) (int c)
  - back compatibility*
- int [gl\\_descent](#) ()
  - Returns the current font's descent.*
- void [gl\\_draw](#) (const char \*)
  - Draws a nul-terminated string in the current font at the current position.*
- void [gl\\_draw](#) (const char \*, float x, float y)
  - Draws a nul-terminated string in the current font at the given position.*
- void [gl\\_draw](#) (const char \*, int n)
  - Draws an array of n characters of the string in the current font at the current position.*
- void [gl\\_draw](#) (const char \*, int n, float x, float y)
  - Draws n characters of the string in the current font at the given position.*
- void [gl\\_draw](#) (const char \*, int n, int x, int y)
  - Draws n characters of the string in the current font at the given position.*
- void [gl\\_draw](#) (const char \*, int x, int y)
  - Draws a nul-terminated string in the current font at the given position.*

- void **gl\_draw** (const char \*, int x, int y, int w, int h, [Fl\\_Align](#))  
*Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to ^X.*
- void **gl\_draw\_image** (const [uchar](#) \*, int x, int y, int w, int h, int d=3, int ld=0)
- void **gl\_finish** ()  
*Releases an OpenGL context.*
- void **gl\_font** (int fontid, int size)  
*Sets the current OpenGL font to the same font as calling [fl\\_font\(\)](#).*
- int **gl\_height** ()  
*Returns the current font's height.*
- void **gl\_measure** (const char \*, int &x, int &y)  
*Measure how wide and tall the string will be when drawn by the [gl\\_draw\(\)](#) function.*
- void **gl\_rect** (int x, int y, int w, int h)  
*Outlines the given rectangle with the current color.*
- void **gl\_rectf** (int x, int y, int w, int h)  
*Fills the given rectangle with the current color.*
- void **gl\_start** ()  
*Creates an OpenGL context.*
- int **gl\_texture\_pile\_height** ()  
*Returns the current maximum height of the pile of pre-computed string textures.*
- void **gl\_texture\_pile\_height** (int max)  
*Changes the maximum height of the pile of pre-computed string textures.*
- void **gl\_texture\_reset** ()  
*To call after GL operations that may invalidate textures used to draw text in GL scenes (e.g., switch between [FL\\_↔DOUBLE](#) / [FL\\_SINGLE](#) modes).*
- double **gl\_width** (const char \*)  
*Returns the width of the string in the current font.*
- double **gl\_width** (const char \*, int n)  
*Returns the width of n characters of the string in the current font.*
- double **gl\_width** ([uchar](#))  
*Returns the width of the character in the current font.*

### 34.186.1 Detailed Description

This file defines wrapper functions for OpenGL in FLTK.

To use OpenGL from within an FLTK application you MUST use [gl\\_visual\(\)](#) to select the default visual before doing [show\(\)](#) on any windows. Mesa will crash if you try to use a visual not returned by [glxChooseVisual](#).

Historically, this did not always work well with [Fl\\_Double\\_Window](#)'s! It can try to draw into the front buffer. Depending on the system this might either crash or do nothing (when pixmap are being used as back buffer and GL is being done by hardware), work correctly (when GL is done with software, such as Mesa), or draw into the front buffer and be erased when the buffers are swapped (when double buffer hardware is being used)

### 34.186.2 Function Documentation

#### 34.186.2.1 [gl\\_color\(\)](#)

```
void gl_color (
 Fl_Color i)
```

Sets the current OpenGL color to an FLTK color.

For color-index modes it will use [fl\\_xpixel\(c\)](#), which is only right if the window uses the default colormap!

**34.186.2.2 gl\_draw()** [1/7]

```
void gl_draw (
 const char * str)
```

Draws a nul-terminated string in the current font at the current position.

See also

[gl\\_texture\\_pile\\_height\(int\)](#)

**34.186.2.3 gl\_draw()** [2/7]

```
void gl_draw (
 const char * str,
 float x,
 float y)
```

Draws a nul-terminated string in the current font at the given position.

See also

[gl\\_texture\\_pile\\_height\(int\)](#)

**34.186.2.4 gl\_draw()** [3/7]

```
void gl_draw (
 const char * str,
 int n)
```

Draws an array of n characters of the string in the current font at the current position.

See also

[gl\\_texture\\_pile\\_height\(int\)](#)

**34.186.2.5 gl\_draw()** [4/7]

```
void gl_draw (
 const char * str,
 int n,
 float x,
 float y)
```

Draws n characters of the string in the current font at the given position.

See also

[gl\\_texture\\_pile\\_height\(int\)](#)

**34.186.2.6 gl\_draw()** [5/7]

```
void gl_draw (
 const char * str,
 int n,
 int x,
 int y)
```

Draws n characters of the string in the current font at the given position.

See also

[gl\\_texture\\_pile\\_height\(int\)](#)

### 34.186.2.7 `gl_draw()` [6/7]

```
void gl_draw (
 const char * str,
 int x,
 int y)
```

Draws a nul-terminated string in the current font at the given position.

See also

[gl\\_texture\\_pile\\_height\(int\)](#)

### 34.186.2.8 `gl_draw()` [7/7]

```
void gl_draw (
 const char * str,
 int x,
 int y,
 int w,
 int h,
 Fl_Align align)
```

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to  $\backslash X$ . and aligned with the edges or center. Exactly the same output as [fl\\_draw\(\)](#).

### 34.186.2.9 `gl_font()`

```
void gl_font (
 int fontid,
 int size)
```

Sets the current OpenGL font to the same font as calling [fl\\_font\(\)](#).

See also

[FI::draw\\_GL\\_text\\_with\\_textures\(int val\)](#)

### 34.186.2.10 `gl_rect()`

```
void gl_rect (
 int x,
 int y,
 int w,
 int h)
```

Outlines the given rectangle with the current color.

If [FI\\_Gl\\_Window::ortho\(\)](#) has been called, then the rectangle will exactly fill the given pixel rectangle.

