1 FLTK Programming Manual	1
2 Preface	3
2.1 Organization	3
2.2 Conventions	4
2.3 Abbreviations	4
2.4 Copyrights and Trademarks	4
3 Introduction to FLTK	5
3.1 History of FLTK	5
3.2 Features	6
3.3 Licensing	7
3.4 What Does "FLTK" Mean?	7
3.5 FLUID	7
3.6 Building and Installing FLTK with CMake	7
3.7 Building and Installing FLTK Under UNIX and macOS with make	7
3.8 Building FLTK Under Microsoft Windows	10
3.8.1 Free and Commercial Microsoft Visual Studio Versions	10
3.8.2 Using the Visual C++ DLL Library	10
3.8.3 GNU toolsets (Cygwin or MinGW) hosted on Windows	11
3.9 Internet Resources	11
3.10 Reporting Bugs	11
4 FLTK Basics	13
4.1 Writing Your First FLTK Program	13
4.1.1 Creating the Widgets	14
4.1.2 Creating Widget Hierarchies	14
4.1.3 Get/Set Methods	15
4.1.4 Redrawing After Changing Attributes	15
4.1.5 Labels	15
4.1.6 Showing the Window	15
4.1.7 The Main Event Loop	15
4.2 Naming Conventions	16
4.3 Header Files	16
4.4 Compiling Programs that Use FLTK	16
4.4.1 Compiling Programs with Standard Compilers	16
4.4.2 Compiling Programs with the 'fltk-config' Script	17
4.4.3 Compiling Multiple Source Files with 'fltk-config'	18
4.4.4 Compiling Programs with Makefiles	18
4.4.5 Compiling Programs with Microsoft Visual C++	19
5 Common Widgets and Attributes	21
5.1 Buttons	21
5.2 Text	22

5.3 Valuators	22
5.4 Groups	23
5.5 Setting the Size and Position of Widgets	24
5.6 Colors	24
5.7 Box Types	25
5.7.1 Making Your Own Boxtypes	25
5.8 Labels and Label Types	27
5.9 Callbacks	31
5.10 When and Reason	32
5.11 Shortcuts	32
6 Coordinates and Layout Widgets	33
6.1 The Widget Coordinate System	33
6.2 Layout and Container Widgets	34
6.2.1 The FI_Flex Layout Widget	34
6.2.2 The FI_Grid Layout Widget	35
6.2.3 The FI_Pack Layout Widget	36
6.2.4 The FI_Scroll Container Widget	36
6.2.5 The FI_Tabs Container Widget	37
6.2.6 The FI_Tile Layout Widget	37
6.2.7 The FI_Wizard Container Widget	37
7 How Does Resizing Work?	39
7.1 Resizing can be disabled	39
7.2 Resizing can be simple	39
7.3 Resizing can be complex	40
7.4 Practical examples	41
8 Designing a Simple Text Editor	45
8.1 Determining the Goals of the Text Editor	45
8.2 Chapter 1: A Minimal App	46
8.3 Chapter 2: Adding a Menu Bar	46
8.4 Chapter 3: Adding a Text Editor widget	48
8.5 Chapter 4: Reading and Writing Files	48
8.6 Chapter 5: Cut, Copy, and Paste	51
8.7 Chapter 6: Find and Find Next	51
8.8 Chapter 7: Replace and Replace Next	52
8.9 Chapter 8: Editor Features	54
8.10 Chapter 9: Split Editor	55
8.11 Chapter 10: Syntax Highlighting	56
9 FI_Terminal Technical Documentation	61
9.1 The Escape Codes FI_Terminal Supports	61
9.2 Useful Terminal Escape Code Documentation	62

9.3 FL_Terminal Design Document	63
10 Drawing Things in FLTK	69
10.1 When Can You Draw Things in FLTK?	69
10.2 What Units Do FLTK Functions Use?	70
10.3 Drawing Functions	71
10.3.1 Boxes	71
10.3.2 Clipping	72
10.3.3 Colors	73
10.3.4 Color Contrast	75
10.3.5 Line Dashes and Thickness	76
10.3.6 Drawing Fast Shapes	77
10.3.7 Drawing Complex Shapes	79
10.3.8 Drawing Text	82
10.3.9 Fonts	84
10.3.10 Character Encoding	85
10.3.11 Drawing Overlays	85
10.4 Drawing Images	85
10.4.1 Direct Image Drawing	86
10.4.2 Direct Image Reading	87
10.4.3 Image Classes	88
10.5 Offscreen Drawing	89
11 Handling Events	91
11.1 The FLTK Event Model	91
11.2 Mouse Events	91
11.2.1 FL_PUSH	91
11.2.2 FL_DRAG	91
11.2.3 FL_RELEASE	92
11.2.4 FL_MOVE	92
11.2.5 FL_MOUSEWHEEL	92
11.3 Focus Events	92
11.3.1 FL_ENTER	92
11.3.2 FL_LEAVE	92
11.3.3 FL_FOCUS	92
11.3.4 FL_UNFOCUS	92
11.4 Keyboard Events	93
11.4.1 FL_KEYBOARD, FL_KEYDOWN, FL_KEYUP	93
11.4.2 FL_SHORTCUT	93
11.5 Widget Events	94
11.5.1 FL_DEACTIVATE	94
11.5.2 FL_ACTIVATE	94
11.5.3 FL_HIDE	94

11.5.4 FL_SHOW	94
11.6 Clipboard Events	94
11.6.1 FL_PASTE	94
11.6.2 FL_SELECTIONCLEAR	94
11.7 Drag and Drop Events	95
11.7.1 Dropped filenames	95
11.7.2 FL_DND_ENTER	95
11.7.3 FL_DND_DRAG	95
11.7.4 FL_DND_LEAVE	95
11.7.5 FL_DND_RELEASE	95
11.8 Other events	96
11.8.1 FL_SCREEN_CONFIGURATION_CHANGED	96
11.8.2 FL_FULLSCREEN	96
11.9 Fl::event_*() methods	96
11.10 Event Propagation	97
11.11 FLTK Compose-Character Sequences	98
12 Adding and Extending Widgets	99
12.1 Subclassing	99
12.2 Making a Subclass of Fl_Widget	99
12.3 The Constructor	99
12.4 Protected Methods of Fl_Widget	100
12.5 Handling Events	103
12.6 Drawing the Widget	104
12.7 Resizing the Widget	104
12.8 Making a Composite Widget	104
12.9 Cut and Paste Support	106
12.10 Drag And Drop Support	106
12.11 Making a subclass of Fl_Window	106
13 Using OpenGL	107
13.1 Using OpenGL in FLTK	107
13.2 Making a Subclass of Fl_Gl_Window	107
13.2.1 Defining the Subclass	108
13.2.2 The draw() Method	108
13.2.3 The handle() Method	108
13.3 OpenGL and support of HighDPI displays	109
13.4 Using OpenGL in Normal FLTK Windows	109
13.5 Using FLTK widgets in OpenGL Windows	110
13.6 OpenGL Drawing Functions	111
13.7 Speeding up OpenGL	112
13.8 Using OpenGL Optimizer with FLTK	112
13.9 Using OpenGL 3.0 (or higher versions)	114

14 FLTK Runtime Options	117
14.1 Runtime Options	117
14.2 Obtaining Current Settings	117
14.3 Administrative Tool	118
14.4 List of Options	118
15 Advanced FLTK	119
15.1 Multithreading	119
15.2 FLTK multithread locking - Fl::lock() and Fl::unlock()	119
15.3 Simple multithreaded examples using Fl::lock	120
15.4 FLTK multithreaded "lockless programming"	122
15.5 FLTK multithreaded Constraints	123
16 Unicode and UTF-8 Support	125
16.1 About Unicode, ISO 10646 and UTF-8	125
16.2 Unicode in FLTK	127
16.3 Illegal Unicode and UTF-8 Sequences	128
16.4 FLTK Unicode and UTF-8 Functions	128
16.5 FLTK Unicode Versions of System Calls	132
17 Constants and Enumerations	133
17.1 Version Numbers	133
17.2 Events	134
17.3 Callback "When" Conditions	135
17.4 Fl::event_button() Values	135
17.5 Fl::event_key() Values	135
17.6 Fl::event_state() Values	136
17.7 Alignment Values	137
17.8 Fonts	137
17.9 Colors	138
17.9.1 Color Constants	138
17.10 Cursors	139
17.11 FD "When" Conditions	140
17.12 Damage Masks	140
18 GLUT Compatibility	141
18.1 Using the GLUT Compatibility Header File	141
18.2 Known Problems	141
18.3 Mixing GLUT and FLTK Code	142
18.4 class Fl_Glut_Window	143
18.4.1 Class Hierarchy	143
18.4.2 Include Files	143
18.4.3 Description	143
18.4.4 Members	143

18.4.5 Methods	144
19 Forms Compatibility	145
19.1 Importing Forms Layout Files	145
19.2 Using the Compatibility Header File	145
19.3 Problems You Will Encounter	146
19.4 Additional Notes	147
20 Operating System Issues	151
20.1 Accessing the OS Interfaces	151
20.2 The Wayland/X11 hybrid library	152
20.3 The UNIX (X11) Interface	152
20.3.1 Handling Other X Events	152
20.3.2 Drawing using Xlib	154
20.3.3 Changing the Display, Screen, or X Visual	154
20.3.4 Using a Subclass of <code>Fl_Window</code> for Special X Stuff	156
20.3.5 Setting the Icon of a Window	158
20.3.6 X Resources	158
20.3.7 Display Scaling Factor	159
20.4 The Windows Interface	159
20.4.1 Using filenames with non-ASCII characters	159
20.4.2 Responding to <code>WM_QUIT</code>	159
20.4.3 Handling Other Windows API Messages	159
20.4.4 Drawing Things Using the Windows GDI	160
20.4.5 HighDPI support	160
20.4.6 Display Scaling Factor	160
20.4.7 Setting the Icon of a Window	161
20.4.8 How to Not Get a MSDOS Console Window	161
20.4.9 Known Windows Bugs and Problems	161
20.5 The Apple OS X Interface	162
20.5.1 Setting the icon of an application	163
20.5.2 Drawing Things Using Quartz	164
20.5.3 Internationalization	164
20.5.4 OpenGL and 'retina' displays	164
20.5.5 <code>Fl_Double_Window</code>	165
20.5.6 Mac File System Specifics	165
20.6 The Wayland Interface	165
20.6.1 HiDPI display support	166
20.6.2 Window icons	167
20.6.3 Window titlebars	167
21 Migrating Code from FLTK 1.3 to 1.4	169
21.1 Changes in Header Files	169

21.2 FL_Preferences	170
21.3 FL::add_timeout and friends	170
21.4 New FL_OVERRIDE Macro	170
21.5 FL_Image::copy() 'const'	171
21.6 Modern CMake	171
22 Software License	175
23 Example Source Code	181
23.1 Example Applications: Overview	181
23.1.1 adjuster	181
23.1.2 animated	181
23.1.3 arc	181
23.1.4 ask	182
23.1.5 bitmap	182
23.1.6 blocks	182
23.1.7 boxtype	182
23.1.8 browser	182
23.1.9 button	182
23.1.10 buttons	182
23.1.11 cairo_test	182
23.1.12 checkers	182
23.1.13 clipboard	183
23.1.14 clock	183
23.1.15 colbrowser	183
23.1.16 color_chooser	183
23.1.17 cube	183
23.1.18 CubeView	183
23.1.19 cursor	183
23.1.20 curve	183
23.1.21 demo	183
23.1.22 device	183
23.1.23 doublebuffer	184
23.1.24 editor	184
23.1.25 fast_slow	184
23.1.26 file_chooser	184
23.1.27 fonts	184
23.1.28 forms	184
23.1.29 fractals	184
23.1.30 fullscreen	184
23.1.31 gl_overlay	184
23.1.32 glpuzzle	185
23.1.33 hello	185

23.1.34 help_dialog	185
23.1.35 icon	185
23.1.36 iconize	185
23.1.37 image	185
23.1.38 inactive	185
23.1.39 input	185
23.1.40 input_choice	185
23.1.41 keyboard	186
23.1.42 label	186
23.1.43 line_style	186
23.1.44 list_visuals	186
23.1.45 mandelbrot	186
23.1.46 menubar	186
23.1.47 message	186
23.1.48 minimum	186
23.1.49 native-filechooser	186
23.1.50 navigation	186
23.1.51 offscreen	187
23.1.52 output	187
23.1.53 overlay	187
23.1.54 pack	187
23.1.55 pixmap	187
23.1.56 pixmap_browser	187
23.1.57 preferences	187
23.1.58 radio	187
23.1.59 resizebox	187
23.1.60 rotated_text	187
23.1.61 resize	188
23.1.62 scroll	188
23.1.63 shape	188
23.1.64 subwindow	188
23.1.65 sudoku	188
23.1.66 symbols	188
23.1.67 table	188
23.1.68 tabs	188
23.1.69 threads	188
23.1.70 tile	189
23.1.71 tiled_image	189
23.1.72 tree	189
23.1.73 twowin	189
23.1.74 unittests	189
23.1.75 utf8	189

23.1.76	valuators	189
23.1.77	windowfocus	189
23.1.78	FLUID	189
23.2	Example Applications: Images	189
23.2.1	cairo_test	190
23.2.2	icon	190
23.2.3	unittests	190
24	FAQ (Frequently Asked Questions)	193
24.1	Where do I start learning FLTK?	193
24.2	How do I make a box with text?	193
24.3	Can I use FLTK to make closed-source commercial applications?	193
24.4	Hitting the 'Escape' key closes windows - how do I prevent this?	194
25	Development of the FLTK library	195
25.1	The Wayland backend for its developer	195
25.1.1	Introduction to Wayland	195
25.1.2	Building libfltk as a Wayland client	196
25.1.3	The hybrid Wayland/X11 platform	197
25.1.4	Listeners	197
25.1.5	Opening a Wayland connection	198
25.1.6	Wayland windows and surfaces	199
25.1.7	Menu windows and other popups	201
25.1.8	FI_Wayland_Graphics_Driver and FI_Cairo_Graphics_Driver	202
25.1.9	Wayland buffers	202
25.1.10	Throttling window redraws	203
25.1.11	Buffer factories	204
25.1.12	Displays and HighDPI support	205
25.1.13	Mouse and trackpad handling	206
25.1.14	Wayland cursors	207
25.1.15	Keyboard support	208
25.1.16	Support of text input methods	209
25.1.17	Interface with libdecor	210
25.1.18	Copy/Paste/Drag-n-Drop	211
25.1.19	EGL as support for OpenGL	211
25.1.20	FLTK-defined, Wayland-specific types	212
25.1.21	Documentation resources	213
25.2	Developer info for bundled libs	214
25.2.1	Introduction	214
25.2.2	Current status	214
25.2.3	How to update the bundled libraries	215
25.2.4	zlib:	215
25.2.5	png:	216

25.2.6 jpeg:	216
25.2.7 nanosvg:	217
25.2.8 libdecor:	218
25.3 Developer Information	218
25.3.1 Non-ASCII Characters	220
25.3.2 Document Structure	220
25.3.3 Creating Links	220
25.3.4 Paragraph Layout	221
25.3.5 Navigation Elements	222
26 Todo List	223
27 Deprecated List	227
28 Module Index	231
28.1 Modules	231
29 Hierarchical Index	233
29.1 Class Hierarchy	233
30 Class Index	237
30.1 Class List	237
31 File Index	245
31.1 File List	245
32 Module Documentation	251
32.1 Callback Function Typedefs	251
32.1.1 Detailed Description	252
32.1.2 Typedef Documentation	252
32.1.2.1 FI_Event_Dispatch	252
32.1.2.2 FI_Timeout_Handler	252
32.2 Windows handling functions	252
32.2.1 Detailed Description	253
32.2.2 Function Documentation	253
32.2.2.1 default_atclose()	253
32.2.2.2 first_window() [1/2]	253
32.2.2.3 first_window() [2/2]	253
32.2.2.4 grab() [1/2]	253
32.2.2.5 grab() [2/2]	253
32.2.2.6 modal()	254
32.2.2.7 next_window()	254
32.2.2.8 set_atclose()	254
32.2.3 Variable Documentation	254
32.2.3.1 atclose	254

32.3 Events handling functions	254
32.3.1 Detailed Description	257
32.3.2 Function Documentation	257
32.3.2.1 add_handler() [1/2]	257
32.3.2.2 add_handler() [2/2]	258
32.3.2.3 add_system_handler()	258
32.3.2.4 belowmouse() [1/2]	258
32.3.2.5 belowmouse() [2/2]	258
32.3.2.6 callback_reason()	259
32.3.2.7 compose()	259
32.3.2.8 compose_reset()	259
32.3.2.9 disable_im()	260
32.3.2.10 enable_im()	260
32.3.2.11 event()	260
32.3.2.12 event_button()	260
32.3.2.13 event_button1()	260
32.3.2.14 event_button2()	260
32.3.2.15 event_button3()	260
32.3.2.16 event_buttons()	261
32.3.2.17 event_clicks() [1/2]	261
32.3.2.18 event_clicks() [2/2]	261
32.3.2.19 event_clipboard()	261
32.3.2.20 event_clipboard_type()	261
32.3.2.21 event_dispatch()	262
32.3.2.22 event_dx()	262
32.3.2.23 event_dy()	262
32.3.2.24 event_inside() [1/2]	262
32.3.2.25 event_inside() [2/2]	263
32.3.2.26 event_is_click() [1/2]	263
32.3.2.27 event_is_click() [2/2]	263
32.3.2.28 event_key() [1/2]	264
32.3.2.29 event_key() [2/2]	264
32.3.2.30 event_length()	264
32.3.2.31 event_original_key()	264
32.3.2.32 event_state() [1/2]	265
32.3.2.33 event_state() [2/2]	265
32.3.2.34 event_text()	265
32.3.2.35 event_x_root()	266
32.3.2.36 event_y_root()	266
32.3.2.37 focus() [1/2]	266
32.3.2.38 focus() [2/2]	266
32.3.2.39 get_key()	266

32.3.2.40	get_mouse()	267
32.3.2.41	handle()	267
32.3.2.42	handle_()	267
32.3.2.43	pushed() [1/2]	268
32.3.2.44	pushed() [2/2]	268
32.3.2.45	remove_handler()	268
32.3.2.46	remove_system_handler()	268
32.3.2.47	test_shortcut()	268
32.3.3	Variable Documentation	268
32.3.3.1	fl_callback_reason_names	269
32.3.3.2	fl_eventnames	269
32.3.3.3	fl_fontnames	269
32.4	Selection & Clipboard functions	270
32.4.1	Detailed Description	270
32.4.2	Function Documentation	270
32.4.2.1	add_clipboard_notify()	271
32.4.2.2	clipboard_contains()	271
32.4.2.3	copy()	271
32.4.2.4	dnd()	272
32.4.2.5	paste() [1/2]	272
32.4.2.6	paste() [2/2]	272
32.4.2.7	selection()	273
32.4.2.8	selection_owner() [1/2]	273
32.4.2.9	selection_owner() [2/2]	273
32.4.2.10	selection_to_clipboard() [1/2]	274
32.4.2.11	selection_to_clipboard() [2/2]	274
32.5	Screen functions	274
32.5.1	Detailed Description	275
32.5.2	Function Documentation	275
32.5.2.1	keyboard_screen_scaling()	275
32.5.2.2	screen_count()	276
32.5.2.3	screen_dpi()	276
32.5.2.4	screen_num() [1/2]	276
32.5.2.5	screen_num() [2/2]	277

Chapter 2

Preface

This manual describes the Fast Light Tool Kit ("FLTK") version 1.4.0, a C++ Graphical User Interface ("GUI") toolkit for UNIX, Microsoft Windows and Apple macOS.

Version 1.4.0 introduces support for a new windowing system under Linux/Unix: Wayland. FLTK applications under Linux/Unix run unchanged as Wayland or X11 clients depending on availability at run-time.

Each of the chapters in this manual is designed as a tutorial for using FLTK, while the appendices provide a convenient reference for all FLTK widgets, functions, and operating system interfaces.

This manual may be printed, modified, and/or used under the terms of the FLTK license provided in [Software License](#).

2.1 Organization

This manual is organized into the following chapters and appendices:

- [Introduction to FLTK](#)
- [FLTK Basics](#)
- [Common Widgets and Attributes](#)
- [Designing a Simple Text Editor](#)
- [Drawing Things in FLTK](#)
- [Handling Events](#)
- [Adding and Extending Widgets](#)
- [Using OpenGL](#)
- [FLTK Runtime Options](#)
- [Advanced FLTK](#)
- [Unicode and UTF-8 Support](#)
- [Constants and Enumerations](#)
- [GLUT Compatibility](#)

- [Forms Compatibility](#)
- [Operating System Issues](#)
- [Migrating Code from FLTK 1.3 to 1.4](#)
- [Developer Information](#)
- [Software License](#)
- [Example Source Code](#)

2.2 Conventions

This manual was generated using Doxygen (see <https://www.doxygen.org/>) to process the source code itself, special comments in the code, and additional documentation files. In general, Doxygen recognizes and denotes the following entities as shown:

- classes, such as `Fl_Widget`,
- methods, such as `Fl_Widget::callback(Fl_Callback* cb, void* p)`,
- functions, such as `fl_draw(const char *str, int x, int y)`,
- internal links, such as [Conventions](#),
- external links, such as <https://www.fltk.org/>.

Other code samples and commands are shown in `regular courier` type.

2.3 Abbreviations

The following abbreviations are used in this manual:

X11

The X Window System version 11.

Xlib

The X Window System interface library.

Windows, WIN32

The Microsoft Windows Application Programmer's Interface for Windows 2000, Windows XP, Windows Vista, Windows 7 and later Windows versions. FLTK uses the preprocessor definition `_WIN32` for the 32 bit and 64 bit Windows API.

macOS (aka Mac OS X), APPLE

The Apple desktop operating system macOS 10.0 and later. macOS 8 and 9 support was dropped after FLTK 1.0.10. FLTK uses the preprocessor definition `__APPLE__` for macOS.

2.4 Copyrights and Trademarks

FLTK is Copyright © 1998 - 2024 by Bill Spitzak and others. Use and distribution of FLTK is governed by the GNU Library General Public License with 4 exceptions, located in [Software License](#).

UNIX is a registered trademark of the X Open Group, Inc. Microsoft and Windows are registered trademarks of Microsoft Corporation. OpenGL is a registered trademark of Silicon Graphics, Inc. Apple, Macintosh, macOS, macOS, and Mac OS X are registered trademarks of Apple Computer, Inc.

Chapter 3

Introduction to FLTK

The Fast Light Tool Kit ("FLTK") is a cross-platform C++ GUI toolkit for UNIX®/Linux® (X11 and Wayland), Microsoft® Windows®, and Apple® macOS®.

FLTK provides modern GUI functionality without bloat and supports 3D graphics via OpenGL® and its built-in GLUT emulation. It was originally developed by Mr. Bill Spitzak and is currently maintained by a small group of developers across the world with a central repository on GitHub.

3.1 History of FLTK

It has always been Bill's belief that the GUI API of all modern systems is much too high level. Toolkits (even FLTK) are *not* what should be provided and documented as part of an operating system. The system only has to provide arbitrary shaped but featureless windows, a powerful set of graphics drawing calls, and a simple *unalterable* method of delivering events to the owners of the windows. NeXT (if you ignored NextStep) provided this, but they chose to hide it and tried to push their own baroque toolkit instead.

Many of the ideas in FLTK were developed on a NeXT (but *not* using NextStep) in 1987 in a C toolkit Bill called "views". Here he came up with passing events downward in the tree and having the handle routine return a value indicating whether it used the event, and the table-driven menus. In general he was trying to prove that complex UI ideas could be entirely implemented in a user space toolkit, with no knowledge or support by the system.

After going to film school for a few years, Bill worked at Sun Microsystems on the (doomed) NeWS project. Here he found an even better and cleaner windowing system, and he reimplemented "views" atop that. NeWS did have an unnecessarily complex method of delivering events which hurt it. But the designers did admit that perhaps the user could write just as good of a button as they could, and officially exposed the lower level interface.

With the death of NeWS Bill realized that he would have to live with X. The biggest problem with X is the "window manager", which means that the toolkit can no longer control the window borders or drag the window around.

At Digital Domain Bill discovered another toolkit, "Forms". Forms was similar to his work, but provided many more widgets, since it was used in many real applications, rather than as theoretical work. He decided to use Forms, except he integrated his table-driven menus into it. Several very large programs were created using this version of Forms.

The need to switch to OpenGL and GLX, portability, and a desire to use C++ subclassing required a rewrite of Forms. This produced the first version of FLTK. The conversion to C++ required so many changes it made it impossible to recompile any Forms objects. Since it was incompatible anyway, Bill decided to incorporate his older ideas as much as possible by simplifying the lower level interface and the event passing mechanism.

Bill received permission to release it for free on the Internet, with the GNU general public license. Response from Internet users indicated that the Linux market dwarfed the SGI and high-speed GL market, so he rewrote it to use X for all drawing, greatly speeding it up on these machines.

Digital Domain has since withdrawn support for FLTK. While Bill is no longer able to actively develop it, he still contributes to FLTK in his free time and is a part of the FLTK development team.

FLTK was later ported to Windows and macOS. FLTK 1.4 added a "driver based" system of virtual device drivers that enabled porting to Wayland as well. Drawing features include Windows GDI+, Cairo (Wayland and X11), and improved text layout with Pango.

There have been experiments using this driver system to build FLTK based on SDL2, Android, and other graphics systems based solely on simple pixel drawing, but this experimental code is not included in FLTK 1.4. There are thoughts to enable more platforms in later FLTK versions.

3.2 Features

FLTK was designed to be statically linked. This was done by splitting it into many small objects and designing it so that functions that are not used do not have pointers to them in the parts that are used, and thus do not get linked in. This allows you to make an easy-to-install program or to modify FLTK to the exact requirements of your application without worrying about bloat. FLTK works fine as a shared library, though, and is now included with several Linux distributions.

Here are some of the core features unique to FLTK:

Note: sizes given below are mostly from 32-bit systems and FLTK 1.1 or earlier, this list needs updates for current FLTK (1.4).

- `sizeof(Fl_Widget) == 64` to `92` (120 in FLTK 1.4 on 64-bit Linux).
- The "core" (the "hello" program compiled & linked with a static FLTK library using gcc on a 486 and then stripped) is 114K. (FLTK 1.4 on 64-bit Linux: 1.1 MB).
- The FLUID program (which includes every widget) is 538k. (FLTK 1.4 with more widgets on 64-bit Linux: 2.3 MB and 2.0 MB on 32-bit Windows).
- Written directly atop core libraries (Xlib, Wayland, Windows or Cocoa) for maximum speed, and carefully optimized for code size and performance.
- Precise low-level compatibility between the X11, Windows and MacOS versions - only about 10% of the code is different.
- Interactive user interface builder program FLUID. Its output is human-readable and editable C++ source code.
- Support for overlay hardware, with emulation if none is available.
- Very small & fast portable 2-D drawing library to hide Xlib, Cairo, Windows, or macOS Quartz.
- OpenGL/Mesa drawing area widget.
- Support for OpenGL overlay hardware on both X11 and Windows, with emulation if none is available.
- Text widgets with cut & paste, undo, and support for Unicode text and international input methods.
- Compatibility header file for the GLUT library.
- Compatibility header file for the XForms library.

3.3 Licensing

FLTK comes with complete free source code. FLTK is available under the terms of the [GNU Library General Public License](#) with exceptions that allow for static linking. Contrary to popular belief, it can be used in commercial software - even Bill Gates could use it!

3.4 What Does "FLTK" Mean?

FLTK was originally designed to be compatible with the Forms Library written for SGI machines. In that library all the functions and structures started with "fl_". This naming was extended to all new methods and widgets in the C++ library, and this prefix was taken as the name of the library. It is almost impossible to search for "FL" on the Internet, due to the fact that it is also the abbreviation for Florida. After much debating and searching for a new name for the toolkit, which was already in use by several people, Bill came up with "FLTK", including a bogus excuse that it stands for "The Fast Light Toolkit".

3.5 FLUID

FLTK comes bundled with FLUID. FLUID, short for Fast Light User Interface Designer, is a graphical editor capable of generating C++ source code and header files ready for compilation. These files ultimately create the graphical user interface for an application.

The FLUID User Handbook is available at <https://www.fltk.org/documentation.php>. It can also be compiled from the FLTK source repository using the `fluid_docs` target in the CMake build environment.

3.6 Building and Installing FLTK with CMake

Starting with version 1.4, the recommended FLTK building system is CMake. CMake is a "Build System Generator" that can generate build environments for usage with Ninja, Make, and many more, for instance IDE's. See file README.CMake.txt of the FLTK source tree for more information.

Note

In FLTK 1.4 you can also use `configure` and `make` as follows to build and install FLTK. However, `configure/make` support will be dropped in FLTK 1.5.0.

3.7 Building and Installing FLTK Under UNIX and macOS with make

In most cases you can just type "make". This will run `configure` with the default of no options and then compile everything.

FLTK uses GNU autoconf to configure itself for your UNIX platform. The main things that the `configure` script will look for are the X11 and OpenGL (or Mesa) header and library files. If these cannot be found in the standard include/library locations you'll need to define the `CFLAGS`, `CXXFLAGS`, and `LDFLAGS` environment variables. For the Bourne and Korn shells you'd use:

```
CFLAGS=-Iincludedir; export CFLAGS
CXXFLAGS=-Iincludedir; export CXXFLAGS
LDFLAGS=-Llibdir; export LDFLAGS
```

For C shell and tcsh, use:

```
setenv CFLAGS "-Iincludedir"
setenv CXXFLAGS "-Iincludedir"
setenv LDFLAGS "-Llibdir"
```

By default configure will look for a C++ compiler named `CC`, `c++`, `g++`, or `gcc` in that order. To use another compiler you need to set the `CXX` environment variable:

```
CXX=x1C; export CXX
setenv CXX "x1C"
```

The `CC` environment variable can also be used to override the default C compiler (`cc` or `gcc`), which is used for a few FLTK source files.

You can run configure yourself to get the exact setup you need. Type `./configure <options>`, where some of the options are:

-enable-cygwin

Enable the Cygwin libraries under Windows

-enable-debug

Enable debugging code & symbols

-disable-gi

Disable OpenGL support

-disable-svg

Disable support of reading and writing of Scalable Vector Graphics (.svg) files.

-disable-print

Disable print support for an X11/Wayland platform

-enable-shared

Enable generation of shared libraries

-enable-threads

Enable multithreading support

-enable-wayland

This is the default for Linux and FreeBSD systems equipped with the Wayland software. Enable the use of Wayland for all window operations, of Cairo for all graphics, and of Pango for text drawing. Resulting FLTK apps run as Wayland clients if a Wayland compositor is available at run-time, and as X11 clients otherwise but keep using Cairo and Pango for all graphics.

-disable-xft

Disables the Xft library, resulting in non anti-aliased fonts (X11 platform). This is not recommended.

-enable-usecairo

All drawing operations use the Cairo library (rather than Xlib) producing antialiased graphics (X11 platform, implies `-enable-pango`).

-enable-pango

Enable the Pango library for drawing any text in any script with any font under X11/Wayland.

-enable-x11

When targeting Cygwin, build with X11 GUI instead of windows GDI. Also applicable to macOS platforms supplemented with XQuartz.

-enable-cairo

Enable support of class `FL_Cairo_Window` (all platforms, requires Cairo as an external library).

-enable-cairoext

Enable the FLTK instrumentation for cairo extended use (implies `-enable-cairo`).

-disable-gdiplus

Don't use GDI+ when drawing curves and oblique lines (Windows platform).

-enable-cp936

Under X11, enable use of the GB2312 locale.

-bindir=/path

Set the location for executables. [default = \$prefix/bin]

-datadir=/path

Set the location for data files. [default = \$prefix/share]

-libdir=/path

Set the location for libraries. [default = \$prefix/lib]

-includedir=/path

Set the location for include files. [default = \$prefix/include]

-mandir=/path

Set the location for man pages. [default = \$prefix/man]

-prefix=/dir

Set the directory prefix for files. [default = /usr/local]

When the configure script is done you can just run the "make" command. This will build the library, FLUID tool, fltk-options (setup tool), and all of the test programs.

To install the library, become root and type "make install". This will copy the "fluid" executable to "bindir", the header files to "includedir", and the library files to "libdir".

3.8 Building FLTK Under Microsoft Windows

NOTE: This documentation section is currently under review. More up-to-date information for this release may be available in the files "README.Windows.txt" and "README.CMake.txt" and you should read these files to determine if there are changes that may be applicable to your build environment.

FLTK 1.4 is officially supported on Windows (2000,) 2003, XP, and later. Older Windows versions prior to Windows 2000 are not officially supported but may still work. The main reason is that the OS version needs to support UTF-8. FLTK 1.4 is known to work on recent versions of Windows such as Windows 7, Windows 8/8.1, Windows 10 and Windows 11, and has been reported to work in both 32-bit and 64-bit Windows versions.

Note

Libraries built by any one of the following build environments can not be mixed with object files from any of the other environments because they use incompatible C++ conventions internally.

FLTK currently supports the following development environments on the Windows platform:

3.8.1 Free and Commercial Microsoft Visual Studio Versions

Visual Studio 2015 Community or later versions use workspace and project files generated by CMake. Older versions and the commercial versions can be used as well, if they can open the project files generated by CMake. FLTK support of Visual C++ is limited to the support of CMake for these Visual Studio versions. Be sure to get your service packs!

Since FLTK 1.4 the project files MUST be generated with CMake. Please read "README.CMake.txt" for more information about this.

3.8.2 Using the Visual C++ DLL Library

The Visual Studio project files can be used to build a DLL version of the FLTK library if CMake option 'FLTK_↔ BUILD_SHARED_LIBS=ON' is set. Because of name mangling differences between PC compilers (even between different versions of Visual Studio) you can only use the DLL that is generated with the same compiler version that you built it with.

When compiling an application or DLL that uses the FLTK DLL with Visual Studio, you need to define the `FL_DLL` preprocessor symbol to get the correct linkage commands embedded within the FLTK header files.

New since FLTK 1.4.0: If you build your application project with CMake and use the CMake target 'fltk::fltk-shared' to link your application, then 'FL_DLL' is defined automatically for you (by CMake Compile Definition). If you use your own (hand-made) Visual Studio project you still need to define `FL_DLL` to compile all source files that use FLTK headers.

3.8.3 GNU toolsets (Cygwin or MinGW) hosted on Windows

If using Cygwin with the Cygwin shell, or MinGW with the Msys shell, these build environments behave very much like a Unix or macOS build and the notes above in the section on *Building and Installing FLTK Under UNIX and Apple macOS* apply, in particular the descriptions of using the "configure" script and its related options.

In general for a build using these tools, e.g. for the Msys shell with MinGW, it should suffice to "cd" into the directory where you have extracted the FLTK tarball and type:

```
./configure
make
```

This will build the FLTK libraries and they can then be utilised directly from the build location. NOTE: this may be simpler than "installing" them in many cases as different tool chains on Windows have different ideas about where the files should be "installed" to.

For example, if you "install" the libraries using Msys/MinGW with the following command

```
make install
```

then Msys will "install" the libraries to where it thinks the path "/usr/local/" leads to. If you only ever build code from within the Msys environment this works well, but the actual "Windows path" these files are located in will be something like "C:\msys\1.0\local\lib", depending on where your Msys installation is rooted, which may not be useful to other tools.

If you want to install your built FLTK libraries in a non-standard location you may do:

```
sh configure --prefix=C:/FLTK
make
```

Where the value passed to "prefix" is the path at which you would like FLTK to be installed.

A subsequent invocation of "make install" will then place the FLTK libraries and header files into that path.

The other options to "configure" may also be used to tailor the build to suit your environment.

3.9 Internet Resources

FLTK is available on the 'net in a bunch of locations:

3.10 Reporting Bugs

To report a bug in FLTK, or for feature requests, please use <https://www.fltk.org/bugs.php> for information about where and how to post bugs, feature requests, or ask for help on using FLTK.

For general support and questions, please use the fltk.general newsgroup (see above, "NNTP Newsgroups") or the web interface to the newsgroups at <https://www.fltk.org/newsgroups.php>.

Chapter 4

FLTK Basics

This chapter teaches you the basics of writing and compiling programs that use FLTK.

4.1 Writing Your First FLTK Program

Up to FLTK 1.3.x all FLTK programs were required to include the file `<FL/Fl.H>` as the first FLTK header file.

Since FLTK 1.4.0 this requirement was relaxed and `<FL/Fl.H>` needs only be included if the class `Fl` is used or if some other stuff like enumerations is used in the source code. Example code in this documentation may still include it "everywhere" even if it is no longer strictly required.

In addition the program must include a header file for each FLTK class it uses. Listing 1 shows a simple "Hello, World!" program that uses FLTK to display the window.

Listing 1 - "hello.cxx"

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
int main(int argc, char **argv) {
    Fl_Window *window = new Fl_Window(340, 180);
    Fl_Box *box = new Fl_Box(20, 40, 300, 100, "Hello, World!");
    box->box(FL_UP_BOX);
    box->labelfont(FL_BOLD + FL_ITALIC);
    box->labelsize(36);
    box->labeltype(FL_SHADOW_LABEL);
    window->end();
    window->show(argc, argv);
    return Fl::run();
}
```

After including the required header files, the program then creates a window. All following widgets will automatically be children of this window.

```
Fl_Window *window = new Fl_Window(340, 180);
```

Then we create a box with the "Hello, World!" string in it. FLTK automatically adds the new box to `window`, the current grouping widget.

```
Fl_Box *box = new Fl_Box(20, 40, 300, 100, "Hello, World!");
```

Next, we set the type of box and the font, size, and style of the label:

```
box->box(FL_UP_BOX);
box->labelfont(FL_BOLD + FL_ITALIC);
box->labelsize(36);
box->labeltype(FL_SHADOW_LABEL);
```

We tell FLTK that we will not add any more widgets to window.

```
window->end();
```

Finally, we show the window and enter the FLTK event loop:

```
window->show(argc, argv);  
return Fl::run();
```

The resulting program will display the "Hello, World!" window:

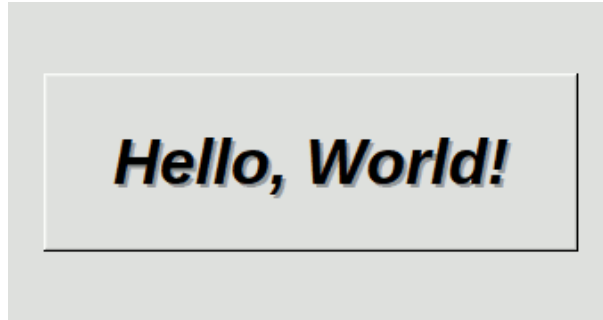

Figure 4.1 The Hello, World! Window

You can quit the program by closing the window or pressing the `ESCAPE` key.

4.1.1 Creating the Widgets

The widgets are created using the C++ `new` operator. For most widgets the arguments to the constructor are:

```
Fl_Widget(x, y, width, height, label)
```

The `x` and `y` parameters determine where the widget or window is placed on the screen. In FLTK the top left corner of the window or screen is the origin (i.e. `x = 0`, `y = 0`).

The `width` and `height` parameters determine the size of the widget or window. The maximum widget size is typically governed by the underlying window system or hardware.

[What Units Do FLTK Functions Use?](#) describes the unit FLTK employs for `x`, `y`, `width`, and `height`, and more generally, for all graphical quantities.

`label` is a pointer to a character string to label the widget with or `NULL`. If not specified the label defaults to `NULL`. The label string must be in static storage such as a string constant because FLTK does not make a copy of it - it just uses the pointer.

4.1.2 Creating Widget Hierarchies

Widgets are commonly ordered into functional groups, which in turn may be grouped again, creating a hierarchy of widgets. FLTK makes it easy to fill groups by automatically adding all widgets that are created between a `myGroup->begin()` and `myGroup->end()`. In this example, `myGroup` would be the *current* group.

Newly created groups and their derived widgets implicitly call `begin()` in the constructor, effectively adding all subsequently created widgets to itself until `end()` is called.

Calling `end()` on one group widget transfers the "current group" property to the **parent** of that widget. Calling `end()` on a top level window (which has no parent) sets the current group to `NULL`.

Setting the current group to `NULL` will stop automatic hierarchies. New widgets can now be added manually using `Fl_Group::add(...)` and `Fl_Group::insert(...)`.

4.1.3 Get/Set Methods

`box->box(FL_UP_BOX)` sets the type of box the [Fl_Box](#) draws, changing it from the default of `FL_NO_BOX`, which means that no box is drawn. In our "Hello, World!" example we use `FL_UP_BOX`, which means that a raised button border will be drawn around the widget. More details are available in the [Box Types](#) section.

You could examine the box type by doing `box->box()`. FLTK uses method name overloading to make short names for get/set methods. A "set" method is always of the form "void name(type)", and a "get" method is always of the form "type name() const".

4.1.4 Redrawing After Changing Attributes

Almost all of the get/set pairs are very fast, short inline functions and thus very efficient. However, *the "set" methods do not call `redraw()`* - you have to call it yourself. This greatly reduces code size and execution time. The only common exceptions are `value()` which calls `redraw()` and `label()` which calls `redraw_label()` if necessary.

4.1.5 Labels

All widgets support labels. In the case of window widgets, the label is used for the label in the title bar. Our example program calls the `labelfont()`, `labelsize()`, and `labeltype()` methods.

The `labelfont()` method sets the typeface and style that is used for the label, which for this example we are using `FL_BOLD` and `FL_ITALIC`.

The `labelsize()` method sets the height of the font in FLTK units.

The `labeltype()` method sets the type of label. FLTK supports normal, embossed, and shadowed labels internally, and more types can be added as desired.

A complete list of all label options can be found in the section on [Labels and Label Types](#).

4.1.6 Showing the Window

The `show()` method shows the widget or window. For windows you can also provide the command-line arguments to allow users to customize the appearance, size, and position of your windows.

4.1.7 The Main Event Loop

All FLTK applications (and most GUI applications in general) are based on a simple event processing model. User actions such as mouse movement, button clicks, and keyboard activity generate events that are sent to an application. The application may then ignore the events or respond to the user, typically by redrawing a button in the "down" position, adding the text to an input field, and so forth.

FLTK also supports idle, timer, and file pseudo-events that cause a function to be called when they occur. Idle functions are called when no user input is present and no timers or files need to be handled - in short, when the application is not doing anything. Idle callbacks are often used to update a 3D display or do other background processing.

Timer functions are called after a specific amount of time has expired. They can be used to pop up a progress dialog after a certain amount of time or do other things that need to happen at more-or-less regular intervals. FLTK timers are not 100% accurate, so they should not be used to measure time intervals, for example.

File functions are called when data is ready to read or write, or when an error condition occurs on a file. They are most often used to monitor network connections (sockets) for data-driven displays.

FLTK applications must periodically check ([Fl::check\(\)](#)) or wait ([Fl::wait\(\)](#)) for events or use the [Fl::run\(\)](#) method to enter a standard event processing loop. Calling [Fl::run\(\)](#) is equivalent to the following code:

```
while (Fl::wait());
```

[Fl::run\(\)](#) does not return until all of the windows under FLTK control are closed by the user or your program.

4.2 Naming Conventions

All public symbols in FLTK start with the characters 'F' and 'L':

- Functions are either `Fl::foo()` or `fl_foo()`.
- Class and type names are capitalized: `Fl_Foo`.
- [Constants and Enumerations](#) are uppercase: `FL_FOO`.
- All header files start with `<FL/...>`.

4.3 Header Files

The proper way to include FLTK header files is:

```
#include <FL/Fl_xyz.H>
```

Note

Case *is significant* on many operating systems, and the C standard uses the forward slash (/) to separate directories. *Do not use any of the following include lines:*

```
#include <FL\Fl_xyz.H>  
#include <fl/fl_xyz.h>  
#include <Fl/fl_xyz.h>
```

4.4 Compiling Programs that Use FLTK

Since FLTK 1.4 CMake is the recommended build system. The details below show the "old" methods and reference information in case you like to write your build configuration manually (e.g. Makefiles, Visual Studio, other IDE's ...).

CMake can simplify this task substantially. For now, refer to README.CMake.txt for further information.

Todo This section needs a major rework. Add a chapter "Building FLTK with CMake".

4.4.1 Compiling Programs with Standard Compilers

Under UNIX (and under Microsoft Windows when using the GNU development tools) you will probably need to tell the compiler where to find the header files. This is usually done using the `-I` option:

```
c++ -I/usr/local/include ...
```

Note

You need a C++ compiler to build FLTK. The commands given in this chapter are **examples** using 'c++'. Please replace this command with the C++ compiler suitable for your system or use the `fltk-config` script as described below (this is recommended).

4.4.2 Compiling Programs with the 'fltk-config' Script

The `fltk-config` script included with FLTK can be used on systems with a Posix compliant shell, for instance Unix/Linux, macOS, Windows with MinGW, MSYS2, or Cygwin.

Note

`fltk-config` is not designed to work on Windows with Visual Studio compilers. If it works, then only by accident and this is undefined behavior.

```
fltk-config --help
```

displays all available options.

`fltk-config` can be used to get the compiler and the options that are required by your compiler to build a program using the FLTK library:

```
fltk-config --cc
fltk-config --cxx
```

return the C and C++ compiler commands used to build FLTK.

```
c++ `fltk-config --cxxflags` ...
```

can be used to include the required compiler flags in the command line.

Similarly, when linking your application you will need to tell the compiler to use the FLTK library:

```
c++ ... -L/usr/local/lib -lfltk -lXext -lX11 ... -lm -ldl
```

Aside from the "fltk" library, there are also the following libraries

- "fltk_forms" for the XForms compatibility classes (deprecated)
- "fltk_gl" for the OpenGL and GLUT classes
- "fltk_images" for the image file classes, [Fl_Help_Dialog](#) widget, and system icon support.

The libraries are named `fltk.lib`, `fltk_forms.lib`, `fltk_gl.lib`, and `fltk_images.lib` under Windows.

Note

The separate `fltk_cairo` library is no longer necessary since FLTK 1.4.0. However, this release of FLTK builds a dummy `fltk_cairo` library for backwards compatibility. You are advised to remove the usage of the `fltk_cairo` library from your build systems and tools. **The `fltk_cairo` library will be removed in a future release.**

As before, the `fltk-config` script can be used to get the options that are required by your linker:

```
c++ ... `fltk-config --ldflags`
```

The forms, GL, and images libraries are included with the "--use-foo" options, as follows:

```
c++ ... `fltk-config --use-forms --ldflags`
c++ ... `fltk-config --use-gl --ldflags`
c++ ... `fltk-config --use-images --ldflags`
c++ ... `fltk-config --use-cairo --ldflags`
c++ ... `fltk-config --use-forms --use-gl --use-images --ldflags`
```

The option `--use-cairo` may be used to build your program with Cairo libs if you use Cairo in your code. It does no longer include the `fltk_cairo` lib but all necessary Cairo compiler flags and Cairo libs, if and only if FLTK has been built with the optional Cairo support by configure or CMake.

Finally, you can use the `fltk-config` script to compile one or more source files as a FLTK program.

The following examples will create an executable named `filename` (or `filename.exe` under Windows) from a single source file:

```
fltk-config --compile filename.cxx
fltk-config --use-forms --compile filename.cpp
fltk-config --use-gl --compile filename.C
fltk-config --use-images --compile filename.cc
fltk-config --use-cairo --compile filename.cpp
fltk-config --use-forms --use-gl --use-images --compile filename.cpp
```

Note

'`fltk-config --compile`' accepts only a limited set of file extensions for C++ source files: `'.cpp'`, `'.cxx'`, `'.cc'`, and `'.C'` (capital 'C').

4.4.3 Compiling Multiple Source Files with 'fltk-config'

Before version 1.4.0 `fltk-config` accepted only a single source file and no additional compiler options or libraries. As of FLTK 1.4.0 it is possible to use additional compiler flags, more than one source file, and additional link libraries.

This is intended to be used for quick prototyping and not for production code development. It can be used to test compiler command options (like `-Wall` or `-Wextra`) or additional link libraries if these are required.

Building from more than one source file with flags and libraries can be achieved as follows:

```
fltk-config [USE-FLAGS] --compile MAIN [FLAGS] [SOURCES] [--link LFLAGS LIBS]
```

where

- arguments in `[. . .]` are optional
- `USE-FLAGS` are as described above, e.g. `--use-images`
- `MAIN` is the main C++ source file as documented above
- `FLAGS` are additional compiler flags
- `SOURCES` are additional source files or libraries
- `--link` is used to separate source files and flags from linker flags and libs
- `LFLAGS` are optional linker flags
- `LIBS` are additional libraries to link against

The final commandline is composed like this example:

```
$ fltk-config --compile main.cxx button.o -Wextra x1.a --link -L/usr/include/cairo/ -lcairo
g++ {fltk-flags} -o main -Wextra main.cxx button.o x1.a {fltk-libs} -L/usr/include/cairo/ -lcairo
```

where `{fltk-flags}` are the compiler flags generated by `fltk-config` as before and `{fltk-libs}` are the usual linker flags and libraries. All optional parameters are used as-is, i.e. there is no syntax checking or special parsing except: the order of flags and source files is preserved (from the commandline) but all flags (`-something`) are positioned before all sources, i.e. arguments w/o leading dash ('-'). All compiler flags and libraries generated from the library build follow all options and source files given on the commandline, and finally everything after `--link` is appended.

4.4.4 Compiling Programs with Makefiles

The previous sections described how to use `fltk-config` to build a program from the command line, and this is very convenient for small test programs. But `fltk-config` can also be used to set the compiler and linker options as variables within a Makefile that can be used to build larger programs.

```
CXX      = $(shell fltk-config --cxx)
DEBUG    = -g
CXXFLAGS = $(shell fltk-config --use-gl --use-images --cxxflags ) -I.
LDLFLAGS = $(shell fltk-config --use-gl --use-images --ldflags )
LDSTATIC = $(shell fltk-config --use-gl --use-images --ldstaticflags )
LINK     = $(CXX)
TARGET  = cube
OBSJS   = CubeMain.o CubeView.o CubeViewUI.o
SRCS    = CubeMain.cxx CubeView.cxx CubeViewUI.cxx
.SUFFIXES: .o .cxx
%.o:    %.cxx
        $(CXX) $(CXXFLAGS) $(DEBUG) -c $<
all:    $(TARGET)
        $(LINK) -o $(TARGET) $(OBSJS) $(LDSTATIC)
$(TARGET): $(OBSJS)
CubeMain.o: CubeMain.cxx CubeViewUI.h
CubeView.o: CubeView.cxx CubeView.h CubeViewUI.h
CubeViewUI.o: CubeViewUI.cxx CubeView.h
clean:  $(TARGET) $(OBSJS)
        rm -f *.o 2> /dev/null
        rm -f $(TARGET) 2> /dev/null
```

4.4.5 Compiling Programs with Microsoft Visual C++

In Visual C++ you will need to tell the compiler where to find the FLTK header files. This can be done by selecting "Settings" from the "Project" menu and then changing the "Preprocessor" settings under the "C/C++" tab.

You will also need to add the following libraries to the `Linker` settings:

- `fltk.lib` or `fltkd.lib`, the main FLTK library (postfix 'd' = Debug)
- all FLTK libraries your program requires (`fltk_gl`, `fltk_images`, ...)
- additional libraries like `libpng.lib`, `libjpeg.lib`, etc.
- the Windows Common Controls (`comctl32.lib`) and
- the GDIplus library if used to build FLTK (`gdiplus.lib`) and
- the Windows Socket (`ws2_32.lib`) libraries.

Note

There's a `Linker` setting "Additional Library Directories" or similar; the exact name depends on the Visual Studio version you're using. You can and **should** use this to simplify adding the libraries above. If you set this to the FLTK library path you can just use the library **names** and don't need to use the full paths to all libraries.

You must also define `_WIN32` if the compiler doesn't do this. Currently all known Windows compilers define `_WIN32` - unless you use Cygwin (that's correct, you must not define `_WIN32` if you use Cygwin).

More information can be found in `README.Windows.txt`.

You can build your Microsoft Windows applications as Console or Desktop applications. If you want to use the standard `C main()` function as the entry point, FLTK includes a `WinMain()` function that will call your `main()` function for you.

Chapter 5

Common Widgets and Attributes

This chapter describes many of the widgets that are provided with FLTK and covers how to query and set the standard attributes.

5.1 Buttons

FLTK provides many types of buttons:

- [Fl_Button](#) - A standard push button.
- [Fl_Check_Button](#) - A button with a check box.
- [Fl_Light_Button](#) - A push button with a light.
- [Fl_Repeat_Button](#) - A push button that repeats when held.
- [Fl_Return_Button](#) - A push button that is activated by the `Enter` key.
- [Fl_Round_Button](#) - A button with a radio circle.

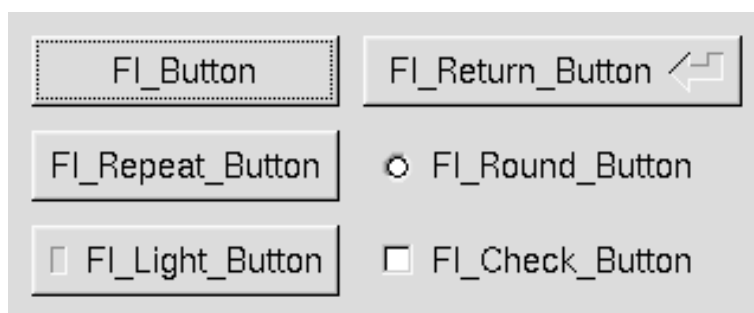

Figure 5.1 FLTK Button Widgets

All of these buttons just need the corresponding `<FL/Fl_xyz_Button.H>` header file. The constructor takes the bounding box of the button and optionally a label string:

```
Fl_Button *button = new Fl_Button(x, y, width, height, "label");
Fl_Light_Button *lbutton = new Fl_Light_Button(x, y, width, height);
Fl_Round_Button *rbutton = new Fl_Round_Button(x, y, width, height, "label");
```

Each button has an associated `type()` which allows it to behave as a push button, toggle button, or radio button:

```
button->type(FL_NORMAL_BUTTON);
lbutton->type(FL_TOGGLE_BUTTON);
rbutton->type(FL_RADIO_BUTTON);
```

For toggle and radio buttons, the `value()` method returns the current button state (0 = off, 1 = on). The `set()` and `clear()` methods can be used on toggle buttons to turn a toggle button on or off, respectively. Radio buttons can be turned on with the `setonly()` method; this will also turn off other radio buttons in the same group.

5.2 Text

FLTK provides several text widgets for displaying and receiving text:

- [Fl_Input](#) - A one-line text input field.
- [Fl_Output](#) - A one-line text output field.
- [Fl_Multiline_Input](#) - A multi-line text input field.
- [Fl_Multiline_Output](#) - A multi-line text output field.
- [Fl_Text_Display](#) - A multi-line text display widget.
- [Fl_Text_Editor](#) - A multi-line text editing widget.
- [Fl_Help_View](#) - A HTML text display widget.

The [Fl_Output](#) and [Fl_Multiline_Output](#) widgets allow the user to copy text from the output field but not change it.

The `value()` method is used to get or set the string that is displayed:

```
Fl_Input *input = new Fl_Input(x, y, width, height, "label");  
input->value("Now is the time for all good men...");
```

The string is copied to the widget's own storage when you set the `value()` of the widget.

The [Fl_Text_Display](#) and [Fl_Text_Editor](#) widgets use an associated [Fl_Text_Buffer](#) class for the value, instead of a simple string.

5.3 Valuators

Unlike text widgets, valuators keep track of numbers instead of strings. FLTK provides the following valuators:

- [Fl_Counter](#) - A widget with arrow buttons that shows the current value.
- [Fl_Dial](#) - A round knob.
- [Fl_Roller](#) - An SGI-like dolly widget.
- [Fl_Scrollbar](#) - A standard scrollbar widget.
- [Fl_Slider](#) - A scrollbar with a knob.
- [Fl_Value_Slider](#) - A slider that shows the current value.

Figure 5.2 FLTK valuator widgets

The `value()` method gets and sets the current value of the widget. The `minimum()` and `maximum()` methods set the range of values that are reported by the widget.

5.4 Groups

The `FL_Group` widget class is used as a general purpose "container" widget. Besides grouping radio buttons, the groups are used to encapsulate windows, tabs, and scrolled windows. The following group classes are available with FLTK:

- `FL_Double_Window` - A double-buffered window on the screen.
- `FL_Gl_Window` - An OpenGL window on the screen.
- `FL_Group` - The base container class; can be used to group any widgets together.
- `FL_Pack` - A collection of widgets that are packed into the group area.
- `FL_Scroll` - A scrolled window area.
- `FL_Tabs` - Displays child widgets as tabs.
- `FL_Tile` - A tiled window area.
- `FL_Window` - A window on the screen.
- `FL_Wizard` - Displays one group of widgets at a time.

5.5 Setting the Size and Position of Widgets

The size and position of widgets is usually set when you create them. You can access them with the `x()`, `y()`, `w()`, and `h()` methods.

You can change the size and position by using the `position()`, `resize()`, and `size()` methods:

```
button->position(x, y);
group->resize(x, y, width, height);
window->size(width, height);
```

If you change a widget's size or position after it is displayed you will have to call `redraw()` on the widget's parent.

5.6 Colors

FLTK stores the colors of widgets as a 32-bit unsigned number that is either an index into a color palette of 256 colors ($0 \leq \text{color} \leq 255$) or a 24-bit RGB color ($\text{color} > 255$). The color palette is *not* the X or Windows colormap, but instead is an internal table with fixed contents.

See the [Colors](#) section of [Drawing Things in FLTK](#) for implementation details.

There are symbols for naming some of the more common colors:

- FL_BLACK
- FL_RED
- FL_GREEN
- FL_YELLOW
- FL_BLUE
- FL_MAGENTA
- FL_CYAN
- FL_WHITE

Other symbols are used as the default colors for all FLTK widgets.

- FL_FOREGROUND_COLOR
- FL_BACKGROUND_COLOR
- FL_INACTIVE_COLOR
- FL_SELECTION_COLOR

The full list of named color values can be found in [FLTK Enumerations](#).

A color value can be created from its RGB components by using the `fl_rgb_color()` function, and decomposed again with `Fl::get_color()`:

```
Fl_Color c = fl_rgb_color(85, 170, 255); // RGB to Fl_Color
Fl::get_color(c, r, g, b); // Fl_Color to RGB
```

The widget color is set using the `color()` method:

```
button->color(FL_RED); // set color using named value
```

Similarly, the label color is set using the `labelcolor()` method:

```
button->labelcolor(FL_WHITE);
```

The `Fl_Color` encoding maps to a 32-bit unsigned integer representing RGBI, so it is also possible to specify a color using a hex constant as a color map index:

```
button->color(0x000000ff); // colormap index #255 (FL_WHITE)
```

or specify a color using a hex constant for the RGB components:

```
button->color(0xff000000); // RGB: red
button->color(0x00ff0000); // RGB: green
button->color(0x0000ff00); // RGB: blue
button->color(0xffff0000); // RGB: white
```

Note

If TrueColor is not available, any RGB colors will be set to the nearest entry in the colormap.

5.7 Box Types

The type `Fl_Boxtype` stored and returned in `Fl_Widget::box()` is an enumeration defined in `Enumerations.H`.

These are the standard box types included with FLTK:

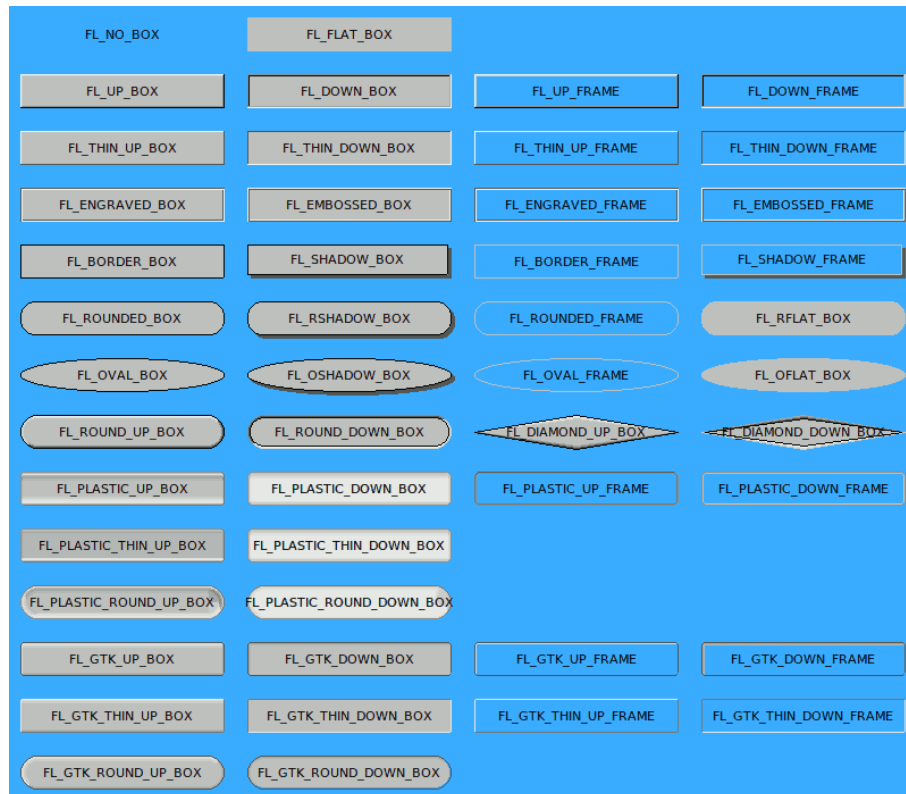

Figure 5.3 FLTK Standard Box Types

`FL_NO_BOX` means nothing is drawn at all, so whatever is already on the screen remains. The `FL_..._FRAME` types only draw their edges, leaving the interior unchanged. The blue color in the image above is the area that is not drawn by the frame types.

5.7.1 Making Your Own Boxtypes

You can define your own boxtypes by making a small function that draws the box and adding it to the table of boxtypes.

The Drawing Function

The drawing function is passed the bounding box and background color for the widget:

```
void xyz_draw(int x, int y, int w, int h, Fl_Color c) {
    ...
}
```

A simple drawing function might fill a rectangle with the given color and then draw a black outline:

```
void xyz_draw(int x, int y, int w, int h, Fl_Color c) {
    fl_color(c);
    fl_rectf(x, y, w, h);
    fl_color(FL_BLACK);
    fl_rect(x, y, w, h);
}
```

Fl_Boxtype fl_down(Fl_Boxtype b)

`fl_down()` returns the "pressed" or "down" version of a box. If no "down" version of a given box exists, the behavior of this function is undefined and some random box or frame is returned. See [Drawing Functions](#) for more details.

Fl_Boxtype fl_frame(Fl_Boxtype b)

`fl_frame()` returns the unfilled, frame-only version of a box. If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned. See [Drawing Functions](#) for more details.

Fl_Boxtype fl_box(Fl_Boxtype b)

`fl_box()` returns the filled version of a frame. If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame is returned. See [Drawing Functions](#) for more details.

Adding Your Box Type

The `Fl::set_boxtype()` method adds or replaces the specified box type:

```
#define XYZ_BOX FL_FREE_BOXTYPE
Fl::set_boxtype(XYZ_BOX, xyz_draw, 1, 1, 2, 2);
```

The last 4 arguments to `Fl::set_boxtype()` are the offsets for the `x`, `y`, `width`, and `height` values that should be subtracted when drawing the label inside the box.

A complete box design contains four box types in this order: a filled, neutral box (`UP_BOX`), a filled, depressed box (`DOWN_BOX`), and the same as outlines only (`UP_FRAME` and `DOWN_FRAME`). The function `fl_down(Fl_Boxtype)` expects the neutral design on a boxtype with a numerical value evenly dividable by two. `fl_frame(Fl_Boxtype)` expects the `UP_BOX` design at a value dividable by four.

5.8 Labels and Label Types

The `label()`, `align()`, `labelfont()`, `labelsize()`, `labeltype()`, `image()`, and `deimage()` methods control the labeling of widgets.

`label()`

The `label()` method sets the string that is displayed for the label. Symbols can be included with the label string by escaping them using the "@" symbol - "@@" displays a single at sign. These are the available symbols:

Figure 5.4 FLTK label symbols

The @ sign may also be followed by the following optional "formatting" characters, in this order:

- '#' forces square scaling, rather than distortion to the widget's shape.
- '+[1-9] or -[1-9] tweaks the scaling a little bigger or smaller.
- '\$' flips the symbol horizontally, '%' flips it vertically.
- '[0-9] - rotates by a multiple of 45 degrees. '5' and '6' do no rotation while the others point in the direction of that key on a numeric keypad. '0', followed by four more digits rotates the symbol by that amount in degrees.

Thus, to show a very large arrow pointing downward you would use the label string "@+92->".

Symbols and text can be combined in a label, however the symbol must be at the beginning and/or at the end of the text. If the text spans multiple lines, the symbol or symbols will scale up to match the height of all the lines.

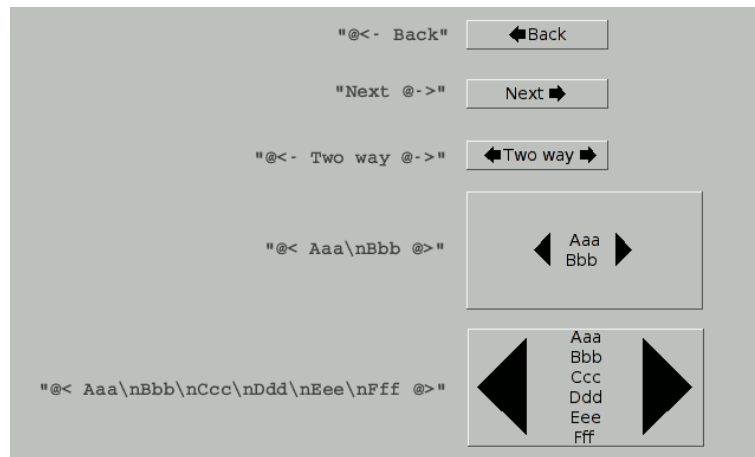

Figure 5.5 FLTK symbols and text

`align()`

The `align()` method positions the label. The following constants are defined and may be OR'd together as needed:

- `FL_ALIGN_CENTER` - center the label in the widget.
- `FL_ALIGN_TOP` - align the label at the top of the widget.
- `FL_ALIGN_BOTTOM` - align the label at the bottom of the widget.
- `FL_ALIGN_LEFT` - align the label to the left of the widget.
- `FL_ALIGN_RIGHT` - align the label to the right of the widget.
- `FL_ALIGN_LEFT_TOP` - The label appears to the left of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_RIGHT_TOP` - The label appears to the right of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_LEFT_BOTTOM` - The label appears to the left of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_RIGHT_BOTTOM` - The label appears to the right of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_INSIDE` - align the label inside the widget.
- `FL_ALIGN_CLIP` - clip the label to the widget's bounding box.
- `FL_ALIGN_WRAP` - wrap the label text as needed.
- `FL_ALIGN_TEXT_OVER_IMAGE` - show the label text over the image.
- `FL_ALIGN_IMAGE_OVER_TEXT` - show the label image over the text (default).
- `FL_ALIGN_IMAGE_NEXT_TO_TEXT` - The image will appear to the left of the text.
- `FL_ALIGN_TEXT_NEXT_TO_IMAGE` - The image will appear to the right of the text.
- `FL_ALIGN_IMAGE_BACKDROP` - The image will be used as a background for the widget.

labeltype()

The `labeltype()` method sets the type of the label. The following standard label types are included:

- `FL_NORMAL_LABEL` - draws the text.
- `FL_NO_LABEL` - does nothing.
- `FL_SHADOW_LABEL` - draws a drop shadow under the text.
- `FL_ENGRAVED_LABEL` - draws edges as though the text is engraved.
- `FL_EMBOSSSED_LABEL` - draws edges as though the text is raised.
- `FL_ICON_LABEL` - draws the icon ([FI_Image](#)) associated with the text.
- `FL_IMAGE_LABEL` - draws the image ([FI_Image](#)) associated with the text.
- `FL_MULTI_LABEL` - draws multiple parts side by side, see [FI_Multi_Label](#).

Note

Some of these `labeltypes` are no longer necessary for normal widgets. Widgets allow for an image and a text side by side, depending on the widget's `align()` flag. `FL_MULTI_LABEL` was designed to be used with [FI_Menu_Item](#)'s to support icons or small images, typically left of the menu text.

As of this writing (FLTK 1.4.0, Sep 2017) `FI_Menu_Items` support only one label part (text or image), but using [FI_Multi_Label](#) as the label can extend this to more than one part.

See also

class [FI_Multi_Label](#), [FI_Widget::align\(\)](#)

image() and deimage()

The `image()` and `deimage()` methods set an image that will be displayed with the widget. The `deimage()` method sets the image that is shown when the widget is inactive, while the `image()` method sets the image that is shown when the widget is active.

To make an image you use a subclass of [FI_Image](#).

Making Your Own Label Types

Label types are actually indexes into a table of functions that draw them. The primary purpose of this is to use this to draw the labels in ways inaccessible through the `fl_font()` mechanism (e.g. `FL_ENGRAVED_LABEL`) or with program-generated letters or symbology.

Label Type Functions

To setup your own label type you will need to write two functions: one to draw and one to measure the label. The draw function is called with a pointer to a `Fl_Label` structure containing the label information, the bounding box for the label, and the label alignment:

```
void xyz_draw(const Fl_Label *label, int x, int y, int w, int h, Fl_Align align) {
    ...
}
```

The label should be drawn *inside* this bounding box, even if `FL_ALIGN_INSIDE` is not enabled. The function is not called if the label value is `NULL`.

The measure function is called with a pointer to a `Fl_Label` structure and references to the width and height:

```
void xyz_measure(const Fl_Label *label, int &w, int &h) {
    ...
}
```

The function should measure the size of the label and set `w` and `h` to the size it will occupy.

Adding Your Label Type

The `Fl::set_labeltype()` method creates a label type using your draw and measure functions:

```
#define XYZ_LABEL FL_FREE_LABELTYPE
Fl::set_labeltype(XYZ_LABEL, xyz_draw, xyz_measure);
```

The label type number `n` can be any integer value starting at the constant `FL_FREE_LABELTYPE`. Once you have added the label type you can use the `labeltype()` method to select your label type.

The `Fl::set_labeltype()` method can also be used to overload an existing label type such as `FL_NORMAL_LABEL`.

Making your own symbols

It is also possible to define your own drawings and add them to the symbol list, so they can be rendered as part of any label.

To create a new symbol, you implement a drawing function `void drawit(Fl_Color c)` which typically uses the functions described in [Drawing Complex Shapes](#) to generate a vector shape inside a two-by-two units sized box around the origin. This function is then linked into the symbols table using `fl_add_symbol()`:

```
int fl_add_symbol(const char *name, void (*drawit)(Fl_Color), int scalable)
```

`name` is the name of the symbol without the "@"; `scalable` must be set to 1 if the symbol is generated using scalable vector drawing functions.

```
int fl_draw_symbol(const char *name, int x, int y, int w, int h, Fl_Color col)
```

This function draws a named symbol fitting the given rectangle.

5.9 Callbacks

Callbacks are functions that are called when the value of a widget changes. A callback function is sent a `Fl_Widget` pointer of the widget that changed and a pointer to data that you provide:

```
void xyz_callback(Fl_Widget *w, void *data) {
...
}
```

The `callback()` method sets the callback function for a widget. You can optionally pass a pointer to some data needed for the callback:

```
int xyz_data;
button->callback(xyz_callback, &xyz_data);
```

Note

You cannot delete a widget inside a callback, as the widget may still be accessed by FLTK after your callback is completed. Instead, use the `Fl::delete_widget()` method to mark your widget for deletion when it is safe to do so.

Many programmers new to FLTK or C++ try to use a non-static class method instead of a static class method or function for their callback. Since callbacks are done outside a C++ class, the `this` pointer is not initialized for class methods.

To work around this problem, define a static method in your class that accepts a pointer to the class, and then have the static method call the class method(s) as needed. The data pointer you provide to the `callback()` method of the widget can be a pointer to the instance of your class.

```
class Foo {
    void my_callback(Fl_Widget *w);
    static void my_static_callback(Fl_Widget *w, void *f) { ((Foo *)f)->my_callback(w); }
    ...
}
...
w->callback(my_static_callback, (void *)this);
```

In an effort to make callbacks easier, more flexible, and type safe, FLTK provides three groups of macros that generate the code needed to call class methods directly with up to five custom parameters.

- `FL_FUNCTION_CALLBACK_#(WIDGET, FUNCTION, ...)` creates code for callbacks to functions and static class methods with up to five arguments. The `#` must be replaced by the number of callback arguments.
- `FL_METHOD_CALLBACK_#(WIDGET, CLASS, SELF, METH, ...)` creates code for callbacks to arbitrary public class methods
- `FL_INLINE_CALLBACK_#(WIDGET, ..., FUNCTION_BODY)` creates code for callback functions that are very close to (almost in the same line) the widget creation code, similar to lambda function in C++11. The last argument of this macro is the callback code.

The syntax is a bit unconventional, but the resulting code is flexible and needs no additional maintenance. It is also C++98 compatible. For example:

```
#include <FL/fl_callback_macros.H>
...
Fl_String *str = new Fl_String("FLTK");
Fl_Button *btn = new Fl_Button(10, 10, 100, 100);
FL_METHOD_CALLBACK_2(btn, Fl_String, str, insert, int, 2, const char*, "...");
...
Fl_Button *inline_cb_btn_2 = new Fl_Button(390, 60, 180, 25, "2 args");
FL_INLINE_CALLBACK_2( inline_cb_btn_2,
    const char *, text, "FLTK", int, number, 2,
    {
        fl_message("We received the message %s with %d!", text, number);
    }
);
```

See also

`Fl_Widget::callback(Fl_Callback*, void*)`, `FL_FUNCTION_CALLBACK_3`, `FL_METHOD_CALLBACK_1`, `FL_INLINE_CALLBACK_2`

5.10 When and Reason

Normally callbacks are performed only when the value of the widget changes. You can change this using the `Fl_Widget::when()` method:

```
button->when (FL_WHEN_NEVER);
button->when (FL_WHEN_CHANGED);
button->when (FL_WHEN_RELEASE);
button->when (FL_WHEN_RELEASE_ALWAYS);
button->when (FL_WHEN_ENTER_KEY);
button->when (FL_WHEN_ENTER_KEY_ALWAYS);
button->when (FL_WHEN_CHANGED | FL_WHEN_NOT_CHANGED);
```

Within the callback, you can query why the callback was called using `Fl::callback_reason()`. For example, setting `myInput->when (FL_WHEN_RELEASE | FL_WHEN_CHANGED)`

for a text input field may return `FL_REASON_LOST_FOCUS` or `FL_REASON_CHANGED` as a callback reason.

5.11 Shortcuts

Shortcuts are key sequences that activate widgets such as buttons or menu items. The `shortcut()` method sets the shortcut for a widget:

```
button->shortcut (FL_Enter);
button->shortcut (FL_SHIFT + 'b');
button->shortcut (FL_CTRL + 'b');
button->shortcut (FL_ALT + 'b');
button->shortcut (FL_CTRL + FL_ALT + 'b');
button->shortcut (0); // no shortcut
```

The shortcut value is the key event value - the ASCII value or one of the special keys described in [Fl::event_key\(\) Values](#) combined with any modifiers like `Shift`, `Alt`, and `Control`.

Chapter 6

Coordinates and Layout Widgets

This chapter describes the coordinate systems that apply when positioning widgets manually, and some of the basics of FLTK layout widgets that are used to position widgets automatically.

6.1 The Widget Coordinate System

All widgets have constructors with `x` and `y` parameters to let the programmer specify the desired initial position of the top left corner during explicit manual layout within `Fl_Window` and `Fl_Group` container widgets.

This position is always relative to the enclosing `Fl_Window`, which is usually, but not always, the top-level application window, or a free-floating pop-up dialog window. In some cases it could also be a subwindow embedded in a higher-level window, as shown in the figure below.

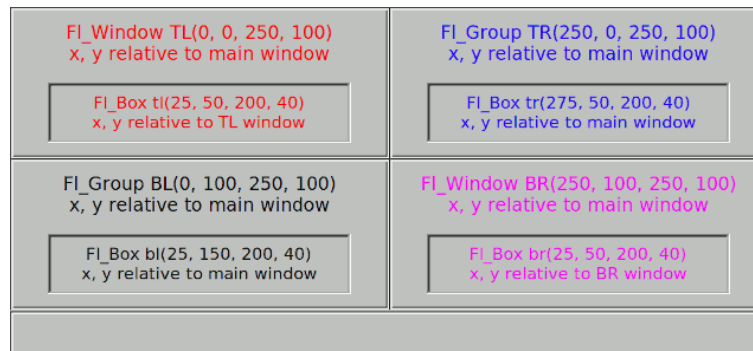

Figure 6.1 FLTK coordinate system

The positions of the TL and BR sub-windows and the TR and BL groups are all relative to the top-left corner of the main window. The positions of the boxes inside the TR and BL groups are also relative to the main window, but the boxes inside the TL and BR sub-windows are positioned relative to the enclosing sub-window.

In other words, the widget hierarchy and positions can be summarized as:

```
Fl_Window main window
  Fl_Window TL subwindow      # x, y relative to main window
    Fl_Box tl box             # x, y relative to TL subwindow
  Fl_Window BR subwindow      # x, y relative to main window
    Fl_Box br box             # x, y relative to BR subwindow
  Fl_Group TR group           # x, y relative to main window
    Fl_Box tr box             # x, y relative to main window
  Fl_Group BL group           # x, y relative to main window
    Fl_Box bl box             # x, y relative to main window
```

6.2 Layout and Container Widgets

There are four main groups of widgets derived from `Fl_Group` for a range of different purposes.

The first group are composite widgets that each contain a fixed set of components that work together for a specific purpose, rather than layout widgets as such, and are not discussed here.

The second group are basically containers offering the same manual layout features as `Fl_Group`, as described above, but which add one new capability. These widgets are `Fl_Scroll`, `Fl_Tabs` and `Fl_Wizard`.

The third group are layout managers that relocate and resize the child widgets added to them in order to satisfy a particular layout algorithm. These widgets are `Fl_Flex`, `Fl_Grid`, `Fl_Pack`, and `Fl_Tile`.

The final group consists of `Fl_Window` and its derivatives. Their special capability is that they can be top-level application windows and dialogs that interface with the operating system window manager, but can also be embedded within other windows and groups as shown in the example above. Note that the window manager may impose its own constraints on the position of top-level windows, and the `x` and `y` position parameters may be treated as hints, or even ignored. The `Fl_Window` class has an extra constructor that omits them.

Descriptions of layout and container widgets follow in alphabetical order.

6.2.1 The `Fl_Flex` Layout Widget

The `Fl_Flex` widget allows the layout of its direct children as a single row or column. If its `type()` is set to give the row or horizontal layout, the children are all resized to have the same height as the `Fl_Flex` and are moved next to each other. If set to give the column or vertical layout, the children are all resized to have the same width as the `Fl_Flex` and are then stacked below each other.

Widget positions (`x`, `y`) need not be given by the user because widgets are positioned inside the `Fl_Flex` container in the order of its children. Widget sizes can be set to `(0, 0)` as in `Fl_Pack` since they are calculated by `Fl_Flex`.

This is similar to `Fl_Pack` described below and `Fl_Flex` is designed to act as a drop-in replacement of `Fl_Pack` with some minor differences.

Other than `Fl_Pack` the `Fl_Flex` widget does **not** resize itself but resizes its children to fill the entire space of the `Fl_Flex` container. Single children of `Fl_Flex` can be set to fixed sizes to inhibit this resizing behavior. In this case the remaining space is distributed to all non-fixed widgets.

`Fl_Flex` widgets can be nested inside each other and with `Fl_Grid` in any combination.

The name `Fl_Flex` was inspired by the CSS 'flex' container.

Figure 6.2 Simple `Fl_Flex` Layout

`Fl_Flex` was added in FLTK 1.4.0.

6.2.2 The `Fl_Grid` Layout Widget

`Fl_Grid` is the most flexible layout container in FLTK 1.4. It is based on a flexible grid of **cells** that can be assigned one widget per cell which is the *anchor* of the widget. Widgets can span multiple rows and columns and the cells can constitute a sparse matrix. Widgets can be aligned inside their cells in several ways (left, right, top, bottom) and can stretch horizontally, vertically, or both, i.e. fill the entire cell.

Widget positions (x, y) need not be given by the user because widgets are assigned to a particular grid cell by row and column number. Widget sizes can be given as their **minimal** sizes and will be resized appropriately depending on the free space.

Optional margins around all cells inside the widget border and gaps between rows and cells make the layout even more flexible.

The `Fl_Grid` widget should be designed with a grid (matrix) and its minimal size in mind. It is designed to **enlarge** cells and widgets in a flexible way when the `Fl_Grid` widget itself is created or resized.

Additional free space inside the `Fl_Grid` container is distributed to widgets by considering minimal row heights, column widths, sizes of widgets, and row and column *weights*. These weights are used to distribute the free space proportionally according to the row and column weights.

`Fl_Grid` widgets can be nested inside each other and with `Fl_Flex` and other subclasses of `Fl_Group` in any combination.

Note

We don't recommend to use `Fl_Pack` as child widgets although this **may** work as well.

The name `Fl_Grid` was inspired by the CSS 'grid' container but it has some properties in common with HTML `<table>` containers as well, for instance row and column spanning.

Figure 6.3 Simple `Fl_Grid` Layout

`Fl_Grid` was added in FLTK 1.4.0.

6.2.3 The `Fl_Pack` Layout Widget

The `Fl_Pack` widget allows the layout of its direct children as a single row, or column. If its `type()` is set to give the row or horizontal layout, the children are all resized to have the same height as the `Fl_Pack` and are moved next to each other. If set to give the column or vertical layout, the children are all resized to have the same width as the `Fl_Pack` and are then stacked below each other. The `Fl_Pack` then resizes itself to shrink-wrap itself around all of the children.

`Fl_Pack` widgets are often used inside an `Fl_Scroll`, as shown in the diagram below, to avoid having to deal with tricky resize behavior when used with nested widgets.

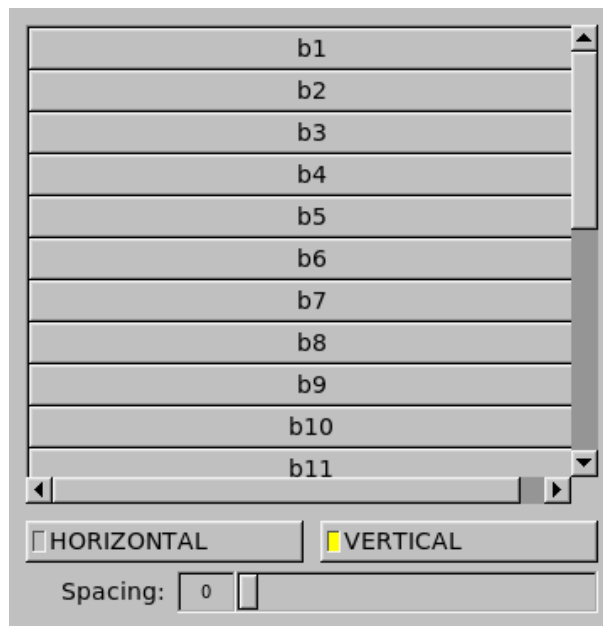

Figure 6.4 `Fl_Pack` test program screenshot

Since FLTK 1.4.0 `Fl_Flex` (described above) can in many cases be used as a drop-in replacement for `Fl_Pack` if this "shrink-wrap" behavior is not required. Note that the `Fl_Pack` layout algorithm can cause some issues because its widget size can change depending on its children and particularly because this is done late, i.e. during `draw()` and not as usual during `resize` of the window.

Note

We recommend that developers evaluate whether using `Fl_Flex` or `Fl_Grid` instead of `Fl_Pack` can be a better solution with more predictable and reliable resizing behavior of the overall program layout.

6.2.4 The `Fl_Scroll` Container Widget

The `Fl_Scroll` container widget can hold an assortment of widgets that may extend beyond its own width and height, in which case horizontal and/or vertical scrollbars may appear automatically so that you can scroll and view the entire contents.

Figure 6.5 `Fl_Scroll` container widget

6.2.5 The FI_Tabs Container Widget

The `FI_Tabs` widget provides a front-to-back stack of individual panels which usually contain `FI_Group` widgets and their children. The user can switch between panels by clicking on the small tabs that protrude from the panels. The appearance of each tab is determined by the child widget's label and related attributes.

Figure 6.6 `FI_Tabs` container widget

6.2.6 The FI_Tile Layout Widget

The `FI_Tile` widget allows the user to resize one or more of its children by dragging on the border between adjacent child widgets. However, the programmer must first explicitly layout the child widgets so that their borders exactly fill the width and height of the `FI_Tile` without having any gaps between them, or at the edges. Some care is needed when initially positioning the children and setting the `resizable()` widget within the `FI_Tile` to prevent squeezing a child to have a zero width or height. For more information see the `FI_Tile` widget manual page, and [How Does Resizing Work?](#).

Figure 6.7 The `FI_Tile` layout widget

6.2.7 The FI_Wizard Container Widget

The `FI_Wizard` widget derives from the `FI_Tabs` class, but instead of having tabs that the user can click to select the corresponding panel, the programmer uses the `prev()`, `next()` or `value()` methods to show the appropriate panel. For example, the user might be able to click on "Next" and "Prev" navigation buttons or keys, as shown below.

Figure 6.8 `FI_Wizard` container widget

Chapter 7

How Does Resizing Work?

This chapter describes the basic mechanism behind the creation of resizable user interface elements in FLTK.

FLTK uses a simple, but very versatile system to resize even the most complex dialogs and interfaces. The resizing is implemented within the `Fl_Group` widget, and the exact resizing behavior of that group is determined by its `resizable()` attribute.

7.1 Resizing can be disabled

```
Summary:
group = new Fl_Group(xg, yg, wg, hg, "No Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
. . .
group->resizable((Fl_Widget*)0); // no resizing
group->end()
```

The `resizable` may be set to the NULL pointer, which means that the group will not resize. Note that this is the default behavior for `Fl_Window` and `Fl_Pack` derived widgets, and therefore the programmer must explicitly set the window's `resizable` attribute if they want to allow the window to be resized.

7.2 Resizing can be simple

```
Summary:
group = new Fl_Group(xg, yg, wg, hg, "Simple Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
. . .
group->resizable(group); // simple proportional resizing
group->end()
```

The `resizable` may be set to the group itself, which means that all widgets within the group will resize as the group itself is resized. This is the default behavior for `Fl_Group` widgets, and is shown in the diagram below.

If the group is stretched horizontally, the widths of the widgets within the group are adjusted proportionally. The same is true for vertical resizing.

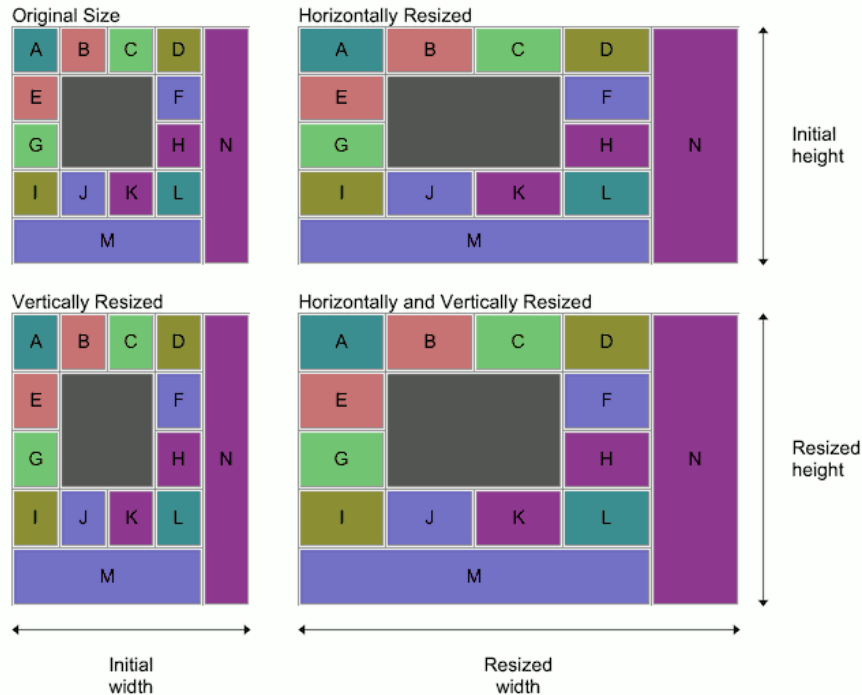

Figure 7.1 Proportional resizing example

7.3 Resizing can be complex

Summary:

```
group = new Fl_Group(xg, yg, wg, hg, "Complex Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
.
.
.
group->resizable(child1); // complex resizing
group->end();
```

It is when the group's `resizable` attribute is set to one of the group's child widgets, that things become really interesting.

In the diagram below, imagine vertical lines extending from the left and right sides of the yellow widget marked "resizable", and horizontal lines extending from the top and bottom sides. Exactly which widgets resize, and by how much, is determined by which ones lie completely or partially within this cross.

The widgets marked B, C, J, K and M clearly lie completely or partially within the vertical part of the cross; the widgets marked E, F, G, H and N lie completely or partially within the horizontal part of the cross; and the widgets marked A, D, I and L do not overlap with the cross at all. The resizing behavior is as follows:

- the width and height of the `resizable` widget increase to match the change in the width and height of the group widget as it is stretched;
- the widths of those widgets that overlap with the vertical part of the cross increase proportionally as the width of the group widget increases, but their heights remain unchanged, i.e. the widgets marked B, C, J, K and M;
- the heights of those widgets that overlap with the horizontal part of the cross increase proportionally as the height of the group widget increases, but their widths remain unchanged, i.e. the widgets marked E, F, G, H and N;

- the widths and heights of the remaining widgets stay the same, i.e. the widgets marked A, D, I and L stay the same size.

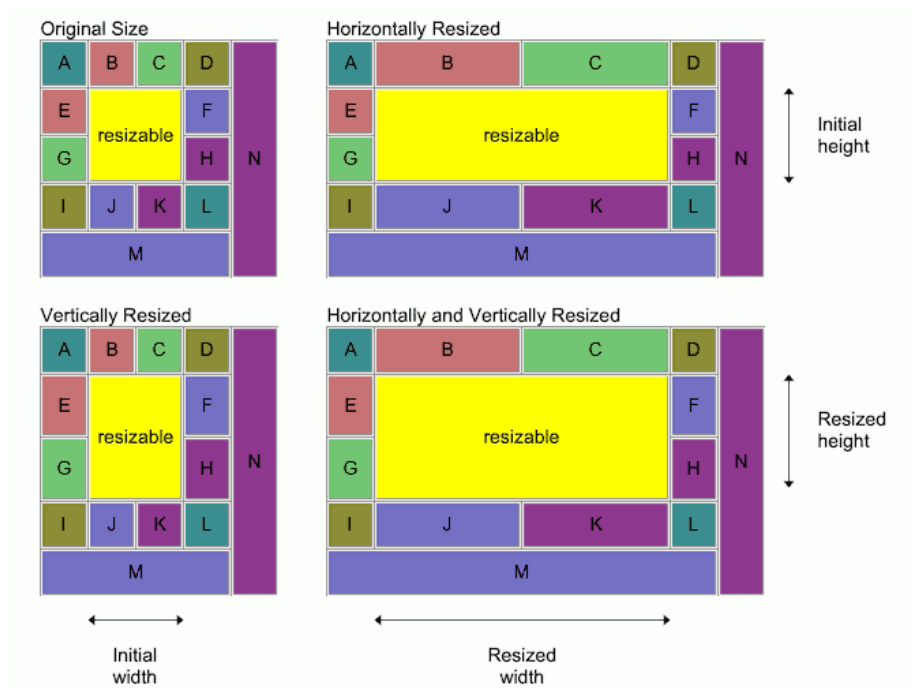

Figure 7.2 Complex resizing example

7.4 Practical examples

Why is this so powerful, you may ask. Well, every widget group can have a completely independent resizing strategy. By replacing one or more of the group's "normal" child widgets with another group widget where all of the above rules can be applied again, it is possible to create a hierarchy of group widgets with very complex layouts and resizing behavior.

Consider a simple dialog box, consisting of an icon box and a message area on the top and a button at the bottom right: which widget should be the `resizable` one?

Setting the `resizable` to be the icon box won't give us what we want:

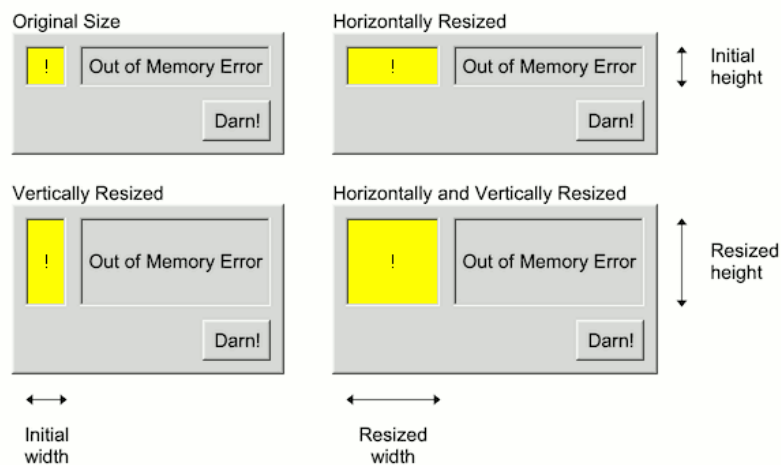

Figure 7.3 Resizing dialog example (a)

The message text area would be the logical choice so that the user can expand the dialog to see if there is more of an explanation below the short error message. This results in the behavior shown in the diagram below.

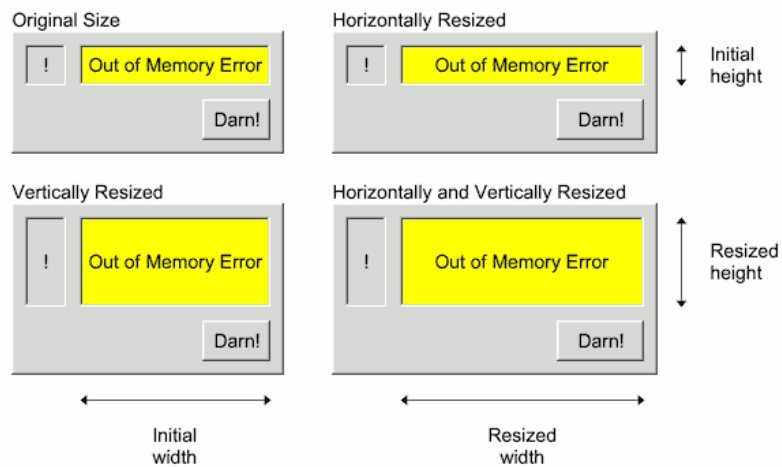

Figure 7.4 Resizing dialog example (b)

The result is close to what we want, but not quite: the text area will fully resize, the "!" icon box will resize vertically but not horizontally, which we can live with, but the "Darn!" button will - wait a minute - resize horizontally?

That's ugly. How do we stop that from happening? Simple: put it in its own group and set the `resizable` to an invisible box widget, as shown in the diagram below.

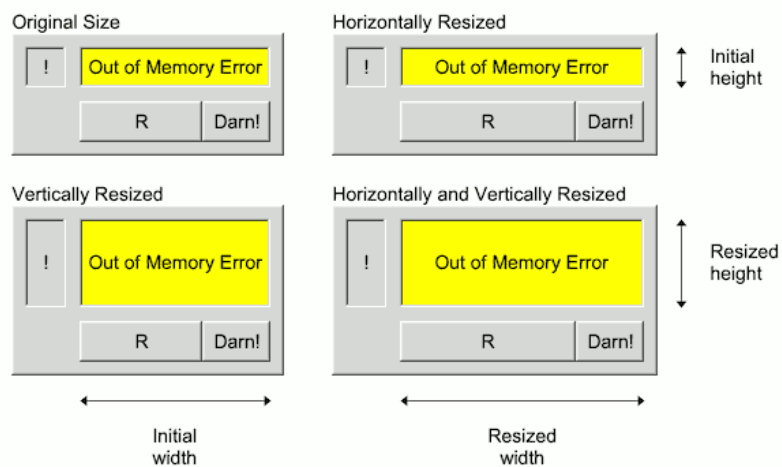

Figure 7.5 Resizing dialog example (c)

Now the invisible box, shown as "R", takes all of the horizontal resizing and the "Darn!" box will stay as it is. Here's the skeleton code:

```
dialog = new Fl_Window(300, 100);
icon = new Fl_Box(0, 0, 50, 50, "!");
text = new Fl_Box(50, 0, 250, 40, "Out of Memory Error");
btns = new Fl_Group(50, 50, 250, 50); // parent group
darn = new Fl_Button(200, 50, 100, 50, "Darn!");
R = new Fl_Box(50, 50, 150, 50); // "invisible" box "R"
R->hide(); // make sure it's invisible
btns->resizable(R); // make "R" parent group resizable
btns->end();
dialog->resizable(text);
dialog->end();
```

Imagine instead that you have a group that has a button, an input field, another button and a second input field, all next to each other, and you want the input fields to resize equally, but not the buttons. How could you achieve this?

Setting either of the input fields to be the `resizable` leaves the other one fixed, as shown below:

Figure 7.6 Resizing input fields example (b)

The answer is to leave the `resizable` of the group set to itself, and to create two equal size subgroups, each of which will resize equally. Add a button and input field to each subgroup, and set each subgroup's `resizable` to the input field, as shown below. Tada!

Figure 7.7 Resizing input fields example (b)

In FLTK it is possible to solve almost any layout and resizing problem by introducing an invisible box into a group, or an extra group into the widget hierarchy. It might take some thought to achieve exactly what you want and sometimes it is necessary to introduce parallel hierarchies in order to get widgets in different groups to resize together.

Imagine you have a group containing three widgets in a row, and you want the widget in the middle to stay the same size when the group is stretched and the ones on either side and the padding between them to resize symmetrically. As described earlier, the default resizing behavior for a group results in proportional resizing of the child widgets (and also of the margins and padding between them) as shown below, which is clearly not what you want.

Figure 7.8 Resizing a row of widgets (a)

Simply adding a group around A and B and setting its `resizable` to A, as in the previous btn-input example, will mean that B stays the same size, but the other widgets won't resize symmetrically, so what else is needed? It isn't immediately obvious how to solve this problem, even for experienced FLTK users. This is possibly because users are generally advised to design widgets so that they don't overlap.

Albrecht Schlosser proposed an innovative technique that involves an invisible box that deliberately overlaps others to achieve the desired behavior. For the current example, this means inserting two new groups into the existing group and adding a hidden `resizable` widget.

The first group, shown in red below, extends from the left edge of the parent group to the middle of the gap between boxes B and C on the right. This first group contains boxes A and B, where A is the first group's `resizable` attribute.

The second group, shown in blue, extends from the right edge of the first group to the right edge of the parent group. This second group contains box C, where C is the second group's `resizable`.

The extra box widget is added to the parent group and is set as the group's `resizable`. The three `resizable` widgets are shown in yellow.

The clever bit is that this extra box widget is not horizontally aligned with any of the existing groups and widgets in the usual way, but instead overlaps the right and left parts of the two new groups by the same small amount, which means that its midpoint is aligned with the edge between the groups.

Note that, for clarity, the height of the original group has been increased to allow space for the additional annotation and to highlight the extra resizable box in the extra space at the bottom of the group. This is fine for the horizontal-only resizing shown here, but means that widgets A, B and C will never change height because the extra resizable box does not overlap them vertically. Only the padding below them will be resized.

Figure 7.9 Resizing a row of widgets (b)

In a real application, you probably want to allow widgets A, B and C to resize vertically while the height of any padding or widgets above or below remains fixed, so the extra resizable box has to lie within the height of widgets A, B and C. Obviously after calling `hide()` on the box it is no longer visible, and may therefore be the same height as the other widgets, or a fraction of the height, as shown below.

Figure 7.10 Resizing a row of widgets (c)

To summarize the key points of the new technique:

- The new resizable widget must overlap the widgets on each side by exactly the same amount.
- The width of the new resizable widget is not fixed, but should probably be a relatively small value to avoid potential problems.
- The total width of the two new groups must equal the width of the existing group and there can be no offsets or gaps between them because margins and gaps will affect the resizing behavior.
- The same principles apply to vertical resizing.

Chapter 8

Designing a Simple Text Editor

This chapter guides you through the design of a simple FLTK-based text editor.

The complete source code for our text editor can be found in the `test/editor.cxx` file.

The tutorial comprises multiple chapters, and you can activate the relevant code by adjusting the `TUTORIAL_↔CHAPTER` macro at the top of the source file to match the chapter number.

Each chapter builds on the previous one. The documentation, as well as the source code, can be read sequentially, maintaining a consistent program structure while introducing additional features step by step.

Note

The tutorial uses several global variables for brevity. Additionally, the order of code blocks is rather uncommon but helps to keep related features within a chapter.

8.1 Determining the Goals of the Text Editor

As our first step, we define what we want our text editor to do:

1. Edit a single text document.
2. Provide a menubar/menus for all functions.
3. Load from a file.
4. Save to a file.
5. Keep track of when the file has been changed.
6. Cut/copy/delete/paste menus.
7. Search and replace functionality.
8. Multiple views of the same text.
9. "C" language syntax highlighting.

8.2 Chapter 1: A Minimal App

Let's ensure that we can set up our build process to compile and verify our code as we add features. We begin by writing a minimal program with no other purpose than opening a window.

The code for that is barely longer than a "Hello, world" program and is marked in the source code as `TUTORIAL`

```

__CHAPTER = 1.
#include <FL/Fl_Double_Window.H>
#include <FL/Fl.H>
Fl_Double_Window *app_window = NULL;
void tut1_build_app_window() {
    app_window = new Fl_Double_Window(640, 480, "FLTK Editor");
}
int main (int argc, char **argv) {
    tut1_build_app_window();
    app_window->show(argc, argv);
    return Fl::run();
}

```

Passing `argc` and `argv` to `Fl_Double_Window::show()` allows FLTK to parse command line options, providing the user with the ability to change the color or graphical scheme of the editor at launch time.

`Fl::run()` will return when no more windows in the app are visible. In other words, if all windows in an app are closed, hidden, or deleted. Pressing "Escape" or clicking the "Close" button in the window frame will close our only window, prompting `Fl::run()` to return, effectively ending the app.

When building FLTK from source, the CMake environment includes the necessary rules to build the editor. You can find more information on how to write your own CMake files in the `README.CMake.txt` text in the top FLTK directory.

For Linux and macOS, FLTK comes with the `fltk-config` script that generates the compiler commands for you:

```
fltk-config --compile editor.cxx
```

If the code compiles and links correctly, running the app will pop up an empty application window on the desktop screen. You can close the window and quit the app by pressing the 'Escape' key or by clicking the "Close" button in the window frame.

Congratulations, you've just built a minimal FLTK app.

8.3 Chapter 2: Adding a Menu Bar

In this chapter, we will handle the window title and add the main menu bar with a File menu and a Quit button.

We need to declare a variable to track track changes in the text, and a buffer for the current filename.

```

// remove `main()` from chapter 1, but keep the rest of the code, then add...
#include <FL/Fl_Menu_Bar.H>
#include <FL/fl_ask.H>
#include <FL/Fl_filename.H>
#include <FL/fl_string_functions.h>
Fl_Menu_Bar *app_menu_bar = NULL;
bool text_changed = false;
char app_filename[FL_PATH_MAX] = "";

```

The window title is either "FLTK Editor" if the text is not saved in any file, or the filename, followed by an * if the text changed. Note that we have two ways to set the label of a widget. `label()` will link a static text, and `copy_label()` which will copy and manage the label text.

```

void update_title() {
    const char *fname = NULL;
    if (app_filename[0])
        fname = fl_filename_name(app_filename);
    if (fname) {
        char buf[FL_PATH_MAX + 3];
        if (text_changed) {
            snprintf(buf, FL_PATH_MAX+2, "%s *", fname);
        } else {

```

```

    snprintf(buf, FL_PATH_MAX+2, "%s", fname);
}
app_window->copy_label(buf);
} else {
    app_window->label("FLTK Editor");
}
}
}

```

Now instead of writing directly to `text_changed`, we write a function that can set and clear the flag, and update the title accordingly.

```

void set_changed(bool v) {
    if (v != text_changed) {
        text_changed = v;
        update_title();
    }
}

```

Let's do the same for changing the filename. If the new filename is NULL, the window title will revert to "FLTK Editor".

```

void set_filename(const char *new_filename) {
    if (new_filename) {
        fl_strncpy(app_filename, new_filename, FL_PATH_MAX);
    } else {
        app_filename[0] = 0;
    }
    update_title();
}

```

But enough of managing window titles. The following code will add the first widget to our window. A menubar is created at the top and all across the main window.