### 34.186.2.11 `gl_rectf()`

```
void gl_rectf (
 int x,
 int y,
 int w,
 int h)
```

Fills the given rectangle with the current color.

See also

[gl\\_rect\(int x, int y, int w, int h\)](#)

**34.186.2.12 gl\_texture\_pile\_height() [1/2]**

```
int gl_texture_pile_height (
 void)
```

Returns the current maximum height of the pile of pre-computed string textures.  
The default value is 100

See also

[Fl::draw\\_GL\\_text\\_with\\_textures\(int\)](#)

**34.186.2.13 gl\_texture\_pile\_height() [2/2]**

```
void gl_texture_pile_height (
 int max)
```

Changes the maximum height of the pile of pre-computed string textures.  
Strings that are often re-displayed can be processed much faster if this pile is set high enough to hold all of them.

Parameters

<i>max</i>	Maximum height of the texture pile
------------	------------------------------------

See also

[Fl::draw\\_GL\\_text\\_with\\_textures\(int\)](#)

**34.187 gl.h**

## 34.192 mac.H File Reference

Mac OS X-specific symbols.

### Classes

- class [Fl\\_Mac\\_App\\_Menu](#)

### Functions

- [Fl\\_Window](#) \* [fl\\_mac\\_find](#) (FLWindow \*)  
*Returns the [Fl\\_Window](#) corresponding to the given macOS-specific window reference.*
- CGContextRef [fl\\_mac\\_gc](#) ()  
*Returns the macOS-specific graphics context for the current window.*
- void [fl\\_mac\\_set\\_about](#) ([Fl\\_Callback](#) \*cb, void \*user\_data, int shortcut=0)  
*Attaches a callback to the "About myprog" item of the system application menu.*
- FLWindow \* [fl\\_mac\\_xid](#) (const [Fl\\_Window](#) \*win)  
*Returns the macOS-specific window reference corresponding to the given [Fl\\_Window](#) object.*

### Variables

- int [fl\\_mac\\_os\\_version](#)  
*The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).*

### 34.192.1 Detailed Description

Mac OS X-specific symbols.

## 34.198 platform\_types.h File Reference

Definitions of platform-dependent types.

### Macros

- #define **FL\_COMMAND** opaque

*An alias for FL\_CTRL on Windows and X11, or FL\_META on MacOS X.*

- #define **FL\_CONTROL** opaque  
*An alias for FL\_META on Windows and X11, or FL\_CTRL on MacOS X.*

## Typedefs

- typedef opaque [fl\\_intptr\\_t](#)  
*An integral type large enough to store a pointer or a long value.*
- typedef opaque [FL\\_Offscreen](#)  
*Platform-specific value representing an offscreen drawing buffer.*
- typedef struct opaque \* [FL\\_Region](#)  
*Pointer to a platform-specific structure representing a collection of rectangles.*
- typedef opaque **FL\_SOCKET**  
*socket or file descriptor*
- typedef opaque [FL\\_Timestamp](#)  
*Platform-specific point in time, used for delta time calculation.*
- typedef opaque [fl\\_uintptr\\_t](#)  
*An unsigned integral type large enough to store a pointer or an unsigned long value.*
- typedef struct opaque \* [GLContext](#)  
*Pointer to a platform-specific structure representing the window's OpenGL rendering context.*

### 34.198.1 Detailed Description

Definitions of platform-dependent types.

The exact nature of these types varies with the platform. Therefore, portable FLTK applications should not assume these types have a specific size, or that they are pointers.

### 34.198.2 Typedef Documentation

#### 34.198.2.1 fl\_intptr\_t

```
typedef opaque fl_intptr_t
```

An integral type large enough to store a pointer or a long value.

A pointer value can be safely cast to fl\_intptr\_t, and later cast back to its initial pointer type without change to the pointer value. A variable of type fl\_intptr\_t can also store a long int value.

#### 34.198.2.2 FL\_Offscreen

```
typedef opaque FL_Offscreen
```

Platform-specific value representing an offscreen drawing buffer.

#### Note

This value can be safely cast to these types on each platform:

- X11: Pixmap
- Wayland: cairo\_t \*
- Windows: HBITMAP
- macOS: CGContextRef

### 34.198.2.3 FI\_Region

```
typedef struct opaque* FI_Region
```

Pointer to a platform-specific structure representing a collection of rectangles.

#### Note

This pointer can be safely cast to these types on each platform:

- X11: Region as defined by X11
- Wayland: `cairo_region_t *`
- Windows: `HRGN`
- macOS: `struct flCocoaRegion *`

### 34.198.2.4 FI\_Timestamp

```
typedef opaque FI_Timestamp
```

Platform-specific point in time, used for delta time calculation.

#### Note

This type may be a struct. `sizeof(FI_Timestamp)` may be different on different platforms. `FI_Timestamp` may change with future ABI changes.

### 34.198.2.5 fl\_uintptr\_t

```
typedef opaque fl_uintptr_t
```

An unsigned integral type large enough to store a pointer or an unsigned long value.

A pointer value can be safely cast to `fl_uintptr_t`, and later cast back to its initial pointer type without change to the pointer value. A variable of type `fl_uintptr_t` can also store an unsigned long int value.

### 34.198.2.6 GLContext

```
typedef struct opaque* GLContext
```

Pointer to a platform-specific structure representing the window's OpenGL rendering context.

#### Note

This pointer can be safely cast to these types on each platform:

- X11: `GLXContext`
- Wayland: `EGLContext`
- Windows: `HGLRC`
- macOS: `NSOpenGLContext *`

## 34.200 wayland.H File Reference

Definitions of functions specific to the Wayland platform.