```

void menu_quit_callback(Fl_Widget *, void *) { /* TODO */ }
void tut2_build_app_menu_bar() {
    app_window->begin();
    app_menu_bar = new Fl_Menu_Bar(0, 0, app_window->w(), 25);
    app_menu_bar->add("File/Quit Editor", FL_COMMAND+'q', menu_quit_callback);
    app_window->callback(menu_quit_callback);
    app_window->end();
}
int main (int argc, char **argv) {
    tut1_build_app_window();
    tut2_build_app_menu_bar();
    app_window->show(argc, argv);
    return Fl::run();
}

```

`begin()` tells FLTK to add all widgets created hereafter to our `app_window`. In this particular case, it is redundant because creating the window in the previous chapter already called `begin()` for us.

In the next line, we create the menu bar and add our first menu item to it. Menus can be constructed like file paths, with forward slashes '/' separating submenus from menu items.

Our basic callback is simple:

```

void menu_quit_callback(Fl_Widget *, void *) {
    Fl::hide_all_windows();
}

```

`Fl::hide_all_windows()` will make all windows invisible, causing `Fl::run()` to return and `main` to exit.

The next line, `app_window->callback(menu_quit_callback)` links the same `menu_quit_callback` to the `app_window` as well. Assigning the window callback removes the default "Escape" key handling and allows the `menu_quit_callback` to handle that keypress with a friendly dialog box instead of just quitting the app.

The `Fl_Widget*` parameter in the callback will either be `app_window` if called through the window callback, or `app_menu_bar` if called by one of the menu items.

One of our goals was to keep track of text changes. If we know the text changed and is unsaved, we should notify the user that she is about to lose her work. We achieve this by adding a dialog box in the Quit callback that queries if the user really wants to quit, even if text was changed:

```

void menu_quit_callback(Fl_Widget *, void *) {
    if (text_changed) {
        int c = fl_choice("Changes in your text have not been saved.\n"
            "Do you want to quit the editor anyway?",
            "Quit", "Cancel", NULL);
        if (c == 1) return;
    }
    Fl::hide_all_windows();
}

```

8.4 Chapter 3: Adding a Text Editor widget

FLTK comes with a pretty capable builtin text editing widget. We will use this `Fl_Text_Editor` widget here to allow users to edit their documents.

`Fl_Text_Editor` needs an `Fl_Text_Buffer` to do anything useful. What might seem like an unnecessary extra step is a great feature: we can assign one text buffer to multiple text editors. In a later chapter, we will use this feature to implement a split editor window.

```
#include <FL/Fl_Text_Buffer.H>
#include <FL/Fl_Text_Editor.H>
Fl_Text_Editor *app_editor = NULL;
Fl_Text_Editor *app_split_editor = NULL; // for later
Fl_Text_Buffer *app_text_buffer = NULL;
// ... callbacks go here
void tut3_build_main_editor() {
    app_window->begin();
    app_text_buffer = new Fl_Text_Buffer();
    app_text_buffer->add_modify_callback(text_changed_callback, NULL);
    app_editor = new Fl_Text_Editor(0, app_menu_bar->h(),
        app_window->w(), app_window->h() - app_menu_bar->h());
    app_editor->buffer(app_text_buffer);
    app_editor->textfont(FL_COURIER);
    app_window->resizable(app_editor);
    app_window->end();
}
```

By setting the `app_editor` to be the `resizable()` property of `app_window`, we make our application window resizable on the desktop, and we ensure that resizing the window will only resize the text editor vertically, but not our menu bar.

To keep track of changes to the document, we add a callback to the text editor that will be called whenever text is added or deleted. The text modify callback sets our `text_changed` flag if text was changed:

```
// insert before tut3_build_main_editor()
void text_changed_callback(int, int n_inserted, int n_deleted, int, const char*, void*) {
    if (n_inserted || n_deleted)
        set_changed(true);
}
```

To wrap this chapter up, we add a "File/New" menu and link it to a callback that clears the text buffer, clears the current filename, and marks the buffer as unchanged.

```
// insert before tut3_build_main_editor()
void menu_new_callback(Fl_Widget*, void*) {
    app_text_buffer->text("");
    set_changed(false);
}
// insert at the end of tut3_build_main_editor()
...
// find the Quit menu and insert the New menu there
int ix = app_menu_bar->find_index(menu_quit_callback);
app_menu_bar->insert(ix, "New", FL_COMMAND+'n', menu_new_callback);
...
```

8.5 Chapter 4: Reading and Writing Files

In this chapter, we will add support for loading and saving text files, so we need three more menu items in the File menu: Open, Save, and Save As.

```
#include <FL/Fl_Native_File_Chooser.H>
#include <FL/platform.H>
#include <errno.h>
// ... add callbacks here
void tut4_add_file_support() {
    int ix = app_menu_bar->find_index(menu_quit_callback);
    app_menu_bar->insert(ix, "Open", FL_COMMAND+'o', menu_open_callback, NULL, FL_MENU_DIVIDER);
    app_menu_bar->insert(ix+1, "Save", FL_COMMAND+'s', menu_save_callback);
    app_menu_bar->insert(ix+2, "Save as...", FL_COMMAND+'S', menu_save_as_callback, NULL, FL_MENU_DIVIDER);
}
```

Note

The menu shortcuts `FL_COMMAND+'s'` and `FL_COMMAND+'S'` look the same at a first glance, but the second shortcut is actually `Ctrl-Shift-S` due to the capital letter 'S'. Also, we use `FL_COMMAND` as our menu shortcut modifier key. `FL_COMMAND` translates to `FL_CTRL` on Windows and Linux, and to `FL_META` on macOS, better known as the cloverleaf, or simply "the Apple key".

We implement the Save As callback first, because we will want to call it from the Open callback later. The basic callback is only a few lines of code.

```
void menu_save_as_callback(Fl_Widget*, void*) {
    Fl_Native_File_Chooser file_chooser;
    file_chooser.title("Save File As...");
    file_chooser.type(Fl_Native_File_Chooser::BROWSE_SAVE_FILE);
    if (file_chooser.show() == 0) {
        app_text_buffer->savefile(file_chooser.filename());
        set_filename(file_chooser.filename());
        set_changed(false);
    }
}
```

However if the user has already set a file name including path information, it is the polite thing to preload the file chooser with that information. This little chunk of code will separate the file name from the path before we call `file_chooser.show()`:

```
// insert before 'if (file_chooser.show()...'
if (app_filename[0]) {
    char temp_filename[FL_PATH_MAX];
    fl_strncpy(temp_filename, app_filename, FL_PATH_MAX);
    const char *name = fl_filename_name(temp_filename);
    if (name) {
        file_chooser.preset_file(name);
        temp_filename[name - temp_filename] = 0;
        file_chooser.directory(temp_filename);
    }
}
```

Great. Now let's add code for our File/Save menu. If no filename was set yet, it falls back to our Save As callback. `Fl_Text_Editor::savefile()` writes the contents of our text widget into a UTF-8 encoded text file.

```
void menu_save_callback(Fl_Widget*, void*) {
    if (!app_filename[0]) {
        menu_save_as_callback(NULL, NULL);
    } else {
        app_text_buffer->savefile(file_chooser.filename());
        set_changed(false);
    }
}
```

Now that we have a save method available, we can improve the `menu_quit_callback` and offer the option to save the current modified text before quitting the app. Here is the new quit callback code that replaces the old callback:

```
void menu_quit_callback(Fl_Widget *, void *) {
    if (text_changed) {
        int r = fl_choice("The current file has not been saved.\n"
            "Would you like to save it now?",
            "Cancel", "Save", "Don't Save");
        if (r == 0) // cancel
            return;
        if (r == 1) { // save
            menu_save_callback(NULL, NULL);
            return;
        }
    }
    Fl::hide_all_windows();
}
```

On to loading a new file. Let's write the function to load a file from a given file name:

```
void load(const char *filename) {
    if (app_text_buffer->loadfile(filename) == 0) {
        set_filename(filename);
        set_changed(false);
    }
}
```

A friendly app should warn the user if file operations fail. This can be done in three lines of code, so let's add an alert dialog after every `loadfile` and `savefile` call. This is exemplary for `load()`, and the code is very similar for the two other locations.

```

void load(const char *filename) {
    if (app_text_buffer->loadfile(filename) == 0) {
        set_filename(filename);
        set_changed(false);
    } else {
        fl_alert("Failed to load file\n%s\n%s",
                filename,
                strerror(errno));
    }
}

```

If the user selects our pulldown "Load" menu, we first check if the current text was modified and provide a dialog box that offers to save the changes before loading a new text file:

```

void menu_open_callback(Fl_Widget*, void*) {
    if (text_changed) {
        int r = fl_choice("The current file has not been saved.\n"
                        "Would you like to save it now?",
                        "Cancel", "Save", "Don't Save");

        if (r == 2)
            return;
        if (r == 1)
            menu_save_callback();
    }
    ...
}

```

If the user did not cancel the operation, we pop up a file chooser for loading the file, using similar code as in Save As.

```

...
Fl_Native_File_Chooser file_chooser;
file_chooser.title("Open File...");
file_chooser.type(Fl_Native_File_Chooser::BROWSE_FILE);
...

```

Again, we preload the file chooser with the last used path and file name:

```

...
if (app_filename[0]) {
    char temp_filename[FL_PATH_MAX];
    fl_strlcpy(temp_filename, app_filename, FL_PATH_MAX);
    const char *name = fl_filename_name(temp_filename);
    if (name) {
        file_chooser.preset_file(name);
        temp_filename[name - temp_filename] = 0;
        file_chooser.directory(temp_filename);
    }
}
...

```

And finally, we pop up the file chooser. If the user cancels the file dialog, we do nothing and keep the current file. Otherwise, we call the `load()` function that we already wrote:

```

if (file_chooser.show() == 0)
    load(file_chooser.filename());
}

```

We really should support two more ways to load documents from a file. Let's modify the "show and run" part of `main()` to handle command line parameters and desktop drag'n'drop operations. For that, we refactor the last two lines of `main()` into a new function:

```

// ... new function here
int main(int argc, char **argv) {
    tut1_build_app_window();
    tut2_build_app_menu_bar();
    tut3_build_main_editor();
    tut4_add_file_support();
    // ... refactor those into the new function
    // app_window->show(argc, argv);
    // return Fl::run();
    return tut4_handle_commandline_and_run(argc, argv);
}

```

Our function to show the window and run the app has a few lines of boilerplate code. `Fl::args_to_utf8()` converts the command line argument from whatever the host system provides into Unicode. `Fl::args()` goes through the list of arguments and gives `args_handler()` a chance to handle each argument. It also makes sure that FLTK specific args are still forwarded to FLTK, so `--scheme plastic` and `--background #aaccff` will draw beautiful blue buttons in a plastic look.

`fl_open_callback()` lets FLTK know what to do if a user drops a text file onto our editor icon (Apple macOS). Here, we ask it to call the `load()` function that we wrote earlier.

```
// ... args_handler here
int tut4_handle_commandline_and_run(int &argc, char **argv) {
    int i = 0;
    Fl::args_to_utf8(argc, argv);
    Fl::args(argc, argv, i, args_handler);
    fl_open_callback(load);
    app_window->show(argc, argv);
    return Fl::run();
}
```

Last work item for this long chapter: what should our `args_handler` do? We could handle additional command line options here, but for now, all we want to handle is file names and paths. Let's make this easy: if the current arg does not start with a '-', we assume it is a file name, and we call `load()`:

```
int args_handler(int argc, char **argv, int &i) {
    if (argv && argv[i] && argv[i][0]!='-') {
        load(argv[i]);
        i++;
        return 1;
    }
    return 0;
}
```

So this is our basic but quite functional text editor app in about 100 lines of code. The following chapters add some user convenience functions and show off some FLTK features including split editors and syntax highlighting.

8.6 Chapter 5: Cut, Copy, and Paste

The FLTK Text Editor widget comes with builtin cut, copy, and paste functionality, but as a courtesy, we should also offer these as menu items in the main menu.

In our feature list, we noted that we want to implement a split text editor. This requires that the callbacks know which text editor has the keyboard focus. Calling `Fl::focus()` may return `NULL` or other unknown widgets, so we add a little test in our callbacks:

```
void menu_cut_callback(Fl_Widget*, void* v) {
    Fl_Widget *e = Fl::focus();
    if (e && (e == app_editor || e == app_split_editor))
        Fl_Text_Editor::kf_cut(0, (Fl_Text_Editor*)e);
}
```

We can write very similar callbacks for undo, redo, copy, paste, and delete. Adding a new menu and the six menu items follows the same pattern as before. Using the Menu/Item notation will create an Edit menu for us:

```
void tut5_cut_copy_paste() {
    app_menu_bar->add("Edit/Undo", FL_COMMAND+'z', menu_undo_callback);
    app_menu_bar->add("Edit/Redo", FL_COMMAND+'z', menu_redo_callback, NULL, FL_MENU_DIVIDER);
    app_menu_bar->add("Edit/Cut", FL_COMMAND+'x', menu_cut_callback);
    app_menu_bar->add("Edit/Copy", FL_COMMAND+'c', menu_copy_callback);
    app_menu_bar->add("Edit/Paste", FL_COMMAND+'v', menu_paste_callback);
    app_menu_bar->add("Edit/Delete", 0, menu_delete_callback);
}
```

8.7 Chapter 6: Find and Find Next

Corporate called. They want a dialog box for their users that can search for some word in the text file. We can add this functionality using a callback and a standard FLTK dialog box.

Here is some code to find a string in a text editor. The first four lines make sure that we start our search at the cursor position of the current editor window. The rest of the code searches the string and marks it if found.

```
void find_next(const char *needle) {
    Fl_Text_Editor *editor = app_editor;
    Fl_Widget *e = Fl::focus();
    if (e && e == app_split_editor)
        editor = app_split_editor;
    int pos = editor->insert_position();
    int found = app_text_buffer->search_forward(pos, needle, &pos);
    if (found) {
        app_text_buffer->select(pos, pos + (int)strlen(needle));
    }
}
```

```

    editor->insert_position(pos + (int)strlen(needle));
    editor->show_insert_position();
} else {
    fl_alert("No further occurrences of '%s' found!", needle);
}
}

```

The callbacks are short, using the FLTK text field dialog box and the `find_next` function that we already implemented. The last searched text is saved in `last_find_text` to be reused by `menu_find_next_callback`. If no search text was set yet, or it was set to an empty text, "Find Next" will forward to `menu_find_callback` and pop up our "Find Text" dialog.

```

char last_find_text[1024] = "";
void menu_find_callback(Fl_Widget*, void* v) {
    const char *find_text = fl_input("Find in text:", last_find_text);
    if (find_text) {
        fl_strlcpy(last_find_text, find_text, sizeof(last_find_text));
        find_next(find_text);
    }
}
void menu_find_next_callback(Fl_Widget*, void* v) {
    if (last_find_text[0]) {
        find_next(last_find_text);
    } else {
        menu_find_callback(NULL, NULL);
    }
}

```

And of course we need to add two menu items to our main application menu.

```

...
app_menu_bar->add("Find/Find...", FL_COMMAND+'f', menu_find_callback);
app_menu_bar->add("Find/Find Next", FL_COMMAND+'g', menu_find_next_callback, NULL, FL_MENU_DIVIDER);
...

```

8.8 Chapter 7: Replace and Replace Next

To implement the next feature, we will need to implement our own "Find and Replace" dialog box. To make this dialog box useful, it needs the following elements:

- a text input field for the text that we want to find
- a text input field for the replacement text
- a button to find the next occurrence
- a button to replace the current text and find the next occurrence
- a button to close the dialog

This is rather complex functionality, so instead of adding more global variables, we will pack this dialog into a class, derived from `Fl_Window`.

Note

The tutorial uses `Fl_Double_Window` instead of `Fl_Window` throughout. Historically, on some platforms, `Fl_Window` renders faster, but has a tendency to flicker. In today's world, this has very little relevance and FLTK optimizes both window types. `Fl_Double_Window` is recommended unless there is a specific reason to use `Fl_Window`.

Let's implement the text replacement code first:

```
char last_replace_text[1024] = "";
void replace_selection(const char *new_text) {
    Fl_Text_Editor *editor = app_editor;
    Fl_Widget *e = Fl::focus();
    if (e && e == app_split_editor)
        editor = app_split_editor;
    int start, end;
    if (app_text_buffer->selection_position(&start, &end)) {
        app_text_buffer->remove_selection();
        app_text_buffer->insert(start, new_text);
        app_text_buffer->select(start, start + (int)strlen(new_text));
        editor->insert_position(start + (int)strlen(new_text));
        editor->show_insert_position();
    }
}
```

As before, the first four lines anticipate a split editor and find the editor that has focus. The code then deletes the currently selected text, replaces it with the new text, selects the new text, and finally sets the text cursor to the end of the new text.

The Replace_Dialog class

The Replace_Dialog class holds pointers to our active UI elements as well as all the callbacks for the dialog buttons.

```
class Replace_Dialog : public Fl_Double_Window {
    Fl_Input *find_text_input;
    Fl_Input *replace_text_input;
    Fl_Button *find_next_button;
    Fl_Button *replace_and_find_button;
    Fl_Button *close_button;
public:
    Replace_Dialog(const char *label);
    void show() FL_OVERRIDE;
private:
    static void find_next_callback(Fl_Widget*, void*);
    static void replace_and_find_callback(Fl_Widget*, void*);
    static void close_callback(Fl_Widget*, void*);
};
Replace_Dialog *replace_dialog = NULL;
```

The constructor creates the dialog and marks it as "non modal". This will make the dialog hover over the application window like a toolbox window until the user closes it, allowing multiple "find and replace" operations. So here is our constructor:

```
Replace_Dialog::Replace_Dialog(const char *label)
: Fl_Double_Window(430, 110, label)
{
    find_text_input = new Fl_Input(100, 10, 320, 25, "Find:");
    replace_text_input = new Fl_Input(100, 40, 320, 25, "Replace:");
    Fl_Flex* button_field = new Fl_Flex(100, 70, w()-100, 40);
    button_field->type(Fl_Flex::HORIZONTAL);
    button_field->margin(0, 5, 10, 10);
    button_field->gap(10);
    find_next_button = new Fl_Button(0, 0, 0, 0, "Next");
    find_next_button->callback(find_next_callback, this);
    replace_and_find_button = new Fl_Button(0, 0, 0, 0, "Replace");
    replace_and_find_button->callback(replace_and_find_callback, this);
    close_button = new Fl_Button(0, 0, 0, 0, "Close");
    close_button->callback(close_callback, this);
    button_field->end();
    set_non_modal();
}
```

All buttons are created inside an `Fl_Flex` group. They will be arranged automatically by `Fl_Flex`, so there is no need to set x and y coordinates or a width or height. `button_field` will lay out the buttons for us.

Note

There is no need to write a destructor or delete individual widgets. When we delete an instance of `Replace_Dialog`, all children are deleted for us.

The `show()` method overrides the window's `show` method. It adds some code to preload the values of the text fields for added convenience. It then pops up the dialog box by calling the original `Fl_Double_Window::show()`.

```
void Replace_Dialog::show() {
    find_text_input->value(last_find_text);
    replace_text_input->value(last_replace_text);
    Fl_Double_Window::show();
}
```

The buttons in the dialog need callbacks to be useful. If callbacks are defined within a class, they must be defined `static`, but a pointer to the class can be provided through the `user_data` field. We have done that in the constructor by adding `this` as the last argument when setting the callback, for example in `close_button->callback(close_callback, this);`.

The callback itself can then extract the `this` pointer with a static cast:

```
void Replace_Dialog::close_callback(Fl_Widget*, void* my_dialog) {
    Replace_Dialog *dlg = static_cast<Replace_Dialog*>(my_dialog);
    dlg->hide();
}
```

The callback for the Find button uses our already implemented `find_next` function:

```
void Replace_Dialog::find_next_callback(Fl_Widget*, void* my_dialog) {
    Replace_Dialog *dlg = static_cast<Replace_Dialog*>(my_dialog);
    fl_strlcpy(last_find_text, dlg->find_text_input->value(), sizeof(last_find_text));
    fl_strlcpy(last_replace_text, dlg->replace_text_input->value(), sizeof(last_replace_text));
    if (last_find_text[0])
        find_next(last_find_text);
}
```

The Replace button callback calls our newly implemented `replace_selection` function and then continues on to the `find_next_callback`:

```
void Replace_Dialog::replace_and_find_callback(Fl_Widget*, void* my_dialog) {
    Replace_Dialog *dlg = static_cast<Replace_Dialog*>(my_dialog);
    replace_selection(dlg->replace_text_input->value());
    find_next_callback(NULL, my_dialog);
}
```

This long chapter comes close to its end. We are missing menu items that pop up our dialog and that allow a quick "Replace and Find Next" functionality without popping up the dialog. The code is quite similar to the "Find" and "Find Next" code in the previous chapter:

```
void menu_replace_callback(Fl_Widget*, void*) {
    if (!replace_dialog)
        replace_dialog = new Replace_Dialog("Find and Replace");
    replace_dialog->show();
}

void menu_replace_next_callback(Fl_Widget*, void*) {
    if (!last_find_text[0]) {
        menu_replace_callback(NULL, NULL);
    } else {
        replace_selection(last_replace_text);
        find_next(last_find_text);
    }
}

void tut7_implement_replace() {
    app_menu_bar->add("Find/Replace...", FL_COMMAND+'r', menu_replace_callback);
    app_menu_bar->add("Find/Replace Next", FL_COMMAND+'t', menu_replace_next_callback);
}
```

8.9 Chapter 8: Editor Features

Chapter 7 was long an intense. Let's relax and implement something simple here. We want menus with check boxes that can toggle some text editor features on and off:

```
void tut8_editor_features() {
    app_menu_bar->add("Window/Line Numbers", FL_COMMAND+'l', menu_linenumbers_callback, NULL, FL_MENU_TOGGLE);
    app_menu_bar->add("Window/Word Wrap", 0, menu_wordwrap_callback, NULL, FL_MENU_TOGGLE);
}
```

The `Fl_Widget` parameter in callbacks always points to the widget that causes the callback. Menu items are not derived from widgets, so to find out which menu item caused a callback, we can do this:

```
void menu_linenumbers_callback(Fl_Widget* w, void*) {
    Fl_Menu_Bar* menu = static_cast<Fl_Menu_Bar*>(w);
    const Fl_Menu_Item* linenumbers_item = menu->mvalue();
}
```

```

if (linenumber_item->value()) {
    app_editor->linenumber_width(40);
} else {
    app_editor->linenumber_width(0);
}
app_editor->redraw();
}

```

Setting the width enables the line numbers, setting it to 0 disables the line number display. When changing the value of a widget, FLTK will make sure that the widget is redrawn to reflect the new value. When changing other attributes such as colors or fonts, FLTK assumes that many attributes are changed at the same time and leaves it to the user to call `Fl_Widget::redraw()` when done. Here we call `app_editor->redraw()` to make sure that the change in the line number setting is also drawn on screen.

Let's not forget to update the line number display for a potential split editor widget as well:

```

// add before the end of menu_linenumbers_callback
if (app_split_editor) {
    if (linenumber_item->value()) {
        app_split_editor->linenumber_width(40);
    } else {
        app_split_editor->linenumber_width(0);
    }
    app_split_editor->redraw();
}

```

The word wrap feature is activated by calling `Fl_Text_Editor::wrap_mode()` with the parameters `Fl_Text_Display::WRAP_AT_BOUNDS` and 0. It's deactivated with `Fl_Text_Display::WRAP_NONE`. The implementation of the callback is the same as `menu_linenumbers_callback`.

8.10 Chapter 9: Split Editor

When editing long source code files, it can be really helpful to split the editor to view statements at the top of the text while adding features at the bottom of the text in a split text view.

FLTK can link multiple text editors to a single text buffer. Let's implement this now. This chapter will show you how to rearrange widgets in an existing widget tree.

Our initializer removes the main text editor from the widget tree and replaces it with an `Fl_Tile`. A tile can hold multiple widgets that can then be resized interactively by the user by clicking and dragging the divider between those widgets.

We start by replacing the editor widget with a tile group of the same size.

```

#include <FL/Fl_Tile.H>
Fl_Tile *app_tile = NULL;
void tut9_split_editor() {
    app_window->begin();
    app_tile = new Fl_Tile(app_editor->x(), app_editor->y(),
                          app_editor->w(), app_editor->h());
    app_window->remove(app_editor);
}

```

Next we add our existing editor as the first child of the tile and create another text editor `app_split_editor` as the second child of the tile, but it's hidden for now with a height of zero pixels.

Note

Creating the new `Fl_Tile` also calls `Fl_Tile::begin()`.

Adding `app_editor` to the tile would have also removed it from `app_window`, so `app_window->remove(app_editor)` in the code above is not really needed, but illustrates what we are doing.

```

app_tile->add(app_editor);
app_split_editor = new FL_Text_Editor(app_tile->x(), app_tile->y()+app_tile->h(),
                                     app_tile->w(), 0);
app_split_editor->buffer(app_text_buffer);
app_split_editor->textfont(FL_COURIER);
app_split_editor->hide();

```

Now we clean up after ourselves and make sure that the resizables are all set correctly. Lastly, we add a menu item with a callback.

```

app_tile->end();
app_tile->size_range(0, 25, 25);
app_tile->size_range(1, 25, 25);
app_window->end();
app_window->resizable(app_tile);
app_tile->resizable(app_editor);
app_menu_bar->add("Window/Split", FL_COMMAND+'i', menu_split_callback, NULL, FL_MENU_TOGGLE);
}

```

Now with all widgets in place, the callback's job is to show and resize, or hide and resize the split editor. We can implement that like here:

```

void menu_split_callback(FL_Widget* w, void*) {
    FL_Menu_Bar* menu = static_cast<FL_Menu_Bar*>(w);
    const FL_Menu_Item* splitview_item = menu->mvalue();
    if (splitview_item->value()) {
        int h_split = app_tile->h()/2;
        app_editor->size(app_tile->w(), h_split);
        app_split_editor->resize(app_tile->x(), app_tile->y() + h_split,
                               app_tile->w(), app_tile->h() - h_split);
        app_split_editor->show();
    } else {
        app_editor->size(app_tile->w(), app_tile->h());
        app_split_editor->resize(app_tile->x(), app_tile->y()+app_tile->h(),
                               app_tile->w(), 0);
        app_split_editor->hide();
    }
    app_tile->resizable(app_editor);
    app_tile->init_sizes();
    app_tile->redraw();
}

```

8.11 Chapter 10: Syntax Highlighting

Chapter 10 adds a lot of code to implement "C" language syntax highlighting. Not all code is duplicated here in the documentation. Please check out `test/editor.cxx` for all the details.

The `FL_Text_Editor` widget supports highlighting of text with different fonts, colors, and sizes. The implementation is based on the excellent `NEdit` text editor core, from <https://sourceforge.net/projects/nedit/>, which uses a parallel "style" buffer which tracks the font, color, and size of the text that is drawn.

Styles are defined using the `FL_Text_Display::Style_Table_Entry` structure defined in `<FL/Fl_Text_Display.H>` ←

```

:
struct Style_Table_Entry {
    FL_Color color;
    FL_Font font;
    int size;
    unsigned attr;
};

```

The `color` member sets the color for the text, the `font` member sets the FLTK font index to use, and the `size` member sets the pixel size of the text. The `attr` member is currently not used.

For our text editor we'll define 7 styles for plain code, comments, keywords, and preprocessor directives:

```

FL_Text_Display::Style_Table_Entry styletable[] = { // Style table
    { FL_BLACK, FL_COURIER, FL_NORMAL_SIZE }, // A - Plain
    { FL_DARK_GREEN, FL_COURIER_ITALIC, FL_NORMAL_SIZE }, // B - Line comments
    { FL_DARK_GREEN, FL_COURIER_ITALIC, FL_NORMAL_SIZE }, // C - Block comments
    { FL_BLUE, FL_COURIER, FL_NORMAL_SIZE }, // D - Strings
    { FL_DARK_RED, FL_COURIER, FL_NORMAL_SIZE }, // E - Directives
    { FL_DARK_RED, FL_COURIER_BOLD, FL_NORMAL_SIZE }, // F - Types
    { FL_BLUE, FL_COURIER_BOLD, FL_NORMAL_SIZE } // G - Keywords
};

```

You'll notice that the comments show a letter next to each style - each style in the style buffer is referenced using a character starting with the letter 'A'.

You call the `highlight_data()` method to associate the style data and buffer with the text editor widget:

```
Fl_Text_Buffer *app_style_buffer;
app_editor->highlight_data(app_style_buffer, styletable,
                          sizeof(styletable) / sizeof(styletable[0]),
                          'A', style_unfinished_cb, 0);
```

Finally, you need to add a callback to the main text buffer so that changes to the text buffer are mirrored in the style buffer:

```
app_text_buffer->add_modify_callback(style_update, app_editor);
```

The `style_update()` function, like the `change_cb()` function described earlier, is called whenever text is added or removed from the text buffer. It mirrors the changes in the style buffer and then updates the style data as necessary:

```
//
// 'style_update()' - Update the style buffer...
//
void
style_update(int      pos,           // I - Position of update
             int      nInserted,    // I - Number of inserted chars
             int      nDeleted,     // I - Number of deleted chars
             int      nRestyled,    // I - Number of restyled chars
             const char *deletedText, // I - Text that was deleted
             void      *cbArg) {    // I - Callback data
    int start,                      // Start of text
        end;                       // End of text
    char last,                     // Last style on line
        *style,                   // Style data
        *text;                    // Text data

    // If this is just a selection change, just unselect the style buffer...
    if (nInserted == 0 && nDeleted == 0) {
        app_style_buffer->unselect();
        return;
    }
    // Track changes in the text buffer...
    if (nInserted > 0) {
        // Insert characters into the style buffer...
        style = new char[nInserted + 1];
        memset(style, 'A', nInserted);
        style[nInserted] = '\0';
        app_style_buffer->replace(pos, pos + nDeleted, style);
        delete[] style;
    } else {
        // Just delete characters in the style buffer...
        app_style_buffer->remove(pos, pos + nDeleted);
    }
    // Select the area that was just updated to avoid unnecessary
    // callbacks...
    app_style_buffer->select(pos, pos + nInserted - nDeleted);
    // Re-parse the changed region; we do this by parsing from the
    // beginning of the line of the changed region to the end of
    // the line of the changed region... Then we check the last
    // style character and keep updating if we have a multi-line
    // comment character...
    start = app_text_buffer->line_start(pos);
    end   = app_text_buffer->line_end(pos + nInserted - nDeleted);
    text  = app_text_buffer->text_range(start, end);
    style = app_style_buffer->text_range(start, end);
    last  = style[end - start - 1];
    style_parse(text, style, end - start);
    app_style_buffer->replace(start, end, style);
    ((Fl_Text_Editor *)cbArg)->redisplay_range(start, end);
    if (last != style[end - start - 1]) {
        // The last character on the line changed styles, so reparse the
        // remainder of the buffer...
        free(text);
        free(style);
        end   = app_text_buffer->length();
        text  = app_text_buffer->text_range(start, end);
        style = app_style_buffer->text_range(start, end);
        style_parse(text, style, end - start);
        app_style_buffer->replace(start, end, style);
        ((Fl_Text_Editor *)cbArg)->redisplay_range(start, end);
    }
    free(text);
    free(style);
}
```

The `style_parse()` function scans a copy of the text in the buffer and generates the necessary style characters for display. It assumes that parsing begins at the start of a line:

```

//
// 'style_parse()' - Parse text and produce style data.
//
void
style_parse(const char *text,
            char *style,
            int length) {
    char current;
    int col;
    int last;
    char buf[255],
        *bufptr;
    const char *temp;
    for (current = *style, col = 0, last = 0; length > 0; length --, text ++ ) {
        if (current == 'A') {
            // Check for directives, comments, strings, and keywords...
            if (col == 0 && *text == '#') {
                // Set style to directive
                current = 'E';
            } else if (strncmp(text, "//", 2) == 0) {
                current = 'B';
            } else if (strncmp(text, "/*", 2) == 0) {
                current = 'C';
            } else if (strncmp(text, "\\\"", 2) == 0) {
                // Quoted quote...
                *style++ = current;
                *style++ = current;
                text ++;
                length --;
                col += 2;
                continue;
            } else if (*text == '\\') {
                current = 'D';
            } else if (!last && islower(*text)) {
                // Might be a keyword...
                for (temp = text, bufptr = buf;
                    islower(*temp) && bufptr < (buf + sizeof(buf) - 1);
                    *bufptr++ = *temp++);
                if (!islower(*temp)) {
                    *bufptr = '\\0';
                    bufptr = buf;
                    if (bsearch(&bufptr, code_types,
                                sizeof(code_types) / sizeof(code_types[0]),
                                sizeof(code_types[0]), compare_keywords)) {
                        while (text < temp) {
                            *style++ = 'F';
                            text ++;
                            length --;
                            col ++;
                        }
                        text --;
                        length ++;
                        last = 1;
                        continue;
                    } else if (bsearch(&bufptr, code_keywords,
                                sizeof(code_keywords) / sizeof(code_keywords[0]),
                                sizeof(code_keywords[0]), compare_keywords)) {
                        while (text < temp) {
                            *style++ = 'G';
                            text ++;
                            length --;
                            col ++;
                        }
                        text --;
                        length ++;
                        last = 1;
                        continue;
                    }
                }
            }
        } else if (current == 'C' && strncmp(text, "*/", 2) == 0) {
            // Close a C comment...
            *style++ = current;
            *style++ = current;
            text ++;
            length --;
            current = 'A';
            col += 2;
            continue;
        } else if (current == 'D') {
            // Continuing in string...
            if (strncmp(text, "\\\"", 2) == 0) {
                // Quoted end quote...
                *style++ = current;
                *style++ = current;
                text ++;
                length --;
            }
        }
    }
}

```

```
        col += 2;
        continue;
    } else if (*text == '\\\"') {
        // End quote...
        *style++ = current;
        col ++;
        current = 'A';
        continue;
    }
}
// Copy style info...
if (current == 'A' && (*text == '{' || *text == '}')) *style++ = 'G';
else *style++ = current;
col ++;
last = isalnum(*text) || *text == '.';
if (*text == '\\n') {
    // Reset column and possibly reset the style
    col = 0;
    if (current == 'B' || current == 'E') current = 'A';
}
}
```

Chapter 9

FI_Terminal Technical Documentation

This chapter covers the vt100/xterm style "escape codes" used by [FI_Terminal](#) for cursor positioning, text colors, and other display screen control features such as full or partial screen clearing, up/down scrolling, character insert/delete, etc.

9.1 The Escape Codes FI_Terminal Supports

These are the escape codes [FI_Terminal](#) actually supports, and is not the 'complete' list that e.g. xterm supports. Most of the important stuff has been implemented, but esoteric features (such as scroll regions) has not.

Features will be added as the widget matures.

```
-----  
--- The CSI (Control Sequence Introducer, or "ESC[") ---  
-----  
ESC[#@ - (ICH) Insert blank Chars (default=1)  
ESC[#A - (CUU) Cursor Up, no scroll/wrap  
ESC[#B - (CUD) Cursor Down, no scroll/wrap  
ESC[#C - (CUF) Cursor Forward, no wrap  
ESC[#D - (CUB) Cursor Back, no wrap  
ESC[#E - (CNL) Cursor Next Line (crlf) xterm, !gnome  
ESC[#F - (CPL) Cursor Preceding Line: move to sol and up # lines  
ESC[#G - (CHA) Cursor Horizontal Absolute positioning  
  
    ESC[G - move to column 1 (start of line, sol)  
    ESC[#G - move to column #  
ESC[#H - (CUP) Cursor Position (#'s are 1 based)  
  
    ESC[H - go to row #1  
    ESC[#H - go to (row #) (default=1)  
    ESC[#;#H - go to (row# ; col#)  
ESC[#I - (CHT) Cursor Horizontal Tab: tab forward  
  
    ESC[#I - tab # times (default 1)  
ESC[#J - (ED) Erase in Display  
  
    ESC[0J - clear to end of display (default)  
    ESC[1J - clear to start of display  
    ESC[2J - clear all lines  
    ESC[3J - clear screen history  
ESC[#K - (EL) Erase in line  
  
    ESC[0K - clear to end of line (default)  
    ESC[1K - clear to start of line  
    ESC[2K - clear current line  
ESC[#L - (IL) Insert # Lines (default=1)  
ESC[#M - (DL) Delete # Lines (default=1)  
ESC[#P - (DCH) Delete # Chars (default=1)  
ESC[#S - (SU) Scroll Up # lines (default=1)  
ESC[#T - (SD) Scroll Down # lines (default=1)  
ESC[#X - (ECH) Erase Characters (default=1)  
ESC[#Z - (CBT) Cursor Backwards Tab  
  
    ESC[#Z - backwards tab # times (default=1)
```

```

ESC[#a - (HPR) move cursor relative [columns] (default=[row,col+1]) (NOT IMPLEMENTED)
ESC[#b - (REP) repeat prev graphics char # times (NOT IMPLEMENTED)
ESC[#d - (VPA) Line Position Absolute [row] (NOT IMPLEMENTED)
ESC[#e - (LPA) Line Position Relative [row] (NOT IMPLEMENTED)
ESC[#f - (CUP) cursor position (#'s 1 based), same as ESC[H
ESC[#g - (TBC) Tabulation Clear

```

```

ESC[0g - Clear tabstop at cursor
ESC[3g - Clear all tabstops
ESC[#m - (SGR) Set Graphic Rendition

```

*** Attribute Enable ***

```

ESC[0m - reset: normal attribs/default fg/bg color (VT100)
ESC[1m - bold (VT100)
ESC[2m - dim
ESC[3m - italic
ESC[4m - underline (VT100)
ESC[5m - blink (NOT IMPLEMENTED) (VT100)
ESC[6m - (unused)
ESC[7m - inverse (VT100)
ESC[8m - (unused)
ESC[9m - strikeout
ESC[21m - doubly underline (Currently this just does single underline)

```

*** Attribute Disable ***

```

ESC[22m - disable bold/dim
ESC[23m - disable italic
ESC[24m - disable underline
ESC[25m - disable blink (NOT IMPLEMENTED)
ESC[26m - (unused)
ESC[27m - disable inverse
ESC[28m - disable hidden
ESC[29m - disable strikeout

```

*** Foreground Text "8 Color" ***

```

ESC[30m - fg Black
ESC[31m - fg Red
ESC[32m - fg Green
ESC[33m - fg Yellow
ESC[34m - fg Blue
ESC[35m - fg Magenta
ESC[36m - fg Cyan
ESC[37m - fg White
ESC[39m - fg default

```

*** Background Text "8 Color" ***

```

ESC[40m - bg Black
ESC[41m - bg Red
ESC[42m - bg Green
ESC[43m - bg Yellow
ESC[44m - bg Blue
ESC[45m - bg Magenta
ESC[46m - bg Cyan
ESC[47m - bg White
ESC[49m - bg default

```

*** Special RGB Color ***

```

ESC [ 38 ; Red ; Grn ; Blue m - where Red,Grn,Blu are decimal (0-255)
ESC[s - save cursor pos (ansi.sys+xterm+gnome, but NOT vt100)
ESC[u - rest cursor pos (ansi.sys+xterm+gnome, but NOT vt100)
ESC[>#q - (DECSCA) Set Cursor style (block/line/blink..) (NOT IMPLEMENTED)
ESC[#;#x - (DECSTBM) Set scroll Region top;bot (NOT IMPLEMENTED)
ESC[#..$t - (DECRARA) (NOT IMPLEMENTED)

```

--- C1 Control Codes ---

```

<ESC>c - (RIS) Reset term to Initial State
<ESC>D - (IND) Index: move cursor down a line, scroll if at bottom
<ESC>E - (NEL) Next Line: basically do a crlf, scroll if at bottom
<ESC>H - (HTS) Horizontal Tab Set: set a tabstop
<ESC>M - (RI) Reverse Index (up w/scroll)

```

NOTE: Acronyms in parens are Digital Equipment Corporation's names these VT features.

9.3 FI_Terminal Design Document

When I started this project, I identified the key concepts needed to implement `FI_Terminal`:

- Draw and manage multiline Unicode text in FLTK
- Allow per-character colors and attributes
- Efficient screen buffer to handle "scrollback history"
- Efficient scrolling with vertical scrollbar for even large screen history
- Mouse selection for copy/paste
- Escape code management to implement VT100 style / ANSI escape codes.

A class was created for each character, since characters can be either ASCII or Utf8 encoded byte sequences. This class is called `Utf8Char`, and handles the character, its fg and bg color, and any attributes like dim, bold, italic, etc.

For managing the screen, after various experiments, I decided a ring buffer was the best way to manage things, the ring split in two:

- 'screen history' which is where lines scrolled off the top are saved
- 'display screen' displayed to the user at all times, and where the cursor lives

Scrolling the display, either by scrollbar or by new text causing the display to scroll up one line, would simply change an 'offset' index# of where in the ring buffer the top of the screen is, automatically moving the top line into the history, all without moving memory around.

In fact the only time screen memory is moved around is during these infrequent operations:

- during scrolling "down"
- character insert/delete operations within a line
- changing the display size
- changing the history size

So a class "RingBuffer" is defined to manage the ring, and accessing its various parts, either as the entire entity ring, just the history, or just the display.

These three concepts, "ring", "history" and "display" are given abbreviated names in the RingBuffer class's API:

NOTE: Abbreviations "hist" and "disp"

"history" may be abbreviated as "hist", and "display" as "disp" in both this text and the source code. 4 character names are used so they line up cleanly in the source, e.g.

```
ring_rows()    ring_cols()
hist_rows()    hist_cols()
disp_rows()    disp_cols()

    4 characters
```

These concepts were able to fit into C++ classes:

Utf8Char

Each character on the screen is a "Utf8Char" which can manage the UTF-8 encoding of any character as one or more bytes. Also in that class is a byte for an attribute (underline, bold, etc), and two integers for fg/bg color.

RingBuffer

The RingBuffer class keeps track of the buffer itself, a single array of Utf8Chars called "ring_chars" whose width is ring_cols() and whose height is ring_rows().

The "top" part of the ring is the history, whose width is hist_cols() and whose height is hist_rows(). hist_use_rows() is used to define what part of the history is currently in use.

The "bottom" part of the ring is the display, whose width is disp_cols() and whose height is disp_rows().

An index number called "offset" points to where in the ring buffer the top of the ring currently is. This index changes each time the screen is scrolled, and affects both where the top of the display is, and where the top of the history is.

The memory layout of the Utf8Char character array is:

```
ring_chars[]:
|-----|
| History | | hist_rows
|-----| |
|         | | _v_
| Display | | disp_rows
|-----| |
|         | | _v_
|<----->|
    ring_cols
    hist_cols
    disp_cols
```

So it's basically a single continuous array of Utf8Char instances where any character can generally be accessed by index# using the formula:

```
ring_chars[ (row*ring_cols)+col ]
```

..where 'row' is the desired row, 'col' is the desired column, and 'ring_cols' is how many columns "wide" the buffer is.

The "offset" index affects that formula as an extra row offset, and the resulting index is then clamped within the range of the ring buffer using modulus.

Methods are used to allow direct access to the characters in the buffer that automatically handle the offset and modulus formulas, namely:

```
u8c_ring_row(row,col) // access the entire ring by row/col
u8c_hist_row(row,col) // access just the history buffer
u8c_disp_row(row,col) // access just the display buffer
```

A key concept is the use of the simple 'offset' index integer to allow the starting point of the history and display to be moved around to implement 'text scrolling', such as when crlf at the screen bottom causes a 'scroll up'.

This is simply an "index offset" integer applied to the hist and disp indexes when drawing the display. So after scrolling two lines up, the offset is just increased by 2, redefining where the top of the history and display are, e.g.

```
Offset is 0:          2      Offset now 2:
                        >      D i s p l a y
                        >
H i s t o r y
                        2      H i s t o r y
                        >
D i s p l a y          >      D i s p l a y
```

This 'offset' trivially implements "text scrolling", avoiding having to physically move memory around. Just the 'offset' changes, the text remains where it is in memory.

This also makes it appear the top line in the display is 'scrolled up' into the bottom of the scrollbar 'history'.

If the offset exceeds the size of the ring buffer, it simply wraps around back to the beginning of the buffer with a modulo.

Indexes into the display and history are also modulo their respective rows, e.g.

```
act_ring_index = (hist_rows + disp_row + offset - scrollbar_pos) % ring_rows;
```

This way indexes for ranges can run beyond the bottom of the ring, and automatically wrap around the ring, e.g.

```

> 2
  3   D i s p l a y
  4
    <-- offset points here

disp
index   H i s t o r y
wraps

      0   D i s p l a y
      1   <- ring_rows points to end of ring
2 :
      3 :
disp_row(5) -> 4 :.....:

```

The dotted lines show where the display would be if not for the fact it extends beyond the bottom of the ring buffer (due to the current offset), and therefore wraps up to the top of the ring.

So to find a particular row in the display, in this case a 5 line display whose lines lie between 0 and 4, some simple math calculates the row position into the ring:

```

act_ring_index = (histrows      // the display exists AFTER the history, so offset the hist_rows
                  + offset      // include the scroll 'offset'
                  + disp_row     // add the desired row relative to the top of the display (0..disp_rows)
                  ) % ring_rows; // make sure the resulting index is within the ring buffer (0..ring_rows)

```

An additional bit of math makes sure if a negative result occurs, that negative value works relative to the end of the ring, e.g.

```

if (act_ring_index < 0) act_ring_index = ring_rows + act_ring_index;

```

This guarantees the `act_ring_index` is within the ring buffer's address space, with all offsets applied.

The math that implements this can be found in the `u8c_xxxx_row()` methods, where "xxxx" is one of the concept regions "ring", "hist" or "disp":

```

Utf8Char *u8c;
u8c = u8c_ring_row(rrow); // address within ring, rrow can be 0..(ring_rows-1)
u8c = u8c_hist_row(hrow); // address within hist, hrow can be 0..(hist_rows-1)
u8c = u8c_disp_row(drow); // address within disp, drow can be 0..(disp_rows-1)

```

The small bit of math is only involved whenever a new row address is needed, so in a display that's 80x25, to walk all the characters in the screen, the math above would only be called 25 times, once for each row, and each column in the row is just a simple integer offset:

```

for ( int row=0; row<disp_rows(); row++ ) { // walk rows: disp_rows = 25
  Utf8Char *u8c = u8c_disp_row(row); // get first char in display 'row'
  for ( int col=0; col<disp_cols(); col++ ) { // walk cols: disp_cols = 80
    u8c[col].do_something(); // work with the char at row/col
  }
}

```

So to recap, the concepts here are:

- The ring buffer itself, a linear array that is conceptually split into a 2 dimensional array of rows and columns whose height and width are:

```
ring_rows -- how many rows in the entire ring buffer
ring_cols -- how many columns in the ring buffer
nchars    -- total chars in ring, e.g. (ring_rows * ring_cols)
```

- The "history" within the ring. For simplicity this is thought of as starting relative to the top of the ring buffer, occupying ring buffer rows:

```
0 .. hist_rows()-1
```

- The "display", or "disp", within the ring, just after the "history". It occupies the ring buffer rows:

```
hist_rows() .. hist_rows()+disp_rows()-1
```

..or similarly:

```
(hist_rows)..(ring_rows-1)
```

The following convenience methods provide access to the start and end indexes within the ring buffer for each entity:

Entire ring ring_srow() – start row index of the ring buffer (always 0) ring_erow() – end row index of the ring buffer

"history" part of ring hist_srow() – start row index of the screen history hist_erow() – end row index of the screen history

"display" part of ring disp_srow() – start row index of the display disp_erow() – end row index of the display

The values returned by these are as described above. For the hist_xxx() and disp_xxx() methods the 'offset' included into the formula. (For this reason hist_srow() won't always be zero the way ring_srow() is, due to the 'offset')

The values returned by these methods can all be passed to the u8c_ring_row() function to access the actual character buffer's contents.

- An "offset" used to move the "history" and "display" around within the ring buffer to implement the "text scrolling" concept. The offset is applied when new characters are added to the buffer, and during drawing to find where the display actually is within the ring.
- The "scrollbar", which only is used when redrawing the screen the user sees, and is simply an additional offset to all the above, where a scrollbar value of zero (the scrollbar tab at the bottom) shows the display rows, and as the scrollbar values increase as the user moves the scrollbar tab upwards, +1 per line, this is subtracted from the normal starting index to let the user work their way backwards into the scrollbar history. Again, negative numbers wrap around within the ring buffer automatically.

The ring buffer allows new content to simply be appended to the ring buffer, and the index# for the start of the display and start of scrollbar history are simply incremented. So the next time the display is "drawn", it starts at a different position in the ring.

This makes scrolling content at high speed trivial, without memory moves. It also makes the concept of "scrolling" with the scrollbar simple as well, simply being an extra index offset applied during drawing.

Mouse Selection

Dragging the mouse across the screen should highlight the text, allowing the user to extend the selection either beyond or before the point started. Extending the drag to the top of the screen should automatically 'scroll up' to select more lines in the scrollbar history, or below the bottom to do the opposite.

The mouse selection is implemented as a class to keep track of the start/end row/col positions of the selection, and other details such as a flag indicating if a selection has been made, what color the fg/bg text should appear when text is selected, and methods that allow setting and extending the selection, clearing the selection, and "scrolling" the selection, to ensure the row/col indexes adjust correctly to track when the screen or scrollbar is scrolled.

Redraw Timer

Knowing when to redraw is tricky with a terminal, because sometimes high volumes of input will come in asynchronously, so in that case we need to determine when to redraw the screen to show the new content; too quickly will cause the screen to spend more time redrawing itself, preventing new input from being added. Too slowly, the user won't see new information appear in a timely manner.

To solve this, a rate timer is used to prevent too many redraws:

- When new data comes in, a 1/10 sec timer is started and a modify flag is set.
- `redraw()` is NOT called yet, allowing more data to continue to arrive quickly
- When the 1/10th second timer fires, the callback checks the modify flag:
 - if set, calls `redraw()`, resets the modify to 0, and calls `FI::repeat_timeout()` to repeat the callback in another 1/10th sec.
 - if clear, no new data came in, so DISABLE the timer, done.

In this way, redraws don't happen more than 10x per second, and `redraw()` is called only when there's new content to see.

The redraw rate can be set by the user application using the `FI_Terminal::redraw_rate()`, 0.10 being the default.

Some terminal operations necessarily call `redraw()` directly, such as interactive mouse selection, or during user scrolling the terminal's scrollbar, where it's important there's no delay in what the user sees while interacting directly with the widget.

Chapter 10

Drawing Things in FLTK

This chapter covers the drawing functions that are provided with FLTK.

10.1 When Can You Draw Things in FLTK?

There are only certain places you can execute FLTK code that draws to the computer's display. Calling these functions at other places will result in undefined behavior!

- The most common place is inside the virtual `Fl_Widget::draw()` method. To write code here, you must subclass one of the existing `Fl_Widget` classes and implement your own version of `draw()`.
- You can also create custom `boxtypes` and `labeltypes`. These involve writing small procedures that can be called by existing `Fl_Widget::draw()` methods. These "types" are identified by an 8-bit index that is stored in the widget's `box()`, `labeltype()`, and possibly other properties.
- You can call `Fl_Window::make_current()` to do incremental update of a widget. Use `Fl_Widget::window()` to find the window.

In contrast, code that draws to other drawing surfaces than the display (i.e., instances of derived classes of the `Fl_Surface_Device` class, except `Fl_Display_Device`, such as `Fl_Printer` and `Fl_Copy_Surface`) can be executed at any time as follows:

1. Make your surface the new current drawing surface calling the `Fl_Surface_Device::push_current(Fl_Surface_Device*)` function.
2. Make a series of calls to any of the drawing functions described below; these will operate on the new current drawing surface;
3. Set the current drawing surface back to its previous state calling `Fl_Surface_Device::pop_current()`.

10.2 What Units Do FLTK Functions Use?

Before version 1.4 all graphical quantities used by FLTK were in pixel units: a window of width 500 units was 500 pixels wide, a line of length 10 units was 10 pixels long, lines of text written using a 14-point font were 14 pixels below each other. This organization is not sufficient to support GUI apps that can be drawn on screens of varying pixel density, especially on High-DPI screens, because widgets become very small and text becomes unreadable.

FLTK version 1.4 introduces a new feature, a screen-specific **scale factor** which is a float number with a typical value in the 1-2.5 range and is used as follows: any graphical element with an FLTK value of v units is drawn on the screen with $v * scale$ units. Thus, a window with width 500 units is $500 * scale$ pixels wide, a line of length 10 units is $10 * scale$ pixels long, lines of text written using a 14-point font are $14 * scale$ pixels below each other. Consider a system with two screens, one with regular DPI and one with a twice higher DPI. If the first screen's scale factor is set to 1 and that of the second screen to 2, the GUI of any FLTK app appears equally sized on the two screens.

FLTK uses several units to measure graphical elements:

- All quantities used by the public FLTK API to measure graphical elements (e.g., window widths, line lengths, font sizes, clipping regions, image widths and heights) are in **FLTK units** except if it's explicitly documented another unit is used. FLTK units are both platform- and DPI-independent. An example of FLTK API using another unit is `Fl_Gl_Window::pixel_w()`.
- Just before drawing to a screen, the library internally multiplies all quantities expressed in FLTK units by the current value of the scale factor for the screen in use and obtains quantities in **drawing units**. The current scale factor value, for an `Fl_Window` named `window`, is given by

```
int nscreen = window->screen_num(); // the screen where window is mapped
float s = Fl::screen_scale(nscreen); // this screen's scale factor
```

 One drawing unit generally corresponds to one screen pixel ...
- ... but not on macOS and for retina displays, where one drawing unit corresponds to two pixels.
- ... and not with the Wayland platform, where one drawing unit may correspond to 1, 2, or 3 pixels according to the current value of the Wayland-defined, integer-valued scale factor.

At application start time, FLTK attempts to detect the adequate scale factor value for each screen of the system. Here is how that's done under the [X11](#), [Windows](#), and [Wayland](#) platforms. If the resulting scale factor is not satisfactory, and also under the macOS platform, it's possible to set the `FLTK_SCALING_FACTOR` environmental variable to the desired numerical value (e.g., 1.75) and any FLTK app will start scaled with that value. Furthermore, it's possible to change the scale factor value of any screen at run time with `ctrl+/-/0/` keystrokes which enlarge, shrink, and reset, respectively, all FLTK windows on a screen and their content. Under macOS, the corresponding GUI scaling shortcuts are `cmd+/-/0/`.

GUI rescaling involves also image drawing: the screen area covered by the drawn image contains a number of pixels that grows with the scale factor. When FLTK draws images, it maps the image data (the size of these data is given by `Fl_Image::data_w()` and `Fl_Image::data_h()`) to the screen area whose size (in FLTK units) is given by `Fl_Image::w()` and `Fl_Image::h()`. How exactly such mapping is performed depends on the image type, the platform and some hardware features. The most common case for `Fl_RGB_Image`'s is that FLTK uses a scaled drawing system feature that directly maps image data to screen pixels. An important feature of FLTK for image drawing is the `Fl_Image::scale()` member function, new in FLTK version 1.4. This function controls the image drawing size (in FLTK units, given by `Fl_Image::w()` and `Fl_Image::h()`) independently from the size of the image data (given by `Fl_Image::data_w()` and `Fl_Image::data_h()`). An image with large enough data size can thus be drawn at the full resolution of the screen even when the screen area covered by the image grows following the GUI scale factor.

The `Fl_Image_Surface` class is intended to create an `Fl_RGB_Image` from a series of FLTK drawing operations. The `Fl_Image_Surface` constructor allows to control whether the size in pixels of the resulting image matches the FLTK units used when performing drawing operations, or matches the number of pixels corresponding to these FLTK units given the current value of the scale factor. The first result is obtained with `new Fl_Image_Surface(w, h)`, the second with `new Fl_Image_Surface(w, h, 1)`.

When drawing to `Fl_Printer` or `Fl_PostScript_File_Device`, the drawing unit is initially one point, that is, 1/72 of an inch. This unit is changed by calls to `Fl_Paged_Device::scale()`.

10.3 Drawing Functions

To use the drawing functions you must first include the `<FL/fl_draw.H>` header file. FLTK provides the following types of drawing functions:

- [Boxes](#)
- [Clipping](#)
- [Colors](#)
- [Color Contrast](#)
- [Line Dashes and Thickness](#)
- [Drawing Fast Shapes](#)
- [Drawing Complex Shapes](#)
- [Drawing Text](#)
- [Fonts](#)
- [Character Encoding](#)
- [Drawing Overlays](#)
- [Drawing Images](#)
- [Direct Image Drawing](#)
- [Direct Image Reading](#)
- [Image Classes](#)
- [Offscreen Drawing](#)

10.3.1 Boxes

FLTK provides three functions that can be used to draw boxes for buttons and other UI controls. Each function uses the supplied upper-lefthand corner and width and height to determine where to draw the box.

```
void fl_draw_box(FL_Boxtype b, int x, int y, int w, int h, FL_Color c)
```

The `fl_draw_box()` function draws a standard boxtype `b` in the specified color `c`.

```
void fl_frame(const char *s, int x, int y, int w, int h)
void fl_frame2(const char *s, int x, int y, int w, int h)
```

The `fl_frame()` and `fl_frame2()` functions draw a series of line segments around the given box. The string `s` must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The results of calling these functions with a string that is not a multiple of 4 characters in length are undefined.

The only difference between `fl_frame()` and `fl_frame2()` is the order of the line segments:

- For `fl_frame()` the order of each set of 4 characters is: top, left, bottom, right.
- For `fl_frame2()` the order of each set of 4 characters is: bottom, right, top, left.

Note that `fl_frame(FL_Boxtype b)` is described in the [Box Types](#) section.

10.3.2 Clipping

You can limit all your drawing to a rectangular region by calling `fl_push_clip()`, and put the drawings back by using `fl_pop_clip()`. This rectangle is measured in [FLTK units](#) and is unaffected by the current transformation matrix.

In addition, the system may provide clipping when updating windows which may be more complex than a simple rectangle.

```
void fl_push_clip(int x, int y, int w, int h)
void fl_clip(int x, int y, int w, int h)
```

Intersect the current clip region with a rectangle and push this new region onto the stack.

The `fl_clip()` version is deprecated and will be removed from future releases.

```
void fl_push_no_clip()
```

Pushes an empty clip region on the stack so nothing will be clipped.

```
void fl_pop_clip()
```

Restore the previous clip region.

Note: You must call `fl_pop_clip()` once for every time you call `fl_push_clip()`. If you return to FLTK with the clip stack not empty unpredictable results occur.

```
int fl_not_clipped(int x, int y, int w, int h)
```

Returns non-zero if any of the rectangle intersects the current clip region. If this returns 0 you don't have to draw the object.

Note: Under X this returns 2 if the rectangle is partially clipped, and 1 if it is entirely inside the clip region.

```
int fl_clip_box(int x, int y, int w, int h, int &X, int &Y, int &W, int &H)
```

Intersect the rectangle `x, y, w, h` with the current clip region and returns the bounding box of the result in `X, Y, W, H`. Returns non-zero if the resulting rectangle is different than the original. This can be used to limit the necessary drawing to a rectangle. `W` and `H` are set to zero if the rectangle is completely outside the region.

```
void fl_clip_region(FL_Region r)
FL_Region fl_clip_region()
```

Replace the top of the clip stack with a clipping region of any shape. `FL_Region` is an operating system specific type. The second form returns the current clipping region.

10.3.3 Colors

FLTK manages colors as 32-bit unsigned integers, encoded as RGBA. When the "RGB" bytes are non-zero, the value is treated as RGB. If these bytes are zero, the "I" byte will be used as an index into the colormap. Colors with both "RGB" set and an "I" > 0 are reserved for special use.

Values from 0 to 255, i.e. the "I" index value, represent colors from the FLTK standard colormap and are allocated as needed on screens without TrueColor support. The `Fl_Color` enumeration type defines the standard colors and color cube for the first 256 colors. All of these are named with symbols in [<FL/Enumerations.H>](#). Example:

Figure 10.1 FLTK default colormap (`Fl_Color 0x00 - 0xff`)

Color values greater than 255 are treated as 24-bit RGB values. These are mapped to the closest color supported by the screen, either from one of the 256 colors in the FLTK colormap or a direct RGB value on TrueColor screens.

`Fl_Color fl_rgb_color(uchar r, uchar g, uchar b)`

`Fl_Color fl_rgb_color(uchar grayscale)`

Generate `Fl_Color` out of specified 8-bit RGB values or one 8-bit grayscale value.

`void fl_color(Fl_Color c)`

`void fl_color(int c)`

Sets the color for all subsequent drawing operations. Please use the first form: the second form is only provided for back compatibility.

For colormapped displays, a color cell will be allocated out of `fl_colormap` the first time you use a color. If the colormap fills up then a least-squares algorithm is used to find the closest color.

`Fl_Color fl_color()`

Returns the last color that was set using `fl_color()`. This can be used for state save/restore.

`void fl_color(uchar r, uchar g, uchar b)`

Set the color for all subsequent drawing operations. The closest possible match to the RGB color is used. The RGB color is used directly on TrueColor displays. For colormap visuals the nearest index in the gray ramp or color cube is used.

`unsigned Fl::get_color(Fl_Color i)`

`void Fl::get_color(Fl_Color i, uchar &red, uchar &green, uchar &blue)`

Generate RGB values from a colormap index value `i`. The first returns the RGB as a 32-bit unsigned integer, and the second decomposes the RGB into three 8-bit values.

`Fl::get_system_colors()`

`Fl::foreground()`

`Fl::background()`

`Fl::background2()`

The first gets color values from the user preferences or the system, and the other routines are used to apply those values.

`Fl::own_colormap()`

`Fl::free_color(Fl_Color i, int overlay)`

`Fl::set_color(Fl_Color i, unsigned c)`

`Fl::own_colormap()` is used to install a local colormap [X11 only].

`Fl::free_color()` and `Fl::set_color()` are used to remove and replace entries from the colormap.

There are two predefined graphical interfaces for choosing colors. The function `fl_show_colormap()` shows a table of colors and returns an `Fl_Color` index value. The `Fl_Color_Chooser` widget provides a standard RGB color chooser.

As the `Fl_Color` encoding maps to a 32-bit unsigned integer representing RGBI, it is also possible to specify a color using a hex constant as a color map index:

```
// COLOR MAP INDEX
color(0x000000II)
    ----- |
    | |
    | | Color map index (8 bits)
    | | Must be zero
button->color(0x000000ff); // colormap index #255 (FL_WHITE)
```

or specify a color using a hex constant for the RGB components:

```
// RGB COLOR ASSIGNMENTS
color(0xRRGGBB00)
    | | | |
    | | | Must be zero
    | | Blue (8 bits)
    | Green (8 bits)
    Red (8 bits)
button->color(0xff000000); // RGB: red
button->color(0x00ff0000); // RGB: green
button->color(0x0000ff00); // RGB: blue
button->color(0xffffffff00); // RGB: white
```

Note

If TrueColor is not available, any RGB colors will be set to the nearest entry in the colormap.

10.3.4 Color Contrast

Although these are not real "drawing" functions, creating readable contrast is essential in a good GUI design. FLTK tries to help with this by providing [fl_contrast\(\)](#) and related functions.

The basic function is `Fl_Color fl_contrast(Fl_Color fg, Fl_Color bg, int context, int size)`;

The parameters `context` and `size` are optional and reserved for future use (since FLTK 1.4.0).

The return value can be used to substitute the foreground color `fg` used for drawing (usually the "text" or "label" color) on a particular background color `bg` with either black (FL_BLACK) or white (FL_WHITE). This is useful if the background color is not known or can be changed by the user or a system "theme".

FLTK calculates the contrast between `fg` and `bg` and returns the same color (`fg`) if the contrast is considered sufficient or one of FL_BLACK or FL_WHITE if the contrast of the given foreground color would be insufficient. Then either FL_BLACK or FL_WHITE is chosen, whichever has the higher contrast with the background color.

Example, may be used in a widget's `draw()` method:

```
Fl_Color bg = color(); // background color of the widget
Fl_Color fg = FL_BLUE; // the chosen foreground (drawing) color
fl_color(fl_contrast(fg, bg)); // set the drawing color
fl_rect(..); // draw a rectangle with sufficient contrast
```

FLTK 1.4.0 introduced a new contrast algorithm which is superior to the one used up to FLTK 1.3.x. You can use

```
fl_contrast_mode(FL_CONTRAST_LEGACY);
```

early in your program to select the old behavior if you really need strict backwards compatibility. This is discouraged because the new algorithm is much better with regard to human contrast perception. The default mode since FLTK 1.4.0 is

```
fl_contrast_mode(FL_CONTRAST_CIELAB);
```

For more info please see the linked documentation of these functions.

Additionally the old and new contrast calculations can be fine tuned with the new function (since 1.4.0)

```
fl_contrast_level(int level);
```

This is not recommended but can be useful for some border cases. Please refer to the documentation of [fl_contrast_level\(\)](#).

Finally, developers can define their own contrast calculation function with

```
void fl_contrast_function(Fl_Contrast_Function *f);
```

Please see the documentation for details.

10.3.5 Line Dashes and Thickness

FLTK supports drawing of lines with different styles and widths.

void `fl_line_style(int style, int width, char* dashes)`

FL_SOLID		FL_CAP_FLAT	
FL_DASH		FL_CAP_ROUND	
FL_DOT		FL_CAP_SQUARE	
FL_DASHDOT		FL_JOIN_MITER	
FL_DASHDOTDOT		FL_JOIN_ROUND	
		FL_JOIN_BEVEL	

Figure 10.2 `fl_line_style()` styles

Set how to draw lines (the "pen"). If you change this it is your responsibility to set it back to the default with `fl_line_style(0)`.

`style` is a bitmask which is a bitwise-OR of the following values. If you don't specify a dash type you will get a solid line. If you don't specify a cap or join type you will get a system-defined default of whatever value is fastest.

- `FL_SOLID` solid line
- `FL_DASH` 75% dashed line
- `FL_DOT` 50% pixel dotted
- `FL_DASHDOT` dash / dot pattern
- `FL_DASHDOTDOT` dash / two dot pattern
- `FL_CAP_FLAT` end is flat
- `FL_CAP_ROUND` end is round
- `FL_CAP_SQUARE` extends past end point 1/2 line width
- `FL_JOIN_MITER` line join extends to a point
- `FL_JOIN_ROUND` line join is rounded
- `FL_JOIN_BEVEL` line join is flat (tidied)

`width` is the number of [FLTK units](#) thick to draw the lines. Zero results in the system-defined default, which on both X and Windows is somewhat different and nicer than 1.

`dashes` is a pointer to an array of dash lengths, measured in [FLTK units](#). The first location is how long to draw a solid portion, the next is how long to draw the gap, then the solid, etc. It is terminated with a zero-length entry. A `NULL` pointer or a zero-length array results in a solid line. Odd array sizes are not supported and result in undefined behavior.

Note

- Full functionality is not available under Windows 95, 98, and Me due to the reduced drawing functionality these operating systems provide.
- Because of how line styles are implemented on Windows systems, you *must* set the line style *after* setting the drawing color. If you set the color after the line style you will lose the line style settings!
- The dashes array does not work under Windows 95, 98, or Me, since those operating systems do not support complex line styles.

10.3.6 Drawing Fast Shapes

These functions are used to draw almost all the FLTK widgets. They draw on exact pixel boundaries and are as fast as possible. Their behavior is duplicated exactly on all platforms FLTK is ported. It is undefined whether these are affected by the [transformation matrix](#), so you should only call these while the matrix is set to the identity matrix (the default).

```
void fl_point(int x, int y)
```

Draw a single pixel at the given coordinates.

```
void fl_rectf(int x, int y, int w, int h)
void fl_rectf(int x, int y, int w, int h, FL_Color c)
```

Color a rectangle that exactly fills the given bounding box.

```
void fl_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)
```

Color a rectangle with "exactly" the passed `r`, `g`, `b` color. On screens with less than 24 bits of color this is done by drawing a solid-colored block using [fl_draw_image\(\)](#) so that the correct color shade is produced.

```
void fl_rect(int x, int y, int w, int h)
void fl_rect(int x, int y, int w, int h, FL_Color c)
```

Draw a 1-pixel border *inside* this bounding box.

```
void fl_rounded_rect(int x, int y, int w, int h, int radius) void fl_rounded_rectf(int x, int y, int w, int h, int radius)
```

Draw an outlined or filled rectangle with rounded corners.

```
void fl_line(int x, int y, int x1, int y1)
void fl_line(int x, int y, int x1, int y1, int x2, int y2)
```

Draw one or two lines between the given points.

```
void fl_loop(int x, int y, int x1, int y1, int x2, int y2)
void fl_loop(int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
```

Outline a 3 or 4-sided polygon with lines.

```
void fl_polygon(int x, int y, int x1, int y1, int x2, int y2)
void fl_polygon(int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
```

Fill a 3 or 4-sided polygon. The polygon must be convex.

```
void fl_xyline(int x, int y, int x1)
void fl_xyline(int x, int y, int x1, int y2)
void fl_xyline(int x, int y, int x1, int y2, int x3)
```

Draw horizontal and vertical lines. A horizontal line is drawn first, then a vertical, then a horizontal.

```
void fl_yxline(int x, int y, int y1)
void fl_yxline(int x, int y, int y1, int x2)
void fl_yxline(int x, int y, int y1, int x2, int y3)
```

Draw vertical and horizontal lines. A vertical line is drawn first, then a horizontal, then a vertical.

```
void fl_arc(int x, int y, int w, int h, double a1, double a2)
void fl_pie(int x, int y, int w, int h, double a1, double a2)
```

Draw ellipse sections using integer coordinates. These functions match the rather limited circle drawing code provided by X and Windows. The advantage over using `fl_arc()` with floating point coordinates is that they are faster because they often use the hardware, and they draw much nicer small circles, since the small sizes are often hard-coded bitmaps.

If a complete circle is drawn it will fit inside the passed bounding box. The two angles are measured in degrees counter-clockwise from 3'o'clock and are the starting and ending angle of the arc, `a2` must be greater or equal to `a1`.

Figure 10.3 `fl_pie()` and `fl_arc()`

`fl_arc()` draws a series of lines to approximate the arc. Notice that the integer version of `fl_arc()` has a different number of arguments to the other `fl_arc()` function described later in this chapter.

`fl_pie()` draws a filled-in pie slice. This slice may extend outside the line drawn by `fl_arc()`; to avoid this use `w-1` and `h-1`.

void `fl_scroll`(int X, int Y, int W, int H, int dx, int dy, void (*draw_area*)(void, int,int,int,int), void* data)

Scroll a rectangle and draw the newly exposed portions. The contents of the rectangular area is first shifted by `dx` and `dy` [FLTK units](#). The callback is then called for every newly exposed rectangular area,

10.3.7 Drawing Complex Shapes

The complex drawing functions let you draw arbitrary shapes with 2-D linear transformations. The functionality matches that found in the Adobe® PostScript™ language. The exact pixels that are filled are less defined than for the fast drawing functions so that FLTK can take advantage of drawing hardware. On both X and Windows the transformed vertices are rounded to integers before drawing the line segments: this severely limits the accuracy of these functions for complex graphics, so use OpenGL when greater accuracy and/or performance is required.

void `fl_load_matrix`(double a,double b,double c,double d,double x,double y) void `fl_load_identity`()

Set the current transformation.

void `fl_push_matrix`()
void `fl_pop_matrix`()

Save and restore the current transformation. The maximum depth of the stack is 32 entries.

```
void fl_scale(double x,double y)
void fl_scale(double x)
void fl_translate(double x,double y)
void fl_rotate(double d)
void fl_mult_matrix(double a,double b,double c,double d,double x,double y)
```

Concatenate another transformation onto the current one. The rotation angle is in degrees (not radians) and is counter-clockwise.

```
double fl_transform_x(double x, double y)
double fl_transform_y(double x, double y)
double fl_transform_dx(double x, double y)
double fl_transform_dy(double x, double y)
void fl_transformed_vertex(double xf, double yf)
```

Transform a coordinate or a distance using the current transformation matrix. After transforming a coordinate pair, it can be added to the vertex list without any further translations using `fl_transformed_vertex()`.

```
void fl_begin_points()
void fl_end_points()
```

Start and end drawing a list of points. Points are added to the list with `fl_vertex()`.

```
void fl_begin_line()
void fl_end_line()
```

Start and end drawing lines.

```
void fl_begin_loop()
void fl_end_loop()
```

Start and end drawing a closed sequence of lines.

```
void fl_begin_polygon()
void fl_end_polygon()
```

Start and end drawing a convex filled polygon.

```
void fl_begin_complex_polygon()
void fl_gap()
void fl_end_complex_polygon()
```

Start and end drawing a complex filled polygon. This polygon may be concave, may have holes in it, or may be several disconnected pieces. Call `fl_gap()` to separate loops of the path. It is unnecessary but harmless to call `fl_gap()` before the first vertex, after the last one, or several times in a row.

`fl_gap()` should only be called between `fl_begin_complex_polygon()` and `fl_end_complex_polygon()`. To outline the polygon, use `fl_begin_loop()` and replace each `fl_gap()` with a `fl_end_loop();fl_begin_loop()` pair.

Note: For portability, you should only draw polygons that appear the same whether "even/odd" or "non-zero" winding rules are used to fill them. Holes should be drawn in the opposite direction of the outside loop.

void `fl_vertex(double x,double y)`

Add a single vertex to the current path.

void `fl_curve(double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)`

Add a series of points on a Bézier curve to the path. The curve ends (and two of the points are) at `X0, Y0` and `X3, Y3`.

void `fl_arc(double x, double y, double r, double start, double end)`

Add a series of points to the current path on the arc of a circle; you can get elliptical paths by using scale and rotate before calling `fl_arc()`. The center of the circle is given by `x` and `y`, and `r` is its radius. `fl_arc()` takes `start` and `end` angles that are measured in degrees counter-clockwise from 3 o'clock. If `end` is less than `start` then it draws the arc in a clockwise direction.

Figure 10.4 `fl_arc(x,y,r,a1,a2)`

void `fl_circle(double x, double y, double r)`

`fl_circle(x, y, r)` is equivalent to `fl_arc(x, y, r, 0, 360)` but may be faster. It must be the *only* thing in the path: if you want a circle as part of a complex polygon you must use `fl_arc()`.

Note: `fl_circle()` draws incorrectly if the transformation is both rotated and non-square scaled.

10.3.8 Drawing Text

All text is drawn in the [current font](#). It is undefined whether this location or the characters are modified by the current transformation.

```
void fl_draw(const char *, int x, int y)
void fl_draw(const char *, int n, int x, int y)
```

Draw a nul-terminated string or an array of `n` bytes starting at the given location. In both cases, the text must be UTF-8 encoded. Text is aligned to the left and to the baseline of the font. To align to the bottom, subtract `fl_descent()` from `y`. To align to the top, subtract `fl_descent()` and add `fl_height()`. This version of `fl_draw()` provides direct access to the text drawing function of the underlying OS. It does not apply any special handling to control characters.

```
void fl_rtl_draw(const char *str, int n, int x, int y)
```

Draw a UTF-8 string of length `n` bytes right to left starting at the given `x, y` location.

```
void fl_draw(const char* str, int x, int y, int w, int h, FL_Align align, FL_Image* img, int draw_symbols)
```

Fancy string drawing function which is used to draw all the labels. The string is formatted and aligned inside the passed box. Handles `'\t'` and `'\n'`, expands all other control characters to `^X`, and aligns inside or against the edges of the box described by `x, y, w` and `h`. See [FL_Widget::align\(\)](#) for values for `align`. The value `FL_ALIGN_INSIDE` is ignored, as this function always prints inside the box.

If `img` is provided and is not `NULL`, the image is drawn above or below the text as specified by the `align` value.

The `draw_symbols` argument specifies whether or not to look for symbol names starting with the `"@"` character.

```
void fl_measure(const char *str, int& w, int& h, int draw_symbols)
```

Measure how wide and tall the string will be when printed by the `fl_draw(...align)` function. This includes leading/trailing white space in the string, kerning, etc.

If the incoming `w` is non-zero it will wrap to that width.

This will probably give unexpected values unless you have called `fl_font()` explicitly in your own code. Refer to the full documentation for `fl_measure()` for details on usage and how to avoid common pitfalls.

See also

`fl_text_extents()` – measure the 'inked' area of a string
`fl_width()` – measure the width of a string or single character
`fl_height()` – measure the height of the [current font](#)
`fl_descent()` – the height of the descender for the [current font](#)

`int fl_height()`

Recommended minimum line spacing for the [current font](#). You can also just use the value of `size` passed to `fl_font()`.

See also

`fl_text_extents()`, `fl_measure()`, `fl_width()`, `fl_descent()`

`int fl_descent()`

Recommended distance above the bottom of a `fl_height()` tall box to draw the text at so it looks centered vertically in that box.

```
double fl_width(const char* txt)
double fl_width(const char* txt, int n)
double fl_width(unsigned int unicode_char)
```

Return the width of a nul-terminated string, a sequence of `n` characters, or a single character in the [current font](#).

See also

`fl_measure()`, `fl_text_extents()`, `fl_height()`, `fl_descent()`

`void fl_text_extents(const char* txt, int& dx, int& dy, int& w, int& h)`

Determines the minimum dimensions of a nul-terminated string, ie. the 'inked area'.

Given a string "txt" drawn using `fl_draw(txt, x, y)` you would determine its extents in [FLTK units](#) on the display using `fl_text_extents(txt, dx, dy, wo, ho)` such that a bounding box that exactly fits around the inked area of the text could be drawn with `fl_rect(x+dx, y+dy, wo, ho)`.

Refer to the full documentation for [fl_text_extents\(\)](#) for details on usage.

See also

[fl_measure\(\)](#), [fl_width\(\)](#), [fl_height\(\)](#), [fl_descent\(\)](#)

```
const char* fl_shortcut_label(int shortcut)
```

Unparse a shortcut value as used by [Fl_Button](#) or [Fl_Menu_Item](#) into a human-readable string like "Alt+N". This only works if the shortcut is a character key or a numbered function key. If the shortcut is zero an empty string is returned. The return value points at a static buffer that is overwritten with each call.

10.3.9 Fonts

FLTK supports a set of standard fonts based on the Times, Helvetica/Arial, Courier, and Symbol typefaces, as well as custom fonts that your application may load. Each font is accessed by an index into a font table.

Initially only the first 16 faces are filled in. There are symbolic names for them: `FL_HELVETICA`, `FL_TIMES`, `FL_COURIER`, and modifier values `FL_BOLD` and `FL_ITALIC` which can be added to these, and `FL_SYMBOL` and `FL_ZAPF_DINGBATS`. Faces greater than 255 cannot be used in [Fl_Widget](#) labels, since [Fl_Widget](#) stores the index as a byte.

One important thing to note about 'current font' is that there are so many paths through the GUI event handling code as widgets are partially or completely hidden, exposed and then re-drawn and therefore you can not guarantee that 'current font' contains the same value that you set on the other side of the event loop. Your value may have been superseded when a widget was redrawn. You are strongly advised to set the font explicitly before you draw any text or query the width and height of text strings, etc.

```
void fl_font(int face, int size)
```

Set the current font, which is then used by the routines described above. You may call this outside a draw context if necessary to call [fl_width\(\)](#), but on X this will open the display.

The font is identified by a *face* and a *size*. The size of the font is measured in [FLTK units](#) and not "points". Lines should be spaced *size* FLTK units apart or more.

```
int fl_font()  
int fl_size()
```

Returns the face and size set by the most recent call to `fl_font(a, b)`. This can be used to save/restore the font.

10.3.10 Character Encoding

FLTK 1.3 and later versions expect all text in Unicode UTF-8 encoding. UTF-8 is ASCII compatible for the first 128 characters. International characters are encoded in multibyte sequences.

FLTK expects individual characters, characters that are not part of a string, in UCS-4 encoding, which is also ASCII compatible, but requires 4 bytes to store a Unicode character.

FLTK can draw accurately any Unicode-supported script for which the system contains relevant fonts. Under X11 platforms, this requires to build the library with the `FLTK_USE_PANGO` CMake option turned On (or with `configure --enable-pango`).

Plain text drawing starting at a user-given coordinate is well supported by FLTK, including for right-to-left scripts. Further text-related operations (i.e., selection, formatting, input, and editing) are functional with left-to-right scripts only.

For more information about character encodings, see the chapter on [Unicode and UTF-8 Support](#).

10.3.11 Drawing Overlays

These functions allow you to draw interactive selection rectangles without using the overlay hardware. FLTK will XOR a single rectangle outline over a window.

```
void fl_overlay_rect(int x, int y, int w, int h)
void fl_overlay_clear()
```

`fl_overlay_rect()` draws a selection rectangle, erasing any previous rectangle by XOR'ing it first. `fl_overlay_clear()` will erase the rectangle without drawing a new one.

Using these functions is tricky. You should make a widget with both a `handle()` and `draw()` method. `draw()` should call `fl_overlay_clear()` before doing anything else. Your `handle()` method should call `window()->make_current()` and then `fl_overlay_rect()` after `FL_DRAG` events, and should call `fl_overlay_clear()` after a `FL_RELEASE` event.

10.4 Drawing Images

To draw images, you can either do it directly from data in your memory, or you can create a [FL_Image](#) object. The advantage of drawing directly is that it is more intuitive, and it is faster if the image data changes more often than it is redrawn. The advantage of using the object is that FLTK will cache translated forms of the image (on X it uses a server pixmap) and thus redrawing is *much* faster.

10.4.1 Direct Image Drawing

The behavior when drawing images when the current transformation matrix is not the identity is not defined, so you should only draw images when the matrix is set to the identity.

```
void fl_draw_image(const uchar *buf,int X,int Y,int W,int H,int D,int L)
void fl_draw_image_mono(const uchar *buf,int X,int Y,int W,int H,int D,int L)
```

Draw an 8-bit per color RGB or luminance image. The pointer points at the "r" data of the top-left pixel. Color data must be in *r, g, b* order. The top left corner is given by *X* and *Y* and the size of the image is given by *W* and *H*. *D* is the delta to add to the pointer between pixels, it may be any value greater or equal to 3, or it can be negative to flip the image horizontally. *L* is the delta to add to the pointer between lines (if 0 is passed it uses *W*D*), and may be larger than *W*D* to crop data, or negative to flip the image vertically.

It is highly recommended that you put the following code before the first `show()` of *any* window in your program to get rid of the dithering if possible:

```
Fl::visual (FL_RGB) ;
```

Gray scale (1-channel) images may be drawn. This is done if `abs(D)` is less than 3, or by calling `fl_draw_image_mono()`. Only one 8-bit sample is used for each pixel, and on screens with different numbers of bits for red, green, and blue only gray colors are used. Setting *D* greater than 1 will let you display one channel of a color image.

Note: The X version does not support all possible visuals. If FLTK cannot draw the image in the current visual it will abort. FLTK supports any visual of 8 bits or less, and all common TrueColor visuals up to 32 bits.

```
typedef void (*Fl_Draw_Image_Cb)(void *data,int x,int y,int w,uchar *buf)
void fl_draw_image(Fl_Draw_Image_Cb cb,void *data,int X,int Y,int W,int H,int D)
void fl_draw_image_mono(Fl_Draw_Image_Cb cb,void *data,int X,int Y,int W,int H,int D)
```

Call the passed function to provide each scan line of the image. This lets you generate the image as it is being drawn, or do arbitrary decompression of stored data, provided it can be decompressed to individual scan lines easily.

The callback is called with the `void*` user data pointer which can be used to point at a structure of information about the image, and the *x*, *y*, and *w* of the scan line desired from the image. 0,0 is the upper-left corner of the image, *not* *X*, *Y*. A pointer to a buffer to put the data into is passed. You must copy *w* pixels from scanline *y*, starting at pixel *x*, to this buffer.

Due to cropping, less than the whole image may be requested. So *x* may be greater than zero, the first *y* may be greater than zero, and *w* may be less than *W*. The buffer is long enough to store the entire *W*D* pixels, this is for convenience with some decompression schemes where you must decompress the entire line at once: decompress it into the buffer, and then if *x* is not zero, copy the data over so the *x*'th pixel is at the start of the buffer.

You can assume the `y`'s will be consecutive, except the first one may be greater than zero.

If `D` is 4 or more, you must fill in the unused bytes with zero.

```
int fl_draw_pixmap(char* const* data, int x, int y, FI_Color bg)
int fl_draw_pixmap(const char* const* cdata, int x, int y, FI_Color bg)
```

Draws XPM image data, with the top-left corner at the given position. The image is dithered on 8-bit displays so you won't lose color space for programs displaying both images and pixmaps. This function returns zero if there was any error decoding the XPM data.

To use an XPM, do:

```
#include "foo.xpm"
...
fl_draw_pixmap(foo, X, Y);
```

Transparent colors are replaced by the optional `FI_Color` argument. To draw with true transparency you must use the `FI_Pixmap` class.

```
int fl_measure_pixmap(char* const* data, int &w, int &h)
int fl_measure_pixmap(const char* const* cdata, int &w, int &h)
```

An XPM image contains the dimensions in its data. This function finds and returns the width and height. The return value is non-zero if the dimensions were parsed ok and zero if there was any problem.

10.4.2 Direct Image Reading

FLTK provides a single function for reading from the current window or off-screen buffer into a RGB(A) image buffer.

```
uchar* fl_read_image(uchar *p, int X, int Y, int W, int H, int alpha)
```

Read a RGB(A) image from the current window or off-screen buffer. The `p` argument points to a buffer that can hold the image and must be at least `W*H*3` bytes when reading RGB images and `W*H*4` bytes when reading RGBA images. If `NULL`, `fl_read_image()` will create an array of the proper size which can be freed using `delete[]`.

The `alpha` parameter controls whether an alpha channel is created and the value that is placed in the alpha channel. If 0, no alpha channel is generated.

10.4.3 Image Classes

FLTK provides a base image class called `Fl_Image` which supports creating, copying, and drawing images of various kinds, along with some basic color operations. Images can be used as labels for widgets using the `image()` and `deimage()` methods or drawn directly. Images can be drawn scaled to any size, independently from the size of the image's data (see `Fl_Image::scale()`).

The `Fl_Image` class does almost nothing by itself, but is instead supported by three basic image types:

- `Fl_Bitmap`
- `Fl_Pixmap`
- `Fl_RGB_Image`

The `Fl_Bitmap` class encapsulates a mono-color bitmap image. The `draw()` method draws the image using the current drawing color.

The `Fl_Pixmap` class encapsulates a colormapped image. The `draw()` method draws the image using the colors in the file, and masks off any transparent colors automatically.

The `Fl_RGB_Image` class encapsulates a full-color (or grayscale) image with 1 to 4 color components. Images with an even number of components are assumed to contain an alpha channel that is used for transparency. The transparency provided by the `draw()` method is either a 24-bit blend against the existing window contents or a "screen door" transparency mask, depending on the platform and screen color depth.

char `fl_can_do_alpha_blending()`

`fl_can_do_alpha_blending()` will return 1, if your platform supports true alpha blending for RGBA images, or 0, if FLTK will use screen door transparency.

FLTK also provides several image classes based on the three standard image types for common file formats:

- `Fl_GIF_Image`
- `Fl_Anim_GIF_Image`
- `Fl_JPEG_Image`
- `Fl_PNG_Image`
- `Fl_PNM_Image`
- `Fl_XBM_Image`
- `Fl_XPM_Image`
- `Fl_SVG_Image`
- `Fl_BMP_Image`
- `Fl_ICO_Image`

Each of these image classes loads a named file of the corresponding format. The `Fl_Shared_Image` class can be used to load any type of image file - the class examines the file and constructs an image of the appropriate type.

Finally, FLTK provides a special image class called `Fl_Tiled_Image` to tile another image object in the specified area. This class can be used to tile a background image in a `Fl_Group` widget, for example.

```
virtual Fl_Image* Fl_Image::copy()
virtual Fl_Image* Fl_Image::copy(int W, int H) const
```

The `copy()` method creates a copy of the image. The second form specifies the new size of the image - the image is resized using the nearest-neighbor algorithm (this is the default).

Note

As of FLTK 1.3.3 the image resizing algorithm can be changed. See [FI_Image::RGB_scaling\(FI_RGB_Scaling method\)](#)

virtual void [FI_Image::draw\(int x, int y, int w, int h, int ox, int oy\)](#)

The `draw()` method draws the image object. `x, y, w, h` indicates the destination rectangle. `ox, oy, w, h` is the source rectangle. This source rectangle is copied to the destination. The source rectangle may extend outside the image, i.e. `ox` and `oy` may be negative and `w` and `h` may be bigger than the image, and this area is left unchanged.

Note

See exceptions for [FI_Tiled_Image::draw\(\)](#) regarding arguments `ox`, `oy`, `w`, and `h`.

virtual void [FI_Image::draw\(int x, int y\)](#)

Draws the image with the upper-left corner at `x, y`. This is the same as doing `img->draw(x, y, img->w(), img->h(), 0, 0)` where `img` is a pointer to any [FI_Image](#) type.

10.5 Offscreen Drawing

Sometimes it can be very useful to generate a complex drawing in memory first and copy it to the screen at a later point in time. This technique can significantly reduce the amount of repeated drawing. Offscreen drawing functions are declared in `<FL/fl_draw.H>`.

[FI_Double_Window](#) uses offscreen rendering to avoid flickering on systems that don't support double-buffering natively.

FLTK can draw into an offscreen buffer at any time. There is no need to wait for an [FI_Widget::draw\(\)](#) to occur.

Note

In FLTK 1.3.x and earlier versions all offscreen drawing functions described below were implemented as macros and created certain temporary variables to save context information. You needed to create local scope blocks with curly braces `{ ... }` if you used offscreen functions more than once in a function or method. This is no longer necessary since offscreen drawing is now implemented in real functions (no macros).

Example:

```
FI_Offscreen oscr = fl_create_offscreen(120, 120);
fl_begin_offscreen(oscr);
fl_color(FL_WHITE);
fl_rectf(0, 0, 120, 120);
fl_end_offscreen();
// other code here
fl_begin_offscreen(oscr);
fl_color(FL_BLACK);
fl_rectf(10, 10, 100, 100);
fl_end_offscreen();
// other code here
fl_delete_offscreen(oscr);
```

FI_Offscreen [fl_create_offscreen\(int w, int h\)](#)

Create an RGB offscreen buffer containing as many pixels as in a screen area of size w,h [FLTK units](#).

```
void fl_delete_offscreen(FI_Offscreen)
```

Delete a previously created offscreen buffer. All drawings are lost.

```
void fl_begin_offscreen(FI_Offscreen)
```

Send all subsequent drawing commands to this offscreen buffer.

```
void fl_end_offscreen()
```

Quit sending drawing commands to this offscreen buffer.

```
void fl_copy_offscreen(int x, int y, int w, int h, FI_Offscreen osrc, int srcx, int srcy)
```

Copy a rectangular area of the size $w*h$ from `srcx,srcy` in the offscreen buffer into the current drawing surface at x,y .

```
void fl_rescale_offscreen(FI_Offscreen &osrc)
```

Adapts the offscreen's size in pixels to a changed value of the scale factor while keeping the offscreen's graphical content.

Chapter 11

Handling Events

This chapter discusses the FLTK event model and how to handle events in your program or widget.

11.1 The FLTK Event Model

Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application. Events can also come from other programs like the window manager.

Events are identified by the integer argument passed to a `handle()` method that overrides the `Fl_Widget::handle()` virtual method. Other information about the most recent event is stored in static locations and acquired by calling the `Fl::event_*` methods. This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the `handle()` method.

Event numbers can be converted to their actual names using the `fl_eventnames[]` array defined in `#include <FL/names.h>`; see next chapter for details.

In the next chapter, the `MyClass::handle()` example shows how to override the `Fl_Widget::handle()` method to accept and process specific events.

11.2 Mouse Events

11.2.1 FL_PUSH

A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling `Fl::event_button()`. You find out the mouse position by calling `Fl::event_x()` and `Fl::event_y()`.

A widget indicates that it "wants" the mouse click by returning non-zero from its `handle()` method, as in the `MyClass::handle()` example. It will then become the `Fl::pushed()` widget and will get `FL_DRAG` and the matching `FL_RELEASE` events. If `handle()` returns zero then FLTK will try sending the `FL_PUSH` to another widget.

11.2.2 FL_DRAG

The mouse has moved with a button held down. The current button state is in `Fl::event_state()`. The mouse position is in `Fl::event_x()` and `Fl::event_y()`.

In order to receive `FL_DRAG` events, the widget must return non-zero when handling `FL_PUSH`.

11.2.3 FL_RELEASE

A mouse button has been released. You can find out what button by calling `Fl::event_button()`.

In order to receive the `FL_RELEASE` event, the widget must return non-zero when handling `FL_PUSH`.

11.2.4 FL_MOVE

The mouse has moved without any mouse buttons held down. This event is sent to the `Fl::belowmouse()` widget.

In order to receive `FL_MOVE` events, the widget must return non-zero when handling `FL_ENTER`.

11.2.5 FL_MOUSEWHEEL

The user has moved the mouse wheel. The `Fl::event_dx()` and `Fl::event_dy()` methods can be used to find the amount to scroll horizontally and vertically.

11.3 Focus Events

11.3.1 FL_ENTER

The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its `handle()` method. It then becomes the `Fl::belowmouse()` widget and will receive `FL_MOVE` and `FL_LEAVE` events.

11.3.2 FL_LEAVE

The mouse has moved out of the widget.

In order to receive the `FL_LEAVE` event, the widget must return non-zero when handling `FL_ENTER`.

11.3.3 FL_FOCUS

This indicates an *attempt* to give a widget the keyboard focus.

If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its `handle()` method. It then becomes the `Fl::focus()` widget and gets `FL_KEYDOWN`, `FL_KEYUP`, and `FL_UNFOCUS` events.

The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check `Fl::event_key()` to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero.

11.3.4 FL_UNFOCUS

This event is sent to the previous `Fl::focus()` widget when another widget gets the focus or the window loses focus.

11.4 Keyboard Events

11.4.1 FL_KEYBOARD, FL_KEYDOWN, FL_KEYUP

A key was pressed (FL_KEYDOWN) or released (FL_KEYUP). FL_KEYBOARD is a synonym for FL_KEYDOWN, and both names are used interchangeably in this documentation.

The key can be found in `Fl::event_key()`. The text that the key should insert can be found with `Fl::event_text()` and its length is in `Fl::event_length()`.

If you use the key, then `handle()` should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a FL_SHORTCUT event. FL_KEYBOARD events are also generated by the character palette/map.

To receive FL_KEYBOARD events you must also respond to the FL_FOCUS and FL_UNFOCUS events by returning 1. This way FLTK knows whether to bother sending your widget keyboard events. (Some widgets don't need them, e.g. `Fl_Box`.)

If you are writing a text-editing widget you may also want to call the `Fl::compose()` function to translate individual keystrokes into characters.

FL_KEYUP events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding FL_KEYDOWN event because focus may have changed between events.

Todo Add details on how to detect repeating keys, since on some X servers a repeating key will generate both FL_KEYUP and FL_KEYDOWN, such that to tell if a key is held, you need `Fl::event_key(int)` to detect if the key is being held down during FL_KEYUP or not.

11.4.2 FL_SHORTCUT

If the `Fl::focus()` widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the `Fl::belowmouse()` widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes!

You can also make "global" shortcuts by using `Fl::add_handler()`. A global shortcut will work no matter what windows are displayed or which one has the focus.

Since version 1.4, FLTK has 3 default global shortcuts (`Ctrl+ +/- /0/` [`Cmd+ +/- /0/` under macOS]) that change the value of the GUI scaling factor. `Ctrl+` zooms-in all app windows of the focussed display (all displays under macOS); `Ctrl-` zooms-out these windows; `Ctrl 0` restores the initial value of the scaling factor. If any window of the display is fullscreen or maximized, scaling shortcuts have no effect. It's possible to deactivate FLTK's default scaling shortcuts with function `Fl::keyboard_screen_scaling()`.

Option `Fl::OPTION_SIMPLE_ZOOM_SHORTCUT` can facilitate the typing necessary to trigger the zoom-in operation with those keyboard layouts where character '+' is located in the shifted position of its key: when this option is On it's not necessary to press also the Shift key to zoom-in.

These scaling shortcuts are installed when the FLTK library opens the display. They have a lower priority than any shortcut defined in any menu and than any user-provided event handler (see `Fl::add_handler()`) installed after FLTK opened the display. Therefore, if a menu item of an FLTK app is given `FL_COMMAND++` as shortcut, that item's callback rather than FLTK's default zooming-in routine is triggered when `Ctrl+` (`Cmd+` under macOS) is pressed.

FLTK sends the `FL_ZOOM_EVENT` when the scaling factor value changes, to which a callback can be associated with `Fl::add_handler()`. By default, FLTK displays the new scaling factor value in a yellow, transient window. This can be changed with option `Fl::OPTION_SHOW_SCALING`.

11.5 Widget Events

11.5.1 FL_DEACTIVATE

This widget is no longer active, due to `deactivate()` being called on it or one of its parents. Please note that although `active()` may still return true for this widget after receiving this event, it is only truly active if `active()` is true for both it and all of its parents. (You can use `active_r()` to check this).

11.5.2 FL_ACTIVATE

This widget is now active, due to `activate()` being called on it or one of its parents.

11.5.3 FL_HIDE

This widget is no longer visible, due to `hide()` being called on it or one of its parents, or due to a parent window being minimized. Please note that although `visible()` may still return true for this widget after receiving this event, it is only truly visible if `visible()` is true for both it and all of its parents. (You can use `visible_r()` to check this).

11.5.4 FL_SHOW

This widget is visible again, due to `show()` being called on it or one of its parents, or due to a parent window being restored. *A child `Fl_Window` will respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass `FL_SHOW` to the base class `handle()` method!*

Note

The events in this chapter ("Widget Events"), i.e. `FL_ACTIVATE`, `FL_DEACTIVATE`, `FL_SHOW`, and `FL_HIDE`, are the only events deactivated and invisible widgets can usually get, depending on their states. Under certain circumstances, there may also be `FL_LEAVE` or `FL_UNFOCUS` events delivered to deactivated or hidden widgets.

11.6 Clipboard Events

11.6.1 FL_PASTE

You should get this event some time after you call `Fl::paste()`. The contents of `Fl::event_text()` is the text to insert and the number of characters is in `Fl::event_length()`.

11.6.2 FL_SELECTIONCLEAR

The `Fl::selection_owner()` will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.

11.7 Drag and Drop Events

FLTK supports drag and drop of text and files from any application on the desktop to an FLTK widget. Text is transferred using UTF-8 encoding.

See [Fl::dnd\(\)](#) for drag and drop from an FLTK widget.

The drag and drop data is available in [Fl::event_text\(\)](#) at the concluding `FL_PASTE`. On some platforms, the event text is also available for the `FL_DND_*` events, however application must not depend on that behavior because it depends on the protocol used on each platform.

`FL_DND_*` events cannot be used in widgets derived from [Fl_Group](#) or [Fl_Window](#).

11.7.1 Dropped filenames

Files are received as a list of full path and file names.

- On some X11 platforms, files are received as a URL-encoded UTF-8 string, that is, non-ASCII bytes (and a few others such as space and %) are replaced by the 3 bytes "%XY" where XY are the byte's hexadecimal value. The [fl_decode_uri\(\)](#) function can be used to transform in-place the received string into a proper UTF-8 string. On these platforms, strings corresponding to dropped files are further prepended by `file://` (or other prefixes such as `computer://`).
- Other X11 situations put all dropped filenames in a single line, separated by spaces.
- On non-X11 platforms, including Wayland, files dropped are received one pathname per line, with no `'\n'` after the last pathname.

11.7.2 FL_DND_ENTER

The mouse has been moved to point at this widget. A widget that is interested in receiving drag'n'drop data must return 1 to receive `FL_DND_DRAG`, `FL_DND_LEAVE` and `FL_DND_RELEASE` events.

11.7.3 FL_DND_DRAG

The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag'n'drop data should indicate the possible drop position.

11.7.4 FL_DND_LEAVE

The mouse has moved out of the widget.

11.7.5 FL_DND_RELEASE

The user has released the mouse button dropping data into the widget. When the receiving widget's `handle()` method gets the `FL_DND_RELEASE` event, it should return 1 to accept the dragged data. Processing of this event must not use code that would make unrelated events be sent to the application (opening a dialog window for example) or that would communicate with the dragging process. The next event received by the `handle()` method will then be an `FL_PASTE` event. The `handle()` method should process this `FL_PASTE` event rapidly to prevent the dragging process from failing with a timeout error.

11.8 Other events

11.8.1 FL_SCREEN_CONFIGURATION_CHANGED

Sent whenever the screen configuration changes (a screen is added/removed, a screen resolution is changed, screens are moved). Use [Fl::add_handler\(\)](#) to be notified of this event.

11.8.2 FL_FULLSCREEN

The application window has been changed from normal to fullscreen, or from fullscreen to normal. If you are using a X window manager which supports Extended Window Manager Hints, this event will not be delivered until the change has actually happened.

11.9 Fl::event_*(*) methods*

FLTK keeps the information about the most recent event in static storage. This information is good until the next event is processed. Thus it is valid inside `handle()` and `callback()` methods.

These are all trivial inline functions and thus very fast and small:

- [Fl::event_button\(\)](#)
- [Fl::event_clicks\(\)](#)
- [Fl::event_dx\(\)](#)
- [Fl::event_dy\(\)](#)
- [Fl::event_inside\(\)](#)
- [Fl::event_is_click\(\)](#)
- [Fl::event_key\(\)](#)
- [Fl::event_length\(\)](#)
- [Fl::event_state\(\)](#)
- [Fl::event_text\(\)](#)
- [Fl::event_x\(\)](#)
- [Fl::event_x_root\(\)](#)
- [Fl::event_y\(\)](#)
- [Fl::event_y_root\(\)](#)
- [Fl::get_key\(\)](#)
- [Fl::get_mouse\(\)](#)
- [Fl::test_shortcut\(\)](#)

11.10 Event Propagation

Widgets receive events via the virtual `handle()` function. The argument indicates the type of event that can be handled. The widget must indicate if it handled the event by returning 1. FLTK will then remove the event and wait for further events from the host. If the widget's handle function returns 0, FLTK may redistribute the event based on a few rules.

Most events are sent directly to the `handle()` method of the `Fl_Window` that the window system says they belong to. The window (actually the `Fl_Group` that `Fl_Window` is a subclass of) is responsible for sending the events on to any child widgets. To make the `Fl_Group` code somewhat easier, FLTK sends some events (`FL_DRAG`, `FL_MOUSE_RELEASE`, `FL_KEYBOARD`, `FL_SHORTCUT`, `FL_UNFOCUS`, and `FL_LEAVE`) directly to leaf widgets. These procedures control those leaf widgets:

- `Fl::add_handler()`
- `Fl::belowmouse()`
- `Fl::focus()`
- `Fl::grab()`
- `Fl::modal()`
- `Fl::pushed()`
- `Fl::release()` (deprecated, see `Fl::grab(0)`)
- `Fl_Widget::take_focus()`

FLTK propagates events along the widget hierarchy depending on the kind of event and the status of the UI. Some events are injected directly into the widgets, others may be resent as new events to a different group of receivers.

Mouse click events are first sent to the window that caused them. The window then forwards the event down the hierarchy until it reaches the widget that is below the click position. If that widget uses the given event, the widget is marked "pushed" and will receive all following mouse motion (`FL_DRAG`) events until the mouse button is released.

Mouse motion (`FL_MOVE`) events are sent to the `Fl::belowmouse()` widget, i.e. the widget that returned 1 on the last `FL_ENTER` event.

Mouse wheel events are sent to the window that caused the event. The window propagates the event down the tree, first to the widget that is below the mouse pointer, and if that does not succeed, to all other widgets in the group. This ensures that scroll widgets work as expected with the widget furthest down in the hierarchy getting the first opportunity to use the wheel event, but also giving scroll bars, that are not directly below the mouse a chance.

Keyboard events are sent directly to the widget that has keyboard focus. If the focused widget rejects the event, it is resent as a shortcut event, first to the top-most window, then to the widget below the mouse pointer, propagating up the hierarchy to all its parents. Those send the event also to all widgets that are not below the mouse pointer. Now if that did not work out, the shortcut is sent to all registered shortcut handlers.

If we are still unsuccessful, the event handler flips the case of the shortcut letter and starts over. Finally, if the key is "escape", FLTK sends a close event to the top-most window.

All other events are pretty much sent right away to the window that created the event.

Widgets can "grab" events. The grabbing window gets all events exclusively, but usually by the same rules as described above.

Windows can also request exclusivity in event handling by making the window modal.

11.11 FLTK Compose-Character Sequences

The character composition done by `Fl_Input` widget requires that you call the `Fl::compose()` function if you are writing your own text editor widget.

Currently, all characters made by single key strokes with or without modifier keys, or by system-defined character compose sequences (that can involve dead keys or a compose key) can be input. You should call `Fl::compose()` in case any enhancements to this processing are done in the future. The interface has been designed to handle arbitrary UTF-8 encoded text.

The following methods are provided for character composition:

- `Fl::compose()`
- `Fl::compose_reset()`

Under Mac OS X, FLTK "previews" partially composed sequences.

Chapter 12

Adding and Extending Widgets

This chapter describes how to add your own widgets or extend existing widgets in FLTK.

12.1 Subclassing

New widgets are created by *subclassing* an existing FLTK widget, typically [Fl_Widget](#) for controls and [Fl_Group](#) for composite widgets.

A control widget typically interacts with the user to receive and/or display a value of some sort.

A composite widget holds a list of child widgets and handles moving, sizing, showing, or hiding them as needed. [Fl_Group](#) is the main composite widget class in FLTK, and all of the other composite widgets ([Fl_Pack](#), [Fl_Scroll](#), [Fl_Tabs](#), [Fl_Tile](#), [Fl_Window](#), [Fl_Flex](#), [Fl_Grid](#), etc.) are subclasses of it.

You can also subclass other existing widgets to provide a different look or user-interface. For example, the button widgets are all subclasses of [Fl_Button](#) since they all interact with the user via a mouse button click. The only difference is the code that draws the face of the button.

12.2 Making a Subclass of Fl_Widget

Your subclasses can directly descend from [Fl_Widget](#) or any subclass of [Fl_Widget](#). [Fl_Widget](#) has only four virtual methods, and overriding some or all of these may be necessary.

12.3 The Constructor

The constructor should have the following arguments:

```
MyClass(int x, int y, int w, int h, const char *label = 0);
```

This will allow the class to be used in FLUID without problems.

The constructor must call the constructor for the base class and pass the same arguments:

```
MyClass::MyClass(int x, int y, int w, int h, const char *label)
: Fl_Widget(x, y, w, h, label) {
// do initialization stuff...
}
```

`Fl_Widget`'s protected constructor sets `x()`, `y()`, `w()`, `h()`, and `label()` to the passed values and initializes the other instance variables to:

```
type(0);
box(FL_NO_BOX);
color(FL_BACKGROUND_COLOR);
selection_color(FL_BACKGROUND_COLOR);
labeltype(FL_NORMAL_LABEL);
labelstyle(FL_NORMAL_STYLE);
labelsize(FL_NORMAL_SIZE);
labelcolor(FL_FOREGROUND_COLOR);
align(FL_ALIGN_CENTER);
callback(default_callback, 0);
flags(ACTIVE|VISIBLE);
image(0);
deimage(0);
```

12.4 Protected Methods of `Fl_Widget`

The following methods are provided for subclasses to use:

- `clear_visible()`
- `damage()`
- `draw_box()`
- `draw_focus()`
- `draw_label()`
- `set_flag()`
- `set_visible()`
- `test_shortcut()`
- `type()`

```
void Fl_Widget::damage(uchar mask)
void Fl_Widget::damage(uchar mask, int x, int y, int w, int h)
uchar Fl_Widget::damage()
```

The first form indicates that a partial update of the object is needed. The bits in `mask` are OR'd into `damage()`. Your `draw()` routine can examine these bits to limit what it is drawing. The public method `Fl_Widget::redraw()` simply does `Fl_Widget::damage(FL_DAMAGE_ALL)`, but the implementation of your widget can call the public `damage(n)`.

The second form indicates that a region is damaged. If only these calls are done in a window (no calls to `damage(n)`) then FLTK will clip to the union of all these calls before drawing anything. This can greatly speed up incremental displays. The mask bits are OR'd into `damage()` unless this is a `Fl_Window` widget.

The third form returns the bitwise-OR of all `damage(n)` calls done since the last `draw()`.

When redrawing your widgets you should look at the damage bits to see what parts of your widget need redrawing. The `handle()` method can then set individual damage bits to limit the amount of drawing that needs to be done:

```
MyClass::handle(int event) {
    ...
    if (change_to_part1) damage(1);
    if (change_to_part2) damage(2);
    if (change_to_part3) damage(4);
}
MyClass::draw() {
    if (damage() & FL_DAMAGE_ALL) {
        ... draw frame/box and other static stuff ...
    }
    if (damage() & (FL_DAMAGE_ALL | 1)) draw_part1();
    if (damage() & (FL_DAMAGE_ALL | 2)) draw_part2();
    if (damage() & (FL_DAMAGE_ALL | 4)) draw_part3();
}
```

Todo Clarify `Fl_Window::damage(uchar)` handling - seems confused/wrong? ORing value doesn't match setting behavior in `Fl_Widget.H`!

```
void Fl_Widget::draw_box() const
void Fl_Widget::draw_box(Fl_Boxtype t, Fl_Color c) const
```

The first form draws this widget's `box()`, using the dimensions of the widget. The second form uses `t` as the box type and `c` as the color for the box.

```
void Fl_Widget::draw_focus()
void Fl_Widget::draw_focus(Fl_Boxtype t, int x, int y, int w, int h) const
```

Draws a focus box inside the widget's bounding box. The second form allows you to specify a different bounding box.

```
void Fl_Widget::draw_label() const
void Fl_Widget::draw_label(int x, int y, int w, int h) const
void Fl_Widget::draw_label(int x, int y, int w, int h, Fl_Align align) const
```

The first form is the usual function for a `draw()` method to call to draw the widget's label. It does not draw the label if it is supposed to be outside the box (on the assumption that the enclosing group will draw those labels).

The second form uses the passed bounding box instead of the widget's bounding box. This is useful so "centered" labels are aligned with some feature, like a moving slider.

The third form draws the label anywhere. It acts as though `FL_ALIGN_INSIDE` has been forced on so the label will appear inside the passed bounding box. This is designed for parent groups to draw labels with.

```
void Fl_Widget::set_flag(int c)
```

Calling `set_flag(SHORTCUT_LABEL)` modifies the behavior of `draw_label()` so that '&' characters cause an underscore to be printed under the next letter.

```
void Fl_Widget::set_visible()
void Fl_Widget::clear_visible()
```

Fast inline versions of `Fl_Widget::hide()` and `Fl_Widget::show()`. These do not send the `FL_HIDE` and `FL_SHOW` events to the widget.

```
int Fl_Widget::test_shortcut()
static int Fl_Widget::test_shortcut(const char *s)
```

The first version tests `Fl_Widget::label()` against the current event (which should be a `FL_SHORTCUT` event). If the label contains a '&' character and the character after it matches the keypress, this returns true. This returns false if the `SHORTCUT_LABEL` flag is off, if the label is `NULL`, or does not have a '&' character in it, or if the keypress does not match the character.

The second version lets you do this test against an arbitrary string.

```
uchar Fl_Widget::type() const
void Fl_Widget::type(uchar t)
```

The property `Fl_Widget::type()` can return an arbitrary 8-bit identifier, and can be set with the protected method `type(uchar t)`. This value had to be provided for Forms compatibility, but you can use it for any purpose you want. Try to keep the value less than 100 to not interfere with reserved values.

FLTK does not use RTTI (Run Time Typing Information) to enhance portability. But this may change in the near future if RTTI becomes standard everywhere.

If you don't have RTTI you can use the clumsy FLTK mechanism, by having `type()` use a unique value. These unique values must be greater than the symbol `FL_RESERVED_TYPE` (which is 100) and less than `FL_WINDOW` (unless you make a subclass of `Fl_Window`). Look through the header files for `FL_RESERVED_TYPE` to find an unused number. If you make a subclass of `Fl_Window` you must use `FL_WINDOW + n` (where `n` must be in the range 1 to 7).

12.5 Handling Events

The virtual method `Fl_Widget::handle(int event)` is called to handle each event passed to the widget. It can:

- Change the state of the widget.
- Call `Fl_Widget::redraw()` if the widget needs to be redisplayed.
- Call `Fl_Widget::damage(uchar c)` if the widget needs a partial-update (assuming you provide support for this in your `draw()` method).
- Call `Fl_Widget::do_callback()` if a callback should be generated.
- Call `Fl_Widget::handle()` on child widgets.

Events are identified by the integer argument. Other information about the most recent event is stored in static locations and acquired by calling the `Fl::event_*` methods. This information remains valid until another event is handled.

Here is a sample `handle()` method for a widget that acts as a pushbutton and also accepts the keystroke 'x' to cause the callback:

```
int MyClass::handle(int event) {
    switch(event) {
        case FL_PUSH:
            highlight = 1;
            redraw();
            return 1;
        case FL_DRAG: {
            int t = Fl::event_inside(this);
            if (t != highlight) {
                highlight = t;
                redraw();
            }
        }
        return 1;
        case FL_RELEASE:
            if (highlight) {
                highlight = 0;
                redraw();
                do_callback();
                // never do anything after a callback, as the callback
                // may delete the widget!
            }
            return 1;
        case FL_SHORTCUT:
            if (Fl::event_key() == 'x') {
                do_callback();
                return 1;
            }
            return 0;
        default:
            return Fl_Widget::handle(event);
    }
}
```

You must return non-zero if your `handle()` method uses the event. If you return zero, the parent widget will try sending the event to another widget.

For debugging purposes, event numbers can be printed as their actual event names using the `fl_eventnames[]` array, e.g.:

```
#include <FL/names.h> // defines fl_eventnames[]
[...
int MyClass::handle(int e) {
    printf("Event was %s (%d)\n", fl_eventnames[e], e); // e.g. "Event was FL_PUSH (1)"
    [...
}
```

12.6 Drawing the Widget

The `draw()` virtual method is called when FLTK wants you to redraw your widget. It will be called if and only if `damage()` is non-zero, and `damage()` will be cleared to zero after it returns. The `draw()` method should be declared protected so that it can't be called from non-drawing code.

The `damage()` value contains the bitwise-OR of all the `damage(n)` calls to this widget since it was last drawn. This can be used for minimal update, by only redrawing the parts whose bits are set. FLTK will turn on the `FL_DAMAGE_ALL` bit if it thinks the entire widget must be redrawn, e.g. for an expose event.

Expose events (and the `damage(mask,x,y,w,h)` function described above) will cause `draw()` to be called with FLTK's clipping turned on. You can greatly speed up redrawing in some cases by testing `fl_not_clipped(x,y,w,h)` or `fl_clip_box()` and skipping invisible parts.

Besides the protected methods described above, FLTK provides a large number of basic drawing functions, which are described in the chapter [Drawing Things in FLTK](#).

12.7 Resizing the Widget

The `resize(x,y,w,h)` method is called when the widget is being resized or moved. The arguments are the new position, width, and height. `x()`, `y()`, `w()`, and `h()` still remain the old size. You must call `resize()` on your base class with the same arguments to get the widget size to actually change.

This should *not* call `redraw()`, at least if only the `x()` and `y()` change. This is because composite widgets like [FL_Scroll](#) may have a more efficient way of drawing the new position.

12.8 Making a Composite Widget

A "composite" widget contains one or more "child" widgets. To make a composite widget you should subclass [FL_Group](#). It is possible to make a composite object that is not a subclass of [FL_Group](#), but you'll have to duplicate the code in [FL_Group](#) anyways.

Instances of the child widgets may be included in the parent:

```
class MyClass : public FL_Group {
    FL_Button the_button;
    FL_Slider the_slider;
    ...
};
```

The constructor has to initialize these instances. They are automatically added to the group, since the [FL_Group](#) constructor does [FL_Group::begin\(\)](#). *Don't forget to call [FL_Group::end\(\)](#) or use the [FL_End](#) pseudo-class:*

```
MyClass::MyClass(int x, int y, int w, int h) :
    FL_Group(x, y, w, h),
    the_button(x + 5, y + 5, 100, 20),
    the_slider(x, y + 50, w, 20)
{
    ... (you could add dynamically created child widgets here) ...
    end(); // don't forget to do this!
}
```

The child widgets need callbacks. These will be called with a pointer to the children, but the widget itself may be found in the `parent()` pointer of the child. Usually these callbacks can be static private methods, with a matching private method:

```
void MyClass::static_slider_cb(FL_Widget* v, void *) { // static method
    ((MyClass*) (v->parent()))->slider_cb();
}
void MyClass::slider_cb() { // normal method
    use(the_slider->value());
}
```

If you make the `handle()` method, you can quickly pass all the events to the children using the `Fl_Group::handle()` method. You don't need to override `handle()` if your composite widget does nothing other than pass events to the children:

```
int MyClass::handle(int event) {
    if (Fl_Group::handle(event)) return 1;
    ... handle events that children don't want ...
}
```

If you override `draw()` you need to draw all the children. If `redraw()` or `damage()` is called on a child, `damage(FL_DAMAGE_CHILD)` is done to the group, so this bit of `damage()` can be used to indicate that a child needs to be drawn. It is fastest if you avoid drawing anything else in this case:

```
int MyClass::draw() {
    Fl_Widget *const*a = array();
    if (damage() == FL_DAMAGE_CHILD) { // only redraw some children
        for (int i = children(); i --; a++) update_child(**a);
    } else { // total redraw
        ... draw background graphics ...
        // now draw all the children atop the background:
        for (int i = children_; i --; a++) {
            draw_child(**a);
            draw_outside_label(**a); // you may not need to do this
        }
    }
}
```

`Fl_Group` provides some protected methods to make drawing easier:

- [draw_child\(\)](#)
- [draw_children\(\)](#)
- [draw_outside_label\(\)](#)
- [update_child\(\)](#)

void [Fl_Group::draw_child\(Fl_Widget &widget\) const](#)

This will force the child's `damage()` bits all to one and call `draw()` on it, then clear the `damage()`. You should call this on all children if a total redraw of your widget is requested, or if you draw something (like a background box) that damages the child. Nothing is done if the child is not `visible()` or if it is clipped.

void [Fl_Group::draw_children\(\)](#)

A convenience function that draws all children of the group. This is useful if you derived a widget from `Fl_Group` and want to draw a special border or background. You can call `draw_children()` from the derived `draw()` method after drawing the box, border, or background.

void [Fl_Group::draw_outside_label\(const Fl_Widget &widget\) const](#)

Draw the labels that are *not* drawn by [draw_label\(\)](#). If you want more control over the label positions you might want to call `child->draw_label(x, y, w, h, a)`.

void [Fl_Group::update_child\(Fl_Widget& widget\) const](#)

Draws the child only if its `damage()` is non-zero. You should call this on all the children if your own `damage` is equal to `FL_DAMAGE_CHILD`. Nothing is done if the child is not `visible()` or if it is clipped.

12.9 Cut and Paste Support

FLTK provides routines to cut and paste UTF-8 encoded text between applications:

- [Fl::copy\(\)](#)
- [Fl::paste\(\)](#)
- [Fl::selection\(\)](#)
- [Fl::selection_owner\(\)](#)

It is also possible to copy and paste image data between applications:

- [Fl_Copy_Surface](#)
- [Fl::clipboard_contains\(\)](#)
- [Fl::paste\(\)](#)

It may be possible to cut/paste other kinds of data by using [Fl::add_handler\(\)](#). Note that handling events beyond those provided by FLTK may be operating system specific. See [Operating System Issues](#) for more details.

12.10 Drag And Drop Support

FLTK provides routines to drag and drop UTF-8 encoded text between applications:

Drag'n'drop operations are initiated by copying data to the clipboard and calling the function [Fl::dnd\(\)](#).

Drop attempts are handled via the following events, already described under [Drag and Drop Events](#) in a previous chapter:

- `FL_DND_ENTER`
- `FL_DND_DRAG`
- `FL_DND_LEAVE`
- `FL_DND_RELEASE`
- `FL_PASTE`

12.11 Making a subclass of Fl_Window

You may want your widget to be a subclass of [Fl_Window](#), [Fl_Double_Window](#), or [Fl_Gl_Window](#). This can be useful if your widget wants to occupy an entire window, and can also be used to take advantage of system-provided clipping, or to work with a library that expects a system window ID to indicate where to draw.

Subclassing [Fl_Window](#) is almost exactly like subclassing [Fl_Group](#), and in fact you can easily switch a subclass back and forth. Watch out for the following differences:

1. [Fl_Window](#) is a subclass of [Fl_Group](#) so *make sure your constructor calls* `end()` unless you actually want children added to your window.
2. When handling events and drawing, the upper-left corner is at 0,0, not `x()`, `y()` as in other [Fl_Widget](#)'s. For instance, to draw a box around the widget, call `draw_box(0,0,w(),h())`, rather than `draw_box(x(),y(),w(),h())`.

You may also want to subclass [Fl_Window](#) in order to get access to different visuals or to change other attributes of the windows. See the [Operating System Issues](#) chapter for more information.

Chapter 13

Using OpenGL

This chapter discusses using FLTK for your OpenGL applications.

13.1 Using OpenGL in FLTK

The easiest way to make an OpenGL display is to subclass [Fl_Gl_Window](#). Your subclass must implement a `draw()` method which uses OpenGL calls to draw the display. Your main program should call `redraw()` when the display needs to change, and (somewhat later) FLTK will call `draw()`.

With a bit of care you can also use OpenGL to draw into normal FLTK windows (see [Using OpenGL in Normal FLTK Windows](#) below). This allows you to use Gouraud shading for drawing your widgets. To do this you use the `gl_start()` and `gl_finish()` functions around your OpenGL code.

You must include FLTK's `<FL/gl.h>` header file. It will include the file `<GL/gl.h>` (on macOS: `<OpenGL/gl.h>`), define some extra drawing functions provided by FLTK, and include the `<windows.h>` header file needed by Windows applications.

Some simple coding rules (see [OpenGL and support of HighDPI displays](#)) allow to write cross-platform code that will support OpenGL run on HighDPI displays (including the 'retina' displays of Apple hardware).

13.2 Making a Subclass of Fl_Gl_Window

To make a subclass of [Fl_Gl_Window](#), you must provide:

- A class definition.
- A `draw()` method.
- A `handle()` method if you need to receive input from the user.

If your subclass provides static controls in the window, they must be redrawn whenever the `FL_DAMAGE_ALL` bit is set in the value returned by `damage()`.

13.2.1 Defining the Subclass

To define the subclass you just subclass the `Fl_Gl_Window` class:

```
class MyWindow : public Fl_Gl_Window {
    void draw();
    int handle(int);
public:
    MyWindow(int X, int Y, int W, int H, const char *L)
        : Fl_Gl_Window(X, Y, W, H, L) {}
};
```

The `draw()` and `handle()` methods are described below. Like any widget, you can include additional private and public data in your class (such as scene graph information, etc.)

13.2.2 The draw() Method

The `draw()` method is where you actually do your OpenGL drawing:

```
void MyWindow::draw() {
    if (!valid()) {
        ... set up projection, viewport, etc ...
        ... window size is in w() and h().
        ... valid() is turned on by FLTK after draw() returns
    }
    ... draw ...
}
```

13.2.3 The handle() Method

The `handle()` method handles mouse and keyboard events for the window:

```
int MyWindow::handle(int event) {
    switch(event) {
    case FL_PUSH:
        ... mouse down event ...
        ... position in Fl::event_x() and Fl::event_y()
        return 1;
    case FL_DRAG:
        ... mouse moved while down event ...
        return 1;
    case FL_RELEASE:
        ... mouse up event ...
        return 1;
    case FL_FOCUS :
    case FL_UNFOCUS :
        ... Return 1 if you want keyboard events, 0 otherwise
        return 1;
    case FL_KEYBOARD:
        ... keypress, key is in Fl::event_key(), ascii in Fl::event_text()
        ... Return 1 if you understand/use the keyboard event, 0 otherwise...
        return 1;
    case FL_SHORTCUT:
        ... shortcut, key is in Fl::event_key(), ascii in Fl::event_text()
        ... Return 1 if you understand/use the shortcut event, 0 otherwise...
        return 1;
    default:
        // pass other events to the base class...
        return Fl_Gl_Window::handle(event);
    }
}
```

When `handle()` is called, the OpenGL context is not set up! If your display changes, you should call `redraw()` and let `draw()` do the work. Don't call any OpenGL drawing functions from inside `handle()`!

You can call *some* OpenGL stuff like hit detection and texture loading functions by doing:

```
case FL_PUSH:
    make_current(); // make OpenGL context current
    if (!valid()) {
        ... set up projection exactly the same as draw ...
        valid(1); // stop it from doing this next time
    }
    ... ok to call NON-DRAWING OpenGL code here, such as hit
    detection, loading textures, etc...
```

Your main program can now create one of your windows by doing `new MyWindow(...)`.

You can also use your new window class in FLUID by:

1. Putting your class definition in a `MyWindow.H` file.
2. Creating a `Fl_Box` widget in FLUID.
3. In the widget panel fill in the "class" field with `MyWindow`. This will make FLUID produce constructors for your new class.
4. In the "Extra Code" field put `#include "MyWindow.H"`, so that the FLUID output file will compile.

You must put `glwindow->show()` in your main code after calling `show()` on the window containing the OpenGL window.

13.3 OpenGL and support of HighDPI displays

HighDPI displays (including the so-called 'retina' displays of Apple hardware) are supported by FLTK in such a way that 1 unit of an FLTK quantity (say, the value given by `Fl_Gl_Window::w()`) corresponds to more than 1 pixel on the display. Conversely, when a program specifies the width and height of the OpenGL viewport, it is necessary to use an API that returns quantities expressed in pixels. That can be done as follows:

```
Fl_Gl_Window *glw = ...;
glViewport(0, 0, glw->pixel_w(), glw->pixel_h());
```

which makes use of the `Fl_Gl_Window::pixel_w()` and `Fl_Gl_Window::pixel_h()` methods giving the size in pixels of an `Fl_Gl_Window` that is potentially mapped to a HighDPI display. Method `Fl_Gl_Window::pixels_per_unit()` can also be useful in this context.

Note

A further coding rule is necessary to properly support retina displays and OpenGL under macOS (see [OpenGL and 'retina' displays](#))

13.4 Using OpenGL in Normal FLTK Windows

Note

Drawing both with OpenGL and Quartz in a normal FLTK window is not possible with the macOS platform. This technique is therefore not useful under macOS because it permits nothing more than what is possible with class `Fl_Gl_Window`.

You can put OpenGL code into the `draw()` method, as described in [Drawing the Widget](#) in the previous chapter, or into the code for a `boxtype` or other places with some care.

Most importantly, before you show *any* windows, including those that don't have OpenGL drawing, you **must** initialize FLTK so that it knows it is going to use OpenGL. You may use any of the symbols described for `Fl_Gl_Window:::mode()` to describe how you intend to use OpenGL:

```
Fl::gl_visual(FL_RGB);
```

You can then put OpenGL drawing code anywhere you can draw normally by surrounding it with `gl_start()` and `gl_finish()` to set up, and later release, an OpenGL context with an orthographic projection so that 0,0 is the lower-left corner of the window and each pixel is one unit. The current clipping is reproduced with OpenGL `glScissor()` commands. These functions also synchronize the OpenGL graphics stream with the drawing done by other X, Windows, or FLTK functions.

```
gl_start();
... put your OpenGL code here ...
gl_finish();
```

The same context is reused each time. If your code changes the projection transformation or anything else you should use `glPushMatrix()` and `glPopMatrix()` functions to put the state back before calling `gl_finish()`.

You may want to use `Fl_Window::current()->h()` to get the drawable height so that you can flip the Y coordinates.

Unfortunately, there are a bunch of limitations you must adhere to for maximum portability:

- You must choose a default visual with `Fl::gl_visual()`.
- You cannot pass `FL_DOUBLE` to `Fl::gl_visual()`.
- You cannot use `Fl_Double_Window` or `Fl_Overlay_Window`.

Do *not* call `gl_start()` or `gl_finish()` when drawing into an `Fl_Gl_Window` !

13.5 Using FLTK widgets in OpenGL Windows

FLTK widgets can be added to `Fl_Gl_Windows` just as they would be added to `Fl_Windows`. They are rendered as an overlay over the user defined OpenGL graphics using 'fl_.' graphics calls that are implemented in GL.

`Fl_Gl_Window` does not add subsequent widgets as children by default as `Fl_Window` does. Call `myGlWindow->begin()` after creating the GL window to automatically add following widgets. Remember to call `myGlWindow->end()`.

```
class My_Gl_Window : public Fl_Gl_Window {
...
    void draw();
...
};
...
myGlWindow = new My_Gl_Window(0, 0, 500, 500);
myGlWindow->begin();
myButton = new Fl_Button(10, 10, 120, 24, "Hello!");
myGlWindow->end();
...
void My_Gl_Window::draw() {
    // ... user GL drawing code
    Fl_Gl_Window::draw(); // Draw FLTK child widgets.
}
```

Users can draw into the overlay by using GL graphics calls as well as all `fl_...` graphics calls from the "Drawing Fast Shapes" section.

```
void My_Gl_Window::draw() {
    // ... user GL drawing code
    Fl_Gl_Window::draw_begin(); // Set up 1:1 projection
    Fl_Window::draw();         // Draw FLTK children
    fl_color(FL_RED);
    fl_rect(10, 10, 100, 100);
    Fl_Gl_Window::draw_end();  // Restore GL state
}
```

Widgets can be drawn with transparencies by assigning an alpha value to a colormap entry and using that color in the widget.

```
Fl::set_color(FL_FREE_COLOR, 255, 255, 0, 127); // 50% transparent yellow
myGlWindow = new My_Gl_Window(0, 0, 500, 500);
myGlWindow->begin();
myButton = new Fl_Button(10, 10, 120, 24, "Hello!");
myButton->box(FL_BORDER_BOX);
myButton->color(FL_FREE_COLOR);
myGlWindow->end();
```

Transparencies can also be set directly when drawing. This can be used to create custom box types and RGB overlay drawings with an alpha channel.

```
fl_color(0, 255, 0, 127); // 50% transparent green
fl_rectf(10, 10, 100, 100);
fl_color(FL_RED); // back to opaque red
fl_rect(20, 20, 80, 80);
```

13.6 OpenGL Drawing Functions

FLTK provides some useful OpenGL drawing functions. They can be freely mixed with any OpenGL calls, and are defined by including `<FL/g1.h>` which you should include instead of the OpenGL header `<GL/g1.h>`.

```
void gl_color(FL_Color)
```

Sets the current OpenGL color to a FLTK color. *For color-index modes it will use `fl_xpixel(c)`, which is only right if this window uses the default colormap!*

```
void gl_rect(int x, int y, int w, int h)
void gl_rectf(int x, int y, int w, int h)
```

Outlines or fills a rectangle with the current color. If `FL_GL_Window::ortho()` has been called, then the rectangle will exactly fill the pixel rectangle passed.

```
void gl_font(FL_Font fontid, int size)
```

Sets the current OpenGL font to the same font you get by calling `fl_font()`.

```
int gl_height()
int gl_descent()
float gl_width(const char *s)
float gl_width(const char *s, int n)
float gl_width(uchar c)
```

Returns information about the current OpenGL font.

```
void gl_draw(const char *s)
void gl_draw(const char *s, int n)
```

Draws a nul-terminated string or an array of `n` characters in the current OpenGL font at the current raster position.

```
void gl_draw(const char *s, int x, int y)
void gl_draw(const char *s, int n, int x, int y)
void gl_draw(const char *s, float x, float y)
void gl_draw(const char *s, int n, float x, float y)
```

Draws a nul-terminated string or an array of `n` characters in the current OpenGL font at the given position.

```
void gl_draw(const char *s, int x, int y, int w, int h, FL_Align)
```

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to `^X`, and aligned with the edges or center. Exactly the same output as `fl_draw()`.

13.7 Speeding up OpenGL

Performance of [Fl_Gl_Window](#) may be improved on some types of OpenGL implementations, in particular MESA and other software emulators, by setting the `GL_SWAP_TYPE` environment variable. This variable declares what is in the backbuffer after you do a `swapbuffers`.

- `setenv GL_SWAP_TYPE COPY`

This indicates that the back buffer is copied to the front buffer, and still contains its old data. This is true of many hardware implementations. Setting this will speed up emulation of overlays, and widgets that can do partial update can take advantage of this as `damage()` will not be cleared to -1.

- `setenv GL_SWAP_TYPE NODAMAGE`

This indicates that nothing changes the back buffer except drawing into it. This is true of MESA and Win32 software emulation and perhaps some hardware emulation on systems with lots of memory.

- All other values for `GL_SWAP_TYPE`, and not setting the variable, cause FLTK to assume that the back buffer must be completely redrawn after a swap.

This is easily tested by running the [gl_overlay](#) demo program and seeing if the display is correct when you drag another window over it or if you drag the window off the screen and back on. You have to exit and run the program again for it to see any changes to the environment variable.

13.8 Using OpenGL Optimizer with FLTK

[OpenGL Optimizer](#) is a scene graph toolkit for OpenGL available from Silicon Graphics for IRIX and Microsoft Windows. It allows you to view large scenes without writing a lot of OpenGL code.

OptimizerWindow Class Definition

To use [OpenGL Optimizer](#) with FLTK you'll need to create a subclass of `Fl_Gl_Widget` that includes several state variables:

```
class OptimizerWindow : public Fl_Gl_Window {
  csContext *context_; // Initialized to 0 and set by draw()...
  csDrawAction *draw_action_; // Draw action...
  csGroup *scene_; // Scene to draw...
  csCamera *camera_; // Viewport for scene...
  void draw();
public:
  OptimizerWindow(int X, int Y, int W, int H, const char *L)
  : Fl_Gl_Window(X, Y, W, H, L) {
    context_ = (csContext *)0;
    draw_action_ = (csDrawAction *)0;
    scene_ = (csGroup *)0;
    camera_ = (csCamera *)0;
  }
  void scene(csGroup *g) { scene_ = g; redraw(); }
  void camera(csCamera *c) {
    camera_ = c;
    if (context_) {
      draw_action_->setCamera(camera_);
      camera_>draw(draw_action_);
      redraw();
    }
  }
};
```

The camera() Method

The `camera()` method sets the camera (projection and viewpoint) to use when drawing the scene. The scene is redrawn after this call.

The draw() Method

The `draw()` method performs the needed initialization and does the actual drawing:

```
void OptimizerWindow::draw() {
    if (!context_) {
        // This is the first time we've been asked to draw; create the
        // Optimizer context for the scene...
#ifdef _WIN32
        context_ = new csContext((HDC)fl_getHDC());
        context_>ref();
        context_>makeCurrent((HDC)fl_getHDC());
#else
        context_ = new csContext(fl_display, fl_visual);
        context_>ref();
        context_>makeCurrent(fl_display, fl_window);
#endif // _WIN32
        ... perform other context setup as desired ...
        // Then create the draw action to handle drawing things...
        draw_action_ = new csDrawAction;
        if (camera_) {
            draw_action_>setCamera(camera_);
            camera_>draw(draw_action_);
        }
    } else {
#ifdef _WIN32
        context_>makeCurrent((HDC)fl_getHDC());
#else
        context_>makeCurrent(fl_display, fl_window);
#endif // _WIN32
    }
    if (!valid()) {
        // Update the viewport for this context...
        context_>setViewport(0, 0, w(), h());
    }
    // Clear the window...
    context_>clear(csContext::COLOR_CLEAR | csContext::DEPTH_CLEAR,
                 0.0f,          // Red
                 0.0f,          // Green
                 0.0f,          // Blue
                 1.0f);         // Alpha
    // Then draw the scene (if any)...
    if (scene_)
        draw_action_>apply(scene_);
}
```

The scene() Method

The `scene()` method sets the scene to be drawn. The scene is a collection of 3D objects in a `csGroup`. The scene is redrawn after this call.

13.9 Using OpenGL 3.0 (or higher versions)

The examples subdirectory contains OpenGL3test.cxx, a toy program showing how to use OpenGL 3.0 (or higher versions) with FLTK in a cross-platform fashion. It contains also OpenGL3-glut-test.cxx which shows how to use FLTK's GLUT compatibility and OpenGL 3.

To access OpenGL 3.0 (or higher versions), use the `FL_OPENGL3` flag when calling `FL_Gl_Window::mode(int a)` or `glutInitDisplayMode()`.

On the Windows and Linux platforms, FLTK creates contexts implementing the highest OpenGL version supported by the hardware. Such contexts may also be compatible with lower OpenGL versions. Access to functions from OpenGL versions above 1.1 requires to load function pointers at runtime on these platforms. FLTK recommends to use the GLEW library to perform this. It is therefore necessary to install the GLEW library (see below).

On the macOS platform, MacOS 10.7 or above is required; GLEW is possible but not necessary. FLTK creates contexts for OpenGL versions 1 and 2 without the `FL_OPENGL3` flag and for OpenGL versions 3.2 and above (**but not below**) with it.

GLEW installation (Linux and Windows platforms)

FLTK needs a header file, `GL/glew.h`, and a library, `libGLEW.*` or equivalent, to support OpenGL 3 and above.

These can be obtained for most Linux distributions by installing package `libglew-dev`.

For the Windows platform :

- the header and a Visual Studio static library (`glew32.lib`) can be downloaded from <http://glew.sourceforge.net/> ;
- a MinGW-style static library (`libglew32.a`) can be built from source (same web site) with the `make` command. Alternatively, pre-built files are available for these architectures :
 - x86: download files `glew.h` and `libglew32.a`;
 - x86_64: install GLEW as an MSYS2 package with command :
`pacman -S mingw-w64-x86_64-glew`

Source-level changes for OpenGL 3:

- Put this in all OpenGL-using source files (instead of, or before if needed, `#include <FL/gl.h>`, and before `#include <FL/glut.h>` if you use GLUT):

```
#if defined(__APPLE__)
# include <OpenGL/gl3.h> // defines OpenGL 3.0+ functions
#else
# if defined(_WIN32)
#   define GLEW_STATIC 1
# endif
# include <GL/glew.h>
#endif
```

- Add the `FL_OPENGL3` flag when calling `FL_Gl_Window::mode(int a)` or `glutInitDisplayMode()`.
- Put this in the `handle(int event)` member function of the first to be created among your `FL_Gl_Window`-derived classes:

```
#ifndef __APPLE__
static int first = 1;
if (first && event == FL_SHOW && shown()) {
    first = 0;
    make_current();
    glewInit(); // defines pters to functions of OpenGL V 1.2 and above
}
#endif
```

- Alternatively, if you use GLUT, put

```
#ifndef __APPLE__
    glewInit(); // defines pters to functions of OpenGL V 1.2 and above
#endif
```

after the first `glutCreateWindow()` call.

If GLEW is installed on the Mac OS development platform, it is possible to use the same code for all platforms, with one exception: put

```
#ifdef __APPLE__
    glewExperimental = GL_TRUE;
#endif
```

before the `glewInit()` call.

Testing for success of the glewInit() call

Testing whether the glewInit() call is successful is to be done as follows:

```
#include <FL/platform.H> // defines FLTK_USE_WAYLAND under the Wayland platform
#include <FL/Fl.H> // for Fl::warning()
#ifdef __APPLE__
#   if defined(_WIN32)
#       define GLEW_STATIC 1
#   endif
#   include <GL/glew.h>
#   GLenum err = glewInit(); // defines pters to functions of OpenGL V 1.2 and above
#   ifdef FLTK_USE_WAYLAND
#       // glewInit returns GLEW_ERROR_NO_GLX_DISPLAY with Wayland
#       if (fl_wl_display() && err == GLEW_ERROR_NO_GLX_DISPLAY) err = GLEW_OK;
#   endif
#   if (err != GLEW_OK) Fl::warning("glewInit() failed returning %u", err);
#endif // ! __APPLE__
```

Changes in the build process

Link with libGLEW.so (with X11 or Wayland), libglew32.a (with MinGW) or glew32.lib (with MS Visual Studio); no change is needed on the Mac OS platform.

Chapter 14

FLTK Runtime Options

In this chapter, we will cover how to access and alter settings for applications created using FLTK, both as an administrator and as a regular user.

Subchapters:

- [Runtime Options](#)
- [Obtaining Current Settings](#)
- [Administrative Tool](#)
- [List of Options](#)

14.1 Runtime Options

FLTK keeps track of various aspects of the user interface in a system-wide database. Users have the ability to set their own preferences and override default or system settings. For instance, FLTK will display a dotted rectangle around the widget with current focus. This might not be desirable for users who do not use keyboard navigation and do not need the rectangle. This can be turned off by setting the `OPTION_VISIBLE_FOCUS` option to 'off' for that user, which will disable the focus rectangle in all FLTK-based applications.

14.2 Obtaining Current Settings

Options are kept in preference files using the signature `Fl_Preferences::CORE_SYSTEM`, "fltk.org", "fltk" for system-wide settings and `Fl_Preferences::CORE_USER`, "fltk.org", "fltk" for individual users. They can be accessed by using the function `bool Fl::option(Fl_Option opt)`. If an application needs to temporarily override user or system settings, it can use the function `void option(Fl_Option opt, bool val)`.

To make changes to options permanently, FLTK provides an administrative tool called `fltk-options`.

14.3 Administrative Tool

`fltk-options` is a hybrid app that is part of FLTK and can be installed on the target system. It includes an up-to-date man page.

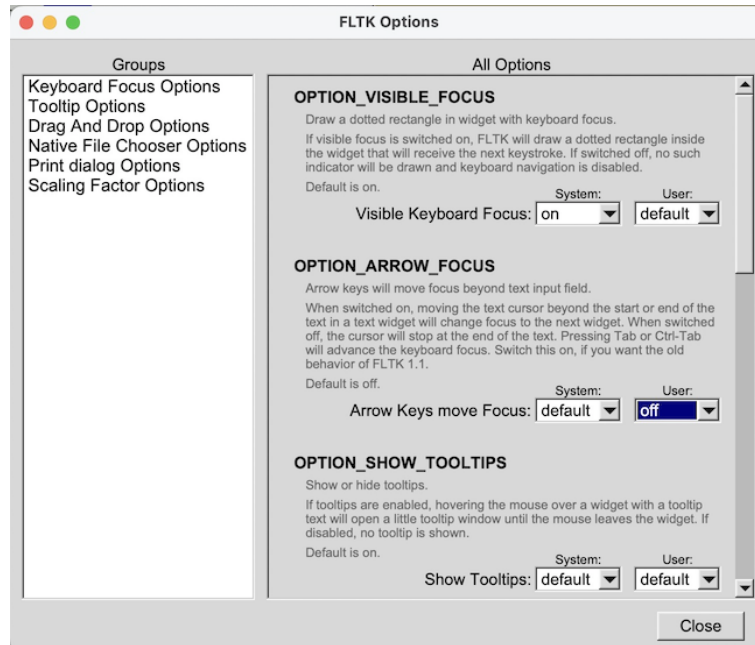

Figure 14.1 `fltk-options` Application

When `fltk-options` is called without any command-line arguments, it opens in interactive mode and provides a user interface to view and alter all system and current user options.

Starting the tool from a shell, the command-line options `-S` and `-U` can be used to display or change system or user options. On MS-Windows, `fltk-options` is also available as `fltk-options-cmd.exe`.

14.4 List of Options

Calling `fltk-options --help` gives a list of all available commands, and options and their values. `fltk-options --help OPTION` prints more detailed information for `OPTION` if available. In interactive mode, tooltips provide this additional information.

A full list of options can be found in the manual at [Fl::Fl_Option](#).

Chapter 15

Advanced FLTK

This chapter explains advanced programming and design topics that will help you to get the most out of FLTK.

15.1 Multithreading

FLTK can be used to implement a GUI for a multithreaded application but, as with multithreaded programming generally, there are some concepts and caveats that must be kept in mind.

Key amongst these is that, for many of the target platforms on which FLTK is supported, only the `main()` thread of the process is permitted to handle system events, create or destroy windows and open or close windows. Further, only the `main()` thread of the process can safely write to the display.

To support this in a portable way, all FLTK `draw()` methods are executed in the `main()` thread. A worker thread may update the state of an existing widget, but it may not do any rendering directly, nor create or destroy a window. (**NOTE:** A special case exists for [FL_Gl_Window](#) where it can, with suitable precautions, be possible to safely render to an existing GL context from a worker thread.)

Creating portable threads

We do not provide a threading interface as part of the library. A simple example showing how threads can be implemented, for all supported platforms, can be found in `test/threads.h` and `test/threads.cxx`.

FLTK has been used with a variety of thread interfaces, so if the simple example shown in `test/threads.cxx` does not cover your needs, you might want to select a third-party library that provides the features you require.

15.2 FLTK multithread locking - `Fl::lock()` and `Fl::unlock()`

In a multithreaded program, drawing of widgets (in the `main()` thread) happens asynchronously to widgets being updated by worker threads, so no drawing can occur safely whilst a widget is being modified (and no widget should be modified whilst drawing is in progress).

FLTK supports multithreaded applications using a locking mechanism internally. This allows a worker thread to lock the rendering context, preventing any drawing from taking place, whilst it changes the value of its widget.

Note

The converse is also true; whilst a worker thread holds the lock, the `main()` thread may not be able to process any drawing requests, nor service any events. So a worker thread that holds the FLTK lock **must** contrive to do so for the shortest time possible or it could impair operation of the application.

The lock operates broadly as follows.

Using the FLTK library, the `main()` thread holds the lock whenever it is processing events or redrawing the display. It acquires (locks) and releases (unlocks) the FLTK lock automatically and no "user intervention" is required. Indeed, a function that runs in the context of the `main()` thread ideally should **not** acquire / release the FLTK lock explicitly. (Though note that the lock calls are recursive, so calling `Fl::lock()` from a thread that already holds the lock, including the `main()` thread, is benign. The only constraint is that every call to `Fl::lock()` **must** be balanced by a corresponding call to `Fl::unlock()` to ensure the lock count is preserved.)

The `main()` thread **must** call `Fl::lock()` **once** before any windows are shown, to enable the internal lock (it is "off" by default since it is not useful in single-threaded applications) but thereafter the `main()` thread lock is managed by the library internally.

A worker thread, when it wants to alter the value of a widget, can acquire the lock using `Fl::lock()`, update the widget, then release the lock using `Fl::unlock()`. Acquiring the lock ensures that the worker thread can update the widget, without any risk that the `main()` thread will attempt to redraw the widget whilst it is being updated.

Note that acquiring the lock is a blocking action; the worker thread will stall for as long as it takes to acquire the lock. If the `main()` thread is engaged in some complex drawing operation this may block the worker thread for a long time, effectively serializing what ought to be parallel operations. (This frequently comes as a surprise to coders less familiar with multithreaded programming issues; see the discussion of "lockless programming" later for strategies for managing this.)

To incorporate the locking mechanism in the library, FLTK must be compiled with `--enable-threads` set during the `configure` process. IDE-based versions of FLTK are automatically compiled with the locking mechanism incorporated if possible. Since version 1.3, the `configure` script that builds the FLTK library also sets `--enable-threads` by default.

15.3 Simple multithreaded examples using `Fl::lock`

In `main()`, call `Fl::lock()` once before `Fl::run()` or `Fl::wait()` to enable the lock and start the runtime multithreading support for your program. All callbacks and derived functions like `handle()` and `draw()` will now be properly locked.

This might look something like this:

```
int main(int argc, char **argv) {
    /* Create your windows and widgets here */
    Fl::lock(); /* "start" the FLTK lock mechanism */
    /* show your window */
    main_win->show(argc, argv);
    /* start your worker threads */
    ... start threads ...
    /* Run the FLTK main loop */
    int result = Fl::run();
    /* terminate any pending worker threads */
    ... stop threads ...
    return result;
}
```

You can start as many threads as you like. From within a thread (other than the `main()` thread) FLTK calls must be wrapped with calls to `Fl::lock()` and `Fl::unlock()`:

```
void my_thread(void) {
    while (thread_still_running) {
        /* do thread work */
        ...
        /* compute new values for widgets */
        ...
        Fl::lock(); // acquire the lock
        my_widget->update(values);
        Fl::unlock(); // release the lock; allow other threads to access FLTK again
        Fl::awake(); // use Fl::awake() to signal main thread to refresh the GUI
    }
}
```

Note

To trigger a refresh of the GUI from a worker thread, the worker code should call `Fl::awake()`

Using `Fl::awake` thread messages

You can send messages from worker threads to the `main()` thread using `Fl::awake(void* message)`. If using this thread message interface, your `main()` might look like this:

```
int main(int argc, char **argv) {
    /* Create your windows and widgets here */
    Fl::lock(); /* "start" the FLTK lock mechanism */
    /* show your window */
    main_win->show(argc, argv);
    /* start your worker threads */
    ... start threads ...
    /* Run the FLTK loop and process thread messages */
    while (Fl::wait() > 0) {
        if ((next_message = Fl::thread_message()) != NULL) {
            /* process your data, update widgets, etc. */
            ...
        }
    }
    /* terminate any pending worker threads */
    ... stop threads ...
    return 0;
}
```

Your worker threads can send messages to the `main()` thread using `Fl::awake(void* message)`:

```
void *msg;          // "msg" is a pointer to your message
Fl::awake(msg);    // send "msg" to main thread
```

A message can be anything you like. The `main()` thread can retrieve the message by calling `Fl::thread_message()`.

Using `Fl::awake` callback messages

You can also request that the `main()` thread call a function on behalf of the worker thread by using `Fl::awake(Fl_Awake_Handler cb, void* userdata)`.

The `main()` thread will execute the callback "as soon as possible" when next processing the pending events. This can be used by a worker thread to perform operations (for example showing or hiding windows) that are prohibited in a worker thread.

```
void do_something_cb(void *userdata) {
    // Will run in the context of the main thread
    ... do_stuff ...
}
// running in worker thread
void *data;          // "data" is a pointer to your user data
Fl::awake(do_something_cb, data); // call to execute cb in main thread
```

Note

The `main()` thread will execute the `Fl_Awake_Handler` callback `do_something_cb` asynchronously to the worker thread, at some short but indeterminate time after the worker thread registers the request. When it executes the `Fl_Awake_Handler` callback, the `main()` thread will use the contents of `*userdata` **at the time of execution**, not necessarily the contents that `*userdata` had at the time that the worker thread posted the callback request. The worker thread should therefore contrive **not** to alter the contents of `*userdata` once it posts the callback, since the worker thread does not know when the `main()` thread will consume that data. It is often useful that `userdata` point to a struct, one member of which the `main()` thread can modify to indicate that it has consumed the data, thereby allowing the worker thread to re-use or update `userdata`.

Warning

The mechanisms used to deliver `Fl::awake(void* message)` and `Fl::awake(Fl_Awake_Handler cb, void* userdata)` events to the `main()` thread can interact in unexpected ways on some platforms. Therefore, for reliable operation, it is advised that a program use either `Fl::awake(Fl_Awake_Handler cb, void* userdata)` or `Fl::awake(void* message)`, but that they never be intermixed. Calling `Fl::awake()` with no parameters should be safe in either case.

If you have to choose between using the `Fl::awake(void* message)` and `Fl::awake(Fl_Awake_Handler cb, void* userdata)` mechanisms and don't know which to choose, then try the `Fl::awake(Fl_Awake_Handler cb, void* userdata)` method first as it tends to be more powerful in general.

15.4 FLTK multithreaded "lockless programming"

The simple multithreaded examples shown above, using the FLTK lock, work well for many cases where multiple threads are required. However, when that model is extended to more complex programs, it often produces results that the developer did not anticipate.

A typical case might go something like this. A developer creates a program to process a huge data set. The program has a `main()` thread and 7 worker threads and is targeted to run on an 8-core computer. When it runs, the program divides the data between the 7 worker threads, and as they process their share of the data, each thread updates its portion of the GUI with the results, locking and unlocking as they do so.

But when this program runs, it is much slower than expected and the developer finds that only one of the eight CPU cores seems to be utilised, despite there being 8 threads in the program. What happened?

The threads in the program all run as expected, but they end up being serialized (that is, not able to run in parallel) because they all depend on the single FLTK lock. Acquiring (and releasing) that lock has an associated cost, and is a **blocking** action if the lock is already held by any other worker thread or by the `main()` thread.

If the worker threads are acquiring the lock "too often", then the lock will **always** be held **somewhere** and every attempt by any other thread (even `main()`) to lock will cause that other thread (including `main()`) to block. And blocking `main()` also blocks event handling, display refresh...

As a result, only one thread will be running at any given time, and the multithreaded program is effectively reduced to being a (complicated and somewhat less efficient) single thread program.

A "solution" is for the worker threads to lock "less often", such that they do not block each other or the `main()` thread. But judging what constitutes locking "too often" for any given configuration, and hence will block, is a very tricky question. What works well on one machine, with a given graphics card and CPU configuration may behave very differently on another target machine.

There are "interesting" variations on this theme, too: for example it is possible that a "faulty" multithreaded program such as described above will work adequately on a single-core machine (where all threads are inherently serialized anyway and so are less likely to block each other) but then stall or even deadlock in unexpected ways on a multicore machine when the threads do interfere with each other. (I have seen this - it really happens.)

The "better" solution is to avoid using the FLTK lock so far as possible. Instead, the code should be designed so that the worker threads do not update the GUI themselves and therefore never need to acquire the FLTK lock. This would be FLTK multithreaded "lockless programming".

There are a number of ways this can be achieved (or at least approximated) in practice but the most direct approach is for the worker threads to make use of the `Fl::awake(Fl_Awake_Handler cb, void* userdata)` method so that GUI updates can all run in the context of the `main()` thread, alleviating the need for the worker thread to ever lock. The onus is then on the worker threads to manage the `userdata` so that it is delivered safely to the `main()` thread, but there are many ways that can be done.

Note

Using `Fl::awake` is not, strictly speaking, entirely "lockless" since the awake handler mechanism incorporates resource locking internally to protect the queue of pending awake messages. These resource locks are held transiently and generally do not trigger the pathological blocking issues described here.

However, aside from using `Fl::awake`, there are many other ways that a "lockless" design can be implemented, including message passing, various forms of IPC, etc.

If you need high performing multithreaded programming, then take some time to study the options and understand the advantages and disadvantages of each; we can't even begin to scratch the surface of this huge topic here!

And of course occasional, sparse, use of the FLTK lock from worker threads will do no harm; it is "excessive" locking (whatever that might be) that triggers the failing behaviour.

It is always a Good Idea to update the GUI at the lowest rate that is acceptable when processing bulk data (or indeed, in all cases!) Updating at a few frames per second is probably adequate for providing feedback during a long calculation. At the upper limit, anything faster than the frame rate of your monitor and the updates will never even be displayed; why waste CPU computing pixels that you will never show?

15.5 FLTK multithreaded Constraints

FLTK supports multiple platforms, some of which allow only the `main()` thread to handle system events and open or close windows. The safe thing to do is to adhere to the following rules for threads on all operating systems:

- Don't `show()` or `hide()` anything that contains `Fl_Window` based widgets from a worker thread. This includes any windows, dialogs, file choosers, subwindows or widgets using `Fl_Gl_Window`. Note that this constraint also applies to non-window widgets that have tooltips, since the tooltip will contain a `Fl_Window` object. The safe and portable approach is **never** to call `show()` or `hide()` on any widget from the context of a worker thread. Instead you can use the `Fl_Awake_Handler` variant of `Fl::awake()` to request the `main()` thread to create, destroy, show or hide the widget on behalf of the worker thread.
- Don't call `Fl::run()`, `Fl::wait()`, `Fl::flush()`, `Fl::check()` or any related methods that will handle system messages from a worker thread
- Don't intermix use of `Fl::awake(Fl_Awake_Handler cb, void* userdata)` and `Fl::awake(void* message)` calls in the same program as they may interact unpredictably on some platforms; choose one or other style of `Fl::awake(<thing>)` mechanism and use that. (Intermixing calls to `Fl::awake()` should be safe with either however.)
- Starting with FLTK 1.4, it's possible to start (or cancel) a timer from a worker thread under the condition that the call to `Fl::add_timeout` (or `Fl::remove_timeout`) is wrapped in `Fl::lock()` and `Fl::unlock()`.
- Don't change window decorations or titles from a worker thread
- The `make_current()` method will probably not work well for regular windows, but should always work for a `Fl_Gl_Window` to allow for high speed rendering on graphics cards with multiple pipelines. Managing thread-safe access to the GL pipelines is left as an exercise for the reader! (And may be target specific...)

See also: `Fl::lock()`, `Fl::unlock()`, `Fl::awake()`, `Fl::awake(Fl_Awake_Handler cb, void* userdata)`, `Fl::awake(void* message)`, `Fl::thread_message()`.

Chapter 16

Unicode and UTF-8 Support

This chapter explains how FLTK handles international text via Unicode and UTF-8.

Unicode support was added to FLTK starting with version 1.3.0 and is still incomplete but mostly functional. This chapter is Work in Progress, reflecting the current state of Unicode support.

16.1 About Unicode, ISO 10646 and UTF-8

The summary of Unicode, ISO 10646 and UTF-8 given below is deliberately brief and provides just enough information for the rest of this chapter.

For further information, please see:

- <https://unicode.org>
- <https://iso.org>
- <https://en.wikipedia.org/wiki/Unicode>
- <https://www.cl.cam.ac.uk/~mgk25/unicode.html>
- <https://tools.ietf.org/html/rfc3629>

The Unicode Standard

The Unicode Standard was originally developed by a consortium of mainly US computer manufacturers and developers of multi-lingual software. It has now become a defacto standard for character encoding and is supported by most of the major computing companies in the world.

Before Unicode, many different systems, on different platforms, had been developed for encoding characters for different languages, but no single encoding could satisfy all languages. Unicode provides access to over 130,000 characters used in all the major languages written today, and is independent of platform and language.

Unicode also provides higher-level concepts needed for text processing and typographic publishing systems, such as algorithms for sorting and comparing text, composite character and text rendering, right-to-left and bi-directional text handling.

Note

There are currently no plans to add this extra functionality to FLTK.

ISO 10646

The International Organisation for Standardization (ISO) had also been trying to develop a single unified character set. Although both ISO and the Unicode Consortium continue to publish their own standards, they have agreed to coordinate their work so that specific versions of the Unicode and ISO 10646 standards are compatible with each other.

The international standard ISO 10646 defines the **Universal Character Set** (UCS) which contains the characters required for almost all known languages. The standard also defines three different implementation levels specifying how these characters can be combined.

Note

There are currently no plans for handling the different implementation levels or the combining characters in FLTK.

In UCS, characters have a unique numerical code and an official name, and are usually shown using 'U+' and the code in hexadecimal, e.g. U+0041 is the "Latin capital letter A". The UCS characters U+0000 to U+007F correspond to US-ASCII, and U+0000 to U+00FF correspond to ISO 8859-1 (Latin1).

ISO 10646 was originally designed to handle a 31-bit character set from U+00000000 to U+7FFFFFFF, but the current idea is that 21 bits will be sufficient for all future needs, giving characters up to U+10FFFF. The complete character set is sub-divided into *planes*. *Plane 0*, also known as the **Basic Multilingual Plane** (BMP), ranges from U+0000 to U+FFFF and consists of the most commonly used characters from previous encoding standards. Other planes contain characters for specialist applications.

Todo FLTK 1.3 and later supports the full Unicode range (21 bits), but there are a few exceptions, for instance binary shortcut values in menus ([Fl_Shortcut](#)) can only be used with characters from the BMP (16 bits). This may be extended in a future FLTK version.

The UCS also defines various methods of encoding characters as a sequence of bytes. UCS-2 encodes Unicode characters into two bytes, which is wasteful if you are only dealing with ASCII or Latin1 text, and insufficient if you need characters above U+00FFFF. UCS-4 uses four bytes, which lets it handle higher characters, but this is even more wasteful for ASCII or Latin1.

UTF-8

The Unicode standard defines various UCS Transformation Formats (UTF). UTF-16 and UTF-32 are based on units of two and four bytes. UCS characters requiring more than 16 bits are encoded using "surrogate pairs" in UTF-16.

UTF-8 encodes all Unicode characters into variable length sequences of bytes. Unicode characters in the 7-bit ASCII range map to the same value and are represented as a single byte, making the transformation to Unicode quick and easy.

All UCS characters above U+007F are encoded as a sequence of several bytes. The top bits of the first byte are set to show the length of the byte sequence, and subsequent bytes are always in the range 0x80 to 0xBF. This combination provides some level of synchronisation and error detection.

Unicode range	Byte sequences
U+00000000 - U+0000007F	0xxxxxxx
U+00000080 - U+000007FF	110xxxxx 10xxxxxx
U+00000800 - U+0000FFFF	1110xxxx 10xxxxxx 10xxxxxx
U+00010000 - U+001FFFFF	11110xxx 10xxxxxx 10xxxxxx 10xxxxxx
U+00200000 - U+03FFFFFF	111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx
U+04000000 - U+7FFFFFFF	1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx

Note

This table contains theoretical values outside the valid Unicode range (U+000000 - U+10FFFF). Such values can only be returned by conversion functions for illegal input values (see [Illegal Unicode and UTF-8 Sequences](#)).

Moving from ASCII encoding to Unicode will allow all new FLTK applications to be easily internationalized and used all over the world. By choosing UTF-8 encoding, FLTK remains largely source-code compatible to previous iterations of the library.

16.2 Unicode in FLTK

Todo Work through the code and this documentation to harmonize the `[OksiD]` and `[fltk2]` functions.

FLTK will be entirely converted to Unicode using UTF-8 encoding. If a different encoding is required by the underlying operating system, FLTK will convert the string as needed.

It is important to note that the initial implementation of Unicode and UTF-8 in FLTK involves three important areas:

- provision of Unicode character tables and some simple related functions;
- conversion of `char*` variables and function parameters from single byte per character representation to UTF-8 variable length sequences;
- modifications to the display font interface to accept general Unicode character or UCS code numbers instead of just ASCII or Latin1 characters.

The current implementation of Unicode / UTF-8 in FLTK will impose the following limitations:

- An implementation note in the `[OksiD]` code says that all functions are LIMITED to 24 bit Unicode values, but also says that only 16 bits are really used under linux and win32. **[Can we verify this?]**
- The `[fltk2]` `fl_utf8encode()` and `fl_utf8decode()` functions are designed to handle Unicode characters in the range U+000000 to U+10FFFF inclusive, which covers all UTF-16 characters, as specified in RFC 3629. *Note that the user must first convert UTF-16 surrogate pairs to UCS.*
- FLTK will only handle single characters, so composed characters consisting of a base character and floating accent characters will be treated as multiple characters.
- FLTK will only compare or sort strings on a byte by byte basis and not on a general Unicode character basis.
- FLTK will not handle right-to-left or bi-directional text.

Todo Verify 16/24 bit Unicode limit for different character sets? OksiD's code appears limited to 16-bit whereas the FLTK2 code appears to handle a wider set. What about illegal characters? See comments in `fl_utf8fromwc()` and `fl_utf8toUtf16()`.

16.3 Illegal Unicode and UTF-8 Sequences

Three pre-processor variables are defined in the source code [1] that determine how `fl_utf8decode()` handles illegal UTF-8 sequences:

- if `ERRORS_TO_CP1252` is set to 1 (the default), `fl_utf8decode()` will assume that a byte sequence starting with a byte in the range 0x80 to 0x9f represents a Microsoft CP1252 character, and will return the value of an equivalent UCS character. Otherwise, it will be processed as an illegal byte value as described below.
- if `STRICT_RFC3629` is set to 1 (not the default!) then UTF-8 sequences that correspond to illegal UCS values are treated as errors. Illegal UCS values include those above U+10FFFF, or corresponding to UTF-16 surrogate pairs. Illegal byte values are handled as described below.
- if `ERRORS_TO_ISO8859_1` is set to 1 (the default), the illegal byte value is returned unchanged, otherwise 0xFFFD, the Unicode REPLACEMENT CHARACTER, is returned instead.

[1] Since FLTK 1.3.4 you may set these three pre-processor variables on your compile command line with `-D"variable=value"` (value: 0 or 1) to avoid editing the source code.

`fl_utf8encode()` is less strict, and only generates the UTF-8 sequence for 0xFFFD, the Unicode REPLACEMENT CHARACTER, if it is asked to encode a UCS value above U+10FFFF.

Many of the `[fltk2]` functions below use `fl_utf8decode()` and `fl_utf8encode()` in their own implementation, and are therefore somewhat protected from bad UTF-8 sequences.

The `[OksiD]` `fl_utf8len()` function assumes that the byte it is passed is the first byte in a UTF-8 sequence, and returns the length of the sequence. Trailing bytes in a UTF-8 sequence will return -1.

- **WARNING:** `fl_utf8len()` can not distinguish between single bytes representing Microsoft CP1252 characters 0x80-0x9f and those forming part of a valid UTF-8 sequence. You are strongly advised not to use `fl_utf8len()` in your own code unless you know that the byte sequence contains only valid UTF-8 sequences.
- **WARNING:** Some of the `[OksiD]` functions below still use `fl_utf8len()` in their implementations. These may need further validation.

Please see the individual function description for further details about error handling and return values.

16.4 FLTK Unicode and UTF-8 Functions

This section provides a brief overview of the functions. For more details, consult the main text for each function via its link.

`int fl_utf8locale()` **FLTK2**

`fl_utf8locale()` returns true if the "locale" seems to indicate that UTF-8 encoding is used.

It is highly recommended that you change your system so this does return true!

`int fl_utf8test(const char *src, unsigned len)` **FLTK2**

`fl_utf8test()` examines the first `len` bytes of `src`. It returns 0 if there are any illegal UTF-8 sequences; 1 if `src` contains plain ASCII or if `len` is zero; or 2, 3 or 4 to indicate the range of Unicode characters found.

`int fl_utf_nb_char(const unsigned char *buf, int len)` **OksiD**

Returns the number of UTF-8 characters in the first `len` bytes of `buf`.

`int fl_unichar_to_utf8_size(Fl_Unichar)`
`int fl_utf8bytes(unsigned ucs)`

Returns the number of bytes needed to encode `ucs` in UTF-8.

`int fl_utf8len(char c)` **OksiD**

If `c` is a valid first byte of a UTF-8 encoded character sequence, `fl_utf8len()` will return the number of bytes in that sequence. It returns -1 if `c` is not a valid first byte.

`unsigned int fl_nonspacing(unsigned int ucs)` **OksiD**

Returns true if `ucs` is a non-spacing character.

`const char* fl_utf8back(const char *p, const char *start, const char *end)` **FLTK2**
`const char* fl_utf8fwd(const char *p, const char *start, const char *end)` **FLTK2**

If `p` already points to the start of a UTF-8 character sequence, these functions will return `p`. Otherwise `fl_utf8back()` searches backwards from `p` and `fl_utf8fwd()` searches forwards from `p`, within the `start` and `end` limits, looking for the start of a UTF-8 character.

`unsigned int fl_utf8decode(const char *p, const char *end, int *len)` **FLTK2**
`int fl_utf8encode(unsigned ucs, char *buf)` **FLTK2**

`fl_utf8decode()` attempts to decode the UTF-8 character that starts at `p` and may not extend past `end`. It returns the Unicode value, and the length of the UTF-8 character sequence is returned via the `len` argument. `fl_utf8encode()` writes the UTF-8 encoding of `ucs` into `buf` and returns the number of bytes in the sequence. See the main documentation for the treatment of illegal Unicode and UTF-8 sequences.

unsigned int `fl_utf8froma(char *dst, unsigned dstlen, const char *src, unsigned srclen)` **FLTK2**

unsigned int `fl_utf8toa(const char *src, unsigned srclen, char *dst, unsigned dstlen)` **FLTK2**

`fl_utf8froma()` converts a character string containing single bytes per character (i.e. ASCII or ISO-8859-1) into UTF-8. If the `src` string contains only ASCII characters, the return value will be the same as `srclen`.

`fl_utf8toa()` converts a string containing UTF-8 characters into single byte characters. UTF-8 characters that do not correspond to ASCII or ISO-8859-1 characters below 0xFF are replaced with '?'.

Both functions return the number of bytes that would be written, not counting the null terminator. `dstlen` provides a means of limiting the number of bytes written, so setting `dstlen` to zero is a means of measuring how much storage would be needed before doing the real conversion.

char* `fl_utf2mbs(const char *src)` **OksiD**

converts a UTF-8 string to a local multi-byte character string. **[More info required here!]**

unsigned int `fl_utf8fromwc(char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)` **FLTK2**

unsigned int `fl_utf8towc(const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen)` **FLTK2**

unsigned int `fl_utf8toUtf16(const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen)` **FLTK2**

These routines convert between UTF-8 and `wchar_t` or "wide character" strings. The difficulty lies in the fact that `sizeof(wchar_t)` is 2 on Windows and 4 on Linux and most other systems. Therefore some "wide characters" on Windows may be represented as "surrogate pairs" of more than one `wchar_t`.

`fl_utf8fromwc()` converts from a "wide character" string to UTF-8. Note that `srclen` is the number of `wchar_t` elements in the source string and on Windows this might be larger than the number of characters. `dstlen` specifies the maximum number of **bytes** to copy, including the null terminator.

`fl_utf8towc()` converts a UTF-8 string into a "wide character" string. Note that on Windows, some "wide characters" might result in "surrogate pairs" and therefore the return value might be more than the number of characters. `dstlen` specifies the maximum number of **wchar_t** elements to copy, including a zero terminating element. **[Is this all worded correctly?]**

`fl_utf8toUtf16()` converts a UTF-8 string into a "wide character" string using UTF-16 encoding to handle the "surrogate pairs" on Windows. `dstlen` specifies the maximum number of `wchar_t` elements to copy, including a zero terminating element. **[Is this all worded correctly?]**

These routines all return the number of elements that would be required for a full conversion of the `src` string, including the zero terminator. Therefore setting `dstlen` to zero is a way of measuring how much storage would be needed before doing the real conversion.

```
unsigned int fl_utf8from_mb(char *dst, unsigned dstlen, const char *src, unsigned srclen) FLTK2
unsigned int fl_utf8to_mb(const char *src, unsigned srclen, char *dst, unsigned dstlen) FLTK2
```

These functions convert between UTF-8 and the locale-specific multi-byte encodings used on some systems for filenames, etc. If `fl_utf8locale()` returns true, these functions don't do anything useful. **[Is this all worded correctly?]**

```
int fl_tolower(unsigned int ucs) OksiD
int fl_toupper(unsigned int ucs) OksiD
int fl_utf_tolower(const unsigned char *str, int len, char *buf) OksiD
int fl_utf_toupper(const unsigned char *str, int len, char *buf) OksiD
```

`fl_tolower()` and `fl_toupper()` convert a single Unicode character from upper to lower case, and vice versa. `fl_utf_tolower()` and `fl_utf_toupper()` convert a string of bytes, some of which may be multi-byte UTF-8 encodings of Unicode characters, from upper to lower case, and vice versa.

Warning: to be safe, `buf` length must be at least `3*len` [for 16-bit Unicode]

```
int fl_utf_strcasecmp(const char *s1, const char *s2) OksiD
int fl_utf_strncasecmp(const char *s1, const char *s2, int n) OksiD
```

`fl_utf_strcasecmp()` is a UTF-8 aware string comparison function that converts the strings to lower case Unicode as part of the comparison. `fl_utf_strncasecmp()` only compares the first `n` characters [bytes?]

16.5 FLTK Unicode Versions of System Calls

- `int fl_access(const char* f, int mode)` **OksiD**
- `int fl_chmod(const char* f, int mode)` **OksiD**
- `int fl_execvp(const char* file, char* const* argv)` **OksiD**
- `FILE* fl_fopen(const char* f, const char* mode)` **OksiD**
- `char* fl_getcwd(char* buf, int maxlen)` **OksiD**
- `char* fl_getenv(const char* name)` **OksiD**
- `char fl_make_path(const char* path)` - returns char ? **OksiD**
- `void fl_make_path_for_file(const char* path)` **OksiD**
- `int fl_mkdir(const char* f, int mode)` **OksiD**
- `int fl_open(const char* f, int o, ...)` **OksiD**
- `int fl_rename(const char* f, const char* t)` **OksiD**
- `int fl_rmdir(const char* f)` **OksiD**
- `int fl_stat(const char* path, struct stat* buffer)` **OksiD**
- `int fl_system(const char* f)` **OksiD**
- `int fl_unlink(const char* f)` **OksiD**

TODO:

- more doc on unicode, add links
- write something about filename encoding on OS X...
- explain the `fl_utf8_...` commands
- explain issues with [FL_Preferences](#)

Chapter 17

Constants and Enumerations

Note

This file is not actively maintained any more, but is left here as a reference, until the doxygen documentation is completed.

See also

[FL/Enumerations.H](#).

This appendix lists the enumerations provided in the [<FL/Enumerations.H>](#) header file, organized by section. Constants whose value are zero are marked with "(0)", this is often useful to know when programming.

17.1 Version Numbers

The FLTK version number is stored in a number of compile-time constants:

- `FL_MAJOR_VERSION` - The major release number, currently 1
- `FL_MINOR_VERSION` - The minor release number, currently 4
- `FL_PATCH_VERSION` - The patch release number, currently 0
- `FL_VERSION` - [Deprecated] A combined floating-point version number for the major, minor, and patch release numbers, currently 1.0400
- `FL_API_VERSION` - A combined integer version number for the major, minor, and patch release numbers, currently 10400 (use this instead of `FL_VERSION`, if possible)
- `FL_ABI_VERSION` - A combined integer version number for the application binary interface (ABI) major, minor, and patch release numbers, currently 10400 (default)

Note

The ABI version (`FL_ABI_VERSION`) is usually constant throughout one major/minor release version, for instance 10300 if `FL_API_VERSION` is 10304. Hence the ABI is constant if only the patch version is changed. You can change this with `configure` or `CMake` though if you want the latest enhancements (called "ABI features", see `CHANGES`).

17.2 Events

Events are identified by an [FL_Event](#) enumeration value. The following events are currently defined:

- `FL_NO_EVENT` - No event (or an event fltk does not understand) occurred (0).
- `FL_PUSH` - A mouse button was pushed.
- `FL_RELEASE` - A mouse button was released.
- `FL_ENTER` - The mouse pointer entered a widget.
- `FL_LEAVE` - The mouse pointer left a widget.
- `FL_DRAG` - The mouse pointer was moved with a button pressed.
- `FL_FOCUS` - A widget should receive keyboard focus.
- `FL_UNFOCUS` - A widget loses keyboard focus.
- `FL_KEYBOARD` - A key was pressed.
- `FL_CLOSE` - A window was closed.
- `FL_MOVE` - The mouse pointer was moved with no buttons pressed.
- `FL_SHORTCUT` - The user pressed a shortcut key.
- `FL_DEACTIVATE` - The widget has been deactivated.
- `FL_ACTIVATE` - The widget has been activated.
- `FL_HIDE` - The widget has been hidden.
- `FL_SHOW` - The widget has been shown.
- `FL_PASTE` - The widget should paste the contents of the clipboard.
- `FL_SELECTIONCLEAR` - The widget should clear any selections made for the clipboard.
- `FL_MOUSEWHEEL` - The horizontal or vertical mousewheel was turned.
- `FL_DND_ENTER` - The mouse pointer entered a widget dragging data.
- `FL_DND_DRAG` - The mouse pointer was moved dragging data.
- `FL_DND_LEAVE` - The mouse pointer left a widget still dragging data.
- `FL_DND_RELEASE` - Dragged data is about to be dropped.
- `FL_SCREEN_CONFIGURATION_CHANGED` - The screen configuration (number, positions) was changed.
- `FL_FULLSCREEN` - The fullscreen state of the window has changed.

17.3 Callback "When" Conditions

The following constants determine when a callback is performed:

- `FL_WHEN_NEVER` - Never call the callback (0).
- `FL_WHEN_CHANGED` - Do the callback only when the widget value changes.
- `FL_WHEN_NOT_CHANGED` - Do the callback whenever the user interacts with the widget.
- `FL_WHEN_RELEASE` - Do the callback when the button or key is released and the value changes.
- `FL_WHEN_ENTER_KEY` - Do the callback when the user presses the ENTER key and the value changes.
- `FL_WHEN_RELEASE_ALWAYS` - Do the callback when the button or key is released, even if the value doesn't change.
- `FL_WHEN_ENTER_KEY_ALWAYS` - Do the callback when the user presses the ENTER key, even if the value doesn't change.

17.4 Fl::event_button() Values

The following constants define the button numbers for `FL_PUSH` and `FL_RELEASE` events:

- `FL_LEFT_MOUSE` - the left mouse button
- `FL_MIDDLE_MOUSE` - the middle mouse button
- `FL_RIGHT_MOUSE` - the right mouse button

17.5 Fl::event_key() Values

The following constants define the non-ASCII keys on the keyboard for `FL_KEYBOARD` and `FL_SHORTCUT` events:

- `FL_Button` - A mouse button; use `Fl_Button + n` for mouse button `n`.
- `FL_BackSpace` - The backspace key.
- `FL_Tab` - The tab key.
- `FL_Enter` - The enter key.
- `FL_Pause` - The pause key.
- `FL_Scroll_Lock` - The scroll lock key.
- `FL_Escape` - The escape key.
- `FL_Home` - The home key.
- `FL_Left` - The left arrow key.
- `FL_Up` - The up arrow key.
- `FL_Right` - The right arrow key.

- `FL_Down` - The down arrow key.
- `FL_Page_Up` - The page-up key.
- `FL_Page_Down` - The page-down key.
- `FL_End` - The end key.
- `FL_Print` - The print (or print-screen) key.
- `FL_Insert` - The insert key.
- `FL_Menu` - The menu key.
- `FL_Num_Lock` - The num lock key.
- `FL_KP` - One of the keypad numbers or keys; use `FL_KP + 'n'` for number `n` and, say, `FL_KP + '*'`.
- `FL_KP_Enter` - The enter key on the keypad.
- `FL_F` - One of the function keys; use `FL_F + n` for function key `n`.
- `FL_Shift_L` - The lefthand shift key.
- `FL_Shift_R` - The righthand shift key.
- `FL_Control_L` - The lefthand control key.
- `FL_Control_R` - The righthand control key.
- `FL_Caps_Lock` - The caps lock key.
- `FL_Meta_L` - The left meta/Windows key.
- `FL_Meta_R` - The right meta/Windows key.
- `FL_Alt_L` - The left alt key.
- `FL_Alt_R` - The right alt key.
- `FL_Delete` - The delete key.

17.6 `Fl::event_state()` Values

The following constants define bits in the `Fl::event_state()` value:

- `FL_SHIFT` - One of the shift keys is down.
- `FL_CAPS_LOCK` - The caps lock is on.
- `FL_CTRL` - One of the ctrl keys is down.
- `FL_ALT` - One of the alt keys is down.
- `FL_NUM_LOCK` - The num lock is on.
- `FL_META` - One of the meta/Windows keys is down.
- `FL_COMMAND` - An alias for `FL_CTRL` on Windows, X11 and Wayland, or `FL_META` on MacOS X.
- `FL_CONTROL` - An alias for `FL_META` on Windows, X11 and Wayland, or `FL_CTRL` on MacOS X.
- `FL_SCROLL_LOCK` - The scroll lock is on.
- `FL_BUTTON1` - Mouse button 1 is pushed.
- `FL_BUTTON2` - Mouse button 2 is pushed.
- `FL_BUTTON3` - Mouse button 3 is pushed.
- `FL_BUTTONS` - Any mouse button is pushed.
- `FL_BUTTON(n)` - Mouse button `n` (where `n > 0`) is pushed.

17.7 Alignment Values

The following constants define bits that can be used with `FL_Widget::align()` to control the positioning of the label:

- `FL_ALIGN_CENTER` - The label is centered (0).
- `FL_ALIGN_TOP` - The label is top-aligned.
- `FL_ALIGN_BOTTOM` - The label is bottom-aligned.
- `FL_ALIGN_LEFT` - The label is left-aligned.
- `FL_ALIGN_RIGHT` - The label is right-aligned.
- `FL_ALIGN_CLIP` - The label is clipped to the widget.
- `FL_ALIGN_WRAP` - The label text is wrapped as needed.
- `FL_ALIGN_TOP_LEFT` - The label appears at the top of the widget, aligned to the left.
- `FL_ALIGN_TOP_RIGHT` - The label appears at the top of the widget, aligned to the right.
- `FL_ALIGN_BOTTOM_LEFT` - The label appears at the bottom of the widget, aligned to the left.
- `FL_ALIGN_BOTTOM_RIGHT` - The label appears at the bottom of the widget, aligned to the right.
- `FL_ALIGN_LEFT_TOP` - The label appears to the left of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_RIGHT_TOP` - The label appears to the right of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_LEFT_BOTTOM` - The label appears to the left of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_RIGHT_BOTTOM` - The label appears to the right of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_INSIDE` - 'or' this with other values to put label inside the widget.
- `FL_ALIGN_TEXT_OVER_IMAGE` - Label text will appear above the image.
- `FL_ALIGN_IMAGE_OVER_TEXT` - Label text will be below the image.
- `FL_ALIGN_IMAGE_NEXT_TO_TEXT` - The image will appear to the left of the text.
- `FL_ALIGN_TEXT_NEXT_TO_IMAGE` - The image will appear to the right of the text.
- `FL_ALIGN_IMAGE_BACKDROP` - The image will be used as a background for the widget.

17.8 Fonts

The following constants define the standard FLTK fonts:

- `FL_HELVETICA` - Helvetica (or Arial) normal (0).
- `FL_HELVETICA_BOLD` - Helvetica (or Arial) bold.
- `FL_HELVETICA_ITALIC` - Helvetica (or Arial) oblique.
- `FL_HELVETICA_BOLD_ITALIC` - Helvetica (or Arial) bold-oblique.
- `FL_COURIER` - Courier normal.

- FL_COURIER_BOLD - Courier bold.
- FL_COURIER_ITALIC - Courier italic.
- FL_COURIER_BOLD_ITALIC - Courier bold-italic.
- FL_TIMES - Times roman.
- FL_TIMES_BOLD - Times bold.
- FL_TIMES_ITALIC - Times italic.
- FL_TIMES_BOLD_ITALIC - Times bold-italic.
- FL_SYMBOL - Standard symbol font.
- FL_SCREEN - Default monospaced screen font.
- FL_SCREEN_BOLD - Default monospaced bold screen font.
- FL_ZAPF_DINGBATS - Zapf-dingbats font.

17.9 Colors

The FL_Color enumeration type holds a FLTK color value. Colors are either 8-bit indexes into a [virtual colormap](#) or 24-bit RGB color values. Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

17.9.1 Color Constants

Constants are defined for the user-defined foreground and background colors, as well as specific colors and the start of the grayscale ramp and color cube in the [virtual colormap](#). Inline functions are provided to retrieve specific grayscale, color cube, or RGB color values.

The following color constants can be used to access the user-defined colors:

- FL_BACKGROUND_COLOR - the default background color
- FL_BACKGROUND2_COLOR - the default background color for text, list, and valuator widgets
- FL_FOREGROUND_COLOR - the default foreground color (0) used for labels and text
- FL_INACTIVE_COLOR - the inactive foreground color
- FL_SELECTION_COLOR - the default selection/highlight color

The following color constants can be used to access the colors from the FLTK standard color cube:

- FL_BLACK
- FL_BLUE
- FL_CYAN
- FL_DARK_BLUE
- FL_DARK_CYAN

- FL_DARK_GREEN
- FL_DARK_MAGENTA
- FL_DARK_RED
- FL_DARK_YELLOW
- FL_GREEN
- FL_MAGENTA
- FL_RED
- FL_WHITE
- FL_YELLOW

The following are named values within the standard grayscale:

- FL_GRAY0
- FL_DARK3
- FL_DARK2
- FL_DARK1
- FL_LIGHT1
- FL_LIGHT2
- FL_LIGHT3

The inline methods for getting a grayscale, color cube, or RGB color value are described in the [Colors](#) section of the [Drawing Things in FLTK](#) chapter.

17.10 Cursors

The following constants define the mouse cursors that are available in FLTK. The double-headed arrows are bitmaps provided by FLTK on X, the others are provided by system-defined cursors.

- FL_CURSOR_DEFAULT - the default cursor, usually an arrow (0)
- FL_CURSOR_ARROW - an arrow pointer
- FL_CURSOR_CROSS - crosshair
- FL_CURSOR_WAIT - watch or hourglass
- FL_CURSOR_INSERT - I-beam
- FL_CURSOR_HAND - hand (uparrow on Windows)
- FL_CURSOR_HELP - question mark
- FL_CURSOR_MOVE - 4-pointed arrow
- FL_CURSOR_NS - up/down arrow
- FL_CURSOR_WE - left/right arrow
- FL_CURSOR_NWSE - diagonal arrow
- FL_CURSOR_NESW - diagonal arrow
- FL_CURSOR_NONE - invisible

17.11 FD "When" Conditions

- `FL_READ` - Call the callback when there is data to be read.
- `FL_WRITE` - Call the callback when data can be written without blocking.
- `FL_EXCEPT` - Call the callback if an exception occurs on the file.

17.12 Damage Masks

The following damage mask bits are used by the standard FLTK widgets:

- `FL_DAMAGE_CHILD` - A child needs to be redrawn.
- `FL_DAMAGE_EXPOSE` - The window was exposed.
- `FL_DAMAGE_SCROLL` - The [Fl_Scroll](#) widget was scrolled.
- `FL_DAMAGE_OVERLAY` - The overlay planes need to be redrawn.
- `FL_DAMAGE_USER1` - First user-defined damage bit.
- `FL_DAMAGE_USER2` - Second user-defined damage bit.
- `FL_DAMAGE_ALL` - Everything needs to be redrawn.

Chapter 18

GLUT Compatibility

This appendix describes the GLUT compatibility header file supplied with FLTK.

FLTK's GLUT compatibility is based on the original GLUT 3.7 and the follow-on FreeGLUT 2.4.0 libraries.

18.1 Using the GLUT Compatibility Header File

You should be able to compile existing GLUT source code by including `<FL/glut.H>` instead of `<GL/glut.h>`. This can be done by editing the source, by changing the `-I` switches to the compiler, or by providing a symbolic link from `GL/glut.h` to `FL/glut.H`.

All files calling GLUT procedures must be compiled with C++. You may have to alter them slightly to get them to compile without warnings, and you may have to rename them to get make to use the C++ compiler.

You must link with the FLTK library. Most of `FL/glut.H` is inline functions. You should take a look at it (and maybe at `test/glpuzzle.cxx` in the FLTK source) if you are having trouble porting your GLUT program.

This has been tested with most of the demo programs that come with the GLUT and FreeGLUT distributions.

18.2 Known Problems

The following functions and/or arguments to functions are missing, and you will have to replace them or comment them out for your code to compile:

- `glutGet (GLUT_ELAPSED_TIME)`
- `glutGet (GLUT_SCREEN_HEIGHT_MM)`
- `glutGet (GLUT_SCREEN_WIDTH_MM)`
- `glutGet (GLUT_WINDOW_NUM_CHILDREN)`
- `glutInitDisplayMode (GLUT_LUMINANCE)`
- `glutKeyboardUpFunc(void(*callback)(unsigned char key, int x, int y))`
- `glutLayerGet (GLUT_HAS_OVERLAY)`

- `glutLayerGet (GLUT_LAYER_IN_USE)`
- `glutPushWindow ()`
- `glutSetColor (), glutGetColor (), glutCopyColormap ()`
- `glutVideoResize ()` missing.
- `glutWarpPointer ()`
- `glutWindowStatusFunc ()`
- Spaceball, buttonbox, dials, and tablet functions

Most of the symbols/enumerations have different values than GLUT uses. This will break code that relies on the actual values. The only symbols guaranteed to have the same values are true/false pairs like `GLUT_DOWN` and `GLUT_UP`, mouse buttons `GLUT_LEFT_BUTTON`, `GLUT_MIDDLE_BUTTON`, `GLUT_RIGHT_BUTTON`, and `GLUT_KEY_F1` thru `GLUT_KEY_F12`.

The strings passed as menu labels are not copied.

`glutPostRedisplay ()` does not work if called from inside a display function. You must use `glutIdleFunc ()` if you want your display to update continuously.

`glutSwapBuffers ()` does not work from inside a display function. This is on purpose, because FLTK swaps the buffers for you.

`glutUseLayer ()` does not work well, and should only be used to initialize transformations inside a resize callback. You should redraw overlays by using `glutOverlayDisplayFunc ()`.

Overlays are cleared before the overlay display function is called. `glutLayerGet (GLUT_OVERLAY_DAMAGED)` always returns true for compatibility with some GLUT overlay programs. You must rewrite your code so that `gl_color ()` is used to choose colors in an overlay, or you will get random overlay colors.

`glutSetCursor (GLUT_CURSOR_FULL_CROSSHAIR)` just results in a small crosshair.

The fonts used by `glutBitmapCharacter ()` and `glutBitmapWidth ()` may be different.

`glutInit (argc, argv)` will consume different switches than GLUT does. It accepts the switches recognized by `Fl::args()`, and will accept any abbreviation of these switches (such as `"-di"` for `"-display"`).

18.3 Mixing GLUT and FLTK Code

You can make your GLUT window a child of a `Fl_Window` with the following scheme. The biggest trick is that GLUT insists on a call to `show ()` the window at the point it is created, which means the `Fl_Window` parent window must already be shown.

- Don't call `glutInit ()`.
- Create your `Fl_Window`, and any FLTK widgets. Leave a blank area in the window for your GLUT window.
- `show ()` the `Fl_Window`. Perhaps call `show (argc, argv)`.
- Call `window->begin ()` so that the GLUT window will be automatically added to it.
- Use `glutInitWindowSize ()` and `glutInitWindowPosition ()` to set the location in the parent window to put the GLUT window.
- Put your GLUT code next. It probably does not need many changes. Call `window->end ()` immediately after the `glutCreateWindow ()` !
- You can call either `glutMainLoop ()`, `Fl::run()`, or loop calling `Fl::wait()` to run the program.

18.4 class Fl_Glut_Window

18.4.1 Class Hierarchy

```
Fl_Gl_Window
|
+----Fl_Glut_Window
```

18.4.2 Include Files

```
#include <FL/glut.H>
```

18.4.3 Description

Each GLUT window is an instance of this class. You may find it useful to manipulate instances directly rather than use GLUT window id's. These may be created without opening the display, and thus can fit better into FLTK's method of creating windows.

The current GLUT window is available in the global variable `glut_window`.

`new Fl_Glut_Window(...)` is the same as `glutCreateWindow()` except it does not `show()` the window or make the window current.

`window->make_current()` is the same as `glutSetWindow(number)`. If the window has not had `show()` called on it yet, some functions that assume an OpenGL context will not work. If you do `show()` the window, call `make_current()` again to set the context.

`~Fl_Glut_Window()` is the same as `glutDestroyWindow()`.

18.4.4 Members

The `Fl_Glut_Window` class contains several public members that can be altered directly:

member	description
<code>display</code>	A pointer to the function to call to draw the normal planes.
<code>entry</code>	A pointer to the function to call when the mouse moves into or out of the window.
<code>keyboard</code>	A pointer to the function to call when a regular key is pressed.
<code>menu[3]</code>	The menu to post when one of the mouse buttons is pressed.
<code>mouse</code>	A pointer to the function to call when a button is pressed or released.
<code>motion</code>	A pointer to the function to call when the mouse is moved with a button down.
<code>overlaydisplay</code>	A pointer to the function to call to draw the overlay planes.
<code>passivemotion</code>	A pointer to the function to call when the mouse is moved with no buttons down.
<code>reshape</code>	A pointer to the function to call when the window is resized.
<code>special</code>	A pointer to the function to call when a special key is pressed.
<code>visibility</code>	A pointer to the function to call when the window is iconified or restored (made visible.)

18.4.5 Methods

```
FI_Glut_Window::FI_Glut_Window(int x, int y, int w, int h, const char *title = 0)  
FI_Glut_Window::FI_Glut_Window(int w, int h, const char *title = 0)
```

The first constructor takes 4 int arguments to create the window with a preset position and size. The second constructor with 2 arguments will create the window with a preset size, but the window manager will choose the position according to its own whims.

```
virtual FI_Glut_Window::~FI_Glut_Window()
```

Destroys the GLUT window.

```
void FI_Glut_Window::make_current()
```

Switches all drawing functions to the GLUT window.

Chapter 19

Forms Compatibility

This appendix describes the Forms compatibility included with FLTK.

Note

The Forms compatibility library is deprecated, no longer actively maintained since FLTK 1.3.0, and likely to be removed completely in FLTK 1.5.

Since FLTK 1.4 building the Forms compatibility library `fltk_forms` (configure/Makefiles) or `fltk::forms` (CMake) can be disabled with one of these commands:

```
- ./configure --disable-forms ...
- cmake -D FLTK_BUILD_FORMS:BOOL=OFF ...
- cmake-gui ...
```

Fluid can still import Forms and XForms designer (.fd) files but w/o any guarantees for working results. Manual fixes may be necessary.

In the next minor or major release (1.5 or higher) the Forms compatibility library will not be built by default or will be removed entirely.

19.1 Importing Forms Layout Files

FLUID can read the .fd files put out by all versions of Forms and XForms fdesign. However, it will mangle them a bit, but it prints a warning message about anything it does not understand. FLUID cannot write fdesign files, so you should save to a new name so you don't write over the old one.

You will need to edit your main code considerably to get it to link with the output from FLUID. If you are not interested in this you may have more immediate luck with the forms compatibility header, [<FL/forms.H>](#).

19.2 Using the Compatibility Header File

You should be able to compile existing Forms or XForms source code by changing the include directory switch to your compiler so that the `forms.h` file supplied with FLTK is included. The `forms.h` file simply pulls in [<FL/forms.H>](#) so you don't need to change your source code. Take a look at [<FL/forms.H>](#) to see how it works, but the basic trick is lots of inline functions. Most of the XForms demo programs work without changes.

You will also have to compile your Forms or XForms program using a C++ compiler. The FLTK library does not provide C bindings or header files.

Although FLTK was designed to be compatible with the GL Forms library (version 0.3 or so), XForms has bloated severely and its interface is X-specific. Therefore, XForms compatibility is no longer a goal of FLTK. Compatibility was limited to things that were free, or that would add code that would not be linked in if the feature is unused, or that was not X-specific.

To use any new features of FLTK, you should rewrite your code to not use the inline functions and instead use "pure" FLTK. This will make it a lot cleaner and make it easier to figure out how to call the FLTK functions. Unfortunately this conversion is harder than expected and even Digital Domain's inhouse code still uses `forms.h` a lot.

19.3 Problems You Will Encounter

Many parts of XForms use X-specific structures like `XEvent` in their interface. I did not emulate these! Unfortunately these features (such as the "canvas" widget) are needed by most large programs. You will need to rewrite these to use FLTK subclasses.

`Fl_Free` widgets emulate the *old* Forms "free" widget. It may be useful for porting programs that change the `handle()` function on widgets, but you will still need to rewrite things.

`Fl_Timer` widgets are provided to emulate the XForms timer. These work, but are quite inefficient and inaccurate compared to using `Fl::add_timeout()`.

All instance variables are hidden. If you directly refer to the `x`, `y`, `w`, `h`, `label`, or other fields of your Forms widgets you will have to add empty parenthesis after each reference. The easiest way to do this is to globally replace `"->x"` with `"->x()"`, etc. Replace `"boxtype"` with `"box()"`.

`const char *` arguments to most FLTK methods are simply stored, while Forms would `strdup()` the passed string. This is most noticeable with the label of widgets. Your program must always pass static data such as a string constant or malloc'd buffer to `label()`. If you are using labels to display program output you may want to try the `Fl_Output` widget.

The default fonts and sizes are matched to the older GL version of Forms, so all labels will draw somewhat larger than an XForms program does.

`fdesign` outputs a setting of a "fdui" instance variable to the main window. I did not emulate this because I wanted all instance variables to be hidden. You can store the same information in the `user_data()` field of a window. To do this, search through the `fdesign` output for all occurrences of `"->fdui"` and edit to use `"->user_data()"` instead. This will require casts and is not trivial.

The prototype for the functions passed to `fl_add_timeout()` and `fl_set_idle_callback()` callback are different.

All the following XForms calls are missing:

- `FL_REVISION, fl_library_version()`
- `FL_RETURN_DBLCLICK` (use `Fl::event_clicks()`)
- `fl_add_signal_callback()`
- `fl_set_form_atactivate()` `fl_set_form_atdeactivate()`
- `fl_set_form_property()`
- `fl_set_app_mainform()`, `fl_get_app_mainform()`
- `fl_set_form_minsize()`, `fl_set_form_maxsize()`
- `fl_set_form_event_cmask()`, `fl_get_form_event_cmask()`
- `fl_set_form_dblbuffer()`, `fl_set_object_dblbuffer()` (use an `Fl_Double_Window` instead)
- `fl_adjust_form_size()`
- `fl_register_raw_callback()`
- `fl_set_object_bw()`, `fl_set_border_width()`
- `fl_set_object_resize()`, `fl_set_object_gravity()`
- `fl_set_object_shortcutkey()`

- `fl_set_object_automatic()`
- `fl_get_object_bbox()` (maybe FLTK should do this)
- `fl_set_object_prehandler()`, `fl_set_object_posthandler()`
- `fl_enumerate_fonts()`
- Most drawing functions
- `fl_set_coordunit()` (FLTK uses pixels all the time)
- `fl_ringbell()`
- `fl_gettime()`
- `fl_win*()` (all these functions)
- `fl_initialize(argc, argv, x, y, z)` ignores last 3 arguments
- `fl_read_bitmapfile()`, `fl_read_pixmapfile()`
- `fl_addto_browser_chars()`
- `FL_MENU_BUTTON` just draws normally
- `fl_set_bitmapbutton_file()`, `fl_set_pixmapbutton_file()`
- `FL_CANVAS` objects
- `FL_DIGITAL_CLOCK` (comes out analog)
- `fl_create_bitmap_cursor()`, `fl_set_cursor_color()`
- `fl_set_dial_angles()`
- `fl_show_oneliner()`
- `fl_set_choice_shortcut(a, b, c)`
- command log
- Only some of file selector is emulated
- `FL_DATE_INPUT`
- `fl_pup*()` (all these functions)
- textbox object (should be easy but I had no sample programs)
- xyplot object

19.4 Additional Notes

These notes were written for porting programs written with the older IRISGL version of Forms. Most of these problems are the same ones encountered when going from old Forms to XForms:

Does Not Run In Background

The IRISGL library always forked when you created the first window, unless "foreground()" was called. FLTK acts like "foreground()" is called all the time. If you really want the fork behavior do "if (fork()) exit(0)" right at the start of your program.

You Cannot Use IRISGL Windows or fl_queue

If a Forms (not XForms) program if you wanted your own window for displaying things you would create a IRISGL window and draw in it, periodically calling Forms to check if the user hit buttons on the panels. If the user did things to the IRISGL window, you would find this out by having the value `FL_EVENT` returned from the call to Forms.

None of this works with FLTK. Nor will it compile, the necessary calls are not in the interface.

You have to make a subclass of `Fl_Gl_Window` and write a `draw()` method and `handle()` method. This may require anywhere from a trivial to a major rewrite.

If you draw into the overlay planes you will have to also write a `draw_overlay()` method and call `redraw_↔overlay()` on the OpenGL window.

One easy way to hack your program so it works is to make the `draw()` and `handle()` methods on your window set some static variables, storing what event happened. Then in the main loop of your program, call `Fl::wait()` and then check these variables, acting on them as though they are events read from `fl_queue`.

You Must Use OpenGL to Draw Everything

The file `<FL/gl.h>` defines replacements for a lot of IRISGL calls, translating them to OpenGL. There are much better translators available that you might want to investigate.

You Cannot Make Forms Subclasses

Programs that call `fl_make_object` or directly setting the handle routine will not compile. You have to rewrite them to use a subclass of `Fl_Widget`. It is important to note that the `handle()` method is not exactly the same as the `handle()` function of Forms. Where a Forms `handle()` returned non-zero, your `handle()` must call `do_callback()`. And your `handle()` must return non-zero if it "understood" the event.

An attempt has been made to emulate the "free" widget. This appears to work quite well. It may be quicker to modify your subclass into a "free" widget, since the "handle" functions match.

If your subclass draws into the overlay you are in trouble and will have to rewrite things a lot.

You Cannot Use `<device.h>`

If you have written your own "free" widgets you will probably get a lot of errors about "getvaluator". You should substitute:

Forms	FLTK
MOUSE_X	<code>Fl::event_x_root()</code>
MOUSE_Y	<code>Fl::event_y_root()</code>
LEFTSHIFTKEY,RIGHTSHIFTKEY	<code>Fl::event_shift()</code>
CAPSLCKKEY	<code>Fl::event_capslock()</code>
LEFTCTRLKEY,RIGHTCTRLKEY	<code>Fl::event_ctrl()</code>
LEFTALTKEY,RIGHTALTKEY	<code>Fl::event_alt()</code>
MOUSE1,RIGHTMOUSE	<code>Fl::event_state()</code>
MOUSE2,MIDDLEMOUSE	<code>Fl::event_state()</code>
MOUSE3,LEFTMOUSE	<code>Fl::event_state()</code>

Anything else in `getvaluator` and you are on your own...

Font Numbers Are Different

The "style" numbers have been changed because I wanted to insert bold-italic versions of the normal fonts. If you use Times, Courier, or Bookman to display any text you will get a different font out of FLTK. If you are really desperate to fix this use the following code:

```
fl_font_name(3, "*courier-medium-r-no*");
fl_font_name(4, "*courier-bold-r-no*");
fl_font_name(5, "*courier-medium-o-no*");
fl_font_name(6, "*times-medium-r-no*");
fl_font_name(7, "*times-bold-r-no*");
fl_font_name(8, "*times-medium-i-no*");
fl_font_name(9, "*bookman-light-r-no*");
fl_font_name(10, "*bookman-demi-r-no*");
fl_font_name(11, "*bookman-light-i-no*");
```

Chapter 20

Operating System Issues

This appendix describes the operating system specific interfaces in FLTK:

- [Accessing the OS Interfaces](#)
- [The Wayland/X11 hybrid library](#)
- [The UNIX \(X11\) Interface](#)
- [The Windows Interface](#)
- [The Apple OS X Interface](#)
- [The Wayland Interface](#)

20.1 Accessing the OS Interfaces

All programs that need to access the operating system specific interfaces must include the following header file:

```
#include <FL/platform.H>
```

This header file will define the appropriate interface for your environment. The pages that follow describe the functionality that is provided for each operating system.

Note

These definitions used to be in [FL/x.H](#) up to FLTK 1.3.x. Usage of [FL/x.H](#) is deprecated since FLTK 1.4.0. You should replace all references of [FL/x.H](#) with [FL/platform.H](#) if your target is FLTK 1.4 or later. [FL/x.H](#) will be retained for backwards compatibility for some releases but will be removed in a later (not yet specified) FLTK release.

WARNING:

The interfaces provided by this header file may change radically in new FLTK releases. Use them only when an existing generic FLTK interface is not sufficient.

20.2 The Wayland/X11 hybrid library

By default, the FLTK library is, under Linux and Unix, a Wayland/X11 hybrid which can run FLTK-based apps as Wayland clients or as X11 clients. The choice between running an app as a Wayland or an X11 client is done as follows, when the app runs function `fl_open_display()` (that function can be called explicitly by the app or implicitly by FLTK, for example the first time an `Fl_Window` is shown):

- if the app contains a global boolean variable named `fl_disable_wayland` and this variable is true, X11 is used;
- if environment variable `FLTK_BACKEND` is not defined, Wayland is used if a Wayland compositor is available, otherwise X11 is used;
- if `$FLTK_BACKEND` equals "wayland", the library makes the app a Wayland client, and stops with error if no Wayland compositor is available;
- if `$FLTK_BACKEND` equals "x11", the library makes the app an X11 client even if a Wayland compositor is available.

The first condition listed above is meant to facilitate conversion of code written for FLTK 1.3.x and containing X11-specific code; add this single statement anywhere in the app's source code:

```
FL_EXPORT bool fl_disable_wayland = true;
```

and the app will always run as an X11 client.

After function `fl_open_display()` has been called, exactly one of the functions `fl_wl_display()` and `fl_x11_display()` returns a non-NULL value. When the former function does, the app runs as a Wayland client, and Wayland-specific functions and symbols described below ([The Wayland Interface](#)) can be used, whereas X11-specific functions and symbols cannot. Otherwise, the app runs as an X11 client, and only X11-specific functions and symbols below ([The UNIX \(X11\) Interface](#)) can be used.

Because a single app can be expected to run either Wayland or X11, it's necessary to use distinct names for global variables and functions in the X11- and the Wayland-specific source code.

Non-default configurations of the FLTK library under Linux/Unix are described in file `README.Wayland.txt`.

20.3 The UNIX (X11) Interface

Cross-platform applications should bracket X11-specific source code between `#if defined(FLTK_USE_X11) / #endif` and should ensure function `fl_x11_display()` returns non-NULL before calling X11-specific functions and using X11-specific symbols.

The UNIX interface provides access to the X Window System state information and data structures.

20.3.1 Handling Other X Events

```
void Fl::add_handler(int (*f)(int))
```

Installs a function to parse unrecognized events. If FLTK cannot figure out what to do with an event, it calls each of these functions (most recent first) until one of them returns non-zero. If none of them returns non-zero then the event is ignored.

FLTK calls this for any X events it does not recognize, or X events with a window ID that FLTK does not recognize. You can look at the X event in the `fl_xevent` variable.

The argument is the FLTK event type that was not handled, or zero for unrecognized X events. These handlers are also called for global shortcuts and some other events that the widget they were passed to did not handle, for example `FL_SHORTCUT`.

```
extern XEvent *fl_xevent
```

This variable contains the most recent X event.

```
extern ulong fl_event_time
```

This variable contains the time stamp from the most recent X event that reported it; not all events do. Many X calls like cut and paste need this value.

```
Window fl_xid(const FL_Window *)
```

Returns the XID for a window, or zero if not `shown()`.

Deprecated Kept for compatibility with FLTK versions before 1.4. Use preferentially `fl_x11_xid(const FL_Window *)` with versions 1.4 and above.

```
FL_Window *fl_find(ulong xid)
```

Returns the `FL_Window` that corresponds to the given XID, or `NULL` if not found. This function uses a cache so it is slightly faster than iterating through the windows yourself.

Deprecated Kept for compatibility with FLTK versions before 1.4. Use preferentially `fl_x11_find(Window)` with versions 1.4 and above.

```
int fl_handle(const XEvent &)
```

This call allows you to supply the X events to FLTK, which may allow FLTK to cooperate with another toolkit or library. The return value is non-zero if FLTK understood the event. If the window does not belong to FLTK and the `add_handler()` functions all return 0, this function will return false.

Besides feeding events your code should call `Fl::flush()` periodically so that FLTK redraws its windows.

This function will call the callback functions. It will not return until they complete. In particular, if a callback pops up a modal window by calling `fl_ask()`, for instance, it will not return until the modal function returns.

20.3.2 Drawing using Xlib

The following global variables are set before `FL_Widget::draw()` is called, or by `FL_Window::make_current()`:

```
extern Display *fl_display; // for compatibility with previous FLTK versions
extern Display *fl_x11_display(); // preferred access starting with FLTK 1.4
extern Window fl_window;
extern GC fl_gc; // for compatibility with previous FLTK versions
extern GC fl_x11_gc(); // preferred access starting with FLTK 1.4
extern int fl_screen;
extern XVisualInfo *fl_visual;
extern Colormap fl_colormap;
```

You must use them to produce Xlib calls. Don't attempt to change them. A typical X drawing call is written like this: `XDrawSomething(fl_display, fl_window, fl_gc, ...);`

Other information such as the position or size of the X window can be found by looking at `FL_Window::current()`, which returns a pointer to the `FL_Window` being drawn.

```
unsigned long fl_xpixel(FL_Color i)
unsigned long fl_xpixel(uchar r, uchar g, uchar b)
```

Returns the X pixel number used to draw the given FLTK color index or RGB color. This is the X pixel that `fl_color()` would use.

```
int fl_parse_color(const char* p, uchar& r, uchar& g, uchar& b)
```

Convert a name into the red, green, and blue values of a color by parsing the X11 color names. On other systems, `fl_parse_color()` can only convert names in hexadecimal encoding, for example `#ff8083`.

```
extern XFontStruct *fl_xfont
```

Points to the font selected by the most recent `fl_font()`. This is not necessarily the current font of `fl_gc`, which is not set until `fl_draw()` is called. If FLTK was compiled with Xft support, `fl_xfont` will usually be 0 and `fl_xftfont` will contain a pointer to the `XftFont` structure instead.

```
extern void *fl_xftfont
```

If FLTK was compiled with Xft support enabled, `fl_xftfont` points to the xft font selected by the most recent `fl_font()`. Otherwise it will be 0. `fl_xftfont` should be cast to `XftFont*`.

20.3.3 Changing the Display, Screen, or X Visual

FLTK uses only a single display, screen, X visual, and X colormap. This greatly simplifies its internal structure and makes it much smaller and faster. You can change which it uses by setting global variables *before the first `FL_Window::show()` is called*. You may also want to call `Fl::visual()`, which is a portable interface to get a full color and/or double buffered visual.

```
int Fl::display(const char *)
```

Set which X display to use. This actually does `putenv("DISPLAY=...")` so that child programs will display on the same screen if called with `exec()`. This must be done before the display is opened. This call is provided under MacOS and Windows but it has no effect.

extern Display *fl_display

The open X display. This is needed as an argument to most Xlib calls. Don't attempt to change it! This is `NULL` before the display is opened.

void fl_open_display()

Opens the display. Does nothing if it is already open. This will make sure `fl_display` is non-zero. You should call this if you wish to do X calls and there is a chance that your code will be called before the first `show()` of a window.

This may call `Fl::abort()` if there is an error opening the display.

void fl_x11_use_display(Display *d)

Directs FLTK to use a pre-established X11 connection.

void fl_close_display()

This closes the X connection. You do *not* need to call this to exit, and in fact it is faster to not do so! It may be useful to call this if you want your program to continue without the X connection. You cannot open the display again, and probably cannot call any FLTK functions.

extern int fl_screen

Which screen number to use. This is set by `fl_open_display()` to the default screen. You can change it by setting this to a different value immediately afterwards. It can also be set by changing the last number in the `Fl::display()` string to "host:0.#".

extern XVisualInfo *fl_visual
extern Colormap fl_colormap

The visual and colormap that FLTK will use for all windows. These are set by `fl_open_display()` to the default visual and colormap. You can change them before calling `show()` on the first window. Typical code for changing the default visual is:

```
Fl::args(argc, argv); // do this first so $DISPLAY is set
fl_open_display();
fl_visual = find_a_good_visual(fl_display, fl_screen);
if (!fl_visual) Fl::abort("No good visual");
fl_colormap = make_a_colormap(fl_display, fl_visual->visual, fl_visual->depth);
// it is now ok to show() windows:
window->show(argc, argv);
```

20.3.4 Using a Subclass of `Fl_Window` for Special X Stuff

FLTK can manage an X window on a different screen, visual and/or colormap, you just can't use FLTK's drawing routines to draw into it. But you can write your own `draw()` method that uses Xlib (and/or OpenGL) calls only.

FLTK can also manage XID's provided by other libraries or programs, and call those libraries when the window needs to be redrawn.

To do this, you need to make a subclass of `Fl_Window` and override some of these virtual functions:

virtual void `Fl_Window::show()`

If the window is already `shown()` this must cause it to be raised, this can usually be done by calling `Fl_Window::show()`. If not `shown()` your implementation must call either `Fl_X::set_xid()` or `Fl_X::make_xid()`.

An example:

```
void MyWindow::show() {
    if (shown()) {Fl_Window::show(); return;} // you must do this!
    fl_open_display(); // necessary if this is first window
    // we only calculate the necessary visual colormap once:
    static XVisualInfo *visual;
    static Colormap colormap;
    if (!visual) {
        visual = figure_out_visual();
        colormap = XCreateColormap(fl_display, RootWindow(fl_display, fl_screen),
                                  vis->visual, AllocNone);
    }
    Fl_X::make_xid(this, visual, colormap);
}
```

```
Fl_X *Fl_X::set_xid(Fl_Window*, Window xid)
```

Allocate a hidden class called an `Fl_X`, put the XID into it, and set a pointer to it from the `Fl_Window`. This causes `Fl_Window::shown()` to return true.