### Typedefs

- typedef struct \_cairo **cairo\_t**
- typedef void \* **EGLContext**

### Functions

- int **fl\_wl\_buffer\_scale** ([Fl\\_Window](#) \*window)  
*Returns the current buffer scaling factor for window.*
- struct wl\_compositor \* **fl\_wl\_compositor** ()  
*Returns the wl\_compositor of the current Wayland session.*
- struct wl\_display \* **fl\_wl\_display** ()  
*Returns the Wayland display in use.*
- [Fl\\_Window](#) \* **fl\_wl\_find** (struct wld\_window \*)  
*Returns the [Fl\\_Window](#) corresponding to a given the platform-specific window reference.*
- cairo\_t \* **fl\_wl\_gc** ()  
*Returns the cairo context associated to the current window or [Fl\\_Image\\_Surface](#).*
- EGLContext **fl\_wl\_glcontext** ([GLContext](#) rc)  
*Returns the EGLContext corresponding to the given GLContext.*
- struct wl\_surface \* **fl\_wl\_surface** (struct wld\_window \*xid)  
*Returns the wl\_surface associated to a shown window.*
- struct wld\_window \* **fl\_wl\_xid** (const [Fl\\_Window](#) \*win)  
*Returns a platform-specific reference associated to a shown window.*

#### 34.200.1 Detailed Description

Definitions of functions specific to the Wayland platform.

#### 34.200.2 Function Documentation

##### 34.200.2.1 fl\_wl\_compositor()

```
struct wl_compositor * fl_wl_compositor ()
```

Returns the wl\_compositor of the current Wayland session.

This allows, for example, to create a wl\_surface with

```
struct wl_surface *my_wl_surface = wl_compositor_create_surface(fl_wl_compositor());
```

## 34.205 x11.H File Reference

Definitions of functions specific to the X11 platform.

### Functions

- `cairo_t * fl_cairo_gc ()`  
*Returns the Cairo-specific currently active graphics context (FLTK\_GRAPHICS\_CAIRO=On)*
- Display \* `fl_x11_display ()`  
*Returns the X11 Display in use.*
- `Fl_Window * fl_x11_find (Window xid)`  
*Returns the [Fl\\_Window](#) corresponding to the given Window reference.*
- GC `fl_x11_gc ()`  
*Returns the X11-specific currently active graphics context.*
- void `fl_x11_use_display (Display *d)`  
*Have FLTK use a pre-established X11 connection.*
- Window `fl_x11_xid (const Fl\_Window *win)`  
*Returns the Window reference for the given [Fl\\_Window](#), or zero if not shown().*

### 34.205.1 Detailed Description

Definitions of functions specific to the X11 platform.

### 34.205.2 Function Documentation

#### 34.205.2.1 fl\_x11\_find()

```
Fl_Window * fl_x11_find (
 Window xid)
```

Returns the [Fl\\_Window](#) corresponding to the given Window reference.

### 34.205.2.2 fl\_x11\_gc()

```
GC fl_x11_gc ()
```

Returns the X11-specific currently active graphics context.

### 34.205.2.3 fl\_x11\_use\_display()

```
void fl_x11_use_display (
 Display * d)
```

Have FLTK use a pre-established X11 connection.

This function must be called before FLTK attempts to open its own X11 connection, that is, as long as [fl\\_x11\\_display\(\)](#) returns NULL.

#### Parameters

<i>d</i>	the X11 Display* value representing a valid, pre-established X11 connection
----------	-----------------------------------------------------------------------------

### 34.205.2.4 fl\_x11\_xid()

```
Window fl_x11_xid (
 const Fl_Window * win)
```

Returns the Window reference for the given [Fl\\_Window](#), or zero if not shown().

13 //
14 // https://www.fltk.org/bugs.php
15 //
16
17 // This file allows easier debugging of Mac OS X Core Graphics
18 // code. This file is normally not included into any FLTK builds,
19 // but since it has proven to be tremendously useful in debugging
20 // the FLTK port to "Quartz", I decided to add this file in case
21 // more bugs show up.
22 //
23 // This header is activated by adding the following
24 // line to "config.h"
25 // #include "src/cgdebug.h"
26 //
27 // Running "./configure" will remove this line from "config.h".
28 //
29 // When used erroneously, Core Graphics prints warnings to
30 // stderr. This is helpful, however it is not possible to
31 // associate a line number or source file with the warning message.
32 // This header file outputs a trace of CG calls, interweaving
33 // them with CG warnings.

## 34.209 Fl.cxx File Reference

Implementation of the member functions of class [Fl](#).

```

#include <FL/Fl.H>
#include <FL/platform.H>
#include "Fl_Screen_Driver.H"
#include "Fl_Window_Driver.H"
#include "Fl_System_Driver.H"
#include "Fl_Timeout.h"
#include <FL/Fl_Window.H>
#include <FL/Fl_Tooltip.H>
#include <FL/fl_draw.H>
#include <ctype.h>
#include <stdlib.h>
#include "flstring.h"

```

### Macros

- #define **FOREVER** 1e20

### Functions

- bool **fl\_clipboard\_notify\_empty** (void)
- void **fl\_close\_display** ()
  - Closes the connection to the windowing system when that's possible.*
- const char \* **fl\_filename\_name** (const char \*name)
  - Gets the file name from a path.*
- [Fl\\_Window](#) \* **fl\_find** (Window xid)
  - Returns the [Fl\\_Window](#) that corresponds to the given window reference, or *NULL* if not found.*
- void **fl\_fix\_focus** ()
- void **fl\_open\_callback** (void(\*cb)(const char \*))
  - Register a function called for each file dropped onto an application icon.*
- void **fl\_open\_display** ()
  - Opens the display.*
- int **fl\_send\_system\_handlers** (void \*e)

- void `fl_throw_focus` ([Fl\\_Widget](#) \*o)
- void `fl_trigger_clipboard_notify` (int source)
- Window `fl_xid_` (const [Fl\\_Window](#) \*w)

## Variables

- bool `fl_disable_wayland` = true  
*Prevent the FLTK library from using its Wayland backend and forces it to use its X11 backend.*
- const char \* `fl_local_alt` = [Fl::system\\_driver\(\)](#)->alt\_name()  
*string pointer used in shortcuts, you can change it to another language*
- const char \* `fl_local_ctrl` = [Fl::system\\_driver\(\)](#)->control\_name()  
*string pointer used in shortcuts, you can change it to another language*
- int(\* `fl_local_grab` )(int)
- const char \* `fl_local_meta` = [Fl::system\\_driver\(\)](#)->meta\_name()  
*string pointer used in shortcuts, you can change it to another language*
- const char \* `fl_local_shift` = [Fl::system\\_driver\(\)](#)->shift\_name()  
*string pointer used in shortcuts, you can change it to another language*
- [Fl\\_Widget](#) \* `fl_oldfocus`
- [Fl\\_Widget](#) \* `fl_selection_requestor`

### 34.209.1 Detailed Description

Implementation of the member functions of class [Fl](#).

### 34.209.2 Function Documentation

#### 34.209.2.1 `fl_close_display()`

```
void fl_close_display ()
```

Closes the connection to the windowing system when that's possible.

You do *not* need to call this to exit, and in fact it is faster to not do so. It may be useful to call this if you want your program to continue without a GUI. You cannot open the display again, and cannot call any FLTK functions.

Note

Requires `#include <FL/platform.H>`

#### 34.209.2.2 `fl_find()`

```
Fl_Window * fl_find (
 Window xid)
```

Returns the [Fl\\_Window](#) that corresponds to the given window reference, or NULL if not found.

**Deprecated** Kept in the X11, Windows, and macOS platforms for compatibility with FLTK versions before 1.4. Please use `fl_x11_find(Window)`, `fl_wl_find(struct wld_window*)`, `fl_win32_find(HWND)` or `fl_mac_find(FLWindow*)` with FLTK 1.4.0 and above.

### 34.209.2.3 fl\_open\_display()

```
void fl_open_display ()
```

Opens the display.

Automatically called by the library when the first window is show()'n. Does nothing if the display is already open.

#### Note

Requires #include <FL/platform.H>

## 34.209.3 Variable Documentation

### 34.209.3.1 fl\_disable\_wayland

```
bool fl_disable_wayland = true
```

Prevent the FLTK library from using its Wayland backend and forces it to use its X11 backend.

Put this declaration somewhere in your code outside the body of any function :

```
FL_EXPORT bool fl_disable_wayland = true;
```

This declaration makes sure source code developed for FLTK 1.3, including X11-specific code, will build and run with FLTK 1.4 and its Wayland platform with this single source code level change. This declaration has no effect on non-Wayland platforms. Don't put this declaration if you want the Wayland backend to be used when it's available.

## 34.210 fl\_arc.cxx File Reference

Utility functions for drawing arcs and circles.

```
#include <FL/fl_draw.H>
```

```
#include <FL/math.h>
```

### 34.210.1 Detailed Description

Utility functions for drawing arcs and circles.

## 34.211 fl\_ask.cxx File Reference

Utility functions for common dialogs.

```
#include <FL/Fl.H>
```

```
#include <FL/Fl_Box.H>
```

```
#include <FL/Fl_Input_.H>
```

```
#include "flstring.h"
```

```
#include "Fl_Screen_Driver.H"
```

```
#include <FL/fl_ask.H>
```

```
#include "Fl_Message.h"
```

```
#include <stdio.h>
```

```
#include <stdarg.h>
```

## Functions

- void [fl\\_alert](#) (const char \*fmt,...)
  - Shows an alert message dialog box.*
- int [fl\\_ask](#) (const char \*fmt,...)
  - Shows a dialog displaying the *fmt* message, this dialog features 2 yes/no buttons.*
- void [fl\\_beep](#) (int type)
  - Emits a system beep.*
- int [fl\\_choice](#) (const char \*fmt, const char \*b0, const char \*b1, const char \*b2,...)

- Shows a dialog displaying the printf style `fmt` message.*

  - int `fl_choice_n` (const char \*fmt, const char \*b0, const char \*b1, const char \*b2,...)

*Shows a dialog displaying the printf style `fmt` message.*
- const char \* `fl_input` (const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*
- const char \* `fl_input` (int maxchar, const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*
- void `fl_message` (const char \*fmt,...)

*Shows an information message dialog box.*
- int `fl_message_hotspot` ()

*Gets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.*
- void `fl_message_hotspot` (int enable)

*Sets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.*
- `Fl_Widget` \* `fl_message_icon` ()

*Gets the `Fl_Box` icon container of the current default dialog used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- void `fl_message_icon_label` (const char \*str)

*Sets the icon label of the dialog window used in many common dialogs.*
- void `fl_message_position` (const int x, const int y, const int center)

*Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- void `fl_message_position` (`Fl_Widget` \*widget)

*Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- int `fl_message_position` (int \*x, int \*y)

*Gets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- void `fl_message_title` (const char \*title)

*Sets the title of the dialog window used in many common dialogs.*
- void `fl_message_title_default` (const char \*title)

*Sets the default title of the dialog window used in many common dialogs.*
- const char \* `fl_password` (const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*
- const char \* `fl_password` (int maxchar, const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*

## Variables

- const char \* `fl_cancel` = "Cancel"

*string pointer used in common dialogs, you can change it to another language*
- const char \* `fl_close` = "Close"

*string pointer used in common dialogs, you can change it to another language*
- `Fl_Font` `fl_message_font_` = `FL_HELVETICA`
- `Fl_Fontsize` `fl_message_size_` = -1
- const char \* `fl_no` = "No"

*string pointer used in common dialogs, you can change it to another language*
- const char \* `fl_ok` = "OK"

*string pointer used in common dialogs, you can change it to another language*
- const char \* `fl_yes` = "Yes"

*string pointer used in common dialogs, you can change it to another language*

### 34.211.1 Detailed Description

Utility functions for common dialogs.