```
void Fl_X::make_xid(Fl_Window*, XVisualInfo* = fl_visual, Colormap = fl_colormap)
```

This static method does the most onerous parts of creating an X window, including setting the label, resize limitations, etc. It then does `Fl_X::set_xid()` with this new window and maps the window.

virtual void `Fl_Window::flush()`

This virtual function is called by `Fl::flush()` to update the window. For FLTK's own windows it does this by setting the global variables `fl_window` and `fl_gc` and then calling the `draw()` method. For your own windows you might just want to put all the drawing code in here.

The X region that is a combination of all `damage()` calls done so far is in `Fl_X::flx(this)->region`. If `NULL` then you should redraw the entire window. The undocumented function `fl_clip_region()` (↔ `XRegion`) will initialize the FLTK clip stack with a region or `NULL` for no clipping. You must set region to `NULL` afterwards as `fl_clip_region()` will own and delete it when done.

If `damage()` & `FL_DAMAGE_EXPOSE` then only X expose events have happened. This may be useful if you have an undamaged image (such as a backing buffer) around.

Here is a sample where an undamaged image is kept somewhere:

```
void MyWindow::flush() {
    fl_clip_region(Fl_X::flx(this)->region);
    Fl_X::flx(this)->region = 0;
    if (damage() != 2) {... draw things into backing store ...}
    ... copy backing store to window ...
}
```

Note

For compatibility with FLTK versions before 1.4, member function `Fl_X::flx(Fl_Window*)` can also be written `Fl_X::i(Fl_Window*)`.

virtual void `Fl_Window::hide()`

Destroy the window server copy of the window. Usually you will destroy contexts, pixmaps, or other resources used by the window, and then call `Fl_Window::hide()` to get rid of the main window identified by `xid()`. If you override this, you must also override the destructor as shown:

```
void MyWindow::hide() {
    if (mypixmap) {
        XFreePixmap(fl_display, mypixmap);
        mypixmap = 0;
    }
    Fl_Window::hide(); // you must call this
}
```

virtual void `Fl_Window::~~Fl_Window()`

Because of the way C++ works, if you override `hide()` you *must* override the destructor as well (otherwise only the base class `hide()` is called):

```
MyWindow::~MyWindow() {
    hide();
}
```

Note

Access to the `Fl_X` hidden class requires to `#define FL_INTERNALS` before compilation.

20.3.5 Setting the Icon of a Window

FLTK recommends to set window icons using these platform-independent methods: `FL_Window::icon(const FL_RGB_Image *)` and `FL_Window::icons(const FL_RGB_Image *[], int)`. See also methods setting default window icons `FL_Window::default_icon(const FL_RGB_Image *)` and `FL_Window::default_icons(const FL_RGB_Image *[], int)`.

FLTK on X11 also supports, for backward compatibility, use of the deprecated method `FL_Window::icon(const void *)` as follows :

Sets the icon for the window to the passed pointer. You will need to cast the icon `Pixmap` to a `char*` when calling this method. To set a monochrome icon using a bitmap compiled with your application use:

```
#include "icon.xbm"
fl_open_display(); // needed if display has not been previously opened
Pixmap p = XCreateBitmapFromData(fl_display, DefaultRootWindow(fl_display),
                                icon_bits, icon_width, icon_height);
window->icon((const void*)p);
```

To use a multi-colored icon, the XPM format and library should be used as follows:

```
#include <X11/xpm.h>
#include "icon.xpm"
fl_open_display(); // needed if display has not been previously opened
Pixmap p, mask;
XpmCreatePixmapFromData(fl_display, DefaultRootWindow(fl_display),
                        icon_xpm, &p, &mask, NULL);
window->icon((const void *)p);
```

When using the Xpm library, be sure to include it in the list of libraries that are used to link the application (usually `-lXpm`).

NOTE:

You must call `FL_Window::show(int argc, char** argv)` for the icon to be used. The `FL_Window::show()` method does not bind the icon to the window.

Any window icon must be set with the above methods before the window is shown.

20.3.6 X Resources

When the `FL_Window::show(int argc, char** argv)` method is called, FLTK looks for the following X resources:

- `background` - The default background color for widgets (color).
- `dndTextOps` - The default setting for drag and drop text operations (boolean).
- `foreground` - The default foreground (label) color for widgets (color).
- `scheme` - The default scheme to use (string).
- `selectBackground` - The default selection color for menus, etc. (color).
- `Text.background` - The default background color for text fields (color).
- `tooltips` - The default setting for tooltips (boolean).
- `visibleFocus` - The default setting for visible keyboard focus on non-text widgets (boolean).

Resources associated with the first window's `FL_Window::xclass()` string are queried first, or if no class has been specified then the class `"fltk"` is used (e.g. `fltk.background`). If no match is found, a global search is done (e.g. `*background`).

20.3.7 Display Scaling Factor

FLTK uses the value of the `Xft.dpi` resource divided by 96. to initialize the display scaling factor. That is also what is done by the gnome and KDE desktops.

20.4 The Windows Interface

Cross-platform applications should bracket Windows-specific source code between `#ifdef _WIN32 / #endif`.

The Windows interface provides access to the Windows GDI state information and data structures.

20.4.1 Using filenames with non-ASCII characters

In FLTK, all strings, including filenames, are UTF-8 encoded. The utility functions `fl_fopen()` and `fl_open()` allow to open files potentially having non-ASCII names in a cross-platform fashion, whereas the standard `fopen()/open()` functions fail to do so.

20.4.2 Responding to WM_QUIT

FLTK will intercept `WM_QUIT` messages that are directed towards the thread that runs the main loop. These are converted to `SIGTERM` signals via `raise()`. This allows you to deal with outside termination requests with the same code on both Windows and UNIX systems. Other processes can send this message via `PostThreadMessage()` in order to request, rather than force your application to terminate.

20.4.3 Handling Other Windows API Messages

By default a single `WNDCLASSEX` called "FLTK" is created. All `Fl_Window`'s are of this class unless you use `Fl_Window::xclass()`. The window class is created the first time `Fl_Window::show()` is called.

You can probably combine FLTK with other libraries that make their own window classes. The easiest way is to call `Fl::wait()`, as it will call `DispatchMessage()` for all messages to the other windows. If necessary you can let the other library take over as long as it calls `DispatchMessage()`, but you will have to arrange for the function `Fl::flush()` to be called regularly so that widgets are updated, timeouts are handled, and the idle functions are called.

```
extern MSG fl_msg
```

This variable contains the most recent message read by `GetMessage()`, which is called by `Fl::wait()`. This may not be the most recent message sent to an FLTK window, because silly Windows calls the handle procedures directly for some events (sigh).

```
void Fl::add_handler(int (*f)(int))
```

Installs a function to parse unrecognized messages sent to FLTK windows. If FLTK cannot figure out what to do with a message, it calls each of these functions (most recent first) until one of them returns non-zero. The argument passed to the functions is the FLTK event that was not handled or zero for unknown messages. If all the handlers return zero then FLTK calls `DefWindowProc()`.

```
HWND fl_xid(const FL_Window *)
```

Returns the window handle for a `FL_Window`, or zero if not `shown()`.

```
FL_Window *fl_find(HWND xid)
```

Returns the `FL_Window` that corresponds to the given window handle, or `NULL` if not found. This function uses a cache so it is slightly faster than iterating through the windows yourself.

20.4.4 Drawing Things Using the Windows GDI

When the virtual function `FL_Widget::draw()` is called, FLTK stores all the extra arguments you need to make a proper GDI call in some global variables:

```
extern HINSTANCE fl_display; // for compatibility with previous FLTK versions
extern HINSTANCE fl_win32_display(); // preferred access starting with FLTK 1.4
extern HWND fl_window;
extern HDC fl_gc; // for compatibility with previous FLTK versions
extern HDC fl_win32_gc(); // preferred access starting with FLTK 1.4
COLORREF fl_rgb();
HPEN fl_pen();
HBRUSH fl_brush();
```

These global variables are set before `FL_Widget::draw()` is called, or by `FL_Window::make_current()`. You can refer to them when needed to produce GDI calls, but don't attempt to change them. The functions return GDI objects for the current color set by `fl_color()` and are created as needed and cached. A typical GDI drawing call is written like this:

```
DrawSomething(fl_gc, ..., fl_brush());
```

It may also be useful to refer to `FL_Window::current()` to get the window's size or position.

20.4.5 HighDPI support

FLTK apps for the Windows platform are by default "Per-monitor DPI-aware V2". This means that any window automatically adjusts its physical size in relation to the scaling factor of the display where it maps. This also means that all drawings (e.g., text, lines, images) take advantage of the full resolution of the display in use. FLTK apps may also use the manifest mechanism to declare their level of DPI awareness. The FLTK library adapts to the DPI awareness level set in the app's manifest, which can be lower than the default level if the manifest sets it so.

20.4.6 Display Scaling Factor

FLTK uses the value given by function `GetDpiForMonitor()` divided by 96. to initialize the scaling factor of each display in the system. This matches the value of "Change the size of text, apps and other items" found in section "System" subsection "Display" of Windows settings.

20.4.7 Setting the Icon of a Window

FLTK recommends to set window icons using these platform-independent methods: `Fl_Window::icon(const Fl_RGB_Image *)` and `Fl_Window::icons(const Fl_RGB_Image *[], int)`. See also methods setting default window icons `Fl_Window::default_icon(const Fl_RGB_Image *)` and `Fl_Window::default_icons(const Fl_RGB_Image *[], int)`.

FLTK on Windows also supports, for backward compatibility, use of the deprecated method `Fl_Window::icon(const void *)` as follows :

Set the icon for the window to the passed pointer. You will need to cast the `HICON` handle to a `char*` when calling this method. To set the icon using an icon resource compiled with your application use:

```
window->icon((const void *)LoadIcon(fl_display, MAKEINTRESOURCE(IDI_ICON)));
```

You can also use the `LoadImage()` and related functions to load specific resolutions or create the icon from bitmap data.

NOTE:

You must call `Fl_Window::show(int argc, char** argv)` for the icon to be used. The `Fl_Window::show()` method does not bind the icon to the window.

Any window icon must be set with the above methods before the window is shown.

20.4.8 How to Not Get a MSDOS Console Window

Windows has a really stupid mode switch stored in the executables that controls whether or not to make a console window.

To always get a console window you simply create a console application (the `"/SUBSYSTEM:CONSOLE"` option for the linker). For a GUI-only application create a Windows application (the `"/SUBSYSTEM:WINDOWS"` option for the linker).

FLTK includes a `WinMain()` function that calls the ANSI standard `main()` entry point for you. *This function creates a console window when you use the debug version of the library.*

Windows applications without a console cannot write to `stdout` or `stderr`, even if they are run from a console window. Any output is silently thrown away. Additionally, Windows applications are run in the background by the console, although you can use "start /wait program" to run them in the foreground.

20.4.9 Known Windows Bugs and Problems

The following is a list of known bugs and problems in the Windows version of FLTK:

- If a program is deactivated, `Fl::wait()` does not return until it is activated again, even though many events are delivered to the program. This can cause idle background processes to stop unexpectedly. This also happens while the user is dragging or resizing windows or otherwise holding the mouse down. We were forced to remove most of the efficiency FLTK uses for redrawing in order to get windows to update while being moved. This is a design error in Windows and probably impossible to get around.
- `Fl_Gl_Window::can_do_overlay()` returns true until the first time it attempts to draw an overlay, and then correctly returns whether or not there is overlay hardware.
- `SetCapture` (used by `Fl::grab()`) doesn't work, and the main window title bar turns gray while menus are popped up.
- Compilation with `gcc 3.4.4` and `-Os` exposes an optimisation bug in `gcc`. The symptom is that when drawing filled circles only the perimeter is drawn. This can for instance be seen in the symbols demo. Other optimisation options such as `-O2` and `-O3` seem to work OK. More details can be found in STR#1656

20.5 The Apple OS X Interface

Cross-platform applications should bracket macOS-specific source code between `#if defined(__APPLE__)` && `!defined(FLTK_USE_X11)` / `#endif`.

FLTK supports Apple OS X using the Apple Cocoa library. Older versions of MacOS are no longer supported.

Control, Option, and Command Modifier Keys

FLTK maps the Mac 'control' key to `FL_CTRL`, the 'option' key to `FL_ALT` and the 'Apple' key to `FL_META`. Furthermore, `FL_COMMAND` designates the 'Apple' key on Mac OS X and the 'control' key on other platforms. Keyboard events return the key name in `Fl::event_key()` and the keystroke translation in `Fl::event_text()`. For example, typing Option-Y on a Mac US keyboard will set `FL_ALT` in `Fl::event_state()`, set `Fl::event_key()` to 'y' and return the Yen symbol in `Fl::event_text()`.

Right Click simulation with Ctrl Click

The Apple HIG guidelines indicate applications should support 'Ctrl Click' to simulate 'Right Click' for e.g. context menus, so users with one-button mice and one-click trackpads can still access right-click features. However, paraphrasing [Manolo's comment on the fltk.coredev newsgroup](#):

- *FLTK does /not/ support Ctrl-Click == Right Click itself because Mac OS X event processing doesn't support this at the system level: the system reports left-clicks with the ctrl modifier when the user ctrl-clicks, and OS X system preferences don't allow changing this behavior. Therefore, applications must handle simulation of Right Click with Ctrl Click in the application code.*

Ian MacArthur provided the following `handle()` method code snippet showing an example of how to do this:

```

case FL_PUSH:
{
    int btn = Fl::event_button();
#ifdef __APPLE__
    int ev_state = Fl::event_state();
#endif
    //
    // Context menu can be called up in one of two ways: -
    // 1 - right click, as normally used on Windows and Linux
    // 2 - Ctrl + left click, as sometimes used on Mac
    //
#ifdef __APPLE__
    // On apple, check right click, and ctrl+left click
    if ((btn == FL_RIGHT_MOUSE) || (ev_state == (FL_CTRL | FL_BUTTON1)))
#else
    // On other platforms, only check right click as ctrl+left is used for selections
    if (btn == FL_RIGHT_MOUSE)
#endif
    {
        // Did we right click on the object?..
    }
}

```

There is a thread about this subject on `fltk.coredev` (Aug 1-14, 2014) entitled "[RFC] Right click emulation for one button mouse on Mac".

Apple "Quit" Event

When the user presses Cmd-Q or requests a termination of the application, FLTK sends an `FL_CLOSE` event to all open windows. If any window remains open, the termination request aborts. If all windows close, the application's event loop terminates, that is, `Fl::run()` returns. The application can then follow FLTK's normal termination path executing cleanup code that may be programmed after termination of the event loop, and returning from `main()`. Function `Fl::program_should_quit()` allows to detect whether the event loop terminated because of a program termination request.

Apple "Open" Event

Whenever the user drops a file onto an application icon, OS X generates an Apple Event of the type "Open". You can have FLTK notify you of an Open event by calling the `fl_open_callback()` function.

void `fl_open_display()`

Opens the display. Does nothing if it is already open. You should call this if you wish to do Cocoa or Quartz calls and there is a chance that your code will be called before the first `show()` of a window.

Window `fl_xid(const Fl_Window *)`

Returns the window reference for an `Fl_Window`, or `NULL` if the window has not been shown. This reference is a pointer to an instance of the subclass `FLWindow` of Cocoa's `NSWindow` class.

`Fl_Window *fl_find(Window xid)`

Returns the `Fl_Window` that corresponds to the given window reference, or `NULL` if not found.

void `fl_mac_set_about(Fl_Callback *cb, void *user_data, int shortcut)`

Attaches the callback `cb` to the "About myprog" item of the system application menu. `cb` will be called with `NULL` first argument and `user_data` second argument. This MacOS-specific function is deprecated in FLTK 1.4 and replaced by `Fl_Sys_Menu_Bar::about(Fl_Callback *cb, void *data)` which is cross-platform.

`Fl_Sys_Menu_Bar` class

The `Fl_Sys_Menu_Bar` class allows to build menu bars that, on Mac OS X, are placed in the system menu bar (at top-left of display), and, on other platforms, at a user-chosen location of a user-chosen window.

20.5.1 Setting the icon of an application

- First, create a `.icns` file containing several copies of your icon of decreasing sizes. This can be done using the Preview application or the Icon Composer application available in "Graphics Tools for Xcode". To create a high resolution icon file, it is necessary to use the `iconutil` command-line utility.
- Put your `.icns` file in the Resources subdirectory of your application bundle.
- Add these two lines to the `Info.plist` file of your application bundle

```
<key>CFBundleIconFile</key>
<string>foo.icns</string>
```

replacing `foo` by your application name. If you use Xcode, just add your `.icns` file to your application target.

20.5.2 Drawing Things Using Quartz

All code inside `FL_Widget::draw()` is expected to call Quartz drawing functions. The Quartz coordinate system is flipped to match FLTK's coordinate system. The origin for all drawing is in the top left corner of the enclosing `FL_Window`. The function `fl_mac_gc()` returns the appropriate Quartz 2D drawing environment (of type `CGContextRef`). For compatibility with previous FLTK versions, deprecated global variable `fl_gc` gives the same value.

Include `FL/platform.H` to declare the `fl_mac_gc()` function (or the `fl_gc` variable).

20.5.3 Internationalization

All FLTK programs contain an application menu with, e.g., the About xxx, Hide xxx, and Quit xxx items. This menu can be internationalized/localized by any of two means.

- using the `FL_Mac_App_Menu` class.
- using the standard Mac OS X localization procedure. Create a language-specific `.lproj` directory (e.g., `German.lproj`) in the Resources subdirectory of the application bundle. Create therein a `Localizable.strings` file that translates all menu items to this language. The German `Localizable.strings` file, for example, contains:

```
"About %@" = "Über %@";
"Print Front Window"="Frontfenster drucken";
"Services" = "Dienste";
"Hide %@"="%@ ausblenden";
"Hide Others"="Andere ausblenden";
"Show All"="Alle einblenden";
"Quit %@"="%@ beenden";
```

Set `"Print Front Window" = ""`; therein so the application menu doesn't show a "Print Front Window" item. To localize the application name itself, create a file `InfoPlist.strings` in each `.lproj` directory and put `CFBundleName = "localized name"`; in each such file.

20.5.4 OpenGL and 'retina' displays

It is possible to have OpenGL produce graphics at the high pixel resolution allowed by the so-called 'retina' displays present on recent Apple hardware. For this, call

```
Fl::use_high_res_GL(1);
```

before any `FL_GI_Window` is shown. Also, adapt your `FL_GI_Window::draw()` and `FL_GI_Window::draw_overlay()` methods replacing

```
glViewport(0, 0, w(), h());
```

by

```
glViewport(0, 0, pixel_w(), pixel_h());
```

making use of the `FL_GI_Window::pixel_w()` and `FL_GI_Window::pixel_h()` methods that return the width and height of the GL scene in pixels: if the `FL_GI_Window` is mapped on a retina display, these methods return twice as much as reported by `FL_Widget::w()` and `FL_Widget::h()`; if it's mapped on a regular display, they return the same values as `w()` and `h()`. These methods dynamically change their values if the window is moved into/out from a retina display. If `Fl::use_high_res_GL(1)` is not called, all `FL_GI_Window`'s are drawn at low resolution. These methods are useful on all platforms because `FL_GI_Window::w()` and `FL_GI_Window::h()` don't return, on HighDPI displays, the quantities in pixels necessary to OpenGL functions.

The `FL_GI_Window::pixels_per_unit()` method is useful when the OpenGL code depends on the pixel dimension of the GL scene. This occurs, e.g., if a window's `handle()` method uses `Fl::event_x()` and `Fl::event_y()` whose returned values should be multiplied by `FL_GI_Window::pixels_per_unit()` to obtain the adequate pixel units. This method may also be useful, for example, to adjust the width of a line in a high resolution GL scene.

20.5.5 FI_Double_Window

OS X double-buffers all windows automatically. On OS X, [FI_Window](#) and [FI_Double_Window](#) are handled internally in the same way.

20.5.6 Mac File System Specifics

Resource Forks (OS X pre 10.6)

FLTK does not access the resource fork of an application. However, a minimal resource fork must be created for OS X applications. Starting with OS X 10.6, resource forks are no longer needed.

Caution (OS X 10.2 and older):

When using UNIX commands to copy or move executables, OS X will NOT copy any resource forks! For copying and moving use CpMac and MvMac respectively. For creating a tar archive, all executables need to be stripped from their Resource Fork before packing, e.g. "DeRez fluid > fluid.r". After unpacking the Resource Fork needs to be reattached, e.g. "Rez fluid.r -o fluid".

It is advisable to use the Finder for moving and copying and Mac archiving tools like Sit for distribution as they will handle the Resource Fork correctly.

Mac File Paths

FLTK uses UTF-8-encoded UNIX-style filenames and paths.

20.6 The Wayland Interface

Cross-platform applications should bracket Wayland-specific source code between `#ifdef FLTK_USE_WAYLAND` / `#endif` and should ensure function `fl_wl_display()` returns non-NULL before calling Wayland-specific functions and using Wayland-specific symbols.

```
extern struct wl_display *fl_wl_display();
```

After `fl_open_display()` has run, function `fl_wl_display()` returns a pointer to the struct `wl_display` representing the connection between the application and Wayland. For example, `wl_display_get_fd(fl_wl_display())` gives the file descriptor one can use to communicate with the Wayland compositor according to the Wayland protocol.

```
struct wld_window *fl_wl_xid(const FI_Window *)
```

Returns a pointer to an FLTK-defined structure holding Wayland-related data created when a window gets `show()`, or NULL if not `show()`.

```
Fl_Window *fl_wl_find(struct wld_window * wld_win)
```

Returns the [Fl_Window](#) that corresponds to the given Window, or NULL if not found.

```
struct wl_surface *fl_wl_surface(struct wld_window *wld_win)
```

Returns a pointer to the struct `wl_surface` corresponding to a `show()` top-level window or subwindow.

```
cairo_t *fl_wl_gc()
```

Drawing natively to a Wayland window : Within an overridden [Fl_Widget::draw\(\)](#) method, or after a call to [Fl_Window::make_current\(\)](#), it's possible to draw using the Cairo library. Function `fl_wl_gc()` returns the adequate `cairo_t*` value. Regular FLTK coordinates, with top-left origin, are to be used. All FLTK-defined drawing functions (e.g., [fl_rect\(\)](#), [fl_draw\(\)](#)) can be used too.

```
void fl_close_display()
```

This closes the Wayland connection. You do not need to call this to exit. It may be useful to call this if you want your program to continue without the Wayland connection. You cannot open the display again, and cannot call any FLTK functions.

See also

[wayland.H](#) for all functions specific of the Wayland platform.

20.6.1 HiDPI display support

FLTK Wayland apps automatically scale according to the Wayland-defined, integer-valued scale factor. On a HiDPI display, it's enough to set this factor to 2 for any FLTK app to be drawn using twice as many pixels and thus to be as readable as it is on a regular display. With the gnome and KDE-plasma desktops, that is achieved in the "Displays" section of the "Settings" application, selecting 200 % for the "Scale" parameter. In addition to this, FLTK apps can also be scaled up or down typing `ctrl+/-/0/` and with the `FLTK_SCALING_FACTOR` environment variable.

20.6.2 Window icons

Standard FLTK functions `FL_Window::icon(const FL_RGB_Image*)`, `FL_Window::icons(const FL_RGB_Image*[], int)`, `FL_Window::default_icon(const FL_RGB_Image*)` and `FL_Window::default_icons(const FL_RGB_Image*[], int)` have no effect on the Wayland platform. The equivalent of a call to `FL_Window::default_icon(const FL_RGB_Image*)` to set the application-specific window icon can be obtained as follows, using FLTK's editor app as an example:

- create a text file named `editor.desktop` containing :

```
[Desktop Entry]
Version=1.0
Type=Application
Name=Editor
Name[fr]=Editeur
Comment=FLTK editor
Exec=editor %F
Icon=/path/to/icon/file/editor.svg
MimeType=text/plain
```

- The `Name=` line therein determines the string displayed when the app runs.
- Optionally, one or more `Name[locale]=` lines can be used to set locale-specific app names.
- The `Icon=` line accepts also `.png` files.
- Put this file in `/usr/local/share/applications/` so it's available to all system users or in `$HOME/.local/share/applications/` so it's available to a single user.

20.6.3 Window titlebars

Wayland supports both client-side window decoration (CSD), where client applications are responsible for drawing window titlebars, and server-side window decoration (SSD), where the Wayland compositor itself draws window titlebars. Among 4 tested Wayland compositors, Mutter (gnome's compositor) and Weston use CSD mode whereas the KWin and Sway compositors use SSD mode. When running in CSD mode, FLTK uses a library called `libdecor` to draw titlebars. The `libdecor` library has been conceived to use various plug-in's to draw titlebars in various fashions intended to match any desktop's preferred titlebar style. FLTK supports drawing titlebars with any `libdecor` plug-in via an environment variable called `LIBDECOR_PLUGIN_DIR` which can be given the name of a directory containing the desired plug-in. When `LIBDECOR_PLUGIN_DIR` is not defined, or points to a directory that doesn't contain a `libdecor` plug-in, FLTK uses its built-in plug-in to draw titlebars. That is the most common situation, until `libdecor` plug-in's become available for popular UNIX desktops.

Chapter 21

Migrating Code from FLTK 1.3 to 1.4

This appendix describes the differences between FLTK 1.3.x and FLTK 1.4.x functions and classes and potential requirements to change source code.

We also explain how code can be made compatible so it can be compiled by both FLTK 1.3.x and 1.4.x.

If you need to migrate your code from prior FLTK versions to FLTK 1.4, then you should first consult the relevant appendices in the FLTK 1.3 online documentation or by downloading the FLTK 1.3 documentation. See <https://www.fltk.org/doc-1.3/index.html> and/or <https://www.fltk.org/software.php>, respectively.

21.1 Changes in Header Files

We strive to include only necessary header files in the public headers of the FLTK library to reduce dependencies and hence compile times.

We try to avoid including system header files as far as possible. Known exceptions are `<stdio.h>` where file system structures and functions are visible in the public API, for instance `FILE*`, and sometimes essential header files like `<stdlib.h>` and/or `<stddef.h>`. Some required system headers **may** be included in platform specific header files like `<FL/platform.H>` or `<FL/platform_types.h>`.

In earlier versions (1.3.x) some of the public FLTK headers included some not strictly required system headers by accident.

The consequence for building user programs with FLTK 1.4 is that if you require a system or FLTK header in your user program that you don't *#include* explicitly but which has been included by FLTK 1.3.x your FLTK 1.3 program may issue compiler errors or warnings about missing header files or missing declarations when compiled with FLTK 1.4.

This is not a fault of FLTK 1.4 but a fault of the source code that did not include all required headers.

In FLTK 1.4 inclusion of `<FL/Fl.H>` is no longer a strict requirement as it was required and documented in FLTK 1.3.x. In FLTK 1.4 you may still need to `#include <FL/Fl.H>` if you are using enumerations or methods of class `Fl` like `Fl::run()` but there are exceptions where this header is included by other FLTK headers, like `Fl_Window.H` and other subclasses.

Suggested solution: include all FLTK and system header files your source code requires explicitly and don't rely on FLTK headers to include a particular header file. If you want your code to be as much as possible compatible with FLTK 1.3.x, then you should `#include <FL/Fl.H>` as required by 1.3.x.

You don't need to include headers of base classes - this is done by all FLTK headers as required. Besides that you need to include some support headers if you use FLTK functions like `fl_choice()` and others. This is described in the function's documentation (if a required header is missing in the docs this is a bug).

If you follow these rules your program will be compatible with both FLTK 1.3.x and FLTK 1.4.x as long as you use only functions and classes defined in FLTK 1.3.

21.2 Fl_Preferences

Starting with FLTK 1.3, preference databases are expected to be in UTF-8 encoding. Previous databases were stored in the current character set or code page which renders them incompatible for text entries using international characters.

Starting with FLTK 1.4, searching a valid path to store the preference files has changed slightly. Please see [Fl_Preferences::Fl_Preferences\(Root, const char*, const char*\)](#) for details.

On Unix/Linux platforms new FLTK preference files are stored using the [XDG Base Directory Specification](#) which means in essence that user preference files are stored in the user's home directory under the subdirectory `.config`, i.e. in `$HOME/.config/fltk.org/` rather than `$HOME/.fltk/fltk.org/`. Existing preference files are still found and used, hence this new location is optional.

You may want to move the preference files from their old locations to their new locations as documented in [Fl_Preferences::Fl_Preferences\(Root, const char*, const char*\)](#).

New [Fl_Preferences](#) types `Fl_Preferences::USER_L`, `Fl_Preferences::SYSTEM_L` and some more combinations with `"_L"` suffix have been defined to make preference files independent of the current locale. This is particularly important for floating point data which is stored in text form with varying decimal separator depending on the locale (either `'.'` or `'.'`). You may want to change your program to use these new constants instead of those without the `"_L"` suffix. For more information see the documentation of [Fl_Preferences](#).

21.3 Fl::add_timeout and friends

Since FLTK 1.4.0 internal timeout handling has been unified across platforms. This ensures equal timeout handling, improved accuracy of [Fl::repeat_timeout\(\)](#), and easier maintenance (less potential for errors).

This will very likely not affect user code, however there is one subtle exception on macOS and Windows: in FLTK 1.3.x these platforms used system timers to schedule timeouts. Since FLTK 1.4.0 all platforms use the same internal timer management that was previously only used on Unix/Linux/X11. The consequence of this change is that the FLTK event loop needs to be executed to trigger timeout events, i.e. you must either call [Fl::wait\(\)](#) repeatedly or start the event loop with [Fl::run\(\)](#).

Code that did not execute the event loop and relied on the system timers has never been cross platform compatible, i.e. it wouldn't work on Unix/Linux. An example would be code that opened a splash window, scheduled a timeout with [Fl::add_timeout\(\)](#), and waited for the timer event w/o running the FLTK event loop. Such code must be modified to execute [Fl::run\(\)](#) and/or use [Fl::wait\(\)](#).

21.4 New FL_OVERRIDE Macro

FLTK 1.4 defines a new macro `FL_OVERRIDE` as "override" if a recent C++ standard (C++11 or higher) is used to compile your code.

This macro is currently defined in [FL/fl_attr.h](#) but this may change in a future release. It is enough to `#include <FL/Fl.H>` to enable this macro.

Unfortunately Visual Studio does not define a meaningful value of `__cplusplus` to detect the C++ standard. Hence we use the Visual Studio version (2015 or higher) to decide whether we can define `FL_OVERRIDE` or not.

The `FL_OVERRIDE` macro is used to decorate declarations of overridden virtual methods in subclasses. Example code from [FL/Fl_Window.H](#):

```
int handle(int) FL_OVERRIDE;
```

```
void resize(int X, int Y, int W, int H) FL_OVERRIDE;
Fl_Window * as_window() FL_OVERRIDE { return this; }
```

The FL_OVERRIDE macro translates to 'override' on newer compilers and to an empty string for older compilers.

We recommend to add this to your overridden virtual methods in subclasses derived from FLTK base classes (widgets) and to compile with C++ standard C++11 or higher to enable the compiler to detect some errors if methods are not overridden correctly.

You don't need to declare the overridden methods 'virtual' if you use FL_OVERRIDE or the keyword override.

Hint: For the GCC and clang compilers you can enable the warning '-Wsuggest-override' to detect where you may (want to) add the FL_OVERRIDE macro.

21.5 Fl_Image::copy() 'const'

Since FLTK 1.4.0 the virtual method `Fl_Image::copy()` has been declared 'const' so read-only ('const') images can be copied w/o casts.

This will very likely not affect user code. However, if you derived your own class from any of the `Fl_*_Image` variants **and** you override `Your_Image::copy()` then you **must** declare this 'const' as well, i.e. you must add the keyword 'const' to the declaration of `copy()` in your header file and in the implementation.

We suggest to add the new FL_OVERRIDE macro or the keyword 'override' (see above) to your own overridden method declarations to enable the compiler to detect such incompatibilities.

Code example in header file:

```
class Your_Image {
    // ...
    Fl_Image *copy() const FL_OVERRIDE;
    Fl_Image *copy(int w, int h) const FL_OVERRIDE;
};
```

Note the 'const' attribute **and** the FL_OVERRIDE macro.

21.6 Modern CMake

FLTK 1.4.0 supports "modern" CMake rather than old or "classic" CMake which was used in FLTK 1.3.x. Modern CMake was introduced in CMake 3.0 (~ 2014) and further developed in later CMake versions. FLTK 1.4.0 requires at least CMake 3.15 (~ 2019) as of February 2024.

There are a lot of advantages that motivated this transition (mentioning only some):

- easier to use for projects using FLTK
- better structure
- uses CMake targets rather than variables
- embeddable in user projects via `FetchContent()` etc.
- embeddable in user projects via `add_subdirectory()`
- better coexistence with main projects if built as a subproject

Note that CMake targets can provide all required build flags and build dependencies which is the main advantage for user projects. For instance, instead of linking both `fltk` and `fltk_images` you need only `fltk_images` and `fltk` is linked in automatically.

Unfortunately there is one drawback you may encounter: Several CMake build option names have been changed, compared to FLTK 1.3.x. This is due to the fact that CMake cache variables are shared between the main (aka superbuild) project and all subprojects. Therefore all FLTK options are now prefixed with `FLTK_`.

This feature is now CMake standard and very common in newer projects. The CMake developers recommend strongly to use modern CMake.

We took the opportunity to redesign all CMake related options and target names for FLTK 1.4.0 to avoid changing these names later. Note that CMake support in 1.3.x was only experimental and the one in FLTK 1.4 (Git) up to the official release was beta state by definition. We apologize for all inconveniencies, hope that this is one of the rare exceptions in FLTK development, and that the new names are now stable as usual.

Changes in Detail:

Since FLTK 1.4.0 CMake target names are "namespaced", i.e. they are created with the prefix `'fltk::'` and the old prefix `'fltk_'` has been stripped off as far as the `CMakeLists.txt` file of user projects is concerned. The known filenames on disk did not change though.

The shared library target names use the common suffix `"-shared"` rather than `"_SHARED"`.

The library `'fltk_cairo'` is no longer used. Its functionality has been included in `libfltk`. FLTK 1.4.0 creates a dummy (empty) `libfltk_cairo` for backwards compatibility only. Please remove `fltk_cairo` from your projects and use only `'fltk::fltk'` and/or the other libraries instead.

For more information and documentation of all options please refer to the file `README.CMake.txt` in the FLTK root directory.

Old and New Library Targets:

Library	Old Target	New Target	Shared Library Target
<code>fltk</code>	<code>fltk</code>	<code>fltk::fltk</code>	<code>fltk::fltk-shared</code>
<code>fltk_forms</code>	<code>fltk_forms</code>	<code>fltk::forms</code>	<code>fltk::forms-shared</code>
<code>fltk_gl</code>	<code>fltk_gl</code>	<code>fltk::gl</code>	<code>fltk::gl-shared</code>
<code>fltk_images</code>	<code>fltk_images</code>	<code>fltk::images</code>	<code>fltk::images-shared</code>
<code>fltk_jpeg</code>	<code>fltk_jpeg</code>	<code>fltk::jpeg</code>	<code>fltk::jpeg-shared</code>
<code>fltk_png</code>	<code>fltk_png</code>	<code>fltk::png</code>	<code>fltk::png-shared</code>
<code>fltk_z</code>	<code>fltk_z</code>	<code>fltk::z</code>	<code>fltk::z-shared</code>
<code>fluid</code>	<code>fluid</code>	<code>fltk::fluid</code>	n/a

For project developers used to the old (1.3.x) names the following table can assist to find the new option names. This table is ordered alphabetically by the old option name. Note that some option names did not change and some of the "old" names have been introduced in early 1.4.0 development.

Old Option Name (FLTK 1.3.x)	New Option Name (FLTK 1.4.x)
<code>FLTK_BUILD_EXAMPLES</code>	<code>FLTK_BUILD_EXAMPLES</code>
<code>FLTK_BUILD_FLTK_OPTIONS</code>	<code>FLTK_BUILD_FLTK_OPTIONS</code>
<code>FLTK_BUILD_FLUID</code>	<code>FLTK_BUILD_FLUID</code>
<code>FLTK_BUILD_FORMS</code>	<code>FLTK_BUILD_FORMS</code>
<code>FLTK_BUILD_TEST</code>	<code>FLTK_BUILD_TEST</code>
<code>FLTK_MSVC_RUNTIME_DLL</code>	<code>FLTK_MSVC_RUNTIME_DLL</code>

Old Option Name (FLTK 1.3.x)	New Option Name (FLTK 1.4.x)
OPTION_ABI_VERSION	FLTK_ABI_VERSION
OPTION_ALLOW_GTK_PLUGIN	FLTK_USE_LIBDECOR_GTK
OPTION_APPLE_X11	FLTK_BACKEND_X11
OPTION_ARCHFLAGS	FLTK_ARCHFLAGS
OPTION_BUILD_HTML_DOCUMENTATION	FLTK_BUILD_HTML_DOCS
OPTION_BUILD_PDF_DOCUMENTATION	FLTK_BUILD_PDF_DOCS
OPTION_BUILD_SHARED_LIBS	FLTK_BUILD_SHARED_LIBS
OPTION_CAIRO	FLTK_OPTION_CAIRO_WINDOW
OPTION_CAIROEXT	FLTK_OPTION_CAIRO_EXT
OPTION_CREATE_LINKS	FLTK_INSTALL_LINKS
OPTION_FILESYSTEM_SUPPORT	FLTK_OPTION_FILESYSTEM_SUPPORT
OPTION_INCLUDE_DRIVER_DOCUMENTATION	FLTK_INCLUDE_DRIVER_DOCS
OPTION_INSTALL_HTML_DOCUMENTATION	FLTK_INSTALL_HTML_DOCS
OPTION_INSTALL_PDF_DOCUMENTATION	FLTK_INSTALL_PDF_DOCS
OPTION_LARGE_FILE	FLTK_OPTION_LARGE_FILE
OPTION_OPTIM	FLTK_OPTION_OPTIM
OPTION_PRINT_SUPPORT	FLTK_OPTION_PRINT_SUPPORT
OPTION_USE_CAIRO	FLTK_GRAPHICS_CAIRO
OPTION_USE_GDIPLUS	FLTK_GRAPHICS_GDIPLUS
OPTION_USE_GL	FLTK_BUILD_GL
OPTION_USE_KDIALOG	FLTK_USE_KDIALOG
OPTION_USE_PANGO	FLTK_USE_PANGO
OPTION_USE_POLL	FLTK_USE_POLL
OPTION_USE_STD	FLTK_OPTION_STD
OPTION_USE_SVG	FLTK_OPTION_SVG
OPTION_USE_SYSTEM_LIBDECOR	FLTK_USE_SYSTEM_LIBDECOR
OPTION_USE_SYSTEM_LIBJPEG	FLTK_USE_SYSTEM_LIBJPEG
OPTION_USE_SYSTEM_LIBPNG	FLTK_USE_SYSTEM_LIBPNG
OPTION_USE_SYSTEM_ZLIB	FLTK_USE_SYSTEM_ZLIB
OPTION_USE_THREADS	FLTK_USE_PTHREADS

OPTION_USE_XINERAMA	FLTK_USE_XINERAMA
OPTION_USE_XRENDER	FLTK_USE_XRENDER
OPTION_WAYLAND_ONLY	FLTK_BACKEND_X11=OFF

Chapter 22

Software License

December 11, 2001

The FLTK library and included programs are provided under the terms of the GNU Library General Public License (LGPL) with the following exceptions:

1. Modifications to the FLTK configure script, config header file, and makefiles by themselves to support a specific platform do not constitute a modified or derivative work.

The authors do request that such modifications be contributed to the FLTK project - send all contributions through the "Software Trouble Report" on the following page: <https://www.fltk.org/bugs.php>

2. Widgets that are subclassed from FLTK widgets do not constitute a derivative work.
3. Static linking of applications and widgets to the FLTK library does not constitute a derivative work and does not require the author to provide source code for the application or widget, use the shared FLTK libraries, or link their applications or widgets against a user-supplied version of FLTK.

If you link the application or widget to a modified version of FLTK, then the changes to FLTK must be provided under the terms of the LGPL in sections 1, 2, and 4.

4. You do not have to provide a copy of the FLTK license with programs that are linked to the FLTK library, nor do you have to identify the FLTK license in your program or documentation as required by section 6 of the LGPL.

However, programs must still identify their use of FLTK. The following example statement can be included in user documentation to satisfy this requirement:

[program/widget] is based in part on the work of the FLTK project (<https://www.fltk.org>).

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1991 Free Software Foundation, Inc.

59 Temple Place - Suite 330, Boston, MA 02111-1307, USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed. [This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software—to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given

copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy. For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE

COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

Chapter 23

Example Source Code

The FLTK distribution contains over 60 sample applications written in, or ported to, FLTK.

If the FLTK archive you received does not contain either an 'examples' or 'test' directory, you can download the complete FLTK distribution from <https://www.fltk.org/software.php>.

Most of the example programs were created while testing a group of widgets. They are not meant to be great achievements in clean C++ programming, but merely a test platform to verify the functionality of the FLTK library.

Note that extra example programs are also available in an additional 'examples' directory, but these are **NOT** built automatically when you build FLTK, unlike those in the 'test' directory shown below.

23.1 Example Applications: Overview

adjuster	animated	arc	ask	bitmap	blocks
boxtype	browser	button	buttons	cairo_test	checkers
clipboard	clock	colbrowser	color_chooser	cube	CubeView
cursor	curve	demo	device	doublebuffer	editor
fast_slow	file_chooser	FLUID	fonts	forms	fractals
fullscreen	gl_overlay	glpuzzle	hello	help_dialog	icon
iconize	image	inactive	input	input_choice	keyboard
label	line_style	list_visuals	mandelbrot	menubar	message
minimum	native-filechooser	navigation	offscreen	output	overlay
pack	pixmap	pixmap_browser	preferences	radio	resize
resizebox	rotated_text	scroll	shape	subwindow	sudoku
symbols	table	tabs	threads	tile	tiled_image
tree	twinwin	unittests	utf8	valuators	windowfocus

23.1.1 adjuster

`adjuster` shows a nifty little widget for quickly setting values in a great range.

23.1.2 animated

`animated` shows a window with an animated square that shows drawing with transparency (alpha channel).

23.1.3 arc

The `arc` demo explains how to derive your own widget to generate some custom drawings. The sample drawings use the matrix based arc drawing for some fun effects.

23.1.4 `ask`

`ask` shows some of FLTK's standard dialog boxes. Click the correct answers or you may end up in a loop, or you may end up in a loop, or you... .

23.1.5 `bitmap`

This simple test shows the use of a single color bitmap as a label for a box widget. Bitmaps are stored in the X11 '.bmp' file format and can be part of the source code.

23.1.6 `blocks`

A wonderful and addictive game that shows the usage of FLTK timers, graphics, and how to implement sound on all platforms. `blocks` is also a good example for the Mac OS X specific bundle format.

23.1.7 `boxtype`

`boxtype` gives an overview of readily available boxes and frames in FLTK. More types can be added by the application programmer. When using themes, FLTK shuffles boxtypes around to give your program a new look.

23.1.8 `browser`

`browser` shows the capabilities of the [FI_Browser](#) widget. Important features tested are loading of files, line formatting, and correct positioning of the browser data window.

23.1.9 `button`

The `button` test is a simple demo of push-buttons and callbacks.

23.1.10 `buttons`

`buttons` shows a sample of FLTK button types.

23.1.11 `cairo_test`

`cairo_test` shows a sample of drawing with Cairo in an [FI_Cairo_Window](#). This program can only be built completely if FLTK was configured with Cairo support. It displays a message box if Cairo support was not included.

23.1.12 `checkers`

Written by Steve Poulsen in early 1979, `checkers` shows how to convert a VT100 text-terminal based program into a neat application with a graphical UI. Check out the code that drags the pieces, and how the pieces are drawn by layering. Then tell me how to beat the computer at Checkers.

23.1.13 clipboard

The `clipboard` demo can be used to view the contents of the system clipboard, either text or image contents. Currently an image is preferred if the clipboard contains both formats. Images can be stored as PNG files so screenshots can be stored on disk with this little FLTK demo program.

23.1.14 clock

The `clock` demo shows two analog clocks. The innards of the `FL_Clock` widget are pretty interesting, explaining the use of timeouts and matrix based drawing.

23.1.15 colbrowser

`colbrowser` runs only on X11 systems. It reads `/usr/lib/X11/rgb.txt` to show the color representation of every text entry in the file. This is beautiful, but only moderately useful unless your UI is written in *Motif*.

23.1.16 color_chooser

The `color_chooser` gives a short demo of FLTK's palette based color chooser and of the RGB based color wheel.

23.1.17 cube

The `cube` demo shows the speed of OpenGL. It also tests the ability to render two OpenGL buffers into a single window, and shows OpenGL text.

23.1.18 CubeView

`CubeView` shows how to create a UI containing OpenGL with FLUID.

23.1.19 cursor

The `cursor` demo shows all mouse cursor shapes that come standard with FLTK. The `fgcolor` and `bgcolor` sliders work only on few systems (some version of Irix for example).

23.1.20 curve

`curve` draws a nice Bézier curve into a custom widget. The `points` option for splines is not supported on all platforms.

23.1.21 demo

This tool allows quick access to most programs in the `test` directory. The menu tree can be changed by editing `test/demo.menu`.

23.1.22 device

Exercises the `FL_Image_Surface`, `FL_Copy_Surface`, and `FL_Printer` classes to draw to an `FL_Image` object, copy graphical data to the clipboard, and for print support.

Note

The `clipboard.cxx` program of the 'test' directory is a clipboard watching application that continuously displays the textual or graphical content of the system clipboard (a.k.a pasteboard on macOS) exercising `Fl::paste()`.

23.1.23 doublebuffer

The `doublebuffer` demo shows the difference between a single buffered window, which may flicker during a slow redraw, and a double buffered window, which never flickers, but uses twice the amount of RAM. Some modern OS's double buffer all windows automatically to allow transparency and shadows on the desktop. FLTK is smart enough to not tripple buffer a window in that case.

23.1.24 editor

FLTK has two very different text input widgets. `Fl_Input` and derived classes are rather light weight, however `Fl_Text_Editor` is a complete port of `nedit` (with permission). The `editor` test is almost a full application, showing custom syntax highlighting and dialog creation. See chapter [Designing a Simple Text Editor](#) for a tutorial about creating this program.

23.1.25 fast_slow

`fast_slow` shows how an application can use the `Fl_Widget::when()` setting to receive different kinds of callbacks.

23.1.26 file_chooser

The standard FLTK `file_chooser` is the result of many iterations, trying to find a middle ground between a complex browser and a fast light implementation.

23.1.27 fonts

`fonts` shows all available text fonts on the host system. If your machine still has some pixmap based fonts, the supported sizes will be shown in bold face. Only the first 256 fonts will be listed.

23.1.28 forms

`forms` is an XForms program with very few changes. Search for "fltk" to find all changes necessary to port to fltk. This demo shows the different boxtypes. Note that some boxtypes are not appropriate for some objects.

23.1.29 fractals

`fractals` shows how to mix OpenGL, Glut and FLTK code. FLTK supports a rather large subset of Glut, so that many Glut applications compile just fine.

23.1.30 fullscreen

This demo shows how to do many of the window manipulations that are popular for games. You can toggle the border on/off, switch between single- and double-buffered rendering, and take over the entire screen. More information in the source code.

23.1.31 gl_overlay

`gl_overlay` shows OpenGL overlay plane rendering. If no hardware overlay plane is available, FLTK will simulate it for you.

23.1.32 `glpuzzle`

The `glpuzzle` test shows how most Glut source code compiles easily under FLTK.

23.1.33 `hello`

`hello`: Hello, World. Need I say more? Well, maybe. This tiny demo shows how little is needed to get a functioning application running with FLTK. Quite impressive, I'd say.

23.1.34 `help_dialog`

`help_dialog` displays the built-in FLTK help browser. The [FL_Help_Dialog](#) understands a subset of html and renders various image formats. This widget makes it easy to provide help pages to the user without depending on the operating system's html browser.

23.1.35 `icon`

`icon` demonstrates how an application icon can be set from an image. This icon should be displayed in the window bar (label), in the task bar, and in the task switcher (Windows: Alt-Tab). This feature is platform specific, hence it is possible that you can't see the icon. On Unix/Linux (X11) this can even depend on the Window Manager (WM).

23.1.36 `iconize`

`iconize` demonstrates the effect of the window functions `hide()`, `iconize()`, and `show()`.

23.1.37 `image`

The `image` demo shows how an image can be created on the fly. This generated image contains an alpha (transparency) channel which lets previous renderings 'shine through', either via true transparency or by using screen door transparency (pixelation).

23.1.38 `inactive`

`inactive` tests the correct rendering of inactive widgets. To see the inactive version of images, you can check out the pixmap or image test.

23.1.39 `input`

This tool shows and tests different types of text input fields based on [FL_Input_](#). The `input` program also tests various settings of [FL_Input::when\(\)](#).

23.1.40 `input_choice`

`input_choice` tests the latest addition to FLTK1, a text input field with an attached pulldown menu. Windows users will recognize similarities to the 'ComboBox'. `input_choice` starts up in 'plastic' scheme, but the traditional scheme is also supported.

23.1.41 keyboard

FLTK unifies keyboard events for all platforms. The `keyboard` test can be used to check the return values of `Fl::event_key()` and `Fl::event_text()`. It is also great to see the modifier buttons and the scroll wheel at work. Quit this application by closing the window. The ESC key will not work.

23.1.42 label

Every FLTK widget can have a label attached to it. The `label` demo shows alignment, clipping, and wrapping of text labels. Labels can contain symbols at the start and end of the text, like `@FLTK` or `@circle uh-huh @square`.

23.1.43 line_style

Advanced line drawing can be tested with `line_style`. Not all platforms support all line styles.

23.1.44 list_visuals

This little app finds all available pixel formats for the current X11 screen. But since you are now an FLTK user, you don't have to worry about any of this.

23.1.45 mandelbrot

`mandelbrot` shows two advanced topics in one test. It creates grayscale images on the fly, updating them via the `idle` callback system. This is one of the few occasions where the `idle` callback is very useful by giving all available processor time to the application without blocking the UI or other apps.

23.1.46 menubar

The `menubar` tests many aspects of FLTK's popup menu system. Among the features are radio buttons, menus taller than the screen, arbitrary sub menu depth, and global shortcuts.

23.1.47 message

`message` pops up a few of FLTK's standard message boxes.

23.1.48 minimum

The `minimum` test program verifies that the update regions are set correctly. In a real life application, the trail would be avoided by choosing a smaller label or by setting label clipping differently.

23.1.49 native-filechooser

The `native-filechooser` program invokes the platform specific file chooser, if available (see [Fl_Native_File_Chooser](#) widget).

23.1.50 navigation

`navigation` demonstrates how the text cursor moves from text field to text field when using the arrow keys, tab, and shift-tab.

23.1.51 offscreen

`offscreen` shows how to draw into an offscreen image and display the offscreen image in the program window.

23.1.52 output

`output` shows the difference between the single line and multi line mode of the [FL_Output](#) widget. Fonts can be selected from the FLTK standard list of fonts.

23.1.53 overlay

The `overlay` test app shows how easy an FLTK window can be layered to display cursor and manipulator style elements. This example derives a new class from [FL_Overlay_Window](#) and provides a new function to draw custom overlays.

23.1.54 pack

The `pack` test program demonstrates the resizing and repositioning of children of the [FL_Pack](#) group. Putting an [FL_Pack](#) into an [FL_Scroll](#) is a useful way to create a browser for large sets of data.

23.1.55 pixmap

This simple test shows the use of a LUT based pixmap as a label for a box widget. Pixmapes are stored in the X11 '.xpm' file format and can be part of the source code. Pixmapes support one transparent color.

23.1.56 pixmap_browser

`pixmap_browser` tests the shared-image interface. When using the same image multiple times, [FL_Shared_Image](#) will keep it only once in memory.

23.1.57 preferences

I do have my `preferences` in the morning, but sometimes I just can't remember a thing. This is where the [FL_Preferences](#) come in handy. They remember any kind of data between program launches.

23.1.58 radio

The `radio` tool was created entirely with *FLUID*. It shows some of the available button types and tests radio button behavior.

23.1.59 resizebox

`resizebox` shows some possible ways of FLTK's automatic resize behavior.

23.1.60 rotated_text

`rotated_text` shows how text can be rotated, i.e. drawn in any given angle. This demo is device specific, for instance it works under X11 only if configured with Xft.

23.1.61 `resize`

The `resize` demo tests size and position functions with the given window manager.

23.1.62 `scroll`

`scroll` shows how to scroll an area of widgets, one of them being a slow custom drawing. [Fl_Scroll](#) uses clipping and smart window area copying to improve redraw speed. The buttons at the bottom of the window control decoration rendering and updates.

23.1.63 `shape`

`shape` is a very minimal demo that shows how to create your own OpenGL rendering widget. Now that you know that, go ahead and write that flight simulator you always dreamt of.

23.1.64 `subwindow`

The `subwindow` demo tests messaging and drawing between the main window and 'true' sub windows. A sub window is different to a group by resetting the FLTK coordinate system to 0, 0 in the top left corner. On Win32 and X11, subwindows have their own operating system specific handle.

23.1.65 `sudoku`

Another highly addictive game - don't play it, I warned you. The implementation shows how to create application icons, how to deal with OS specifics, and how to generate sound.

23.1.66 `symbols`

`symbols` are a speciality of FLTK. These little vector drawings can be integrated into labels. They scale and rotate, and with a little patience, you can define your own. The rotation number refers to 45 degree rotations if you were looking at a numeric keypad (2 is down, 6 is right, etc.).

23.1.67 `table`

The `table` demo shows the features of the [Fl_Table](#) widget.

23.1.68 `tabs`

The `tabs` tool was created with *FLUID*. It tests correct hiding and redisplaying of tabs, navigation across tabs, resize behavior, and no unneeded redrawing of invisible widgets.

The `tabs` application shows the [Fl_Tabs](#) widget on the left and the [Fl_Wizard](#) widget on the right side for direct comparison of these two panel management widgets.

23.1.69 `threads`

FLTK can be used in a multithreading environment. There are some limitations, mostly due to the underlying operating system. `threads` shows how to use [Fl::lock\(\)](#), [Fl::unlock\(\)](#), and [Fl::awake\(\)](#) in secondary threads to keep FLTK happy. Although locking works on all platforms, this demo is not available on every machine.

23.1.70 tile

The `tile` tool shows a nice way of using `Fl_Tile`. To test correct resizing of subwindows, the widget for region 1 is created from an `Fl_Window` class.

23.1.71 tiled_image

The `tiled_image` demo uses a small image as the background for a window by repeating it over the full size of the widget. The window is resizable and shows how the image gets repeated.

23.1.72 tree

The `tree` demo shows the features of the `Fl_Tree` widget.

23.1.73 twowin

The `twowin` program tests focus transfer from one window to another window.

23.1.74 unittests

`unittests` exercises all of FLTK's drawing features (e.g., text, lines, circles, images), as well as scrollbars and schemes.

23.1.75 utf8

`utf8` shows all fonts available to the platform that runs it, and how each font draws each of the Unicode code points ranging between U+0020 and U+FFFF.

23.1.76 valuator

`valuator` shows all of FLTK's nifty widgets to change numeric values.

23.1.77 windowfocus

`windowfocus` shows a very special case when a new window is shown while the focus stays in the original window.

23.1.78 FLUID

FLUID is not only a big test program, but also a very useful visual UI designer. Many parts of FLUID were created using FLUID. Check out the FLUID User Manual and the tutorials that come with it at <https://www.fltk.org/documentation.php>.

23.2 Example Applications: Images

This chapter contains a few selected images of the test and example applications listed above. It is not meant to be complete or a full reference. The reason some images are included here is to show how the display **should** look when running the example programs.

23.2.1 cairo_test

The `cairo_test` demo program shows three shiny buttons drawn with Cairo in an `Fl_Cairo_Window`.

Figure 23.1 Buttons drawn with Cairo

23.2.2 icon

The `icon` program lets you set the program icon from an image (here an `Fl_RGB_Image`).

Figure 23.2 Green icon (Windows 10)

23.2.3 unittests

Select "drawing images" in the browser at the left side to see the image drawing example:

Figure 23.3 Image Drawing

Chapter 24

FAQ (Frequently Asked Questions)

A list of frequently asked questions about FLTK.

This appendix describes various frequently asked questions regarding FLTK.

- [Where do I start learning FLTK?](#)
- [How do I make a box with text?](#)
- [Can I use FLTK to make closed-source commercial applications?](#)
- [Hitting the 'Escape' key closes windows - how do I prevent this?](#)

24.1 Where do I start learning FLTK?

It is assumed you know C++, which is the language all FLTK programs are written in, including FLTK itself.

If you like reading manuals to work your way into things, a good start is the FLTK documentation's [Introduction to FLTK](#). Under the [FLTK Basics](#) section there's an example 'hello world' program that includes a line-by-line description.

If you like looking at simple code first to pique your interest, and then read up from there, start with the example programs in the `test/` and `examples/` directory that is included with the source code. A good place to start is the 'hello world' program in `test/hello.cxx`. Also do a google search for "FLTK example programs". "Erco's Cheat Page" is one that shows many simple examples of how to do specific things.

If you like to run example programs and look for ones that are like yours and then read them, download and build FLTK from the source, then run the `test/demo` program. Also, go into the 'examples/' directory and run 'make', then run some of those programs.

If you prefer watching TV to reading books and code, google search for "FLTK video tutorials" which has some introductory examples of how to write FLTK programs in C++ and build them.

24.2 How do I make a box with text?

The 'hello world' program shows how to make a box with text. All widgets have labels, so picking a simple widget like [Fl_Box](#) and setting its `label()` and using `align()` to align the label and `labelfont()` to set the font, and `labelsize()` to set the size, you can get text just how you want.

Labels are not selectable though; if you want selectable text, you can use [Fl_Output](#) or [Fl_Multiline_Output](#) for simple text that doesn't include scrollbars. For more complex text that might want scrollbars and multiple colors/fonts, use either [Fl_Text_Display](#) which handles plain text, or [Fl_Help_View](#) which handles simple HTML formatted text.

24.3 Can I use FLTK to make closed-source commercial applications?

Yes. The FLTK [Software License](#) is standard LGPL, but also includes a special clause ("exception") to allow for static linking. Specifically:

```
[from the top of the FLTK LGPL License section on exceptions]
```

```
3. Static linking of applications and widgets to the FLTK library does
```

not constitute a derivative work and does not require the author to provide source code for the application or widget, use the shared FLTK libraries, or link their applications or widgets against a user-supplied version of FLTK.

If you link the application or widget to a modified version of FLTK, then the changes to FLTK must be provided under the terms of the LGPL in sections 1, 2, and 4.

4. You do not have to provide a copy of the FLTK license with programs that are linked to the FLTK library, nor do you have to identify the FLTK license in your program or documentation as required by section 6 of the LGPL.

However, programs must still identify their use of FLTK. The following example statement can be included in user documentation to satisfy this requirement:

```
[program/widget] is based in part on the work of the
FLTK project (https://www.fltk.org).
```

24.4 Hitting the 'Escape' key closes windows - how do I prevent this?

[From FLTK article #378]

1. FLTK has a "global event handler" that makes Escape try to close the window, the same as clicking the close box. To disable this everywhere you can install your own that pretends it wants the escape key and thus stops the default one from seeing it (this may not be what you want, see below about the callbacks):

```
static int my_handler(int event) {
    if (event == FL_SHORTCUT) return 1; // eat all shortcut keys
    return 0;
}
...in main():
    Fl::add_handler(my_handler);
...
```

1. Attempts to close a window (both clicking the close box or typing Escape) call that window's callback. The default version of the callback does hide(). To make the window not close or otherwise do something different you replace the callback. To make the main window exit the program:

```
void my_callback(Fl_Widget*, void*) {
    exit(0);
}
...
main_window->callback(my_callback);
...
```

If you don't want Escape to close the main window and exit you can check for and ignore it. This is better than replacing the global handler because Escape will still close pop-up windows:

```
void my_callback(Fl_Widget*, void*) {
    if (Fl::event() == FL_SHORTCUT && Fl::event_key() == FL_Escape)
        return; // ignore Escape
    exit(0);
}
```

The reason for calling a window callback can also be found using using the `Fl::callback_reason()` method:

```
void my_callback(Fl_Widget*, void*) {
    if (Fl::callback_reason() == FL_REASON_CANCELLED)
        return; // ignore that the user pressed the Escape key
    if (Fl::callback_reason() == FL_REASON_CLOSED)
        save_and_exit(); // user clicked the Close button in the window decoration
    exit(0); // fallback for other callback reasons
}
```

It is very common to ask for confirmation before exiting, this can be done with:

```
void my_callback(Fl_Widget*, void*) {
    if (fl_choice("Are you sure you want to quit?",
                 "continue", "quit", NULL))
        exit(0);
}
```

Chapter 25

Development of the FLTK library

- [The Wayland backend for its developer](#)
- [Developer info for bundled libs](#)
- [Developer Information](#)

25.1 The Wayland backend for its developer

This chapter describes how the Wayland backend of FLTK works from a developer's viewpoint.

25.1.1 Introduction to Wayland

Wayland usage involves communication via a Unix domain socket between a client application and another process called the Wayland compositor which creates, moves, resizes and draws windows on the display. Diverse Wayland compositors exist. They can follow rather diverse logics. For example, FreeBSD offers Sway which is a tiling compositor where the display is always entirely filled with whatever resizable windows are mapped at any given time. Compositors follow either the client-side decoration (CSD) rule where client apps draw window titlebars, or the server-side decoration (SSD) rule where the compositor draws titlebars. FLTK supports both CSD and SSD compositors. It uses a library called `libdecor` charged of determining whether a CSD or a SSD compositor is active, and of drawing titlebars in the first case.

Wayland is divided in various protocols that a given compositor may or may not support, although they all support the `core` protocol. Each protocol adds functionality not available in the core protocol. [Wayland Explorer](#) lists all protocols. The core protocol allows a client app to discover what protocols the connected compositor supports. Protocols can be stable, which means they have a defined API that will not change but can be expanded, or unstable. For example, mapping a window on a display is not done by the core protocol but by the `xdg shell` protocol which is stable. The names of symbols used by unstable protocols always begin with letter 'z'. For example, FLTK uses unstable protocol `Text input` to support CJK input methods; its symbol names begin with `zwp_↔text_input_v3`.

Wayland makes intensive use of the *listener* mechanism. A listener is a small array of pointers to FLTK-defined callback functions associated to a Wayland-defined object; Wayland calls these functions when defined events occur (more at [Listeners](#) below).

Wayland differs noticeably from X11 in that rendering is left to clients: Wayland provides no drawing API. Instead, Wayland provides objects of type `struct wl_buffer` which encapsulate a memory array of pixel values shared between the client and the compositor. The client app is expected to draw to that memory buffer with whatever means it chooses, and to instruct the compositor to map those pixels to the display when the drawing is complete. The Wayland platform of FLTK draws with the Cairo library to `Fl_Window`'s and `Fl_Image_Surface`'s, and with OpenGL to `Fl_Gl_Window`'s.

Wayland differs also from X11 in that the position of a window in the display is completely hidden to the client app. This prevents function `Fl_Window::position()` from having any effect on a top-level window. Wayland also prevents a client app from knowing whether a window is minimized: `Fl_Window::show()` has no effect on a minimized window. Subwindows can be positioned as usual relatively to their parent window. Wayland allows to create popup windows positioned relatively to a previously mapped other window. This allows FLTK to position adequately menu and tooltip windows (see [Menu windows and other popups](#)). FLTK uses also popups for the small,

yellow windows that display the new scale factor value when it's changed: these are created as short-lived popups centered above `Fl::first_window()`.

Wayland uses a trick of its own to handle lists of linked records. It defines type `struct wl_list` and a few macros (`wl_list_init()`, `wl_list_for_each()`, `wl_list_insert()`, `wl_list_for_each_safe()`, `wl_list_remove()`) to manage linked lists. Records put in these lists must contain a member variable of type `struct wl_list` used to link records together and often named 'link'. Access to such a list is possible memorizing a value of type `struct wl_list` computed by macro `wl_list_init()`. Macro `wl_list_for_each(arg1, arg2, arg3)` allows to run through all list elements with:

- `arg1` is a pointer variable of the type of elements of the linked list;
- `arg2` is the address of a variable of type `struct wl_list` identifying the targeted list;
- `arg3` is the name of the member variable of these elements used to link them together.

For example, `wl_list_for_each()` can be used as follows to scan the linked list of all displays of the system (see `Fl_Wayland_Screen_Driver::output`):

```
Fl_Wayland_Screen_Driver::output *output;
Fl_Wayland_Screen_Driver *scr_driver = (Fl_Wayland_Screen_Driver*)Fl::screen_driver();
wl_list_for_each(output, &(scr_driver->outputs), link) {
    // ... work with output, an item of the linked list of all displays in the system ...
}
```

Overall, and ignoring for now OpenGL usage, FLTK interacts with Wayland as follows :

- When opening the display: FLTK calls `Fl::add_fd()` in `FL_READ` mode to associate a callback function called `wayland_socket_callback` to the socket connecting the client and the compositor.
- Client to compositor: FLTK calls C functions of the `libwayland-client.so`, `libwayland-cursor.so` and `libxkbcommon.so` shared libraries and of the `libdecor` library. These send suitable messages to the compositor writing to the socket. The names of these functions begin with `wl_`, `xkb_` or `libdecor_`.
- Compositor to client: the callback function `wayland_socket_callback` runs when there are data to read in the socket; it calls `wl_display_dispatch()` which interprets the read data and calls corresponding listeners.

The core protocol defines also a number of mostly opaque structures whose names begin with `wl_`. The names of symbols and types defined by the other protocols FLTK uses begin with `xdg_`, `zwp_text_input_v3`, `zxdg_toplevel_decoration_`, `gtk_shell1_` and `gtk_surface1_`. FLTK defines a few structures holding Wayland-related data. The names of FLTK-defined structures don't begin with `wl_`. For example, `struct wld_window` (see [wld_window](#)) is used to store all Wayland-specific data associated to a mapped `Fl_Window`.

25.1.2 Building libfltk as a Wayland client

Classes `Fl_Wayland_Window_Driver`, `Fl_Wayland_Screen_Driver`, `Fl_Wayland_Graphics_Driver`, `Fl_Wayland_Copy_Surface_Driver`, `Fl_Wayland_Image_Surface_Driver` and `Fl_Wayland_Gl_Window_Driver` and file `fl_wayland_platform_init.cxx` contain all the Wayland-specific code of the FLTK library. This code is located at `src/drivers/Wayland/` in the FLTK source tree. A single C++ source file generally contains all the code of a given class. The code related to copy, paste and drag-and-drop operations, however, is gathered in file `fl_wayland_clipboard_dnd.cxx` and contains a few member functions of class `Fl_Wayland_Screen_Driver`. Furthermore, class `Fl_UNIX_System_Driver` is used by both the Wayland and the X11 FLTK platforms. File `FL/fl_config.h` defines preprocessor variables `FLTK_USE_WAYLAND` and `FLTK_USE_CAIRO`.

The public C API to Wayland, xkb, EGL and libdecor libraries are obtained with

```
#include <wayland-client.h>
#include <wayland-cursor.h>
#include <xkbcommon/xkbcommon.h>
#include <xkbcommon/xkbcommon-compose.h>
#include <linux/input.h> // for BTN_LEFT, BTN_RIGHT, BTN_MIDDLE
#include "../../libdecor/src/libdecor.h"
#include "../../libdecor/src/libdecor-plugin.h"
#if HAVE_GL
# include <wayland-egl.h>
# include <EGL/egl.h>
#endif // HAVE_GL
```

as necessary.

File `README.Wayland.txt` details what software packages are needed on Debian-based, Fedora and FreeBSD systems for FLTK to use Wayland. Wayland protocols are packaged as XML files accompanied by a utility program, `wayland-scanner`, able to generate a header file and a necessary glue C source file from a

given XML file. For example, for FLTK to use the `xdg-shell` protocol, these commands are run at build time to generate a `.c` file (`xdg-shell-protocol.c`) that will be compiled into `libfltk` and a header file (`xdg-shell-client-protocol.h`) that the FLTK code will include:

```
PROTOCOLS=`pkg-config --variable=pkgdatadir wayland-protocols`
wayland-scanner private-code $PROTOCOLS/stable/xdg-shell/xdg-shell.xml xdg-shell-protocol.c
wayland-scanner client-header $PROTOCOLS/stable/xdg-shell/xdg-shell.xml xdg-shell-client-protocol.h
```

Similar operations are performed for FLTK to use protocols `xdg-decoration`, `Text input` and `GTK Shell`.

25.1.3 The hybrid Wayland/X11 platform

The Wayland platform of FLTK is normally a two-legged hybrid able to use either Wayland or X11 and to choose between these possibilities at run-time, without any change to the client application. The Wayland/X11 hybrid is essentially a version of the FLTK library containing both all Wayland-specific and all X11-specific code. That's reflected in file `FL/fl_config.h` which defines both `FLTK_USE_WAYLAND` and `FLTK_USE_X11`. This creates the constraint that Wayland and X11 cannot use the same type name for different purposes or the same symbol name. That is why function `fl_xid(const Fl_Window*)` is deprecated in FLTK 1.4 and replaced by `fl_wl_xid()` for Wayland and `fl_x11_xid()` for X11. Also, global variable `Window fl_window` is not used by the Wayland platform which instead uses `static struct wld_window *Fl_Wayland_Window_Driver:: wld_window`. The FLTK library contains also a short source file, `fl_wayland_platform_init.cxx`, that determines, at startup time, whether the app will run as a Wayland or as an X11 client. Function `attempt_wayland()` therein performs this choice as follows :

- if the app defines a global bool variable called `fl_disable_wayland` and this variable is true, the X11 leg is chosen;
- if environment variable `FLTK_BACKEND` is defined to string "wayland", the Wayland leg is chosen;
- if environment variable `FLTK_BACKEND` is defined to string "x11", the X11 leg is chosen;
- otherwise, a connection to a Wayland compositor is attempted; if it's successful, the Wayland leg is chosen; if it's not, the X11 leg is chosen.

The first condition listed above is meant to facilitate transition to FLTK 1.4 of source code written for FLTK 1.3 and containing X11-specific code : it's enough to put

```
FL_EXPORT bool fl_disable_wayland = true;
```

anywhere in the source code, for the app to run with 1.4, using the x11 leg of the hybrid platform, without any other change in the source code nor to the application's environment.

Function `attempt_wayland()` must be called before the very first platform-dependent operation FLTK performs so that operation is done the Wayland or the X11 way, as appropriate. That's why 4 locations of the FLTK source code call `attempt_wayland()`: `Fl_Graphics_Driver::newMainGraphicsDriver()`, `Fl_Screen_Driver::newScreenDriver()`, `Fl_Window_Driver::newWindowDriver(Fl_Window*)`, and `Fl_Image_Surface_Driver::newImageSurfaceDriver()`.

In special situations, such as with embedded systems equipped with the Wayland software but lacking the X11 library, it's possible to build the FLTK library such as it contains only the Wayland backend. This is achieved building FLTK with `cmake -DFLTK_BACKEND_X11=OFF` or with `configure -disable-x11`. In that case, `FL/fl_config.h` does not define `FLTK_USE_X11`.

The rest of this chapter describes what happens when the Wayland leg has been chosen.

25.1.4 Listeners

A Wayland 'listener' is a small array of pointers to FLTK-defined callback functions associated to a Wayland-defined object, usually right after creation of this object, by a call to a specific Wayland function named following the form `wl_XXX_add_listener()`. After defined events have occurred, the Wayland compositor sends appropriate commands to the client through the socket; the event loop detects the availability of data in the socket and calls function `wayland_socket_callback()`; this function calls the appropriate member of the listener and transmits relevant information to the client app as parameters of this call. For example, this code:

```
static void surface_enter(.....) { ..... } // called when a surface enters a display
static void surface_leave(.....) { ..... } // called when a surface leaves a display
static struct wl_surface_listener surface_listener = {
    surface_enter,
    surface_leave,
};
some_pointer_type pter_to_data;
```

```
struct wl_surface *my_wl_surface;
my_wl_surface = wl_compositor_create_surface(scr_driver->wl_compositor);
wl_surface_add_listener(my_wl_surface, &surface_listener, ptr_to_data);
```

creates a Wayland object of type `struct wl_surface` (roughly, a window), and associates it with a 2-member listener called `surface_listener`. After this, Wayland is expected to call the 2 listener members, `surface_enter` or `surface_leave`, each time `my_wl_surface` will enter or leave, respectively, a display. The arguments of these calls, not detailed here, allow the member functions to identify which surface enters or leaves which display. The `wl_surface_add_listener()` call above also associates `ptr_to_data` to `my_wl_surface` as *user data*. The `wl_surface` object's "user data" can be obtained later calling function `wl_surface_get_user_data()`.

Wayland function `wl_proxy_get_listener()` returns a pointer to a Wayland object's listener provided that object is transmitted cast to type `struct wl_proxy *`. This gives a handy way to distinguish FLTK-created Wayland objects from objects of other origin: the listener of an FLTK-created object is a known FLTK listener. For example, function `Fl_Wayland_Window_Driver::surface_to_window()` uses this possibility calling `wl_proxy_get_listener((struct wl_proxy *)wl_surface)` for any object of type `struct wl_surface`: if that object was created as in the example above, this call returns a pointer to FLTK's `surface_listener` static variable.

25.1.5 Opening a Wayland connection

Establishing a Wayland connection requires environment variable `XDG_RUNTIME_DIR` to be defined and to point to a directory containing a socket connected to a Wayland compositor. This variable is usually set by the login procedure of Wayland-friendly desktops. Which socket-file to use within that directory is determined as follows:

- the client may call `Fl::display(const char *display_name)` before `fl_open_display()` runs or use the `-display` command line argument and transmit there the socket name;
- environment variable `WAYLAND_DISPLAY` can be defined to the socket name;
- otherwise, "wayland-0" is used.

Which socket is selected determines the compositor used by the client application: that at the other end of the socket.

Establishing the connection begins with a call to `wl_display_connect(const char *display_name)`. That call is done inside function `attempt_wayland()` mentioned before with a NULL argument, or when a non default Wayland display name is specified as explained above. That call returns a `struct wl_display` pointer or NULL in case of failure. Such NULL return is the hint that allows the FLTK display opening procedure of the Wayland/X11 hybrid to recognize when Wayland access is not possible and to fallback to X11. If the call is successful, its non-NULL return is assigned to class variable `Fl_Wayland_Screen_Driver::wl_display`. The rest of the work is done in function `Fl_Wayland_Screen_Driver::open_display_platform()`. A call to `wl_registry_add_listener()` associates a 2-member listener, whose 1st member, `registry_handle_global()`, will be called by Wayland a number of times to indicate each time a protocol supported by the compositor or a system feature such as displays and keyboards.

```
FLTK runs this code to receive calls to registry_handle_global():
static void sync_done(void *data, struct wl_callback *cb, uint32_t time) {
    *(struct wl_callback **)data = NULL;
    wl_callback_destroy(cb);
}
static const struct wl_callback_listener sync_listener = {
    sync_done
};
struct wl_callback *registry_cb = wl_display_sync(wl_display);
wl_callback_add_listener(registry_cb, &sync_listener, &registry_cb);
while (registry_cb) wl_display_dispatch(wl_display);
```

A pointer to an object of type `struct wl_callback` created by function `wl_display_sync()` is assigned to variable `registry_cb`. Then a 1-member listener is attached to this object. Wayland will run this listener's member function, `sync_done()`, after all calls to `registry_handle_global()` have occurred. Function `sync_done()` sets to null variable `registry_cb` and destroys the `wl_callback`. Finally, function `wl_display_dispatch()` is called as long as variable `registry_cb` is not null. Thus, when `sync_done()` runs, FLTK has received all due calls to `registry_handle_global()`.

The prototype of function `registry_handle_global` is:

```
static void registry_handle_global(void *user_data, struct wl_registry *wl_registry,
    uint32_t id, const char *interface, uint32_t version)
```

Each time Wayland calls `registry_handle_global()`, `interface` and `version` give the name and version of a component or feature of the Wayland system. Here is the list of the `interface` value for all protocols

and system features FLTK uses:

interface	use
wl_compositor	create wl_surface objects
wl_subcompositor	create subwindows
wl_shm	create buffers and buffer factories
wl_seat	create the unique "seat"
wl_data_device	support of copy/paste/drag-n-drop
wl_output	received once for each display
xdg_wm_base	create mapped windows
gtk_shell1	signals Mutter is in use + titlebar gestures
weston_desktop_shell	signals Weston is in use
org_kde_plasma_shell	signals KDE/Plasma is in use
zwp_text_input_manager_v3	interface with Text Input Methods
zxdg_decoration_manager_v1	select between CSD and SSD modes

Wayland compositors typically support several other protocols (e.g., `zxdg_output_manager_v1`) that FLTK does not use.

Each time `registry_handle_global` runs with an interface from the table above, FLTK calls `wl_registry_bind()` which returns a pointer to a Wayland structure that will be the client's access point to the corresponding Wayland protocol or system feature. This pointer is stored in a dedicated member variable of the unique `Fl_Wayland_Screen_Driver` object of an FLTK app, or of another object accessible from this object. For example, when interface equals "wl_compositor", the value returned by `wl_registry_bind()` is stored as member `wl_compositor` of the `Fl_Wayland_Screen_Driver` object. `registry_handle_global()` also identifies whether the Mutter, Weston, or KWin compositor is connected and stores this information in static member variable `Fl_Wayland_Screen_Driver::compositor`.

Wayland calls `registry_handle_global()` with its parameter interface equals to "wl_output" once for each screen connected to the system. Each time, an object of type `struct wl_output` is created, to which a 4-member listener is associated by function `wl_output_add_listener()`. The 3rd member of this 4-function listener, `output_done()`, runs after all initialization steps of the screen have completed and turns to `true` member `done` of a record of type `struct Fl_Wayland_Screen_Driver::output` associated to the screen. Function `sync_done()` mentioned above therefore also calls `wl_display_dispatch()` until the `done` member of all `Fl_Wayland_Screen_Driver::output` records are `true`. Overall, after return from function `sync_done()`, FLTK has been made aware of all optional protocols and features of its connected Wayland compositor, and has initialized all screens of the system.

Finally, function `wl_display_get_fd()` is called to obtain the file descriptor of the Wayland socket and a call to `Fl::add_fd()` makes FLTK listen to this descriptor in `FL_READ` mode and associates function `wayland_socket_callback()` from file `Fl_Wayland_Screen_Driver.cxx` with it. This function calls `wl_display_dispatch()` which reads and interprets data available from the file descriptor, and calls corresponding listeners. The `wl_display_dispatch()` call is repeated as long as data are available for reading.

The event loop is run by function `Fl_Unix_System_Driver::wait()` which is used by both the Wayland and X11 FLTK backends. Among various tasks, this function waits for data arriving on the file descriptors FLTK is listening. Overall, the event loop of the Wayland backend is nearly exactly the same as that used by the X11 backend. The Wayland backend differs only in the callback function handling data read from the Wayland connection socket, and in overridden functions `Fl_Wayland_Screen_Driver::poll_or_select_with_delay()` and `Fl_Wayland_Screen_Driver::poll_or_select()`.

25.1.6 Wayland windows and surfaces

Wayland defines objects called surfaces of type `struct wl_surface`. A Wayland surface "has a rectangular area which may be displayed on zero or more displays, present buffers, receive user input, and define a local coordinate system". In short, surface is the name Wayland uses for a window. Buffers allow the client app to define the graphical content of surfaces (see [Wayland buffers](#)). FLTK creates a surface each time an `Fl_Window` is `show()`'n calling function `wl_compositor_create_surface()`. Static member function `Fl_Wayland_Window_Driver::surface_to_window(struct wl_surface *)` gives the `Fl_Window*` corresponding to the surface given in argument.

FLTK recognizes 4 mutually exclusive kinds of surfaces :

- DECORATED are toplevel windows with a titlebar;
- UNFRAMED are toplevel windows without titlebar;
- POPUP correspond to menus and tooltips;
- SUBWINDOW correspond to an [Fl_Window](#) embedded in another [Fl_Window](#).

Function `Fl_Wayland_Window_Driver::makeWindow()` creates all these surfaces, creates for each a record of type `struct wld_window` (see [wld_window](#)), and stores the window kind in member variable `kind` of this record. Member variable `xid` of the window's `Fl_X` record stores the adress of this record.

Except for SUBWINDOW's, each surface needs a Wayland object of type `struct xdg_surface` used to make it become a mapped window and stored in member `xdg_surface` of the window's `wld_window` record. For DECORATED windows, this object is created inside `libdecor` and transmitted to FLTK by function `libdecor_frame_get_xdg_surface()`. For UNFRAMED and POPUP windows, it's created by function `xdg_wm_base_get_xdg_surface()`. Finally, each surface is also associated to one more Wayland object whose type varies with the window's kind. These explain this part of the `wld_window` record:

```
union {
    struct libdecor_frame *frame; // created for DECORATED by libdecor_decorate()
    struct wl_subsurface *subsurface; // created for SUBWINDOW by wl_subcompositor_get_subsurface()
    struct xdg_popup *xdg_popup; // created for POPUP by xdg_surface_get_popup()
    struct xdg_toplevel *xdg_toplevel; // created for UNFRAMED by xdg_surface_get_toplevel()
};
```

Except for SUBWINDOW's, each surface is associated to a 'configure' function that Wayland calls one or more times when the window is going to be mapped on the display. The 'configure' function of DECORATED surfaces is `handle_configure()` which is the 1st member of a 4-member listener named `libdecor_frame_iface` associated to a decorated window when it's created calling `libdecor_decorate()`. Finally, a call to `libdecor_frame_map()` triggers the process of mapping the newly created DECORATED surface on a display. Wayland calls `handle_configure()` twice during this process. The first `handle_configure()` run allows to set the window's `xdg_surface` object which is returned by function `libdecor_frame_get_xdg_surface()`. FLTK distinguishes the first from the second run of `handle_configure()` by looking at the `xdg_surface` member variable that's NULL at the beginning of the 1st run and not NULL later. Wayland calls `handle_configure()` also during operations such as resizing, minimizing (see below). With the help of a few calls to `libdecor` functions, FLTK obtains in this function all needed information about the size and state of the mapped window. The 'configure' functions of UNFRAMED and POPUP surfaces are `xdg_surface_configure()`, `xdg_toplevel_configure()` and `popup_configure()`. The mapping process of these surfaces is triggered by a call to `wl_surface_commit()`. These 'configure' functions transmit effective window size information to FLTK. Also, they are where the window's `Fl_Window_Driver::wait_for_expose_value` member variable is set to 0 to indicate that the window has been mapped to display. **Caution**: there are some small differences between how and when the various Wayland compositors call `handle_configure()`.

When a decorated window changes size, whatever the cause of it, Wayland calls `handle_configure()` which sets member variable `Fl_Wayland_Window_Driver::in_handle_configure` to true and calls the window's virtual `resize()` function which ultimately runs `Fl_Wayland_Window_Driver::resize()` which calls `Fl_Group::resize()` to perform FLTK's resize operations and `Fl_Wayland_Graphics_Driver::buffer_release()` to delete the existing window buffer that's not adequate for the new window size. At the end of the run of `handle_configure()`, `in_handle_configure` is set back to false. When the window size change is caused by the app itself calling the window's `resize()` function, `Fl_Wayland_Window_Driver::in_handle_configure` is false. This allows `Fl_Wayland_Window_Driver::resize()` to detect that Wayland needs be informed of the desired size change, which gets done by a call to `libdecor_frame_commit()`. Wayland later calls `handle_configure()` and events described above unfold.

Wayland generally does not provide a way to control where the compositor should map a window in the system displays. Nevertheless, for multi-display systems, Wayland allows to control on what display should the compositor map a fullscreen window. That is done inside function `handle_configure()` which calls `libdecor_frame_set_fullscreen()` for DECORATED windows and inside function `xdg_toplevel_configure()` which calls `xdg_toplevel_set_fullscreen()` for UNFRAMED. The `struct wl_output` pointer for the targeted display is transmitted as 2nd argument of these calls.

25.1.7 Menu windows and other popups

Menu windows, tiny menu title windows, and tooltip windows are implemented using Wayland's popup mechanism which allows to position a popup window relatively to a previously mapped window, itself a popup or another kind of window, with the restriction that any popup must overlap or at least touch that other window. Member function `Fl_Wayland_Window_Driver::makeWindow` calls member function `Fl_Wayland_Window_Driver::process_menu_or_tooltip` to create all popups.

This function gets called after FLTK has computed using a given algorithm the desired (x,y) position of the popup window's top-left corner, using coordinates centered on the top-left corner of the toplevel window from which the popup originates. This algorithm is able to prevent popups from being positioned beyond the screen borders under the assumption that the position of a toplevel window inside a screen is known. While this assumption holds for other platforms, it does not for the Wayland platform. The FLTK code for the Wayland platform therefore modifies the algorithm that FLTK uses to compute the position of menu windows. The key information used by this algorithm is obtained by member function `Fl_Window_Driver::menu_window_area` which computes the coordinates of the rectangle where menu windows are allowed to be positioned. Under other platforms, this function just returns the origin and size of the work area of the screen in use. In contrast, the Wayland platform handles two situations differently :

- For menu windows that are not taller than the display in use, the Wayland-overridden member function `Fl_Wayland_Window_Driver::menu_window_area` returns large negative origin and large width and height values. This lets the standard FLTK algorithm position the menu relatively to its window of origin without concern about screen limits, and relies on Wayland's constraint mechanism described below to prevent the menu from going beyond these limits, without FLTK having to know where they are.
- Menu windows taller than the screen where they are mapped need special handling described in detail in a comment above the source code of function `Fl_Wayland_Window_Driver::process_menu_or_tooltip`.

Function `Fl_Wayland_Window_Driver::process_menu_or_tooltip` first computes `origin_win`, pointer to the `Fl_Window` relatively to which the popup is to be positioned. Window `origin_win` is the parent menu window when the popup is a sub-menu; it's the tiny windowtitle when the popup is a menu with a title; otherwise, it's the window containing the point of origin of the popup. An object of type `struct xdg_positioner` created by function `xdg_wm_base_create_positioner()` is used to express the rules that will determine the popup position relatively to `origin_win` as follows:

- Function `xdg_positioner_set_anchor_rect()` determines a rectangle in `origin_win` relatively to which the popup is to be positioned. When the popup to be created is a menu window spawned by an `Fl_Menu_Bar`, that rectangle is the full area of the menu title window. Otherwise, that rectangle is an adequately located point.
- Function `xdg_positioner_set_size()` sets the popup size.
- The `xdg_positioner_set_anchor(positioner, XDG_POSITIONER_ANCHOR_BOTTOM_LEFT)`; and `xdg_positioner_set_gravity(positioner, XDG_POSITIONER_GRAVITY_BOTTOM_RIGHT)`; calls position the popup so that its top-left corner is initially below and at right of the bottom-left corner of the `origin_win`'s anchor rectangle.
- The call to `xdg_positioner_set_offset()` further changes the popup vertical position.
- The call to `xdg_positioner_set_constraint_adjustment()` uses constraint flags `XDG_POSITIONER_CONSTRAINT_ADJUSTMENT_SLIDE_X` and `XDG_POSITIONER_CONSTRAINT_ADJUSTMENT_SLIDE_Y` which mean that the compositor will move the popup horizontally and vertically if its initial position would make it expand beyond the edges of the screen. Furthermore, flag `XDG_POSITIONER_CONSTRAINT_ADJUSTMENT_FLIP_Y` is added when the popup is a menu window spawned by an `Fl_Menu_Bar`; this has the popup flipped above the `Fl_Menu_Bar` if there's not enough screen room below it for the popup.
- Finally, a call to function `xdg_surface_get_popup()` creates the popup accounting for position rules listed above. The positioner is then deleted by `xdg_positioner_destroy()`, a listener is associated to the popup surface with `xdg_popup_add_listener()`, and a call to `wl_surface_commit()` triggers the mapping of the popup on the display.

Overall, the expected coordinates of the top-left corner of the popup relatively to `origin_win` are `popup_x`, `popup_y`. They are memorized in a record of FLTK-defined type `struct win_positioner` that's associated to the popup listener. When the compositor maps the popup, function `popup_configure`, the first element of the popup listener, runs and receives as arguments the coordinates of the popup top left and its size. These values account for the positioning constraints of the popup which may have moved it to avoid screen borders. This function can therefore detect whether constraints applied have modified the effective popup location in comparison to the expected coordinates which are available as member variables of the `struct win_positioner` record mentioned above. That's key to the handling by FLTK of tall menu windows.

Groups of popups containing a menutitle, the associated menuwindow, and optionally a submenu window and that don't belong to an `Fl_Menu_Bar` are mapped in a different order: the menuwindow is mapped first, and the menutitle is mapped second above it as a child popup. Function `Fl_Window_Driver::is_floating_title()` detects when such a menutitle is created, static member variable `previous_floatingtitle` is assigned the value of this menutitle, and the menutitle is mapped only after the menuwindow has been mapped, as a child of it. This positions better the popup group in the display relatively to where the popup was created.

25.1.8 Fl_Wayland_Graphics_Driver and Fl_Cairo_Graphics_Driver

The Wayland platform of FLTK uses an `Fl_Wayland_Graphics_Driver` object for all its on-screen drawing operations. This object is created by function `Fl_Graphics_Driver::newMainGraphicsDriver()` called by `Fl_Display_Device::display_device()` when the library opens the display. New `Fl_Wayland_Graphics_Driver` objects are also created for each `Fl_Image_Surface` and each `Fl_Copy_Surface` used, and deleted when these objects are deleted.

Class `Fl_Wayland_Graphics_Driver` derives from class `Fl_Cairo_Graphics_Driver` which implements all the FLTK drawing API for a Cairo surface. Function `Fl_Wayland_Graphics_Driver::cairo_init()` creates the Cairo surface used by each `Fl_Wayland_Graphics_Driver` object by calling `cairo_image_surface_create_for_data()` for the window's or offscreen's `draw_buffer` (see below).

Class `Fl_Cairo_Graphics_Driver` is also used by the X11 leg of the hybrid Wayland-X11 platform because this leg draws to the display with an `Fl_X11_Cairo_Graphics_Driver` object which derives from class `Fl_Cairo_Graphics_Driver`. Finally, `Fl_Cairo_Graphics_Driver` is also used, in the form of an object from its derived class `Fl_PostScript_Graphics_Driver`, when the hybrid Wayland-X11 platform draws PDF or PostScript, or when the classic X11 platform uses Pango and draws PDF or PostScript. This happens when classes `Fl_PDF_File_Surface`, `Fl_PostScript_File_Device` and `Fl_Printer` are used.

25.1.9 Wayland buffers

Wayland uses buffers, objects of type `struct wl_buffer`, to draw to surfaces. In principle, one or more buffers can be associated to a surface, and functions `wl_surface_attach()` and `wl_surface_commit()` are called to first attach one such buffer to the surface and then inform the compositor to map this buffer's graphics content on the display. Wayland buffers can use various memory layouts. FLTK uses `WL_SHM_FORMAT_ARGB8888`, which is the same layout as what Cairo calls `CAIRO_FORMAT_ARGB32`.

FLTK calls function `Fl_Wayland_Window_Driver::make_current()` before drawing to any `Fl_Window`. Member `buffer` of this `Fl_Window`'s `struct wld_window` (see `wld_window`) is NULL when the window has just been created or resized. In that case, FLTK calls `Fl_Wayland_Graphics_Driver::create_wld_buffer()` which returns a pointer to a `struct wld_buffer` containing

- a Wayland buffer, member `wl_buffer`;
- a Cairo image surface, created by a call to `Fl_Wayland_Graphics_Driver::cairo_init()`.

Each of these two objects encapsulates a byte array of the same size and the same memory layout destined to contain the `Fl_Window`'s graphics. The Cairo image surface object is where FLTK draws. The Wayland buffer is what Wayland maps on the display. FLTK copies the Cairo surface's byte array to the Wayland buffer's byte array before beginning the mapping operation. If `width` and `height` are a window's dimensions in pixels,

```
int stride = cairo_format_stride_for_width(CAIRO_FORMAT_ARGB32, width);
int size = stride * height;
```

give `size`, the common size of both byte arrays.

The effective creation of the `wl_buffer` object is delayed until function `Fl_Wayland_Graphics_Driver::buffer_commit()` gets called. Section [Buffer factories](#) below details how FLTK creates `wl_buffer` objects.

The `struct Fl_Wayland_Graphics_Driver::wld_buffer` (see `wld_buffer`) contains a pointer to the byte array of the Cairo image surface (member `draw_buffer.buffer`), information about the Wayland buffer

(members `wl_buffer` and `data`), the common size of the Cairo surface's and Wayland buffer's byte arrays (member `draw_buffer.data_size`), and other information. A pointer to this struct `Fl_Wayland_Graphics_Driver::wld_buffer` is memorized as member `buffer` of the `Fl_Window`'s `wld_window`. All drawing operations to the `Fl_Window` then modify the content of the Cairo image surface.

Function `Fl_Wayland_Window_Driver::flush()` is in charge of sending FLTK graphics data to the display. That is done by calling function `Fl_Wayland_Graphics_Driver::buffer_commit()` which creates the struct `wl_buffer` object calling `create_shm_buffer()` if that was not done before, copies the byte array of the Cairo surface to the Wayland buffer's starting memory address, and calls functions `wl_surface_attach()` and `wl_surface_commit()`. Before calling `Fl_Window::flush()`, FLTK has computed a damaged region. If that region is not null, `Fl_Wayland_Graphics_Driver::buffer_commit()` copies only the damaged parts of the Cairo surface to the Wayland buffer and calls function `wl_surface_damage_buffer()` for these parts to inform the compositor of what parts of the surface need its attention.

Wayland buffer deletion

Each `wld_buffer` record contains boolean member `in_use` which is set to `true` just before the buffer gets committed, and boolean member `released` which is set to `true` when FLTK no longer needs the buffer and calls `Fl_Wayland_Graphics_Driver::buffer_release()`. FLTK's buffer-creating function, `Fl_Wayland_Graphics_Driver::create_shm_buffer()`, attaches a 1-member listener to each buffer which Wayland calls after a commit operation to indicate the client is allowed to re-use the buffer. This listener's member function, `buffer_release_listener()`, turns to false member `in_use` of the buffer's `wld_buffer` record. Since the two events 'FLTK no longer needs the buffer' and 'the client is allowed to re-use the buffer' can arrive in any order, FLTK deletes the struct `wl_buffer` object by running `do_buffer_release()` only after both events happened, that is, when `in_use` is false and `released` is true. That's why function `do_buffer_release()` is called by both functions `Fl_Wayland_Graphics_Driver::buffer_release()` and `buffer_release_listener()`.

25.1.10 Throttling window redraws

FLTK uses Wayland's synchronization mechanism to make sure any committed `wl_buffer` is not changed while the compositor is using it and to refrain from calling `wl_surface_commit()` more frequently than the system can process it. Firstly, as seen above, Wayland calls function `buffer_release_listener()` when the client is free to reuse or destroy a given `wl_buffer`. FLTK won't change or destroy a committed `wl_buffer` before that call. Second, this 2-step mechanism prevents Wayland clients from committing new buffer states too frequently:

- `Fl_Wayland_Graphics_Driver::buffer_commit()` first calls function `wl_surface_frame()` to obtain a pointer to a struct `wl_callback` object and stores it as member `frame_cb` of the surface's `wld_window`. Then it calls `wl_callback_add_listener()` to associate this object to the FLTK-defined, callback function `surface_frame_done()`. It next calls `wl_surface_commit()`. Together, these 3 calls instruct Wayland to start mapping the buffer content to the display and to call `surface_frame_done()` later, when it will have become ready for another mapping operation.
- Later, `surface_frame_done()` runs and destroys the `wl_callback` object by function `wl_callback_destroy()` and sets member `frame_cb` to `NULL`.

Member variable `draw_buffer_needs_commit` of the `wld_buffer` is also important in this mechanism : it informs FLTK that the graphics buffer has changed and needs being committed. This variable is turned `true` every time a graphics operation changes the buffer content and turned `false` when the buffer gets committed.

This procedure ensures that FLTK never calls `wl_surface_commit()` before the compositor becomes ready for a new commit because `Fl_Wayland_Window_Driver::flush()` calls `Fl_Wayland_Graphics_Driver::buffer_commit()` only if `frame_cb` is `NULL`. If it's not `NULL`, the exact content of function

```
surface_frame_done() :
static void surface_frame_done(void *data, struct wl_callback *cb, uint32_t time) {
    struct wld_window *window = (struct wld_window *)data;
    wl_callback_destroy(cb);
    window->frame_cb = NULL;
    if (window->buffer && window->buffer->draw_buffer_needs_commit) {
        Fl_Wayland_Graphics_Driver::buffer_commit(window);
    }
}
```

has the effect that when the mapping operation eventually completes, Wayland runs `surface_frame_done()`, which, if the buffer's `draw_buffer_needs_commit` member is true, calls `Fl_Wayland_Graphics_Driver::buffer_commit()` anew. The net result is that the screen shows the most recent surface content. This synchronization mechanism is also used when performing an interactive window resize operation. During such operation, the compositor informs the client an interactive resize is being performed and sends window resize commands at high rate (~60 Hz) to the client via the socket. Libdecor turns on flag `LIBDECOR_WINDOW_STATE_RESIZING` to inform the client, and runs function `handle_configure()` for each received resize command. Before calling `Fl_Group::resize()` and later `Fl_Window::draw()`, `handle_configure()` tests whether `window->frame_cb` is NULL. When it's not because a previous resize operation is being performed, the current resize command is skipped. At the end of the interactive resize, flag `LIBDECOR_WINDOW_STATE_RESIZING` is off and Wayland sends a final resize command which is not skipped. Overall, this ensures the client program resizes its window as frequently as it can without falling behind resize commands sent by the compositor. To account for a bug in Mutter (issue #878), the `window->frame_cb` object is not created when a toplevel window is being resized and is entirely covered by one subwindow.

Progressive window drawing

FLTK supports progressive drawing when an app calls function `Fl_Window::make_current()` at any time and then calls the FLTK drawing API. This is made possible in function `Fl_Wayland_Window_Driver::make_current()` with

```
// to support progressive drawing
if ( (!Fl_Wayland_Window_Driver::in_flush_) && window->buffer && (!window->frame_cb)
    && window->buffer->draw_buffer_needs_commit && (!wait_for_expose_value) ) {
    Fl_Wayland_Graphics_Driver::buffer_commit(window);
}
```

Thus, `buffer_commit()` runs only when `frame_cb` is NULL. If an app rapidly performs calls to `Fl_Window::make_current()` and to drawing functions, FLTK will copy `draw_buffer` to the Wayland buffer and instruct Wayland to map it to the display when `frame_cb` is NULL which means that the compositor is ready to start performing a mapping operation. This occurs when the progressive drawing operation begins. Later, `frame_cb` is generally found non NULL when `Fl_Wayland_Window_Driver::make_current()` runs because the compositor is busy processing the previous Wayland buffer. When the compositor has completed this processing, the client app runs `surface_frame_done()` which, provided member variable `draw_buffer_needs_commit` is true, calls `Fl_Wayland_Graphics_Driver::buffer_commit()`. This makes the compositor map the Wayland buffer in its new, more advanced, state.

An example of progressive drawing is given by FLTK's mandelbrot test app. When set to fullscreen, this app can be seen to progressively fill its window from top to bottom by blocks of lines, each block appearing when the compositor is ready to map a new buffer. When the compositor is not ready, the app does not block but continues computing and drawing in memory but not on display more lines of the desired Mandelbrot graph.

25.1.11 Buffer factories

Wayland names *buffer factory* a software procedure that constructs objects of type `struct wl_buffer` for use by a client application. FLTK creates a `wl_buffer` object each time an `Fl_Window` is mapped on a display or resized. That's done by member function `Fl_Wayland_Graphics_Driver::create_shm_buffer()` which follows this 3-step procedure to create a "buffer factory" for FLTK and to construct Wayland buffers from it:

- Libdecor function `libdecor_os_create_anonymous_file(off_t size)` creates an adequate file and mmap's it. This file lives in RAM because it is created by function `memfd_create()`. FLTK sets this file size to 10 MB unless the size of the buffer to be created is larger; in that case the anonymous file is sized to twice the buffer size.
- Wayland function `wl_shm_create_pool()` shares this mmap'ed memory with the Wayland compositor and returns an object of type `struct wl_shm_pool` which encapsulates this memory. A record of type `struct Fl_Wayland_Graphics_Driver::wld_shm_pool_data` is created and associated to the newly created `wl_shm_pool` by `wl_shm_pool_set_user_data()`. This record stores the starting address (`pool_memory`) and size (`pool_size`) of the pool's encapsulated memory. The record also contains member `buffers` of type `struct wl_list` which stores the access point to the linked list of `wl_buffer` objects that will be created from the `wl_shm_pool`.
- A variable named `chunk_offset` represents the offset within the pool's shared memory available for the buffer being constructed. It equals 0 when the pool has just been created and is updated as detailed below

each time a buffer is created from the pool. A record of type `struct Fl_Wayland_Graphics_Driver::wld_buffer` is created. This record will contain (member `wl_buffer`) the address of a `wl_buffer` object that's created by function `wl_shm_pool_create_buffer()`. This `wl_buffer` object encapsulates a section of a given size of the pool's shared memory beginning at offset `chunk_offset` in it. Quantity `pool_memory + chunk_offset` is therefore the address of the beginning of the mmap'ed memory section encapsulated by this `wl_buffer`. Member `shm_pool` of the newly constructed `Fl_Wayland_Graphics_Driver::wld_buffer` object is set to the address of the current `wl_shm_pool` object. This record is added to the head of the linked list of current pool's buffers by a call to `wl_list_insert()`. At that point, a `struct Fl_Wayland_Graphics_Driver::wld_buffer` record is part of the linked list of all such records corresponding to `wl_buffer` objects created from the same `wl_shm_pool` object, and member `shm_pool` of this record gives the address of this `wl_shm_pool`. When a new `struct Fl_Wayland_Graphics_Driver::wld_buffer` record is to be created,

```
struct wld_shm_pool_data *pool_data =
    (struct wld_shm_pool_data *)wl_shm_pool_get_user_data(pool);
struct Fl_Wayland_Graphics_Driver::wld_buffer *record = wl_container_of(pool_data->buffers.next,
    record, link);
int chunk_offset = ((char*)record->data - pool_data->pool_memory) + record->data_size;
```

gives the offset within the current pool's mmap'ed memory available for a new `wl_buffer`. Macro `wl_container_of()` gives the address of a record belonging to a linked list of records of the same type.

A window's `wl_buffer` is re-filled by graphics data and committed each time the window gets redrawn, and is set to be destroyed by function `Fl_Wayland_Graphics_Driver::buffer_release()` when `Fl_Window::hide()` runs or the window is resized. When the `wl_buffer` is no longer in use, function `do_buffer_release()` gets called as explained above. It destroys the `wl_buffer` with `wl_buffer_destroy()`, and removes the corresponding `Fl_Wayland_Graphics_Driver::wld_buffer` record from the linked list of buffers from the same `wl_shm_pool`. Since new `Fl_Wayland_Graphics_Driver::wld_buffer` records are added at the head of the linked list, and since the record at the head of this list is used to compute the offset within the pool's mmap'ed memory available for a new `wl_buffer`, destruction of the last created `wl_buffer` allows to re-use the destroyed buffer's pool's memory for a new `wl_buffer`.

When function `do_buffer_release()` finds the list of buffers from a given pool empty, two situations can occur. 1) This pool is the current pool. Its mmap'ed memory will be re-used from offset 0 to create future `wl_buffer` objects. 2) This pool is not current. It gets destroyed with `wl_shm_pool_destroy()`, the pool's mmap'ed memory is munmap'ed, and the pool's associated `struct wld_shm_pool_data` is freed. In situation 1) above, the next `wl_buffer` to be created can need more memory than the current pool's memory size. If so, the current pool gets destroyed and replaced by a new, larger pool.

If the sum of `chunk_offset` plus the buffer size is larger than the current pool's size when function `create_shm_buffer()` is called, `chunk_offset` is reset to 0, and a new `wl_shm_pool` object is created and used by FLTK's "buffer factory". This mechanism allows to access new mmap'ed memory when `chunk_offset` reaches the end of the previous mmap'ed section.

Wayland uses also `wl_buffer` objects to support cursors. FLTK uses the "buffer factory" described here when creating custom cursors (see [custom-cursor](#)) with function `Fl_Wayland_Window_Driver::set_cursor(const Fl_RGB_Image *, ...)` which calls `create_shm_buffer()` via `set_cursor_4args()`, `custom_offscreen()` and `create_wld_buffer()`. In contrast, standard shaped-cursors (e.g., `FL_CURSOR_INSERT`) use their own "buffer factory" inside Wayland functions such as `wl_cursor_theme_get_cursor()`. Therefore, the fact that the `wl_buffer` objects behind standard cursors are never destroyed doesn't prevent disused `struct wl_shm_pool` objects from being freed because those buffers come from a distinct "buffer factory". The "buffer factory" described here is also used by function `offscreen_from_text()` when displaying dragged text in a DnD operation.

25.1.12 Displays and HighDPI support

Wayland uses the concept of *seat* of type `struct wl_seat` which encompasses displays, a keyboard, a mouse, and a trackpad. Although Wayland may be in principle able to deal with several seats, FLTK's Wayland platform is conceived for one seat only. That seat may contain one or more displays, which Wayland calls *outputs*, of type `struct wl_output`.

As written above, function `registry_handle_global()` discovers the available seat at start-up time. This function also associates a listener to each display connected to the system by calling function `wl_output_add_listener()`. This listener's member functions run at program startup when Wayland discovers its displays (see [Opening a Wayland connection](#)). Member `output_mode` runs also when the display is resized and mem-

ber `output_scale` also when the Wayland scale factor (see below) is changed. FLTK defines type `struct Fl_Wayland_Screen_Driver::output` to store display size and scaling information. One such record is created for each display. These records are put in a `struct wl_list` accessible from member `outputs` of the single `Fl_Wayland_Screen_Driver` object.

FLTK uses 2 distinct scaling parameters for each display:

- `int wld_scale;` This member variable of the `struct Fl_Wayland_Screen_Driver::output` record typically equals 1 for standard, and 2 for HighDPI displays. The effect of value `n` of variable `wld_scale` is that 1 Wayland graphics unit represents a block of $n \times n$ pixels. Another effect is that a drawing buffer for a surface of size $W \times H$ units contains $W * n * H * n * 4$ bytes. Member function `output_scale()` mentioned above sets this value for each system's display at startup time. Member function `Fl_Wayland_Graphics_Driver::buffer_commit()` informs the Wayland compositor of the value of `wld_scale` calling `wl_surface_set_buffer_scale()` which is enough to make FLTK apps HighDPI-aware. Under the gnome and KDE desktops, this parameter is visible in the "Settings" app, "Displays" section, "Scale" parameter which is 200% on HighDPI displays.
- `float gui_scale;` This other member variable is where FLTK's own GUI scaling mechanism with `ctrl+/-/0/` keystrokes and with environment variable `FLTK_SCALING_FACTOR` operates: when FLTK is scaled at 150%, `gui_scale` is assigned value 1.5. Function `Fl_Wayland_Screen_Driver::scale(int n, float f)` assigns value `f` to the `gui_scale` member variable of display # `n`. This variable is used by function `Fl_Wayland_Window_Driver::make_current()` when it calls `Fl_Wayland_Graphics_Driver::set_buffer()` that scales the graphics driver by this factor with `cairo_scale()`.

Overall, an FLTK object, say an `Fl_Window`, of size $W \times H$ FLTK units occupies $\text{int}(W * \text{gui_scale}) * \text{wld_scale} \times \text{int}(H * \text{gui_scale}) * \text{wld_scale}$ pixels on the display.

When an `Fl_Window` is to be shown, `Fl_Wayland_Window_Driver::makeWindow()` creates a `struct wl_surface` with `wl_compositor_create_surface()` and associates it calling `wl_surface_add_listener()` with a 2-member listener called `surface_listener` encharged of managing as follows the list of displays where this `wl_surface` will map. The `Fl_Window` possesses an initially empty linked list of displays accessible at member `outputs` of the window's `wld_window` record. When the `Fl_Window`, or more exactly its associated `struct wl_surface` is mapped on a display, member `surface_enter()` of `surface_listener` runs. This function adds the display where the surface belongs to the end of the linked list of displays for this surface. When a surface is dragged or enlarged across the edge of a display in a multi-display system and expands on a second display, `surface_enter()` runs again, and this surface's list of displays contains 2 items. When a surface leaves a display, member `surface_leave()` of `surface_listener` runs. It removes that display from the surface's list of displays. Each time the first item of a surface's list of displays changes, function `change_scale()` is called and applies that display's `gui_scale` value to that surface calling `Fl_Window_Driver::screen_num(int)`. When a window is unmapped by function `Fl_Wayland_Window_Driver::hide()`, the surface's list of displays is emptied.

Fractional scaling

The KWin and gnome compositors allow to use *fractional scaling* that can take values between 100% and 400% that are not a multiple of 100%. Wayland implements this rendering all `wl_surface`'s as if the scaling had the next value above that is a multiple of 100% (e.g., 175% --> 200%), and downsizing them to the desired fractional scale value at the compositing stage. Seen from FLTK, everything runs with `wld_scale` having an integer value (1, 2, 3 or 4).

Some gnome versions may natively support fractional scaling. Others require to use these commands to make them accept/refuse fractional scaling:

```
gsettings set org.gnome.mutter experimental-features "[ 'scale-monitor-framebuffer' ]"
gsettings reset org.gnome.mutter experimental-features
```

25.1.13 Mouse and trackpad handling

FLTK receives information about mouse and pointer events via a 'listener' made up of 5 pointers to functions which Wayland calls when events listed in table below occur. These functions receive from Wayland enough information in their parameters to generate corresponding FLTK events, that is, calls to `Fl::handle(int event_type, Fl_Window *)`.

listener function	called by Wayland when	resulting FLTK events
pointer_enter	pointer enters a window	FL_ENTER
pointer_leave	pointer leaves a window	FL_LEAVE
pointer_motion	pointer moves inside a window	FL_MOVE
pointer_button	state of mouse buttons changes	FL_PUSH, FL_RELEASE
pointer_axis	trackpad is moved vertically or horizontally	FL_MOUSEWHEEL

pointer_listener is installed by a call to function `wl_pointer_add_listener()` made by function `seat_capabilities()` which is itself another 'listener' made up of 2 function pointers

```
static struct wl_seat_listener seat_listener = {
    seat_capabilities,
    seat_name
};
```

installed by a call to function `wl_seat_add_listener()` made by function `registry_handle_global()` when it receives a "wl_seat" interface.

Handling middle mouse button clicks on window titlebars

The gnome desktop, via its `gnome-tweaks` application, allows to determine what happens when a middle mouse button click occurs on a window titlebar. To obey this setting, FLTK implements part of the `GTK Shell` protocol as follows. Mutter, gnome's Wayland compositor, declares its support of the `GTK Shell` protocol calling `registry_handle_global()` with its interface argument equal to "gtk_shell1". FLTK initializes then member variable `seat->gtk_shell` of type `struct gtk_shell1*`.

Member functions of `pointer_listener` mentioned above run for all mouse events on all `wl_surface` objects. The table above describes what these functions do for mouse events on FLTK-created `wl_surface` objects. But they also run for the `libdecor`-created `wl_surface` objects corresponding to window titlebars. Thus, member function `pointer_enter()` runs when the mouse enters a titlebar. It calls `Fl_Wayland_Screen_Driver::event_coords_from_surface()` which calls `Fl_Wayland_Window_Driver::surface_to_window()` which, as mentioned above, can distinguish FLTK-created from non FLTK-created `wl_surface` objects. This allows `pointer_enter()` to identify the entered surface as a titlebar and to assign static global variable `gtk_shell_surface` with the titlebar's `wl_surface` when the mouse enters a titlebar. Similarly, member function `pointer_leave()` sets `gtk_shell_surface` to NULL when the mouse leaves this titlebar. When there's a click on a titlebar, member function `pointer_button()` runs this code

```
if (gtk_shell_surface && state == WL_POINTER_BUTTON_STATE_PRESSED && button == BTN_MIDDLE) {
    struct gtk_surface1 *gtk_surface = gtk_shell1_get_gtk_surface(seat->gtk_shell, gtk_shell_surface);
    gtk_surface1_titlebar_gesture(gtk_surface, serial, seat->wl_seat, GTK_SURFACE1_GESTURE_MIDDLE_CLICK);
    gtk_surface1_release(gtk_surface);
    return;
}
```

which ensures that what `gnome-tweaks` has assigned to middle-click events is executed. At this point, FLTK obeys what `libdecor` decides for right-click (display the window menu) and double-click (maximize the window) events on titlebars which may diverge from `gnome-tweaks` settings.

25.1.14 Wayland cursors

Wayland defines types `struct wl_cursor` and `struct wl_cursor_theme` to hold cursor-related data. FLTK uses function `init_cursors()` from file `Fl_Wayland_Screen_Driver.cxx` to obtain the 'cursor theme' name using function `libdecor_get_cursor_settings()` of library `libdecor`. Function `wl_cursor_theme_load()` then returns a pointer to an object of type `struct wl_cursor_theme` stored in member variable `cursor_theme` of the `Fl_Wayland_Screen_Driver::seat` record. Function `init_cursors()` is itself called by a 'listener' called `seat_capabilities()` installed when function `registry_handle_global()` receives a "wl_seat" interface, at program startup. It is also called when the value of the Wayland scaling factor changes: `output_done()` calls `try_update_cursor()` calls `init_cursors()`. Function `output_done()` belongs to a 'listener' installed when function `registry_handle_global()` receives a "wl_output" interface.

Each time `Fl_Window::cursor(Fl_Cursor)` runs, FLTK calls `Fl_Wayland_Window_Driver::set_cursor(Fl_Cursor)` which calls `wl_cursor_theme_get_cursor()` to set the current cursor shape to one of the standard shapes from the `Fl_Cursor` enumeration. This Wayland function selects a cursor shape based on the current `wl_cursor_theme` object and a cursor name and returns a pointer to a `struct wl_cursor`. Under the gnome desktop, cursor names are the files of directory `/usr/share/icons/XXXX/cursors/` where XXXX is the 'gnome cursor theme' (default= Adwaita). For example, what FLTK calls

`FL_CURSOR_INSERT` corresponds to file `xterm` therein. The full correspondance between `Fl_Cursor` values and names of files therein is found in function `Fl_Wayland_Window_Driver::set_cursor(Fl_Cursor)`. FLTK stores in member variable `default_cursor` of the `Fl_Wayland_Screen_Driver::seat` record a pointer to the currently used `wl_cursor` object, and the current `Fl_Cursor` value in member `standard_cursor` of the `Fl_Wayland_Window_Driver` object.

Finally, function `do_set_cursor()` of file `Fl_Wayland_Screen_Driver.cxx` makes the system pointer use the current `wl_cursor` object to draw its shape on screen. That's done with a call to `wl_pointer_set_cursor()` and a few other functions.

Custom cursor shapes

To support custom cursors, FLTK presently uses a non-public type, `struct cursor_image`, defined in file `Fl_Wayland_Window_Driver.cxx` as follows:

```
struct cursor_image {
    struct wl_cursor_image image;
    struct wl_cursor_theme *theme;
    struct wl_buffer *buffer;
    int offset;
};
```

This definition has been copied to the FLTK source code from file `wayland-cursor.c` of the Wayland project source code because it's not accessible via Wayland header files. It shows that a pointer to a `cursor_image` object can also be viewed as a pointer to the embedded `struct wl_cursor_image` object, this one being part of the public Wayland API. It also shows that a `struct cursor_image` object has an associated `struct wl_buffer` object used to contain the cursor's graphics.

Function `Fl_Wayland_Window_Driver::set_cursor(const Fl_RGB_Image *rgb, int hotx, int hoty)` gives FLTK support of custom cursor shapes. It calls `Fl_Wayland_Window_Driver::set_cursor_4args()` that creates a `cursor_image` object, allocates the corresponding `wl_buffer` by a call to `Fl_Wayland_Graphics_Driver::create_shm_buffer()` via `custom_offscreen()` and `create_wld_buffer()` and draws the cursor shape into that buffer using the offscreen-drawing method of FLTK.

The public type `struct wl_cursor` is essentially an array of `wl_cursor_image` objects and a name:

```
struct wl_cursor {
    unsigned int image_count;
    struct wl_cursor_image **images;
    char *name;
};
```

Function `Fl_Wayland_Window_Driver::set_cursor_4args()` also creates a `struct wl_cursor` object containing a single `wl_cursor_image`, which is in fact the `cursor_image`. Finally, a `struct Fl_Wayland_Window_Driver::custom_cursor` (see [wld_window](#)) is allocated and used to memorize the `struct wl_cursor` and the cursor's image and hotspot. A pointer to this `struct Fl_Wayland_Window_Driver::custom_cursor` object is stored in member `custom_cursor` of the window's `wld_window`.

Function `Fl_Wayland_Window_Driver::set_cursor_4args()` is also called when a window with a custom cursor is moved between distinct displays or when a display is rescaled to adapt the cursor size to the new display's scale factor.

Static member function `Fl_Wayland_Window_Driver::delete_cursor()` is used to delete any custom cursor shape. This occurs when a window associated to a custom cursor is un-mapped and when such a window gets associated to a standard cursor or to a new custom cursor.

25.1.15 Keyboard support

The "Mouse handling" section above mentioned function `seat_capabilities()` that Wayland calls when the app discovers its "seat". Presence of flag `WL_SEAT_CAPABILITY_KEYBOARD` in argument `capabilities` of this function indicates that a keyboard is available. In that case, a call to `wl_seat_get_keyboard()` returns a pointer stored in member `wl_keyboard` of the `Fl_Wayland_Screen_Driver::seat` object, and a call to `wl_keyboard_add_listener()` installs a 6-member listener of type `struct wl_keyboard_listener`. These 6 FLTK-defined, callback functions are used as follows.

1) Function `wl_keyboard_keymap()` runs when the app starts and also if the keyboard layout is changed during run-time. It allows initialization of access to this keyboard. Noticeably, member `xkb_state` of type `struct xkb_state*` of the current `Fl_Wayland_Screen_Driver::seat` record is adequately initialized.

2-3) Functions `wl_keyboard_enter()` and `wl_keyboard_leave()`, called when focus enters and leaves a surface, send `FL_FOCUS` and `FL_UNFOCUS` events to the `Fl_Window` object corresponding to this surface.

4) Function `wl_keyboard_key()` runs each time a keyboard key is pressed or released. Its argument `key`, to which 8 must be added, provides the keycode via function `xkb_state_key_get_one_sym()` and then the corresponding text via function `xkb_state_key_get_utf8()` which is put in `Fl::e_text`. Then, a few calls to functions whose name begin with `xkb_compose_` are necessary to support dead and compose keys. Finally a call to `Fl::handle()` sends an `FL_KEYDOWN` or `FL_KEYUP` event to the appropriate `Fl_Window`. Also, function `wl_keyboard_key()` uses global variable `Fl_Int_Vector key_vector` to record all currently pressed keys. This is the base of the implementation of `Fl_Wayland_Screen_Driver::event_↵key(int)`.

5) Function `wl_keyboard_modifiers()` runs when a modifier key (e.g., shift, control) is pressed or released. Calls to functions `xkb_state_update_mask()` and `xkb_state_mod_name_is_active()` allow FLTK to set `Fl::e_state` adequately.

6) Function `wl_keyboard_repeat_info()` does not run, for now, because this would require version 4 of the `wl_keyboard` object which is at version 2 in all tested Wayland compositors.

25.1.16 Support of text input methods

When the connected Wayland compositor supports text input methods, function `registry_handle_↵global()` gets called with its interface argument equal to `zwp_text_input_manager_v3_↵interface.name`. The following call to `wl_registry_bind()` returns a pointer to type struct `zwp_text_input_manager_v3` that is stored as member `text_input_base` of the `Fl_Wayland_↵_Screen_Driver` object.

Later, when function `seat_capabilities()` runs, `text_input_base` is found not NULL, which triggers a call to function `zwp_text_input_manager_v3_get_text_input()` returning a value of type struct `zwp_text_input_v3 *` and stored as member `text_input` of the `Fl_Wayland_Screen_Driver::seat` object. Next, a call to `zwp_text_input_v3_add_listener()` associates this `text_input` with a 6-member listener of type struct `zwp_text_input_v3_listener`. These 6 FLTK-defined, callback functions are used as follows.

1-2) Functions `text_input_enter()` and `text_input_leave()` run when text input enters or leaves a surface.

3-4) Functions `text_input_preedit_string()` and `text_input_commit_string()` are called when the text input method prepares the client app to later insert 'marked' text or regular text, respectively. Complex text input often begins by inserting temporary text which is said to be 'marked' before replacing it with the text that will stay in the document. FLTK underlines marked text to distinguish it from regular text.

5) Function `text_input_done()` runs when it's time to send either regular or marked text to the client app. This is done by function `send_text_to_fltk()` which uses static variables `current_pre_edit`, `pending_↵_pre_edit` and `pending_commit` to determine the sent text.

6) Function `text_input_delete_surrounding_text()` has no effect at present, without this preventing input methods that have been tested with FLTK from working satisfactorily.

It's necessary to inform the running text input method of the current location of the insertion point in the active surface. This information allows the input method to map its auxiliary window close to the insertion point. The flow of information on this topic is as follows:

- The two FLTK widgets supporting text input, `Fl_Input` and `Fl_Text_Display`, transmit to FLTK the window coordinates of the bottom of the current insertion point and the line height each time they change calling function `fl_set_spot()`.
- `fl_set_spot()` calls the platform override of virtual member function `Fl_Screen_Driver::set_↵spot()`. Under Wayland, this just calls `Fl_Wayland_Screen_Driver::insertion_point_↵location(int x, int y, int height)` which calls `zwp_text_input_v3_set_cursor_↵_rectangle()` to inform the text input method about the surface position and size of the insertion point and also memorizes this information in static member variables of class `Fl_Wayland_Screen_Driver`.
- Callback function `text_input_enter()` calls `Fl_Wayland_Screen_Driver::insertion_↵point_location(int *x, int *y, int *height)` which gives it the stored position information, and then calls `zwp_text_input_v3_set_cursor_rectangle()` to inform the text input method about the position of the insertion point.

25.1.17 Interface with libdecor

FLTK uses a library called `libdecor` to determine whether the Wayland compositor uses CSD or SSD mode, and also to draw window titlebars when in CSD mode (see [libdecor](#)). `libdecor` is conceived to be present in a shared library linked to the Wayland client application which itself, and if the running Wayland compositor uses CSD mode, loads another shared library intended to draw titlebars in a way that best matches the Desktop. As of late 2023, `libdecor` contains two titlebar-drawing plugins:

- `libdecor-gtk` intended for the Gnome desktop;
- `libdecor-cairo` for other situations.

On recent Linux distributions, FLTK uses the system `libdecor` shared library available via packages `libdecor-0-dev` and `libdecor-0-plugin-1-gtk`. On earlier Linux versions, or if CMake option `FLTK_USE_SYSTEM_LIBDECOR` is set to OFF, FLTK bundles the most recent source code of `libdecor` and its plugins. The `libdecor` code bundled inside FLTK is compiled and put in `libfltk`. FLTK uses `libdecor-gtk` when software package `libgtk-3-dev` is present in the build system, and `libdecor-cairo` otherwise. FLTK prefixes all symbols of its bundled `libdecor` with "fl_". This allows an FLTK client app to link to other libraries which may use the system version of `libdecor`.

`libdecor` uses the Wayland protocol `XDG decoration` to request being decorated by a supporting compositor. If the running compositor supports SSD, `libdecor` doesn't draw window titlebars because the compositor does it. That is what happens with the KWin and Sway compositors. However, if environment variable `LIBDECOR_FORCE_CSD` is defined to value 1 when an FLTK app runs, `libdecor` instructs an SSD-able compositor to refrain from decorating its windows and decorates windows itself.

Whatever the value of `FLTK_USE_SYSTEM_LIBDECOR`, FLTK and `libdecor` use environment variable `LIBDECOR_PLUGIN_DIR` as follows: if this variable is defined and points to the name of a directory, this directory is searched for a potential `libdecor` plugin in the form of a shared library; if one is found, FLTK and `libdecor` load it and use it.

The `libdecor` source code bundled in FLTK is identical to that of the `libdecor` repository. Nevertheless, FLTK uses this code with some minor changes. For example, except if `FLTK_USE_SYSTEM_LIBDECOR` is 1, FLTK needs to modify function `libdecor_new()` charged of loading the plugin, to make it use the plugin code that is included in `libfltk` if none is found as a dynamic library. This is done as follows in file `libdecor/build/fl_`

```
libdecor.c:
#define libdecor_new libdecor_new_orig
#include "../src/libdecor.c"
#undef libdecor_new
void libdecor_new() { // FLTK rewrite of this function
    .....
}
```

FLTK compiles file `fl_libdecor.c` which includes `libdecor.c` to the effect that all of the `libdecor` code becomes part of `libfltk` except that function `libdecor_new()` is substituted by its FLTK rewrite, without file `libdecor.c` being modified at all. This trick is also used to modify function `libdecor_frame_set_`
`minimized()` to bypass a bug in the Weston compositor before version 10. Similarly, FLTK compiles file `fl_`
`libdecor-plugins.c` which includes either `libdecor-gtk.c` or `libdecor-cairo.c` to the effect that the desired plugin becomes part of `libfltk`.

To support function `Fl_Widget_Surface::draw_decorated_window()` that draws a mapped window and its titlebar, FLTK needs to perform two operations: 1) identify what plugin is operating, and 2) call a function that is specific of that plugin and that returns the pixels of the drawn titlebar.

FLTK performs operation 1) above using its function `get_libdecor_plugin_description()` of file `fl_`
`_libdecor-plugins.c` that returns a human readable string describing the running plugin. Each plugin puts its own string in member `description` of a record of type `struct libdecor_plugin_description`. Although this type is public in header file `libdecor-plugin.h`, accessing the symbol defined by the plugin to store a pointer to a value of this type is complicated for a reason and solved by a method detailed in a comment before function `get_libdecor_plugin_description()`.

Operation 2) above is done by FLTK-defined function `fl_libdecor_titlebar_buffer()` from file `fl_`
`_libdecor-plugins.c`. This function calls `get_libdecor_plugin_description()` seen above to get the running plugin's descriptive string. That is "GTK3 plugin" with `libdecor-gtk`. FLTK function `gtk_titlebar_buffer()` is then called, and returns a pointer to the start of a byte buffer containing the titlebar graphics. That is, again, not possible with the public `libdecor` API. Therefore, FLTK copies to `fl_libdecor-plugins.c` the definitions of several types given in `libdecor-gtk.c` or `libdecor-cairo.c` such as type `struct border_component`.

25.1.18 Copy/Paste/Drag-n-Drop

FLTK follows the procedure that is very well described in item "Wayland clipboard and drag & drop" of the [Documentation resources](#). All corresponding source code is in file `src/drivers/Wayland/fl_wayland_←_clipboard_dnd.cxx`.

This part of the `Fl_Wayland_Screen_Driver::seat` record stores pointers to Wayland objects used for clipboard and D-n-D operations:

```
struct wl_data_device_manager *data_device_manager;
struct wl_data_device *data_device;
struct wl_data_source *data_source;
```

FLTK can copy or paste plain UTF-8 text or image data to/from the clipboard. Images are copied to the clipboard as image/bmp mime type. Images in image/bmp or image/png mime types from the clipboard can be pasted to FLTK apps.

Files dropped are received one pathname per line, with no '\n' after the last pathname.

25.1.19 EGL as support for OpenGL

Wayland uses [EGL™](#) to interface OpenGL with the underlying native platform window system. OpenGL-using FLTK apps are therefore linked to `libwayland-egl.so` and `libEGL.so` in addition to `libGL.so` and `libGLU.←so`.

EGL completely hides the `wl_buffer` objects it uses to draw to GL windows. The `wld_buffer` structure and the 'buffer factory' described previously are not used for `Fl_Gl_Window`'s: the `buffer` member of an `Fl_Gl_Window`'s `wld_window` structure is always NULL.

EGL is initialized calling member function `Fl_Wayland_Gl_Window_Driver::init()` once, the first time the `Fl_Wayland_Gl_Window_Driver` c'tor runs. That is done with calls to `eglGetDisplay()`, `egl←Initialize()`, and `eglBindAPI()`.

Member function `Fl_Wayland_Gl_Window_Driver::find()` calls `eglChooseConfig()` to filter the set of GL configurations that match the `Fl_Gl_Window`'s `mode()`, and puts in the returned `Fl_Gl_Choice` object the first matching configuration. The filtering gets done with bits `EGL_WINDOW_BIT`, to support the creation of window surfaces, and `EGL_OPENGL_BIT`, to support the creation of OpenGL contexts.

EGL needs 2 more objects created for each `Fl_Gl_Window`. They have types `struct wl_egl_window` and `EGLSurface`, and are created by member function `Fl_Wayland_Gl_Window_Driver::make_←current_before()` which runs at the beginning of `Fl_Gl_Window::make_current()`. The first argument of the call to `wl_egl_window_create()` therein has type `struct wl_surface *` and is what connects EGL with the targeted Wayland window.

EGL creates with `eglCreateContext()` an object of type `EGLContext` via member function `Fl_←Wayland_Gl_Window_Driver::create_gl_context()` called by `Fl_Gl_Window::make_current()`.

Types `EGLContext` and `GLContext` are 2 names for the same object. The call to `eglCreateContext()` is made asking for a GL context of version at least 2. This does not prevent from obtaining contexts of higher versions, namely above 3.2, which are compatible with version 2 (the so-called compatibility profile) under all tested Linux systems.

FLTK function `Fl_Gl_Window::make_current()` calls overridden function `Fl_Wayland_Gl_Window_←_Driver::set_gl_context()` which calls EGL function `eglMakeCurrent()` when the cached context changes.

FLTK calls function `Fl_Wayland_Gl_Window_Driver::swap_buffers()` each time it wants a GL context to be sent to the display. This function contains some pure GL code to emulate an overlay buffer to support `Fl_Gl_Window` objects overriding their `draw_overlay()` member function. Then, it calls function `eglSwap_←Buffers()`.

The overridden `Fl_Wayland_Gl_Window_Driver::resize()` function is implemented with calls to `wl_←_egl_window_get_attached_size()` and `wl_egl_window_resize()`.

Class `Fl_Wayland_Gl_Plugin` exists to allow `libfltk` to call functions from `libfltk_gl`, `libwayland-egl.so` or `libEGL.so` and without having `libfltk` force linking any FLTK app with these GL-related libraries. For example, `Fl_Wayland_Window_Driver::flush()` needs to call `Fl_Gl_←Window::valid(0)`.

Throttling GL window redraws

Although no documentation covering this subject was found, the EGL library internally uses `wl_callback` objects to throttle GL window redraws, and FLTK needs not interfere with these operations. Nevertheless FLTK creates and uses `wl_callback` objects for GL windows in 2 cases:

- when a decorated GL window is being interactively resized. Function `Fl_Wayland_Gl_Window_Driver::resize()` creates a `wl_callback` object, assigns it to `xid->frame_cb` and calls `wl_callback_add_listener()` before calling `wl_egl_window_resize()`. This allows the mechanism described above that prevents surfaces from being resized too frequently to operate with decorated `Fl_Gl_Window`'s too.
- when a GL subwindow is being refreshed by `Fl_Wayland_Gl_Window_Driver::swap_buffers()`. FLTK checks that `xid->frame_cb` is NULL and if so creates a `wl_callback` calling `wl_surface_frame()` before calling `eglSwapBuffers()`. This is useful if the GL subwindow becomes entirely out from the screen area. In that case, the Mutter compositor stops signaling that the subwindow is ready for new commits which FLTK detects because `xid->frame_cb` remains non-NULL. If the subwindow eventually re-appears partially on-screen, `xid->frame_cb` becomes NULL and FLTK calls `eglSwapBuffers()` to redraw the GL scene.

25.1.20 FLTK-defined, Wayland-specific types

struct `wld_window`

Defined in `Fl_Wayland_Window_Driver.H`. One such record is created for each `show()`'n `Fl_Window` by `Fl_Wayland_Window_Driver::makeWindow()`. Function `fl_wl_xid(Fl_Window*)` returns a pointer to the `struct wld_window` of its argument.

```
struct wld_window {
    Fl_Window *fl_win;
    struct wl_list outputs; // linked list of displays where part or whole of window maps
    struct wl_surface *wl_surface; // the window's surface
    struct wl_callback *frame_cb; // non-NULL until Wayland can process new surface commit
    struct Fl_Wayland_Graphics_Driver::wld_buffer *buffer; // see \ref wld_buffer
    struct xdg_surface *xdg_surface;
    enum Fl_Wayland_Window_Driver::kind kind; // DECORATED or POPUP or SUBWINDOW or UNFRAMED
    union {
        struct libdecor_frame *frame; // for DECORATED windows
        struct wl_subsurface *subsurface; // for SUBWINDOW windows
        struct xdg_popup *xdg_popup; // for POPUP windows
        struct xdg_toplevel *xdg_toplevel; // for UNFRAMED windows
    };
    struct Fl_Wayland_Window_Driver::custom_cursor {
        struct wl_cursor *wl_cursor;
        const Fl_RGB_Image *rgb;
        int hotx, hoty;
    } *custom_cursor; // non-null when using custom cursor
    int configured_width; // used when negotiating window size with the compositor
    int configured_height;
    int floating_width; // helps restoring size after un-maximizing
    int floating_height;
    int state; // indicates whether window is fullscreen, maximized. Used otherwise for POPUPS
    bool covered; // specially for Mutter and issue #878
}
```

struct `Fl_Wayland_Graphics_Driver::draw_buffer`

Defined in file `Fl_Wayland_Graphics_Driver.H`. One such record is created when an `Fl_Image_Surface` object is created. One such record is also embedded inside each `struct Fl_Wayland_Graphics_Driver::wld_buffer` record (see `wld_buffer`).

```
struct Fl_Wayland_Graphics_Driver::draw_buffer {
    unsigned char *buffer; // address of the beginning of the Cairo image surface's byte array
    cairo_t *cairo; // used when drawing to the Cairo image surface
    size_t data_size; // of buffer and wl_buffer, in bytes
    int stride; // bytes per line
    int width; // in pixels
};
```

FLTK gives offscreen buffers the platform-dependent type `Fl_Offscreen` which is in fact member `cairo_` of `struct Fl_Wayland_Graphics_Driver::draw_buffer`. Thus, a variable with type `Fl_Offscreen` needs be cast to type `cairo_t*`. Static member function `struct draw_buffer *offscreen_buffer(Fl_Offscreen)` of class `Fl_Wayland_Graphics_Driver` returns the `draw_buffer` record corresponding to an `Fl_Offscreen` value.

struct `Fl_Wayland_Graphics_Driver::wld_buffer`

Defined in file `Fl_Wayland_Graphics_Driver.H`. One such record is created by `Fl_Wayland_Graphics_Driver::create_wld_buffer()` when an `Fl_Window` is `show()`'n or resized, when a custom cursor shape is created, or when text is dragged.

```

struct Fl_Wayland_Graphics_Driver::wld_buffer {
    struct draw_buffer draw_buffer; // see draw_buffer
    struct wl_list link; // links all buffers from the same wl_shm_pool
    struct wl_buffer *wl_buffer; // the Wayland buffer
    void *data; // address of the beginning of the Wayland buffer's byte array
    struct wl_shm_pool *shm_pool; // pter to wl_shm_pool from which this wl_buffer comes
    bool draw_buffer_needs_commit; // true when draw_buffer has been modified but not yet committed
    bool in_use; // true while being committed
    bool released; // true after buffer_release() was called
};

```

struct Fl_Wayland_Screen_Driver::output

Defined in `Fl_Wayland_Screen_Driver.H`. One such record is created for each display of the system by function `registry_handle_global()` when it receives a "wl_output" interface. These records are kept in a linked list of them all, and an identifier of this linked list is stored in member `outputs` of the unique `Fl_Wayland_Screen_Driver` object `FLTK` uses. Thus,

```

Fl_Wayland_Screen_Driver *scr_driver = (Fl_Wayland_Screen_Driver*)Fl::screen_driver();
struct wl_list list_of_all_displays = scr_driver->outputs;

```

gives access, the Wayland way, to the linked list of displays in the system.

```

struct Fl_Wayland_Screen_Driver::output { // one record for each display
    uint32_t id; // an identifier of the display
    int x, y; // logical position of the top-left of display
    int width; // nber of horizontal pixels
    int height; // nber of vertical pixels
    float dpi; // at this point, always 96.
    struct wl_output *wl_output; // the Wayland object for this display
    int wld_scale; // Wayland scale factor
    float gui_scale; // FLTK scale factor
    bool done; // true means record members have been initialized
    struct wl_list link; // links these records together
};

```

It's possible to get the `FLTK`-defined record associated to a display from the Wayland-associated object for the same display, say `struct wl_output *wl_output`, by this call: `(struct Fl_Wayland_Screen_Driver::output *)wl_output_get_user_data(wl_output)`.

struct Fl_Wayland_Screen_Driver::seat

Defined in file `Fl_Wayland_Screen_Driver.H`. One record is created by function `registry_handle_global()` when it receives a "wl_seat" or `wl_data_device_manager_interface.name` interface. A pointer to this struct is stored in member `seat` of the client's unique `Fl_Wayland_Screen_Driver` object.

```

struct Fl_Wayland_Screen_Driver::seat {
    struct wl_seat *wl_seat;
    struct wl_pointer *wl_pointer;
    struct wl_keyboard *wl_keyboard;
    uint32_t keyboard_enter_serial;
    struct wl_surface *keyboard_surface;
    struct wl_list pointer_outputs;
    struct wl_cursor_theme *cursor_theme;
    struct wl_cursor *default_cursor;
    struct wl_surface *cursor_surface;
    struct wl_surface *pointer_focus;
    int pointer_scale;
    uint32_t serial;
    uint32_t pointer_enter_serial;
    struct wl_data_device_manager *data_device_manager;
    struct wl_data_device *data_device;
    struct wl_data_source *data_source;
    struct xkb_state *xkb_state;
    struct xkb_context *xkb_context;
    struct xkb_keymap *xkb_keymap;
    struct xkb_compose_state *xkb_compose_state;
    char *name;
    struct zwf_text_input_v3 *text_input;
};

```

25.1.21 Documentation resources

The Wayland book	Extensive introduction to Wayland programming written by the author of the <code>sway</code> compositor, unfortunately unachieved.
------------------	--

Wayland Explorer	Documentation of all Wayland protocols, both stable and unstable. A language-independent syntax is used which makes function names usable from C or C++ not always obvious. Some useful functions seem undocumented here for an unclear reason.
Wayland Protocol Specification	Documentation for all functions of the Wayland core protocol.
Wayland clipboard and drag & drop	Detailed explanation of how clipboard and drag-and-drop work under Wayland.
Wayland and input methods	Blog article introducing to the issue of text input methods under Wayland.
Input Method Hub	Entry page for input method support giving newcomers a first understanding of what input methods are and how they are implemented in Wayland.

25.2 Developer info for bundled libs

This chapter details the procedure to update the libraries which are bundled inside FLTK.

25.2.1 Introduction

This file is mainly intended for FLTK developers and contains information about the current versions of all bundled libraries and about how to upgrade these bundled libraries.

Starting with FLTK 1.4.0 the bundled libraries jpeg, png, and zlib use "symbol prefixing" with the prefix 'fltk_' for all external symbols to distinguish the bundled libraries from existing system libraries and to avoid runtime errors.

User code compiled correctly with the header files provided by the bundled image libraries need not be changed.

The nanosvg library is not affected.

25.2.2 Current status

Current versions of bundled libraries (as of June 1, 2024):

Library	Version/git commit	Release date	FLTK Version
jpeg	jpeg-9f	2024-01-14	1.4.0
nanosvg	7aeda550a8 [1]	2023-12-02	1.4.0
png	libpng-1.6.43	2024-02-23	1.4.0
zlib	zlib-1.3.1	2024-01-22	1.4.0
libdecor	c2bd8ad6 [2]	2024-05-31	1.4.0

Previous versions of bundled libraries (FLTK 1.3.x):

Library	Version	Release date	FLTK Version
jpeg	jpeg-9e	2022-01-16	1.3.9
png	libpng-1.6.40	2023-06-21	1.3.9
zlib	zlib-1.3	2023-08-18	1.3.9
jpeg	jpeg-9d	2020-01-12	1.3.6 - 1.3.8
png	libpng-1.6.37	2019-04-14	1.3.6 - 1.3.8
zlib	zlib-1.2.11	2017-01-15	1.3.6 - 1.3.8

[1] Git commit in branch 'fltk' of <https://github.com/fltk/nanosvg>
See also git tag 'fltk_yyyy-mm-dd' where yyyy-mm-dd == "Release date" and file nanosvg/README.txt.

[2] Git commit in <https://gitlab.freedesktop.org/libdecor/libdecor>

General information:

FLTK does not include the entire library distributions. We only provide the source files necessary to build the FLTK library and some README and/or CHANGELOG files. There are no test programs or other contributed files.

We use our own build files, hence a few files MUST NOT be upgraded when the library source files are upgraded. We strive to keep changes to the library source files as small as possible. Patching library code to work with FLTK should be a rare exception. Symbol prefixing with prefix 'fltk_' is one such exception to the rule.

If patches are necessary all changes in the library files should be marked with "FLTK" in a comment so a developer who upgrades the library later is aware of changes in the source code for FLTK. Look for 'FLTK' and/or 'fltk_' to find the differences.

Additional comments should be added to show the rationale, i.e. why a particular change was necessary. If applicable, add a reference to a Software Trouble Report, GitHub Issue or Pull Request (PR) like "STR 3456", "Issue #123", or "PR #234".

25.2.3 How to update the bundled libraries

It is generally advisable to use a graphical merge program. I'm using 'meld' under Linux, but YMMV.

Do not add any source files unless they are required to build the library.

Some config header files may be pre-generated in the FLTK sources. These header files should be left untouched, but it may be necessary to update these files if new items were added to the new library version. In this case the new header should be pre-generated on a Linux system with default options unless otherwise mentioned below for a specific library. Currently there are no known exceptions.

Merging source files:

Please check if some source and header files contain "FLTK" comments and/or 'fltk_' symbol prefixing to be aware of necessary merges. It is also good to download the distribution tar ball or Git source files of the previous version and to run a (graphical) diff or merge tool on the previous version and the bundled version of FLTK to see the "previous" differences.

Files that were not patched in previous versions should be copied to the new version w/o changes. Files that had FLTK specific patches must be merged manually. FLTK patches should be verified (if still necessary) and should be kept in the new source files.

Source and header files that have been added in the new library version should be added in FLTK as well if they are necessary to build the library. A simple "trial and error" should be sufficient to find files that need to be added. Added files must be added to FLTK's build files as well, usually to both 'Makefile' and 'CMakeLists.txt' to be used in configure/make and in CMake based builds, respectively.

Upgrade order:

There is only one dependency between all bundled libraries: libpng depends on zlib. Hence zlib should be upgraded first, then all other libs can be upgraded in arbitrary order.

Tests after merge:

Tests should be done on as many platforms as possible, both with autotools (configure/make) and CMake. Windows (Visual Studio) and macOS (Xcode) builds need CMake to generate the IDE files.

Upgrade notes for specific libraries:

The following chapters contain informations about specific files and how they are upgraded. Since the changes in all bundled libraries are not known in advance this information may change in the future. Please verify that no other changes are necessary.

25.2.4 zlib:

Website: <https://zlib.net/>

Download: See website and follow links.

Repository: git clone <https://github.com/madler/zlib.git>

zlib should be upgraded first because libpng depends on zlib.

Download the latest zlib sources, 'cd' to /path-to/zlib and run

```
$ ./configure --zprefix
```

This creates the header file 'zconf.h' with definitions to enable the standard 'z_' symbol prefix.

Unfortunately zlib requires patching some source and header files to convert this 'z_' prefix to 'fltk_z_' to be more specific. As of this writing (Nov. 2021) three files need symbol prefix patches:

- gzread.c
- zconf.h
- zlib.h

You may want to compare these files and/or the previous version to find out which changes are required. The general rule is to change all occurrences of 'z_' to 'fltk_z_' but there *are* exceptions.

The following files need special handling:

- CMakeLists.txt: Keep FLTK version, update manually if necessary.
- Makefile: Same as CMakeLists.txt.
- gzread.c: Merge changes (see above, manual merge recommended).
- zconf.h: Merge changes (see above, manual merge recommended).
- zlib.h: Merge changes (see above, manual merge recommended).
- makedepend: Keep this file.

Run 'make depend' in the zlib folder on a Linux system after the upgrade to update this file.

25.2.5 png:

Website: <http://libpng.org/pub/png/libpng.html>

Download: See website and follow links.

Repository: git clone <https://git.code.sf.net/p/libpng/code> libpng

libpng should be upgraded after zlib because it depends on zlib.

Download the latest libpng sources, 'cd' to /path-to/libpng and run

```
$ ./configure --with-libpng-prefix=fltk_
$ make
```

This creates the header files 'pnglibconf.h' and 'pngprefix.h' with the 'fltk_' symbol prefix.

The following files need special handling:

- CMakeLists.txt: Keep FLTK version, update manually if necessary.
- Makefile: Same as CMakeLists.txt.
- pnglibconf.h: Generate on a Linux system and merge (see above).
- pngprefix.h: Generate on a Linux system and merge (see above).
- makedepend: Keep this file.

Run 'make depend' in the png folder on a Linux system after the upgrade to update this file.

25.2.6 jpeg:

Website: <https://ijg.org/>

Download: See website and follow links.

Repository: N/A

Download the latest jpeg-xy sources on a Linux (or Unix) system, 'cd' to /path-to/jpeg-xy and run

```
$ ./configure
$ make [-jN]
```

This builds the library and should create the static library file '.libs/libjpeg.a'.

Execute the following command to extract the libjpeg symbol names used to build the 'prefixed' libfltk_jpeg library:

```
$ nm --extern-only --defined-only .libs/libjpeg.a | awk '{print $3}' \
  | sed '/^$/d' | sort -u | awk '{print "#define \"$1\" fltk_\"$1\"}' \
  > fltk_jpeg_prefix.h
```

This creates the header file 'fltk_jpeg_prefix.h' with the '# define' statements using the 'fltk_' symbol prefix.

The following files need special handling:

- CMakeLists.txt: Keep FLTK version, update manually if necessary.
- Makefile: Same as CMakeLists.txt.
- fltk_jpeg_prefix.h: Generate on a Linux system and merge (see above).
- jconfig.h: keep changes flagged with

```
/* FLTK */
```

Note: more to come...

- makedepend: Keep this file.

Run 'make depend' in the jpeg folder on a Linux system after the upgrade to update this file.

25.2.7 nanosvg:

Website: <https://github.com/memononen/nanosvg>

Download: See website and follow links.

Repository: git clone <https://github.com/memononen/nanosvg.git>

FLTK Fork: git clone <https://github.com/fltk/nanosvg.git>

FLTK has its own GitHub fork of the original repository (see above).

The intention is to update this fork from time to time so the FLTK specific patches are up-to-date with the original library. Hopefully the FLTK patches will be accepted upstream at some time in the future so we no longer need our own patches. AlbrechtS, 04 Feb 2018.

Update (Feb 22, 2021): The upstream library is officially no longer maintained (see README.md) although updates appear from time to time.

Use this fork (branch 'fltk') to get the nanosvg library with FLTK specific patches:

```
$ git clone https://github.com/fltk/nanosvg.git nanosvg-fltk
$ cd nanosvg-fltk
$ git checkout fltk
$ cd src
$ cp nanosvg.h nanosvgrast.h /path/to/fltk-1.4/nanosvg/
```

This library does not have its own build files since it is a header-only library. The headers are included in FLTK where necessary.

The following files need special handling:

nanosvg.h: Merge or download from FLTK's fork (see above).

nanosvgrast.h: Merge or download from FLTK's fork (see above).

Maintaining branch 'fltk' in FLTK's fork of nanosvg (fltk/nanosvg):

Only maintainers with write access on fltk/nanosvg can do this. Others can fork our fltk/nanosvg fork in their own GitHub account and either open a PR on fltk/nanosvg or tell us about their changes in fltk.development.

Use something similar to the following commands to update FLTK's fork of nanosvg to the latest version. Commands are only examples, you may need to change more or less, depending on the outstanding updates.

Step 1: clone the fltk/nanosvg fork, set the remote 'upstream', and update the 'master' branch:

```
$ cd /to/your/dev/dir
$ git clone https://github.com/fltk/nanosvg.git nanosvg-fltk
$ cd nanosvg-fltk
$ git remote add upstream https://github.com/memononen/nanosvg
$ git checkout master
$ git pull upstream master
```

Note: the 'master' branch must never be changed, i.e. it must always be the same as 'upstream/master'. Never commit your own (FLTK specific) changes to branch 'master'.

Step 2: rebase branch 'fltk' on the new master (upstream/master), fix potential conflicts, and tag the new branch.

It is important to keep the individual FLTK specific patches intact (one commit per patch) because this will preserve the history and the committer and make it easier to skip single patches when they are accepted upstream.

```
$ git checkout fltk
$ git rebase upstream/master
```

At this point you may need to fix conflicts! Do whatever is necessary to update the branch 'fltk'.

Now 'git tag' the 'fltk' branch for later reference.

Hint: use 'git show <any-older-tag-name>' to see its contents. I like to write a summary of commits in the tag comment.

```
$ git tag -a fltk_yyyy-mm-dd fltk
```

Replace 'yyyy-mm-dd' with the current date and add a comment when asked for it (your editor will open an empty file).

Step 3: at this point it is recommended to copy the changed header files to your working copy of the FLTK library and test the changes. If anything is wrong, go back, fix the bugs and change the git tag (delete and create a new one).

Step 4: push the new branch 'fltk' and the tag to the fltk/nanosvg repository:

```
$ git push -f origin fltk
$ git push origin fltk_yyyy-mm-dd
```

Step 5: copy the changed files to your working copy of the FLTK repository (if not done already), update this file accordingly, and commit/push the update to the fltk/fltk repository.

25.2.8 libdecor:

Website: <https://gitlab.freedesktop.org/libdecor/libdecor>

Download: See website and follow links.

Repository: git clone <https://gitlab.freedesktop.org/libdecor/libdecor.git>

libdecor is used by the Wayland/X11 hybrid platform to draw window titlebars when FLTK apps run as Wayland clients and the running Wayland compositor uses client-side decoration. In the future, when libdecor will have made its way into Linux packages, FLTK will use the system version of libdecor. libdecor will remain as an FLTK bundle to support Linux configurations where the libdecor package is not available or not installed.

FLTK uses libdecor source files without any modification. This part of the libdecor source tree is copied to directory libdecor/ of the FLTK source tree:

```
LICENSE
README.md
src/    ... and files below except meson.build files
```

Furthermore, directory libdecor/build/ of the FLTK source tree does not originate from the libdecor source tree but contains 3 FLTK-created files. File build/Makefile may need changes if a libdecor update adds or renames source files.

25.3 Developer Information

This chapter describes FLTK development and documentation.

Example

```
/** \file
    Fl_Clock, Fl_Clock_Output widgets. */

/**
    \class Fl_Clock_Output
    \brief This widget can be used to display a program-supplied time.

    The time shown on the clock is not updated. To display the current time,
    use Fl_Clock instead.

    \image html clock.png
    \image latex clock.png "" width=10cm
    \image html round_clock.png
    \image latex clock.png "" width=10cm
    \image html round_clock.png "" width=10cm */

/**
    Returns the displayed time.
    Returns the time in seconds since the UNIX epoch (January 1, 1970).
    \see value(ulong)
    */
ulong value() const {return value_;}

/**
    Set the displayed time.
    Set the time in seconds since the UNIX epoch (January 1, 1970).
    \param[in] v seconds since epoch
    \see value()
    */
void Fl_Clock_Output::value(ulong v) {
    [...]
}

/**
    Create an Fl_Clock widget using the given position, size, and label string.
    The default boxtype is \c FL_NO_BOX.
    \param[in] X, Y, W, H position and size of the widget
    \param[in] L widget label, default is no label
    */
Fl_Clock::Fl_Clock(int X, int Y, int W, int H, const char *L)
    : Fl_Clock_Output(X, Y, W, H, L) {}
```

```

/**
 * Create an Fl_Clock widget using the given boxtype, position, size, and
 * label string.
 * \param[in] t boxtype
 * \param[in] X, Y, W, H position and size of the widget
 * \param[in] L widget label, default is no label
 */
Fl_Clock::Fl_Clock(uchar t, int X, int Y, int W, int H, const char *L)
    : Fl_Clock_Output(X, Y, W, H, L) {
    type(t);
    box(t==FL_ROUND_CLOCK ? FL_NO_BOX : FL_UP_BOX);
}

```

Note

From Duncan: (will be removed later, just for now as a reminder)

I've just added comments for the `fl_color_chooser()` functions, and in order to keep them and the general Function Reference information for them together, I created a new doxygen group, and used `\ingroup` in the three comment blocks. This creates a new Modules page (which may not be what we want) with links to it from the File Members and `Fl_Color_Chooser.H` pages. It needs a bit more experimentation on my part unless someone already knows how this should be handled. (Maybe we can add it to a `functions.dox` file that defines a functions group and do that for all of the function documentation?)

Update: the trick is not to create duplicate entries in a new group, but to move the function information into the doxygen comments for the class, and use the navigation links provided. Simply using `\relatesalso` as the first doxygen command in the function's comment puts it in the appropriate place. There is no need to have `\defgroup` and `\ingroup` as well, and indeed they don't work. So, to summarize:

```

Gizmo.H
/** \class Gizmo
 * A gizmo that does everything
 */
class Gizmo {
    etc
};
extern int popup_gizmo(...);

Gizmo.cxx:
/** \relatesalso Gizmo
 * Pops up a gizmo dialog with a Gizmo in it
 */
int popup_gizmo(...);

```

Comments Within Doxygen Comment Blocks

You can use HTML comment statements to embed comments in doxygen comment blocks. These comments will not be visible in the generated document.

```

The following text is a developer comment.
<!-- *** This *** is *** invisible *** -->
This will be visible again.

```

will be shown as:

```

The following text is a developer comment.
<!-- *** This *** is *** invisible *** -->
This will be visible again.

```

Different Headlines

You can use HTML tags `<H1> ... <H4>` for headlines with different sizes. As of doxygen 1.8.x there must not be more than three spaces at the beginning of the line for this to work. Currently (doxygen 1.8.6) there seems to be no difference in the font sizes of `<H3>` and `<H4>` in the pdf output, whereas the html output uses different font sizes.

```

<H1>Headline in big text (H1)</H1>
<H2>Headline in big text (H2)</H2>
<H3>Headline in big text (H3)</H3>
<H4>Headline in big text (H4)</H4>

```

Headline in big text (H1)

Headline in big text (H2)

Headline in big text (H3)

Headline in big text (H4)

25.3.1 Non-ASCII Characters

Doxygen understands many HTML quoting characters like `"`, `ü`, `ç`, `Ç`, but not all HTML quoting characters.

This will appear in the document:

```
Doxygen understands many HTML quoting characters like
&quot;; &uuml;; &ccedil;; &Ccedil;; but not all HTML quoting characters.
```

For further informations about HTML quoting characters see

<http://www.doxygen.org/manual/htmlcmds.html>

Alternatively you can use **UTF-8** encoding within Doxygen comments.

25.3.2 Document Structure

- `\page` creates a named page
- `\section` creates a named section within that page
- `\subsection` creates a named subsection within the current section
- `\subsubsection` creates a named subsubsection within the current subsection

All these statements take a "name" as their first argument, and a title as their second argument. The title can contain spaces.

The page, section, and subsection titles are formatted in blue color and a size like "`<H1>`", "`<H2>`", and "`<H3>`", and "`<H4>`", respectively.

By **FLTK documentation convention**, a file like this one with a doxygen documentation chapter has the name "`<chapter>.dox`". The `\page` statement at the top of the page is "`\page <chapter> This is the title`". Sections within a documentation page must be called "`<chapter>_<section>`", where "`<chapter>`" is the name part of the file, and "`<section>`" is a unique section name within the page that can be referenced in links. The same for subsections and subsubsections.

These doxygen page and section commands work only in special documentation chapters, not within normal source or header documentation blocks. However, links **from** normal (e.g. class) documentation **to** documentation sections **do work**.

This page has

```
\page development I - Developer Information
```

at its top.

This section is

```
\section development_structure Document Structure
```

The following section is

```
\section development_links Creating Links
```

25.3.3 Creating Links

Links to other documents and external links can be embedded with

- doxygen `\ref` links to other doxygen `\page`, `\section`, `\subsection` and `\anchor` locations
 - HTML links without markup - doxygen creates "`http://...`" links automatically
 - standard, non-Doxygen, HTML links
- ```
- see chapter \ref unicode creates a link to the named chapter
unicode that has been created with a \page statement.
- For further informations about quoting see
http://www.doxygen.org/manual/htmlcmds.html
- see FLTK Library creates
a standard HTML link
```

appears as:

- see chapter [Unicode and UTF-8 Support](#) creates a link to the named chapter unicode that has been created with a `\page` statement.
- For further informations about quoting see <http://www.doxygen.org/manual/htmlcmds.html>
- see [FLTK Library](#) creates a standard HTML link

### 25.3.4 Paragraph Layout

There is no real need to use HTML `<P>` and `</P>` tags within the text to tell doxygen to start or stop a paragraph. In most cases, when doxygen encounters a blank line or some, but not all, `\commands` in the text it knows that it has reached the start or end of a paragraph. Doxygen also offers the `\par` command for special paragraph handling. It can be used to provide a paragraph title and also to indent a paragraph. Unfortunately `\par` won't do what you expect if you want to have doxygen links and sometimes html tags don't work either.

```
\par Normal Paragraph with title

This paragraph will have a title, but because there is a blank line
between the \par and the text, it will have the normal layout.

\par Indented Paragraph with title
This paragraph will also have a title, but because there is no blank
line between the \par and the text, it will be indented.

\par
It is also possible to have an indented paragraph without title.
This is how you indent subsequent paragraphs.

\par No link to Fl_Widget::draw()
Note that the paragraph title is treated as plain text.
Doxygen type links will not work.
HTML characters and tags may or may not work.

Fl_Widget::draw() links and "html" tags work

\par
Use a single line ending with
 for complicated paragraph titles.
```

The above code produces the following paragraphs:

#### Normal Paragraph with title

This paragraph will have a title, but because there is a blank line between the `\par` and the text, it will have the normal layout.

#### Indented Paragraph with title

This paragraph will also have a title, but because there is no blank line between the `\par` and the text, it will be indented.

It is also possible to have an indented paragraph without title. This is how you indent subsequent paragraphs.

#### No link to `Fl_Widget::draw()`

Note that the paragraph title is treated as plain text. Doxygen type links will not work. HTML characters and tags may or may not work.

[Fl\\_Widget::draw\(\)](#) links and "html" tags work

Use a single line ending with `<br>` for complicated paragraph titles.

### 25.3.5 Navigation Elements

Each introduction (tutorial) page ends with navigation elements. These elements must only be included in the html documentation, therefore they must be separated with `\htmlonly` and `\endhtmlonly`.

The following code gives the navigation bar at the bottom of this page:

```
\htmlonly
<hr>
<table summary="navigation bar" width="100%" border="0">
<tr>
 <td width="45%" align="LEFT">

 [Prev]
 Migrating Code from FLTK 1.3 to 1.4

 </td>
 <td width="10%" align="CENTER">
 [Index]
 </td>
 <td width="45%" align="RIGHT">

 Software License
 [Next]

 </td>
</tr>
</table>
\endhtmlonly
```

# Chapter 26

## Todo List

### Page [Adding and Extending Widgets](#)

Clarify `Fl_Window::damage(uchar)` handling - seems confused/wrong? ORing value doesn't match setting behavior in `Fl_Widget.H!`

### Member `Fl::now (double offset=0)`

`Fl::system_driver()->gettime()` was implemented for the Forms library and has a limited resolution (on Windows: milliseconds). On POSIX platforms it uses `gettimeofday()` with microsecond resolution. A new function could use a better resolution on Windows with its multimedia timers which requires a new dependency: `winmm.lib (dll)`. This could be a future improvement, maybe set as a build option or generally (requires Win95 or 98?).

### Member `Fl_Browser::scrollbar_width () const`

This method should eventually be removed in 1.4+

### Member `Fl_Browser::scrollbar_width (int width)`

This method should eventually be removed in 1.4+

### Class `Fl_Chart`

Refactor `Fl_Chart::type()` information.

### Member `Fl_File_Input::errorcolor (Fl_Color c)`

Remove `Fl_File_Input::errorcolor(Fl_Color)` in FLTK 1.5.0 or higher.

### Member `Fl_File_Input::errorcolor () const`

Remove `Fl_File_Input::errorcolor()` in FLTK 1.5.0 or higher.

### Member `fl_filename_list (const char *d, struct dirent **l, Fl_File_Sort_F *s=fl_numericsort)`

should support returning OS error messages

### Class `Fl_Grid`

This (relative group coordinates of nested groups of `Fl_Grid`) needs explanation and maybe an example.

### Member `Fl_Grid::Cell::~~Cell ()`

`Fl_Grid`'s cell destructor should remove the cell from the grid. Currently it does nothing!

### Member `Fl_Grid::clear_layout ()`

`Fl_Grid::clear()` needs to be implemented as documented above!

### Member `Fl_Grid::debug (int level=127)`

Add more information about cells and children.

Control output by using `level`.

### Member `Fl_Grid::Fl_Grid (int X, int Y, int W, int H, const char *L=0)`

More documentation of `Fl_Grid` constructor?

### Member `Fl_Grid::layout ()`

Document when and why to call `layout()` w/o args. See `Fl_Flex::layout()`

**Member `FI_Grid::layout` (int rows, int cols, int margin=-1, int gap=-1)**

Document when and why to call `layout()` w/o args. See `FI_Flex::layout()`

**Member `FI_Group::delete_child` (int n)**

Reimplementation of `FI_Group::delete_child(int)` in more FLTK subclasses. This is not yet complete.

**Member `fl_height` (int font, int size)**

In the future, when the XFT issues are resolved, this function should simply return the 'size' value.

**Member `FI_Help_View::find` (const char \*s, int p=0)**

complex HTML entities for Unicode code points > 0x80 are currently treated like one byte (not character!) and do not (yet) match correctly ("`<`" matches "`<`" but "`€`" doesn't match "`€`", and "`ü`" doesn't match "`ü`")

**Member `FI_Input::handle_mouse` (int, int, int, int, int keepmark=0)**

Add comment and parameters

**Member `FI_Input::handletext` (int e, int, int, int, int)**

Add comment and parameters

**Class `FI_Label`**

There is an aspiration that the `FI_Label` type will become a widget by itself. That way we will be avoiding a lot of code duplication by handling labels in a similar fashion to widgets containing text. We also provide an easy interface for very complex labels, containing html or vector graphics. However, this re-factoring is not in place in this release.

**Member `FI_Menu::add` (const char \*, int shortcut, FI\_Callback \*, void \*=0, int=0)**

Raw integer shortcut needs examples. Dependent on responses to <https://www.fltk.org/newsgroups.php?gfltk.coredev+v:10086> and results of STR#2344

**Member `FI_Shortcut`**

Discuss and decide whether we can "shift" these special keyboard flags to the upper byte to enable full 21-bit Unicode characters (U+0000 . . . U+10FFFF) plus the keyboard indicator bits as this was originally intended. This would be possible if we could rely on **all** programs being coded with symbolic names and not hard coded bit values.

**Member `FI_Terminal::scrollbar`**

Support `scrollbar_left/right()` - See `FI_Browser::scrollbar` docs

Support new `ScrollbarStyle`

**Member `FI_Text_Display::extend_range_for_styles` (int \*start, int \*end)**

Unicode?

**Member `FI_Text_Display::handle_vline` (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const**

we need to handle hidden hyphens and tabs here!

we handle all styles and selections

we must provide code to get pixel positions of the middle of a character as well

**Member `FI_Text_Display::overstrike` (const char \*text)**

Unicode? Find out exactly what we do here and simplify.

**Member `FI_Text_Display::position_to_linecol` (int pos, int \*lineNum, int \*column) const**

a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.

**Member `FI_Text_Display::scroll` (int topLineNum, int horizOffset)**

Column numbers make little sense here.

**Member `FI_Text_Display::scrollbar_width` (int width)**

This method should eventually be removed

**Member `FI_Text_Display::scrollbar_width` () const**

This method should eventually be removed.

**Member `Fl_Text_Display::shortcut` (int s)**

FIXME : get set methods pointing on `shortcut_` have no effects as `shortcut_` is unused in this class and derived!

**Member `Fl_Text_Display::shortcut` () const**

FIXME : get set methods pointing on `shortcut_` have no effects as `shortcut_` is unused in this class and derived!

**Member `Fl_Text_Display::wrapped_column` (int row, int column) const**

What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function `TextDXYToUnconstrainedPosition` does not exist (nedit port?)

Unicode?

**Member `Fl_Text_Display::wrapped_row` (int row) const**

What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function `TextDXYToUnconstrainedPosition` does not exist (nedit port?)

**Member `Fl_Tiled_Image::Fl_Tiled_Image` (Fl\_Image \*i, int W=0, int H=0)**

Fix `Fl_Tiled_Image` as background image for widgets and windows and fix the implementation of `Fl::scheme(const char *)`.

**Member `Fl_Tree::handle` (int e) FL\_OVERRIDE**

add `Fl_Widget_Tracker` (see `Fl_Browser_cxx::handle()`)

**Member `Fl_Tree::is_scrollbar` (Fl\_Widget \*w)**

should be const

**Member `Fl_Tree::show_self` ()**

should be const

**Member `Fl_Window::show` () FL\_OVERRIDE**

Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

**Page `FLTK Basics`**

This section needs a major rework. Add a chapter "Building FLTK with CMake".

**Page `Handling Events`**

Add details on how to detect repeating keys, since on some X servers a repeating key will generate both `FL_↔KEYUP` and `FL_KEYDOWN`, such that to tell if a key is held, you need `Fl::event_key(int)` to detect if the key is being held down during `FL_KEYUP` or not.

**Page `Unicode and UTF-8 Support`**

Verify 16/24 bit Unicode limit for different character sets? OksiD's code appears limited to 16-bit whereas the FLTK2 code appears to handle a wider set. What about illegal characters? See comments in `fl_utf8fromwc()` and `fl_utf8toUtf16()`.

Work through the code and this documentation to harmonize the `[OksiID]` and `[fltk2]` functions.

FLTK 1.3 and later supports the full Unicode range (21 bits), but there are a few exceptions, for instance binary shortcut values in menus (`Fl_Shortcut`) can only be used with characters from the BMP (16 bits). This may be extended in a future FLTK version.

## Chapter 27

# Deprecated List

### Member `Fl::release ()`

Use `Fl::grab(0)` instead.

### Member `Fl::set_idle (Fl_Old_Idle_Handler cb)`

This method is obsolete - use the `add_idle()` method instead.

### Member `Fl::version ()`

Use `int Fl::api_version()` instead.

### Member `fl_ask (const char *fmt,...)`

`fl_ask()` is deprecated since it uses "Yes" and "No" for the buttons which does not conform to the current FLTK Human Interface Guidelines. Use `fl_choice()` with the appropriate verbs instead.

### Member `Fl_Browser::position () const`

"in 1.4.0 - use `vposition()` instead"

### Member `Fl_Browser::position (int pos)`

"in 1.4.0 - use `vposition(pos)` instead"

### Member `Fl_Browser::scrollbar_width () const`

Use `scrollbar_size()` instead.

### Member `Fl_Browser::scrollbar_width (int width)`

Use `scrollbar_size()` instead.

### Member `fl_clip (int x, int y, int w, int h)`

Please use `fl_push_clip(int x, int y, int w, int h)` instead. `fl_clip(int, int, int, int)` will be removed in FLTK 1.5.

### Member `Fl_File_Input::errorcolor () const`

Will be removed in FLTK 1.5.0 or higher.

### Member `Fl_File_Input::errorcolor (Fl_Color c)`

Will be removed in FLTK 1.5.0 or higher.

### Member `fl_find (Window xid)`

Kept in the X11, Windows, and macOS platforms for compatibility with FLTK versions before 1.4. Please use `fl_x11_find(Window)`, `fl_wl_find(struct wld_window*)`, `fl_win32_find(HWND)` or `fl_mac_find(FLWindow*)` with FLTK 1.4.0 and above.

### Member `Fl_GIF_Image::Fl_GIF_Image (const char *imagename, const unsigned char *data)`

Please use `Fl_GIF_Image(const char *imagename, const unsigned char *data, const size_t length)` instead.

### Member `Fl_Group::focus (Fl_Widget *W)`

This is for backwards compatibility only. You should use `W->take_focus()` instead.

### Member `Fl_Group::sizes ()`

Deprecated since 1.4.0. Please use `bounds()` instead.

**Member `Fl_Image::draw_scaled` (int X, int Y, int W, int H)**

Only for API compatibility with FLTK 1.3.4.

**Member `Fl_Image::label` (`Fl_Menu_Item *m`)**

Please use `Fl_Menu_Item::image()` instead.

**Member `Fl_Image::label` (`Fl_Widget *w`)**

Please use `Fl_Widget::image()` or `Fl_Widget::deimage()` instead.

**Member `Fl_Image_Surface::highres_image` ()**

Use `image()` instead.

**Member `Fl_Input::position` (int p)**

"in 1.4.0 - use `insert_position(p)` instead"

**Member `Fl_Input::position` (int p, int m)**

"in 1.4.0 - use `insert_position(p, m)` or `Fl_Widget::position(x, y)` instead"

**Member `Fl_Input::position` () const**

"in 1.4.0 - use `insert_position()` instead"

**Member `Fl_Menu_Item::check` ()**

Please use `Fl_Menu_Item::set()` instead. This method will be removed in FLTK 1.5.0 or later.

**Member `Fl_Menu_Item::checked` () const**

Please use `Fl_Menu_Item::value()` instead. This method will be removed in FLTK 1.5.0 or later.

**Member `Fl_Menu_Item::uncheck` ()**

Please use `Fl_Menu_Item::clear()` instead. This method will be removed in FLTK 1.5.0 or later.

**Member `Fl_Multi_Label::label` (`Fl_Menu_Item *`)**

since 1.4.0: please use `Fl_Menu_Item::label(Fl_Multi_Label *)`

**Member `Fl_Preferences::Fl_Preferences` (const char \*path, const char \*vendor, const char \*application)**

"in 1.4.0 - use `Fl_Preferences(path, vendor, application, flags)` instead"

**Member `Fl_Text_Display::scrollbar_width` (int width)**

Use `scrollbar_size()` instead.

**Member `Fl_Text_Display::scrollbar_width` () const**

Use `scrollbar_size()` instead.

**Member `Fl_Text_Selection::position` (int \*startpos, int \*endpos) const**

"in 1.4.0 - use `selected(startpos, endpos)` instead"

**Member `Fl_Tile::position` (int oldx, int oldy, int newx, int newy)**

"in 1.4.0 - use `move_intersection(p)` instead"

**Member `Fl_Tree::first_visible` ()**

in 1.3.3 ABI – use `first_visible_item()` instead.

**Member `Fl_Tree::item_clicked` (`Fl_Tree_Item *val`)**

in 1.3.3 ABI – use `callback_item()` instead.

**Member `Fl_Tree::item_clicked` ()**

in 1.3.3 ABI – use `callback_item()` instead.

**Member `Fl_Tree::last_visible` ()**

in 1.3.3 – use `last_visible_item()` instead.

**Member `FI_Tree_Item::FI_Tree_Item (const FI_Tree_Prefs &prefs)`**

in 1.3.3 ABI – you must use `FI_Tree_Item(FI_Tree*)` for proper horizontal scrollbar behavior.

**Member `FI_Tree_Item::next_displayed (FI_Tree_Prefs &prefs)`**

in 1.3.3 for confusing name, use `next_visible()` instead

**Member `FI_Tree_Item::prev_displayed (FI_Tree_Prefs &prefs)`**

in 1.3.3 for confusing name, use `prev_visible()`

**Member `FL_VERSION`**

This `double` version number is retained for compatibility with existing program code. New code should use `int FL_API_VERSION` instead. `FL_VERSION` is deprecated because comparisons of floating point values may fail due to rounding errors. However, there are currently no plans to remove this deprecated constant.

**Member `FI_Widget::color2 (unsigned a)`**

Use `selection_color(unsigned)` instead.

**Member `FI_Widget::color2 () const`**

Use `selection_color()` instead.

**Member `FI_Window::free_position ()`**

please use `force_position(0)` instead

**Member `FI_Window::icon () const`**

in 1.3.3

**Member `FI_Window::icon (const void *ic)`**

in 1.3.3 in favor of platform-independent methods `FI_Window::icon(const FI_RGB_Image *icon)` and `FI_Window::icons(const FI_RGB_Image *icons[], int count)`.

**Page `Operating System Issues`**

Kept for compatibility with FLTK versions before 1.4. Use preferentially `fl_x11_xid(const FI_Window *)` with versions 1.4 and above.

Kept for compatibility with FLTK versions before 1.4. Use preferentially `fl_x11_find(Window)` with versions 1.4 and above.

# Chapter 28

## Module Index

### 28.1 Modules

Here is a list of all modules:

Callback Function Typedefs . . . . .	251
Windows handling functions . . . . .	252
Events handling functions . . . . .	254
Selection & Clipboard functions . . . . .	270
Screen functions . . . . .	274
Color & Font functions . . . . .	280
Drawing functions . . . . .	294
Multithreading support functions . . . . .	330
Safe widget deletion support functions . . . . .	331
Cairo Support Functions and Classes . . . . .	334
Unicode and UTF-8 functions . . . . .	336
String handling functions . . . . .	353
Mac OS X-specific symbols . . . . .	354
Common Dialog Classes and Functions . . . . .	355
File names and URI utility functions . . . . .	370

# Chapter 29

## Hierarchical Index

### 29.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

FI_Grid::Cell . . . . .	379
FI_Terminal::CharStyle . . . . .	380
FI_GIF_Image::GIF_FRAME::CPAL . . . . .	381
FI_Terminal::Cursor . . . . .	381
FI_Preferences::Entry . . . . .	381
FI_Terminal::EscapeSeq . . . . .	382
FI . . . . .	382
FI_Cairo_State . . . . .	484
FI_Callback_User_Data . . . . .	487
FL_CHART_ENTRY . . . . .	495
FI_End . . . . .	532
FI_File_Chooser . . . . .	538
FI_File_Icon . . . . .	546
FI_Gl_Choice . . . . .	577
FI_Glut_Bitmap_Font . . . . .	587
FI_Glut_StrokeChar . . . . .	587
FI_Glut_StrokeFont . . . . .	587
FI_Glut_StrokeStrip . . . . .	588
FI_Glut_StrokeVertex . . . . .	588
FI_Help_Block . . . . .	618
FI_Help_Dialog . . . . .	618
FI_Help_Font_Stack . . . . .	620
FI_Help_Font_Style . . . . .	621
FI_Help_Link . . . . .	621
FI_Help_Target . . . . .	622
FI_Image . . . . .	634
FI_Bitmap . . . . .	431
FI_XBM_Image . . . . .	1217
FI_Pixmap . . . . .	758
FI_GIF_Image . . . . .	574
FI_Anim_GIF_Image . . . . .	418
FI_XPM_Image . . . . .	1218
FI_RGB_Image . . . . .	815
FI_BMP_Image . . . . .	434
FI_ICO_Image . . . . .	633
FI_JPEG_Image . . . . .	681
FI_PNG_Image . . . . .	764
FI_PNM_Image . . . . .	765
FI_SVG_Image . . . . .	871
FI_Shared_Image . . . . .	843

FI_Tiled_Image . . . . .	1037
FI_Image_Reader . . . . .	644
FI_Label . . . . .	683
FI_Mac_App_Menu . . . . .	687
FI_Menu_Item . . . . .	711
FI_Multi_Label . . . . .	728
FI_Native_File_Chooser . . . . .	732
FI_Plugin . . . . .	761
FI_Device_Plugin . . . . .	526
FI_Preferences . . . . .	776
FI_Plugin_Manager . . . . .	762
FI_Rect . . . . .	808
FI_Scroll::FI_Region_LRTB . . . . .	811
FI_Scroll::FI_Region_XYWH . . . . .	811
FI_Scheme . . . . .	825
FI_Scroll::FI_Scrollbar_Data . . . . .	840
FI_Surface_Device . . . . .	865
FI_Display_Device . . . . .	529
FI_Widget_Surface . . . . .	1187
FI_Copy_Surface . . . . .	519
FI_EPS_File_Surface . . . . .	533
FI_Image_Surface . . . . .	645
FI_Paged_Device . . . . .	746
FI_PDF_File_Surface . . . . .	752
FI_PostScript_File_Device . . . . .	769
FI_Printer . . . . .	798
FI_SVG_File_Surface . . . . .	868
FI_Text_Buffer . . . . .	956
FI_Text_Selection . . . . .	1023
FI_Timeout . . . . .	1040
FI_Tooltip . . . . .	1050
FI_Tree_Item . . . . .	1098
FI_Tree_Item_Array . . . . .	1120
FI_Tree_Prefs . . . . .	1123
FI_Widget . . . . .	1144
FI_Box . . . . .	436
FI_Button . . . . .	478
FI_Light_Button . . . . .	684
FI_Check_Button . . . . .	500
FI_Radio_Light_Button . . . . .	807
FI_Round_Button . . . . .	823
FI_Radio_Round_Button . . . . .	807
FI_Radio_Button . . . . .	806
FI_Repeat_Button . . . . .	812
FI_Return_Button . . . . .	813
FI_Shortcut_Button . . . . .	852
FI_Toggle_Button . . . . .	1049
FI_Chart . . . . .	488
FI_Clock_Output . . . . .	509
FI_Clock . . . . .	506
FI_Round_Clock . . . . .	824
FI_FormsBitmap . . . . .	568
FI_FormsPixmap . . . . .	569
FI_FormsText . . . . .	571
FI_Free . . . . .	571
FI_Group . . . . .	605

FI_Browser_ . . . . .	460
FI_Browser . . . . .	438
FI_File_Browser . . . . .	536
FI_Hold_Browser . . . . .	630
FI_Multi_Browser . . . . .	727
FI_Select_Browser . . . . .	842
FI_Check_Browser . . . . .	495
FI_Color_Chooser . . . . .	513
FI_Flex . . . . .	557
FI_Grid . . . . .	590
FI_Help_View . . . . .	622
FI_Input_Choice . . . . .	675
FI_Pack . . . . .	744
FI_Scroll . . . . .	829
FI_Spinner . . . . .	859
FI_Table . . . . .	884
FI_Table_Row . . . . .	903
FI_Tabs . . . . .	906
FI_Terminal . . . . .	920
FI_Text_Display . . . . .	974
FI_Text_Editor . . . . .	1015
FI_Tile . . . . .	1027
FI_Tree . . . . .	1055
FI_Window . . . . .	1192
FI_Double_Window . . . . .	530
FI_Cairo_Window . . . . .	485
FI_Overlay_Window . . . . .	741
FI_Gl_Window . . . . .	577
FI_Glut_Window . . . . .	588
FI_Single_Window . . . . .	855
FI_Menu_Window . . . . .	726
FI_Wizard . . . . .	1216
FI_Input_ . . . . .	654
FI_Input . . . . .	650
FI_File_Input . . . . .	552
FI_Float_Input . . . . .	567
FI_Int_Input . . . . .	680
FI_Multiline_Input . . . . .	730
FI_Output . . . . .	739
FI_Multiline_Output . . . . .	731
FI_Secret_Input . . . . .	840
FI_Spinner::FI_Spinner_Input . . . . .	865
FI_Menu_ . . . . .	688
FI_Choice . . . . .	502
FI_Scheme_Choice . . . . .	827
FI_Menu_Bar . . . . .	705
FI_Sys_Menu_Bar . . . . .	876
FI_Menu_Button . . . . .	708
FI_Positioner . . . . .	766
FI_Progress . . . . .	804
FI_Timer . . . . .	1047
FI_Valuator . . . . .	1128
FI_Adjuster . . . . .	415
FI_Counter . . . . .	522
FI_Simple_Counter . . . . .	854
FI_Dial . . . . .	527

FI_Fill_Dial . . . . .	555
FI_Line_Dial . . . . .	686
FI_Roller . . . . .	821
FI_Slider . . . . .	856
FI_Fill_Slider . . . . .	556
FI_Hor_Fill_Slider . . . . .	631
FI_Hor_Nice_Slider . . . . .	631
FI_Hor_Slider . . . . .	632
FI_Nice_Slider . . . . .	739
FI_Scrollbar . . . . .	837
FI_Value_Slider . . . . .	1141
FI_Hor_Value_Slider . . . . .	632
FI_Value_Input . . . . .	1133
FI_Value_Output . . . . .	1138
FI_Widget_Tracker . . . . .	1190
FI_GIF_Image::GIF_FRAME . . . . .	1219
FI_ICO_Image::IconDirEntry . . . . .	1219
FI_Text_Editor::Key_Binding . . . . .	1220
FI_Terminal::Margin . . . . .	1220
FI_Preferences::Name . . . . .	1221
FI_Preferences::Node . . . . .	1222
FI_Paged_Device::page_format . . . . .	1222
FI_Terminal::PartialUtf8Buf . . . . .	1223
FI_Terminal::RingBuffer . . . . .	1223
FI_Preferences::RootNode . . . . .	1224
FI_Scroll::ScrollInfo . . . . .	1224
FI_Terminal::Selection . . . . .	1225
FI_Tile::Size_Range . . . . .	1226
FI_Text_Display::Style_Table_Entry . . . . .	1226
FI_Terminal::Utf8Char . . . . .	1226

# Chapter 30

## Class Index

### 30.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">FI_Grid::Cell</a>	379
<a href="#">FI_Terminal::CharStyle</a>	380
<a href="#">FI_GIF_Image::GIF_FRAME::CPAL</a>	381
<a href="#">FI_Terminal::Cursor</a>	381
<a href="#">FI_Preferences::Entry</a>	381
<a href="#">FI_Terminal::EscapeSeq</a>	382
<a href="#">FI</a>	
The <a href="#">FI</a> is the FLTK global (static) class containing state information and global methods for the current application	382
<a href="#">FI_Adjuster</a>	
Was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range	415
<a href="#">FI_Anim_GIF_Image</a>	
Supports loading, caching, and drawing of animated CompuServe GIF <sup>SM</sup> images	418
<a href="#">FI_Bitmap</a>	
Supports caching and drawing of mono-color (bitmap) images	431
<a href="#">FI_BMP_Image</a>	
Supports loading, caching, and drawing of Windows Bitmap (BMP) image files	434
<a href="#">FI_Box</a>	
This widget simply draws its box, and possibly its label	436
<a href="#">FI_Browser</a>	
Displays a scrolling list of text lines, and manages all the storage for the text	438
<a href="#">FI_Browser_</a>	
This is the base class for browsers	460
<a href="#">FI_Button</a>	
Buttons generate callbacks when they are clicked by the user	478
<a href="#">FI_Cairo_State</a>	
Contains all the necessary info on the current cairo context	484
<a href="#">FI_Cairo_Window</a>	
This defines an FLTK window with Cairo support	485
<a href="#">FI_Callback_User_Data</a>	
A class prototype that allows for additional data in callbacks	487
<a href="#">FI_Chart</a>	
<a href="#">FI_Chart</a> displays simple charts	488
<a href="#">FL_CHART_ENTRY</a>	
For internal use only	495
<a href="#">FI_Check_Browser</a>	
Displays a scrolling list of text lines that may be selected and/or checked by the user	495
<a href="#">FI_Check_Button</a>	
A button with a "checkmark" to show its status	500

<a href="#">FI_Choice</a>	A button that is used to pop up a menu . . . . .	502
<a href="#">FI_Clock</a>	This widget provides a round analog clock display . . . . .	506
<a href="#">FI_Clock_Output</a>	This widget can be used to display a program-supplied time . . . . .	509
<a href="#">FI_Color_Chooser</a>	Standard RGB color chooser . . . . .	513
<a href="#">FI_Copy_Surface</a>	Supports copying of graphical data to the clipboard . . . . .	519
<a href="#">FI_Counter</a>	Controls a single floating point value with button (or keyboard) arrows . . . . .	522
<a href="#">FI_Device_Plugin</a>	This plugin socket allows the integration of new device drivers for special window or screen types	526
<a href="#">FI_Dial</a>	Circular dial to control a single floating point value . . . . .	527
<a href="#">FI_Display_Device</a>	The computer's display . . . . .	529
<a href="#">FI_Double_Window</a>	The <a href="#">FI_Double_Window</a> provides a double-buffered window . . . . .	530
<a href="#">FI_End</a>	This is a dummy class that allows you to end a <a href="#">FI_Group</a> in a constructor list of a class: . . . . .	532
<a href="#">FI_EPS_File_Surface</a>	Encapsulated PostScript drawing surface . . . . .	533
<a href="#">FI_File_Browser</a>	Displays a list of filenames, optionally with file-specific icons . . . . .	536
<a href="#">FI_File_Chooser</a>	Displays a standard file selection dialog that supports various selection modes . . . . .	538
<a href="#">FI_File_Icon</a>	Manages icon images that can be used as labels in other widgets and as icons in the FileBrowser widget . . . . .	546
<a href="#">FI_File_Input</a>	This widget displays a pathname in a text input field . . . . .	552
<a href="#">FI_Fill_Dial</a>	Draws a dial with a filled arc . . . . .	555
<a href="#">FI_Fill_Slider</a>	Widget that draws a filled horizontal slider, useful as a progress or value meter . . . . .	556
<a href="#">FI_Flex</a>	<a href="#">FI_Flex</a> is a container (layout) widget for one row or one column of widgets . . . . .	557
<a href="#">FI_Float_Input</a>	Subclass of <a href="#">FI_Input</a> that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits) . . . . .	567
<a href="#">FI_FormsBitmap</a>	Forms compatibility Bitmap Image Widget . . . . .	568
<a href="#">FI_FormsPixmap</a>	Forms pixmap drawing routines . . . . .	569
<a href="#">FI_FormsText</a>	. . . . .	571
<a href="#">FI_Free</a>	Emulation of the Forms "free" widget . . . . .	571
<a href="#">FI_GIF_Image</a>	Supports loading, caching, and drawing of CompuServe GIF <sup>SM</sup> images . . . . .	574
<a href="#">FI_GI_Choice</a>	. . . . .	577
<a href="#">FI_GI_Window</a>	Sets things up so OpenGL works . . . . .	577
<a href="#">FI_Glut_Bitmap_Font</a>	Gtk glut font/size attributes used in the glutXXX functions . . . . .	587
<a href="#">FI_Glut_StrokeChar</a>	. . . . .	587
<a href="#">FI_Glut_StrokeFont</a>	. . . . .	587

<a href="#">FI_Glut_StrokeStrip</a> . . . . .	588
<a href="#">FI_Glut_StrokeVertex</a> . . . . .	588
<a href="#">FI_Glut_Window</a> GLUT is emulated using this window class and these static variables (plus several more static variables hidden in <code>glut_compatibility.cxx</code> ): . . . . .	588
<a href="#">FI_Grid</a> <a href="#">FI_Grid</a> is a container (layout) widget with multiple columns and rows . . . . .	590
<a href="#">FI_Group</a> FLTK container widget . . . . .	605
<a href="#">FI_Help_Block</a> . . . . .	618
<a href="#">FI_Help_Dialog</a> Displays a standard help dialog window using the <a href="#">FI_Help_View</a> widget . . . . .	618
<a href="#">FI_Help_Font_Stack</a> . . . . .	620
<a href="#">FI_Help_Font_Style</a> <a href="#">FI_Help_View</a> font stack element definition . . . . .	621
<a href="#">FI_Help_Link</a> Definition of a link for the html viewer . . . . .	621
<a href="#">FI_Help_Target</a> <a href="#">FI_Help_Target</a> structure . . . . .	622
<a href="#">FI_Help_View</a> Displays HTML text . . . . .	622
<a href="#">FI_Hold_Browser</a> The <a href="#">FI_Hold_Browser</a> is a subclass of <a href="#">FI_Browser</a> which lets the user select a single item, or no items by clicking on the empty space . . . . .	630
<a href="#">FI_Hor_Fill_Slider</a> . . . . .	631
<a href="#">FI_Hor_Nice_Slider</a> Single thumb tab slider . . . . .	631
<a href="#">FI_Hor_Slider</a> Horizontal Slider class . . . . .	632
<a href="#">FI_Hor_Value_Slider</a> . . . . .	632
<a href="#">FI_ICO_Image</a> Supports loading, caching, and drawing of Windows icon (.ico) files . . . . .	633
<a href="#">FI_Image</a> Base class for image caching, scaling and drawing . . . . .	634
<a href="#">FI_Image_Reader</a> . . . . .	644
<a href="#">FI_Image_Surface</a> Directs all graphics requests to an <a href="#">FI_Image</a> . . . . .	645
<a href="#">FI_Input</a> This is the FLTK text input widget . . . . .	650
<a href="#">FI_Input_</a> This class provides a low-overhead text input field . . . . .	654
<a href="#">FI_Input_Choice</a> A combination of the input widget and a menu button . . . . .	675
<a href="#">FI_Int_Input</a> Subclass of <a href="#">FI_Input</a> that only allows the user to type decimal digits (or hex numbers of the form 0xaeF) . . . . .	680
<a href="#">FI_JPEG_Image</a> Supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images . . . . .	681
<a href="#">FI_Label</a> This struct stores all information for a text or mixed graphics label . . . . .	683
<a href="#">FI_Light_Button</a> This subclass displays the "on" state by turning on a light, rather than drawing pushed in . . . . .	684
<a href="#">FI_Line_Dial</a> . . . . .	686
<a href="#">FI_Mac_App_Menu</a> . . . . .	687
<a href="#">FI_Menu_</a> Base class of all widgets that have a menu in FLTK . . . . .	688

<a href="#">FI_Menu_Bar</a>	This widget provides a standard menubar interface . . . . .	705
<a href="#">FI_Menu_Button</a>	This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of <a href="#">FI_Menu_Item</a> objects . . . . .	708
<a href="#">FI_Menu_Item</a>	The <a href="#">FI_Menu_Item</a> structure defines a single menu item that is used by the <a href="#">FI_Menu_</a> class . . . . .	711
<a href="#">FI_Menu_Window</a>	Window type used for menus . . . . .	726
<a href="#">FI_Multi_Browser</a>	Subclass of <a href="#">FI_Browser</a> which lets the user select any set of the lines . . . . .	727
<a href="#">FI_Multi_Label</a>	Allows a mixed text and/or graphics label to be applied to an <a href="#">FI_Menu_Item</a> or <a href="#">FI_Widget</a> . . . . .	728
<a href="#">FI_Multiline_Input</a>	This input field displays 'n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys . . . . .	730
<a href="#">FI_Multiline_Output</a>	This widget is a subclass of <a href="#">FI_Output</a> that displays multiple lines of text . . . . .	731
<a href="#">FI_Native_File_Chooser</a>	This class lets an FLTK application easily and consistently access the operating system's native file chooser . . . . .	732
<a href="#">FI_Nice_Slider</a>	. . . . .	739
<a href="#">FI_Output</a>	This widget displays a piece of text . . . . .	739
<a href="#">FI_Overlay_Window</a>	This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image . . . . .	741
<a href="#">FI_Pack</a>	This widget was designed to add the functionality of compressing and aligning widgets . . . . .	744
<a href="#">FI_Paged_Device</a>	Represents page-structured drawing surfaces . . . . .	746
<a href="#">FI_PDF_File_Surface</a>	To send graphical output to a PDF file . . . . .	752
<a href="#">FI_Pixmap</a>	Supports caching and drawing of colormap (pixmap) images, including transparency . . . . .	758
<a href="#">FI_Plugin</a>	<a href="#">FI_Plugin</a> allows link-time and run-time integration of binary modules . . . . .	761
<a href="#">FI_Plugin_Manager</a>	<a href="#">FI_Plugin_Manager</a> manages link-time and run-time plugin binaries . . . . .	762
<a href="#">FI_PNG_Image</a>	Supports loading, caching, and drawing of Portable Network Graphics (PNG) image files . . . . .	764
<a href="#">FI_PNM_Image</a>	Supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files . . . . .	765
<a href="#">FI_Positioner</a>	This class is provided for Forms compatibility . . . . .	766
<a href="#">FI_PostScript_File_Device</a>	To send graphical output to a PostScript file . . . . .	769
<a href="#">FI_Preferences</a>	<a href="#">FI_Preferences</a> store user settings between application starts . . . . .	776
<a href="#">FI_Printer</a>	OS-independent print support . . . . .	798
<a href="#">FI_Progress</a>	Displays a progress bar for the user . . . . .	804
<a href="#">FI_Radio_Button</a>	. . . . .	806
<a href="#">FI_Radio_Light_Button</a>	. . . . .	807
<a href="#">FI_Radio_Round_Button</a>	. . . . .	807
<a href="#">FI_Rect</a>	Rectangle with standard FLTK coordinates (X, Y, W, H) . . . . .	808

<a href="#">FI_Scroll::FI_Region_LRTB</a>	A local struct to manage a region defined by left/right/top/bottom . . . . .	811
<a href="#">FI_Scroll::FI_Region_XYWH</a>	A local struct to manage a region defined by xywh . . . . .	811
<a href="#">FI_Repeat_Button</a>	The <a href="#">FI_Repeat_Button</a> is a subclass of <a href="#">FI_Button</a> that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down . . . . .	812
<a href="#">FI_Return_Button</a>	The <a href="#">FI_Return_Button</a> is a subclass of <a href="#">FI_Button</a> that generates a callback when it is pressed or when the user presses the Enter key . . . . .	813
<a href="#">FI_RGB_Image</a>	Supports caching and drawing of full-color images with 1 to 4 channels of color information . . . . .	815
<a href="#">FI_Roller</a>	"dolly" control commonly used to move 3D objects . . . . .	821
<a href="#">FI_Round_Button</a>	Buttons generate callbacks when they are clicked by the user . . . . .	823
<a href="#">FI_Round_Clock</a>	A clock widget of type <code>FL_ROUND_CLOCK</code> . . . . .	824
<a href="#">FI_Scheme</a>	. . . . .	825
<a href="#">FI_Scheme_Choice</a>	. . . . .	827
<a href="#">FI_Scroll</a>	This container widget lets you maneuver around a set of widgets much larger than your window . . . . .	829
<a href="#">FI_Scrollbar</a>	Displays a slider with arrow buttons at the ends of the scrollbar . . . . .	837
<a href="#">FI_Scroll::FI_Scrollbar_Data</a>	A local struct to manage a scrollbar's xywh region and tab values . . . . .	840
<a href="#">FI_Secret_Input</a>	Subclass of <a href="#">FI_Input</a> that displays its input as a string of placeholders . . . . .	840
<a href="#">FI_Select_Browser</a>	The class is a subclass of <a href="#">FI_Browser</a> which lets the user select a single item, or no items by clicking on the empty space . . . . .	842
<a href="#">FI_Shared_Image</a>	This class supports caching, loading, and drawing of image files . . . . .	843
<a href="#">FI_Shortcut_Button</a>	A button that allows the user to type a key combination to create shortcuts . . . . .	852
<a href="#">FI_Simple_Counter</a>	This widget creates a counter with only 2 arrow buttons . . . . .	854
<a href="#">FI_Single_Window</a>	This is the same as <a href="#">FI_Window</a> . . . . .	855
<a href="#">FI_Slider</a>	Sliding knob inside a box . . . . .	856
<a href="#">FI_Spinner</a>	This widget is a combination of a numerical input widget and repeat buttons . . . . .	859
<a href="#">FI_Spinner::FI_Spinner_Input</a>	. . . . .	865
<a href="#">FI_Surface_Device</a>	A drawing surface that's susceptible to receive graphical output . . . . .	865
<a href="#">FI_SVG_File_Surface</a>	A drawing surface producing a Scalable Vector Graphics (SVG) file . . . . .	868
<a href="#">FI_SVG_Image</a>	Supports loading, caching and drawing of scalable vector graphics (SVG) images . . . . .	871
<a href="#">FI_Sys_Menu_Bar</a>	A class to create and modify menus that appear on macOS in the menu bar at the top of the screen . . . . .	876
<a href="#">FI_Table</a>	A table of widgets or other content . . . . .	884
<a href="#">FI_Table_Row</a>	A table with row selection capabilities . . . . .	903

<a href="#">FI_Tabs</a>	Container widget that displays a set of tabs, with each tab representing a different child widget	906
<a href="#">FI_Terminal</a>	Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control	920
<a href="#">FI_Text_Buffer</a>	This class manages Unicode text displayed in one or more <a href="#">FI_Text_Display</a> widgets	956
<a href="#">FI_Text_Display</a>	Rich text display widget	974
<a href="#">FI_Text_Editor</a>	This is the FLTK text editor widget	1015
<a href="#">FI_Text_Selection</a>	This is an internal class for <a href="#">FI_Text_Buffer</a> to manage text selections	1023
<a href="#">FI_Tile</a>	Lets you resize its children by dragging the border between them	1027
<a href="#">FI_Tiled_Image</a>	This class supports tiling of images over a specified area	1037
<a href="#">FI_Timeout</a>	The internal class <a href="#">FI_Timeout</a> handles all timeout related functions	1040
<a href="#">FI_Timer</a>	This is provided only to emulate the Forms Timer widget	1047
<a href="#">FI_Toggle_Button</a>	The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off	1049
<a href="#">FI_Tooltip</a>	Tooltip support for all FLTK widgets	1050
<a href="#">FI_Tree</a>	Tree widget	1055
<a href="#">FI_Tree_Item</a>	Tree widget item	1098
<a href="#">FI_Tree_Item_Array</a>	Manages an array of <a href="#">FI_Tree_Item</a> pointers	1120
<a href="#">FI_Tree_Prefs</a>	Tree widget's preferences	1123
<a href="#">FI_Valuator</a>	Controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object	1128
<a href="#">FI_Value_Input</a>	Displays a numeric value	1133
<a href="#">FI_Value_Output</a>	Displays a floating point value	1138
<a href="#">FI_Value_Slider</a>	<a href="#">FI_Slider</a> widget with a box displaying the current value	1141
<a href="#">FI_Widget</a>	<a href="#">FI_Widget</a> is the base class for all widgets in FLTK	1144
<a href="#">FI_Widget_Surface</a>	A surface on which any FLTK widget can be drawn	1187
<a href="#">FI_Widget_Tracker</a>	This class should be used to control safe widget deletion	1190
<a href="#">FI_Window</a>	This widget produces an actual window	1192
<a href="#">FI_Wizard</a>	This widget is based off the <a href="#">FI_Tabs</a> widget, but instead of displaying tabs it only changes "tabs" under program control	1216
<a href="#">FI_XBM_Image</a>	Supports loading, caching, and drawing of X Bitmap (XBM) bitmap files	1217
<a href="#">FI_XPM_Image</a>	Supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency	1218
<a href="#">FI_GIF_Image::GIF_FRAME</a>		1219

<a href="#">FI_ICO_Image::IconDirEntry</a>	
Windows ICONDIRENTRY structure	
1219	
<a href="#">FI_Text_Editor::Key_Binding</a>	
Simple linked list item associating a key/state to a function	1220
<a href="#">FI_Terminal::Margin</a>	1220
<a href="#">FI_Preferences::Name</a>	
'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly	1221
<a href="#">FI_Preferences::Node</a>	1222
<a href="#">FI_Paged_Device::page_format</a>	
Width, height and name of a page format	1222
<a href="#">FI_Terminal::PartialUtf8Buf</a>	1223
<a href="#">FI_Terminal::RingBuffer</a>	1223
<a href="#">FI_Preferences::RootNode</a>	1224
<a href="#">FI_Scroll::ScrollInfo</a>	
Structure to manage scrollbar and widget interior sizes	1224
<a href="#">FI_Terminal::Selection</a>	1225
<a href="#">FI_Tile::Size_Range</a>	1226
<a href="#">FI_Text_Display::Style_Table_Entry</a>	
This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr	1226
<a href="#">FI_Terminal::Utf8Char</a>	1226

# Chapter 31

## File Index

### 31.1 File List

Here is a list of all documented files with brief descriptions:

<a href="#">Enumerations.H</a>	This file contains type definitions and general enumerations . . . . .	1229
<a href="#">filename.H</a>	File names and URI utility functions . . . . .	1263
<a href="#">FI.H</a>	FI static class . . . . .	1265
<a href="#">FI_Adjuster.H</a>	. . . . .	1273
<a href="#">FI_Anim_GIF_Image.H</a>	. . . . .	1274
<a href="#">fl_ask.H</a>	API for common dialogs . . . . .	1275
<a href="#">fl_attr.h</a>	This file defines compiler-specific macros . . . . .	1279
<a href="#">FI_Bitmap.H</a>	. . . . .	1282
<a href="#">FI_BMP_Image.H</a>	. . . . .	1283
<a href="#">FI_Box.H</a>	FI_Box widget . . . . .	1283

## Module Documentation

### 32.1 Callback Function Typedefs

Typedefs defined in [<FL/FI.H>](#) for callback or handler functions passed as function parameters.

#### Typedefs

- typedef void(\* **FI\_Abort\_Handler**) (const char \*format,...)  
*Signature of set\_abort functions passed as parameters.*
- typedef int(\* **FI\_Args\_Handler**) (int argc, char \*\*argv, int &i)  
*Signature of args functions passed as parameters.*
- typedef void(\* **FI\_Atclose\_Handler**) ([FI\\_Window](#) \*window, void \*data)  
*Signature of set\_atclose functions passed as parameters.*
- typedef void(\* **FI\_Awake\_Handler**) (void \*data)  
*Signature of some wakeup callback functions passed as parameters.*
- typedef void() **FI\_Box\_Draw\_F**(int x, int y, int w, int h, [FI\\_Color](#) color)  
*Signature of some box drawing functions passed as parameters.*
- typedef void() **FI\_Box\_Draw\_Focus\_F**([FI\\_Boxtype](#) bt, int x, int y, int w, int h, [FI\\_Color](#) fg, [FI\\_Color](#) bg)  
*Signature of box focus frame drawing functions.*
- typedef void(\* **FI\_Clipboard\_Notify\_Handler**) (int source, void \*data)  
*Signature of add\_clipboard\_notify functions passed as parameters.*
- typedef int(\* **FI\_Event\_Dispatch**) (int event, [FI\\_Window](#) \*w)  
*Signature of event\_dispatch functions passed as parameters.*
- typedef int(\* **FI\_Event\_Handler**) (int event)  
*Signature of add\_handler functions passed as parameters.*
- typedef void(\* **FI\_FD\_Handler**) ([FL\\_SOCKET](#) fd, void \*data)  
*Signature of add\_fd functions passed as parameters.*
- typedef void(\* **FI\_Idle\_Handler**) (void \*data)  
*Signature of add\_idle callback functions passed as parameters.*
- typedef void() **FI\_Label\_Draw\_F**(const [FI\\_Label](#) \*label, int x, int y, int w, int h, [FI\\_Align](#) align)  
*Signature of some label drawing functions passed as parameters.*
- typedef void() **FI\_Label\_Measure\_F**(const [FI\\_Label](#) \*label, int &width, int &height)  
*Signature of some label measurement functions passed as parameters.*
- typedef void(\* **FI\_Old\_Idle\_Handler**) ()  
*Signature of set\_idle callback functions passed as parameters.*
- typedef int(\* **FI\_System\_Handler**) (void \*event, void \*data)  
*Signature of add\_system\_handler functions passed as parameters.*
- typedef void(\* **FI\_Timeout\_Handler**) (void \*data)  
*Signature of timeout callback functions passed as parameters.*

### 32.1.1 Detailed Description

Typedefs defined in [<FL/Fl.H>](#) for callback or handler functions passed as function parameters.

FLTK uses callback functions as parameters for some function calls, e.g. to set up global event handlers ([Fl::add\\_handler\(\)](#)), to add a timeout handler ([Fl::add\\_timeout\(\)](#)), and many more.

The typedefs defined in this group describe the function parameters used to set up or clear the callback functions and should also be referenced to define the callback function to handle such events in the user's code.

See also

[Fl::add\\_handler\(\)](#), [Fl::add\\_timeout\(\)](#), [Fl::repeat\\_timeout\(\)](#), [Fl::remove\\_timeout\(\)](#) and others

### 32.1.2 Typedef Documentation

#### 32.1.2.1 Fl\_Event\_Dispatch

```
typedef int(* Fl_Event_Dispatch) (int event, Fl_Window *w)
```

Signature of event\_dispatch functions passed as parameters.

See also

[Fl::event\\_dispatch\(Fl\\_Event\\_Dispatch\)](#)

#### 32.1.2.2 Fl\_Timeout\_Handler

```
typedef void(* Fl_Timeout_Handler) (void *data)
```

Signature of timeout callback functions passed as parameters.

Please see [Fl::add\\_timeout\(\)](#) for details.

## 32.2 Windows handling functions

Windows and standard dialogs handling declared in [<FL/Fl.H>](#)

### Functions

- static void [Fl::default\\_atclose](#) ([Fl\\_Window](#) \*, void \*)  
*Default callback for window widgets.*
- static [Fl\\_Window](#) \* [Fl::first\\_window](#) ()  
*Returns the first top-level window in the list of shown() windows.*
- static void [Fl::first\\_window](#) ([Fl\\_Window](#) \*)  
*Sets the window that is returned by [first\\_window\(\)](#).*
- static [Fl\\_Window](#) \* [Fl::grab](#) ()  
*Returns the window that currently receives all events.*
- static void [Fl::grab](#) ([Fl\\_Window](#) \*)  
*Selects the window to grab.*
- static [Fl\\_Window](#) \* [Fl::modal](#) ()  
*Returns the top-most [modal\(\)](#) window currently shown.*
- static [Fl\\_Window](#) \* [Fl::next\\_window](#) (const [Fl\\_Window](#) \*)  
*Returns the next top-level window in the list of shown() windows.*
- static void [Fl::set\\_abort](#) ([Fl\\_Abort\\_Handler](#) f)  
*For back compatibility, sets the void [Fl::fatal](#) handler callback.*
- static void [Fl::set\\_atclose](#) ([Fl\\_Atclose\\_Handler](#) f)  
*For back compatibility, sets the [Fl::atclose](#) handler callback.*

## Variables

- static void(\* [Fl::atclose](#) )(Fl\_Window \*, void \*)  
*Back compatibility: default window callback handler.*

### 32.2.1 Detailed Description

Windows and standard dialogs handling declared in [<FL/FL.H>](#)

### 32.2.2 Function Documentation

#### 32.2.2.1 default\_atclose()

```
void Fl::default_atclose (
 Fl_Window * window,
 void * v) [static]
```

Default callback for window widgets.

It hides the window and then calls the default widget callback.

#### 32.2.2.2 first\_window() [1/2]

```
Fl_Window * Fl::first_window () [static]
```

Returns the first top-level window in the list of shown() windows.

If a [modal\(\)](#) window is shown this is the top-most modal window, otherwise it is the most recent window to get an event.

#### 32.2.2.3 first\_window() [2/2]

```
void Fl::first_window (
 Fl_Window * window) [static]
```

Sets the window that is returned by [first\\_window\(\)](#).

The window is removed from wherever it is in the list and inserted at the top. This is not done if [Fl::modal\(\)](#) is on or if the window is not shown(). Because the first window is used to set the "parent" of modal windows, this is often useful.

#### 32.2.2.4 grab() [1/2]

```
static Fl_Window * Fl::grab () [inline], [static]
```

Returns the window that currently receives all events.

#### Returns

The window that currently receives all events, or NULL if event grabbing is currently OFF.

#### 32.2.2.5 grab() [2/2]

```
void Fl::grab (
 Fl_Window * win) [static]
```

Selects the window to grab.

This is used when pop-up menu systems are active.

Send all events to the passed window no matter where the pointer or focus is (including in other programs). The window *does not have to be shown()*, this lets the [handle\(\)](#) method of a "dummy" window override all event handling and allows you to map and unmap a complex set of windows (under both X and Windows *some* window must be mapped because the system interface needs a window id).

If [grab\(\)](#) is on it will also affect show() of windows by doing system-specific operations (on X it turns on *override-redirect*). These are designed to make menus popup reliably and faster on the system.

To turn off grabbing do `Fl::grab(0)`.

*Be careful that your program does not enter an infinite loop while `grab()` is on. On X this will lock up your screen!*

To avoid this potential lockup, all newer operating systems seem to limit mouse pointer grabbing to the time during which a mouse button is held down. Some OS's may not support grabbing at all.

### 32.2.2.6 modal()

```
static Fl_Window * Fl::modal () [inline], [static]
```

Returns the top-most `modal()` window currently shown.

This is the most recently shown() window with `modal()` true, or NULL if there are no `modal()` windows shown(). The `modal()` window has its `handle()` method called for all events, and no other windows will have `handle()` called (`grab()` overrides this).

### 32.2.2.7 next\_window()

```
Fl_Window * Fl::next_window (
 const Fl_Window * window) [static]
```

Returns the next top-level window in the list of shown() windows.

You can use this call to iterate through all the windows that are shown().

#### Parameters

in	<code>window</code>	must be shown and not NULL
----	---------------------	----------------------------

### 32.2.2.8 set\_atclose()

```
static void Fl::set_atclose (
 Fl_Atclose_Handler f) [inline], [static]
```

For back compatibility, sets the `Fl::atclose` handler callback.

You can now simply change the callback for the window instead.

See also

[Fl\\_Window::callback\(Fl\\_Callback\\*\)](#)

## 32.2.3 Variable Documentation

### 32.2.3.1 atclose