This file defines the functions

- [fl\\_alert\(\)](#)
- [fl\\_beep\(\)](#)
- [fl\\_message\(\)](#)
- [fl\\_ask\(\)](#)
- [fl\\_choice\(\)](#)
- [fl\\_input\(\)](#)
- [fl\\_input\\_str\(\)](#)
- [fl\\_password\(\)](#)
- [fl\\_password\\_str\(\)](#)

and some more functions to change their behavior (positioning, window title, and more). Since FLTK 1.4.0 a big part of these functions is implemented in class `Fl_Message`.

## 34.212 fl\_boxtype.cxx File Reference

Drawing code for common box types.

```
#include <FL/Fl.H>
#include <FL/Fl_Widget.H>
#include <FL/fl_draw.H>
#include <config.h>
```

### Macros

- `#define D1 BORDER_WIDTH`
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)`
- `#define fl_border_box fl_rectbound`  
*allow consistent naming*

### Functions

- void `fl_border_frame` (int x, int y, int w, int h, [Fl\\_Color](#) c)  
*Draws a frame of type FL\_BORDER\_FRAME.*
- void `fl_down_box` (int x, int y, int w, int h, [Fl\\_Color](#) c)  
*Draws a box of type FL\_DOWN\_BOX.*
- void `fl_down_frame` (int x, int y, int w, int h, [Fl\\_Color](#))  
*Draws a frame of type FL\_DOWN\_FRAME.*
- void `fl_draw_box` ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) c)  
*Draws a box using given type, position, size and color.*
- void `fl_draw_box_focus` ([Fl\\_Boxtype](#) bt, int x, int y, int w, int h, [Fl\\_Color](#) fg, [Fl\\_Color](#) bg)  
*Draws the focus rectangle inside a box using given type, position, size and color.*
- void `fl_embossed_box` (int x, int y, int w, int h, [Fl\\_Color](#) c)  
*Draws a box of type FL\_EMBOSSED\_BOX.*
- void `fl_embossed_frame` (int x, int y, int w, int h, [Fl\\_Color](#))  
*Draws a frame of type FL\_EMBOSSED\_FRAME.*
- void `fl_engraved_box` (int x, int y, int w, int h, [Fl\\_Color](#) c)

- Draws a box of type FL\_ENGRAVED\_BOX.*

  - void **fl\_engraved\_frame** (int x, int y, int w, int h, [FI\\_Color](#))

*Draws a frame of type FL\_ENGRAVED\_FRAME.*
- void **fl\_flat\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

*Draws a box of type FL\_FLAT\_BOX.*
- void **fl\_frame** (const char \*s, int x, int y, int w, int h)

*Draws a series of line segments around the given box.*
- void **fl\_frame2** (const char \*s, int x, int y, int w, int h)

*Draws a series of line segments around the given box.*
- const [uchar](#) \* **fl\_gray\_ramp** ()
- void **fl\_internal\_boxtype** ([Fl\\_Boxtype](#) t, [Fl\\_Box\\_Draw\\_F](#) \*f, [Fl\\_Box\\_Draw\\_Focus\\_F](#) \*ff)

*Sets the drawing function for a given box type.*
- void **fl\_no\_box** (int, int, int, int, [FI\\_Color](#))

*Draws a box of type FL\_NO\_BOX.*
- void **fl\_rectbound** (int x, int y, int w, int h, [FI\\_Color](#) bgcolor)

*Draws a bounded rectangle with a given position, size and color.*
- void **fl\_thin\_down\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

*Draws a box of type FL\_THIN\_DOWN\_BOX.*
- void **fl\_thin\_down\_frame** (int x, int y, int w, int h, [FI\\_Color](#))

*Draws a frame of type FL\_THIN\_DOWN\_FRAME.*
- void **fl\_thin\_up\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

*Draws a box of type FL\_THIN\_UP\_BOX.*
- void **fl\_thin\_up\_frame** (int x, int y, int w, int h, [FI\\_Color](#))

*Draws a frame of type FL\_THIN\_UP\_FRAME.*
- void **fl\_up\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

*Draws a box of type FL\_UP\_BOX.*
- void **fl\_up\_frame** (int x, int y, int w, int h, [FI\\_Color](#))

*Draws a frame of type FL\_UP\_FRAME.*

### 34.212.1 Detailed Description

Drawing code for common box types.

### 34.212.2 Function Documentation

#### 34.212.2.1 fl\_internal\_boxtype()

```
void fl_internal_boxtype (
 Fl_Boxtype t,
 Fl_Box_Draw_F * f,
 Fl_Box_Draw_Focus_F * ff)
```

Sets the drawing function for a given box type.

#### Parameters

in	<i>t</i>	box type
in	<i>f</i>	box drawing function
in	<i>ff</i>	optional box focus rectangle drawing function

**34.212.2.2 fl\_rectbound()**

```
void fl_rectbound (
 int x,
 int y,
 int w,
 int h,
 Fl_Color bgcolor)
```

Draws a bounded rectangle with a given position, size and color.  
Equivalent to drawing a box of type FL\_BORDER\_BOX.

**34.213 fl\_cmap.h**

```

## 34.214 fl\_color.cxx File Reference

Color handling.

```

#include <FL/Fl.H>
#include <FL/Fl_Device.H>
#include <FL/Fl_Graphics_Driver.H>
#include "fl_cmap.h"

```

### Functions

- **FL\_Color fl\_color\_average** (FL\_Color color1, FL\_Color color2, float weight)  
*Returns the weighted average color between the two given colors.*
- **FL\_Color fl\_inactive** (FL\_Color c)  
*Returns the inactive, dimmed version of the given color.*

### Variables

- unsigned **fl\_cmap** [256]

#### 34.214.1 Detailed Description

Color handling.

#### 34.214.2 Variable Documentation

##### 34.214.2.1 fl\_cmap

```
unsigned fl_cmap[256]
```

**Initial value:**

```
= {
}
```

## 34.215 Fl\_compose.cxx File Reference

Utility functions to support text input.