```
void(* Fl::atclose)(Fl_Window *, void *)=default_atclose [static], [default]
```

Back compatibility: default window callback handler.

See also

[Fl::set\\_atclose\(\)](#)

## 32.3 Events handling functions

Fl class events handling API declared in `<FL/Fl.H>`

### Functions

- static void [Fl::add\\_handler](#) ([Fl\\_Event\\_Handler](#) ha)
  - Install a function to parse unrecognized events.*
- static void [Fl::add\\_handler](#) ([Fl\\_Event\\_Handler](#) ha, [Fl\\_Event\\_Handler](#) before)

- Install a function to parse unrecognized events with less priority than another function.*

  - static void `Fl::add_system_handler` (`Fl_System_Handler` h, void \*data)
- Install a function to intercept system events.*

  - static `Fl_Widget *` `Fl::belowmouse` ()

*Gets the widget that is below the mouse.*

  - static void `Fl::belowmouse` (`Fl_Widget *`)

*Sets the widget that is below the mouse.*

  - static `Fl_Callback_Reason` `Fl::callback_reason` ()

*Give the reason for calling a callback.*

  - static int `Fl::compose` (int &del)

*Any text editing widget should call this for each `FL_KEYBOARD` event.*

  - static void `Fl::compose_reset` ()

*If the user moves the cursor, be sure to call `Fl::compose_reset()`.*

  - static void `Fl::disable_im` ()

*Disables the system input methods facilities.*

  - static void `Fl::enable_im` ()

*Enables the system input methods facilities.*

  - static int `Fl::event` ()

*Returns the last event that was processed.*

  - static int `Fl::event_alt` ()

*Returns non-zero if the Alt key is pressed.*

  - static int `Fl::event_button` ()

*Gets which particular mouse button caused the current event.*

  - static int `Fl::event_button1` ()

*Returns non-zero if mouse button 1 is currently held down.*

  - static int `Fl::event_button2` ()

*Returns non-zero if button 2 is currently held down.*

  - static int `Fl::event_button3` ()

*Returns non-zero if button 3 is currently held down.*

  - static int `Fl::event_buttons` ()

*Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.*

  - static int `Fl::event_clicks` ()

*Returns non zero if we had a double click event.*

  - static void `Fl::event_clicks` (int i)

*Manually sets the number returned by `Fl::event_clicks()`.*

  - static void \* `Fl::event_clipboard` ()

*During an `FL_PASTE` event of non-textual data, returns a pointer to the pasted data.*

  - static const char \* `Fl::event_clipboard_type` ()

*Returns the type of the pasted data during an `FL_PASTE` event.*

  - static int `Fl::event_command` ()

*Returns non-zero if the `FL_COMMAND` key is pressed, either `FL_CTRL` or on OSX `FL_META`.*

  - static int `Fl::event_ctrl` ()

*Returns non-zero if the Control key is pressed.*

  - static `Fl_Event_Dispatch` `Fl::event_dispatch` ()

*Return the current event dispatch function.*

  - static void `Fl::event_dispatch` (`Fl_Event_Dispatch` d)

*Set a new event dispatch function.*

  - static int `Fl::event_dx` ()

*Returns the current horizontal mouse scrolling associated with the `FL_MOUSEWHEEL` event.*

  - static int `Fl::event_dy` ()

*Returns the current vertical mouse scrolling associated with the `FL_MOUSEWHEEL` event.*

- static int `Fl::event_inside` (const `Fl_Widget *`)  
*Returns whether or not the mouse event is inside a given child widget.*
- static int `Fl::event_inside` (int, int, int, int)  
*Returns whether or not the mouse event is inside the given rectangle.*
- static int `Fl::event_is_click` ()  
*Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last `FL_PUSH` or `FL_KEYBOARD` event for it to be considered a "drag" rather than a "click".*
- static void `Fl::event_is_click` (int i)  
*Clears the value returned by `Fl::event_is_click()`.*
- static int `Fl::event_key` ()  
*Gets which key on the keyboard was last pushed.*
- static int `Fl::event_key` (int key)  
*Returns true if the given `key` was held down (or pressed) during the last event.*
- static int `Fl::event_length` ()  
*Returns the length of the text in `Fl::event_text()`.*
- static int `Fl::event_original_key` ()  
*Returns the keycode of the last key event, regardless of the NumLock state.*
- static int `Fl::event_shift` ()  
*Returns non-zero if the Shift key is pressed.*
- static int `Fl::event_state` ()  
*Returns the keyboard and mouse button states of the last event.*
- static int `Fl::event_state` (int mask)  
*Returns non-zero if any of the passed event state bits are turned on.*
- static const char \* `Fl::event_text` ()  
*Returns the text associated with the current event, including `FL_PASTE` or `FL_DND_RELEASE` events.*
- static int `Fl::event_x` ()  
*Returns the mouse position of the event relative to the `Fl_Window` it was passed to.*
- static int `Fl::event_x_root` ()  
*Returns the mouse position on the screen of the event.*
- static int `Fl::event_y` ()  
*Returns the mouse position of the event relative to the `Fl_Window` it was passed to.*
- static int `Fl::event_y_root` ()  
*Returns the mouse position on the screen of the event.*
- static `Fl_Widget *` `Fl::focus` ()  
*Gets the current `Fl::focus()` widget.*
- static void `Fl::focus` (`Fl_Widget *`)  
*Sets the widget that will receive `FL_KEYBOARD` events.*
- static int `Fl::get_key` (int key)  
*Returns true if the given `key` is held down now.*
- static void `Fl::get_mouse` (int &, int &)  
*Return where the mouse is on the screen by doing a round-trip query to the server.*
- static int `Fl::handle` (int, `Fl_Window *`)  
*Handle events from the window system.*
- static int `Fl::handle_` (int, `Fl_Window *`)  
*Handle events from the window system.*
- static `Fl_Event_Handler` `Fl::last_handler` ()  
*Returns the last function installed by a call to `Fl::add_handler()`*
- static `Fl_Widget *` `Fl::pushed` ()  
*Gets the widget that is being pushed.*
- static void `Fl::pushed` (`Fl_Widget *`)  
*Sets the widget that is being pushed.*

- static void [Fl::remove\\_handler](#) ([Fl\\_Event\\_Handler](#) h)  
*Removes a previously added event handler.*
- static void [Fl::remove\\_system\\_handler](#) ([Fl\\_System\\_Handler](#) h)  
*Removes a previously added system event handler.*
- static int [Fl::test\\_shortcut](#) ([Fl\\_Shortcut](#))  
*Tests the current event, which must be an [FL\\_KEYBOARD](#) or [FL\\_SHORTCUT](#), against a shortcut value (described in [Fl\\_Button](#)).*

## Variables

*This is an array of font names you can use to convert font numbers into names.*

### 32.3.1 Detailed Description

[Fl](#) class events handling API declared in [<FL/Fl.H>](#)

### 32.3.2 Function Documentation

#### 32.3.2.1 [add\\_handler\(\)](#) [1/2]

```
void Fl::add_handler (
 Fl_Event_Handler ha) [static]
```

Install a function to parse unrecognized events.

If FLTK cannot figure out what to do with an event, it calls each of these functions (most recent first) until one of them returns non-zero. If none of them returns non-zero then the event is ignored. Events that cause this to be called are:

- [FL\\_SHORTCUT](#) events that are not recognized by any widget. This lets you provide global shortcut keys.
- [FL\\_SCREEN\\_CONFIGURATION\\_CHANGED](#) events. Under X11, this event requires the libXrandr.so shared library to be loadable at run-time and the X server to implement the RandR extension.
- [FL\\_ZOOM\\_EVENT](#) events.
- System events that FLTK does not recognize. See [fl\\_xevent](#).
- *Some* other events when the widget FLTK selected returns zero from its [handle\(\)](#) method. Exactly which ones may change in future versions, however.

See also

[Fl::remove\\_handler\(Fl\\_Event\\_Handler\)](#)  
[Fl::event\\_dispatch\(Fl\\_Event\\_Dispatch d\)](#)  
[Fl::handle\(int, Fl\\_Window\\*\)](#)

### 32.3.2.2 `add_handler()` [2/2]

```
void Fl::add_handler (
 Fl_Event_Handler ha,
 Fl_Event_Handler before) [static]
```

Install a function to parse unrecognized events with less priority than another function.

Install function `ha` to handle unrecognized events giving it the priority just lower than that of function `before` which was previously installed.

See also

[Fl::add\\_handler\(Fl\\_Event\\_Handler\)](#)

[Fl::last\\_handler\(\)](#)

### 32.3.2.3 `add_system_handler()`

```
void Fl::add_system_handler (
 Fl_System_Handler ha,
 void * data) [static]
```

Install a function to intercept system events.

FLTK calls each of these functions as soon as a new system event is received. The processing will stop at the first function to return non-zero. If all functions return zero then the event is passed on for normal handling by FLTK.

Each function will be called with a pointer to the system event as the first argument and `data` as the second argument. The system event pointer will always be `void *`, but will point to different objects depending on the platform:

- X11: XEvent
- Windows: MSG
- OS X: NSEvent
- Wayland: not implemented

Parameters

<i>ha</i>	The event handler function to register
<i>data</i>	User data to include on each call

See also

[Fl::remove\\_system\\_handler\(Fl\\_System\\_Handler\)](#)

### 32.3.2.4 `belowmouse()` [1/2]

```
static Fl_Widget * Fl::belowmouse () [inline], [static]
```

Gets the widget that is below the mouse.

See also

[belowmouse\(Fl\\_Widget\\*\)](#)

### 32.3.2.5 `belowmouse()` [2/2]

```
void Fl::belowmouse (
 Fl_Widget * o) [static]
```

Sets the widget that is below the mouse.

This is for highlighting buttons. It is not used to send FL\_PUSH or FL\_MOVE directly, for several obscure reasons, but those events typically go to this widget. This is also the first widget tried for FL\_SHORTCUT events.

If you change the belowmouse widget, the previous one and all parents (that don't contain the new widget) are sent FL\_LEAVE events. Changing this does *not* send FL\_ENTER to this or any widget, because sending FL\_ENTER is supposed to *test* if the widget wants the mouse (by it returning non-zero from [handle\(\)](#)).

### 32.3.2.6 callback\_reason()

```
Fl_Callback_Reason Fl::callback_reason () [static]
```

Give the reason for calling a callback.

Returns

the reason for the current callback

See also

[Fl\\_Widget::when\(\)](#), [Fl\\_Widget::do\\_callback\(\)](#), [Fl\\_Widget::callback\(\)](#)

### 32.3.2.7 compose()

```
int Fl::compose (
 int & del) [static]
```

Any text editing widget should call this for each FL\_KEYBOARD event.

Use of this function is very simple.

If *true* is returned, then it has modified the [Fl::event\\_text\(\)](#) and [Fl::event\\_length\(\)](#) to a set of *bytes* to insert (it may be of zero length!). It will also set the "del" parameter to the number of *bytes* to the left of the cursor to delete, this is used to delete the results of the previous call to [Fl::compose\(\)](#).

If *false* is returned, the keys should be treated as function keys, and del is set to zero. You could insert the text anyways, if you don't know what else to do.

Text editing widgets can preferentially call [fl\\_set\\_spot\(\)](#) to indicate the window coordinates of the bottom of the current insertion point and the line height. This way, auxiliary windows that help choosing among alternative characters with some text input methods appear just below or above the insertion point. If widgets don't do that, such auxiliary windows appear at the widget's bottom.

On some platforms, text can involve marked text, that is, temporary text replaced by other text during the input process. This occurs, e.g., under Wayland or macOS when using dead keys or when entering CJK characters. Text editing widgets should preferentially signal marked text, usually underlining it. Widgets can use `int Fl::compose_state` after having called [Fl::compose\(int&\)](#) to obtain the length in bytes of marked text that always finishes at the current insertion point. Widgets should also call `void fl_reset_spot()` when processing FL\_UNFOCUS events. The [Fl\\_Input](#) and [Fl\\_Text\\_Editor](#) widgets underline marked text. If none of this is done by a user-defined text editing widget, text input will work, but will not signal to the user what text is marked.

Finally, text editing widgets should call `set_flag(MAC_USE_ACCENTS_MENU)`; in their constructor if they want to use, on the macOS platform, the feature introduced with Mac OS 10.7 "Lion" where pressing and holding certain keys on the keyboard opens a diacritic marks popup window.

Note

For compatibility with FLTK 1.3, text editing widgets can call `Fl::insertion_point_location(int x, int y, int height)` and `Fl::reset_marked_text()` only under the macOS platform to indicate/reset the coordinates of the current insertion point. This is deprecated in version 1.4 because redundant with the platform-independent [fl\\_set\\_spot\(\)](#) and [fl\\_reset\\_spot\(\)](#) functions.

### 32.3.2.8 compose\_reset()

```
void Fl::compose_reset () [static]
```

If the user moves the cursor, be sure to call [Fl::compose\\_reset\(\)](#).

The next call to [Fl::compose\(\)](#) will start out in an initial state. In particular it will not set "del" to non-zero. This call is very fast so it is ok to call it many times and in many places.

**32.3.2.9 disable\_im()**

```
void Fl::disable_im () [static]
```

Disables the system input methods facilities.

See also

[enable\\_im\(\)](#)

**32.3.2.10 enable\_im()**

```
void Fl::enable_im () [static]
```

Enables the system input methods facilities.

This is the default.

See also

[disable\\_im\(\)](#)

**32.3.2.11 event()**

```
static int Fl::event () [inline], [static]
```

Returns the last event that was processed.

This can be used to determine if a callback is being done in response to a keypress, mouse click, etc.

**32.3.2.12 event\_button()**

```
static int Fl::event_button () [inline], [static]
```

Gets which particular mouse button caused the current event.

This returns garbage if the most recent event was not a FL\_PUSH or FL\_RELEASE event.

Return values

<i>FL_LEFT_MOUSE</i>	
<i>FL_MIDDLE_MOUSE</i>	
<i>FL_RIGHT_MOUSE.</i>	

See also

[Fl::event\\_buttons\(\)](#)

**32.3.2.13 event\_button1()**

```
static int Fl::event_button1 () [inline], [static]
```

Returns non-zero if mouse button 1 is currently held down.

For more details, see [Fl::event\\_buttons\(\)](#).

**32.3.2.14 event\_button2()**

```
static int Fl::event_button2 () [inline], [static]
```

Returns non-zero if button 2 is currently held down.

For more details, see [Fl::event\\_buttons\(\)](#).

**32.3.2.15 event\_button3()**

```
static int Fl::event_button3 () [inline], [static]
```

Returns non-zero if button 3 is currently held down.  
For more details, see [Fl::event\\_buttons\(\)](#).

### 32.3.2.16 event\_buttons()

```
static int Fl::event_buttons () [inline], [static]
```

Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.

This function returns the button state at the time of the event. During an FL\_RELEASE event, the state of the released button will be 0. To find out, which button caused an FL\_RELEASE event, you can use [Fl::event\\_button\(\)](#) instead.

#### Returns

a bit mask value like { [FL\_BUTTON1] | [FL\_BUTTON2] | [FL\_BUTTON3] }

### 32.3.2.17 event\_clicks() [1/2]

```
static int Fl::event_clicks () [inline], [static]
```

Returns non zero if we had a double click event.

#### Return values

<i>Non-zero</i>	if the most recent FL_PUSH or FL_KEYBOARD was a "double click".
<i>N-1</i>	for N clicks. A double click is counted if the same button is pressed again while <a href="#">event_is_click()</a> is true.

### 32.3.2.18 event\_clicks() [2/2]

```
static void Fl::event_clicks (
 int i) [inline], [static]
```

Manually sets the number returned by [Fl::event\\_clicks\(\)](#).

This can be used to set it to zero so that later code does not think an item was double-clicked.

#### Parameters

in	<i>i</i>	corresponds to no double-click if 0, i+1 mouse clicks otherwise
----	----------	-----------------------------------------------------------------

#### See also

int [event\\_clicks\(\)](#)

### 32.3.2.19 event\_clipboard()

```
static void * Fl::event_clipboard () [inline], [static]
```

During an FL\_PASTE event of non-textual data, returns a pointer to the pasted data.

The returned data is an [Fl\\_RGB\\_Image](#) \* when the result of [Fl::event\\_clipboard\\_type\(\)](#) is [Fl::clipboard\\_image](#).

### 32.3.2.20 event\_clipboard\_type()

```
static const char * Fl::event_clipboard_type () [inline], [static]
```

Returns the type of the pasted data during an FL\_PASTE event.

This type can be [Fl::clipboard\\_plain\\_text](#) or [Fl::clipboard\\_image](#).

### 32.3.2.21 event\_dispatch()

```
void Fl::event_dispatch (
 Fl_Event_Dispatch d) [static]
```

Set a new event dispatch function.

The event dispatch function is called after native events are converted to FLTK events, but before they are handled by FLTK. If the dispatch function `Fl_Event_Dispatch d` is set, it is up to the dispatch function to call `Fl::handle_(int, Fl_Window*)` or to ignore the event.

The dispatch function itself must return 0 if it ignored the event, or non-zero if it used the event. If you call `Fl::handle_()`, then this will return the correct value.

The event dispatch can be used to handle exceptions in FLTK events and callbacks before they reach the native event handler:

```
int myHandler(int e, Fl_Window *w) {
 try {
 return Fl::handle_(e, w);
 } catch () {
 ...
 }
}
main() {
 Fl::event_dispatch(myHandler);
 ...
 Fl::run();
}
```

#### Parameters

<i>d</i>	new dispatch function, or NULL
----------	--------------------------------

#### See also

[Fl::add\\_handler\(Fl\\_Event\\_Handler\)](#)

[Fl::handle\(int, Fl\\_Window\\*\)](#)

[Fl::handle\\_\(int, Fl\\_Window\\*\)](#)

### 32.3.2.22 event\_dx()

```
static int Fl::event_dx () [inline], [static]
```

Returns the current horizontal mouse scrolling associated with the `FL_MOUSEWHEEL` event.

Right is positive.

### 32.3.2.23 event\_dy()

```
static int Fl::event_dy () [inline], [static]
```

Returns the current vertical mouse scrolling associated with the `FL_MOUSEWHEEL` event.

Down is positive.

### 32.3.2.24 event\_inside() [1/2]

```
int Fl::event_inside (
 const Fl_Widget * o) [static]
```

Returns whether or not the mouse event is inside a given child widget.

Returns non-zero if the current `Fl::event_x()` and `Fl::event_y()` put it inside the given child widget's bounding box.

This method can only be used to check whether the mouse event is inside a **child** widget of the window that handles the event, and there must not be an intermediate subwindow (i.e. the widget must not be inside a subwindow of the current window). However, it is valid if the widget is inside a nested `Fl_Group`.

You must not use it with the window itself as the `o` argument in a window's `handle()` method.

**Note**

The mentioned restrictions are necessary, because this method does not transform coordinates of child widgets, and thus the given widget `o` must be within the *same* window that is handling the current event. Otherwise the results are undefined.

You should always call this rather than doing your own comparison so you are consistent about edge effects.

**See also**

[Fl::event\\_inside\(int, int, int, int\)](#)

**Parameters**

<code>in</code>	<code>o</code>	child widget to be tested
-----------------	----------------	---------------------------

**Returns**

non-zero, if mouse event is inside the widget

**32.3.2.25 event\_inside() [2/2]**

```
int Fl::event_inside (
 int xx,
 int yy,
 int ww,
 int hh) [static]
```

Returns whether or not the mouse event is inside the given rectangle.

Returns non-zero if the current [Fl::event\\_x\(\)](#) and [Fl::event\\_y\(\)](#) put it inside the given arbitrary bounding box.

You should always call this rather than doing your own comparison so you are consistent about edge effects.

To find out, whether the event is inside a child widget of the current window, you can use [Fl::event\\_inside\(const Fl\\_Widget \\*\)](#).

**Parameters**

<code>in</code>	<code>xx,yy,ww,hh</code>	bounding box
-----------------	--------------------------	--------------

**Returns**

non-zero, if mouse event is inside

**32.3.2.26 event\_is\_click() [1/2]**

```
static int Fl::event_is_click () [inline], [static]
```

Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last `FL_PUSH` or `FL_KEYBOARD` event for it to be considered a "drag" rather than a "click".

You can test this on `FL_DRAG`, `FL_RELEASE`, and `FL_MOVE` events.

**32.3.2.27 event\_is\_click() [2/2]**

```
static void Fl::event_is_click (
 int i) [inline], [static]
```

Clears the value returned by [Fl::event\\_is\\_click\(\)](#).

Useful to prevent the *next* click from being counted as a double-click or to make a popup menu pick an item with a single click. Don't pass non-zero to this.

**32.3.2.28 event\_key()** [1/2]

```
static int Fl::event_key () [inline], [static]
```

Gets which key on the keyboard was last pushed.

The returned integer 'key code' is not necessarily a text equivalent for the keystroke. For instance: if someone presses '5' on the numeric keypad with numlock on, [Fl::event\\_key\(\)](#) may return the 'key code' for this key, and NOT the character '5'. To always get the '5', use [Fl::event\\_text\(\)](#) instead.

**Returns**

an integer 'key code', or 0 if the last event was not a key press or release.

**See also**

int [event\\_key\(int\)](#), [event\\_text\(\)](#), [compose\(int&\)](#).

**32.3.2.29 event\_key()** [2/2]

```
int Fl::event_key (
 int key) [static]
```

Returns true if the given *key* was held down (or pressed) *during* the last event.

This is constant until the next event is read from the server.

[Fl::get\\_key\(int\)](#) returns true if the given key is held down *now*. Under X this requires a round-trip to the server and is *much* slower than [Fl::event\\_key\(int\)](#).

Keys are identified by the *unshifted* values. FLTK defines a set of symbols that should work on most modern machines for every key on the keyboard:

- All keys on the main keyboard producing a printable ASCII character use the value of that ASCII character (as though shift, ctrl, and caps lock were not on). The space bar is 32.
- All keys on the numeric keypad producing a printable ASCII character use the value of that ASCII character plus FL\_KP (e.g., FL\_KP + '4', FL\_KP + '/'). The highest possible value is FL\_KP\_Last so you can range-check to see if something is on the keypad.
- All numbered function keys use the number on the function key plus FL\_F. The highest possible number is FL\_F\_Last, so you can range-check a value.
- Buttons on the mouse are considered keys, and use the button number (where the left button is 1) plus FL\_Button.
- All other keys on the keypad have a symbol: FL\_Escape, FL\_BackSpace, FL\_Tab, FL\_Enter, FL\_Print, FL\_↵\_Scroll\_Lock, FL\_Pause, FL\_Insert, FL\_Home, FL\_Page\_Up, FL\_Delete, FL\_End, FL\_Page\_Down, FL\_Left, FL\_Up, FL\_Right, FL\_Down, FL\_Iso\_Key, FL\_Shift\_L, FL\_Shift\_R, FL\_Control\_L, FL\_Control\_R, FL\_Caps\_↵\_Lock, FL\_Alt\_L, FL\_Alt\_R, FL\_Meta\_L, FL\_Meta\_R, FL\_Menu, FL\_Num\_Lock, FL\_KP\_Enter. Be careful not to confuse these with the very similar, but all-caps, symbols used by [Fl::event\\_state\(\)](#).

On X [Fl::get\\_key\(FL\\_Button+n\)](#) does not work.

On Windows [Fl::get\\_key\(FL\\_KP\\_Enter\)](#) and [Fl::event\\_key\(FL\\_KP\\_Enter\)](#) do not work.

**32.3.2.30 event\_length()**

```
static int Fl::event_length () [inline], [static]
```

Returns the length of the text in [Fl::event\\_text\(\)](#).

There will always be a nul at this position in the text. However there may be a nul before that if the keystroke translates to a nul character or you paste a nul character.

**32.3.2.31 event\_original\_key()**

```
static int Fl::event_original_key () [inline], [static]
```

Returns the keycode of the last key event, regardless of the NumLock state.

If NumLock is deactivated, FLTK translates events from the numeric keypad into the corresponding arrow key events. [event\\_key\(\)](#) returns the translated key code, whereas [event\\_original\\_key\(\)](#) returns the keycode before NumLock translation.

### 32.3.2.32 `event_state()` [1/2]

```
static int Fl::event_state () [inline], [static]
```

Returns the keyboard and mouse button states of the last event.

This is a bitfield of what shift states were on and what mouse buttons were held down during the most recent event. The legal event state bits are:

- `FL_SHIFT`
- `FL_CAPS_LOCK`
- `FL_CTRL`
- `FL_ALT`
- `FL_NUM_LOCK`
- `FL_META`
- `FL_SCROLL_LOCK`
- `FL_BUTTON1`
- `FL_BUTTON2`
- `FL_BUTTON3`

#### Note

FLTK platforms differ in what `Fl::event_state()` returns when it is called while a modifier key is being pressed or released. Under X11 and Wayland, `Fl::event_state()` indicates the state of the modifier keys just **prior** to the event. Thus, during the `FL_KEYDOWN` event generated when pressing the shift key, for example, the `FL_↔SHIFT` bit of `event_state()` is 0 and becomes 1 only at the next event (which can be another `FL_KEYDOWN`, `FL_DRAG` or `FL_KEYUP`). Under other platforms, the reported state of modifier keys includes that of the key being pressed or released. Notice that `Fl::event_state()` returns the same value under all platforms when it's called while a non-modifier key (e.g., a letter, a function key) is being pressed or released. X servers do not agree on shift states, and `FL_NUM_LOCK`, `FL_META`, and `FL_SCROLL_LOCK` may not work. The values were selected to match the XFree86 server on Linux.

### 32.3.2.33 `event_state()` [2/2]

```
static int Fl::event_state (
 int mask) [inline], [static]
```

Returns non-zero if any of the passed event state bits are turned on.

Use `mask` to pass the event states you're interested in. The legal event state bits are defined in `Fl::event_state()`.

### 32.3.2.34 `event_text()`

```
static const char * Fl::event_text () [inline], [static]
```

Returns the text associated with the current event, including `FL_PASTE` or `FL_DND_RELEASE` events.

This can be used in response to `FL_KEYUP`, `FL_KEYDOWN`, `FL_PASTE`, and `FL_DND_RELEASE`.

When responding to `FL_KEYUP`/`FL_KEYDOWN`, use this function instead of `Fl::event_key()` to get the text equivalent of keystrokes suitable for inserting into strings and text widgets.

The returned string is guaranteed to be NULL terminated. However, see `Fl::event_length()` for the actual length of the string, in case the string itself contains NULLs that are part of the text data.

#### Returns

A NULL terminated text string equivalent of the last keystroke.

**32.3.2.35 event\_x\_root()**

```
static int Fl::event_x_root () [inline], [static]
```

Returns the mouse position on the screen of the event.

To find the absolute position of an [Fl\\_Window](#) on the screen, use the difference between [event\\_x\\_root\(\)](#), [event\\_y\\_root\(\)](#) and [event\\_x\(\)](#), [event\\_y\(\)](#).

**32.3.2.36 event\_y\_root()**

```
static int Fl::event_y_root () [inline], [static]
```

Returns the mouse position on the screen of the event.

To find the absolute position of an [Fl\\_Window](#) on the screen, use the difference between [event\\_x\\_root\(\)](#), [event\\_y\\_root\(\)](#) and [event\\_x\(\)](#), [event\\_y\(\)](#).

**32.3.2.37 focus() [1/2]**

```
static Fl_Widget * Fl::focus () [inline], [static]
```

Gets the current [Fl::focus\(\)](#) widget.

See also

[Fl::focus\(Fl\\_Widget\\*\)](#)

**32.3.2.38 focus() [2/2]**

```
void Fl::focus (
 Fl_Widget * o) [static]
```

Sets the widget that will receive `FL_KEYBOARD` events.

Use this function inside the `handle(int)` member function of a widget of yours to give focus to the widget, for example when it receives the `FL_FOCUS` or the `FL_PUSH` event. Otherwise, use [Fl\\_Widget::take\\_focus\(\)](#) to give focus to a widget;

If you change [Fl::focus\(\)](#), the previous widget and all parents (that don't contain the new widget) are sent `FL_↔UNFOCUS` events. Changing the focus does *not* send `FL_FOCUS` to this or any widget, because sending `FL_↔FOCUS` is supposed to *test* if the widget wants the focus (by it returning non-zero from [handle\(\)](#)).

Widgets can set the `NEEDS_KEYBOARD` flag to indicate that a keyboard is essential for the widget to function. Touchscreen devices will be sent a request to show an on-screen keyboard if no hardware keyboard is connected.

See also

[Fl\\_Widget::take\\_focus\(\)](#)

[Fl\\_Widget::needs\\_keyboard\(\) const](#)

[Fl\\_Widget::needs\\_keyboard\(bool\)](#)

**32.3.2.39 get\_key()**

```
int Fl::get_key (
 int key) [static]
```

Returns true if the given `key` is held down *now*.

Under X this requires a round-trip to the server and is *much* slower than [Fl::event\\_key\(int\)](#).

See also

[event\\_key\(int\)](#)

**32.3.2.40 get\_mouse()**

```
void Fl::get_mouse (
 int & x,
 int & y) [static]
```

Return where the mouse is on the screen by doing a round-trip query to the server.

You should use [Fl::event\\_x\\_root\(\)](#) and [Fl::event\\_y\\_root\(\)](#) if possible, but this is necessary if you are not sure if a mouse event has been processed recently (such as to position your first window). If the display is not open, this will open it.

**32.3.2.41 handle()**

```
int Fl::handle (
 int e,
 Fl_Window * window) [static]
```

Handle events from the window system.

This is called from the native event dispatch after native events have been converted to FLTK notation. This function calls [Fl::handle\\_\(int, Fl\\_Window\\*\)](#) unless the user sets a dispatch function. If a user dispatch function is set, the user must make sure that [Fl::handle\\_\(\)](#) is called, or the event will be ignored.

**Parameters**

<i>e</i>	the event type ( <a href="#">Fl::event_number()</a> is not yet set)
<i>window</i>	the window that caused this event

**Returns**

0 if the event was not handled

**See also**

[Fl::add\\_handler\(Fl\\_Event\\_Handler\)](#)

[Fl::event\\_dispatch\(Fl\\_Event\\_Dispatch\)](#)

**32.3.2.42 handle\_()**

```
int Fl::handle_ (
 int e,
 Fl_Window * window) [static]
```

Handle events from the window system.

This function is called from the native event dispatch, unless the user sets another dispatch function. In that case, the user dispatch function must decide when to call [Fl::handle\\_\(int, Fl\\_Window\\*\)](#)

Callbacks can set `FL_REASON_CLOSED` and `FL_REASON_CANCELLED`.

**Parameters**

<i>e</i>	the event type ( <a href="#">Fl::event_number()</a> is not yet set)
<i>window</i>	the window that caused this event

**Returns**

0 if the event was not handled

**See also**

[Fl::event\\_dispatch\(Fl\\_Event\\_Dispatch\)](#)

**32.3.2.43 pushed()** [1/2]

```
static Fl_Widget * Fl::pushed () [inline], [static]
```

Gets the widget that is being pushed.

See also

[void pushed\(Fl\\_Widget\\*\)](#)

**32.3.2.44 pushed()** [2/2]

```
void Fl::pushed (
 Fl_Widget * o) [static]
```

Sets the widget that is being pushed.

FL\_DRAG or FL\_RELEASE (and any more FL\_PUSH) events will be sent to this widget.

If you change the pushed widget, the previous one and all parents (that don't contain the new widget) are sent FL\_RELEASE events. Changing this does *not* send FL\_PUSH to this or any widget, because sending FL\_PUSH is supposed to *test* if the widget wants the mouse (by it returning non-zero from [handle\(\)](#)).

**32.3.2.45 remove\_handler()**

```
void Fl::remove_handler (
 Fl_Event_Handler ha) [static]
```

Removes a previously added event handler.

See also

[Fl::handle\(int, Fl\\_Window\\*\)](#)

**32.3.2.46 remove\_system\_handler()**

```
void Fl::remove_system_handler (
 Fl_System_Handler ha) [static]
```

Removes a previously added system event handler.

Parameters

<i>ha</i>	The event handler function to remove
-----------	--------------------------------------

See also

[Fl::add\\_system\\_handler\(Fl\\_System\\_Handler\)](#)

**32.3.2.47 test\_shortcut()**

```
int Fl::test_shortcut (
 Fl_Shortcut shortcut) [static]
```

Tests the current event, which must be an FL\_KEYBOARD or FL\_SHORTCUT, against a shortcut value (described in [Fl\\_Button](#)).

Not to be confused with [Fl\\_Widget::test\\_shortcut\(\)](#).

Returns

non-zero if there is a match.

**32.3.3 Variable Documentation**

### 32.3.3.1 fl\_callback\_reason\_names

```
const char* const fl_callback_reason_names[]
```

**Initial value:**

```
=
{
 "FL_REASON_UNKNOWN",
 "FL_REASON_SELECTED",
 "FL_REASON_DESELECTED",
 "FL_REASON_RESELECTED",
 "FL_REASON_OPENED",
 "FL_REASON_CLOSED",
 "FL_REASON_DRAGGED",
 "FL_REASON_CANCELLED",
 "FL_REASON_CHANGED",
 "FL_REASON_GOT_FOCUS",
 "FL_REASON_LOST_FOCUS",
 "FL_REASON_RELEASED",
 "FL_REASON_ENTER_KEY",
 NULL, NULL, NULL,
 NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL,
 NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL,
 "FL_REASON_USER", "FL_REASON_USER+1", "FL_REASON_USER+2", "FL_REASON_USER+3",
}
```

This is an array of callback reason names you can use to convert font numbers into names.

The array gets defined inline wherever your '#include <FL/names.h>' appears.

### 32.3.3.2 fl\_eventnames

```
const char* const fl_eventnames[]
```

This is an array of event names you can use to convert event numbers into names.

The array gets defined inline wherever your '#include <FL/names.h>' appears.

**Example:**

```
#include <FL/names.h> // array will be defined here
int MyClass::handle(int e) {
 printf("Event was %s (%d)\n", fl_eventnames[e], e);
 // ..resulting output might be e.g. "Event was FL_PUSH (1)"..
 [...]
}
```

### 32.3.3.3 fl\_fontnames

```
const char* const fl_fontnames[]
```

**Initial value:**

```
=
{
 "FL_HELVETICA",
 "FL_HELVETICA_BOLD",
 "FL_HELVETICA_ITALIC",
 "FL_HELVETICA_BOLD_ITALIC",
 "FL_COURIER",
 "FL_COURIER_BOLD",
 "FL_COURIER_ITALIC",
 "FL_COURIER_BOLD_ITALIC",
 "FL_TIMES",
 "FL_TIMES_BOLD",
 "FL_TIMES_ITALIC",
 "FL_TIMES_BOLD_ITALIC",
 "FL_SYMBOL",
 "FL_SCREEN",
 "FL_SCREEN_BOLD",
 "FL_ZAPF_DINGBATS",
}
```

This is an array of font names you can use to convert font numbers into names.

The array gets defined inline wherever your '#include <FL/names.h>' appears.

**Example:**

```
#include <FL/names.h> // array will be defined here
int MyClass::my_callback(Fl_Widget *w, void*) {
 int fnum = w->labelfont();
 // Resulting output might be e.g. "Label's font is FL_HELVETICA (0)"
 printf("Label's font is %s (%d)\n", fl_fontnames[fnum], fnum);
 // ..resulting output might be e.g. "Label's font is FL_HELVETICA (0)"..
 [...]
}
```

## 32.4 Selection & Clipboard functions

FLTK global copy/cut/paste functions declared in <FL/FL.H>

### Functions

- static void `Fl::add_clipboard_notify` (`Fl_Clipboard_Notify_Handler` h, void \*data=0)  
*FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.*
- static int `Fl::clipboard_contains` (const char \*type)  
*Returns non 0 if the clipboard contains data matching type.*
- static void `Fl::copy` (const char \*stuff, int len, int destination=0, const char \*type=`Fl::clipboard_plain_text`)  
*Copies the data pointed to by stuff to the selection buffer (destination is 0), the clipboard (destination is 1), or both (destination is 2).*
- static int `Fl::dnd` ()  
*Initiate a Drag And Drop operation.*
- static void `Fl::paste` (`Fl_Widget` &receiver)  
*Backward compatibility only.*
- static void `Fl::paste` (`Fl_Widget` &receiver, int source, const char \*type=`Fl::clipboard_plain_text`)  
*Pastes the data from the selection buffer (source is 0) or the clipboard (source is 1) into receiver.*
- static void `Fl::remove_clipboard_notify` (`Fl_Clipboard_Notify_Handler` h)  
*Stop calling the specified callback when there are changes to the selection buffer or the clipboard.*
- static void `Fl::selection` (`Fl_Widget` &owner, const char \*, int len)  
*Changes the current selection.*
- static `Fl_Widget *` `Fl::selection_owner` ()  
*back-compatibility only: Gets the widget owning the current selection*
- static void `Fl::selection_owner` (`Fl_Widget *`)  
*Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.*
- static int `Fl::selection_to_clipboard` ()  
*Returns the current selection\_to\_clipboard mode.*
- static void `Fl::selection_to_clipboard` (int mode)  
*Copies selections on X11 directly to the clipboard if enabled.*

### Variables

- static char const \*const `Fl::clipboard_image` = "image"  
*Denotes image data.*
- static char const \*const `Fl::clipboard_plain_text` = "text/plain"  
*Denotes plain textual data.*

#### 32.4.1 Detailed Description

FLTK global copy/cut/paste functions declared in <FL/FL.H>

#### 32.4.2 Function Documentation

### 32.4.2.1 add\_clipboard\_notify()

```
void Fl::add_clipboard_notify (
 Fl_Clipboard_Notify_Handler h,
 void * data = 0) [static]
```

FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard. The source argument indicates which of the two has changed. Only changes by other applications are reported.

Example:

```
void clip_callback(int source, void *data) {
 if (source == 0) printf("CLIP CALLBACK: selection buffer changed\n");
 if (source == 1) printf("CLIP CALLBACK: clipboard changed\n");
}
[...]
```

```
int main() {
 [...]
 Fl::add_clipboard_notify(clip_callback);
 [...]
}
```

#### Note

Some systems require polling to monitor the clipboard and may therefore have some delay in detecting changes.

### 32.4.2.2 clipboard\_contains()

```
int Fl::clipboard_contains (
 const char * type) [static]
```

Returns non 0 if the clipboard contains data matching `type`.

The clipboard can contain both text and image data; in that situation this function returns non 0 to both requests. This function is *not* meant to check whether the clipboard is empty. This function does not allow to query the selection buffer because FLTK allows to copy/paste non-textual data only from/to the clipboard.

#### Parameters

<code>type</code>	can be <a href="#">Fl::clipboard_plain_text</a> or <a href="#">Fl::clipboard_image</a> .
-------------------	------------------------------------------------------------------------------------------

### 32.4.2.3 copy()

```
void Fl::copy (
 const char * stuff,
 int len,
 int destination = 0,
 const char * type = Fl::clipboard_plain_text) [static]
```

Copies the data pointed to by `stuff` to the selection buffer (`destination` is 0), the clipboard (`destination` is 1), or both (`destination` is 2).

Copying to both is only relevant on X11, on other platforms it maps to the clipboard (1). `len` is the number of relevant bytes in `stuff`. `type` is always [Fl::clipboard\\_plain\\_text](#). The selection buffer is used for middle-mouse pastes and for drag-and-drop selections. The clipboard is used for traditional copy/cut/paste operations.

#### Note

This function is, at present, intended only to copy UTF-8 encoded textual data. To copy graphical data, use the [Fl\\_Copy\\_Surface](#) class. The `type` argument may allow in the future to copy other kinds of data. Copies data to the selection buffer, the clipboard, or both.

The `destination` can be:

- 0: selection buffer (see note below)
- 1: clipboard

- 2: both

The selection buffer exists only on the X11 platform and is used for middle-mouse pastes and for drag-and-drop selections. The clipboard is used for traditional copy/cut/paste operations. On all other platforms the selection buffer (`destination = 0`) is mapped to the clipboard, i.e. on platforms other than X11 all `destinations` are equivalent and the data is always copied to the clipboard.

#### Note

Please see `Fl::selection_to_clipboard()` to enable duplication of the selection buffer to the clipboard on X11, i.e. if `destination = 0` (selection buffer) **and** `Fl::selection_to_clipboard()` is enabled, then the data is copied to both the selection buffer and the clipboard. This makes the X11 behavior similar to other platforms but keeps the selection buffer for X11 specific inter process communication.

`type` should always be `Fl::clipboard_plain_text` which is the default. Other values are ignored and reserved for future extensions.

#### Note

This function is, at present, intended only to copy UTF-8 encoded textual data. To copy graphical data, use the `Fl_Copy_Surface` class. The `type` argument may allow to copy other kinds of data in the future.

#### Parameters

in	<i>stuff</i>	text data to be copied
in	<i>len</i>	the number of relevant bytes in <i>stuff</i>
in	<i>destination</i>	0 = selection, 1 = clipboard, 2 = both (see description)
in	<i>type</i>	usually plain text (see description)

#### 32.4.2.4 dnd()

```
int Fl::dnd () [static]
```

Initiate a Drag And Drop operation.

The selection buffer should be filled with relevant data before calling this method. FLTK will then initiate the system wide drag and drop handling. Dropped data will be marked as *text*.

Create a selection first using: `Fl::copy(const char *stuff, int len, 0)`

#### 32.4.2.5 paste() [1/2]

```
void Fl::paste (
 Fl_Widget & receiver) [static]
```

Backward compatibility only.

This calls `Fl::paste(receiver, 0)`;

See also

[Fl::paste\(Fl\\_Widget &receiver, int clipboard, const char\\* type\)](#)

#### 32.4.2.6 paste() [2/2]

```
void Fl::paste (
 Fl_Widget & receiver,
 int source,
 const char * type = Fl::clipboard_plain_text) [static]
```

Pastes the data from the selection buffer (`source` is 0) or the clipboard (`source` is 1) into `receiver`.

The selection buffer (`source` is 0) is used for middle-mouse pastes and for drag-and-drop selections. The clipboard (`source` is 1) is used for copy/cut/paste operations.

If `source` is 1, the optional `type` argument indicates what type of data is requested from the clipboard. At present, `Fl::clipboard_plain_text` (requesting text data) and `Fl::clipboard_image` (requesting image data) are possible. Set things up so the handle function of the `receiver` widget will be called with an `FL_PASTE` event some time in the future if the clipboard does contain data of the requested type.

The handle function of `receiver` can process the `FL_PASTE` event as follows:

- If the `receiver` widget is known to only receive text data, the text string from the specified `source` is in `Fl::event_text()` with UTF-8 encoding, and the number of bytes is in `Fl::event_length()`. If `Fl::paste()` gets called during the drop step of a files-drag-and-drop operation, `Fl::event_text()` contains a list of filenames (see [Drag and Drop Events](#)).
- If the `receiver` widget can potentially receive non-text data, use `Fl::event_clipboard_type()` to determine what sort of data is being sent. If `Fl::event_clipboard_type()` returns `Fl::clipboard_plain_text`, proceed as above. If it returns `Fl::clipboard_image`, the pointer returned by `Fl::event_clipboard()` can be safely cast to type `Fl_RGB_Image *` to obtain a pointer to the pasted image. If `receiver` accepts the clipboard image, `receiver.handle()` should return 1 and the application should take ownership of this image (that is, delete it after use). Conversely, if `receiver.handle()` returns 0, the application must not use the image.

The receiver should be prepared to be called *directly* by this, or for it to happen *later*, or possibly *not at all*. This allows the window system to take as long as necessary to retrieve the paste buffer (or even to screw up completely) without complex and error-prone synchronization code in FLTK.

Platform details for image data:

- Unix/Linux platform: Clipboard images in PNG or BMP formats are recognized. Requires linking with the `fltk_images` library.
- Windows platform: Both bitmap and vectorial (Enhanced metafile) data from clipboard can be pasted as image data.
- Mac OS X platform: Both bitmap (TIFF) and vectorial (PDF) data from clipboard can be pasted as image data.

### 32.4.2.7 selection()

```
void Fl::selection (
 Fl_Widget & owner,
 const char * text,
 int len) [static]
```

Changes the current selection.

The block of text is copied to an internal buffer by FLTK (be careful if doing this in response to an `FL_PASTE` as this *may* be the same buffer returned by `event_text()`). The `selection_owner()` widget is set to the passed owner.

### 32.4.2.8 selection\_owner() [1/2]

```
static Fl_Widget * Fl::selection_owner () [inline], [static]
```

back-compatibility only: Gets the widget owning the current selection

See also

```
Fl_Widget* selection_owner(Fl_Widget*)
```

### 32.4.2.9 selection\_owner() [2/2]

```
void Fl::selection_owner (
 Fl_Widget * owner) [static]
```

Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.

`FL_SELECTIONCLEAR` is sent to the previous selection owner, if any.

*Copying the buffer every time the selection is changed is obviously wasteful, especially for large selections. An interface will probably be added in a future version to allow the selection to be made by a callback function. The current interface will be emulated on top of this.*

### 32.4.2.10 selection\_to\_clipboard() [1/2]

```
static int Fl::selection_to_clipboard () [inline], [static]
```

Returns the current selection\_to\_clipboard mode.

See also

void [selection\\_to\\_clipboard\(int\)](#)

### 32.4.2.11 selection\_to\_clipboard() [2/2]

```
static void Fl::selection_to_clipboard (
 int mode) [inline], [static]
```

Copies selections on X11 directly to the clipboard if enabled.

This method can be called on all platforms. Other platforms than X11 are not affected by this feature.

If this is switched on (`mode = 1`), [Fl::copy\(\)](#) copies all data to the clipboard regardless of its `destination` argument. If the destination is 0 (selection buffer) data is copied to both the selection buffer and the clipboard.

Drag and drop is also affected since drag-and-drop data is copied to the selection buffer.

You can use this to make the experience of data selection and copying more like that on other platforms (Windows, macOS, and even Wayland).

The default operation mode is the standard X11 behavior (disabled).

Note

This feature is experimental and enabling it may have unexpected side effects. It is your own responsibility if you enable it.

Since

1.4.0

Parameters

in	<i>mode</i>	1 = enable selection_to_clipboard, 0 = disable selection_to_clipboard
----	-------------	-----------------------------------------------------------------------

See also

[copy\(const char \\*, int, int, const char \\*\)](#)

## 32.5 Screen functions

[Fl](#) global screen functions declared in [<FL/Fl.H>](#).

### Functions

- static int [Fl::h](#) ()  
*Returns the height in pixels of the main screen work area.*
- static void [Fl::keyboard\\_screen\\_scaling](#) (int value)  
*Controls the possibility to scale all windows by ctrl+/-/0/ or cmd+/-/0/.*
- static int [Fl::screen\\_count](#) ()  
*Gets the total count of available screens.*
- static void [Fl::screen\\_dpi](#) (float &h, float &v, int n=0)  
*Gets the screen resolution in dots-per-inch for the given screen.*
- static int [Fl::screen\\_num](#) (int x, int y)  
*Gets the screen number of a screen that contains the specified screen position x, y.*
- static int [Fl::screen\\_num](#) (int x, int y, int w, int h)

- Gets the screen number for the screen which intersects the most with the rectangle defined by  $x$ ,  $y$ ,  $w$ ,  $h$ .*

  - static float **Fl::screen\_scale** (int  $n$ )
    - Current value of the GUI scaling factor for screen number  $n$  ( $n$  [0, Fl::screen\_count()-1])*
  - static void **Fl::screen\_scale** (int  $n$ , float factor)
    - Sets the value of the GUI scaling factor for screen number  $n$  ( $n$  [0, Fl::screen\_count()-1]).*
  - static int **Fl::screen\_scaling\_supported** ()
    - See if scaling factors are supported by this platform.*
  - static void **Fl::screen\_work\_area** (int &X, int &Y, int &W, int &H)
    - Gets the bounding box of the work area of the screen that contains the mouse pointer.*
  - static void **Fl::screen\_work\_area** (int &X, int &Y, int &W, int &H, int  $mx$ , int  $my$ )
    - Gets the bounding box of the work area of a screen that contains the specified screen position  $mx$ ,  $my$ .*
  - static void **Fl::screen\_work\_area** (int &X, int &Y, int &W, int &H, int  $n$ )
    - Gets the bounding box of the work area of the given screen.*
  - static void **Fl::screen\_xywh** (int &X, int &Y, int &W, int &H)
    - Gets the bounding box of a screen that contains the mouse pointer.*
  - static void **Fl::screen\_xywh** (int &X, int &Y, int &W, int &H, int  $mx$ , int  $my$ )
    - Gets the bounding box of a screen that contains the specified screen position  $mx$ ,  $my$ .*
  - static void **Fl::screen\_xywh** (int &X, int &Y, int &W, int &H, int  $mx$ , int  $my$ , int  $mw$ , int  $mh$ )
    - Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by  $mx$ ,  $my$ ,  $mw$ ,  $mh$ .*
  - static void **Fl::screen\_xywh** (int &X, int &Y, int &W, int &H, int  $n$ )
    - Gets the screen bounding rect for the given screen.*
  - static int **Fl::w** ()
    - Returns the width in pixels of the main screen work area.*
  - static int **Fl::x** ()
    - Returns the leftmost x coordinate of the main screen work area.*
  - static int **Fl::y** ()
    - Returns the topmost y coordinate of the main screen work area.*

### 32.5.1 Detailed Description

**Fl** global screen functions declared in `<FL/FL.H>`.

FLTK supports high-DPI screens using a screen scaling factor. The scaling factor is initialized by the library to a value based on information obtained from the OS. If this initial value is not satisfactory, the `FLTK_SCALING_FACTOR` environment variable can be set to a value FLTK will multiply to the OS-given value. The 2 variants of functions `Fl::screen_scale()` allow to programmatically get and set scaling factor values. The scaling factor value can be further changed at runtime by typing `Ctrl/+/-/0/` (`Cmd/+/-/0/` under macOS). See [FL\\_SHORTCUT](#) for more details about these shortcuts.

### 32.5.2 Function Documentation

#### 32.5.2.1 keyboard\_screen\_scaling()

```
void Fl::keyboard_screen_scaling (
 int value) [static]
```

Controls the possibility to scale all windows by `ctrl/+/-/0/` or `cmd/+/-/0/`.

This function **should** be called before `fl_open_display()` runs. If it is not called, the default is to handle these keys for window scaling.

#### Note

This function can currently only be used to switch the internal handler **off**, i.e. `value` must be 0 (zero) - all other values result in undefined behavior and are reserved for future extension.

## Parameters

<i>value</i>	0 to stop recognition of ctrl+/-/0/ (or cmd+/-/0/ under macOS) keys as window scaling.
--------------	----------------------------------------------------------------------------------------

**32.5.2.2 screen\_count()**

```
int Fl::screen_count () [static]
```

Gets the total count of available screens.

## Note

Screen numbers range from 0 to [Fl::screen\\_count\(\)-1](#) in the FLTK API.

**32.5.2.3 screen\_dpi()**

```
void Fl::screen_dpi (
 float & h,
 float & v,
 int n = 0) [static]
```

Gets the screen resolution in dots-per-inch for the given screen.

## Parameters

out	<i>h,v</i>	horizontal and vertical resolution
in	<i>n</i>	the screen number (0 to <a href="#">Fl::screen_count()</a> - 1)

## See also

void [screen\\_xywh\(int &x, int &y, int &w, int &h, int mx, int my\)](#)

**32.5.2.4 screen\_num()** [1/2]

```
int Fl::screen_num (
 int x,
 int y) [static]
```

Gets the screen number of a screen that contains the specified screen position *x*, *y*.

## Parameters

in	<i>x,y</i>	the absolute screen position
----	------------	------------------------------

## Returns

a screen number [0 , [Fl::screen\\_count\(\)-1](#)]

## Attention

When the running system contains screens with different scaling factor values, this API may become ambiguous because a given value pair (*x*, *y*) may belong to distinct screens. In that situation, other APIs should be preferred, e.g., [Fl\\_Window::screen\\_num\(\)](#) and [Fl::screen\\_scale\(int\)](#).

**32.5.2.5 screen\_num()** [2/2]

```
int Fl::screen_num (
 int x,
 int y,
 int w,
 int h) [static]
```

Gets the screen number for the screen which intersects the most with the rectangle defined by *x*, *y*, *w*, *h*.

**Parameters**

in	<i>x,y,w,h</i>	the rectangle to search for intersection with
----	----------------	-----------------------------------------------

**Returns**

a screen number [0 , [Fl::screen\\_count\(\)-1](#)]

**32.5.2.6 screen\_scale()**

```
void Fl::screen_scale (
 int n,
 float factor) [static]
```

Sets the value of the GUI scaling factor for screen number *n* (*n* [0 , [Fl::screen\\_count\(\)-1](#)]). Also sets the scale factor value of all windows mapped to screen number *n*, if any.

**32.5.2.7 screen\_scaling\_supported()**

```
int Fl::screen_scaling_supported () [static]
```

See if scaling factors are supported by this platform.

**Returns**

0 if scaling factors are not supported by this platform, 1 if a single scaling factor value is shared by all screens, 2 if each screen can have its own scaling factor value.

**See also**

[Fl::screen\\_scale\(int\)](#)

**32.5.2.8 screen\_work\_area()** [1/3]

```
void Fl::screen_work_area (
 int & X,
 int & Y,
 int & W,
 int & H) [static]
```

Gets the bounding box of the work area of the screen that contains the mouse pointer.

**Parameters**

out	<i>X,Y,W,H</i>	the work area bounding box
-----	----------------	----------------------------

**See also**

void [screen\\_work\\_area\(int &x, int &y, int &w, int &h, int mx, int my\)](#)

**32.5.2.9 screen\_work\_area()** [2/3]

```
void Fl::screen_work_area (
 int & X,
 int & Y,
 int & W,
 int & H,
 int mx,
 int my) [static]
```

Gets the bounding box of the work area of a screen that contains the specified screen position `mx`, `my`.

**Parameters**

out	<i>X,Y,W,H</i>	the work area bounding box
in	<i>mx,my</i>	the absolute screen position

**32.5.2.10 screen\_work\_area()** [3/3]

```
void Fl::screen_work_area (
 int & X,
 int & Y,
 int & W,
 int & H,
 int n) [static]
```

Gets the bounding box of the work area of the given screen.

**Parameters**

out	<i>X,Y,W,H</i>	the work area bounding box
in	<i>n</i>	the screen number (0 to <code>Fl::screen_count()</code> - 1)

**See also**

void [screen\\_xywh\(int &x, int &y, int &w, int &h, int mx, int my\)](#)

**Note**

Like all quantities accessible via public APIs of FLTK, values of `x`, `y`, `w`, `h` are given in FLTK units, that is, in drawing units divided by the scaling factor of screen `n`.

**32.5.2.11 screen\_xywh()** [1/4]

```
void Fl::screen_xywh (
 int & X,
 int & Y,
 int & W,
 int & H) [static]
```

Gets the bounding box of a screen that contains the mouse pointer.

**Parameters**

out	<i>X,Y,W,H</i>	the corresponding screen bounding box
-----	----------------	---------------------------------------

## See also

`void screen_xywh(int &x, int &y, int &w, int &h, int mx, int my)`

**32.5.2.12 screen\_xywh()** [2/4]

```
void Fl::screen_xywh (
 int & X,
 int & Y,
 int & W,
 int & H,
 int mx,
 int my) [static]
```

Gets the bounding box of a screen that contains the specified screen position `mx`, `my`.

## Parameters

out	<i>X,Y,W,H</i>	the corresponding screen bounding box
in	<i>mx,my</i>	the absolute screen position

**32.5.2.13 screen\_xywh()** [3/4]

```
void Fl::screen_xywh (
 int & X,
 int & Y,
 int & W,
 int & H,
 int mx,
 int my,
 int mw,
 int mh) [static]
```

Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by `mx`, `my`, `mw`, `mh`.

## Parameters

out	<i>X,Y,W,H</i>	the corresponding screen bounding box
in	<i>mx,my,mw,mh</i>	the rectangle to search for intersection with

## See also

`void screen_xywh(int &X, int &Y, int &W, int &H, int n)`

**32.5.2.14 screen\_xywh()** [4/4]

```
void Fl::screen_xywh (
 int & X,
 int & Y,
 int & W,
 int & H,
 int n) [static]
```

Gets the screen bounding rect for the given screen.

Under Windows, Mac OS X, and X11 + the Gnome desktop, screen #0 contains the menubar/taskbar

## Parameters

out	X,Y,W,H	the corresponding screen bounding box
in	n	the screen number (0 to <code>Fl::screen_count() - 1</code> )

## Note

Like all quantities accessible via public APIs of FLTK, values of X,Y,W,H are given in FLTK units, that is, in drawing units divided by the scaling factor of screen n.

## See also

void `screen_xywh(int &x, int &y, int &w, int &h, int mx, int my)`

## 32.6 Color & Font functions

fl global color, font functions.

### Functions

- `Fl_Color fl_color ()`  
*Return the last `fl_color()` that was set.*
- void `fl_color (Fl_Color c)`  
*Set the color for all subsequent drawing operations.*
- void `fl_color (int c)`  
*for back compatibility - use `fl_color(Fl_Color c)` instead*
- void `fl_color (uchar r, uchar g, uchar b)`  
*Set the color for all subsequent drawing operations.*
- `Fl_Color fl_color_average (Fl_Color color1, Fl_Color color2, float weight)`  
*Returns the weighted average color between the two given colors.*
- `Fl_Color fl_contrast (Fl_Color fg, Fl_Color bg, int context, int size)`  
*Returns a color that contrasts with the background color.*
- void `fl_contrast_function (Fl_Contrast_Function *f)`  
*Register a custom contrast function.*
- int `fl_contrast_level ()`  
*Get the contrast level (sensitivity) of the `fl_contrast()` method.*
- void `fl_contrast_level (int level)`  
*Set the contrast level (sensitivity) of the `fl_contrast()` method.*
- int `fl_contrast_mode ()`  
*Return the current contrast algorithm (mode).*
- void `fl_contrast_mode (int mode)`  
*Set the contrast algorithm (mode).*
- int `fl_descent ()`  
*Return the recommended distance above the bottom of a `fl_height()` tall box to draw the text at so it looks centered vertically in that box.*
- `Fl_Font fl_font ()`  
*Return the `face` set by the most recent call to `fl_font()`.*
- void `fl_font (Fl_Font face, Fl_Fontsize fsize)`  
*Sets the current font, which is then used in various drawing routines.*
- int `fl_height ()`  
*Return the recommended minimum line spacing for the current font.*
- int `fl_height (int font, int size)`

- This function returns the actual height of the specified font and size.*
- **FI\_Color fl\_inactive** (FI\_Color c)  
*Returns the inactive, dimmed version of the given color.*
  - **const char \* fl\_latin1\_to\_local** (const char \*t, int n=-1)  
*Convert text from Windows/X11 latin1 character set to local encoding.*
  - **double fl\_lightness** (FI\_Color color)  
*Return the perceived lightness of a color.*
  - **const char \* fl\_local\_to\_latin1** (const char \*t, int n=-1)  
*Convert text from local encoding to Windows/X11 latin1 character set.*
  - **const char \* fl\_local\_to\_mac\_roman** (const char \*t, int n=-1)  
*Convert text from local encoding to Mac Roman character set.*
  - **double fl\_luminance** (FI\_Color color)  
*Return the raw / physical luminance of a color.*
  - **const char \* fl\_mac\_roman\_to\_local** (const char \*t, int n=-1)  
*Convert text from Mac Roman character set to local encoding.*
  - **FI\_Color fl\_show\_colormap** (FI\_Color oldcol)  
*Pops up a window to let the user pick a colormap entry.*
  - **FI\_Fontsize fl\_size** ()  
*Return the size set by the most recent call to fl\_font().*
  - **void fl\_text\_extents** (const char \*, int &dx, int &dy, int &w, int &h)  
*Determine the minimum pixel dimensions of a nul-terminated string using the current fl\_font().*
  - **void fl\_text\_extents** (const char \*t, int n, int &dx, int &dy, int &w, int &h)  
*Determine the minimum pixel dimensions of a sequence of n characters (bytes) using the current fl\_font().*
  - **double fl\_width** (const char \*txt)  
*Return the typographical width of a nul-terminated string using the current font face and size.*
  - **double fl\_width** (const char \*txt, int n)  
*Return the typographical width of a sequence of n characters using the current font face and size.*
  - **double fl\_width** (unsigned int c)  
*Return the typographical width of a single character using the current font face and size.*
  - **static void FI::free\_color** (FI\_Color i, int overlay=0)  
*Frees the specified color from the colormap, if applicable.*
  - **static unsigned FI::get\_color** (FI\_Color i)  
*Returns the RGB value(s) for the given FLTK color index.*
  - **static void FI::get\_color** (FI\_Color i, uchar &red, uchar &green, uchar &blue)  
*Returns the RGB value(s) for the given FLTK color index.*
  - **static void FI::get\_color** (FI\_Color i, uchar &red, uchar &green, uchar &blue, uchar &alpha)  
*Returns the RGBA value(s) for the given FLTK color index.*
  - **static const char \* FI::get\_font** (FI\_Font)  
*Gets the string for this face.*
  - **static const char \* FI::get\_font\_name** (FI\_Font, int \*attributes=0)  
*Get a human-readable string describing the family of this face.*
  - **static int FI::get\_font\_sizes** (FI\_Font, int \*&sizep)  
*Return an array of sizes in sizep.*
  - **static void FI::set\_color** (FI\_Color i, unsigned c)  
*Sets an entry in the fl\_color index table.*
  - **static void FI::set\_color** (FI\_Color, uchar, uchar, uchar)  
*Sets an entry in the fl\_color index table.*
  - **static void FI::set\_color** (FI\_Color, uchar, uchar, uchar, uchar)  
*Sets an entry in the fl\_color index table.*
  - **static void FI::set\_font** (FI\_Font, const char \*)  
*Changes a face.*

- static void **Fl::set\_font** (*Fl\_Font*, *Fl\_Font*)  
*Copies one face to another.*
- static *Fl\_Font* **Fl::set\_fonts** (const char \**=0*)  
*FLTK will open the display, and add every fonts on the server to the face table.*

### 32.6.1 Detailed Description

fl global color, font functions.

These functions are declared in [<FL/Fl.H>](#) or [<FL/fl\\_draw.H>](#).

### 32.6.2 Function Documentation

#### 32.6.2.1 fl\_color() [1/3]

```
Fl_Color fl_color () [inline]
```

Return the last `fl_color()` that was set.

This can be used for state save/restore.

#### 32.6.2.2 fl\_color() [2/3]

```
void fl_color (
 Fl_Color c) [inline]
```

Set the color for all subsequent drawing operations.

For color-mapped displays, a color cell will be allocated out of `fl_colormap` the first time you use a color. If the colormap fills up then a least-squares algorithm is used to find the closest color. If no valid graphical context (`fl_gc`) is available, the foreground is not set for the current window.

##### Parameters

in	<i>c</i>	color
----	----------	-------

#### 32.6.2.3 fl\_color() [3/3]

```
void fl_color (
 uchar r,
 uchar g,
 uchar b) [inline]
```

Set the color for all subsequent drawing operations.

The closest possible match to the RGB color is used. The RGB color is used directly on TrueColor displays. For colormap visuals the nearest index in the gray ramp or color cube is used. If no valid graphical context (`fl_gc`) is available, the foreground is not set for the current window.

##### Parameters

in	<i>r,g,b</i>	color components
----	--------------	------------------

#### 32.6.2.4 fl\_color\_average()

```
Fl_Color fl_color_average (
 Fl_Color color1,
 Fl_Color color2,
 float weight)
```

Returns the weighted average color between the two given colors.

The red, green and blue values are averages using the following formula:

$$\text{color} = \text{color1} * \text{weight} + \text{color2} * (1 - \text{weight})$$

Thus, a `weight` value of 1.0 will return the first color, while a value of 0.0 will return the second color.

#### Parameters

in	<i>color1,color2</i>	boundary colors
in	<i>weight</i>	weighting factor

### 32.6.2.5 fl\_contrast()

```
Fl_Color fl_contrast (
 Fl_Color fg,
 Fl_Color bg,
 int context,
 int size)
```

Returns a color that contrasts with the background color.

This will be the foreground color if it contrasts sufficiently with the background color. Otherwise, returns `FL_WHITE` or `FL_BLACK` depending on which color provides the best contrast.

FLTK 1.4.0 uses a different default contrast function than earlier releases (1.3.x) but you can use the old "legacy" contrast function by calling

```
fl_contrast_mode(FL_CONTRAST_LEGACY);
```

early in your main program.

#### Note

It is a known issue that static initialization using `fl_contrast()` may already have been executed before you call this function in `main()`. You should be aware of this and, if necessary, write your own (static) contrast initialization function. This should rarely be necessary.

You can change the behavior of `fl_contrast()` in several ways:

- Change the "level" (sensitivity) for contrast calculation, see `fl_contrast_level()`. Valid levels are 0 - 100, the default "medium" value depends on the contrast mode. If you raise the level above the default value the overall contrast will generally be higher, i.e. the required contrast to return the foreground color is raised and therefore the calculated color switches "earlier" to either black or white. In other words, using the following values:
  - 0 always uses the foreground color
  - the default, unmodified algorithm allows a sufficient contrast such that the text is readable
  - 100 will always use black or white

Changing the `level` is particularly useful and intended for the "legacy mode" to improve the results partially. Values slightly above 50 (50 - 70) will likely return the best results (50 is the default, as used in FLTK 1.3.x).

#### Note

Different contrast modes (algorithms) can use their own values and defaults of `fl_contrast_level()`.

- Change the used contrast calculation function. You can either use the old (FLTK 1.3.x) function or use the better but slower function based on the CIELAB (L\*a\*b\*) color model, or you can define your own custom contrast function if you need even better contrast results.

The following contrast functions are available:

- `FL_CONTRAST_LEGACY`, the old FLTK 1.3.x compatible function. This is the fastest function (using integer arithmetic) but it provides worse results in border cases. You may want to use this on embedded or otherwise CPU constrained systems or if you need strict backwards compatibility. For slightly better results you may utilize the new `fl_contrast_level(int)` function (since 1.4.0) to increase the contrast sensitivity. This will provide slightly better results than FLTK 1.3.x and earlier but we recommend to use the new default function:

- `FL_CONTRAST_CIELAB`, based on the CIELAB (L\*a\*b\*) color model. This function is superior regarding the human contrast perception but may be slightly slower - which should not matter on a modern CPU. The default contrast level in this mode is 39 which results in a very similar experience as the old contrast function but avoids unreadable border cases. **This is the default since FLTK 1.4.0.**
- `FL_CONTRAST_CUSTOM`, your own contrast calculation function.

In the future we **may** provide even more (and superior) contrast algorithms.

The new parameters `context` and `size` (since 1.4.0) are defined for future extensions and are currently not used. Default values are 0.

- The `context` is intended to differentiate text and other kinds of objects, e.g. radio buttons, check marks, or icon types.
- The `size` parameter is an unspecified (object) size that may be used to calculate the required contrast. In text mode this must be the font size. Rule: the larger the object (font), the lower the required contrast.

#### Note

These new optional parameters must be provided in the custom contrast function which is the reason why they are added now. In the future we may use the (font) size to adjust the calculated contrast, and users defining their own contrast functions may use them in their functions.

#### Parameters

in	<i>fg</i>	foreground (text) color
in	<i>bg</i>	background color
in	<i>context</i>	graphical context (optional, default = 0 == text)
in	<i>size</i>	unspecified size (optional, default = 0 == undefined)

#### Returns

contrasting color: `fg`, `FL_BLACK`, or `FL_WHITE`

#### See also

[fl\\_contrast\\_level\(int\)](#)

[fl\\_contrast\\_mode\(int\)](#)

[fl\\_contrast\\_function\(\)](#)

#### 32.6.2.6 fl\_contrast\_function()

```
void fl_contrast_function (
 Fl_Contrast_Function * f)
```

Register a custom contrast function.

Your custom contrast function will be called when `fl_contrast()` is called if and only if you previously registered your function and called `fl_contrast_mode(FL_CONTRAST_CUSTOM)`.

Your custom contrast function must provide the signature

```
Fl_Color my_contrast_function(Fl_Color fg, Fl_Color bg, int context, int size)
```

The arguments are the same as for the full `fl_contrast()` function since FLTK 1.4. You can use the supplied `size` to modify the result. Depending on the caller the `size` parameter can be 0 (default) or a valid size. In the context of text, i.e. `context == 0`, the `size` parameter is the fontsize.

The `context` parameter is not yet used and will always be 0 unless included in a call to `fl_contrast()`. The value 0 must be interpreted as text. In the future the `context` argument will be used to supply a different context than text (small icons, large icons, etc.). The exact usage is not yet specified.

Your function may also use `fl_contrast_level()` to modify the result accordingly.

Since

1.4.0

See also

[fl\\_contrast\\_mode\(int\)](#)

[fl\\_contrast\\_level\(int\)](#)

[fl\\_contrast\(\)](#)

### 32.6.2.7 fl\_contrast\_level() [1/2]

```
int fl_contrast_level ()
```

Get the contrast level (sensitivity) of the [fl\\_contrast\(\)](#) method. This returns the level of the currently selected contrast mode.

Returns

The current contrast level.

See also

[fl\\_contrast\\_level\(int level\)](#)

[fl\\_contrast\\_mode\(int mode\)](#)

Since

1.4.0

### 32.6.2.8 fl\_contrast\_level() [2/2]

```
void fl_contrast_level (
 int level)
```

Set the contrast level (sensitivity) of the [fl\\_contrast\(\)](#) method.

This can be used to tune the legacy [fl\\_contrast\(\)](#) function to achieve slightly better results. The default value is defined per contrast mode (see below). Values between 50 and 70 may be useful for the legacy contrast mode but you can raise it up to 100. Lower values than 50 are probably not useful.

The contrast `level` affects not only the legacy (1.3.x) [fl\\_contrast\(\)](#) function but also the new CIELAB contrast mode which is the default since FLTK 1.4.0. See default value below.

Other contrast modes are currently not affected by the contrast level.

You may use the contrast level if you define your own custom contrast function in mode `FL_CONTRAST_CUSTOM`.

Note

All contrast modes store their own contrast level because the behavior is slightly different. You must change the contrast mode [fl\\_contrast\\_mode\(\)](#) **before** you set or get the contrast level.

The default contrast level is

- 50 in mode `FL_CONTRAST_LEGACY` (compatible with FLTK 1.3.x)
- 39 in mode `FL_CONTRAST_CIELAB` (similar threshold as in FLTK 1.3.x)
- 0 (undefined) for all other modes

See the description of [fl\\_contrast\\_mode\(int mode\)](#) for more information about the contrast level per mode.

Example:

```
fl_contrast_mode(FL_CONTRAST_LEGACY);
fl_contrast_level(60);
```

A `level` greater than 50 (probably best in the range 50 to 70) may achieve better results of the legacy [fl\\_contrast\(\)](#) function in some border cases of low contrast between foreground and background colors but we recommend to use the new default algorithm `FL_CONTRAST_CIELAB` unless you need strict backwards compatibility or use a CPU constrained embedded system.

## Parameters

<code>in</code>	<code>/level</code>	valid range is 0 to 100
-----------------	---------------------	-------------------------

## Since

1.4.0

**32.6.2.9 fl\_contrast\_mode()** [1/2]

```
int fl_contrast_mode ()
```

Return the current contrast algorithm (mode).

## Returns

Contrast algorithm (mode).

## Since

1.4.0

## See also

[fl\\_contrast\\_mode\(int\)](#)

**32.6.2.10 fl\_contrast\_mode()** [2/2]

```
void fl_contrast_mode (
 int mode)
```

Set the contrast algorithm (mode).

You can use one of

- `FL_CONTRAST_NONE` (not recommended: returns the foreground color)
- `FL_CONTRAST_LEGACY` (same as in FLTK 1.3.x)
- `FL_CONTRAST_CIELAB` (better, this is the default since FLTK 1.4.0)
- `FL_CONTRAST_CUSTOM` (you must define your own contrast algorithm)

If you set `FL_CONTRAST_CUSTOM` you must also register your custom contrast function by calling [fl\\_contrast\\_function\(\)](#).

You may set the contrast level [fl\\_contrast\\_level\(int\)](#) after setting the contrast mode. This affects the contrast algorithm as described below:

- `FL_CONTRAST_LEGACY`: default level is 50 which is compatible with FLTK 1.3.x and older. This mode is no longer the default and is not recommended because it doesn't take human contrast perception into account and doesn't properly handle sRGB color values. You may get better contrasts if you set the level higher than 50. Values in the range 50 to 70 may be useful. Higher values result in higher contrast, i.e. the algorithm switches "earlier" to black or white mode.
- `FL_CONTRAST_CIELAB`: default level is 39 which appears to be a good value. The higher the level is, the more contrast is to be expected. Values in the range below 39 accept lower contrast and values above 39 switch "earlier" to black or white. Values between 36 and 46 may yield usable contrast experience.

**Note**

The goal of `fl_contrast()` is to achieve a "sufficient" contrast between text and background. Level 39 in CIELAB mode means that the accepted contrast is about 39% of the lightness difference between both colors. This can be perceived as very low contrast in some cases, but the text should at least be readable. Note that the highest possible contrast value on a medium gray background is 50% (either black or white). Bill Spitzak wrote on May 16, 2024 in `fltk.general` in thread "FLTK 1.4 Menu Bar Style": *"I would certainly aim for a function that does not alter color combinations where it is physically possible to read the text, even if squinting is needed."* See <https://groups.google.com/g/fltkgeneral/c/EkWI4HTHSLA/m/rsZunZ1vAwAJ>

**Parameters**

<code>in</code>	<code>mode</code>	if invalid, <code>FL_CONTRAST_CIELAB</code> will be selected
-----------------	-------------------	--------------------------------------------------------------

**Since**

1.4.0

**See also**[fl\\_contrast\\_function\(Fl\\_Contrast\\_Function \\*\)](#)[fl\\_contrast\\_level\(int\)](#)**32.6.2.11 fl\_font()** [1/2]`Fl_Font fl_font ( ) [inline]`Return the `face` set by the most recent call to `fl_font()`.

This can be used to save/restore the font.

**32.6.2.12 fl\_font()** [2/2]

```
void fl_font (
 Fl_Font face,
 Fl_Fontsize fsize)
```

Sets the current font, which is then used in various drawing routines.

You may call this outside a draw context if necessary to measure text, for instance by calling `fl_width()`, `fl_measure()`, or `fl_text_extents()`, but on X this will open the display.The font is identified by a `face` and a `size`. The size of the font is measured in pixels and not "points". Lines should be spaced `size` pixels apart or more.**32.6.2.13 fl\_height()** [1/2]`int fl_height ( ) [inline]`

Return the recommended minimum line spacing for the current font.

You can also use the value of `size` passed to `fl_font()`.**32.6.2.14 fl\_height()** [2/2]

```
int fl_height (
 int font,
 int size)
```

This function returns the actual height of the specified `font` and `size`.

Normally the font height should always be 'size', but with the advent of XFT, there are (currently) complexities that seem to only be solved by asking the font what its actual font height is. (See STR#2115)

This function was originally undocumented in 1.1.x, and was used only by `Fl_Text_Display`. We're now documenting it in 1.3.x so that apps that need precise height info can get it with this function.

**Returns**

the height of the font in pixels.

**Todo** In the future, when the XFT issues are resolved, this function should simply return the 'size' value.

**32.6.2.15 fl\_latin1\_to\_local()**

```
const char * fl_latin1_to_local (
 const char * t,
 int n = -1)
```

Convert text from Windows/X11 latin1 character set to local encoding.

**Parameters**

in	<i>t</i>	character string (latin1 encoding)
in	<i>n</i>	optional number of characters (bytes) to convert (default is all)

**Returns**

pointer to internal buffer containing converted characters

**32.6.2.16 fl\_lightness()**

```
double fl_lightness (
 Fl_Color color)
```

Return the perceived lightness of a color.

This function calculates the perceived lightness of `Fl_Color color`.

The returned lightness value `Lstar` according to the CIELAB (L\*a\*b\*) color model is almost linear with respect to human perception. It is in the range 0 (black) to 100 (white).

The result values of two colors can be compared directly and the difference is their perceived contrast.

**Parameters**

in	<i>color</i>	Fl_Color value
----	--------------	----------------

**Returns**

perceived lightness (0 .. 100)

**Since**

1.4.0

**32.6.2.17 fl\_local\_to\_latin1()**

```
const char * fl_local_to_latin1 (
 const char * t,
 int n = -1)
```

Convert text from local encoding to Windows/X11 latin1 character set.

**Parameters**

in	<i>t</i>	character string (local encoding)
in	<i>n</i>	optional number of characters (bytes) to convert (default is all)

**Returns**

pointer to internal buffer containing converted characters

**32.6.2.18 fl\_local\_to\_mac\_roman()**

```
const char * fl_local_to_mac_roman (
 const char * t,
 int n = -1)
```

Convert text from local encoding to Mac Roman character set.

**Parameters**

in	<i>t</i>	character string (local encoding)
in	<i>n</i>	optional number of characters to convert (default is all)

**Returns**

pointer to internal buffer containing converted characters

**32.6.2.19 fl\_luminance()**

```
double fl_luminance (
 Fl_Color color)
```

Return the raw / physical luminance of a color.

This function calculates the physical luminance of `Fl_Color color`.

The returned luminance value (aka  $Y$ ) is the physical luminance of the `Fl_Color color`.

The result is in the range 0.0 (black) to 1.0 (white).

**Note**

This is probably not what you want if you are interested in perceived contrast or lightness calculation because the luminance  $Y$  is **not** linear with respect to human perception.

See [fl\\_lightness\(Fl\\_Color\)](#) for a function that returns the perceived lightness of a color which can be used directly for contrast calculation.

**Parameters**

in	<i>color</i>	Fl_Color value
----	--------------	----------------

**Returns**

Raw (physical) luminance (0.0 .. 1.0)

**Since**

1.4.0

**See also**

[fl\\_lightness\(Fl\\_Color\)](#)

### 32.6.2.20 fl\_mac\_roman\_to\_local()

```
const char * fl_mac_roman_to_local (
 const char * t,
 int n = -1)
```

Convert text from Mac Roman character set to local encoding.

#### Parameters

in	<i>t</i>	character string (Mac Roman encoding)
in	<i>n</i>	optional number of characters to convert (default is all)

#### Returns

pointer to internal buffer containing converted characters

### 32.6.2.21 fl\_show\_colormap()

```
Fl_Color fl_show_colormap (
 Fl_Color oldcol)
```

Pops up a window to let the user pick a colormap entry.

Figure 32.1 fl\_show\_colormap

#### Parameters

in	<i>oldcol</i>	color to be highlighted when grid is shown.
----	---------------	---------------------------------------------

#### Return values

<i>Fl_Color</i>	value of the chosen colormap entry.
-----------------	-------------------------------------

[Fl\\_Color\\_Chooser](#)

### 32.6.2.22 fl\_size()

```
Fl_Fontsize fl_size () [inline]
```

Return the `size` set by the most recent call to [fl\\_font\(\)](#).

This can be used to save/restore the font.

### 32.6.2.23 fl\_text\_extents() [1/2]

```
void fl_text_extents (
 const char * c,
 int & dx,
 int & dy,
 int & w,
 int & h)
```

Determine the minimum pixel dimensions of a nul-terminated string using the current [fl\\_font\(\)](#).

Usage: given a string "txt" drawn using `fl_draw(txt, x, y)` you would determine its pixel extents on the display using `fl_text_extents(txt, dx, dy, wo, ho)` such that a bounding box that exactly fits around the text could be drawn with `fl_rect(x+dx, y+dy, wo, ho)`. Note the `dx, dy` values hold the offset of the first "colored in" pixel of the string, from the draw origin.

Note the desired font and font size must be set with [fl\\_font\(\)](#) before calling this function.

This differs slightly from [fl\\_measure\(\)](#) in that the `dx/dy` values are also returned.

No FLTK symbol expansion will be performed.

Example use:

```
int dx,dy,W,H;
fl_font(FL_HELVETICA, 12); // set font face+size first
fl_text_extents("Some text", dx, dy, W, H); // get width and height of string
printf("text's width=%d, height=%d\n", W, H);
```

### 32.6.2.24 fl\_text\_extents() [2/2]

```
void fl_text_extents (
 const char * t,
 int n,
 int & dx,
 int & dy,
 int & w,
 int & h) [inline]
```

Determine the minimum pixel dimensions of a sequence of `n` characters (bytes) using the current [fl\\_font\(\)](#).

Note

The string length is measured in bytes, not (UTF-8) characters.

See also

[fl\\_text\\_extents\(const char\\*, int& dx, int& dy, int& w, int& h\)](#)

### 32.6.2.25 fl\_width()

```
double fl_width (
 unsigned int c) [inline]
```

Return the typographical width of a single character using the current font face and size.

**Note**

If a valid `fl_gc` is NOT found then it uses the first window `gc`, or the screen `gc` if no fltk window is available when called.

**32.6.2.26 free\_color()**

```
void Fl::free_color (
 Fl_Color i,
 int overlay = 0) [static]
```

Frees the specified color from the colormap, if applicable.

If `overlay` is non-zero then the color is freed from the overlay colormap.

**32.6.2.27 get\_color() [1/3]**

```
unsigned Fl::get_color (
 Fl_Color i) [static]
```

Returns the RGB value(s) for the given FLTK color index.

This form returns the RGB values packed in a 32-bit unsigned integer with the red value in the upper 8 bits, the green value in the next 8 bits, and the blue value in bits 8-15. The lower 8 bits will always be 0.

**32.6.2.28 get\_color() [2/3]**

```
void Fl::get_color (
 Fl_Color i,
 uchar & red,
 uchar & green,
 uchar & blue) [static]
```

Returns the RGB value(s) for the given FLTK color index.

This form returns the red, green, and blue values separately in referenced variables.

**See also**

unsigned [get\\_color\(Fl\\_Color c\)](#)

**32.6.2.29 get\_color() [3/3]**

```
void Fl::get_color (
 Fl_Color i,
 uchar & red,
 uchar & green,
 uchar & blue,
 uchar & alpha) [static]
```

Returns the RGBA value(s) for the given FLTK color index.

This form returns the red, green, blue, and alpha values separately in referenced variables.

**See also**

unsigned [get\\_color\(Fl\\_Color c\)](#)

**32.6.2.30 get\_font()**

```
const char * Fl::get_font (
 Fl_Font fnum) [static]
```

Gets the string for this face.

This string is different for each face. Under X this value is passed to `XListFonts` to get all the sizes of this face.

**32.6.2.31 get\_font\_name()**

```
const char * Fl::get_font_name (
 Fl_Font fnum,
 int * attributes = 0) [static]
```

Get a human-readable string describing the family of this face.

This is useful if you are presenting a choice to the user. There is no guarantee that each face has a different name. The return value points to a static buffer that is overwritten each call.

The integer pointed to by `attributes` (if the pointer is not zero) is set to zero, `FL_BOLD` or `FL_ITALIC` or `FL_↔_BOLD | FL_ITALIC`. To locate a "family" of fonts, search forward and back for a set with non-zero attributes, these faces along with the face with a zero attribute before them constitute a family.

**32.6.2.32 get\_font\_sizes()**

```
int Fl::get_font_sizes (
 Fl_Font fnum,
 int *& sizes) [static]
```

Return an array of sizes in `sizes`.

The return value is the length of this array. The sizes are sorted from smallest to largest and indicate what sizes can be given to `fl_font()` that will be matched exactly (`fl_font()` will pick the closest size for other sizes). A zero in the first location of the array indicates a scalable font, where any size works, although the array may list sizes that work "better" than others. Warning: the returned array points at a static buffer that is overwritten each call. Under X this will open the display.

**32.6.2.33 set\_color() [1/3]**

```
void Fl::set_color (
 Fl_Color i,
 unsigned c) [static]
```

Sets an entry in the `fl_color` index table.

You can set it to any 8-bit RGB color. The color is not allocated until `fl_color(i)` is used.

**32.6.2.34 set\_color() [2/3]**

```
void Fl::set_color (
 Fl_Color i,
 uchar red,
 uchar green,
 uchar blue) [static]
```

Sets an entry in the `fl_color` index table.

You can set it to any 8-bit RGB color. The color is not allocated until `fl_color(i)` is used.

**32.6.2.35 set\_color() [3/3]**

```
void Fl::set_color (
 Fl_Color i,
 uchar red,
 uchar green,
 uchar blue,
 uchar alpha) [static]
```

Sets an entry in the `fl_color` index table.

You can set it to any 8-bit RGBA color.

**Note**

The color transparency is effective under the Wayland, hybrid Wayland/X11 and macOS platforms, whereas it has no effect under the X11 and Windows platforms. It's also effective for widgets added to an [FL\\_GI\\_Window](#).

## Version

1.4

**32.6.2.36 set\_font()**

```
void Fl::set_font (
 Fl_Font fnum,
 const char * name) [static]
```

Changes a face.

## Parameters

<i>fnum</i>	The font number to be assigned a new face
<i>name</i>	Name of the font to assign. The string pointer is simply stored, the string is not copied, so the string must be in static memory. The exact name to be used depends on the platform :

- Windows, X11, Xft: use the family name prefixed by one character to indicate the desired font variant. Characters ' ', 'I', 'B', 'P' denote plain, italic, bold, and bold-italic variants, respectively. For example, string "IGabriola" is to be used to denote the "Gabriola italic" font. The "Oblique" suffix, in whatever case, is to be treated as "italic", that is, prefix the family name with 'I'.
- Other platforms, i.e., X11 + Pango, Wayland, macOS: use the full font name as returned by function [Fl::get\\_font\\_name\(\)](#) or as listed by applications test/fonts or test/utf8. No prefix is to be added.

**32.6.2.37 set\_fonts()**

```
Fl_Font Fl::set_fonts (
 const char * xstarname = 0) [static]
```

FLTK will open the display, and add every fonts on the server to the face table.

It will attempt to put "families" of faces together, so that the normal one is first, followed by bold, italic, and bold italic. The only argument to this function is somewhat obsolete since FLTK and most underlying operating systems move to support Unicode. For completeness, following is the original documentation and a few updates:

On X11, the optional argument is a string to describe the set of fonts to add. Passing NULL will select only fonts that have the ISO8859-1 character set (and are thus usable by normal text). Passing "-\*" will select all fonts with any encoding as long as they have normal X font names with dashes in them. Passing "\*" will list every font that exists (on X this may produce some strange output). Other values may be useful but are system dependent.

With the Xft option on Linux, this parameter is ignored.

With Windows, NULL selects fonts with ANSI\_CHARSET encoding and non-NULL selects all fonts.

On macOS, this parameter is ignored.

The return value is how many faces are in the table after this is done.

**32.7 Drawing functions**

FLTK global graphics and GUI drawing functions.

**Enumerations**

- enum {
  - FL\_SOLID = 0 , FL\_DASH = 1 , FL\_DOT = 2 , FL\_DASHDOT = 3 ,
  - FL\_DASHDOTDOT = 4 , FL\_CAP\_FLAT = 0x100 , FL\_CAP\_ROUND = 0x200 , FL\_CAP\_SQUARE = 0x300 ,
  - FL\_JOIN\_MITER = 0x1000 , FL\_JOIN\_ROUND = 0x2000 , FL\_JOIN\_BEVEL = 0x3000 }

## Functions

- int `fl_add_symbol` (const char \*name, void(\*drawit)(FI\_Color), int scalable)  
*Adds a symbol to the system.*
- int `fl_antialias` ()  
*Return whether line drawings are currently antialiased.*
- void `fl_antialias` (int state)  
*Turn antialiased line drawings ON or OFF, if supported by platform.*
- void `fl_arc` (double x, double y, double r, double start, double end)  
*Add a series of points to the current path on the arc of a circle.*
- void `fl_arc` (int x, int y, int w, int h, double a1, double a2)  
*Draw ellipse sections using integer coordinates.*
- void `fl_begin_complex_polygon` ()  
*Start drawing a complex filled polygon.*
- void `fl_begin_line` ()  
*Start drawing a list of lines.*
- void `fl_begin_loop` ()  
*Start drawing a closed sequence of lines.*
- void `fl_begin_offscreen` (FI\_Offscreen ctx)  
*Send all subsequent drawing commands to this offscreen buffer.*
- void `fl_begin_points` ()  
*Start drawing a list of points.*
- void `fl_begin_polygon` ()  
*Start drawing a convex filled polygon.*
- char `fl_can_do_alpha_blending` ()  
*Check whether platform supports true alpha blending for RGBA images.*
- FI\_RGB\_Image \* `fl_capture_window` (FI\_Window \*win, int x, int y, int w, int h)  
*Captures the content of a rectangular zone of a mapped window.*
- void `fl_chord` (int x, int y, int w, int h, double a1, double a2)  
*fl\_chord declaration is a place holder - the function does not yet exist*
- void `fl_circle` (double x, double y, double r)  
*fl\_circle(x,y,r) is equivalent to fl\_arc(x,y,r,0,360), but may be faster.*
- void `fl_clip` (int x, int y, int w, int h)  
*Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).*
- int `fl_clip_box` (int x, int y, int w, int h, int &X, int &Y, int &W, int &H)  
*Intersect a rectangle with the current clip region and return the bounding box of the result.*
- FI\_Region `fl_clip_region` ()  
*Return the current clipping region.*
- void `fl_clip_region` (FI\_Region r)  
*Replace the top of the clipping stack with a clipping region of any shape.*
- void `fl_copy_offscreen` (int x, int y, int w, int h, FI\_Offscreen pixmap, int srcx, int srcy)  
*Copy a rectangular area of the given offscreen buffer into the current drawing destination.*
- FI\_Offscreen `fl_create_offscreen` (int w, int h)  
*Creation of an offscreen graphics buffer.*
- void `fl_cursor` (FI\_Cursor)  
*Sets the cursor for the current window to the specified shape and colors.*
- void `fl_cursor` (FI\_Cursor, FI\_Color fg, FI\_Color bg=FL\_WHITE)
- void `fl_curve` (double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)  
*Add a series of points on a Bézier curve to the path.*
- void `fl_delete_offscreen` (FI\_Offscreen ctx)  
*Deletion of an offscreen graphics buffer.*

- void **fl\_draw** (const char \*str, int n, int x, int y)  
*Draws starting at the given x, y location a UTF-8 string of length n bytes.*
- void **fl\_draw** (const char \*str, int x, int y)  
*Draw a nul-terminated UTF-8 string starting at the given x, y location.*
- void **fl\_draw** (const char \*str, int x, int y, int w, int h, **FL\_Align** align, **FL\_Image** \*img=0, int draw\_symbols=1, int spacing=0)  
*Fancy string drawing function which is used to draw all the labels.*
- void **fl\_draw** (const char \*str, int x, int y, int w, int h, **FL\_Align** align, void(\*callthis)(const char \*, int, int, int), **FL\_Image** \*img=0, int draw\_symbols=1, int spacing=0)  
*The same as fl\_draw(const char\*,int,int,int,int,FL\_Align,FL\_Image\*,int) with the addition of the callthis parameter, which is a pointer to a text drawing function such as fl\_draw(const char\*, int, int, int) to do the real work.*
- void **fl\_draw** (int angle, const char \*str, int n, int x, int y)  
*Draw at the given x, y location a UTF-8 string of length n bytes rotating angle degrees counter-clockwise.*
- void **fl\_draw** (int angle, const char \*str, int x, int y)  
*Draw a nul-terminated UTF-8 string starting at the given x, y location and rotating angle degrees counter-clockwise.*
- void **fl\_draw\_arrow** (**FL\_Rect** bb, **FL\_Arrow\_Type** t, **FL\_Orientation** o, **FL\_Color** color)  
*Draw an "arrow like" GUI element for the selected scheme.*
- void **fl\_draw\_box** (**FL\_Boxtype**, int x, int y, int w, int h, **FL\_Color**)  
*Draws a box using given type, position, size and color.*
- void **fl\_draw\_box\_focus** (**FL\_Boxtype**, int x, int y, int w, int h, **FL\_Color**, **FL\_Color**)  
*Draws the focus rectangle inside a box using given type, position, size and color.*
- void **fl\_draw\_check** (**FL\_Rect** bb, **FL\_Color** col)  
*Draw a check mark inside the given bounding box.*
- void **fl\_draw\_circle** (int x, int y, int d, **FL\_Color** color)  
*Draw a potentially small, filled circle using a given color.*
- void **fl\_draw\_image** (const uchar \*buf, int X, int Y, int W, int H, int D=3, int L=0)  
*Draw an 8-bit per color RGB or luminance image.*
- void **fl\_draw\_image** (**FL\_Draw\_Image\_Cb** cb, void \*data, int X, int Y, int W, int H, int D=3)  
*Draw an image using a callback function to generate image data.*
- void **fl\_draw\_image\_mono** (const uchar \*buf, int X, int Y, int W, int H, int D=1, int L=0)  
*Draw a gray-scale (1 channel) image.*
- void **fl\_draw\_image\_mono** (**FL\_Draw\_Image\_Cb** cb, void \*data, int X, int Y, int W, int H, int D=1)  
*Draw a gray-scale image using a callback function to generate image data.*
- int **fl\_draw\_pixmap** (char \*const \*data, int x, int y, **FL\_Color** bg=FL\_GRAY)  
*Draw XPM image data, with the top-left corner at the given position.*
- int **fl\_draw\_pixmap** (const char \*const \*data, int x, int y, **FL\_Color** bg=FL\_GRAY)  
*Draw XPM image data, with the top-left corner at the given position.*
- void **fl\_draw\_radio** (int x, int y, int d, **FL\_Color** color)  
*Draw a round check mark (circle) of a radio button.*
- int **fl\_draw\_symbol** (const char \*label, int x, int y, int w, int h, **FL\_Color**)  
*Draw the named symbol in the given rectangle using the given color.*
- void **fl\_end\_complex\_polygon** ()  
*End complex filled polygon, and draw.*
- void **fl\_end\_line** ()  
*End list of lines, and draw.*
- void **fl\_end\_loop** ()  
*End closed sequence of lines, and draw.*
- void **fl\_end\_offscreen** ()  
*Quit sending drawing commands to the current offscreen buffer.*
- void **fl\_end\_points** ()  
*End list of points, and draw.*

- **void fl\_end\_polygon ()**  
*End convex filled polygon, and draw.*
- **const char \* fl\_expand\_text** (const char \*from, char \*buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw\_symbols=0)  
*Copy from to buf, replacing control characters with ^X.*
- **void fl\_focus\_rect** (int x, int y, int w, int h)  
*Draw a dotted rectangle, used to indicate keyboard focus on a widget.*
- **void fl\_frame** (const char \*s, int x, int y, int w, int h)  
*Draws a series of line segments around the given box.*
- **void fl\_frame2** (const char \*s, int x, int y, int w, int h)  
*Draws a series of line segments around the given box.*
- **void fl\_gap ()**  
*Separate loops of the path.*
- **void fl\_line** (int x, int y, int x1, int y1)  
*Draw a line from (x,y) to (x1,y1)*
- **void fl\_line** (int x, int y, int x1, int y1, int x2, int y2)  
*Draw a line from (x,y) to (x1,y1) and another from (x1,y1) to (x2,y2)*
- **void fl\_line\_style** (int style, int width=0, char \*dashes=0)  
*Set how to draw lines (the "pen").*
- **void fl\_load\_identity ()**  
*Set the transformation matrix to identity.*
- **void fl\_load\_matrix** (double a, double b, double c, double d, double x, double y)  
*Set the current transformation matrix.*
- **void fl\_loop** (int x, int y, int x1, int y1, int x2, int y2)  
*Outline a 3-sided polygon with lines.*
- **void fl\_loop** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)  
*Outline a 4-sided polygon with lines.*
- **void fl\_measure** (const char \*str, int &x, int &y, int draw\_symbols=1)  
*Measure how wide and tall the string will be when printed by the fl\_draw() function with align parameter.*
- **int fl\_measure\_pixmap** (char \*const \*data, int &w, int &h)  
*Get the dimensions of a pixmap.*
- **int fl\_measure\_pixmap** (const char \*const \*cdata, int &w, int &h)  
*Get the dimensions of a pixmap.*
- **void fl\_mult\_matrix** (double a, double b, double c, double d, double x, double y)  
*Concatenate another transformation onto the current one.*
- **int fl\_not\_clipped** (int x, int y, int w, int h)  
*Does the rectangle intersect the current clip region?*
- **unsigned int fl\_old\_shortcut** (const char \*s)  
*Emulation of XForms named shortcuts.*
- **void fl\_overlay\_clear ()**  
*Erase a selection rectangle without drawing a new one.*
- **void fl\_overlay\_rect** (int x, int y, int w, int h)  
*Draw a transient dotted selection rectangle.*
- **float fl\_override\_scale ()**  
*Removes any GUI scaling factor in subsequent drawing operations.*
- **void fl\_pie** (int x, int y, int w, int h, double a1, double a2)  
*Draw filled ellipse sections using integer coordinates.*
- **void fl\_point** (int x, int y)  
*Draw a single pixel at the given coordinates.*
- **void fl\_polygon** (int x, int y, int x1, int y1, int x2, int y2)  
*Fill a 3-sided polygon.*

- void **fl\_polygon** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)  
*Fill a 4-sided polygon.*
- void **fl\_pop\_clip** ()  
*Restore the previous clip region.*
- void **fl\_pop\_matrix** ()  
*Restore the current transformation matrix from the stack.*
- void **fl\_push\_clip** (int x, int y, int w, int h)  
*Intersect the current clip region with a rectangle and push this new region onto the stack.*
- void **fl\_push\_matrix** ()  
*Save the current transformation matrix on the stack.*
- void **fl\_push\_no\_clip** ()  
*Push an empty clip region onto the stack so nothing will be clipped.*
- **uchar \* fl\_read\_image** (**uchar** \*p, int X, int Y, int W, int H, int alpha=0)  
*Reads an RGB(A) image from the current window or off-screen buffer.*
- void **fl\_rect** (**FL\_Rect** r)  
*Draw a border inside the given bounding box.*
- void **fl\_rect** (int x, int y, int w, int h)  
*Draw a border inside the given bounding box.*
- void **fl\_rect** (int x, int y, int w, int h, **FL\_Color** c)  
*Draw with passed color a border inside the given bounding box.*
- void **fl\_rectf** (**FL\_Rect** bb, **uchar** r, **uchar** g, **uchar** b)  
*Color a rectangle with "exactly" the passed  $r, g, b$  color.*
- void **fl\_rectf** (**FL\_Rect** r)  
*Color with current color a rectangle that exactly fills the given bounding box.*
- void **fl\_rectf** (**FL\_Rect** r, **FL\_Color** c)  
*Color with passed color a rectangle that exactly fills the given bounding box.*
- void **fl\_rectf** (int x, int y, int w, int h)  
*Color with current color a rectangle that exactly fills the given bounding box.*
- void **fl\_rectf** (int x, int y, int w, int h, **FL\_Color** c)  
*Color with passed color a rectangle that exactly fills the given bounding box.*
- void **fl\_rectf** (int x, int y, int w, int h, **uchar** r, **uchar** g, **uchar** b)  
*Color a rectangle with "exactly" the passed  $r, g, b$  color.*
- void **fl\_rescale\_offscreen** (**FL\_Offscreen** &ctx)  
*Adapts an offscreen buffer to a changed value of the scale factor.*
- void **fl\_reset\_spot** (void)  
*Resets marked text.*
- void **fl\_restore\_clip** ()  
*Undo any clobbering of the clip region done by your program.*
- void **fl\_restore\_scale** (float s)  
*Restores the GUI scaling factor and the clipping region in subsequent drawing operations.*
- void **fl\_rotate** (double d)  
*Concatenate rotation transformation onto the current one.*
- void **fl\_rounded\_rect** (int x, int y, int w, int h, int r)  
*Draw a rounded border inside the given bounding box.*
- void **fl\_rounded\_rectf** (int x, int y, int w, int h, int r)  
*Color with current color a rounded rectangle that exactly fills the given bounding box.*
- void **fl\_rtl\_draw** (const char \*str, int n, int x, int y)  
*Draw a UTF-8 string of length  $n$  bytes right to left starting at the given  $x, y$  location.*
- void **fl\_scale** (double x)  
*Concatenate scaling transformation onto the current one.*
- void **fl\_scale** (double x, double y)

- Concatenate scaling transformation onto the current one.*

  - void `fl_scroll` (int X, int Y, int W, int H, int dx, int dy, void(\*draw\_area)(void \*, int, int, int, int), void \*data)

*Scroll a rectangle and draw the newly exposed portions.*
- void `fl_set_spot` (int font, int size, int X, int Y, int W, int H, `FL_Window` \*win=0)

*Inform text input methods about the current text insertion cursor.*
- void `fl_set_status` (int X, int Y, int W, int H)

*Related to text input methods under X11.*
- const char \* `fl_shortcut_label` (unsigned int shortcut)

*Get a human-readable string from a shortcut value.*
- const char \* `fl_shortcut_label` (unsigned int shortcut, const char \*\*eom)

*Get a human-readable string from a shortcut value.*
- double `fl_transform_dx` (double x, double y)

*Transform distance using current transformation matrix.*
- double `fl_transform_dy` (double x, double y)

*Transform distance using current transformation matrix.*
- double `fl_transform_x` (double x, double y)

*Transform coordinate using the current transformation matrix.*
- double `fl_transform_y` (double x, double y)

*Transform coordinate using the current transformation matrix.*
- void `fl_transformed_vertex` (double xf, double yf)

*Add coordinate pair to the vertex list without further transformations.*
- void `fl_translate` (double x, double y)

*Concatenate translation transformation onto the current one.*
- void `fl_vertex` (double x, double y)

*Add a single vertex to the current path.*
- void `fl_xyline` (int x, int y, int x1)

*Draw a horizontal line from (x,y) to (x1,y).*
- void `fl_xyline` (int x, int y, int x1, int y2)

*Draw a horizontal line from (x,y) to (x1,y), then vertical from (x1,y) to (x1,y2).*
- void `fl_xyline` (int x, int y, int x1, int y2, int x3)

*Draw a horizontal line from (x,y) to (x1,y), then a vertical from (x1,y) to (x1,y2) and then another horizontal from (x1,y2) to (x3,y2).*
- void `fl_yxline` (int x, int y, int y1)

*Draw a vertical line from (x,y) to (x,y1)*
- void `fl_yxline` (int x, int y, int y1, int x2)

*Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1).*
- void `fl_yxline` (int x, int y, int y1, int x2, int y3)

*Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1), then another vertical from (x2,y1) to (x2,y3).*

### 32.7.1 Detailed Description

FLTK global graphics and GUI drawing functions.

These functions are declared in `<FL/fl_draw.H>`, and in `<FL/platform.H>` for offscreen buffer-related ones.

### 32.7.2 Enumeration Type Documentation

### 32.7.2.1 anonymous enum

anonymous enum

FL_SOLID		FL_CAP_FLAT	
FL_DASH		FL_CAP_ROUND	
FL_DOT		FL_CAP_SQUARE	
FL_DASHDOT		FL_JOIN_MITER	
FL_DASHDOTDOT		FL_JOIN_ROUND	
		FL_JOIN_BEVEL	

Figure 32.2 `fl_line_style()` styles

#### Enumerator

FL_SOLID	line style: solid line
FL_DASH	line style: 75% dashed line
FL_DOT	line style: 50% pixel dotted
FL_DASHDOT	line style: dash / dot pattern
FL_DASHDOTDOT	line style: dash / two dot pattern
FL_CAP_FLAT	cap style: end is flat
FL_CAP_ROUND	cap style: end is round
FL_CAP_SQUARE	cap style: end wraps end point
FL_JOIN_MITER	join style: line join extends to a point
FL_JOIN_ROUND	join style: line join is rounded
FL_JOIN_BEVEL	join style: line join is tidied

## 32.7.3 Function Documentation

### 32.7.3.1 `fl_add_symbol()`

```
int fl_add_symbol (
 const char * name,
 void(*) (Fl_Color) drawit,
 int scalable)
```

Adds a symbol to the system.

#### Parameters

in	<i>name</i>	name of symbol (without the "@")
in	<i>drawit</i>	function to draw symbol
in	<i>scalable</i>	set to 1 if <i>drawit</i> uses scalable vector drawing

## Returns

1 on success, 0 on failure

## 32.7.3.2 fl\_antialias()

```
void fl_antialias (
 int state) [inline]
```

Turn antialiased line drawings ON or OFF, if supported by platform.

Currently, only the Windows platform allows to change whether line drawings are antialiased. Turning it OFF may accelerate heavy drawing operations.

## 32.7.3.3 fl\_arc() [1/2]

```
void fl_arc (
 double x,
 double y,
 double r,
 double start,
 double end) [inline]
```

Add a series of points to the current path on the arc of a circle.

The arc is drawn counter-clockwise from 3 o'clock. If *end* is less than *start* then it draws the arc in a clockwise direction. To draw an arc across the 3 o'clock line, *start* and *end* can be greater than 360 or less than 0. For example, to draw a counter-clockwise arc from 6 to 12 o'clock, *start* would be -90 deg, and *end* would be at +90 deg.

You can get elliptical paths by using *scale* and *rotate* before calling *fl\_arc()*.

## Parameters

in	<i>x,y,r</i>	center and radius of circular arc
in	<i>start,end</i>	angles of start and end of arc measured in degrees

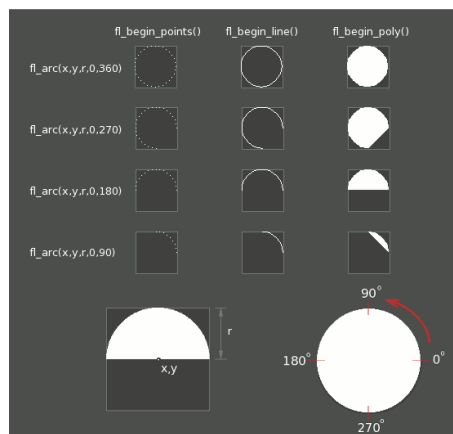

Figure 32.3 fl\_arc(x,y,r,a1,a2)

## Examples:

```
// Draw an arc of points
fl_begin_points();
fl_arc(100.0, 100.0, 50.0, 0.0, 180.0);
fl_end_points();
// Draw arc with a line
fl_begin_line();
fl_arc(200.0, 100.0, 50.0, 0.0, 180.0);
fl_end_line();
// Draw filled arc
fl_begin_polygon();
fl_arc(300.0, 100.0, 50.0, 0.0, 180.0);
```

```
fl_end_polygon();
```

### 32.7.3.4 fl\_arc() [2/2]