```
#include <FL/Fl.H>
#include "Fl_Screen_Driver.H"
```

### 34.215.1 Detailed Description

Utility functions to support text input.

## 34.216 fl\_contrast.cxx File Reference

Color contrast handling.

```
#include <FL/Fl.H>
#include <math.h>
```

### Macros

- #define **DEBUG\_CONTRAST\_LEGACY** 0

### Functions

- [Fl\\_Color](#) **fl\_contrast** ([Fl\\_Color](#) fg, [Fl\\_Color](#) bg, int context, int size)  
*Returns a color that contrasts with the background color.*
- void **fl\_contrast\_function** ([Fl\\_Contrast\\_Function](#) \*f)  
*Register a custom contrast function.*
- int **fl\_contrast\_level** ()  
*Get the contrast level (sensitivity) of the [fl\\_contrast\(\)](#) method.*
- void **fl\_contrast\_level** (int level)  
*Set the contrast level (sensitivity) of the [fl\\_contrast\(\)](#) method.*
- int **fl\_contrast\_mode** ()  
*Return the current contrast algorithm (mode).*
- void **fl\_contrast\_mode** (int mode)  
*Set the contrast algorithm (mode).*
- double **fl\_lightness** ([Fl\\_Color](#) color)  
*Return the perceived lightness of a color.*
- double **fl\_luminance** ([Fl\\_Color](#) color)  
*Return the raw / physical luminance of a color.*
- unsigned **get\_color** ([Fl\\_Color](#) i)

### Variables

- unsigned **fl\_cmap** [256]

### 34.216.1 Detailed Description

Color contrast handling.

Implementation of [fl\\_contrast\(\)](#) and its variants.

## 34.217 fl\_curve.cxx File Reference

Utility for drawing Bézier curves, adding the points to the current fl\_begin/fl\_vertex/fl\_end path.

```
#include <FL/fl_draw.H>
#include <math.h>
```

### 34.217.1 Detailed Description

Utility for drawing Bézier curves, adding the points to the current fl\_begin/fl\_vertex/fl\_end path.

Incremental math implementation: I very much doubt this is optimal! From Foley/vanDam page 511. If anybody has a better algorithm, please send it!

## 34.218 Fl\_Double\_Window.cxx File Reference

[Fl\\_Double\\_Window](#) implementation.

```
#include <FL/Fl.H>
#include <FL/platform.H>
#include <FL/Fl_Double_Window.H>
#include <FL/fl_draw.H>
#include "Fl_Window_Driver.H"
```

### 34.218.1 Detailed Description

[Fl\\_Double\\_Window](#) implementation.

## 34.219 Fl\_get\_system\_colors.cxx File Reference

System color support.

```
#include <FL/Fl.H>
#include "Fl_Screen_Driver.H"
#include "Fl_System_Driver.H"
#include <FL/fl_draw.H>
#include <FL/platform.H>
#include <FL/math.h>
#include <FL/fl_utf8.h>
#include <FL/fl_string_functions.h>
#include "flstring.h"
#include <stdio.h>
#include <stdlib.h>
#include <FL/Fl_Pixmap.H>
#include <FL/Fl_Tiled_Image.H>
#include "tile.xpm"
```

### Macros

- `#define D1 BORDER_WIDTH`
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)`

### Functions

- void `fl_down_box` (int, int, int, int, [Fl\\_Color](#))  
*Draws a box of type FL\_DOWN\_BOX.*
- void `fl_down_frame` (int, int, int, int, [Fl\\_Color](#))

- Draws a frame of type FL\_DOWN\_FRAME.*
- int `fl_parse_color` (const char \*p, uchar &r, uchar &g, uchar &b)
  - Parse a string containing a description of a color and write r, g, and b.*
- void `fl_round_down_box` (int, int, int, int, FI\_Color)
- void `fl_round_focus` (FI\_Boxtype, int, int, int, int, FI\_Color, FI\_Color)
- void `fl_round_up_box` (int, int, int, int, FI\_Color)
- void `fl_thin_down_box` (int, int, int, int, FI\_Color)
  - Draws a box of type FL\_THIN\_DOWN\_BOX.*
- void `fl_thin_down_frame` (int, int, int, int, FI\_Color)
  - Draws a frame of type FL\_THIN\_DOWN\_FRAME.*
- void `fl_thin_up_box` (int, int, int, int, FI\_Color)
  - Draws a box of type FL\_THIN\_UP\_BOX.*
- void `fl_thin_up_frame` (int, int, int, int, FI\_Color)
  - Draws a frame of type FL\_THIN\_UP\_FRAME.*
- void `fl_up_box` (int, int, int, int, FI\_Color)
  - Draws a box of type FL\_UP\_BOX.*
- void `fl_up_frame` (int, int, int, int, FI\_Color)
  - Draws a frame of type FL\_UP\_FRAME.*

## Variables

- const char \* `fl_bg` = NULL
- const char \* `fl_bg2` = NULL
- const char \* `fl_fg` = NULL

### 34.219.1 Detailed Description

System color support.

### 34.219.2 Function Documentation

#### 34.219.2.1 fl\_parse\_color()

```
int fl_parse_color (
 const char * p,
 uchar & r,
 uchar & g,
 uchar & b)
```

Parse a string containing a description of a color and write r, g, and b.

This call is used by the Pixmap file format interpreter and by the command line arguments parser to set UI colors. RGB color triplets usually start with a '#' character, but it can be omitted if it does not conflict with the later rules. Color components are defined in hexadecimal notation with 1, 2, 3, or four hex digits per component, making color triplets 3, 6, 9, or 12 characters long. The interpreter is case insensitive. Valid code examples include "FF0000" for red, "#0F0" for green, and "000000004444" for a dark blue.

On the X11 platform, color values can also be given a color name like "red". The list of accepted color names is provided by the X11 server.

If none of the color interpretations work, `fl_parse_color` returns 0. The Pixmap reader interprets those as transparent, and are usually written as "None", "#transparent", or "bg".

#### Parameters

in	<i>p</i>	a C-string describing the color
out	<i>r,g,b</i>	the color components in the 0...255 range

**Returns**

0 if the color cannot be interpreted, 1 otherwise

**34.220 Fl\_Gl\_Choice.H**

16
17 // Internal interface to set up OpenGL.
18 //
19 // A "Fl_Gl_Choice" is created from an OpenGL mode and holds information
20 // necessary to create a window (on X) and to create an OpenGL "context"
21 // (on both X and Win32).
22 //
23 // create_gl_context takes a window (necessary only on Win32) and an
24 // Fl_Gl_Choice and returns a new OpenGL context. All contexts share
25 // display lists with each other.
26 //
27 // On X another create_gl_context is provided to create it for any
28 // X visual.
29 //
30 // set_gl_context makes the given OpenGL context current and makes
31 // it draw into the passed window. It tracks the current one context
32 // to avoid calling the context switching code when the same context
33 // is used, though it is a mystery to me why the GLX/WGL libraries
34 // don't do this themselves...
35 //
36 // delete_gl_context destroys the context.
37 //
38 // This code is used by Fl_Gl_Window, gl_start(), and gl_visual()
39
40 #ifndef Fl_Gl_Choice_H

## 34.237 FI\_Timeout.h File Reference

[FI\\_Timeout](#) handling.

```
#include <FL/Fl.H>
```

### Classes

- class [FI\\_Timeout](#)

*The internal class [FI\\_Timeout](#) handles all timeout related functions.*

### Macros

- `#define FL_TIMEOUT_DEBUG 0`

### 34.237.1 Detailed Description

[FI\\_Timeout](#) handling.

This file contains implementations of:

- [Fl::add\\_timeout\(\)](#)
- [Fl::repeat\\_timeout\(\)](#)
- [Fl::has\\_timeout\(\)](#)
- [Fl::remove\\_timeout\(\)](#)
- [Fl::remove\\_next\\_timeout\(\)](#)

and related methods of class [FI\\_Timeout](#).

## 34.238 FI\_Timeout.h

*Write an RGB(A) image to a PNG image file.*

### 34.241.1 Detailed Description

PNG image support functions.

### 34.241.2 Function Documentation

#### 34.241.2.1 fl\_write\_png() [1/3]

```

int fl_write_png (
 const char * filename,
 const char * pixels,
 int w,

```

```

 int h,
 int d,
 int ld)

```

Write raw image data to a PNG image file.

This is a very basic and restricted function to create a PNG image file from raw image data, e.g. a screenshot.

The image data must be aligned w/o gaps after each row ( $ld = 0$  or  $ld = w * d$ ) or  $ld$  must be the total length of each row, i.e.  $w * d + \text{gapsize}$ . If  $ld == 0$  then  $ld = w * d$  is assumed.

The total data size must be  $(w * d + \text{gapsize}) * h = ld' * h$  where  $ld' = w * d$  if  $ld == 0$ .

For further restrictions and return values please see [fl\\_write\\_png\(const char \\*filename, Fl\\_RGB\\_Image \\*img\)](#).

#### Parameters

in	<i>filename</i>	Output filename, extension should be '.png'
in	<i>pixels</i>	Image data
in	<i>w</i>	Image data width
in	<i>h</i>	Image data height
in	<i>d</i>	Image depth: 1 = GRAY, 2 = GRAY + alpha, 3 = RGB, 4 = RGBA
in	<i>ld</i>	Line delta: default (0) = $w * d$

#### Returns

success (0) or error code, see ...

#### See also

[fl\\_write\\_png\(const char \\*filename, Fl\\_RGB\\_Image \\*img\)](#)

#### 34.241.2.2 fl\_write\_png() [2/3]

```

int fl_write_png (
 const char * filename,
 const unsigned char * pixels,
 int w,
 int h,
 int d,
 int ld)

```

Write raw image data to a PNG image file.

#### See also

[fl\\_write\\_png\(const char \\*filename, const char \\*pixels, int w, int h, int d, int ld\)](#)

#### 34.241.2.3 fl\_write\_png() [3/3]

```

int fl_write_png (
 const char * filename,
 Fl_RGB_Image * img)

```

Write an RGB(A) image to a PNG image file.

This is a very basic and restricted function to create a PNG image file from an RGB image ([Fl\\_RGB\\_Image](#)).

The image data must be aligned w/o gaps, i.e. `ld()` **MUST** be zero or equal to `data_w() * data_h()`.

The image file is always written with the original image size `data_w()` and `data_h()`, even if the image has been scaled.

Image depth 1 (gray), 2 (gray + alpha channel), 3 (RGB) and 4 (RGBA) are supported.

#### Note

Currently there is no error handling except for errors when opening the file. This may be changed in the future.

**Parameters**

in	<i>filename</i>	Output filename, extension should be '.png'
in	<i>img</i>	RGB image to be written

**Returns**

success (0) or error code: negative values are errors

**Return values**

0	success, file has been written
-1	png or zlib library not available
-2	file open error

**See also**

`fl_write_png(const char *, int, int, int, const unsigned char *)`

## Functions

- `int fl_casumericsort` (struct dirent \*\*A, struct dirent \*\*B)  
*Compares directory entries alphanumerically (case-insensitive).*
- `int fl_numericsort` (struct dirent \*\*A, struct dirent \*\*B)  
*Compares directory entries alphanumerically (case-sensitive).*

### 34.246.1 Function Documentation

#### 34.246.1.1 fl\_casumericsort()