```
void fl_arc (
 int x,
 int y,
 int w,
 int h,
 double a1,
 double a2) [inline]
```

Draw ellipse sections using integer coordinates.

These functions match the rather limited circle drawing code provided by X and Windows. The advantage over using `fl_arc` with floating point coordinates is that they are faster because they often use the hardware, and they draw much nicer small circles, since the small sizes are often hard-coded bitmaps.

If a complete circle is drawn it will fit inside the passed bounding box. The two angles are measured in degrees counter-clockwise from 3 o'clock and are the starting and ending angle of the arc, `a2` must be greater or equal to `a1`.

`fl_arc()` draws a series of lines to approximate the arc. Notice that the integer version of `fl_arc()` has a different number of arguments than the double version `fl_arc(double x, double y, double r, double start, double end)`

#### Parameters

in	<code>x,y,w,h</code>	bounding box of complete circle
in	<code>a1,a2</code>	start and end angles of arc measured in degrees counter-clockwise from 3 o'clock. <code>a2</code> must be greater than or equal to <code>a1</code> .

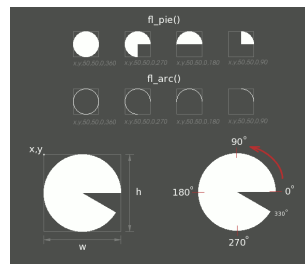

Figure 32.4 `fl_pie()` and `fl_arc()`

### 32.7.3.5 fl\_begin\_complex\_polygon()

```
void fl_begin_complex_polygon () [inline]
```

Start drawing a complex filled polygon.

The polygon may be concave, may have holes in it, or may be several disconnected pieces. Call `fl_gap()` to separate loops of the path.

To outline the polygon, use `fl_begin_loop()` and replace each `fl_gap()` with `fl_end_loop();fl_begin_loop()` pairs.

#### Note

For portability, you should only draw polygons that appear the same whether "even/odd" or "non-zero" winding rules are used to fill them. Holes should be drawn in the opposite direction to the outside loop.

### 32.7.3.6 fl\_begin\_offscreen()

```
void fl_begin_offscreen (
 Fl_Offscreen ctx)
```

Send all subsequent drawing commands to this offscreen buffer.

#### Parameters

<code>ctx</code>	the offscreen buffer.
------------------	-----------------------

#### Note

The `ctx` argument must have been created by [fl\\_create\\_offscreen\(\)](#).

#### 32.7.3.7 fl\_begin\_points()

```
void fl_begin_points () [inline]
```

Start drawing a list of points.

Points are added to the list with [fl\\_vertex\(\)](#).

#### 32.7.3.8 fl\_can\_do\_alpha\_blending()

```
char fl_can_do_alpha_blending () [inline]
```

Check whether platform supports true alpha blending for RGBA images.

#### Returns

1 if true alpha blending supported by platform

0 not supported so FLTK will use screen door transparency

#### 32.7.3.9 fl\_capture\_window()

```
Fl_RGB_Image * fl_capture_window (
 Fl_Window * win,
 int x,
 int y,
 int w,
 int h)
```

Captures the content of a rectangular zone of a mapped window.

#### Parameters

<code>win</code>	a mapped <a href="#">Fl_Window</a> (derived types including <a href="#">Fl_Gl_Window</a> are also possible)
<code>x,y,w,h</code>	window area to be captured. Intersecting sub-windows are captured too.

#### Returns

The captured pixels as an [Fl\\_RGB\\_Image](#). The raw and drawing sizes of the image can differ. Returns NULL when capture was not successful. The image depth may differ between platforms.

#### Version

1.4

#### 32.7.3.10 fl\_circle()

```
void fl_circle (
 double x,
```

```
double y,
double r) [inline]
```

`fl_circle(x,y,r)` is equivalent to `fl_arc(x,y,r,0,360)`, but may be faster.

#### Parameters

in	<i>x,y,r</i>	center and radius of circle
----	--------------	-----------------------------

#### Note

`fl_circle()` is best used as part of the [Drawing Complex Shapes](#) API, that is, flanked by `fl_begin_XXX()` and `fl_end_XXX()` calls where XXX can be 'loop' or 'polygon' to draw, respectively a circle or a disk. Transformation functions (e.g., `fl_scale(double, double)`) can be also used for `fl_circle()` to draw empty or filled ellipses. It must be the *only* thing in the path: if you want a circle as part of a complex polygon you must use `fl_arc()`. Nevertheless, `fl_circle()` can also be used by itself to draw circles.

### 32.7.3.11 fl\_clip()

```
void fl_clip (
 int x,
 int y,
 int w,
 int h) [inline]
```

Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).

#### Parameters

in	<i>x,y,w,h</i>	position and size
----	----------------	-------------------

**Deprecated** Please use `fl_push_clip(int x, int y, int w, int h)` instead. `fl_clip(int, int, int, int)` will be removed in FLTK 1.5.

### 32.7.3.12 fl\_clip\_box()

```
int fl_clip_box (
 int x,
 int y,
 int w,
 int h,
 int & X,
 int & Y,
 int & W,
 int & H) [inline]
```

Intersect a rectangle with the current clip region and return the bounding box of the result.

Returns non-zero if the resulting rectangle is different to the original. The given rectangle (*x*, *y*, *w*, *h*) *should* be entirely inside its window, otherwise the result may be unexpected, i.e. this function *may* not clip the rectangle to the window coordinates and size. In particular *x* and *y* *should* not be negative.

The resulting bounding box can be used to limit the necessary drawing to this rectangle.

#### Example:

```
void MyGroup::draw() {
 int X = 0, Y = 0, W = 0, H = 0;
 int ret = fl_clip_box(x(), y(), w(), h(), X, Y, W, H);
 if (ret == 0) { // entire group is visible (not clipped)
 // full drawing code here
 } else { // parts of this group are clipped
 // partial drawing code here (uses X, Y, W, and H to test)
 }
}
```

```

}
}

```

`W` and `H` are set to zero if the rectangle is completely outside the clipping region. In this case `X` and `Y` are undefined and should not be used. Possible values are `(0, 0)`, `(x, y)`, or anything else (platform dependent).

#### Note

This function is platform-dependent. If the given rectangle is not entirely inside the window, the results are not guaranteed to be the same on all platforms.

#### Parameters

in	<code>x,y,w,h</code>	position and size of rectangle
out	<code>X,Y,W,H</code>	position and size of resulting bounding box.

#### Returns

Non-zero if the resulting rectangle is different to the original.

#### See also

[fl\\_not\\_clipped\(\)](#)

#### 32.7.3.13 fl\_clip\_region() [1/2]

```
Fl_Region fl_clip_region () [inline]
```

Return the current clipping region.

#### Note

This function is mostly intended for internal use by the FLTK library when drawing to the display. Its return value can be always NULL if the current drawing surface is not the display.

#### 32.7.3.14 fl\_clip\_region() [2/2]

```
void fl_clip_region (
 Fl_Region r) [inline]
```

Replace the top of the clipping stack with a clipping region of any shape.

`Fl_Region` is an operating system specific type.

#### Note

This function is mostly intended for internal use by the FLTK library when drawing to the display. Its effect can be null if the current drawing surface is not the display.

#### Parameters

in	<code>r</code>	clipping region
----	----------------	-----------------

#### 32.7.3.15 fl\_copy\_offscreen()

```
void fl_copy_offscreen (
 int x,
 int y,
```

```

 int w,
 int h,
 Fl_Offscreen pixmap,
 int srcx,
 int srcy) [inline]

```

Copy a rectangular area of the given offscreen buffer into the current drawing destination.

#### Parameters

<i>x,y</i>	position where to draw the copied rectangle
<i>w,h</i>	size of the copied rectangle
<i>pixmap</i>	offscreen buffer containing the rectangle to copy
<i>srcx,srcy</i>	origin in offscreen buffer of rectangle to copy

#### 32.7.3.16 fl\_create\_offscreen()

```

Fl_Offscreen fl_create_offscreen (
 int w,
 int h)

```

Creation of an offscreen graphics buffer.

#### Parameters

<i>w,h</i>	width and height in FLTK units of the buffer.
------------	-----------------------------------------------

#### Returns

the created graphics buffer.

The pixel size of the created graphics buffer is equal to the number of pixels in an area of the screen containing the current window sized at *w,h* FLTK units. This pixel size varies with the value of the scale factor of this screen.

#### Note

Work with the `fl_XXX_offscreen()` functions is equivalent to work with an [Fl\\_Image\\_Surface](#) object, as follows :

Fl_Offscreen-based approach	Fl_Image_Surface-based approach
<code>Fl_Offscreen off = fl_create_offscreen(w, h)</code>	<code>Fl_Image_Surface *surface = new Fl_Image_Surface(w, h, 1)</code>
<code>fl_begin_offscreen(off)</code>	<code>Fl_Surface_Device::push_current(surface)</code>
<code>fl_end_offscreen()</code>	<code>Fl_Surface_Device::pop_current()</code>
<code>fl_copy_offscreen(x,y,w,h, off, sx,sy)</code>	<code>fl_copy_offscreen(x,y,w,h, surface-&gt;offscreen(), sx,sy)</code>
<code>fl_rescale_offscreen(off)</code>	<code>surface-&gt;rescale()</code>
<code>fl_delete_offscreen(off)</code>	delete surface

#### 32.7.3.17 fl\_cursor()

```

void fl_cursor (
 Fl_Cursor c)

```

Sets the cursor for the current window to the specified shape and colors.

The cursors are defined in the [<FL/Enumerations.H>](#) header file.

**32.7.3.18 fl\_curve()**

```
void fl_curve (
 double x0,
 double y0,
 double x1,
 double y1,
 double x2,
 double y2,
 double x3,
 double y3) [inline]
```

Add a series of points on a Bézier curve to the path.

The curve ends (and two of the points) are at X0,Y0 and X3,Y3.

**Parameters**

in	X0,Y0	curve start point
in	X1,Y1	curve control point
in	X2,Y2	curve control point
in	X3,Y3	curve end point

**32.7.3.19 fl\_delete\_offscreen()**

```
void fl_delete_offscreen (
 Fl_Offscreen ctx)
```

Deletion of an offscreen graphics buffer.

**Parameters**

ctx	the buffer to be deleted.
-----	---------------------------

**Note**

The `ctx` argument must have been created by [fl\\_create\\_offscreen\(\)](#).

**32.7.3.20 fl\_draw() [1/5]**

```
void fl_draw (
 const char * str,
 int x,
 int y)
```

Draw a nul-terminated UTF-8 string starting at the given `x`, `y` location.

Text is aligned to the left and to the baseline of the font. To align to the bottom, subtract [fl\\_descent\(\)](#) from `y`. To align to the top, subtract [fl\\_descent\(\)](#) and add [fl\\_height\(\)](#). This version of `fl_draw` provides direct access to the text drawing function of the underlying OS. It does not apply any special handling to control characters.

**32.7.3.21 fl\_draw() [2/5]**

```
void fl_draw (
 const char * str,
 int x,
 int y,
 int w,
 int h,
```

```

 Fl_Align align,
 Fl_Image * img,
 int draw_symbols,
 int spacing)

```

Fancy string drawing function which is used to draw all the labels.

The string is formatted and aligned inside the passed box. Handles '\t' and '\n', expands all other control characters to '^X', and aligns inside or against the edges of the box. See [Fl\\_Widget::align\(\)](#) for values of `align`. The value `FL_ALIGN_INSIDE` is ignored, as this function always prints inside the box. If `img` is provided and is not `NULL`, the image is drawn above or below the text as specified by the `align` value. The `draw_symbols` argument specifies whether or not to look for symbol names starting with the '@' character'

#### Parameters

in	<i>str</i>	UTF-8 string, can start and end with an '@sym' symbol, can contain '\n'
in	<i>x,y,w,h</i>	bounding box
in	<i>align</i>	label and image alignment in bounding box
in	<i>img</i>	pointer to image
in	<i>draw_symbols</i>	if true, interpret leading and trailing '@sym' as graphical symbols
in	<i>spacing</i>	spacing between text and image

#### 32.7.3.22 fl\_draw() [3/5]

```

void fl_draw (
 const char * str,
 int x,
 int y,
 int w,
 int h,
 Fl_Align align,
 void*(const char *, int, int, int) callthis,
 Fl_Image * img,
 int draw_symbols,
 int spacing)

```

The same as `fl_draw(const char*,int,int,int,int,Fl_Align,Fl_Image*,int)` with the addition of the `callthis` parameter, which is a pointer to a text drawing function such as `fl_draw(const char*, int, int, int)` to do the real work.

#### Parameters

in	<i>str</i>	UTF-8 string, can start and end with an '@sym' symbol, can contain '\n'
in	<i>x,y,w,h</i>	bounding box
in	<i>align</i>	label and image alignment in bounding box
in	<i>callthis</i>	pointer to text drawing function
in	<i>img</i>	pointer to image
in	<i>draw_symbols</i>	if true, interpret leading and trailing '@sym' as graphical symbols
in	<i>spacing</i>	spacing between text and image

#### 32.7.3.23 fl\_draw() [4/5]

```

void fl_draw (
 int angle,
 const char * str,
 int n,

```

```

 int x,
 int y) [inline]

```

Draw at the given *x*, *y* location a UTF-8 string of length *n* bytes rotating *angle* degrees counter-clockwise.

#### Note

When using X11 (Unix, Linux, Cygwin et al.) this needs Xft to work. Under plain X11 (w/o Xft) rotated text is not supported by FLTK. A warning will be issued to `stderr` at runtime (only once) if you use this method with an angle other than 0.

#### 32.7.3.24 `fl_draw()` [5/5]

```

void fl_draw (
 int angle,
 const char * str,
 int x,
 int y)

```

Draw a nul-terminated UTF-8 string starting at the given *x*, *y* location and rotating *angle* degrees counter-clockwise.

This version of `fl_draw` provides direct access to the text drawing function of the underlying OS and is supported by all fltk platforms except X11 without Xft.

#### 32.7.3.25 `fl_draw_arrow()`

```

void fl_draw_arrow (
 Fl_Rect r,
 Fl_Arrow_Type t,
 Fl_Orientation o,
 Fl_Color col)

```

Draw an "arrow like" GUI element for the selected scheme.

In the future this function should be integrated in `Fl_Scheme` as a virtual method, i.e. it would call a method like ...  
`Fl_Scheme::current()->draw_arrow(r, t, o, col);`

#### Parameters

in	<i>r</i>	bounding box
in	<i>t</i>	arrow type
in	<i>o</i>	orientation
in	<i>col</i>	arrow color

#### Since

1.4.0

#### 32.7.3.26 `fl_draw_box()`

```

void fl_draw_box (
 Fl_Boxtype t,
 int x,
 int y,
 int w,
 int h,
 Fl_Color c)

```

Draws a box using given type, position, size and color.

## Parameters

in	<i>t</i>	box type
in	<i>x,y,w,h</i>	position and size
in	<i>c</i>	color

**32.7.3.27 fl\_draw\_box\_focus()**

```
void fl_draw_box_focus (
 Fl_Boxtype bt,
 int x,
 int y,
 int w,
 int h,
 Fl_Color fg,
 Fl_Color bg)
```

Draws the focus rectangle inside a box using given type, position, size and color.

Boxes can set their own focus drawing callback. The focus frame does not need to be a rectangle at all, but should fit inside the shape of the box.

## Parameters

in	<i>bt</i>	box type
in	<i>x,y,w,h</i>	position and size
in	<i>fg,bg</i>	foreground and background color

**32.7.3.28 fl\_draw\_check()**

```
void fl_draw_check (
 Fl_Rect bb,
 Fl_Color col)
```

Draw a check mark inside the given bounding box.

The check mark is allowed to fill the entire box but the algorithm used makes sure that a 1-pixel border is kept free if the box is large enough. You need to calculate margins for box borders etc. yourself.

The check mark size is limited (minimum and maximum size) and the check mark is always centered in the given box.

## Note

If the box is too small (bad GUI design) the check mark will be drawn over the box borders. This is intentional for better user experience. Otherwise users might not be able to recognize if a box is checked.

The size limits are implementation details and may be changed at any time.

## Parameters

in	<i>bb</i>	rectangle that defines the bounding box
in	<i>col</i>	Fl_Color to draw the check mark

## Since

1.4.0

**32.7.3.29 fl\_draw\_circle()**

```
void fl_draw_circle (
 int x,
 int y,
 int d,
 Fl_Color color)
```

Draw a potentially small, filled circle using a given color.

This function draws a filled circle bounded by rectangle  $(x, y, d, d)$  using color `color`

This function is the same as `fl_pie(x, y, d, d, 0, 360)` except with some systems that don't draw small circles well. In that situation, the circle diameter `d` is converted from FLTK units to pixels and this function approximates a filled circle by drawing several filled rectangles if the converted diameter is 6 pixels.

The current drawing color `fl_color()` is preserved across the call.

**Parameters**

in	<code>x,y</code>	coordinates of top left of the bounding box
in	<code>d</code>	diameter == width and height of the bounding box in FLTK units
in	<code>color</code>	the color used to draw the circle

**Since**

1.4.0

**32.7.3.30 fl\_draw\_image() [1/2]**

```
void fl_draw_image (
 const uchar * buf,
 int X,
 int Y,
 int W,
 int H,
 int D = 3,
 int L = 0) [inline]
```

Draw an 8-bit per color RGB or luminance image.

**Parameters**

in	<code>buf</code>	points at the "r" data of the top-left pixel. Color data must be in <code>r, g, b</code> order. Luminance data is only one <code>gray</code> byte.
in	<code>X,Y</code>	position where to put top-left corner of image
in	<code>W,H</code>	size of the image
in	<code>D</code>	delta to add to the pointer between pixels. It may be any value greater than or equal to 1, or it can be negative to flip the image horizontally
in	<code>L</code>	delta to add to the pointer between lines (if 0 is passed it uses $\bar{W} * D$ ), and may be larger than $\bar{W} * D$ to crop data, or negative to flip the image vertically

It is highly recommended that you put the following code before the first `show()` of *any* window in your program to get rid of the dithering if possible:

```
Fl::visual(FL_RGB);
```

Gray scale (1-channel) images may be drawn. This is done if `abs(D)` is less than 3, or by calling `fl_draw_image_mono()`. Only one 8-bit sample is used for each pixel, and on screens with different numbers of bits for red, green, and blue only gray colors are used. Setting `D` greater than 1 will let you display one channel of a color image.

**Note:**

The X version does not support all possible visuals. If FLTK cannot draw the image in the current visual it will abort. FLTK supports any visual of 8 bits or less, and all common TrueColor visuals up to 32 bits.

**32.7.3.31 fl\_draw\_image() [2/2]**

```
void fl_draw_image (
 Fl_Draw_Image_Cb cb,
 void * data,
 int X,
 int Y,
 int W,
 int H,
 int D = 3) [inline]
```

Draw an image using a callback function to generate image data.

You can generate the image as it is being drawn, or do arbitrary decompression of stored data, provided it can be decompressed to individual scan lines.

**Parameters**

in	<i>cb</i>	callback function to generate scan line data
in	<i>data</i>	user data passed to callback function
in	<i>X,Y</i>	screen position of top left pixel
in	<i>W,H</i>	image width and height
in	<i>D</i>	data size per pixel in bytes (must be greater than 0)

**See also**

[fl\\_draw\\_image\(const uchar\\* buf, int X, int Y, int W, int H, int D, int L\)](#)

The callback function *cb* is called with the `void*` *data* user data pointer to allow access to a structure of information about the image, and the *x*, *y*, and *w* of the scan line desired from the image. 0,0 is the upper-left corner of the image, not *x*, *y*. A pointer to a buffer to put the data into is passed. You must copy *w* pixels from scanline *y*, starting at pixel *x*, to this buffer.

Due to cropping, less than the whole image may be requested. So *x* may be greater than zero, the first *y* may be greater than zero, and *w* may be less than *W*. The buffer is long enough to store the entire *W* \* *D* pixels, this is for convenience with some decompression schemes where you must decompress the entire line at once: decompress it into the buffer, and then if *x* is not zero, copy the data over so the *x*'<sup>th</sup> pixel is at the start of the buffer.

You can assume the *y*'<sup>s</sup> will be consecutive, except the first one may be greater than zero.

If *D* is 4 or more, you must fill in the unused bytes with zero.

**32.7.3.32 fl\_draw\_image\_mono() [1/2]**

```
void fl_draw_image_mono (
 const uchar * buf,
 int X,
 int Y,
 int W,
 int H,
 int D = 1,
 int L = 0) [inline]
```

Draw a gray-scale (1 channel) image.

**See also**

[fl\\_draw\\_image\(const uchar\\* buf, int X,int Y,int W,int H, int D, int L\)](#)

**32.7.3.33 fl\_draw\_image\_mono()** [2/2]

```
void fl_draw_image_mono (
 Fl_Draw_Image_Cb cb,
 void * data,
 int X,
 int Y,
 int W,
 int H,
 int D = 1) [inline]
```

Draw a gray-scale image using a callback function to generate image data.

See also

[fl\\_draw\\_image\(Fl\\_Draw\\_Image\\_Cb cb, void\\* data, int X,int Y,int W,int H, int D\)](#)

**32.7.3.34 fl\_draw\_pixmap()** [1/2]

```
int fl_draw_pixmap (
 char *const * data,
 int x,
 int y,
 Fl_Color bg = FL_GRAY) [inline]
```

Draw XPM image data, with the top-left corner at the given position.

See also

[fl\\_draw\\_pixmap\(const char\\* const\\* data, int x, int y, Fl\\_Color bg\)](#)

**32.7.3.35 fl\_draw\_pixmap()** [2/2]

```
int fl_draw_pixmap (
 const char *const * data,
 int x,
 int y,
 Fl_Color bg = FL_GRAY)
```

Draw XPM image data, with the top-left corner at the given position.

The image is dithered on 8-bit displays so you won't lose color space for programs displaying both images and pixmaps.

Parameters

in	<i>data</i>	pointer to XPM image data
in	<i>x,y</i>	position of top-left corner
in	<i>bg</i>	background color

Returns

0 if there was any error decoding the XPM data.

**32.7.3.36 fl\_draw\_radio()**

```
void fl_draw_radio (
 int x,
 int y,
```

```
int d,
 Fl_Color color)
```

Draw a round check mark (circle) of a radio button.

This draws only the round "radio button mark", it does not draw the (also typically round) box of the radio button.

Call this only if the radio button is ON.

This method draws a scheme specific "circle" with a particular light effect if the scheme is gtk+. For all other schemes this function draws a simple, small circle.

The `color` must be chosen by the caller so it has enough contrast with the background.

The bounding box of the circle is the rectangle (`x`, `y`, `d`, `d`).

The current drawing color `fl_color()` is preserved across the call.

#### Parameters

in	<code>x,y</code>	coordinates of top left of the bounding box
in	<code>d</code>	diameter == width and height of the bounding box in FLTK units
in	<code>color</code>	the base color used to draw the circle

#### Since

1.4.0

#### 32.7.3.37 fl\_draw\_symbol()

```
int fl_draw_symbol (
 const char * label,
 int x,
 int y,
 int w,
 int h,
 Fl_Color col)
```

Draw the named symbol in the given rectangle using the given color.

#### Parameters

in	<code>label</code>	name of symbol
in	<code>x,y</code>	position of symbol
in	<code>w,h</code>	size of symbol
in	<code>col</code>	color of symbox

#### Returns

1 on success, 0 on failure

#### 32.7.3.38 fl\_expand\_text()

```
const char * fl_expand_text (
 const char * from,
 char * buf,
 int maxbuf,
 double maxw,
 int & n,
 double & width,
 int wrap,
 int draw_symbols)
```

Copy *from* to *buf*, replacing control characters with ^X.

Stop at a newline or if *maxbuf* characters written to buffer. Also word-wrap if width exceeds *maxw*. Returns a pointer to the start of the next line of characters. Sets *n* to the number of characters put into the buffer. Sets *width* to the width of the string in the [current font](#).

#### Parameters

in	<i>from</i>	input text, can contain ' ' and single or double '@' characters
out	<i>buf</i>	buffer for the output text segment
in	<i>maxbuf</i>	size of the buffer, or 0 to use the internal buffer allocated in this function
in	<i>maxw</i>	maximum width in pixels of the output text
out	<i>n</i>	number of characters in the output text segment
out	<i>width</i>	actual width in pixels of the output text
in	<i>wrap</i>	if true, wrap at <i>maxw</i> , else wrap at newlines
in	<i>draw_symbols</i>	if true, double '@' characters are escaped into a single '@'

#### Returns

pointer to the next character in the input text

#### 32.7.3.39 fl\_focus\_rect()

```
void fl_focus_rect (
 int x,
 int y,
 int w,
 int h) [inline]
```

Draw a dotted rectangle, used to indicate keyboard focus on a widget.

This method draws the rectangle in the current color and independent of the [Fl::visible\\_focus\(\)](#) option. You may need to set the current color with [fl\\_color\(\)](#) before you call this.

#### 32.7.3.40 fl\_frame()

```
void fl_frame (
 const char * s,
 int x,
 int y,
 int w,
 int h)
```

Draws a series of line segments around the given box.

The string *s* must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The order of each set of 4 characters is: top, left, bottom, right. The result of calling [fl\\_frame\(\)](#) with a string that is not a multiple of 4 characters in length is undefined. The only difference between this function and [fl\\_frame2\(\)](#) is the order of the line segments.

#### Parameters

in	<i>s</i>	sets of 4 grayscale values in top, left, bottom, right order
in	<i>x,y,w,h</i>	position and size

**32.7.3.41 fl\_frame2()**

```
void fl_frame2 (
 const char * s,
 int x,
 int y,
 int w,
 int h)
```

Draws a series of line segments around the given box.

The string *s* must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The order of each set of 4 characters is: bottom, right, top, left. The result of calling `fl_frame2()` with a string that is not a multiple of 4 characters in length is undefined. The only difference between this function and `fl_frame()` is the order of the line segments.

**Parameters**

in	<i>s</i>	sets of 4 grayscale values in bottom, right, top, left order
in	<i>x,y,w,h</i>	position and size

**32.7.3.42 fl\_gap()**

```
void fl_gap () [inline]
```

Separate loops of the path.

It is unnecessary but harmless to call `fl_gap()` before the first vertex, after the last vertex, or several times in a row.

**32.7.3.43 fl\_line\_style()**

```
void fl_line_style (
 int style,
 int width = 0,
 char * dashes = 0) [inline]
```

Set how to draw lines (the "pen").

If you change this it is your responsibility to set it back to the default using `fl_line_style(0)`.

FL_SOLID		FL_CAP_FLAT	
FL_DASH		FL_CAP_ROUND	
FL_DOT		FL_CAP_SQUARE	
FL_DASHDOT		FL_JOIN_MITER	
FL_DASHDOTDOT		FL_JOIN_ROUND	
		FL_JOIN_BEVEL	

Figure 32.5 `fl_line_style()` styles

## Parameters

in	<i>style</i>	A bitmask which is a bitwise-OR of <a href="#">Line Styles</a> , a cap style, and a join style. If you don't specify a dash type you will get a solid line. If you don't specify a cap or join type you will get a system-defined default of whatever value is fastest.
in	<i>width</i>	The thickness of the lines in pixels. Zero results in the system defined default, which on both X and Windows is somewhat different and nicer than 1.
in	<i>dashes</i>	A pointer to an array of dash lengths, measured in pixels. The first location is how long to draw a solid portion, the next is how long to draw the gap, then the solid, etc. It is terminated with a zero-length entry. A <code>NULL</code> pointer or a zero-length array results in a solid line. Odd array sizes are not supported and result in undefined behavior.

## Note

Because of how line styles are implemented on Win32 systems, you *must* set the line style *after* setting the drawing color. If you set the color after the line style you will lose the line style settings.

The `dashes` array does not work under the (unsupported!) operating systems Windows 95, 98 or Me, since those operating systems do not support complex line styles.

32.7.3.44 `fl_load_matrix()`

```
void fl_load_matrix (
 double a,
 double b,
 double c,
 double d,
 double x,
 double y) [inline]
```

Set the current transformation matrix.

## Parameters

in	<i>a,b,c,d,x,y</i>	transformation matrix elements
----	--------------------	--------------------------------

32.7.3.45 `fl_measure()`

```
void fl_measure (
 const char * str,
 int & w,
 int & h,
 int draw_symbols)
```

Measure how wide and tall the string will be when printed by the `fl_draw()` function with `align` parameter.

If the incoming `w` is non-zero it will wrap to that width.

The [current font](#) is used to do the width/height calculations, so unless its value is known at the time `fl_measure()` is called, it is advised to first set the current font with `fl_font()`. With event-driven GUI programming you can never be sure which widget was exposed and redrawn last, nor which font it used. If you have not called `fl_font()` explicitly in your own code, the width and height may be set to unexpected values, even zero!

**Note:** In the general use case, it's a common error to forget to set `w` to 0 before calling `fl_measure()` when wrap behavior isn't needed.

## Parameters

in	<i>str</i>	nul-terminated string
out	<i>w,h</i>	width and height of string in current font

## Parameters

in	<i>draw_symbols</i>	non-zero to enable @symbol handling [default=1]
----	---------------------	-------------------------------------------------

```
// Example: Common use case for fl_measure()
const char *s = "This is a test";
int wi=0, hi=0; // initialize to zero before calling fl_measure()
fl_font(FL_HELVETICA, 14); // set current font face/size to be used for measuring
fl_measure(s, wi, hi); // returns pixel width/height of string in current font
```

**32.7.3.46 fl\_measure\_pixmap() [1/2]**

```
int fl_measure_pixmap (
 char *const * data,
 int & w,
 int & h)
```

Get the dimensions of a pixmap.

An XPM image contains the dimensions in its data. This function returns the width and height.

## Parameters

in	<i>data</i>	pointer to XPM image data.
out	<i>w,h</i>	width and height of image

## Returns

non-zero if the dimensions were parsed OK

0 if there were any problems

**32.7.3.47 fl\_measure\_pixmap() [2/2]**

```
int fl_measure_pixmap (
 const char *const * cdata,
 int & w,
 int & h)
```

Get the dimensions of a pixmap.

## See also

[fl\\_measure\\_pixmap\(char\\* const\\* data, int &w, int &h\)](#)

**32.7.3.48 fl\_mult\_matrix()**

```
void fl_mult_matrix (
 double a,
 double b,
 double c,
 double d,
 double x,
 double y) [inline]
```

Concatenate another transformation onto the current one.

## Parameters

in	<i>a,b,c,d,x,y</i>	transformation matrix elements such that $X' = aX + cY + x$ and $Y' = bX + dY + y$
----	--------------------	------------------------------------------------------------------------------------

**32.7.3.49 fl\_not\_clipped()**

```
int fl_not_clipped (
 int x,
 int y,
 int w,
 int h) [inline]
```

Does the rectangle intersect the current clip region?

**Parameters**

in	<i>x,y,w,h</i>	position and size of rectangle
----	----------------	--------------------------------

**Returns**

non-zero if any of the rectangle intersects the current clip region. If this returns 0 you don't have to draw the object.

**Note**

Under X this returns 2 if the rectangle is partially clipped and 1 if it is entirely inside the clip region.

**See also**

[fl\\_clip\\_box\(\)](#)

**32.7.3.50 fl\_old\_shortcut()**

```
unsigned int fl_old_shortcut (
 const char * s)
```

Emulation of XForms named shortcuts.

Converts ASCII shortcut specifications (eg. "^c") into the FLTK integer equivalent (eg. FL\_CTRL+'c')

These ASCII characters are used to specify the various keyboard modifier keys:

```
- Alt
+ - Shift
^ - Control
! - Meta
@ - Command (Ctrl on linux/win, Meta on OSX)
```

These special characters can be combined to form chords of modifier keys. (See 'Remarks' below)

After the optional modifier key prefixes listed above, one can either specify a single keyboard character to use as the shortcut, or a numeric sequence in hex, decimal or octal.

Examples:

```
"c" -- Uses 'c' as the shortcut
"#^c" -- Same as FL_ALT|FL_CTRL|'c'
"#^!c" -- Same as FL_ALT|FL_CTRL|FL_META|'c'
"@c" -- Same as FL_COMMAND|'c' (see FL_COMMAND for platform specific behavior)
"0x63" -- Same as "c" (hex 63=='c')
"99" -- Same as "c" (dec 99=='c')
"0143" -- Same as "c" (octal 0143=='c')
"^0x63" -- Same as (FL_CTRL|'c'), or (FL_CTRL|0x63)
"^99" -- Same as (FL_CTRL|'c'), or (FL_CTRL|99)
"^0143" -- Same as (FL_CTRL|'c'), or (FL_CTRL|0143)
```

## Remarks

Due to XForms legacy, there are some odd things to consider when using the modifier characters.

(1) You can use the special modifier keys for chords *only* if the modifiers are provided in this order: #, +, ^, !, @. Other ordering can yield undefined results.

So for instance, Ctrl-Alt-c must be specified as "#^c" (and not "^#c"), due to the above ordering rule.

(2) If you want to make a shortcut that uses one of the special modifier characters (as the character being modified), then to avoid confusion, specify the numeric equivalent, e.g.

If you want..	Then use..
'#' as the shortcut..	"0x23" (instead of just "#").
'+' as the shortcut..	"0x2b" (instead of just "+").
'^' as the shortcut..	"0x5e" (instead of just "^").
Alt-+ as the shortcut..	"#0x2b" (instead of "#+").
Alt-^ as the shortcut..	"#0x5e" (instead of "#^").
..etc..	

As a general rule that's easy to remember, unless the shortcut key to be modified is a single alpha-numeric character [A-Z,a-z,0-9), it's probably best to use the numeric equivalents.

Don't fix these silly legacy issues in a future release. Nobody is using this anymore.

### 32.7.3.51 fl\_overlay\_clear()

```
void fl_overlay_clear ()
```

Erase a selection rectangle without drawing a new one.

#### See also

[fl\\_overlay\\_rect\(int x, int y, int w, int h\)](#)

### 32.7.3.52 fl\_overlay\_rect()

```
void fl_overlay_rect (
 int x,
 int y,
 int w,
 int h)
```

Draw a transient dotted selection rectangle.

This function saves the current screen content and then draws a dotted selection rectangle into the front screen buffer. If another selection rectangle was drawn earlier, the previous screen graphics are restored first.

To clear the selection rectangle, call [fl\\_overlay\\_clear\(\)](#).

The typical (and only) use for this function is to draw a selection rectangle during a mouse drag event sequence without having to redraw the entire content of the widget.

Your event handle should look similar to this (also see `test/mandelbrot.cxx`):

```
int MyWidget::handle(int event) {
 static int ix, iy;
 switch (event) {
 case FL_PUSH:
 ix = Fl::event_x(); iy = Fl::event_y();
 return 1;
 case FL_DRAG:
 this->make_current();
 fl_overlay_rect(ix, iy, ix-Fl::event_x(), iy-Fl::event_y());
 return 1;
 case FL_RELEASE:
 this->make_current();
 fl_overlay_clear();
 // select the element under the rectangle
 return 1;
 }
 return MySuperWidget::handle(event);
}
```

**Note**

Between drawing an overlay rect and clearing it, the content of the widget must not change.

`fl_overlay_rect()` and `fl_overlay_clear()` should be called when the actual event occurs, and *not* within `MyWidget::draw()`.

`fl_overlay_rect()` and `fl_overlay_clear()` should not be mixed with `Fl_Overlay_Window`. `Fl_Overlay_Window` provides an entirely different way of drawing selection outlines and is not limited to rectangles.

**Parameters**

<code>x,y,w,h</code>	position and size of the overlay rectangle.
----------------------	---------------------------------------------

**See also**

[fl\\_overlay\\_clear\(\)](#)

**32.7.3.53 fl\_override\_scale()**

```
float fl_override_scale ()
```

Removes any GUI scaling factor in subsequent drawing operations.

This must be matched by a later call to [fl\\_restore\\_scale\(\)](#). This function can be used to transiently perform drawing operations that are not rescaled by the current value of the GUI scaling factor. The resulting drawing context has no clipping region.

**Returns**

The GUI scaling factor value that was in place when the function started.

**32.7.3.54 fl\_pie()**

```
void fl_pie (
 int x,
 int y,
 int w,
 int h,
 double a1,
 double a2) [inline]
```

Draw filled ellipse sections using integer coordinates.

Like [fl\\_arc\(\)](#), but [fl\\_pie\(\)](#) draws a filled-in pie slice. This slice may extend outside the line drawn by [fl\\_arc\(\)](#); to avoid this use `w - 1` and `h - 1`.

**Parameters**

in	<code>x,y,w,h</code>	bounding box of complete circle
in	<code>a1,a2</code>	start and end angles of arc measured in degrees counter-clockwise from 3 o'clock. <code>a2</code> must be greater than or equal to <code>a1</code> .

Figure 32.6 `fl_pie()` and `fl_arc()`

### 32.7.3.55 `fl_polygon()`

```
void fl_polygon (
 int x,
 int y,
 int x1,
 int y1,
 int x2,
 int y2,
 int x3,
 int y3) [inline]
```

Fill a 4-sided polygon.

The polygon must be convex.

### 32.7.3.56 `fl_pop_clip()`

```
void fl_pop_clip () [inline]
```

Restore the previous clip region.

You must call `fl_pop_clip()` once for every time you call `fl_push_clip()`. Unpredictable results may occur if the clip stack is not empty when you return to FLTK.

### 32.7.3.57 `fl_push_clip()`

```
void fl_push_clip (
 int x,
 int y,
 int w,
 int h) [inline]
```

Intersect the current clip region with a rectangle and push this new region onto the stack.

#### Parameters

in	$x,y,w,h$	position and size
----	-----------	-------------------

### 32.7.3.58 `fl_push_matrix()`

```
void fl_push_matrix () [inline]
```

Save the current transformation matrix on the stack.

The maximum depth of the stack is 32.

### 32.7.3.59 `fl_read_image()`

```
uchar * fl_read_image (
 uchar * p,
```

```

 int X,
 int Y,
 int w,
 int h,
 int alpha)

```

Reads an RGB(A) image from the current window or off-screen buffer.

#### Parameters

in	<i>p</i>	pixel buffer, or NULL to allocate one
in	<i>X,Y</i>	position of top-left of image to read
in	<i>w,h</i>	width and height of image to read
in	<i>alpha</i>	alpha value for image (0 for none)

#### Returns

pointer to pixel buffer, or NULL if allocation failed.

The *p* argument points to a buffer that can hold the image and must be at least  $w*h*3$  bytes when reading RGB images, or  $w*h*4$  bytes when reading RGBA images. If NULL, `fl_read_image()` will create an array of the proper size which can be freed using `delete[]`.

The *alpha* parameter controls whether an alpha channel is created and the value that is placed in the alpha channel. If 0, no alpha channel is generated.

#### See also

[fl\\_capture\\_window\(\)](#)

#### 32.7.3.60 fl\_rect() [1/3]

```

void fl_rect (
 Fl_Rect r) [inline]

```

Draw a border *inside* the given bounding box.

This is the same as `fl_rect(int x, int y, int w, int h)` but with `Fl_Rect r` as input argument.

#### 32.7.3.61 fl\_rect() [2/3]

```

void fl_rect (
 int x,
 int y,
 int w,
 int h) [inline]

```

Draw a border *inside* the given bounding box.

This function is meant for quick drawing of simple boxes. The behavior is undefined for line widths that are not 1.

#### 32.7.3.62 fl\_rect() [3/3]

```

void fl_rect (
 int x,
 int y,
 int w,
 int h,
 Fl_Color c) [inline]

```

Draw with passed color a border *inside* the given bounding box.

#### Warning

The current color is changed to *c* upon return.

**32.7.3.63 fl\_rectf()** [1/4]

```
void fl_rectf (
 Fl_Rect bb,
 uchar r,
 uchar g,
 uchar b) [inline]
```

Color a rectangle with "exactly" the passed *r*, *g*, *b* color.

This is the same as `fl_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)` but with `Fl_Rect bb` (bounding box) as argument instead of (*x*, *y*, *w*, *h*).

See also

[fl\\_rectf\(int x, int y, int w, int h, uchar r, uchar g, uchar b\)](#)

**32.7.3.64 fl\_rectf()** [2/4]

```
void fl_rectf (
 Fl_Rect r,
 Fl_Color c) [inline]
```

Color with passed color a rectangle that exactly fills the given bounding box.

Warning

The current color is changed to *c* upon return.

**32.7.3.65 fl\_rectf()** [3/4]

```
void fl_rectf (
 int x,
 int y,
 int w,
 int h,
 Fl_Color c) [inline]
```

Color with passed color a rectangle that exactly fills the given bounding box.

Warning

The current color is changed to *c* upon return.

**32.7.3.66 fl\_rectf()** [4/4]

```
void fl_rectf (
 int x,
 int y,
 int w,
 int h,
 uchar r,
 uchar g,
 uchar b) [inline]
```

Color a rectangle with "exactly" the passed *r*, *g*, *b* color.

On screens with less than 24 bits of color this is done by drawing a solid-colored block using `fl_draw_image()` so that the correct color shade is produced. On other screens, the current color is changed to `fl_color(r, g, b)` upon return.

**32.7.3.67 fl\_rescale\_offscreen()**

```
void fl_rescale_offscreen (
 Fl_Offscreen & ctx)
```

Adapts an offscreen buffer to a changed value of the scale factor.

The `ctx` argument must have been created by [fl\\_create\\_offscreen\(\)](#) and the calling context must not be between [fl\\_begin\\_offscreen\(\)](#) and [fl\\_end\\_offscreen\(\)](#). The graphical content of the offscreen is preserved. The current scale factor value is given by `Fl_Graphics_Driver::default_driver().scale()`.

**Version**

1.4

**32.7.3.68 fl\_reset\_spot()**

```
void fl_reset_spot (
 void)
```

Resets marked text.

In many languages, typing a character can involve multiple keystrokes. For example, the Å can be composed of two dots (¨) on top of the character, followed by the letter A (on a Mac with U.S. keyboard, you'd type Alt-U, Shift-A. To inform the user that the dots may be followed by another character, the ¨ is underlined).

Call this function if character composition needs to be aborted for some reason. One such example would be the text input widget losing focus.

**32.7.3.69 fl\_restore\_scale()**

```
void fl_restore_scale (
 float s)
```

Restores the GUI scaling factor and the clipping region in subsequent drawing operations.

**Parameters**

<code>s</code>	Value returned by a previous call to <a href="#">fl_override_scale()</a> .
----------------	----------------------------------------------------------------------------

**32.7.3.70 fl\_rotate()**

```
void fl_rotate (
 double d) [inline]
```

Concatenate rotation transformation onto the current one.

**Parameters**

<code>in</code>	<code>d</code>	- rotation angle, counter-clockwise in degrees (not radians)
-----------------	----------------	--------------------------------------------------------------

**32.7.3.71 fl\_rounded\_rect()**

```
void fl_rounded_rect (
 int x,
 int y,
 int w,
 int h,
 int r) [inline]
```

Draw a rounded border *inside* the given bounding box.

The radius code is optimized for speed and works best for values between 5 and 15 units.

**32.7.3.72 fl\_rounded\_rectf()**

```
void fl_rounded_rectf (
 int x,
 int y,
 int w,
 int h,
 int r) [inline]
```

Color with current color a rounded rectangle that exactly fills the given bounding box. The radius code is optimized for speed and works best for values between 5 and 15 units.

**32.7.3.73 fl\_scale() [1/2]**

```
void fl_scale (
 double x) [inline]
```

Concatenate scaling transformation onto the current one.

**Parameters**

in	x	scale factor in both x-direction and y-direction
----	---	--------------------------------------------------

**32.7.3.74 fl\_scale() [2/2]**

```
void fl_scale (
 double x,
 double y) [inline]
```

Concatenate scaling transformation onto the current one.

**Parameters**

in	x,y	scale factors in x-direction and y-direction
----	-----	----------------------------------------------

**32.7.3.75 fl\_scroll()**

```
void fl_scroll (
 int X,
 int Y,
 int W,
 int H,
 int dx,
 int dy,
 void(*) (void *, int, int, int, int) draw_area,
 void * data)
```

Scroll a rectangle and draw the newly exposed portions.

**Parameters**

in	X,Y	position of top-left of rectangle
in	W,H	size of rectangle
in	dx,dy	pixel offsets for shifting rectangle
in	draw_area	callback function to draw rectangular areas
in	data	pointer to user data for callback The contents of the rectangular area is first shifted by dx and dy pixels. The draw_area callback is then called for every newly exposed rectangular area.

**32.7.3.76 fl\_set\_spot()**

```
void fl_set_spot (
 int font,
 int size,
 int X,
 int Y,
 int W,
 int H,
 Fl_Window * win = 0)
```

Inform text input methods about the current text insertion cursor.

**Parameters**

<i>font</i>	Font currently in use in text input.
<i>size</i>	Size of the current font.
<i>X,Y</i>	Position of the bottom of the current text insertion cursor.
<i>W,H</i>	Width and height of the current text insertion cursor.
<i>win</i>	Points to the <a href="#">Fl_Window</a> object containing the current text widget, or NULL.

**32.7.3.77 fl\_set\_status()**

```
void fl_set_status (
 int X,
 int Y,
 int W,
 int H)
```

Related to text input methods under X11.

This function is presently used only by the `utf8` test application and only for the X11 platform. This function is apparently not indispensable for text input to work correctly as suggested by other apps that don't use it (e.g., editor).

**32.7.3.78 fl\_shortcut\_label() [1/2]**

```
const char * fl_shortcut_label (
 unsigned int shortcut)
```

Get a human-readable string from a shortcut value.

Unparse a shortcut value as used by [Fl\\_Button](#) or [Fl\\_Menu\\_Item](#) into a human-readable string like "Alt+N". This only works if the shortcut is a character key or a numbered function key. If the shortcut is zero then an empty string is returned. The return value points at a static buffer that is overwritten with each call.

**Since**

FLTK 1.3.4 modifier key names can be localized, but key names can not yet be localized. This may be added to a future FLTK version.

Modifier key names (human-readable shortcut names) can be defined with the following global `const char *` pointer variables:

- `fl_local_ctrl` => name of `FL_CTRL`
- `fl_local_alt` => name of `FL_ALT`
- `fl_local_shift` => name of `FL_SHIFT`
- `fl_local_meta` => name of `FL_META`

```
fl_local_ctrl = "Strg"; // German for "Ctrl"
fl_local_shift = "Umschalt"; // German for "Shift"
```

**Note**

Due to **random** static initialization order this should always be done from code in `main()` or called by `main()` as opposed to static initialization since the default strings in the FLTK library are set by static initializers. Otherwise this **might** result in the wrong order so FLTK's internal initialization overwrites your strings.

The shortcut name will be constructed by adding all modifier names in the order defined above plus the name of the key. A '+' character is added to each modifier name unless it has a trailing '\' or a trailing '+'.

Example:

Ctrl+Alt+Shift+Meta+F12

The default values for modifier key names are as given above for all platforms except macOS. macOS uses graphical characters that represent the typical macOS modifier names in menus, e.g. cloverleaf, saucepan, etc. You may, however, redefine macOS modifier names as well.

**Parameters**

in	<i>shortcut</i>	the integer value containing the ASCII character or extended keystroke plus modifiers
----	-----------------	---------------------------------------------------------------------------------------

**Returns**

a pointer to a static buffer containing human readable text for the shortcut

**32.7.3.79 fl\_shortcut\_label() [2/2]**

```
const char * fl_shortcut_label (
 unsigned int shortcut,
 const char ** eom)
```

Get a human-readable string from a shortcut value.

**Parameters**

in	<i>shortcut</i>	the integer value containing the ASCII character or extended keystroke plus modifiers
in	<i>eom</i>	if this pointer is set, it will receive a pointer to the end of the modifier text

**Returns**

a pointer to a static buffer containing human readable text for the shortcut

**See also**

[fl\\_shortcut\\_label\(unsigned int shortcut\)](#)

**32.7.3.80 fl\_transform\_dx()**

```
double fl_transform_dx (
 double x,
 double y) [inline]
```

Transform distance using current transformation matrix.

**Parameters**

in	<i>x,y</i>	coordinate
----	------------	------------

**32.7.3.81 fl\_transform\_dy()**

```
double fl_transform_dy (
 double x,
 double y) [inline]
```

Transform distance using current transformation matrix.

**Parameters**

in	x,y	coordinate
----	-----	------------

**32.7.3.82 fl\_transform\_x()**

```
double fl_transform_x (
 double x,
 double y) [inline]
```

Transform coordinate using the current transformation matrix.

**Parameters**

in	x,y	coordinate
----	-----	------------

**32.7.3.83 fl\_transform\_y()**

```
double fl_transform_y (
 double x,
 double y) [inline]
```

Transform coordinate using the current transformation matrix.

**Parameters**

in	x,y	coordinate
----	-----	------------

**32.7.3.84 fl\_transformed\_vertex()**

```
void fl_transformed_vertex (
 double xf,
 double yf) [inline]
```

Add coordinate pair to the vertex list without further transformations.

**Parameters**

in	xf,yf	transformed coordinate
----	-------	------------------------

**32.7.3.85 fl\_translate()**

```
void fl_translate (
 double x,
 double y) [inline]
```

Concatenate translation transformation onto the current one.

## Parameters

in	x,y	translation factor in x-direction and y-direction
----	-----	---------------------------------------------------

**32.7.3.86 fl\_vertex()**

```
void fl_vertex (
 double x,
 double y) [inline]
```

Add a single vertex to the current path.

## Parameters

in	x,y	coordinate
----	-----	------------

**32.8 Multithreading support functions**

fl multithreading support functions declared in <[FL/Fl.H](#)>

**Functions**

- static int [Fl::awake](#) ([Fl\\_Awake\\_Handler](#) cb, void \*message=0)  
*See void awake(void\* message=0).*
- static void [Fl::awake](#) (void \*message=0)  
*Sends a message pointer to the main thread, causing any pending [Fl::wait\(\)](#) call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.*
- static int [Fl::lock](#) ()  
*The [lock\(\)](#) method blocks the current thread until it can safely access FLTK widgets and data.*
- static void \* [Fl::thread\\_message](#) ()  
*The [thread\\_message\(\)](#) method returns the last message that was sent from a child by the [awake\(\)](#) method.*
- static void [Fl::unlock](#) ()  
*The [unlock\(\)](#) method releases the lock that was set using the [lock\(\)](#) method.*

**32.8.1 Detailed Description**

fl multithreading support functions declared in <[FL/Fl.H](#)>

**32.8.2 Function Documentation****32.8.2.1 awake() [1/2]**

```
int Fl::awake (
 Fl_Awake_Handler func,
 void * data = 0) [static]
```

See void awake(void\* message=0).

Let the main thread know an update is pending and have it call a specific function.

Registers a function that will be called by the main thread during the next message handling cycle. Returns 0 if the callback function was registered, and -1 if registration failed. Over a thousand awake callbacks can be registered simultaneously.

See also

[Fl::awake\(void\\* message=0\)](#)

### 32.8.2.2 `awake()` [2/2]

```
void Fl::awake (
 void * msg = 0) [static]
```

Sends a message pointer to the main thread, causing any pending [Fl::wait\(\)](#) call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.

Multiple calls to [Fl::awake\(\)](#) will queue multiple pointers for the main thread to process, up to a system-defined (typically several thousand) depth. The default message handler saves the last message which can be accessed using the [Fl::thread\\_message\(\)](#) function.

In the context of a threaded application, a call to [Fl::awake\(\)](#) with no argument will trigger event loop handling in the main thread. Since it is not possible to call [Fl::flush\(\)](#) from a subsidiary thread, [Fl::awake\(\)](#) is the best (and only, really) substitute.

It's *not* necessary to wrap calls to any form of [Fl::awake\(\)](#) by [Fl::lock\(\)](#) and [Fl::unlock\(\)](#). Nevertheless, the early, single call to [Fl::lock\(\)](#) used to initialize threading support is necessary.

Function [Fl::awake\(\)](#) in all its forms is typically called by worker threads, but it can be used safely by the main thread too, as a means to break the event loop.

See also

[Multithreading](#)

### 32.8.2.3 `lock()`

```
int Fl::lock () [static]
```

The [lock\(\)](#) method blocks the current thread until it can safely access FLTK widgets and data.

Child threads should call this method prior to updating any widgets or accessing data. The main thread must call [lock\(\)](#) to initialize the threading support in FLTK. [lock\(\)](#) will return non-zero if threading is not available on the platform.

Child threads must call [unlock\(\)](#) when they are done accessing FLTK.

When the [wait\(\)](#) method is waiting for input or timeouts, child threads are given access to FLTK. Similarly, when the main thread needs to do processing, it will wait until all child threads have called [unlock\(\)](#) before processing additional data.

Returns

0 if threading is available on the platform; non-zero otherwise.

See also: [Multithreading](#)

### 32.8.2.4 `thread_message()`

```
void * Fl::thread_message () [static]
```

The [thread\\_message\(\)](#) method returns the last message that was sent from a child by the [awake\(\)](#) method.

See also: [Multithreading](#)

### 32.8.2.5 `unlock()`

```
void Fl::unlock () [static]
```

The [unlock\(\)](#) method releases the lock that was set using the [lock\(\)](#) method.

Child threads should call this method as soon as they are finished accessing FLTK.

See also: [Multithreading](#)

## 32.9 Safe widget deletion support functions

These functions, declared in `<FL/Fl.H>`, support deletion of widgets inside callbacks.

## Functions

- static void [Fl::clear\\_widget\\_pointer](#) ([Fl\\_Widget](#) const \*w)  
*Clears a widget pointer in the watch list.*
- static void [Fl::delete\\_widget](#) ([Fl\\_Widget](#) \*w)  
*Schedules a widget for deletion at the next call to the event loop.*
- static void [Fl::do\\_widget\\_deletion](#) ()  
*Deletes widgets previously scheduled for deletion.*
- static void [Fl::release\\_widget\\_pointer](#) ([Fl\\_Widget](#) \*&w)  
*Releases a widget pointer from the watch list.*
- static void [Fl::watch\\_widget\\_pointer](#) ([Fl\\_Widget](#) \*&w)  
*Adds a widget pointer to the widget watch list.*

### 32.9.1 Detailed Description

These functions, declared in `<FL/Fl.H>`, support deletion of widgets inside callbacks.

[Fl::delete\\_widget\(\)](#) should be called when deleting widgets or complete widget trees ([Fl\\_Group](#), [Fl\\_Window](#), ...) inside callbacks.

The other functions are intended for internal use. The preferred way to use them is by using the helper class [Fl\\_Widget\\_Tracker](#).

The following is to show how it works ...

There are three groups of related methods:

1. scheduled widget deletion
  - [Fl::delete\\_widget\(\)](#) schedules widgets for deletion
  - [Fl::do\\_widget\\_deletion\(\)](#) deletes all scheduled widgets
2. widget watch list ("smart pointers")
  - [Fl::watch\\_widget\\_pointer\(\)](#) adds a widget pointer to the watch list
  - [Fl::release\\_widget\\_pointer\(\)](#) removes a widget pointer from the watch list
  - [Fl::clear\\_widget\\_pointer\(\)](#) clears a widget pointer *in* the watch list
3. the class [Fl\\_Widget\\_Tracker](#):
  - the constructor calls [Fl::watch\\_widget\\_pointer\(\)](#)
  - the destructor calls [Fl::release\\_widget\\_pointer\(\)](#)
  - the access methods can be used to test, if a widget has been deleted

See also

[Fl\\_Widget\\_Tracker](#).

### 32.9.2 Function Documentation

#### 32.9.2.1 clear\_widget\_pointer()

```
void Fl::clear_widget_pointer (
 Fl_Widget const * w) [static]
```

Clears a widget pointer *in* the watch list.

This is called when a widget is destroyed (by its destructor). You should never call this directly.

#### Note

Internal use only !

This method searches the widget watch list for pointers to the widget and clears each pointer that points to it. Widget pointers can be added to the widget watch list by calling [Fl::watch\\_widget\\_pointer\(\)](#) or by using the helper class [Fl\\_Widget\\_Tracker](#) (recommended).

See also

[Fl::watch\\_widget\\_pointer\(\)](#)  
class [Fl\\_Widget\\_Tracker](#)

### 32.9.2.2 delete\_widget()

```
void Fl::delete_widget (
 Fl_Widget * wi) [static]
```

Schedules a widget for deletion at the next call to the event loop.

Use this method to delete a widget inside a callback function.

To avoid early deletion of widgets, this function should be called toward the end of a callback and only after any call to the event loop ([Fl::wait\(\)](#), [Fl::flush\(\)](#), [Fl::check\(\)](#), [fl\\_ask\(\)](#), etc.).

When deleting groups or windows, you must only delete the group or window widget and not the individual child widgets.

Since

FLTK 1.3.4 the widget will be hidden immediately, but the actual destruction will be delayed until the event loop is finished. Up to FLTK 1.3.3 windows wouldn't be hidden before the event loop was done, hence you had to [hide\(\)](#) a window in your window close callback if you called [Fl::delete\\_widget\(\)](#) to destroy (and hide) the window.

FLTK 1.3.0 it is not necessary to remove widgets from their parent groups or windows before calling this, because it will be done in the widget's destructor, but it is not a failure to do this nevertheless.

Note

In FLTK 1.1 you **must** remove widgets from their parent group (or window) before deleting them.

See also

[Fl\\_Widget::~~Fl\\_Widget\(\)](#)

### 32.9.2.3 do\_widget\_deletion()

```
void Fl::do_widget_deletion () [static]
```

Deletes widgets previously scheduled for deletion.

This is for internal use only. You should never call this directly.

[Fl::do\\_widget\\_deletion\(\)](#) is called from the FLTK event loop or whenever you call [Fl::wait\(\)](#). The previously scheduled widgets are deleted in the same order they were scheduled by calling [Fl::delete\\_widget\(\)](#).

See also

[Fl::delete\\_widget\(Fl\\_Widget \\*wi\)](#)

### 32.9.2.4 release\_widget\_pointer()

```
void Fl::release_widget_pointer (
 Fl_Widget *& w) [static]
```

Releases a widget pointer from the watch list.

This is used to remove a widget pointer that has been added to the watch list with [Fl::watch\\_widget\\_pointer\(\)](#), when it is not needed anymore.

Note

Internal use only, please use class [Fl\\_Widget\\_Tracker](#) instead.

See also

[Fl::watch\\_widget\\_pointer\(\)](#)

### 32.9.2.5 watch\_widget\_pointer()

```
void Fl::watch_widget_pointer (
 Fl_Widget *& w) [static]
```

Adds a widget pointer to the widget watch list.

#### Note

Internal use only, please use class [Fl\\_Widget\\_Tracker](#) instead.

This can be used, if it is possible that a widget might be deleted during a callback or similar function. The widget pointer must be added to the watch list before calling the callback. After the callback the widget pointer can be queried, if it is NULL. If it is NULL, then the widget has been deleted during the callback and must not be accessed anymore. If the widget pointer is *not* NULL, then the widget has not been deleted and can be accessed safely.

After accessing the widget, the widget pointer must be released from the watch list by calling [Fl::release\\_widget\\_pointer\(\)](#).

Example for a button that is clicked (from its [handle\(\)](#) method):

```
Fl_Widget *wp = this; // save 'this' in a pointer variable
Fl::watch_widget_pointer(wp); // add the pointer to the watch list
set_changed(); // set the changed flag
do_callback(); // call the callback
if (!wp) { // the widget has been deleted
 // DO NOT ACCESS THE DELETED WIDGET !
} else { // the widget still exists
 clear_changed(); // reset the changed flag
}
Fl::release_widget_pointer(wp); // remove the pointer from the watch list
```

This works, because all widgets call [Fl::clear\\_widget\\_pointer\(\)](#) in their destructors.

#### See also

[Fl::release\\_widget\\_pointer\(\)](#)

[Fl::clear\\_widget\\_pointer\(\)](#)

An easier and more convenient method to control widget deletion during callbacks is to use the class [Fl\\_Widget\\_Tracker](#) with a local (automatic) variable.

#### See also

class [Fl\\_Widget\\_Tracker](#)

## 32.10 Cairo Support Functions and Classes

### Classes

- class [Fl\\_Cairo\\_State](#)  
*Contains all the necessary info on the current cairo context.*
- class [Fl\\_Cairo\\_Window](#)  
*This defines an FLTK window with Cairo support.*

### Functions

- static bool [Fl::cairo\\_autolink\\_context](#) ()  
*Gets the current autolink mode for Cairo support.*
- static void [Fl::cairo\\_autolink\\_context](#) (bool alink)  
*When `FLTK_HAVE_CAIRO` is defined and [cairo\\_autolink\\_context\(\)](#) is true, any current window `dc` is linked to a current Cairo context.*
- static cairo\_t\* [Fl::cairo\\_cc](#) ()  
*Gets the current Cairo context linked with a fltk window.*
- static void [Fl::cairo\\_cc](#) (cairo\_t \*c, bool own=false)  
*Sets the current Cairo context to `c`.*
- static void [Fl::cairo\\_flush](#) (cairo\_t \*c)  
*Flush Cairo drawings on Cairo context `c`.*
- static cairo\_t\* [Fl::cairo\\_make\\_current](#) ([Fl\\_Window](#) \*w)  
*Provides a Cairo context for window `wi`.*

### 32.10.1 Detailed Description

### 32.10.2 Function Documentation

#### 32.10.2.1 `cairo_autolink_context()` [1/2]

```
static bool Fl::cairo_autolink_context () [inline], [static]
```

Gets the current autolink mode for Cairo support.

##### Return values

<i>false</i>	if no Cairo context autolink is made for each window.
<i>true</i>	if any fltk window is attached a Cairo context when it is current.

##### See also

void [cairo\\_autolink\\_context\(bool alink\)](#)

##### Note

Only available when configure has the `--enable-cairo` option

#### 32.10.2.2 `cairo_autolink_context()` [2/2]

```
static void Fl::cairo_autolink_context (
 bool alink) [inline], [static]
```

When `FLTK_HAVE_CAIRO` is defined and [cairo\\_autolink\\_context\(\)](#) is true, any current window `dc` is linked to a current Cairo context.

This is not the default, because it may not be necessary to add Cairo support to all fltk supported windows. When you wish to associate a Cairo context in this mode, you need to call explicitly in your `draw()` overridden method, [Fl::cairo\\_make\\_current\(Fl\\_Window\\*\)](#). This will create a Cairo context only for this Window. Still in custom Cairo application it is possible to handle completely this process automatically by setting `alink` to true. In this last case, you don't need anymore to call [Fl::cairo\\_make\\_current\(\)](#). You can use [Fl::cairo\\_cc\(\)](#) to get the current Cairo context anytime.

##### Note

Only available when configure has the `--enable-cairo` option

#### 32.10.2.3 `cairo_cc()`

```
static void Fl::cairo_cc (
 cairo_t * c,
 bool own = false) [inline], [static]
```

Sets the current Cairo context to `c`.

Set `own` to true if you want fltk to handle this `cc` deletion.

##### Note

Only available when configure has the `--enable-Cairo` option

### 32.10.2.4 `cairo_flush()`

```
static void Fl::cairo_flush (
 cairo_t * c) [inline], [static]
```

Flush Cairo drawings on Cairo context *c*.

This is **required** on Windows if you use the Cairo context provided by the "Cairo autolink" option. Call this when all your drawings on the Cairo context are finished. This is maybe not necessary on other platforms than Windows but it does no harm if you call it always.

You don't need to use this if you use an [Fl\\_Cairo\\_Window](#) which does this automatically after the draw callback returns.

Code example for "Cairo autolink" mode:

In the overridden `draw()` method of your subclass of [Fl\\_Window](#) or any widget:

```
cairo_t *cc = Fl::cairo_cc(); // get the "autolink" Cairo context
// ... your Cairo drawings are here ...
Fl::cairo_flush(cc); // flush Cairo drawings to the device
```

If you configure FLTK with '`--enable-cairo`' or CMake option '`FLTK_OPTION_CAIRO_WINDOW`' (i.e. without '`--enable-cairoext`' or CMake option '`FLTK_OPTION_CAIRO_EXT`') or if you don't enable the 'autolink' Cairo context you may do the equivalent to use Cairo drawings in an overridden `draw()` method of derived classes by using

```
// get the Cairo context for the \c window
cairo_t *cc = Fl::cairo_make_current(window);
// ... your Cairo drawings are here ...
Fl::cairo_flush(cc); // flush Cairo drawings to the device
```

See also

[Fl::cairo\\_autolink\\_context\(bool\)](#)

[Fl::cairo\\_make\\_current\(Fl\\_Window\\*\)](#);

### 32.10.2.5 `cairo_make_current()`

```
cairo_t * Fl::cairo_make_current (
 Fl_Window * wi) [static]
```

Provides a Cairo context for window *wi*.

This is needed in a `draw()` override if [Fl::cairo\\_autolink\\_context\(\)](#) returns false, which is the default. The `cairo_↔context()` does not need to be freed as it is freed every time a new Cairo context is created. When the program terminates, a call to `Fl::cairo_make_current(0)` will destroy any residual context.

Note

A new Cairo context is not always re-created when this method is used. In particular, if the current graphical context and the current window didn't change between two calls, the previous gc is internally kept, thus optimizing the drawing performances. Also, after this call, [Fl::cairo\\_cc\(\)](#) is adequately updated with this Cairo context.

Only available when configure has the `--enable-cairo` option

Returns

The valid `cairo_t *cairo` context associated to this window.

Return values

<code>NULL</code>	if <i>wi</i> is <code>NULL</code> or maybe with GL windows under Wayland
-------------------	--------------------------------------------------------------------------

## 32.11 Unicode and UTF-8 functions

fl global Unicode and UTF-8 handling functions declared in `<FL/fl_utf8.h>`

## Macros

- `#define ERRORS_TO_CP1252 1`  
Set to 1 to turn bad UTF-8 bytes in the 0x80-0x9f range into the Unicode index for Microsoft's CP1252 character set.
- `#define ERRORS_TO_ISO8859_1 1`  
Set to 1 to turn bad UTF-8 bytes into ISO-8859-1.
- `#define NBC 0xFFFF + 1`
- `#define STRICT_RFC3629 0`  
A number of Unicode code points are in fact illegal and should not be produced by a UTF-8 converter.

## Functions

- `int fl_access` (const char \*f, int mode)  
Cross-platform function to test a files access() with a UTF-8 encoded name or value.
- `int fl_chdir` (const char \*path)  
Cross-platform function to change the current working directory, given as a UTF-8 encoded string.
- `int fl_chmod` (const char \*f, int mode)  
Cross-platform function to set a files mode() with a UTF-8 encoded name or value.
- `int fl_close_fd` (int fd)  
Cross-platform function to close a file descriptor.
- `int fl_execvp` (const char \*file, char \*const \*argv)
- `FILE * fl_fopen` (const char \*f, const char \*mode)  
Cross-platform function to open files with a UTF-8 encoded name.
- `char * fl_getcwd` (char \*buf, int len)  
Cross-platform function to get the current working directory as a UTF-8 encoded value.
- `char * fl_getenv` (const char \*v)  
Cross-platform function to get environment variables with a UTF-8 encoded name or value.
- `char fl_make_path` (const char \*path)  
Cross-platform function to recursively create a path in the file system.
- `void fl_make_path_for_file` (const char \*path)  
Cross-platform function to create a path for the file in the file system.
- `int fl_mkdir` (const char \*f, int mode)  
Cross-platform function to create a directory with a UTF-8 encoded name.
- `unsigned int fl_nonspacing` (unsigned int ucs)  
Returns true if the Unicode character ucs is non-spacing.
- `int fl_open` (const char \*fname, int oflags,...)  
Cross-platform function to open files with a UTF-8 encoded name.
- `int fl_open_ext` (const char \*fname, int binary, int oflags,...)  
Cross-platform function to open files with a UTF-8 encoded name.
- `int fl_putenv` (const char \*var)  
Cross-platform function to write environment variables with a UTF-8 encoded name or value.
- `int fl_rename` (const char \*f, const char \*n)  
Cross-platform function to rename a filesystem object using UTF-8 encoded names.
- `int fl_rmdir` (const char \*f)  
Cross-platform function to remove a directory with a UTF-8 encoded name.
- `int fl_stat` (const char \*f, struct stat \*b)  
Cross-platform function to stat() a file using a UTF-8 encoded name or value.
- `int fl_system` (const char \*cmd)  
Cross-platform function to run a system command with a UTF-8 encoded string.
- `int fl_tolower` (unsigned int ucs)  
Returns the Unicode lower case value of ucs.
- `int fl_toupper` (unsigned int ucs)

- Returns the Unicode upper case value of `ucs`.*

  - unsigned `fl_ucs_to_Utf16` (const unsigned ucs, unsigned short \*dst, const unsigned dstlen)

*Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.*
- int `fl_unlink` (const char \*fname)

*Cross-platform function to `unlink()` (that is, delete) a file using a UTF-8 encoded filename.*
- char \* `fl_utf2mbcs` (const char \*s)

*Converts UTF-8 string `s` to a local multi-byte character string.*
- const char \* `fl_utf8back` (const char \*p, const char \*start, const char \*end)

*Move `p` backward until it points to the start of a UTF-8 character.*
- int `fl_utf8bytes` (unsigned ucs)

*Return the number of bytes needed to encode the given UCS4 character in UTF-8.*
- unsigned `fl_utf8decode` (const char \*p, const char \*end, int \*len)

*Decode a single UTF-8 encoded character starting at `p`.*
- int `fl_utf8encode` (unsigned ucs, char \*buf)

*Write the UTF-8 encoding of `ucs` into `buf` and return the number of bytes written.*
- unsigned `fl_utf8from_mb` (char \*dst, unsigned dstlen, const char \*src, unsigned srclen)

*Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.*
- unsigned `fl_utf8froma` (char \*dst, unsigned dstlen, const char \*src, unsigned srclen)

*Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.*
- unsigned `fl_utf8fromwc` (char \*dst, unsigned dstlen, const wchar\_t \*src, unsigned srclen)

*Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.*
- const char \* `fl_utf8fwd` (const char \*p, const char \*start, const char \*end)

*Move `p` forward until it points to the start of a UTF-8 character.*
- int `fl_utf8len` (char c)

*Returns the byte length of the UTF-8 sequence with first byte `c`, or -1 if `c` is not valid.*
- int `fl_utf8len1` (char c)

*Returns the byte length of the UTF-8 sequence with first byte `c`, or 1 if `c` is not valid.*
- int `fl_utf8locale` ()

*Return true if the "locale" seems to indicate that UTF-8 encoding is used.*
- int `fl_utf8strlen` (const char \*text, int len)

*Return the length in bytes of a UTF-8 string.*
- int `fl_utf8test` (const char \*src, unsigned srclen)

*Examines the first `srclen` bytes in `src` and returns a verdict on whether it is UTF-8 or not.*
- unsigned `fl_utf8to_mb` (const char \*src, unsigned srclen, char \*dst, unsigned dstlen)

*Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).*
- unsigned `fl_utf8toa` (const char \*src, unsigned srclen, char \*dst, unsigned dstlen)

*Convert a UTF-8 sequence into an array of 1-byte characters.*
- unsigned `fl_utf8toUtf16` (const char \*src, unsigned srclen, unsigned short \*dst, unsigned dstlen)

*Convert a UTF-8 sequence into an array of 16-bit characters.*
- unsigned `fl_utf8towc` (const char \*src, unsigned srclen, wchar\_t \*dst, unsigned dstlen)

*Converts a UTF-8 string into a wide character string.*
- int `fl_utf_nb_char` (const unsigned char \*buf, int len)

*Returns the number of Unicode chars in the UTF-8 string.*
- int `fl_utf_strcasecmp` (const char \*s1, const char \*s2)

*UTF-8 aware `strcasecmp` - converts to Unicode and tests.*
- int `fl_utf_strncasecmp` (const char \*s1, const char \*s2, int n)

*UTF-8 aware `strncasecmp` - converts to lower case Unicode and tests.*
- int `fl_utf_tolower` (const unsigned char \*str, int len, char \*buf)

*Converts the string `str` to its lower case equivalent into `buf`.*
- int `fl_utf_toupper` (const unsigned char \*str, int len, char \*buf)

*Converts the string `str` to its upper case equivalent into `buf`.*

- `int fl_wcwidth (const char *src)`  
*extended wrapper around `fl_wcwidth_(unsigned int ucs)` function.*
- `int fl_wcwidth_ (unsigned int ucs)`  
*Wrapper to adapt Markus Kuhn's implementation of `wcwidth()` for FLTK.*

### 32.11.1 Detailed Description

`fl` global Unicode and UTF-8 handling functions declared in `<FL/fl_utf8.h>`

### 32.11.2 Macro Definition Documentation

#### 32.11.2.1 ERRORS\_TO\_CP1252

```
#define ERRORS_TO_CP1252 1
```

Set to 1 to turn bad UTF-8 bytes in the 0x80-0x9f range into the Unicode index for Microsoft's CP1252 character set.

You should also set `ERRORS_TO_ISO8859_1`. With this a huge amount of more available text (such as all web pages) are correctly converted to Unicode.

#### 32.11.2.2 ERRORS\_TO\_ISO8859\_1

```
#define ERRORS_TO_ISO8859_1 1
```

Set to 1 to turn bad UTF-8 bytes into ISO-8859-1.

If this is zero they are instead turned into the Unicode REPLACEMENT CHARACTER, of value 0xfffd. If this is on `fl_utf8decode()` will correctly map most (perhaps all) human-readable text that is in ISO-8859-1. This may allow you to completely ignore character sets in your code because virtually everything is either ISO-8859-1 or UTF-8.

#### 32.11.2.3 STRICT\_RFC3629

```
#define STRICT_RFC3629 0
```

A number of Unicode code points are in fact illegal and should not be produced by a UTF-8 converter.

Turn this on will replace the bytes in those encodings with errors. If you do this then converting arbitrary 16-bit data to UTF-8 and then back is not an identity, which will probably break a lot of software.

### 32.11.3 Function Documentation

#### 32.11.3.1 fl\_access()

```
int fl_access (
 const char * f,
 int mode)
```

Cross-platform function to test a files `access()` with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where the standard `access()` function fails with UTF-8 encoded non-ASCII filenames.

Windows defines the mode values 0 for existence, 2 for writable, 4 for readable, and 6 of readable and writable. On other systems, the modes `X_OK`, `W_OK`, and `R_OK` are usually defined as 1, 2, and 4.

Upon successful completion, the value 0 is returned on all platforms.

#### Parameters

in	<i>f</i>	the UTF-8 encoded filename
in	<i>mode</i>	the mode to test

**Returns**

the return value of `_waccess()` on Windows or `access()` on other platforms.

**32.11.3.2 fl\_chdir()**

```
int fl_chdir (
 const char * path)
```

Cross-platform function to change the current working directory, given as a UTF-8 encoded string.

This function is especially useful on the Windows platform where the standard `_wchdir()` function needs a `path` in UTF-16 encoding.

The `path` is converted to a system specific encoding if necessary and the system specific `chdir (converted↔_path)` function is called.

The function returns 0 on success and -1 on error. Depending on the platform, `errno` **may** be set if an error occurs.

**Note**

The possible `errno` values are platform specific. Refer to the documentation of the platform specific `chdir()` function.

If the function is not implemented on a particular platform the default implementation returns -1 and `errno` is **not** set.

If the `path` is `NULL` the function returns -1, but `errno` is **not** changed. This is a convenience feature of `fl_chdir()` as opposed to `chdir()`.

**Parameters**

in	<i>path</i>	the target directory for <code>chdir</code> (may be <code>NULL</code> )
----	-------------	-------------------------------------------------------------------------

**Returns**

0 if successful, -1 on error (`errno` may be set)

**32.11.3.3 fl\_chmod()**

```
int fl_chmod (
 const char * f,
 int mode)
```

Cross-platform function to set a files mode() with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where the standard `chmod()` function fails with UTF-8 encoded non-ASCII filenames.

**Parameters**

in	<i>f</i>	the UTF-8 encoded filename
in	<i>mode</i>	the mode to set

**Returns**

the return value of `_wchmod()` on Windows or `chmod()` on other platforms.

**32.11.3.4 fl\_close\_fd()**

```
int fl_close_fd (
 int fd)
```

Cross-platform function to close a file descriptor.

**Returns**

0 in case of success, or -1 in case of error.

**32.11.3.5 fl\_fopen()**

```
FILE * fl_fopen (
 const char * f,
 const char * mode)
```

Cross-platform function to open files with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard `fopen()` function fails with UTF-8 encoded non-ASCII filenames.

**Parameters**

<i>f</i>	the UTF-8 encoded filename
<i>mode</i>	same as the second argument of the standard <code>fopen()</code> function

**Returns**

a FILE pointer upon successful completion, or NULL in case of error.

**See also**

[fl\\_open\(\)](#).

**32.11.3.6 fl\_getcwd()**

```
char * fl_getcwd (
 char * buf,
 int len)
```

Cross-platform function to get the current working directory as a UTF-8 encoded value.

This function is especially useful on the Windows platform where the standard `_wgetcwd()` function returns UTF-16 encoded non-ASCII filenames.

If `buf` is NULL a buffer of size `(len+1)` is allocated, filled with the current working directory, and returned. In this case the buffer must be released by the caller with `free()` to prevent memory leaks.

**Parameters**

in	<i>buf</i>	the buffer to populate (may be NULL)
in	<i>len</i>	the length of the buffer

**Returns**

the CWD encoded as UTF-8

**32.11.3.7 fl\_getenv()**

```
char * fl_getenv (
 const char * v)
```

Cross-platform function to get environment variables with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where non-ASCII environment variables are encoded as wide characters. The returned value of the variable is encoded in UTF-8 as well.

On platforms other than Windows this function calls `getenv` directly. The return value is returned as-is.

The return value is a pointer to an implementation defined buffer:

- an internal buffer that is (re)allocated as needed (Windows) or
- the string in the environment itself (Unix, Linux, MacOS) or
- any other implementation (other platforms). This string must be considered read-only and must not be freed by the caller.

If the resultant string is to be used later it must be copied to a safe place. The next call to `fl_getenv()` or any other environment changes may overwrite the string.

#### Note

This function is not thread-safe.

#### Parameters

in	v	the UTF-8 encoded environment variable
----	---	----------------------------------------

#### Returns

the environment variable in UTF-8 encoding, or NULL in case of error.

### 32.11.3.8 fl\_make\_path()

```
char fl_make_path (
 const char * path)
```

Cross-platform function to recursively create a path in the file system.

This function creates a `path` in the file system by recursively creating all directories.

#### Parameters

in	<i>path</i>	a Unix style ('/' forward slashes) absolute or relative pathname
----	-------------	------------------------------------------------------------------

#### Returns

1 if the path was created, 0 if creating the path failed at some point

### 32.11.3.9 fl\_make\_path\_for\_file()

```
void fl_make_path_for_file (
 const char * path)
```

Cross-platform function to create a path for the file in the file system.

This function strips the filename from the given `path` and creates a path in the file system by recursively creating all directories.

### 32.11.3.10 fl\_mkdir()

```
int fl_mkdir (
 const char * f,
 int mode)
```

Cross-platform function to create a directory with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard `_wmkdir()` function expects UTF-16 encoded non-ASCII filenames.

## Parameters

in	<i>f</i>	the UTF-8 encoded filename
in	<i>mode</i>	the mode of the directory

## Returns

the return value of `_wmkdir()` on Windows or `mkdir()` on other platforms.

**32.11.3.11 `fl_nonspacing()`**

```
unsigned int fl_nonspacing (
 unsigned int ucs)
```

Returns true if the Unicode character `ucs` is non-spacing.

Non-spacing characters in Unicode are typically combining marks like tilde (~), diaeresis (¨), or other marks that are added to a base character, for instance 'a' (base character) + '¨' (combining mark) = 'ä' (German Umlaut).

- [http://unicode.org/glossary/#base\\_character](http://unicode.org/glossary/#base_character)
- [http://unicode.org/glossary/#nonspacing\\_mark](http://unicode.org/glossary/#nonspacing_mark)
- [http://unicode.org/glossary/#combining\\_character](http://unicode.org/glossary/#combining_character)

**32.11.3.12 `fl_open()`**

```
int fl_open (
 const char * fname,
 int oflags,
 ...)
```

Cross-platform function to open files with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard `open()` function fails with UTF-8 encoded non-ASCII filenames.

## Parameters

in	<i>fname</i>	the UTF-8 encoded filename
in	<i>oflags</i>	other arguments are as in the standard <code>open()</code> function

## Returns

a file descriptor upon successful completion, or -1 in case of error.

## See also

[fl\\_fopen\(\)](#), [fl\\_open\\_ext\(\)](#), [fl\\_close\\_fd\(int fd\)](#).

**32.11.3.13 `fl_open_ext()`**

```
int fl_open_ext (
 const char * fname,
 int binary,
 int oflags,
 ...)
```

Cross-platform function to open files with a UTF-8 encoded name.

In comparison with `fl_open()`, this function allows to control whether the file is opened in binary (a.k.a. untranslated) mode. This is especially useful on the Windows platform where files are by default opened in text (translated) mode.

#### Parameters

in	<i>fname</i>	the UTF-8 encoded filename
in	<i>binary</i>	if non-zero, the file is to be accessed in binary (a.k.a. untranslated) mode.
in	<i>oflags,...</i>	these arguments are as in the standard <code>open()</code> function. Setting <code>oflags</code> to zero opens the file for reading.

#### Returns

a file descriptor upon successful completion, or -1 in case of error.

### 32.11.3.14 fl\_putenv()

```
int fl_putenv (
 const char * var)
```

Cross-platform function to write environment variables with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where non-ASCII environment variables are encoded as wide characters.

The given argument `var` must be encoded in UTF-8 in the form "name=value". The 'name' part must conform to platform dependent restrictions on environment variable names.

The string given in `var` is copied and optionally converted to the required encoding for the platform. On platforms other than Windows this function calls `putenv` directly.

The return value is zero on success and non-zero in case of error. The value in case of error is platform specific and returned as-is.

#### Note

The copied string is allocated on the heap and "lost" on some platforms, i.e. calling `fl_putenv()` to change environment variables frequently may cause memory leaks. There may be an option to avoid this in a future implementation.

This function is not thread-safe.

#### Parameters

in	<i>var</i>	the UTF-8 encoded environment variable 'name=value'
----	------------	-----------------------------------------------------

#### Returns

0 on success, non-zero in case of error.

### 32.11.3.15 fl\_rename()

```
int fl_rename (
 const char * f,
 const char * n)
```

Cross-platform function to rename a filesystem object using UTF-8 encoded names.

This function is especially useful on the Windows platform where the standard `_wrename()` function expects UTF-16 encoded non-ASCII filenames.

#### Parameters

in	<i>f</i>	the UTF-8 encoded filename to change
in	<i>n</i>	the new UTF-8 encoded filename to set

**Returns**

the return value of `_wrename()` on Windows or `rename()` on other platforms.

**32.11.3.16 fl\_rmdir()**

```
int fl_rmdir (
 const char * f)
```

Cross-platform function to remove a directory with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard `_wrmdir()` function expects UTF-16 encoded non-ASCII filenames.

**Parameters**

in	<i>f</i>	the UTF-8 encoded filename to remove
----	----------	--------------------------------------

**Returns**

the return value of `_wrmdir()` on Windows or `rmdir()` on other platforms.

**32.11.3.17 fl\_stat()**

```
int fl_stat (
 const char * f,
 struct stat * b)
```

Cross-platform function to `stat()` a file using a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where the standard `stat()` function fails with UTF-8 encoded non-ASCII filenames.

**Parameters**

in	<i>f</i>	the UTF-8 encoded filename
	<i>b</i>	the stat struct to populate

**Returns**

the return value of `_wstat()` on Windows or `stat()` on other platforms.

**32.11.3.18 fl\_system()**

```
int fl_system (
 const char * cmd)
```

Cross-platform function to run a system command with a UTF-8 encoded string.

This function is especially useful on the Windows platform where non-ASCII program (file) names must be encoded as wide characters.

On platforms other than Windows this function calls `system()` directly.

**Parameters**

in	<i>cmd</i>	the UTF-8 encoded command string
----	------------	----------------------------------

**Returns**

the return value of `_wsystem()` on Windows or `system()` on other platforms.

**32.11.3.19 fl\_ucs\_to\_Utf16()**

```
unsigned fl_ucs_to_Utf16 (
 const unsigned ucs,
 unsigned short * dst,
 const unsigned dstlen)
```

Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.

These are used by some system calls, especially on Windows.

`ucs` is the value to convert.

`dst` points at an array to write, and `dstlen` is the number of locations in this array. At most `dstlen` words will be written, and a 0 terminating word will be added if `dstlen` is large enough. Thus this function will never overwrite the buffer and will attempt return a zero-terminated string if space permits. If `dstlen` is zero then `dst` can be set to NULL and no data is written, but the length is returned.

The return value is the number of 16-bit words that *would* be written to `dst` if it is large enough, not counting any terminating zero.

If the return value is greater than `dstlen` it indicates truncation, you should then allocate a new array of size `return+1` and call this again.

Unicode characters in the range 0x10000 to 0x10fff are converted to "surrogate pairs" which take two words each (in UTF-16 encoding). Typically, setting `dstlen` to 2 will ensure that any valid Unicode value can be converted, and setting `dstlen` to 3 or more will allow a NULL terminated sequence to be returned.

**32.11.3.20 fl\_unlink()**

```
int fl_unlink (
 const char * fname)
```

Cross-platform function to `unlink()` (that is, delete) a file using a UTF-8 encoded filename.

This function is especially useful on the Windows platform where the standard function expects UTF-16 encoded non-ASCII filenames.

**Parameters**

<code>fname</code>	the filename to unlink
--------------------	------------------------

**Returns**

the return value of `_wunlink()` on Windows or `unlink()` on other platforms.

**32.11.3.21 fl\_utf8back()**

```
const char * fl_utf8back (
 const char * p,
 const char * start,
 const char * end)
```

Move `p` backward until it points to the start of a UTF-8 character.

If it already points at the start of one then it is returned unchanged. Any UTF-8 errors are treated as though each byte of the error is an individual character.

`start` is the start of the string and is used to limit the backwards search for the start of a UTF-8 character.

`end` is the end of the string and is assumed to be a break between characters. It is assumed to be greater than `p`.

If you wish to decrement a UTF-8 pointer, pass `p-1` to this.

**32.11.3.22 fl\_utf8bytes()**

```
int fl_utf8bytes (
```

```
unsigned ucs)
```

Return the number of bytes needed to encode the given UCS4 character in UTF-8.  
Returns number of bytes that `utf8encode()` will use to encode the character `ucs`.

#### Parameters

<code>in</code>	<code>ucs</code>	UCS4 encoded character
-----------------	------------------	------------------------

#### Returns

number of bytes required

#### 32.11.3.23 `fl_utf8decode()`

```
unsigned fl_utf8decode (
 const char * p,
 const char * end,
 int * len)
```

Decode a single UTF-8 encoded character starting at `p`.

The resulting Unicode value (in the range 0-0x10ffff) is returned, and `len` is set to the number of bytes in the UTF-8 encoding (adding `len` to `p` will point at the next character).

If `p` points at an illegal UTF-8 encoding, including one that would go past `end`, or where a code uses more bytes than necessary, then `*(unsigned char*)p` is translated as though it is in the Microsoft CP1252 character set and `len` is set to 1. Treating errors this way allows this to decode almost any ISO-8859-1 or CP1252 text that has been mistakenly placed where UTF-8 is expected, and has proven very useful.

If you want errors to be converted to error characters (as the standards recommend), adding a test to see if the length is unexpectedly 1 will work:

```
if (*p & 0x80) { // what should be a multibyte encoding
 code = fl_utf8decode(p,end,&len);
 if (len<2) code = 0xFFFD; // Turn errors into REPLACEMENT CHARACTER
} else { // handle the 1-byte UTF-8 encoding:
 code = *p;
 len = 1;
}
```

Direct testing for the 1-byte case (as shown above) will also speed up the scanning of strings where the majority of characters are ASCII.

#### 32.11.3.24 `fl_utf8encode()`

```
int fl_utf8encode (
 unsigned ucs,
 char * buf)
```

Write the UTF-8 encoding of `ucs` into `buf` and return the number of bytes written.

Up to 4 bytes may be written. If you know that `ucs` is less than 0x10000 then at most 3 bytes will be written. If you wish to speed this up, remember that anything less than 0x80 is written as a single byte.

If `ucs` is greater than 0x10ffff this is an illegal character according to RFC 3629. These are converted as though they are 0xFFFD (REPLACEMENT CHARACTER).

RFC 3629 also says many other values for `ucs` are illegal (in the range 0xd800 to 0xdfff, or ending with 0xfffe or 0xffff). However I encode these as though they are legal, so that `utf8encode/fl_utf8decode` will be the identity for all codes between 0 and 0x10ffff.

#### 32.11.3.25 `fl_utf8from_mb()`

```
unsigned fl_utf8from_mb (
 char * dst,
 unsigned dstlen,
 const char * src,
 unsigned srclen)
```

Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

On Unix or on Windows when a UTF-8 locale is in effect, this does not change the data. You may also want to check if `fl_utf8test()` returns non-zero, so that the filesystem can store filenames in UTF-8 encoding regardless of the locale.

### 32.11.3.26 `fl_utf8froma()`

```
unsigned fl_utf8froma (
 char * dst,
 unsigned dstlen,
 const char * src,
 unsigned srclen)
```

Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.

It is possible this should convert Microsoft's CP1252 to UTF-8 instead. This would translate the codes in the range 0x80-0x9f to different characters. Currently it does not do this.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

`srclen` is the number of bytes in `src` to convert.

If the return value equals `srclen` then this indicates that no conversion is necessary, as only ASCII characters are in the string.

### 32.11.3.27 `fl_utf8fromwc()`

```
unsigned fl_utf8fromwc (
 char * dst,
 unsigned dstlen,
 const wchar_t * src,
 unsigned srclen)
```

Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

`srclen` is the number of words in `src` to convert. On Windows this is not necessarily the number of characters, due to there possibly being "surrogate pairs" in the UTF-16 encoding used. On Unix `wchar_t` is 32 bits and each location is a character.

On Unix if a `src` word is greater than 0x10ffff then this is an illegal character according to RFC 3629. These are converted as though they are 0xFFFFD (REPLACEMENT CHARACTER). Characters in the range 0xd800 to 0xdfff, or ending with 0xfffe or 0xffff are also illegal according to RFC 3629. However I encode these as though they are legal, so that `fl_utf8towc` will return the original data.

On Windows "surrogate pairs" are converted to a single character and UTF-8 encoded (as 4 bytes). Mismatched halves of surrogate pairs are converted as though they are individual characters.

### 32.11.3.28 `fl_utf8fwd()`

```
const char * fl_utf8fwd (
 const char * p,
 const char * start,
 const char * end)
```

Move `p` forward until it points to the start of a UTF-8 character.

If it already points at the start of one then it is returned unchanged. Any UTF-8 errors are treated as though each byte of the error is an individual character.

`start` is the start of the string and is used to limit the backwards search for the start of a UTF-8 character.

`end` is the end of the string and is assumed to be a break between characters. It is assumed to be greater than `p`.

This function is for moving a pointer that was jumped to the middle of a string, such as when doing a binary search for a position. You should use either this or [fl\\_utf8back\(\)](#) depending on which direction your algorithm can handle the pointer moving. Do not use this to scan strings, use [fl\\_utf8decode\(\)](#) instead.

### 32.11.3.29 fl\_utf8len()

```
int fl_utf8len (
 char c)
```

Returns the byte length of the UTF-8 sequence with first byte `c`, or -1 if `c` is not valid. This function is helpful for finding faulty UTF-8 sequences.

See also

[fl\\_utf8len1](#)

### 32.11.3.30 fl\_utf8len1()

```
int fl_utf8len1 (
 char c)
```

Returns the byte length of the UTF-8 sequence with first byte `c`, or 1 if `c` is not valid. This function can be used to scan faulty UTF-8 sequences, albeit ignoring invalid codes.

See also

[fl\\_utf8len](#)

### 32.11.3.31 fl\_utf8locale()

```
int fl_utf8locale (
 void)
```

Return true if the "locale" seems to indicate that UTF-8 encoding is used.

If true the `fl_utf8to_mb` and `fl_utf8from_mb` don't do anything useful.

*It is highly recommended that you change your system so this does return true.* On Windows this is done by setting the "codepage" to CP\_UTF8. On Unix this is done by setting `$LC_CTYPE` to a string containing the letters "utf" or "UTF" in it, or by deleting all `$LC*` and `$LANG` environment variables. In the future it is likely that all non-Asian Unix systems will return true, due to the compatibility of UTF-8 with ISO-8859-1.

### 32.11.3.32 fl\_utf8strlen()

```
int fl_utf8strlen (
 const char * text,
 int len)
```

Return the length in bytes of a UTF-8 string.

Parameters

in	<i>text</i>	encoded in UTF-8
in	<i>len</i>	number of Unicode characters, -1 to test until the end of text

Returns

number of bytes that make up the Unicode string

See also

[fl\\_utf\\_nb\\_char\(const unsigned char \\*buf, int len\)](#)

**32.11.3.33 fl\_utf8test()**

```
int fl_utf8test (
 const char * src,
 unsigned srclen)
```

Examines the first `srclen` bytes in `src` and returns a verdict on whether it is UTF-8 or not.

- Returns 0 if there is any illegal UTF-8 sequences, using the same rules as [fl\\_utf8decode\(\)](#). Note that some UCS values considered illegal by RFC 3629, such as 0xffff, are considered legal by this.
- Returns 1 if there are only single-byte characters (ie no bytes have the high bit set). This is legal UTF-8, but also indicates plain ASCII. It also returns 1 if `srclen` is zero.
- Returns 2 if there are only characters less than 0x800.
- Returns 3 if there are only characters less than 0x10000.
- Returns 4 if there are characters in the 0x10000 to 0x10ffff range.

Because there are many illegal sequences in UTF-8, it is almost impossible for a string in another encoding to be confused with UTF-8. This is very useful for transitioning Unix to UTF-8 filenames, you can simply test each filename with this to decide if it is UTF-8 or in the locale encoding. My hope is that if this is done we will be able to cleanly transition to a locale-less encoding.

**32.11.3.34 fl\_utf8to\_mb()**

```
unsigned fl_utf8to_mb (
 const char * src,
 unsigned srclen,
 char * dst,
 unsigned dstlen)
```

Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).

Unfortunately due to stupid design you will have to do this as needed for filenames. This is a bug on both Unix and Windows.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

If [fl\\_utf8locale\(\)](#) returns true then this does not change the data.

**32.11.3.35 fl\_utf8toa()**

```
unsigned fl_utf8toa (
 const char * src,
 unsigned srclen,
 char * dst,
 unsigned dstlen)
```

Convert a UTF-8 sequence into an array of 1-byte characters.

If the UTF-8 decodes to a character greater than 0xff then it is replaced with '?'.

Errors in the UTF-8 sequence are converted as individual bytes, same as [fl\\_utf8decode\(\)](#) does. This allows ISO-8859-1 text mistakenly identified as UTF-8 to be printed correctly (and possibly CP1252 on Windows).

`src` points at the UTF-8 sequence, and `srclen` is the number of bytes to convert.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

**32.11.3.36 fl\_utf8toUtf16()**

```
unsigned fl_utf8toUtf16 (
 const char * src,
 unsigned srclen,
 unsigned short * dst,
 unsigned dstlen)
```

Convert a UTF-8 sequence into an array of 16-bit characters.

These are used by some system calls, especially on Windows.

`src` points at the UTF-8, and `srclen` is the number of bytes to convert.

`dst` points at an array to write, and `dstlen` is the number of locations in this array. At most `dstlen-1` words will be written there, plus a 0 terminating word. Thus this function will never overwrite the buffer and will always return a zero-terminated string. If `dstlen` is zero then `dst` can be null and no data is written, but the length is returned. The return value is the number of 16-bit words that *would* be written to `dst` if it were long enough, not counting the terminating zero. If the return value is greater or equal to `dstlen` it indicates truncation, you can then allocate a new array of size `return+1` and call this again.

Errors in the UTF-8 are converted as though each byte in the erroneous string is in the Microsoft CP1252 encoding. This allows ISO-8859-1 text mistakenly identified as UTF-8 to be printed correctly.

Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (this is called UTF-16 encoding).

**32.11.3.37 fl\_utf8towc()**

```
unsigned fl_utf8towc (
 const char * src,
 unsigned srclen,
 wchar_t * dst,
 unsigned dstlen)
```

Converts a UTF-8 string into a wide character string.

This function generates 32-bit `wchar_t` (e.g. "ucs4" as it were) except on Windows where it is equivalent to `fl_utf8toUtf16` and returns UTF-16.

`src` points at the UTF-8, and `srclen` is the number of bytes to convert.

`dst` points at an array to write, and `dstlen` is the number of locations in this array. At most `dstlen-1` `wchar_t` will be written there, plus a 0 terminating `wchar_t`.

The return value is the number of `wchar_t` that *would* be written to `dst` if it were long enough, not counting the terminating zero. If the return value is greater or equal to `dstlen` it indicates truncation, you can then allocate a new array of size `return+1` and call this again.

Notice that `sizeof(wchar_t)` is 2 on Windows and is 4 on Linux and most other systems. Where `wchar_t` is 16 bits, Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (this is called UTF-16 encoding). If `wchar_t` is 32 bits this rather nasty problem is avoided.

Note that Windows includes Cygwin, i.e. compiled with Cygwin's POSIX layer (`cygwin1.dll`, `-enable-cygwin`), either native (GDI) or X11.

**32.11.3.38 fl\_utf\_nb\_char()**

```
int fl_utf_nb_char (
 const unsigned char * buf,
 int len)
```

Returns the number of Unicode chars in the UTF-8 string.

See also

[fl\\_utf8strlen\(const char \\*text, int len\)](#)

**32.11.3.39 fl\_utf\_strcasecmp()**

```
int fl_utf_strcasecmp (
 const char * s1,
 const char * s2)
```

UTF-8 aware `strncasecmp` - converts to Unicode and tests.

#### Returns

result of comparison

#### Return values

0	if the strings are equal
1	if s1 is greater than s2
-1	if s1 is less than s2

#### 32.11.3.40 `fl_utf_strncasecmp()`

```
int fl_utf_strncasecmp (
 const char * s1,
 const char * s2,
 int n)
```

UTF-8 aware `strncasecmp` - converts to lower case Unicode and tests.

#### Parameters

<i>s1,s2</i>	the UTF-8 strings to compare
<i>n</i>	the maximum number of UTF-8 characters to compare

#### Returns

result of comparison

#### Return values

0	if the strings are equal
>0	if s1 is greater than s2
<0	if s1 is less than s2

#### 32.11.3.41 `fl_utf_tolower()`

```
int fl_utf_tolower (
 const unsigned char * str,
 int len,
 char * buf)
```

Converts the string `str` to its lower case equivalent into `buf`.

Warning: to be safe `buf` length must be at least  $3 * len$  [for 16-bit Unicode]

#### 32.11.3.42 `fl_utf_toupper()`

```
int fl_utf_toupper (
 const unsigned char * str,
 int len,
 char * buf)
```

Converts the string `str` to its upper case equivalent into `buf`.

Warning: to be safe `buf` length must be at least  $3 * len$  [for 16-bit Unicode]

**32.11.3.43 fl\_wcwidth()**

```
int fl_wcwidth (
 const char * src)
```

extended wrapper around [fl\\_wcwidth\\_\(unsigned int ucs\)](#) function.

**Parameters**

in	src	pointer to start of UTF-8 byte sequence
----	-----	-----------------------------------------

**Returns**

width of character in columns

Depending on build options, this function may map C1 control characters (0x80 to 0x9f) to CP1252, and return the width of that character instead. This is not the same behaviour as [fl\\_wcwidth\\_\(unsigned int ucs\)](#) .

Note that other control characters and DEL will still return -1, so if you want different behaviour, you need to test for those characters before calling [fl\\_wcwidth\(\)](#), and handle them separately.

**32.11.3.44 fl\_wcwidth\_()**

```
int fl_wcwidth_ (
 unsigned int ucs)
```

Wrapper to adapt Markus Kuhn's implementation of `wcwidth()` for FLTK.

**Parameters**

in	ucs	Unicode character value
----	-----	-------------------------

**Returns**

width of character in columns

See <http://www.cl.cam.ac.uk/~mgk25/ucs/wcwidth.c> for Markus Kuhn's original implementation of `wcwidth()` and `wcswidth()` (defined in IEEE Std 1002.1-2001) for Unicode.

**WARNING:** this function returns widths for "raw" Unicode characters. It does not even try to map C1 control characters (0x80 to 0x9F) to CP1252, and C0/C1 control characters and DEL will return -1. You are advised to use [fl\\_width\(const char\\* src\)](#) instead.

## 32.12 String handling functions

String handling functions declared in [<FL/fl\\_string\\_functions.h>](#)

**Functions**

- char \* [fl\\_strdup](#) (const char \*s)  
*Cross platform interface to POSIX function `strdup()`.*
- size\_t [fl\\_strlcpy](#) (char \*, const char \*, size\_t)

**32.12.1 Detailed Description**

String handling functions declared in [<FL/fl\\_string\\_functions.h>](#)

**32.12.2 Function Documentation**

### 32.12.2.1 fl\_strdup()

```
char * fl_strdup (
 const char * s)
```

Cross platform interface to POSIX function strdup().

The `fl_strdup()` function returns a pointer to a new string which is a duplicate of the string 's'. Memory for the new string is obtained with `malloc(3)`, and can be freed with `free(3)`.

Implementation:

- POSIX: `strdup()`
- WinAPI: `_strdup()`

## 32.13 Mac OS X-specific symbols

Mac OS X-specific symbols declared in `<FL/platform.H>`

### Classes

- class `FL_Mac_App_Menu`

### Functions

- `FL_Window * fl_mac_find (FL_Window *)`  
*Returns the `FL_Window` corresponding to the given macOS-specific window reference.*
- `CGContextRef fl_mac_gc ()`  
*Returns the macOS-specific graphics context for the current window.*
- `void fl_mac_set_about (FL_Callback *cb, void *user_data, int shortcut=0)`  
*Attaches a callback to the "About myprog" item of the system application menu.*
- `FL_Window * fl_mac_xid (const FL_Window *win)`  
*Returns the macOS-specific window reference corresponding to the given `FL_Window` object.*
- `void fl_open_callback (void(*cb)(const char *))`  
*Register a function called for each file dropped onto an application icon.*

### Variables

- `int fl_mac_os_version`  
*The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).*

### 32.13.1 Detailed Description

Mac OS X-specific symbols declared in `<FL/platform.H>`

See also

[The Apple OS X Interface](#)

### 32.13.2 Function Documentation

#### 32.13.2.1 fl\_mac\_set\_about()

```
void fl_mac_set_about (
 FL_Callback * cb,
 void * user_data,
 int shortcut = 0)
```

Attaches a callback to the "About myprog" item of the system application menu.

For back-compatibility. Equivalent to `FL_Sys_Menu_Bar::about(FL_Callback *cb, void *user_data)`.

### 32.13.2.2 fl\_open\_callback()

```
void fl_open_callback (
 void(*) (const char *) cb)
```

Register a function called for each file dropped onto an application icon.

This function is effective only on the Mac OS X platform. `cb` will be called with a single Unix-style file name and path. If multiple files were dropped, `cb` will be called multiple times.

This function should be called before `fl_open_display()` is called, either directly or indirectly (this happens at the first `show()` of a window), to be effective for files dropped on the application icon at launch time. It can also be called at any point to change the function used to open dropped files. A call with a NULL argument, after a previous call, makes the app ignore files dropped later.

## 32.13.3 Variable Documentation

### 32.13.3.1 fl\_mac\_os\_version

```
int fl_mac_os_version [extern]
```

The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).

FLTK initializes this global variable before `main()` begins running. If the value is needed in a static initializer, a previous call to `FL::system_driver()` makes sure `fl_mac_os_version` has been initialized.

## 32.14 Common Dialog Classes and Functions

Common dialog functions for file selection, message output, and more.

### Files

- file [fl\\_ask.cxx](#)

*Utility functions for common dialogs.*

### Classes

- class [FL\\_Color\\_Chooser](#)

*The [FL\\_Color\\_Chooser](#) widget provides a standard RGB color chooser.*

- class [FL\\_File\\_Chooser](#)

*The [FL\\_File\\_Chooser](#) widget displays a standard file selection dialog that supports various selection modes.*

### Functions

- void [fl\\_alert](#) (const char \*fmt,...)

*Shows an alert message dialog box.*

- int [fl\\_ask](#) (const char \*fmt,...)

*Shows a dialog displaying the `fmt` message, this dialog features 2 yes/no buttons.*

- void [fl\\_beep](#) (int type)

*Emits a system beep.*

- int [fl\\_choice](#) (const char \*fmt, const char \*b0, const char \*b1, const char \*b2,...)

*Shows a dialog displaying the printf style `fmt` message.*

- int [fl\\_choice\\_n](#) (const char \*fmt, const char \*b0, const char \*b1, const char \*b2,...)

*Shows a dialog displaying the printf style `fmt` message.*

- int [fl\\_color\\_chooser](#) (const char \*name, double &r, double &g, double &b, int cmode)

*Pops up a window to let the user pick an arbitrary RGB color.*

- int [fl\\_color\\_chooser](#) (const char \*name, uchar &r, uchar &g, uchar &b, int cmode)

*Pops up a window to let the user pick an arbitrary RGB color.*

- char \* [fl\\_dir\\_chooser](#) (const char \*message, const char \*fname, int relative)  
*Shows a file chooser dialog and gets a directory.*
- char \* [fl\\_file\\_chooser](#) (const char \*message, const char \*pat, const char \*fname, int relative)  
*Shows a file chooser dialog and gets a filename.*
- void [fl\\_file\\_chooser\\_callback](#) (void(\*cb)(const char \*))  
*Set the file chooser callback.*
- void [fl\\_file\\_chooser\\_ok\\_label](#) (const char \*l)  
*Set the "OK" button label.*
- const char \* [fl\\_input](#) (const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- const char \* [fl\\_input](#) (int maxchar, const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- void [fl\\_message](#) (const char \*fmt,...)  
*Shows an information message dialog box.*
- int [fl\\_message\\_hotspot](#) ()  
*Gets whether or not to move the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#) to follow the mouse pointer.*
- void [fl\\_message\\_hotspot](#) (int enable)  
*Sets whether or not to move the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#) to follow the mouse pointer.*
- [Fl\\_Widget](#) \* [fl\\_message\\_icon](#) ()  
*Gets the [Fl\\_Box](#) icon container of the current default dialog used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- void [fl\\_message\\_icon\\_label](#) (const char \*str)  
*Sets the icon label of the dialog window used in many common dialogs.*
- void [fl\\_message\\_position](#) (const int x, const int y, const int center)  
*Sets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- void [fl\\_message\\_position](#) ([Fl\\_Widget](#) \*widget)  
*Sets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- int [fl\\_message\\_position](#) (int \*x, int \*y)  
*Gets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).*
- void [fl\\_message\\_title](#) (const char \*title)  
*Sets the title of the dialog window used in many common dialogs.*
- void [fl\\_message\\_title\\_default](#) (const char \*title)  
*Sets the default title of the dialog window used in many common dialogs.*
- const char \* [fl\\_password](#) (const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- const char \* [fl\\_password](#) (int maxchar, const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*

## Variables

- static void(\* [Fl::error](#) )(const char \*,...) = [Fl\\_System\\_Driver::error](#)  
*FLTK calls [Fl::error\(\)](#) to output a normal error message.*
- static void(\* [Fl::fatal](#) )(const char \*,...) = [Fl\\_System\\_Driver::fatal](#)  
*FLTK calls [Fl::fatal\(\)](#) to output a fatal error message.*
- const char \* [fl\\_cancel](#) = "Cancel"  
*string pointer used in common dialogs, you can change it to another language*
- const char \* [fl\\_close](#) = "Close"

*string pointer used in common dialogs, you can change it to another language*

- `Fl_Font fl_message_font_ = FL_HELVETICA`
- `Fl_Fontsize fl_message_size_ = -1`
- `const char * fl_no = "No"`

*string pointer used in common dialogs, you can change it to another language*

- `const char * fl_ok = "OK"`

*string pointer used in common dialogs, you can change it to another language*

- `const char * fl_yes = "Yes"`

*string pointer used in common dialogs, you can change it to another language*

- `static void(* Fl::warning)(const char *,...) = Fl_System_Driver::warning`  
*FLTK calls `Fl::warning()` to output a warning message.*

### 32.14.1 Detailed Description

Common dialog functions for file selection, message output, and more.

### 32.14.2 Function Documentation

#### 32.14.2.1 fl\_alert()

```
void fl_alert (
 const char * fmt,
 ...)
```

Shows an alert message dialog box.