```
int fl_casumericsort (
 struct dirent ** A,
 struct dirent ** B)
```

Compares directory entries alphanumerically (case-insensitive).

#### Note

This comparison is UTF-8 aware.

#### See also

[fl\\_numericsort\(\)](#)

#### 34.246.1.2 fl\_numericsort()

```
int fl_numericsort (
 struct dirent ** A,
 struct dirent ** B)
```

Compares directory entries alphanumerically (case-sensitive).

Numbers are compared without sign, i.e. "-" is not taken as a sign of following numerical values. The following list of files would be in ascending order (examples are ASCII and numbers only for simplicity):

1. 1zzz.txt
2. 2xxx.txt
3. 19uuu.txt
4. 100aaa.txt
5. file1z.txt
6. file5a.txt
7. file5z.txt
8. file30z.txt
9. file200a.txt
10. temp+5.txt ('+' is lexically lower than '-')
11. temp-5.txt ('-' is not a sign)
12. temp-100.txt (100 is bigger than 5, no sign)

**Parameters**

in	<i>A</i>	first directory entry
in	<i>B</i>	second directory entry

**Returns**

comparison result (-1, 0, or +1)

**Return values**

-1	$A < B$
0	$A == B$
+1	$A > B$

**Note**

This comparison is UTF-8 aware.

**See also**

[fl\\_casenumercsort\(\)](#)

## 34.251 vsnprintf.c File Reference

Portable vsnprintf() implementation.

```

#include <stdio.h>
#include "flstring.h"

```

### Functions

- int **fl\_sprintf** (char \*str, size\_t size, const char \*fmt,...)
- int **fl\_vsnprintf** (char \*buffer, size\_t bufsz, const char \*format, va\_list ap)

*FLTK's platform independent wrapper for the vsnprintf() C library function.*

### 34.251.1 Detailed Description

Portable vsnprintf() implementation.

### 34.251.2 Function Documentation

#### 34.251.2.1 fl\_vsnprintf()

```

int fl_vsnprintf (
 char * buffer,
 size_t bufsz,
 const char * format,
 va_list ap)

```

FLTK's platform independent wrapper for the vsnprintf() C library function.

This function guarantees:

- access to vsnprintf(), even on systems that don't have it (FLTK's own built-in code is used)
- Guarantees NUL termination. Even if string expands larger than the buffer, a terminating NUL is included, unlike some implementations of vsnprintf(), notably Microsoft Visual Studio (pre-2015), which can leave the string unterminated when truncated.

If the build environment for FLTK has vsnprintf(), **fl\_vsnprintf()** is just a wrapper around the compiler's provided function. Otherwise, if the function is NOT available, FLTK's own built-in version is provided.

The FLTK built in provides these style options:

- %[ -+#]
- \* – padding width

- .\* – precision width
- Data types: h, l, ll, L
- Floating point formats: E, G, e, f, g
- Integer formats: B, X, b, d, i, o, u, x
- Pointer format: p
- String/char: c, s, n

## 34.260 big5\_emacs.h

```

1 /* $XFree86: xc/lib/X11/lcUniConv/big5_emacs.h,v 1.1 2000/11/28 18:50:06 dawes Exp $ */
2
3 /*
4 * BIG5-0 and BIG5-1
5 */
6
7 /*
8 BIG5 with its 13494 characters doesn't fit in a single 94x94 or 96x96
9 block. Therefore Emacs/Mule developers, in a typically Japanese way of
10 thinking, have developed an alternative encoding of BIG5 in two 94x94
11 planes, very similar to the SHIFT_JIS encoding for JISX0208.
12
13 Conversion between BIG5 codes (s1,s2) and BIG5-0 codes (c1,c2):
14 Example. (s1,s2) = 0xA140, (c1,c2) = 0x2121.
15 0xA1 <= s1 <= 0xC7, 0x40 <= s2 <= 0x7E || 0xA1 <= s2 <= 0xFE,
16 0x21 <= c1 <= 0x62, 0x21 <= c2 <= 0x7E.
17 Invariant:
18 157*(s1-0xA1) + (s2 < 0x80 ? s2-0x40 : s2-0x62)
19 = 94*(c1-0x21)+(c2-0x21)
20 Conversion (s1,s2) -> (c1,c2):
21 t := 157*(s1-0xA1) + (s2 < 0x80 ? s2-0x40 : s2-0x62)
22 c1 := (t div 94) + 0x21
23 c2 := (t mod 94) + 0x21
24 Conversion (c1,c2) -> (s1,s2):
25 t := 94*(c1-0x21)+(c2-0x21)
26 t2 := t mod 157
27 s1 := (t div 157) + 0xA1
28 s2 := (t2 < 0x3F ? t2+0x40 : t2+0x62)
29
30 Conversion between BIG5 codes (s1,s2) and BIG5-1 codes (c1,c2):
31 Example. (s1,s2) = 0xC940, (c1,c2) = 0x2121.
32 0xC9 <= s1 <= 0xF9, 0x40 <= s2 <= 0x7E || 0xA1 <= s2 <= 0xFE,
33 0x21 <= c1 <= 0x72, 0x21 <= c2 <= 0x7E.
34 Invariant:
35 157*(s1-0xC9) + (s2 < 0x80 ? s2-0x40 : s2-0x62)
36 = 94*(c1-0x21)+(c2-0x21)
37 Conversion (s1,s2) -> (c1,c2):
38 t := 157*(s1-0xC9) + (s2 < 0x80 ? s2-0x40 : s2-0x62)
39 c1 := (t div 94) + 0x21
40 c2 := (t mod 94) + 0x21
41 Conversion (c1,c2) -> (s1,s2):
42 t := 94*(c1-0x21)+(c2-0x21)
43 t2 := t mod 157
44 s1 := (t div 157) + 0xC9
45 s2 := (t2 < 0x3F ? t2+0x40 : t2+0x62)