```
#include <FL/fl_ask.H>
```

##### Parameters

in	<i>fmt</i>	can be used as a sprintf-like format and variables for the message text
----	------------	-------------------------------------------------------------------------

#### 32.14.2.2 fl\_ask()

```
int fl_ask (
 const char * fmt,
 ...)
```

Shows a dialog displaying the *fmt* message, this dialog features 2 yes/no buttons.

```
#include <FL/fl_ask.H>
```

##### Parameters

in	<i>fmt</i>	can be used as a sprintf-like format and variables for the message text
----	------------	-------------------------------------------------------------------------

##### Return values

0	if the no button is selected
1	if yes is selected

**Deprecated** `fl_ask()` is deprecated since it uses "Yes" and "No" for the buttons which does not conform to the current FLTK Human Interface Guidelines. Use `fl_choice()` with the appropriate verbs instead.

### 32.14.2.3 fl\_beep()

```
void fl_beep (
 int type)
```

Emits a system beep.

This function is platform specific. Depending on the input `type` a different sound may be played or the system speaker may beep with a different volume.

On X the system speaker is used which may not work at all on newer systems that don't have a speaker. Since 1.4.0 `FL_BEEP_DEFAULT` and other types honor the system or user settings whereas `FL_BEEP_ERROR` uses 100% volume. This may be changed in a future version.

On Wayland an ASCII BEL (0x07) is output to `stderr`.

On Windows the `MessageBeep()` function is used to play different sounds depending on the `type` argument.

On macOS the system beep function `NSBeep()` is used for `FL_BEEP_DEFAULT` and `FL_BEEP_ERROR`. Other types are ignored.

On other platforms the behavior is undefined and may change in the future.

#### Parameters

in	<code>type</code>	The beep type from the <a href="#">Fl_Beep</a> enumeration (optional)
----	-------------------	-----------------------------------------------------------------------

```
#include <FL/fl_ask.H>
```

### 32.14.2.4 fl\_choice()

```
int fl_choice (
 const char * fmt,
 const char * b0,
 const char * b1,
 const char * b2,
 ...)
```

Shows a dialog displaying the printf style `fmt` message.

This dialog features up to 3 customizable choice buttons which are specified in order of *right-to-left* in the dialog, e.g.

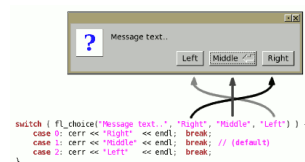

Figure 32.7 `fl_choice()` button ordering

```
#include <FL/fl_ask.H>
```

Three choices with printf() style formatting:

Figure 32.8 `fl_choice()` three choices with printf formatting

```
int num_msgs = GetNumberOfMessages();
switch (fl_choice("What to do with %d messages?", "Send", "Save", "Delete", num_msgs)) {
case 0: .. // Send
case 1: .. // Save (default)
case 2: .. // Delete
..
}
```

Three choice example:

Figure 32.9 fl\_choice() three choices

```
switch (fl_choice("How many bedrooms?", "Zero", "One", "Two")) {
 case 0: .. // "Zero"
 case 1: .. // "One" (default)
 case 2: .. // "Two"
}
```

Two choice example:

Figure 32.10 fl\_choice() two choices

```
switch (fl_choice("Empty trash?", "Yes", "No", 0)) {
 case 0: .. // Yes
 case 1: .. // No (default)
}
```

One choice example:

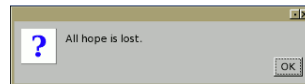

Figure 32.11 fl\_choice() one choice

```
fl_choice("All hope is lost.", "OK", 0, 0); // "OK" default
```

#### Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>b0</i>	text label for right button 0
in	<i>b1</i>	text label for middle button 1 (can be 0)
in	<i>b2</i>	text label for left button 2 (can be 0)

#### Return values

0	if the button with <i>b0</i> text is pushed or the user pressed the <code>Escape</code> key or clicked the window close button
1	if the button with <i>b1</i> text is pushed or the user pressed the <code>Return</code> key
2	if the button with <i>b2</i> text is pushed

#### 32.14.2.5 fl\_choice\_n()

```
int fl_choice_n (
 const char * fmt,
 const char * b0,
 const char * b1,
 const char * b2,
 ...)
```

Shows a dialog displaying the printf style *fmt* message.

This function is like `fl_choice()` but returns `-1` if the dialog window was closed by pressing the `Escape` key or the window close button rather than pushing one of the dialog buttons.

See also

[fl\\_choice\(\)](#)

#### Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>b0</i>	text label for right button 0
in	<i>b1</i>	text label for middle button 1 (can be 0)
in	<i>b2</i>	text label for left button 2 (can be 0)

#### Return values

-3	reserved, FLTK 1.3 only: another dialog is still open (not possible in 1.4)
-2	if the dialog was closed by pushing the window close button
-1	if the dialog was closed by hitting Escape
0	if the button with <i>b0</i> text is pushed
1	if the button with <i>b1</i> text is pushed
2	if the button with <i>b2</i> text is pushed

#### 32.14.2.6 fl\_color\_chooser() [1/2]

```
int fl_color_chooser (
 const char * name,
 double & r,
 double & g,
 double & b,
 int cmode) [related]
```

Pops up a window to let the user pick an arbitrary RGB color.

Note

```
#include <FL/Fl_Color_Chooser.H>
```

Figure 32.12 fl\_color\_chooser

## Parameters

in	<i>name</i>	Title label for the window
in, out	<i>r,g,b</i>	Color components in the range 0.0 to 1.0.
in	<i>cmode</i>	Optional mode for color chooser. See <a href="#">mode(int)</a> . Default -1 if none (rgb mode).

## Return values

1	if user confirms the selection
0	if user cancels the dialog

## 32.14.2.7 fl\_color\_chooser() [2/2]

```
int fl_color_chooser (
 const char * name,
 uchar & r,
 uchar & g,
 uchar & b,
 int cmode) [related]
```

Pops up a window to let the user pick an arbitrary RGB color.

## Note

```
#include <FL/Fl_Color_Chooser.H>
```

Figure 32.13 fl\_color\_chooser

## Parameters

in	<i>name</i>	Title label for the window
in, out	<i>r,g,b</i>	Color components in the range 0 to 255.
in	<i>cmode</i>	Optional mode for color chooser. See <a href="#">mode(int)</a> . Default -1 if none (rgb mode).

## Return values

1	if user confirms the selection
0	if user cancels the dialog

**32.14.2.8 fl\_dir\_chooser()**

```
char * fl_dir_chooser (
 const char * message,
 const char * fname,
 int relative) [related]
```

Shows a file chooser dialog and gets a directory.

## Note

```
#include <FL/Fl_File_Chooser.H>
```

## Parameters

in	<i>message</i>	title bar text
in	<i>fname</i>	initial/default directory name
in	<i>relative</i>	0 for absolute path return, relative otherwise

## Returns

the directory path string chosen by the user or NULL if user cancels

**32.14.2.9 fl\_file\_chooser()**

```
char * fl_file_chooser (
 const char * message,
 const char * pat,
 const char * fname,
 int relative) [related]
```

Shows a file chooser dialog and gets a filename.

## Note

```
#include <FL/Fl_File_Chooser.H>
```

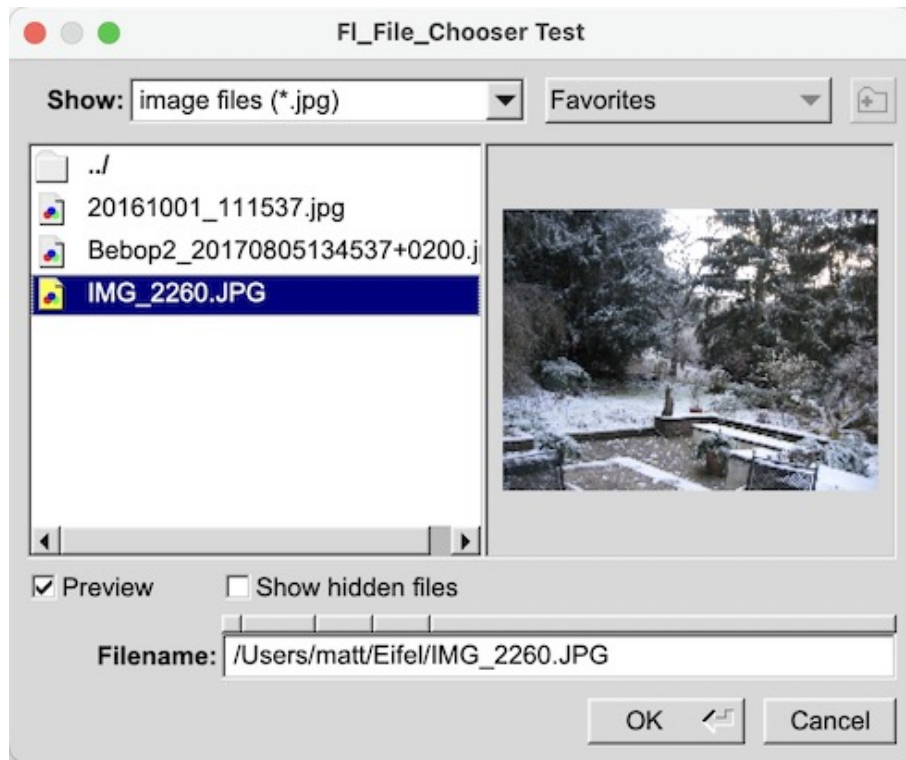

Figure 32.14 Fl\_File\_Chooser

## Parameters

in	<i>message</i>	text in title bar
in	<i>pat</i>	filename pattern filter
in	<i>fname</i>	initial/default filename selection
in	<i>relative</i>	0 for absolute path name, relative path name otherwise

## Returns

the user selected filename, in absolute or relative format or NULL if user cancels

## 32.14.2.10 fl\_file\_chooser\_callback()

```
void fl_file_chooser_callback (
 void(*) (const char *) cb) [related]
```

Set the file chooser callback.

## Note

```
#include <FL/Fl_File_Chooser.H>
```

## 32.14.2.11 fl\_file\_chooser\_ok\_label()

```
void fl_file_chooser_ok_label (
 const char * l) [related]
```

Set the "OK" button label.

## Note

```
#include <FL/Fl_File_Chooser.H>
```

**32.14.2.12 fl\_input() [1/2]**

```
const char * fl_input (
 const char * fmt,
 const char * defstr,
 ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

Returns the string in an internally allocated buffer that may be changed later. You **must** copy the string immediately after return from this method - at least before the next execution of the event loop.

```
#include <FL/fl_ask.H>
```

## Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

## Returns

the user string input if OK was pushed

## Return values

<i>NULL</i>	if Cancel was pushed or the window was closed by the user
-------------	-----------------------------------------------------------

**32.14.2.13 fl\_input() [2/2]**

```
const char * fl_input (
 int maxchar,
 const char * fmt,
 const char * defstr,
 ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

This is the same as `const char *fl_input(const char *fmt, const char *defstr, ...)` except that it has an additional parameter to limit the number of characters the user can input.

Returns the string in an internally allocated buffer that may be changed later. You **must** copy the string immediately after return from this method - at least before the next execution of the event loop.

```
#include <FL/fl_ask.H>
```

## Parameters

in	<i>maxchar</i>	maximum number of characters the user can input (UTF-8 aware)
in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

## Returns

the user string input if OK was pushed

## Return values

<code>NULL</code>	if Cancel was pushed or the window was closed by the user
-------------------	-----------------------------------------------------------

**32.14.2.14 fl\_message()**

```
void fl_message (
 const char * fmt,
 ...)
```

Shows an information message dialog box.

```
#include <FL/fl_ask.H>
```

## Parameters

<code>in</code>	<code>fmt</code>	can be used as an sprintf-like format and variables for the message text
-----------------	------------------	--------------------------------------------------------------------------

**32.14.2.15 fl\_message\_hotspot()** [1/2]

```
int fl_message_hotspot (
 void)
```

Gets whether or not to move the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#) to follow the mouse pointer.

This is a permanent setting. It remains active and affects the window position unless overridden by an explicit positioning request by means of one of the [fl\\_message\\_position\(\)](#) variants.

```
#include <FL/fl_ask.H>
```

## Returns

0 if disabled, non-zero otherwise

## See also

[void fl\\_message\\_hotspot\(int\)](#)  
[int fl\\_message\\_position\(int \\*x, int \\*y\)](#)  
[void fl\\_message\\_position\(FL\\_Widget \\*\)](#)  
[fl\\_message\\_position\(\)](#)

**32.14.2.16 fl\_message\_hotspot()** [2/2]

```
void fl_message_hotspot (
 int enable)
```

Sets whether or not to move the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#) to follow the mouse pointer.

The default is *enabled*, so that the default button is the hotspot and appears at the mouse position.

```
#include <FL/fl_ask.H>
```

## Parameters

<code>in</code>	<code>enable</code>	non-zero enables hotspot behavior, 0 disables hotspot
-----------------	---------------------	-------------------------------------------------------

### 32.14.2.17 fl\_message\_icon()

```
Fl_Widget * fl_message_icon ()
```

Gets the `Fl_Box` icon container of the current default dialog used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.

The return value cannot be Null. The object pointed to is an `Fl_Box` widget. The returned pointer (`Fl_Widget *`) can be safely cast to an `Fl_Box*` pointer.

#### Note

You can set some attributes of this **default** icon box. These attributes are sticky, i.e. they will be used in all subsequent common dialogs unless overridden by specific "one shot" variables. Setting any attribute except those mentioned below causes undefined behavior.

Supported icon attributes:

- `box()`
- `labelfont()`
- `labelsize()`
- `color()`
- `labelcolor()`
- `image()`
- `align()`

The icon size can not be changed. If you set an `image()` you should scale it to the available size, i.e. `w()` and `h()` of the icon box.

```
#include <FL/fl_ask.H>
```

### 32.14.2.18 fl\_message\_icon\_label()

```
void fl_message_icon_label (
 const char * str)
```

Sets the icon label of the dialog window used in many common dialogs.

This icon label will be used in the next call of one of the common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.

The label `str` is stored internally as a reference, it must be in scope until the dialog function (e.g. `fl_choice`) is called.

It applies only to the **next** call of one of the common dialogs and will be reset after that call so the next dialog will use its default label unless set again.

#### Note

This label string must be short, usually only one character so it fits in the icon box. You can use any valid UTF-8 character, e.g. the Euro sign ("€") which is three bytes in UTF-8 encoding.

```
#include <FL/fl_ask.H>
```

#### Parameters

<code>in</code>	<code>str</code>	icon label
-----------------	------------------	------------

### 32.14.2.19 fl\_message\_position() [1/3]

```
void fl_message_position (
 const int x,
```

```
const int y,
const int center)
```

Sets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).

The position set with this method overrides the hotspot setting, i.e. setting a position has higher priority than the hotspot mode set by [fl\\_message\\_hotspot\(int\)](#).

The preferred position set by any of the [fl\\_message\\_position\(\)](#) variants affects only the next call of one of the common dialogs. The preferred position is reset to 0 (unset) as soon as the dialog is shown.

If the optional argument `center` is non-zero (true) the message box will be centered at the given coordinates rather than using the X/Y position as the window position (top left corner).

```
#include <FL/fl_ask.H>
```

#### Parameters

in	<code>x</code>	Preferred X position
in	<code>y</code>	Preferred Y position
in	<code>center</code>	1 = centered, 0 = absolute

#### See also

[int fl\\_message\\_position\(int \\*x, int \\*y\)](#)

#### 32.14.2.20 fl\_message\_position() [2/3]

```
void fl_message_position (
 Fl_Widget * widget)
```

Sets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).

The message box will be centered over the given widget or window extensions.

Everything else is like [fl\\_message\\_position\(int, int, int\)](#) with argument 'center' set to 1.

```
#include <FL/fl_ask.H>
```

#### Parameters

in	<code>widget</code>	Widget or window to position the message box over.
----	---------------------	----------------------------------------------------

#### See also

[int fl\\_message\\_position\(int x, int y, int center\)](#)

#### 32.14.2.21 fl\_message\_position() [3/3]

```
int fl_message_position (
 int * x,
 int * y)
```

Gets the preferred position for the message box used in many common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).

```
#include <FL/fl_ask.H>
```

The position set with this method overrides the hotspot setting, i.e. setting a position has higher priority than the hotspot mode set by [fl\\_message\\_hotspot\(int\)](#).

The preferred position set by any of the [fl\\_message\\_position\(\)](#) variants affects only the next call of one of the common dialogs. The preferred position is reset to 0 (unset) as soon as the dialog is shown.

#### Parameters

out	<code>x</code>	Preferred X position, returns -1 if not set
-----	----------------	---------------------------------------------

## Parameters

out	<i>y</i>	Preferred Y position, returns -1 if not set
-----	----------	---------------------------------------------

## Returns

whether position is currently set or not

## Return values

0	position is not set (hotspot may be enabled or not)
1	position is set (window position)
2	position is set (message box centered)

## See also

[fl\\_message\\_hotspot\(\)](#)  
[fl\\_message\\_hotspot\(int\)](#)  
[fl\\_message\\_position\(int, int\)](#)  
[fl\\_message\\_position\(const int x, const int y, const int center\)](#)  
[fl\\_message\\_position\(FL\\_Widget \\*\)](#)

**32.14.2.22 fl\_message\_title()**

```
void fl_message_title (
 const char * title)
```

Sets the title of the dialog window used in many common dialogs.

This window `title` will be used in the next call of one of the common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#).

The `title` string is copied internally, so that you can use a local variable or free the string immediately after this call. It applies only to the **next** call of one of the common dialogs and will be reset to an empty title (the default for all dialogs) after that call.

```
#include <FL/fl_ask.H>
```

## Parameters

in	<i>title</i>	window label, string copied internally
----	--------------	----------------------------------------

**32.14.2.23 fl\_message\_title\_default()**

```
void fl_message_title_default (
 const char * title)
```

Sets the default title of the dialog window used in many common dialogs.

This window `title` will be used in all subsequent calls of one of the common dialogs like [fl\\_message\(\)](#), [fl\\_alert\(\)](#), [fl\\_ask\(\)](#), [fl\\_choice\(\)](#), [fl\\_input\(\)](#), [fl\\_password\(\)](#), unless a specific title has been set with [fl\\_message\\_title\(const char \\*title\)](#). The default is no title. You can override the default title for a single dialog with [fl\\_message\\_title\(const char \\*title\)](#).

The `title` string is copied internally, so that you can use a local variable or free the string immediately after this call.

```
#include <FL/fl_ask.H>
```

## Parameters

in	<i>title</i>	default window label, string copied internally
----	--------------	------------------------------------------------

**32.14.2.24 fl\_password()** [1/2]

```
const char * fl_password (
 const char * fmt,
 const char * defstr,
 ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

Like `fl_input()` except the input text is not shown, '\*' or similar replacement characters are displayed instead.

```
#include <FL/fl_ask.H>
```

**Parameters**

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

**Returns**

the user string input if OK was pushed

**Return values**

<i>NULL</i>	if Cancel was pushed or the window was closed by the user
-------------	-----------------------------------------------------------

**32.14.2.25 fl\_password()** [2/2]

```
const char * fl_password (
 int maxchar,
 const char * fmt,
 const char * defstr,
 ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

Like `fl_input()` except the input text is not shown, '\*' or similar replacement characters are displayed instead.

```
#include <FL/fl_ask.H>
```

**Parameters**

in	<i>maxchar</i>	input length limit in chars, 0 = no limit
in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

**Returns**

the user string input if OK was pushed

**Return values**

<i>NULL</i>	if Cancel was pushed or the window was closed by the user
-------------	-----------------------------------------------------------

**32.14.3 Variable Documentation**

### 32.14.3.1 error

```
void(* Fl::error)(const char *format,...) = Fl_System_Driver::error [static]
```

FLTK calls `Fl::error()` to output a normal error message.

The default version on Windows displays the error message in a MessageBox window.

The default version on all other platforms prints the error message to `stderr`.

You can override the behavior by setting the function pointer to your own routine.

`Fl::error()` means there is a recoverable error such as the inability to read an image file. The default implementation returns after displaying the message.

#### Note

```
#include <FL/Fl.H>
```

### 32.14.3.2 fatal

```
void(* Fl::fatal)(const char *format,...) = Fl_System_Driver::fatal [static]
```

FLTK calls `Fl::fatal()` to output a fatal error message.

The default version on Windows displays the error message in a MessageBox window.

The default version on all other platforms prints the error message to `stderr`.

You can override the behavior by setting the function pointer to your own routine.

`Fl::fatal()` must not return, as FLTK is in an unusable state, however your version may be able to use `longjmp` or an exception to continue, as long as it does not call FLTK again. The default implementation exits with status 1 after displaying the message.

#### Note

```
#include <FL/Fl.H>
```

### 32.14.3.3 warning

```
void(* Fl::warning)(const char *format,...) = Fl_System_Driver::warning [static]
```

FLTK calls `Fl::warning()` to output a warning message.

The default version on Windows returns *without* printing a warning message, because Windows programs normally don't have `stderr` (a console window) enabled.

The default version on all other platforms prints the warning message to `stderr`.

You can override the behavior by setting the function pointer to your own routine.

`Fl::warning()` means that there was a recoverable problem, the display may be messed up, but the user can probably keep working - all X protocol errors call this, for example. The default implementation returns after displaying the message.

#### Note

```
#include <FL/Fl.H>
```

## 32.15 File names and URI utility functions

File names and URI functions defined in `<FL/filename.H>`

### Macros

- `#define FL_PATH_MAX 2048`  
*all path buffers should use this length*

### Typedefs

- `typedef int() Fl_File_Sort_F(struct dirent **, struct dirent **)`  
*File sorting function.*

## Functions

- void `fl_decode_uri` (char \*uri)  
*Decodes a URL-encoded string.*
- int `fl_filename_absolute` (char \*to, int tolen, const char \*from)  
*Makes a filename absolute from a relative filename to the current working directory.*
- int `fl_filename_absolute` (char \*to, int tolen, const char \*from, const char \*cwd)  
*Concatenate the absolute path *base* with *from* to form the new absolute path in *to*.*
- int `fl_filename_expand` (char \*to, int tolen, const char \*from)  
*Expands a filename containing shell variables and tilde (~).*
- const char \* `fl_filename_ext` (const char \*buf)  
*Gets the extension of a filename.*
- void `fl_filename_free_list` (struct dirent \*\*l, int n)  
*Free the list of filenames that is generated by `fl_filename_list()`.*
- int `fl_filename_isdir` (const char \*name)  
*Determines if a file exists and is a directory from its filename.*
- int `fl_filename_list` (const char \*d, struct dirent \*\*l, `FI_File_Sort_F` \*s=`fl_numeric_sort`)  
*Portable and const-correct wrapper for the `scandir()` function.*
- int `fl_filename_match` (const char \*name, const char \*pattern)  
*Checks if a string *s* matches a pattern *p*.*
- const char \* `fl_filename_name` (const char \*filename)  
*Gets the file name from a path.*
- int `fl_filename_relative` (char \*to, int tolen, const char \*from)  
*Makes a filename relative to the current working directory.*
- int `fl_filename_relative` (char \*to, int tolen, const char \*from, const char \*cwd)  
*Makes a filename relative to any other directory.*
- char \* `fl_filename_setext` (char \*to, int tolen, const char \*ext)  
*Replaces the extension in *buf* of *max*.*
- int `fl_open_uri` (const char \*uri, char \*msg, int msglen)  
*Opens the specified Uniform Resource Identifier (URI).*

### 32.15.1 Detailed Description

File names and URI functions defined in [<FL/filename.H>](#)

### 32.15.2 Typedef Documentation

#### 32.15.2.1 FI\_File\_Sort\_F

```
typedef int() Fl_File_Sort_F(struct dirent **, struct dirent **)
File sorting function.
```

See also

[fl\\_filename\\_list\(\)](#)

### 32.15.3 Function Documentation

### 32.15.3.1 fl\_decode\_uri()

```
void fl_decode_uri (
 char * uri)
```

Decodes a URL-encoded string.

In a Uniform Resource Identifier (URI), all non-ASCII bytes and several others (e.g., '<', '"', ''') are URL-encoded using 3 bytes by "%XY" where XY is the hexadecimal value of the byte. This function decodes the URI restoring its original UTF-8 encoded content. Decoding is done in-place.

### 32.15.3.2 fl\_filename\_absolute() [1/2]

```
int fl_filename_absolute (
 char * to,
 int tolen,
 const char * from)
```

Makes a filename absolute from a relative filename to the current working directory.

```
#include <FL/filename.H>
[...]
fl_chdir("/var/tmp");
fl_filename_absolute(out, sizeof(out), "foo.txt"); // out="/var/tmp/foo.txt"
fl_filename_absolute(out, sizeof(out), "../foo.txt"); // out="/var/tmp/foo.txt"
fl_filename_absolute(out, sizeof(out), "../log/messages"); // out="/var/log/messages"
```

#### Parameters

out	<i>to</i>	resulting absolute filename
in	<i>tolen</i>	size of the absolute filename buffer
in	<i>from</i>	relative filename

#### Returns

0 if no change, non zero otherwise

### 32.15.3.3 fl\_filename\_absolute() [2/2]

```
int fl_filename_absolute (
 char * to,
 int tolen,
 const char * from,
 const char * base)
```

Concatenate the absolute path *base* with *from* to form the new absolute path in *to*.

```
#include <FL/filename.H>
char out[FL_PATH_MAX];
fl_filename_absolute(out, sizeof(out), "../foo.txt", "/var/tmp"); // out="/var/foo.txt"
fl_filename_absolute(out, sizeof(out), "../local/bin", "/usr/bin"); // out="/usr/local/bin"
```

#### Parameters

out	<i>to</i>	resulting absolute filename
in	<i>tolen</i>	size of the absolute filename buffer
in	<i>from</i>	relative filename
in	<i>base</i>	<i>from</i> is relative to this absolute file path

**Returns**

0 if no change, non zero otherwise

**32.15.3.4 fl\_filename\_expand()**

```
int fl_filename_expand (
 char * to,
 int tolen,
 const char * from)
```

Expands a filename containing shell variables and tilde (~).

Currently handles these variants:

```
"~username" // if 'username' does not exist, result will be unchanged
"~/file"
"$VARIABLE" // does NOT handle ${VARIABLE}
```

**Examples:**

```
#include <FL/filename.H>
[.]
putenv("TMPDIR=/var/tmp");
fl_filename_expand(out, sizeof(out), "~fred/.cshrc"); // out="/usr/fred/.cshrc"
fl_filename_expand(out, sizeof(out), "~/cshrc"); // out="/usr/<yourname>/cshrc"
fl_filename_expand(out, sizeof(out), "$TMPDIR/foo.txt"); // out="/var/tmp/foo.txt"
```

**Parameters**

out	to	resulting expanded filename
in	tolen	size of the expanded filename buffer
in	from	filename containing shell variables

**Returns**

0 if no change, non zero otherwise

**32.15.3.5 fl\_filename\_ext()**

```
const char * fl_filename_ext (
 const char * buf)
```

Gets the extension of a filename.

```
#include <FL/filename.H>
[.]
const char *out;
out = fl_filename_ext("/some/path/foo.txt"); // result: ".txt"
out = fl_filename_ext("/some/path/foo"); // result: NULL
```

**Parameters**

in	buf	the filename to be parsed
----	-----	---------------------------

**Returns**

a pointer to the extension (including !.) if any or NULL otherwise

**32.15.3.6 fl\_filename\_free\_list()**

```
void fl_filename_free_list (
 struct dirent *** list,
 int n)
```

Free the list of filenames that is generated by [fl\\_filename\\_list\(\)](#).

Free everything that was allocated by a previous call to `fl_filename_list()`. Use the return values as parameters for this function.

#### Parameters

<code>in, out</code>	<code>list</code>	table containing the resulting directory listing
<code>in</code>	<code>n</code>	number of entries in the list

### 32.15.3.7 fl\_filename\_isdir()

```
int fl_filename_isdir (
 const char * n)
```

Determines if a file exists and is a directory from its filename.

```
#include <FL/filename.H>
[...
fl_filename_isdir("/etc"); // returns non-zero
fl_filename_isdir("/etc/hosts"); // returns 0
```

#### Parameters

<code>in</code>	<code>n</code>	the filename to parse
-----------------	----------------	-----------------------

#### Returns

non zero if file exists and is a directory, zero otherwise

### 32.15.3.8 fl\_filename\_list()

```
int fl_filename_list (
 const char * d,
 dirent *** list,
 Fl_File_Sort_F * sort)
```

Portable and const-correct wrapper for the `scandir()` function.

For each file in that directory a "dirent" structure is created. The only portable thing about a dirent is that `dirent.d_name` is the nul-terminated file name. A pointers array to these dirent's is created and a pointer to the array is returned in `*list`. The number of entries is given as a return value. If there is an error reading the directory a number less than zero is returned, and `errno` has the reason; `errno` does not work under Windows.

#### Include:

```
#include <FL/filename.H>
```

#### Parameters

<code>in</code>	<code>d</code>	the name of the directory to list. It does not matter if it has a trailing slash.
<code>out</code>	<code>list</code>	table containing the resulting directory listing

## Parameters

<code>in</code>	<code>sort</code>	sorting functor: <ul style="list-style-type: none"> <li>• <code>fl_alphasort</code>: The files are sorted in ascending alphabetical order; upper and lowercase letters are compared according to their ASCII ordering uppercase before lowercase.</li> <li>• <code>fl_casealphasort</code>: The files are sorted in ascending alphabetical order; upper and lowercase letters are compared equally case is not significant.</li> <li>• <code>fl_casenumersort</code>: The files are sorted in ascending "alphanumeric" order, where an attempt is made to put unpadded numbers in consecutive order; upper and lowercase letters are compared equally case is not significant.</li> <li>• <code>fl_numericssort</code>: The files are sorted in ascending "alphanumeric" order, where an attempt is made to put unpadded numbers in consecutive order; upper and lowercase letters are compared according to their ASCII ordering - uppercase before lowercase.</li> </ul>
-----------------	-------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

the number of entries if no error, a negative value otherwise.

**Todo** should support returning OS error messages

32.15.3.9 `fl_filename_match()`

```
int fl_filename_match (
 const char * s,
 const char * p)
```

Checks if a string `s` matches a pattern `p`.

The following syntax is used for the pattern:

- `*` matches any sequence of 0 or more characters.
- `?` matches any single character.
- `[set]` matches any character in the set. Set can contain any single characters, or a-z to represent a range. To match `]` or `-` they must be the first characters. To match `^` or `!` they must not be the first characters.
- `[^set]` or `[!set]` matches any character not in the set.
- `{X|Y|Z}` or `{X,Y,Z}` matches any one of the subexpressions literally.
- `\x` quotes the character `x` so it has no special meaning.
- `x` all other characters are matched "exactly" on a **case-insensitive** basis.

## Notes:

- `s` and `p` are matched on a char/byte basis, not as UCS codepoints or UTF-8 sequences.
- `[set]` ranges must run from low to high, i.e. `[a-z]` and not `[z-a]`
- `[set]` comparison is **case-sensitive**, i.e. `[a-z]` won't match "A".
- `\x` only applies to the `fl_filename_match` special characters `*` `?` `[` `{`
- `\x` needs a double `\` or the compiler will complain about non-standard escape sequences.

## Include:

```
#include <FL/filename.H>
```

## Parameters

in	s	the string to check for a match
in	p	the string pattern

## Returns

non zero if the string matches the pattern

## 32.15.3.10 fl\_filename\_name()

```
const char * fl_filename_name (
 const char * filename)
```

Gets the file name from a path.

Similar to `basename(3)`, exceptions shown below.

```
#include <FL/filename.H>
[...
const char *out;
out = fl_filename_name("/usr/lib"); // out="lib"
out = fl_filename_name("/usr/"); // out="" (basename(3) returns "usr" instead)
out = fl_filename_name("/usr"); // out="usr"
out = fl_filename_name("/"); // out="" (basename(3) returns "/" instead)
out = fl_filename_name("."); // out="."
out = fl_filename_name(".."); // out=".."
```

## Returns

a pointer to the char after the last slash, or to `filename` if there is none.

## 32.15.3.11 fl\_filename\_relative() [1/2]

```
int fl_filename_relative (
 char * to,
 int tolen,
 const char * from)
```

Makes a filename relative to the current working directory.

Return the *from* path made relative to the working directory, similar to C++17 `std::filesystem::path::lexically_relative`. This function can also be called with a fourth argument for a user supplied *base* directory path

These conversions are purely lexical. They do not check that the paths exist, do not follow symlinks, and do not access the filesystem at all.

Path arguments must be absolute (start at the root directory) and must not contain `.` or `..` segments, or double separators. A single trailing separator is ok.

On Windows, path arguments must start with a drive name, e.g. `c:\`. Windows network paths and other special paths starting with a double separator are not supported (`\\cloud\drive\path`, `\\?\`, etc.) . Separators can be `\` and `/` and will be preserved. Newly created separators are always the forward slash `/`.

On Windows and macOS, the path segment tests are case insensitive.

If the path can not be generated, *from* path is copied into the *to* buffer and 0 is returned.

```
#include <FL/filename.H>
[...
fl_chdir("/var/tmp/somedir"); // set cwd to /var/tmp/somedir
[...
char out[FL_PATH_MAX];
fl_filename_relative(out, sizeof(out), "/var/tmp/somedir/foo.txt"); // out="foo.txt", return=1
fl_filename_relative(out, sizeof(out), "/var/tmp/foo.txt"); // out="../foo.txt", return=1
fl_filename_relative(out, sizeof(out), "foo.txt"); // out="foo.txt", return=0 (no
change)
fl_filename_relative(out, sizeof(out), "../foo.txt"); // out="../foo.txt", return=0 (no
change)
fl_filename_relative(out, sizeof(out), "../foo.txt"); // out="../foo.txt", return=0 (no
change)
```

## Parameters

out	<i>to</i>	resulting relative filename
in	<i>tolen</i>	size of the relative filename buffer
in	<i>from</i>	absolute filename

## Returns

0 if no change, non zero otherwise

## See also

[fl\\_filename\\_relative\(char \\*to, int tolen, const char \\*from, const char \\*base\)](#)

**32.15.3.12 fl\_filename\_relative() [2/2]**

```
int fl_filename_relative (
 char * to,
 int tolen,
 const char * from,
 const char * base)
```

Makes a filename relative to any other directory.

## Parameters

out	<i>to</i>	resulting relative filepath
in	<i>tolen</i>	size of the relative filename buffer
in	<i>from</i>	absolute filepath
in	<i>base</i>	generate filepath relative to this absolute filepath

## Returns

0 if no change, non zero otherwise

## See also

[fl\\_filename\\_relative\(char \\*to, int tolen, const char \\*from\)](#)

**32.15.3.13 fl\_filename\_setext()**

```
char * fl_filename_setext (
 char * buf,
 int buflen,
 const char * ext)
```

Replaces the extension in `buf` of max.

size `buflen` with the extension in `ext`.

If there's no `'!` in `buf`, `ext` is appended.

If `ext` is NULL, behaves as if it were an empty string (`""`).

**Example**

```
#include <FL/filename.H>
[.]
char buf[FL_PATH_MAX] = "/path/myfile.cxx";
fl_filename_setext(buf, sizeof(buf), ".txt"); // buf[] becomes "/path/myfile.txt"
```

**Returns**

buf itself for calling convenience.

**32.15.3.14 fl\_open\_uri()**

```
int fl_open_uri (
 const char * uri,
 char * msg,
 int msglen)
```

Opens the specified Uniform Resource Identifier (URI).

Uses an operating-system dependent program or interface. For URIs using the "ftp", "http", or "https" schemes, the system default web browser is used to open the URI, while "mailto" and "news" URIs are typically opened using the system default mail reader and "file" URIs are opened using the file system navigator.

On success, the (optional) msg buffer is filled with the command that was run to open the URI; on Windows, this will always be "open uri".

On failure, the msg buffer is filled with an English error message.

**Note****Platform Specific Issues: Windows**

With "file:" based URIs on Windows, you may encounter issues with anchors being ignored. Example: "file://c:/some/index.html#anchor" may open in the browser without the "#anchor" suffix. The behavior seems to vary across different Windows versions. Workaround: open a link to a separate html file that redirects to the desired "file:" URI.

**Example**

```
#include <FL/filename.H>
[...]
char errmsg[512];
if (!fl_open_uri("http://google.com/", errmsg, sizeof(errmsg))) {
 char warnmsg[768];
 sprintf(warnmsg, "Error: %s", errmsg);
 fl_alert(warnmsg);
}
```

**Parameters**

<i>uri</i>	The URI to open
<i>msg</i>	Optional buffer which contains the command or error message
<i>msglen</i>	Length of optional buffer

**Returns**

1 on success, 0 on failure

# Chapter 33

## Class Documentation

### 33.1 FI\_Grid::Cell Class Reference

#### Public Member Functions

- [FI\\_Grid\\_Align](#) **align** () const
- void **align** ([FI\\_Grid\\_Align](#) align)
- **Cell** ([FI\\_Widget](#) \*w, int row, int col)
- **Cell** (int row, int col)
- void **Cell\_** ()
- short **col** () const
- short **colspan** () const
- void **colspan** (short v)
- void **minimum\_size** (int \*w, int \*h) const
- void **minimum\_size** (int w, int h)
- [Cell](#) \* **next** ()  
*Returns the next widget cell of the same row of this cell.*
- void **next** ([Cell](#) \*c)  
*Sets the next pointer of a grid's cell.*
- short **row** () const
- short **rowspan** () const
- void **rowspan** (short v)
- [FI\\_Widget](#) \* **widget** () const
- **~Cell** ()  
*The destructor deletes the cell.*

#### Friends

- class [FI\\_Grid](#)

#### 33.1.1 Constructor & Destructor Documentation

##### 33.1.1.1 ~Cell()

```
FI_Grid::Cell::~Cell () [inline]
```

The destructor deletes the cell.

**Todo** [FI\\_Grid](#)'s cell destructor should remove the cell from the grid. Currently it does nothing!

#### 33.1.2 Member Function Documentation

### 33.1.2.1 next()

```
void Fl_Grid::Cell::next (
 Cell * c) [inline]
```

Sets the `next` pointer of a grid's cell.

**Internal** use only!

Do not use this method, it may corrupt the allocated memory.

The documentation for this class was generated from the following file:

- [Fl\\_Grid.H](#)

## 33.2 Fl\_Terminal::CharStyle Class Reference

### Public Member Functions

- void **attrib** ([uchar](#) val)
- [uchar](#) **attrib** (void) const
- void **bgcolor** ([Fl\\_Color](#) val)
- void **bgcolor** (int r, int g, int b)
- [Fl\\_Color](#) **bgcolor** (void) const
- void **bgcolor\_xterm** ([Fl\\_Color](#) val)
- void **bgcolor\_xterm** ([uchar](#) val)
- void **charflags** ([uchar](#) val)
- [uchar](#) **charflags** (void) const
- **CharStyle** (bool fontsize\_defer)
- int **charwidth** (void) const
- void **clr\_charflag** ([uchar](#) val)
- [uchar](#) **colorbits\_only** ([uchar](#) inflags) const
- void **defaultbgcolor** ([Fl\\_Color](#) val)
- [Fl\\_Color](#) **defaultbgcolor** (void) const
- void **defaultfgcolor** ([Fl\\_Color](#) val)
- [Fl\\_Color](#) **defaultfgcolor** (void) const
- void **fgcolor** ([Fl\\_Color](#) val)
- void **fgcolor** (int r, int g, int b)
- [Fl\\_Color](#) **fgcolor** (void) const
- void **fgcolor\_xterm** ([Fl\\_Color](#) val)
- void **fgcolor\_xterm** ([uchar](#) val)
- [Fl\\_Color](#) **fltk\_bg\_color** ([uchar](#) ci)
- [Fl\\_Color](#) **fltk\_fg\_color** ([uchar](#) ci)
- int **fontdescent** (void) const
- void **fontface** ([Fl\\_Font](#) val)
- [Fl\\_Font](#) **fontface** (void) const
- int **fontheight** (void) const
- void **fontsize** ([Fl\\_Fontsize](#) val)
- [Fl\\_Fontsize](#) **fontsize** (void) const
- int **onoff** (bool flag, [Attrib](#) a)
- void **set\_charflag** ([uchar](#) val)
- void **sgr\_blink** (bool val)
- void **sgr\_bold** (bool val)
- void **sgr\_dbl\_under** (bool val)
- void **sgr\_dim** (bool val)
- void **sgr\_inverse** (bool val)
- void **sgr\_italic** (bool val)
- void **sgr\_reset** (void)
- void **sgr\_strike** (bool val)
- void **sgr\_underline** (bool val)

- void **update** (void)
- void **update\_fake** (void)

The documentation for this class was generated from the following files:

- [FI\\_Terminal.H](#)
- FI\_Terminal.cxx

### 33.3 FI\_GIF\_Image::GIF\_FRAME::CPAL Struct Reference

#### Public Attributes

- [uchar](#) **b**
- [uchar](#) **g**
- [uchar](#) **r**

The documentation for this struct was generated from the following file:

- FI\_GIF\_Image.H

### 33.4 FI\_Terminal::Cursor Class Reference

#### Public Member Functions

- void **bgcolor** ([FI\\_Color](#) val)
- [FI\\_Color](#) **bgcolor** (void) const
- void **col** (int val)
- int **col** (void) const
- int **down** (void)
- void **fgcolor** ([FI\\_Color](#) val)
- [FI\\_Color](#) **fgcolor** (void) const
- void **h** (int val)
- int **h** (void) const
- void **home** (void)
- bool **is\_rowcol** (int drow, int dcol) const
- int **left** (void)
- int **right** (void)
- void **row** (int val)
- int **row** (void) const
- void **scroll** (int nrows)
- int **up** (void)

The documentation for this class was generated from the following files:

- [FI\\_Terminal.H](#)
- FI\_Terminal.cxx

### 33.5 FI\_Preferences::Entry Struct Reference

#### Public Attributes

- char \* **name**
- char \* **value**

The documentation for this struct was generated from the following file:

- FI\_Preferences.H

## 33.6 FI\_Terminal::EscapeSeq Class Reference

### Public Member Functions

- int **defvalmax** (int dval, int max) const
- void **esc\_mode** (char val)
- char **esc\_mode** (void) const
- bool **is\_csi** (void) const
- int **parse** (char c)
- bool **parse\_in\_progress** (void) const
- void **reset** (void)
- void **restore\_cursor** (int &row, int &col)
- void **save\_cursor** (int row, int col)
- int **total\_vals** (void) const
- int **val** (int i) const

### Static Public Attributes

- static const int **completed** = 1
- static const int **fail** = -1
- static const int **maxbuff** = 80
- static const int **maxvals** = 20
- static const int **success** = 0

The documentation for this class was generated from the following files:

- [FI\\_Terminal.H](#)
- [FI\\_Terminal.cxx](#)

## 33.7 FI Class Reference

The [FI](#) is the FLTK global (static) class containing state information and global methods for the current application.  
`#include <Fl.H>`

### Public Types

- enum [FI\\_Option](#) {  
[OPTION\\_ARROW\\_FOCUS](#) = 0, [OPTION\\_VISIBLE\\_FOCUS](#), [OPTION\\_DND\\_TEXT](#), [OPTION\\_SHOW\\_TOOLTIPS](#),  
[OPTION\\_FNFC\\_USES\\_GTK](#), [OPTION\\_FNFC\\_USES\\_ZENITY](#), [OPTION\\_FNFC\\_USES\\_KDIALOG](#),  
[OPTION\\_PRINTER\\_USES\\_GTK](#),  
[OPTION\\_SHOW\\_SCALING](#), [OPTION\\_SIMPLE\\_ZOOM\\_SHORTCUT](#), [OPTION\\_LAST](#) }

*Enumerator for global FLTK options.*

### Static Public Member Functions

- static int [abi\\_check](#) (const int val=[FL\\_ABI\\_VERSION](#))  
*Returns whether the runtime library ABI version is correct.*
- static int [abi\\_version](#) ()  
*Returns the compiled-in value of the [FL\\_ABI\\_VERSION](#) constant.*
- static int [add\\_awesome\\_handler\\_](#) ([FI\\_Awake\\_Handler](#), void \*)  
*Adds an awake handler for use in [awake\(\)](#).*
- static void [add\\_check](#) ([FI\\_Timeout\\_Handler](#), void \*=0)  
*FLTK will call this callback just before it flushes the display and waits for events.*
- static void [add\\_clipboard\\_notify](#) ([FI\\_Clipboard\\_Notify\\_Handler](#) h, void \*data=0)  
*FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.*

- static void `add_fd` (int fd, `FI_FD_Handler` cb, void \*=0)  
*Adds file descriptor fd to listen to.*
- static void `add_fd` (int fd, int when, `FI_FD_Handler` cb, void \*=0)  
*Adds file descriptor fd to listen to.*
- static void `add_handler` (`FI_Event_Handler` ha)  
*Install a function to parse unrecognized events.*
- static void `add_handler` (`FI_Event_Handler` ha, `FI_Event_Handler` before)  
*Install a function to parse unrecognized events with less priority than another function.*
- static void `add_idle` (`FI_Idle_Handler` cb, void \*data=0)  
*Adds a callback function that is called every time by `FI::wait()` and also makes it act as though the timeout is zero (this makes `FI::wait()` return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called repeatedly).*
- static void `add_system_handler` (`FI_System_Handler` h, void \*data)  
*Install a function to intercept system events.*
- static void `add_timeout` (double t, `FI_Timeout_Handler` cb, void \*data=0)  
*Adds a one-shot timeout callback.*
- static int `api_version` ()  
*Returns the compiled-in value of the `FL_API_VERSION` constant.*
- static int `arg` (int argc, char \*\*argv, int &i)  
*Parse a single switch from argv, starting at word i.*
- static void `args` (int argc, char \*\*argv)  
*Parse all command line switches matching standard FLTK options only.*
- static int `args` (int argc, char \*\*argv, int &i, `FI_Args_Handler` cb=0)  
*Parse command line switches using the cb argument handler.*
- static int `args_to_utf8` (int argc, char \*\*&argv)  
*Convert Windows commandline arguments to UTF-8.*
- static int `awake` (`FI_Awake_Handler` cb, void \*message=0)  
*See void awake(void\* message=0).*
- static void `awake` (void \*message=0)  
*Sends a message pointer to the main thread, causing any pending `FI::wait()` call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.*
- static void `background` (uchar, uchar, uchar)  
*Changes fl\_color(FL\_BACKGROUND\_COLOR) to the given color, and changes the gray ramp from 32 to 56 to black to white.*
- static void `background2` (uchar, uchar, uchar)  
*Changes the alternative background color.*
- static `FI_Widget` \* `belowmouse` ()  
*Gets the widget that is below the mouse.*
- static void `belowmouse` (`FI_Widget` \*)  
*Sets the widget that is below the mouse.*
- static int `box_border_radius_max` ()  
*Get the maximum border radius of all "rounded" boxtypes in pixels.*
- static void `box_border_radius_max` (int R)  
*Set the maximum border radius of all "rounded" boxtypes in pixels.*
- static `FI_Color` `box_color` (`FI_Color`)  
*Gets the drawing color to be used for the background of a box.*
- static int `box_dh` (`FI_Boxtype`)  
*Returns the height offset for the given boxtype.*
- static int `box_dw` (`FI_Boxtype`)  
*Returns the width offset for the given boxtype.*
- static int `box_dx` (`FI_Boxtype`)

- Returns the X offset for the given boxtype.*

  - static int `box_dy` (`Fl_Boxtype`)
- Returns the Y offset for the given boxtype.*

  - static int `box_shadow_width` ()
- Get the box shadow width of all "shadow" boxtypes in pixels.*

  - static void `box_shadow_width` (int W)
- Set the box shadow width of all "shadow" boxtypes in pixels.*

  - static bool `cairo_autolink_context` ()
- Gets the current autolink mode for Cairo support.*

  - static void `cairo_autolink_context` (bool alink)
- When FLTK\_HAVE\_CAIRO is defined and `cairo_autolink_context()` is true, any current window dc is linked to a current Cairo context.*

  - static cairo\_t \* `cairo_cc` ()
- Gets the current Cairo context linked with a fltk window.*

  - static void `cairo_cc` (cairo\_t \*c, bool own=false)
- Sets the current Cairo context to c.*

  - static void `cairo_flush` (cairo\_t \*c)
- Flush Cairo drawings on Cairo context c.*

  - static cairo\_t \* `cairo_make_current` (`Fl_Window` \*w)
- Provides a Cairo context for window wi.*

  - static `Fl_Callback_Reason` `callback_reason` ()
- Give the reason for calling a callback.*

  - static int `check` ()
- Same as `Fl::wait(0)`.*

  - static void `clear_widget_pointer` (`Fl_Widget` const \*w)
- Clears a widget pointer in the watch list.*

  - static int `clipboard_contains` (const char \*type)
- Returns non 0 if the clipboard contains data matching type.*

  - static int `compose` (int &del)
- Any text editing widget should call this for each FL\_KEYBOARD event.*

  - static void `compose_reset` ()
- If the user moves the cursor, be sure to call `Fl::compose_reset()`.*

  - static void `copy` (const char \*stuff, int len, int destination=0, const char \*type=`Fl::clipboard_plain_text`)
- Copies the data pointed to by stuff to the selection buffer (destination is 0), the clipboard (destination is 1), or both (destination is 2).*

  - static int `damage` ()
- If true then `flush()` will do something.*

  - static void `damage` (int d)
- If true then `flush()` will do something.*

  - static void `default_atclose` (`Fl_Window` \*, void \*)
- Default callback for window widgets.*

  - static void `delete_widget` (`Fl_Widget` \*w)
- Schedules a widget for deletion at the next call to the event loop.*

  - static void `disable_im` ()
- Disables the system input methods facilities.*

  - static void `display` (const char \*)
- Sets the X or Wayland display to use for all windows.*

  - static int `dnd` ()
- Initiate a Drag And Drop operation.*

  - static int `dnd_text_ops` ()
- Gets whether drag and drop text operations are supported.*

- static void `dnd_text_ops` (int v)  
*Sets whether drag and drop text operations are supported.*
- static void `do_widget_deletion` ()  
*Deletes widgets previously scheduled for deletion.*
- static int `draw_box_active` ()  
*Determines if the currently drawn box is active or inactive.*
- static int `draw_GL_text_with_textures` ()  
*returns whether whether OpenGL uses textures to draw all text.*
- static void `draw_GL_text_with_textures` (int val)  
*sets whether OpenGL uses textures to draw all text.*
- static void `enable_im` ()  
*Enables the system input methods facilities.*
- static int `event` ()  
*Returns the last event that was processed.*
- static int `event_alt` ()  
*Returns non-zero if the Alt key is pressed.*
- static int `event_button` ()  
*Gets which particular mouse button caused the current event.*
- static int `event_button1` ()  
*Returns non-zero if mouse button 1 is currently held down.*
- static int `event_button2` ()  
*Returns non-zero if button 2 is currently held down.*
- static int `event_button3` ()  
*Returns non-zero if button 3 is currently held down.*
- static int `event_buttons` ()  
*Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.*
- static int `event_clicks` ()  
*Returns non zero if we had a double click event.*
- static void `event_clicks` (int i)  
*Manually sets the number returned by `FL::event_clicks()`.*
- static void \* `event_clipboard` ()  
*During an `FL_PASTE` event of non-textual data, returns a pointer to the pasted data.*
- static const char \* `event_clipboard_type` ()  
*Returns the type of the pasted data during an `FL_PASTE` event.*
- static int `event_command` ()  
*Returns non-zero if the `FL_COMMAND` key is pressed, either `FL_CTRL` or on OSX `FL_META`.*
- static int `event_ctrl` ()  
*Returns non-zero if the Control key is pressed.*
- static `FL_Event_Dispatch` `event_dispatch` ()  
*Return the current event dispatch function.*
- static void `event_dispatch` (`FL_Event_Dispatch` d)  
*Set a new event dispatch function.*
- static int `event_dx` ()  
*Returns the current horizontal mouse scrolling associated with the `FL_MOUSEWHEEL` event.*
- static int `event_dy` ()  
*Returns the current vertical mouse scrolling associated with the `FL_MOUSEWHEEL` event.*
- static int `event_inside` (const `FL_Widget` \*)  
*Returns whether or not the mouse event is inside a given child widget.*
- static int `event_inside` (int, int, int, int)  
*Returns whether or not the mouse event is inside the given rectangle.*
- static int `event_is_click` ()

- Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last `FL_PUSH` or `FL_KEYBOARD` event for it to be considered a "drag" rather than a "click".
- static void `event_is_click` (int i)  
Clears the value returned by `Fl::event_is_click()`.
  - static int `event_key` ()  
Gets which key on the keyboard was last pushed.
  - static int `event_key` (int key)  
Returns true if the given `key` was held down (or pressed) during the last event.
  - static int `event_length` ()  
Returns the length of the text in `Fl::event_text()`.
  - static int `event_original_key` ()  
Returns the keycode of the last key event, regardless of the NumLock state.
  - static int `event_shift` ()  
Returns non-zero if the Shift key is pressed.
  - static int `event_state` ()  
Returns the keyboard and mouse button states of the last event.
  - static int `event_state` (int mask)  
Returns non-zero if any of the passed event state bits are turned on.
  - static const char \* `event_text` ()  
Returns the text associated with the current event, including `FL_PASTE` or `FL_DND_RELEASE` events.
  - static int `event_x` ()  
Returns the mouse position of the event relative to the `Fl_Window` it was passed to.
  - static int `event_x_root` ()  
Returns the mouse position on the screen of the event.
  - static int `event_y` ()  
Returns the mouse position of the event relative to the `Fl_Window` it was passed to.
  - static int `event_y_root` ()  
Returns the mouse position on the screen of the event.
  - static `Fl_Window` \* `first_window` ()  
Returns the first top-level window in the list of `shown()` windows.
  - static void `first_window` (`Fl_Window` \*)  
Sets the window that is returned by `first_window()`.
  - static void `flush` ()  
Causes all the windows that need it to be redrawn and graphics forced out through the pipes.
  - static `Fl_Widget` \* `focus` ()  
Gets the current `Fl::focus()` widget.
  - static void `focus` (`Fl_Widget` \*)  
Sets the widget that will receive `FL_KEYBOARD` events.
  - static void `foreground` (`uchar`, `uchar`, `uchar`)  
Changes `fl_color(FL_FOREGROUND_COLOR)`.
  - static void `free_color` (`Fl_Color` i, int overlay=0)  
Frees the specified color from the colormap, if applicable.
  - static int `get_awesome_handler_` (`Fl_Awake_Handler` &, void \*&)  
Gets the last stored awake handler for use in `awake()`.
  - static `Fl_Box_Draw_F` \* `get_boxtype` (`Fl_Boxtype`)  
Gets the current box drawing function for the specified box type.
  - static unsigned `get_color` (`Fl_Color` i)  
Returns the RGB value(s) for the given FLTK color index.
  - static void `get_color` (`Fl_Color` i, `uchar` &red, `uchar` &green, `uchar` &blue)  
Returns the RGB value(s) for the given FLTK color index.
  - static void `get_color` (`Fl_Color` i, `uchar` &red, `uchar` &green, `uchar` &blue, `uchar` &alpha)

- Returns the RGBA value(s) for the given FLTK color index.*

  - static const char \* [get\\_font](#) (FL\_Font)

*Gets the string for this face.*
- static const char \* [get\\_font\\_name](#) (FL\_Font, int \*attributes=0)

*Get a human-readable string describing the family of this face.*
- static int [get\\_font\\_sizes](#) (FL\_Font, int \*&sizep)

*Return an array of sizes in sizep.*
- static int [get\\_key](#) (int key)

*Returns true if the given key is held down now.*
- static void [get\\_mouse](#) (int &, int &)

*Return where the mouse is on the screen by doing a round-trip query to the server.*
- static void [get\\_system\\_colors](#) ()

*Read the user preference colors from the system and use them to call [Fl::foreground\(\)](#), [Fl::background\(\)](#), and [Fl::background2\(\)](#).*
- static int [gl\\_visual](#) (int, int \*alist=0)

*This does the same thing as [Fl::visual\(int\)](#) but also requires OpenGL drawing to work.*
- static FL\_Window \* [grab](#) ()

*Returns the window that currently receives all events.*
- static void [grab](#) (FL\_Window &win)

*See [grab\(FL\\_Window\\*\)](#)*
- static void [grab](#) (FL\_Window \*)

*Selects the window to grab.*
- static int [h](#) ()

*Returns the height in pixels of the main screen work area.*
- static int [handle](#) (int, FL\_Window \*)

*Handle events from the window system.*
- static int [handle\\_](#) (int, FL\_Window \*)

*Handle events from the window system.*
- static int [has\\_check](#) (FL\_Timeout\_Handler, void \*=0)

*Returns 1 if the check exists and has not been called yet, 0 otherwise.*
- static int [has\\_idle](#) (FL\_Idle\_Handler cb, void \*data=0)

*Returns true if the specified idle callback is currently installed.*
- static int [has\\_timeout](#) (FL\_Timeout\_Handler cb, void \*data=0)

*Returns true if the timeout exists and has not been called yet.*
- static void [hide\\_all\\_windows](#) ()

*Hide all visible windows to make FLTK leave [Fl::run\(\)](#).*
- static int [is\\_scheme](#) (const char \*name)

*Returns whether the current scheme is the given name.*
- static void [keyboard\\_screen\\_scaling](#) (int value)

*Controls the possibility to scale all windows by ctrl/+/-/0/ or cmd/+/-/0/.*
- static FL\_Event\_Handler [last\\_handler](#) ()

*Returns the last function installed by a call to [Fl::add\\_handler\(\)](#)*
- static int [lock](#) ()

*The [lock\(\)](#) method blocks the current thread until it can safely access FLTK widgets and data.*
- static int [menu\\_linespacing](#) ()

*Gets the default line spacing used by menus.*
- static void [menu\\_linespacing](#) (int H)

*Sets the default line spacing used by menus.*
- static FL\_Window \* [modal](#) ()

*Returns the top-most [modal\(\)](#) window currently shown.*
- static FL\_Window \* [next\\_window](#) (const FL\_Window \*)

- Returns the next top-level window in the list of shown() windows.*

  - static `FI_Timestamp now` (double offset=0)

*Set a time stamp at this point in time with optional signed offset in seconds.*
- static bool `option` (`FI_Option` opt)

*FLTK library options management.*
- static void `option` (`FI_Option` opt, bool val)

*Override an option while the application is running.*
- static void `own_colormap` ()

*Makes FLTK use its `own colormap`.*
- static void `paste` (`FI_Widget` &receiver)

*Backward compatibility only.*
- static void `paste` (`FI_Widget` &receiver, int source, const char \*type=`FI::clipboard_plain_text`)

*Pastes the data from the selection buffer (*source is 0*) or the clipboard (*source is 1*) into receiver.*
- static int `program_should_quit` ()

*Returns non-zero when a request for program termination was received and accepted.*
- static void `program_should_quit` (int should\_i)

*Indicate to the FLTK library whether a program termination request was received and accepted.*
- static `FI_Widget` \* `pushed` ()

*Gets the widget that is being pushed.*
- static void `pushed` (`FI_Widget` \*)

*Sets the widget that is being pushed.*
- static `FI_Widget` \* `readqueue` ()

*Reads the default callback queue and returns the first widget.*
- static int `ready` ()

*This is similar to `FI::check()` except this does not call `FI::flush()` or any callbacks, which is useful if your program is in a state where such callbacks are illegal.*
- static void `redraw` ()

*Redraws all widgets.*
- static void `release` ()

*Releases the current grabbed window, equals `grab(0)`.*
- static void `release_widget_pointer` (`FI_Widget` \*&w)

*Releases a widget pointer from the watch list.*
- static int `reload_scheme` ()

*Called internally when setting a new scheme according to scheme name.*
- static void `remove_check` (`FI_Timeout_Handler`, void \*=0)

*Removes a check callback.*
- static void `remove_clipboard_notify` (`FI_Clipboard_Notify_Handler` h)

*Stop calling the specified callback when there are changes to the selection buffer or the clipboard.*
- static void `remove_fd` (int)

*Removes a file descriptor handler.*
- static void `remove_fd` (int, int when)

*Removes a file descriptor handler.*
- static void `remove_handler` (`FI_Event_Handler` h)

*Removes a previously added event handler.*
- static void `remove_idle` (`FI_Idle_Handler` cb, void \*data=0)

*Removes the specified idle callback, if it is installed.*
- static int `remove_next_timeout` (`FI_Timeout_Handler` cb, void \*data=0, void \*\*data\_return=0)

*Remove the next matching timeout callback and return its *data* pointer.*
- static void `remove_system_handler` (`FI_System_Handler` h)

*Removes a previously added system event handler.*
- static void `remove_timeout` (`FI_Timeout_Handler` cb, void \*data=0)

- Remove one or more matching timeout callbacks from the timer queue.*

  - static void `repeat_timeout` (double t, `FI_Timeout_Handler` cb, void \*data=0)

*Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.*
- static int `run` ()

*Calls `FI::wait()` repeatedly as long as any windows are displayed.*
- static void `run_checks` ()
- static void `run_idle` ()
- static const char \* `scheme` ()
- See void `scheme(const char *name)`
- static int `scheme` (const char \*name)
- Sets the current widget scheme.
- static int `screen_count` ()
- Gets the total count of available screens.
- static void `screen_dpi` (float &h, float &v, int n=0)
- Gets the screen resolution in dots-per-inch for the given screen.
- static `FI_Screen_Driver` \* `screen_driver` ()
- Returns a pointer to the unique `FI_Screen_Driver` object of the platform.
- static int `screen_num` (int x, int y)
- Gets the screen number of a screen that contains the specified screen position x, y.
- static int `screen_num` (int x, int y, int w, int h)
- Gets the screen number for the screen which intersects the most with the rectangle defined by x, y, w, h.
- static float `screen_scale` (int n)
- Current value of the GUI scaling factor for screen number n (n [0, `FI::screen_count()-1`])
- static void `screen_scale` (int n, float factor)
- Sets the value of the GUI scaling factor for screen number n (n [0, `FI::screen_count()-1`]).
- static int `screen_scaling_supported` ()
- See if scaling factors are supported by this platform.
- static void `screen_work_area` (int &X, int &Y, int &W, int &H)
- Gets the bounding box of the work area of the screen that contains the mouse pointer.
- static void `screen_work_area` (int &X, int &Y, int &W, int &H, int mx, int my)
- Gets the bounding box of the work area of a screen that contains the specified screen position mx, my.
- static void `screen_work_area` (int &X, int &Y, int &W, int &H, int n)
- Gets the bounding box of the work area of the given screen.
- static void `screen_xywh` (int &X, int &Y, int &W, int &H)
- Gets the bounding box of a screen that contains the mouse pointer.
- static void `screen_xywh` (int &X, int &Y, int &W, int &H, int mx, int my)
- Gets the bounding box of a screen that contains the specified screen position mx, my.
- static void `screen_xywh` (int &X, int &Y, int &W, int &H, int mx, int my, int mw, int mh)
- Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by mx, my, mw, mh.
- static void `screen_xywh` (int &X, int &Y, int &W, int &H, int n)
- Gets the screen bounding rect for the given screen.
- static int `scrollbar_size` ()
- Gets the default scrollbar size used by `FI_Browser_`, `FI_Help_View`, `FI_Scroll`, and `FI_Text_Display` widgets.
- static void `scrollbar_size` (int W)
- Sets the default scrollbar size that is used by the `FI_Browser_`, `FI_Help_View`, `FI_Scroll`, and `FI_Text_Display` widgets.
- static double `seconds_between` (`FI_Timestamp` &back, `FI_Timestamp` &further\_back)
- Return the time in seconds between two time stamps.
- static double `seconds_since` (`FI_Timestamp` &then)
- Return the time in seconds between now and a previously taken time stamp.
- static void `selection` (`FI_Widget` &owner, const char \*, int len)
- Changes the current selection.

- static [FI\\_Widget](#) \* [selection\\_owner](#) ()  
*back-compatibility only: Gets the widget owning the current selection*
- static void [selection\\_owner](#) ([FI\\_Widget](#) \*)  
*Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.*
- static int [selection\\_to\\_clipboard](#) ()  
*Returns the current selection\_to\_clipboard mode.*
- static void [selection\\_to\\_clipboard](#) (int mode)  
*Copies selections on X11 directly to the clipboard if enabled.*
- static void **set\_abort** ([FI\\_Abort\\_Handler](#) f)  
*For back compatibility, sets the void FI::fatal handler callback.*
- static void [set\\_atclose](#) ([FI\\_Atclose\\_Handler](#) f)  
*For back compatibility, sets the FI::atclose handler callback.*
- static void [set\\_box\\_color](#) ([FI\\_Color](#))  
*Sets the drawing color for the box that is currently drawn.*
- static void [set\\_boxtype](#) ([FI\\_Boxtype](#), [FI\\_Box\\_Draw\\_F](#) \*, [uchar](#), [uchar](#), [uchar](#), [uchar](#), [FI\\_Box\\_Draw\\_Focus\\_F](#) \*  
\*=NULL)  
*Sets the function to call to draw a specific box type.*
- static void **set\_boxtype** ([FI\\_Boxtype](#), [FI\\_Boxtype](#) from)  
*Copies the from boxtype.*
- static void [set\\_color](#) ([FI\\_Color](#) i, unsigned c)  
*Sets an entry in the fl\_color index table.*
- static void [set\\_color](#) ([FI\\_Color](#), [uchar](#), [uchar](#), [uchar](#))  
*Sets an entry in the fl\_color index table.*
- static void [set\\_color](#) ([FI\\_Color](#), [uchar](#), [uchar](#), [uchar](#), [uchar](#))  
*Sets an entry in the fl\_color index table.*
- static void [set\\_font](#) ([FI\\_Font](#), const char \*)  
*Changes a face.*
- static void **set\_font** ([FI\\_Font](#), [FI\\_Font](#))  
*Copies one face to another.*
- static [FI\\_Font](#) [set\\_fonts](#) (const char \*  
\*=0)  
*FLTK will open the display, and add every fonts on the server to the face table.*
- static void [set\\_idle](#) ([FI\\_Old\\_Idle\\_Handler](#) cb)  
*Sets an idle callback.*
- static void **set\_labeltype** ([FI\\_Labeltype](#), [FI\\_Label\\_Draw\\_F](#) \*, [FI\\_Label\\_Measure\\_F](#) \*)  
*Sets the functions to call to draw and measure a specific labeltype.*
- static void **set\_labeltype** ([FI\\_Labeltype](#), [FI\\_Labeltype](#) from)  
*Sets the functions to call to draw and measure a specific labeltype.*
- static int **system** (const char \*command)  
*Run a command line on the computer.*
- static [FI\\_System\\_Driver](#) \* **system\_driver** ()  
*Returns a pointer to the unique FI\_System\_Driver object of the platform.*
- static int [test\\_shortcut](#) ([FI\\_Shortcut](#))  
*Tests the current event, which must be an FL\_KEYBOARD or FL\_SHORTCUT, against a shortcut value (described in FI\_Button).*
- static void \* [thread\\_message](#) ()  
*The thread\_message() method returns the last message that was sent from a child by the awake() method.*
- static long [ticks\\_between](#) ([FI\\_Timestamp](#) &back, [FI\\_Timestamp](#) &further\_back)  
*Return the time in ticks (60Hz) between two time stamps.*
- static long [ticks\\_since](#) ([FI\\_Timestamp](#) &then)  
*Return the time in ticks (60Hz) between now and a previously taken time stamp.*

- static void `unlock` ()  
*The `unlock()` method releases the lock that was set using the `lock()` method.*
- static int `use_high_res_GL` ()  
*returns whether GL windows should be drawn at high resolution on Apple computers with retina displays.*
- static void `use_high_res_GL` (int val)  
*sets whether GL windows should be drawn at high resolution on Apple computers with retina displays*
- static double `version` ()  
*Returns the compiled-in value of the `FL_VERSION` constant.*
- static int `visible_focus` ()  
*Gets or sets the visible keyboard focus on buttons and other non-text widgets.*
- static void `visible_focus` (int v)  
*Gets or sets the visible keyboard focus on buttons and other non-text widgets.*
- static int `visual` (int)  
*Selects a visual so that your graphics are drawn correctly.*
- static int `w` ()  
*Returns the width in pixels of the main screen work area.*
- static int `wait` ()  
*Waits until "something happens" and then returns.*
- static double `wait` (double time)  
*Waits a maximum of `time_to_wait` seconds or until "something happens".*
- static void `watch_widget_pointer` (FI\_Widget \*&w)  
*Adds a widget pointer to the widget watch list.*
- static int `x` ()  
*Returns the leftmost x coordinate of the main screen work area.*
- static int `y` ()  
*Returns the topmost y coordinate of the main screen work area.*

## Static Public Attributes

- static void(\* `atclose` )(FI\_Window \*, void \*)  
*Back compatibility: default window callback handler.*
- static char const \*const `clipboard_image` = "image"  
*Denotes image data.*
- static char const \*const `clipboard_plain_text` = "text/plain"  
*Denotes plain textual data.*
- static void(\* `error` )(const char \*,...) = FI\_System\_Driver::error  
*FLTK calls `Fl::error()` to output a normal error message.*
- static void(\* `fatal` )(const char \*,...) = FI\_System\_Driver::fatal  
*FLTK calls `Fl::fatal()` to output a fatal error message.*
- static const char \*const `help` = helpmsg+13  
*Usage string displayed if `Fl::args()` detects an invalid argument.*
- static void(\* `idle` )()  
*The currently executing idle callback function: DO NOT USE THIS DIRECTLY!*
- static void(\* `warning` )(const char \*,...) = FI\_System\_Driver::warning  
*FLTK calls `Fl::warning()` to output a warning message.*

## Friends

- class `FI_System_Driver`

### 33.7.1 Detailed Description

The `FI` is the FLTK global (static) class containing state information and global methods for the current application.

## 33.7.2 Member Enumeration Documentation

### 33.7.2.1 Fl\_Option

enum [Fl::Fl\\_Option](#)

Enumerator for global FLTK options.

These options can be set system wide, per user, or for the running application only.

See also

[Fl::option\(Fl\\_Option, bool\)](#)

[Fl::option\(Fl\\_Option\)](#)

#### Enumerator

OPTION_ARROW_FOCUS	When switched on, moving the text cursor beyond the start or end of a text in a text widget will change focus to the next text widget. (This is considered 'old' behavior) When switched off (default), the cursor will stop at the end of the text. Pressing Tab or Ctrl-Tab will advance the keyboard focus. See also: <a href="#">Fl_Input::tab_nav()</a>
OPTION_VISIBLE_FOCUS	If visible focus is switched on (default), FLTK will draw a dotted rectangle inside the widget that will receive the next keystroke. If switched off, no such indicator will be drawn and keyboard navigation is disabled.
OPTION_DND_TEXT	If text drag-and-drop is enabled (default), the user can select and drag text from any text widget. If disabled, no dragging is possible, however dropping text from other applications still works.
OPTION_SHOW_TOOLTIPS	If tooltips are enabled (default), hovering the mouse over a widget with a tooltip text will open a little tooltip window until the mouse leaves the widget. If disabled, no tooltip is shown.
OPTION_FNFC_USES_GTK	When switched on (default), <a href="#">Fl_Native_File_Chooser</a> runs GTK file dialogs if the GTK library is available on the platform (linux/unix only). When switched off, GTK file dialogs aren't used even if the GTK library is available.
OPTION_FNFC_USES_ZENITY	Meaningful for the Wayland/X11 platform only. When switched on, the library uses a Zenity-based file dialog. When switched off (default), no zenity-based file dialog is used.
OPTION_FNFC_USES_KDIALOG	Meaningful for the Wayland/X11 platform only. When switched on, the library uses a kdialog-based file dialog if command 'kdialog' is available on the running system. When switched off (default), no kdialog-based file dialog is used.
OPTION_PRINTER_USES_GTK	When switched on (default), <a href="#">Fl_Printer</a> runs the GTK printer dialog if the GTK library is available on the platform (linux/unix only). When switched off, the GTK printer dialog isn't used even if the GTK library is available.
OPTION_SHOW_SCALING	When switched on (default), the library shows in a transient yellow window the zoom factor value. When switched off, no such window gets displayed.
OPTION_SIMPLE_ZOOM_SHORTCUT	When switched on and when the keyboard in use has '+' in the shifted position of its key, pressing that key and ctrl triggers the zoom-in operation. When switched off (default), the zoom-in operation requires that also the shift key is pressed. Under macOS, this option has no effect because the OS itself generates = followed by + when pressing and the '= +' key without pressing shift.
OPTION_LAST	For internal use only.

### 33.7.3 Member Function Documentation

#### 33.7.3.1 `abi_check()`

```
static int Fl::abi_check (
 const int val = FL_ABI_VERSION) [inline], [static]
```

Returns whether the runtime library ABI version is correct.

This enables you to check the ABI version of the linked FLTK library at runtime.

Returns 1 (true) if the compiled ABI version (in the header files) and the linked library ABI version (used at runtime) are the same, 0 (false) otherwise.

Argument `val` can be used to query a particular library ABI version. Use for instance 10303 to query if the runtime library is compatible with FLTK ABI version 1.3.3. This is rarely useful.

The default `val` argument is `FL_ABI_VERSION`, which checks the version defined at configure time (i.e. in the header files at program compilation time) against the linked library version used at runtime. This is particularly useful if you linked with a shared object library, but it also concerns static linking.

See also

[Fl::abi\\_version\(\)](#)

#### 33.7.3.2 `abi_version()`

```
int Fl::abi_version () [static]
```

Returns the compiled-in value of the `FL_ABI_VERSION` constant.

This is useful for checking the version of a shared library.

#### 33.7.3.3 `add_check()`

```
void Fl::add_check (
 Fl_Timeout_Handler cb,
 void * argp = 0) [static]
```

FLTK will call this callback just before it flushes the display and waits for events.

This is different than an idle callback because it is only called once, then FLTK calls the system and tells it not to return until an event happens.

This can be used by code that wants to monitor the application's state, such as to keep a display up to date. The advantage of using a check callback is that it is called only when no events are pending. If events are coming in quickly, whole blocks of them will be processed before this is called once. This can save significant time and avoid the application falling behind the events.

Sample code:

```
bool state_changed; // anything that changes the display turns this on
void callback(void*) {
 if (!state_changed) return;
 state_changed = false;
 do_expensive_calculation();
 widget->redraw();
}
main() {
 Fl::add_check(callback);
 return Fl::run();
}
```

#### 33.7.3.4 `add_fd()` [1/2]

```
void Fl::add_fd (
 int fd,
 Fl_FD_Handler cb,
 void * d = 0) [static]
```

Adds file descriptor `fd` to listen to.

See [Fl::add\\_fd\(int fd, int when, Fl\\_FD\\_Handler cb, void\\* = 0\)](#) for details

### 33.7.3.5 `add_fd()` [2/2]

```
void Fl::add_fd (
 int fd,
 int when,
 Fl_FD_Handler cb,
 void * d = 0) [static]
```

Adds file descriptor `fd` to listen to.

When the `fd` becomes ready for reading `Fl::wait()` will call the callback and then return. The callback is passed the `fd` and the arbitrary `void*` argument.

This version takes a `when` bitfield, with the bits `FL_READ`, `FL_WRITE`, and `FL_EXCEPT` defined, to indicate when the callback should be done.

There can only be one callback of each type for a file descriptor. `Fl::remove_fd()` gets rid of *all* the callbacks for a given file descriptor.

Under UNIX/Linux/macOS *any* file descriptor can be monitored (files, devices, pipes, sockets, etc.). Due to limitations in Microsoft Windows, Windows applications can only monitor sockets.

Under macOS, `Fl::add_fd()` opens the display if that's not been done before.

### 33.7.3.6 `add_idle()`

```
void Fl::add_idle (
 Fl_Idle_Handler cb,
 void * data = 0) [static]
```

Adds a callback function that is called every time by `Fl::wait()` and also makes it act as though the timeout is zero (this makes `Fl::wait()` return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called repeatedly).

The idle function can be used to get background processing done.

You can have multiple idle callbacks. To remove an idle callback use `Fl::remove_idle()`.

`Fl::wait()` and `Fl::check()` call idle callbacks, but `Fl::ready()` does not.

The idle callback can call any FLTK functions, including `Fl::wait()`, `Fl::check()`, and `Fl::ready()`.

FLTK will not recursively call the idle callback.

### 33.7.3.7 `add_timeout()`

```
void Fl::add_timeout (
 double time,
 Fl_Timeout_Handler cb,
 void * data = 0) [static]
```

Adds a one-shot timeout callback.

The callback function `cb` will be called by `Fl::wait()` at `time` seconds after this function is called. The callback function must have the signature `Fl_Timeout_Handler`. The optional `data` argument is passed to the callback (default: `NULL`).

The timer is removed from the timer queue before the callback function is called. It is safe to reschedule the timeout inside the callback function.

You can have multiple timeout callbacks, even the same timeout callback with different timeout values and/or different `data` values. They are all considered different timer objects.

To remove a timeout while it is active (pending) use `Fl::remove_timeout()`.

If you need more accurate, repeated timeouts, use `Fl::repeat_timeout()` to reschedule the subsequent timeouts.

Please see `Fl::repeat_timeout()` for an example.

Since version 1.4, a timeout can be started from a child thread under the condition that the call to `Fl::add_timeout` is wrapped in `Fl::lock()` and `Fl::unlock()`.

#### Parameters

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: <code>NULL</code> )

See also

[FL\\_Timeout\\_Handler](#)

[FL::repeat\\_timeout\(double time, FL\\_Timeout\\_Handler cb, void \\*data\)](#)

[FL::remove\\_timeout\(FL\\_Timeout\\_Handler cb, void \\*data\)](#)

[FL::has\\_timeout\(FL\\_Timeout\\_Handler cb, void \\*data\)](#)

### 33.7.3.8 `api_version()`

```
int FL::api_version () [static]
```

Returns the compiled-in value of the `FL_API_VERSION` constant.

This is useful for checking the version of a shared library.

### 33.7.3.9 `arg()`

```
int FL::arg (
 int argc,
 char ** argv,
 int & i) [static]
```

Parse a single switch from `argv`, starting at word `i`.

Returns the number of words eaten (1 or 2, or 0 if it is not recognized) and adds the same value to `i`.

This is the default argument handler used internally by `FL::args(...)`, but you can use this function if you prefer to step through the standard FLTK switches yourself.

All standard FLTK switches except `-bg2` may be abbreviated to just one letter and case is ignored:

- `-bg color` or `-background color`  
Sets the background color using [FL::background\(\)](#).
- `-bg2 color` or `-background2 color`  
Sets the secondary background color using [FL::background2\(\)](#).
- `-display host:n.n`  
Sets the X display to use; this option is silently ignored under Windows and MacOS.
- `-dnd` and `-nodnd`  
Enables or disables drag and drop text operations using [FL::dnd\\_text\\_ops\(\)](#).
- `-fg color` or `-foreground color`  
Sets the foreground color using [FL::foreground\(\)](#).
- `-geometry WxH+X+Y`  
Sets the initial window position and size according to the standard X geometry string.
- `-iconic`  
Iconifies the window using [FL\\_Window::iconize\(\)](#).
- `-kbd` and `-nokbd`  
Enables or disables visible keyboard focus for non-text widgets using [FL::visible\\_focus\(\)](#).
- `-name string`  
Sets the window class using [FL\\_Window::xclass\(\)](#).
- `-scheme string`  
Sets the widget scheme using [FL::scheme\(\)](#).
- `-title string`  
Sets the window title using [FL\\_Window::label\(\)](#).
- `-tooltips` and `-notooltips`  
Enables or disables tooltips using [FL\\_Tooltip::enable\(\)](#).

Color values are commonly given as three digit or six digit hex numbers.

- The order of fg, bg, and bg2 in the command line does not matter
- There is no way at the moment to set the selection color.
- Setting the bg2 color also changes the fg color to have sufficient contrast
- Explicitly setting fg color overrides the bg2/contrast constraint.
- Setting the bg color will update the color lookup table for the gray ramp, so color index values can stay the same for all apps, it's just mapped to different RGB values.
- The calculation of the gray ramp is only based on the bg color, so there is no way at the moment to create an inverted (dark mode) ramp.
- Consequently, setting bg to black creates a an all-black ramp, setting a somewhat dark bg color creates a extremely dark ramp.
- Setting the bg has no influence on bg2 or fg.

If your program requires other switches in addition to the standard FLTK options, you will need to pass your own argument handler to `Fl::args(int,char**,int&,Fl_Args_Handler)` explicitly.

See also

`fl_parse_color(const char* p, uchar& r, uchar& g, uchar& b)` to see how color values can be defined

### 33.7.3.10 args() [1/2]

```
void Fl::args (
 int argc,
 char ** argv) [static]
```

Parse all command line switches matching standard FLTK options only.

It parses all the switches, and if any are not recognized it calls `Fl::abort(Fl::help)`, i.e. unlike the long form, an unrecognized switch generates an error message and causes the program to exit.

### 33.7.3.11 args() [2/2]

```
int Fl::args (
 int argc,
 char ** argv,
 int & i,
 Fl_Args_Handler cb = 0) [static]
```

Parse command line switches using the `cb` argument handler.

Returns 0 on error, or the number of words processed.

FLTK provides this as an *entirely optional* command line switch parser. You don't have to call it if you don't want to. Everything it can do can be done with other calls to FLTK.

To use the switch parser, call `Fl::args(...)` near the start of your program. This does **not** open the display, instead switches that need the display open are stashed into static variables. Then you **must** display your first window by calling `window->show(argc,argv)`, which will do anything stored in the static variables.

Providing an argument handler callback `cb` lets you define your own switches. It is called with the same `argc` and `argv`, and with `i` set to the index of the switch to be processed. The `cb` handler should return zero if the switch is unrecognized, and not change `i`. It should return non-zero to indicate the number of words processed if the switch is recognized, i.e. 1 for just the switch, and more than 1 for the switch plus associated parameters. `i` should be incremented by the same amount.

The `cb` handler is called **before** any other tests, so *you can also override any standard FLTK switch* (this is why FLTK can use very short switches instead of the long ones all other toolkits force you to use). See [Fl::arg\(\)](#) for descriptions of the standard switches.

On return `i` is set to the index of the first non-switch. This is either:

- The first word that does not start with '-'.

- The word '-' (used by many programs to name stdin as a file)
- The first unrecognized switch (return value is 0).
- `argc`

The return value is `i` unless an unrecognized switch is found, in which case it is zero. If your program takes no arguments other than switches you should produce an error if the return value is less than `argc`.

A usage string is displayed if `Fl::args()` detects an invalid argument on the command-line. You can change the message by setting the `Fl::help` pointer.

A very simple command line parser can be found in `examples/howto-parse-args.cxx`

The simpler `Fl::args(int argc, char **argv)` form is useful if your program does not have command line switches of its own.

### 33.7.3.12 `args_to_utf8()`

```
int Fl::args_to_utf8 (
 int argc,
 char **& argv) [static]
```

Convert Windows commandline arguments to UTF-8.

#### Note

This function does nothing on other (non-Windows) platforms, hence you may call it on all platforms or only on Windows by using platform specific code like `'#ifdef _WIN32'` etc. - it's your choice. Calling it on other platforms returns quickly w/o wasting much CPU time.

This function *must be called on Windows platforms* in `main()` before the array `argv` is used if your program uses any commandline argument strings (these should be UTF-8 encoded). This applies also to standard FLTK commandline arguments like `"-name"` (class name) and `"-title"` (window title in the title bar).

Unfortunately Windows **neither** provides commandline arguments in UTF-8 encoding **nor** as Windows "Wide Character" strings in the standard `main()` and/or the Windows specific `WinMain()` function.

On Windows platforms (no matter which build system) this function calls a Windows specific function to retrieve commandline arguments as Windows "Wide Character" strings, converts these strings to an internally allocated buffer (or multiple buffers) and returns the result in `argv`. For implementation details please refer to the source code; however these details may be changed in the future.

Note that `argv` is provided by reference so it can be overwritten.

In the recommended simple form the function overwrites the variable `argv` and allocates a new array of strings pointed to by `argv`. You may use this form on all platforms and it is as simple as adding one line to old programs to make them work with international (UTF-8) commandline arguments.

```
int main(int argc, char **argv) {
 Fl::args_to_utf8(argc, argv); // add this line
 // ... use argc and argv, e.g. for commandline parsing
 window->show(argc, argv);
 return Fl::run();
}
```

For an example see 'examples/howto-parse-args.cxx' in the FLTK sources.

If you want to retain the original `argc` and `argv` variables the following slightly longer and more complicated code works as well on all platforms.

```
int main(int argc, char **argv) {
 char **argvn = argv; // must copy argv to work on all platforms
 int argcn = Fl::args_to_utf8(argc, argvn);
 // ... use argcn and argvn, e.g. for commandline parsing
 window->show(argcn, argvn);
 return Fl::run();
}
```

#### Parameters

in	<code>argc</code>	used only on non-Windows platforms
out	<code>argv</code>	modified only on Windows platforms

**Returns**

argument count (always the same as argc)

**Since**

1.4.0

**33.7.3.13 background()**

```
void Fl::background (
 uchar r,
 uchar g,
 uchar b) [static]
```

Changes fl\_color(FL\_BACKGROUND\_COLOR) to the given color, and changes the gray ramp from 32 to 56 to black to white.

These are the colors used as backgrounds by almost all widgets and used to draw the edges of all the boxtypes.

**33.7.3.14 background2()**

```
void Fl::background2 (
 uchar r,
 uchar g,
 uchar b) [static]
```

Changes the alternative background color.

This color is used as a background by [Fl\\_Input](#) and other text widgets.

This call may change fl\_color(FL\_FOREGROUND\_COLOR) if it does not provide sufficient contrast to FL\_↔BACKGROUND2\_COLOR.

**33.7.3.15 box\_border\_radius\_max() [1/2]**

```
static int Fl::box_border_radius_max () [inline], [static]
```

Get the maximum border radius of all "rounded" boxtypes in pixels.

**Since**

1.4.0

**33.7.3.16 box\_border\_radius\_max() [2/2]**

```
static void Fl::box_border_radius_max (
 int R) [inline], [static]
```

Set the maximum border radius of all "rounded" boxtypes in pixels.

Must be at least 5, default = 15.

**Note**

This does **not** apply to the "round" boxtypes which have really round sides (i.e. composed of half circles) as opposed to "rounded" boxtypes that have only rounded corners with a straight border between corners.

The box border radius of "rounded" boxtypes is typically calculated as about 2/5 of the box height or width, whichever is smaller. The upper limit can be set by this method for all "rounded" boxtypes.

**Since**

1.4.0

### 33.7.3.17 `box_color()`

```
Fl_Color Fl::box_color (
 Fl_Color c) [static]
```

Gets the drawing color to be used for the background of a box.

This method is only useful inside box drawing code. It returns the color to be used, either `fl_inactive(c)` if the widget is `!active_r()` or `c` otherwise.

### 33.7.3.18 `box_dh()`

```
int Fl::box_dh (
 Fl_Boxtype t) [static]
```

Returns the height offset for the given boxtype.

See also

[box\\_dy\(\)](#).

### 33.7.3.19 `box_dw()`

```
int Fl::box_dw (
 Fl_Boxtype t) [static]
```

Returns the width offset for the given boxtype.

See also

[box\\_dy\(\)](#).

### 33.7.3.20 `box_dx()`

```
int Fl::box_dx (
 Fl_Boxtype t) [static]
```

Returns the X offset for the given boxtype.

See also

[box\\_dy\(\)](#)

### 33.7.3.21 `box_dy()`

```
int Fl::box_dy (
 Fl_Boxtype t) [static]
```

Returns the Y offset for the given boxtype.

These functions return the offset values necessary for a given boxtype, useful for computing the area inside a box's borders, to prevent overdrawing the borders.

For instance, in the case of a boxtype like `FL_DOWN_BOX` where the border width might be 2 pixels all around, the above functions would return 2, 2, 4, and 4 for `box_dx`, `box_dy`, `box_dw`, and `box_dh` respectively.

An example to compute the area inside a widget's box():

```
int X = yourwidget->x() + Fl::box_dx(yourwidget->box());
int Y = yourwidget->y() + Fl::box_dy(yourwidget->box());
int W = yourwidget->w() - Fl::box_dw(yourwidget->box());
int H = yourwidget->h() - Fl::box_dh(yourwidget->box());
```

These functions are mainly useful in the `draw()` code for deriving custom widgets, where one wants to avoid drawing over the widget's own border `box()`.

**33.7.3.22 box\_shadow\_width()** [1/2]

```
static int Fl::box_shadow_width () [inline], [static]
```

Get the box shadow width of all "shadow" boxtypes in pixels.

Since

1.4.0

**33.7.3.23 box\_shadow\_width()** [2/2]

```
static void Fl::box_shadow_width (
 int W) [inline], [static]
```

Set the box shadow width of all "shadow" boxtypes in pixels.

Must be at least 1, default = 3. There is no upper limit.

Since

1.4.0

**33.7.3.24 check()**

```
int Fl::check () [static]
```

Same as Fl::wait(0).

Calling this during a big calculation will keep the screen up to date and the interface responsive:

```
while (!calculation_done()) {
 calculate();
 Fl::check();
 if (user_hit_abort_button()) break;
}
```

This returns non-zero if any windows are displayed, and 0 if no windows are displayed (this is likely to change in future versions of FLTK).

**33.7.3.25 display()**

```
void Fl::display (
 const char * d) [static]
```

Sets the X or Wayland display to use for all windows.

This sets the environment variable \$DISPLAY or \$WAYLAND\_DISPLAY to the passed string, so this only works before you show() the first window or otherwise open the display.

This does nothing on other platforms.

**33.7.3.26 dnd\_text\_ops()** [1/2]

```
static int Fl::dnd_text_ops () [inline], [static]
```

Gets whether drag and drop text operations are supported.

This returns whether selected text can be dragged from text fields or dragged within a text field as a cut/paste shortcut.

**33.7.3.27 dnd\_text\_ops()** [2/2]

```
static void Fl::dnd_text_ops (
 int v) [inline], [static]
```

Sets whether drag and drop text operations are supported.

This specifically affects whether selected text can be dragged from text fields or dragged within a text field as a cut/paste shortcut.

### 33.7.3.28 draw\_box\_active()

```
int Fl::draw_box_active () [static]
```

Determines if the currently drawn box is active or inactive.

If inactive, the box color should be changed to the inactive color.

See also

[Fl::box\\_color\(Fl\\_Color c\)](#)

### 33.7.3.29 draw\_GL\_text\_with\_textures() [1/2]

```
static int Fl::draw_GL_text_with_textures () [inline], [static]
```

returns whether whether OpenGL uses textures to draw all text.

Default is yes.

See also

[draw\\_GL\\_text\\_with\\_textures\(int val\)](#)

Version

1.4.0

### 33.7.3.30 draw\_GL\_text\_with\_textures() [2/2]

```
static void Fl::draw_GL_text_with_textures (
 int val) [inline], [static]
```

sets whether OpenGL uses textures to draw all text.

By default, FLTK draws OpenGL text using textures, if the necessary hardware support is available. Call `Fl::draw_GL_text_with_textures(0)` once in your program before the first call to `gl_font()` to have FLTK draw instead OpenGL text using a legacy, platform-dependent procedure. It's recommended not to deactivate textures under the MacOS platform because the MacOS legacy procedure is extremely rudimentary.

Parameters

<i>val</i>	use 0 to prevent FLTK from drawing GL text with textures
------------	----------------------------------------------------------

See also

[gl\\_texture\\_pile\\_height\(int max\)](#)

Version

1.4.0

### 33.7.3.31 flush()

```
void Fl::flush () [static]
```

Causes all the windows that need it to be redrawn and graphics forced out through the pipes.

This is what `wait()` does before looking for events.

Note: in multi-threaded applications you should only call `Fl::flush()` from the main thread. If a child thread needs to trigger a redraw event, it should instead call `Fl::awake()` to get the main thread to process the event queue.

### 33.7.3.32 `get_system_colors()`

```
void Fl::get_system_colors () [static]
```

Read the user preference colors from the system and use them to call [Fl::foreground\(\)](#), [Fl::background\(\)](#), and [Fl::background2\(\)](#).

This is done by `Fl_Window::show(argc,argv)` before applying the `-fg` and `-bg` switches.

On X this reads some common values from the Xdefaults database. KDE users can set these values by running the "krdb" program, and newer versions of KDE set this automatically if you check the "apply style to other X programs" switch in their control panel.

### 33.7.3.33 `gl_visual()`

```
static int Fl::gl_visual (
 int ,
 int * alist = 0) [static]
```

This does the same thing as [Fl::visual\(int\)](#) but also requires OpenGL drawing to work.

This *must* be done if you want to draw in normal windows with OpenGL with [gl\\_start\(\)](#) and [gl\\_end\(\)](#). It may be useful to call this so your X windows use the same visual as an [Fl\\_Gl\\_Window](#), which on some servers will reduce colormap flashing.

See [Fl\\_Gl\\_Window](#) for a list of additional values for the argument.

### 33.7.3.34 `has_timeout()`

```
int Fl::has_timeout (
 Fl_Timeout_Handler cb,
 void * data = 0) [static]
```

Returns true if the timeout exists and has not been called yet.

Both arguments `cb` and `data` must match with at least one timer in the queue of active timers to return true (1).

#### Note

It is a known inconsistency that [Fl::has\\_timeout\(\)](#) does not use the `data` argument as a wildcard (match all) if it is zero (NULL) which [Fl::remove\\_timeout\(\)](#) does. This is so for backwards compatibility with FLTK 1.3.x. Therefore using 0 (zero, NULL) as the timeout `data` value is discouraged unless you're sure that you don't need to use `Fl::has_timeout(callback, (void *)0);` or `Fl::remove_timeout(callback, (void *)0);`.

#### Parameters

in	<i>cb</i>	Timer callback
in	<i>data</i>	User data

#### Returns

whether the timer was found in the queue

#### Return values

0	not found
1	found

### 33.7.3.35 `hide_all_windows()`

```
void Fl::hide_all_windows () [static]
```

Hide all visible windows to make FLTK leave [Fl::run\(\)](#).

`Fl::run()` will run as long as there are visible windows. Call `Fl::hide_all_windows()` to hide (close) all currently shown (visible) windows, effectively terminating the `Fl::run()` loop.

See also

[Fl::run\(\)](#)

Since

1.4.0

### 33.7.3.36 `is_scheme()`

```
static int Fl::is_scheme (
 const char * name) [inline], [static]
```

Returns whether the current scheme is the given name.

This is a fast inline convenience function to support scheme-specific code in widgets, e.g. in their `draw()` methods, if required.

Use a valid scheme name, not `NULL` (although `NULL` is allowed, this is not a useful argument - see below).

If `Fl::scheme()` has not been set or has been set to the default scheme ("none" or "base"), then this will always return 0 regardless of the argument, because `Fl::scheme()` is `NULL` in this case.

Note

The stored scheme name is always lowercase, and this method will do a case-sensitive compare, so you **must** provide a lowercase string to return the correct value. This is intentional for performance reasons.

Example:

```
if (Fl::is_scheme("gtk+")) { your_code_here(); }
```

Parameters

in	<i>name</i>	lowercase string of requested scheme name.
----	-------------	--------------------------------------------

Returns

1 if the given scheme is active, 0 otherwise.

See also

[Fl::scheme\(const char \\*name\)](#)

### 33.7.3.37 `menu_linespacing()` [1/2]

```
int Fl::menu_linespacing () [static]
```

Gets the default line spacing used by menus.

Returns

The default line spacing, in pixels.

### 33.7.3.38 `menu_linespacing()` [2/2]

```
void Fl::menu_linespacing (
 int H) [static]
```

Sets the default line spacing used by menus.

Default is 4.

## Parameters

<code>in</code>	<code>H</code>	The new default line spacing between menu items, in pixels.
-----------------	----------------	-------------------------------------------------------------

**33.7.3.39 now()**

```
Fl_Timestamp Fl::now (
 double offset = 0) [static]
```

Set a time stamp at this point in time with optional signed offset in seconds.

The time stamp is an opaque type and does not represent the time of day or some time and date in the calendar. It is used with [Fl::seconds\\_between\(\)](#) and [Fl::seconds\\_since\(\)](#) to measure elapsed time.

```
Fl_Timestamp start = Fl::now();
// do something
double s = Fl::seconds_since(start);
printf("That operation took %g seconds\n", s);
```

Depending on the system the resolution may be milliseconds or microseconds. Under certain conditions (particularly on Windows) the value in member `sec` may wrap around and does not represent a real time (maybe runtime of the system). Function [seconds\\_since\(\)](#) below uses this to subtract two timestamps which is always a correct delta time with milliseconds or microseconds resolution.

## Parameters

<code>offset</code>	optional signed offset in seconds added to the current time
---------------------	-------------------------------------------------------------

## Returns

this moment in time offset by `offset` as an opaque time stamp

**Todo** [Fl::system\\_driver\(\)->gettime\(\)](#) was implemented for the Forms library and has a limited resolution (on Windows: milliseconds). On POSIX platforms it uses `gettimeofday()` with microsecond resolution. A new function could use a better resolution on Windows with its multimedia timers which requires a new dependency: `winmm.lib` (dll). This could be a future improvement, maybe set as a build option or generally (requires Win95 or 98?).

## See also

[Fl::seconds\\_since\(Fl\\_Timestamp& then\)](#)

[Fl::seconds\\_between\(Fl\\_Timestamp& back, Fl\\_Timestamp& further\\_back\)](#)

[Fl::ticks\\_since\(Fl\\_Timestamp& then\)](#)

[Fl::ticks\\_between\(Fl\\_Timestamp& back, Fl\\_Timestamp& further\\_back\)](#)

**33.7.3.40 option()** [1/2]

```
bool Fl::option (
 Fl_Option opt) [static]
```

FLTK library options management.

Options provide a way for the user to modify the behavior of an FLTK application. For example, clearing the `OPTION_SHOW_TOOLTIPS` will disable tooltips for all FLTK applications.

Options are set by the user or the administrator on user or machine level. In 1.3, FLUID has an Options dialog for that. In 1.4, there is an app named `fltk-options` that can be used from the command line or as a GUI tool. The machine level setting is read first, and the user setting can override the machine setting.

This function is used throughout FLTK to quickly query the user's wishes. There are options for using a native file chooser instead of the FLTK one wherever possible, disabling tooltips, disabling visible focus, disabling FLTK file chooser preview, etc. .

See [Fl::Fl\\_Option](#) for a list of available options.

Example:

```
if (Fl::option(Fl::OPTION_ARROW_FOCUS))
 { ..on.. }
else
 { ..off.. }
```

#### Note

Options can be managed with the `fltk-options` program, new in FLTK 1.4.0. In 1.3.x, options can be set in FLUID.

#### Parameters

<i>opt</i>	which option
------------	--------------

#### Returns

true or false

#### See also

enum [Fl::Fl\\_Option](#)

[Fl::option\(Fl\\_Option, bool\)](#)

`fltk-options` application in command line and GUI mode

#### Since

FLTK 1.3.0

### 33.7.3.41 option() [2/2]

```
void Fl::option (
 Fl_Option opt,
 bool val) [static]
```

Override an option while the application is running.

Apps can override the machine settings and the user settings by calling `Fl::option(option, bool)`. The override takes effect immediately for this option for all widgets in the app for the life time of the app.

The override is not saved anywhere, and relaunching the app will restore the old settings.

Example:

```
Fl::option(Fl::OPTION_ARROW_FOCUS, true); // on
Fl::option(Fl::OPTION_ARROW_FOCUS, false); // off
```

#### Parameters

<i>opt</i>	which option
<i>val</i>	set to true or false

#### See also

enum [Fl::Fl\\_Option](#)

bool [Fl::option\(Fl\\_Option\)](#)

### 33.7.3.42 own\_colormap()

```
void Fl::own_colormap () [static]
```

Makes FLTK use its `own colormap`.

This may make FLTK display better and will reduce conflicts with other programs that want lots of colors. However the colors may flash as you move the cursor between windows. This does nothing if the current visual is not colormapped.

### 33.7.3.43 `program_should_quit()` [1/2]

```
static int Fl::program_should_quit () [inline], [static]
```

Returns non-zero when a request for program termination was received and accepted.

On the MacOS platform, the "Quit xxx" item of the application menu is such a request, that is considered accepted when all windows are closed. On other platforms, this function returns 0 until `Fl::program_should_quit(1)` is called.

#### Version

1.4.0

### 33.7.3.44 `program_should_quit()` [2/2]

```
static void Fl::program_should_quit (
 int should_i) [inline], [static]
```

Indicate to the FLTK library whether a program termination request was received and accepted.

A program may set this to 1, for example, while performing a platform-independent command asking the program to cleanly terminate, similarly to the "Quit xxx" item of the application menu under MacOS.

#### Version

1.4.0

### 33.7.3.45 `readqueue()`

```
Fl_Widget * Fl::readqueue () [static]
```

Reads the default callback queue and returns the first widget.

All `Fl_Widget`s that don't have a callback defined use the default callback `static Fl_Widget::default_callback()` that puts a pointer to the widget in a queue. This method reads the oldest widget out of this queue.

The queue (FIFO) is limited (currently 20 items). If the queue overflows, the oldest entry (`Fl_Widget *`) is discarded. Relying on the default callback and reading the callback queue with `Fl::readqueue()` is not recommended. If you need a callback, you should set one with `Fl_Widget::callback(Fl_Callback *cb, void *data)` or one of its variants.

#### See also

[Fl\\_Widget::callback\(\)](#)

[Fl\\_Widget::callback\(Fl\\_Callback \\*cb, void \\*data\)](#)

[Fl\\_Widget::default\\_callback\(\)](#)

### 33.7.3.46 `ready()`

```
int Fl::ready () [static]
```

This is similar to `Fl::check()` except this does *not* call `Fl::flush()` or any callbacks, which is useful if your program is in a state where such callbacks are illegal.

This returns true if `Fl::check()` would do anything (it will continue to return true until you call `Fl::check()` or `Fl::wait()`).

```
while (!calculation_done()) {
 calculate();
 if (Fl::ready()) {
 do_expensive_cleanup();
 Fl::check();
 if (user_hit_abort_button()) break;
 }
}
```

**33.7.3.47 release()**

```
static void Fl::release () [inline], [static]
```

Releases the current grabbed window, equals grab(0).

**Deprecated** Use Fl::grab(0) instead.

See also

[grab\(Fl\\_Window\\*\)](#)

**33.7.3.48 reload\_scheme()**

```
int Fl::reload_scheme () [static]
```

Called internally when setting a new scheme according to scheme name. Loads or reloads the current scheme selection.

**Returns**

Always 1 (this may change in the future)

See void [Fl::scheme\(const char \\*name\)](#)

**33.7.3.49 remove\_check()**

```
void Fl::remove_check (
 Fl_Timeout_Handler cb,
 void * argp = 0) [static]
```

Removes a check callback. It is harmless to remove a check callback that no longer exists.

**33.7.3.50 remove\_next\_timeout()**

```
int Fl::remove_next_timeout (
 Fl_Timeout_Handler cb,
 void * data = 0,
 void ** data_return = 0) [static]
```

Remove the next matching timeout callback and return its `data` pointer. This method removes only the next matching timeout and returns in `data_return` (if non-NULL) the `data` member given when the timeout was scheduled. This method is useful if you remove a timeout before it is scheduled and you need to get and use its data value, for instance to free() or delete the data associated with the timeout. This method returns non-zero if a matching timeout was found and zero if no timeout matched the request. If the return value is  $N > 1$  then there are  $N - 1$  more matching timeouts pending. If you need to remove all timeouts with a particular callback `cb` you must repeat this call until it returns 1 (all timeouts removed) or zero (no matching timeout), whichever occurs first.

**Parameters**

in	<i>cb</i>	Timer callback to be removed (must match)
in	<i>data</i>	Wildcard if NULL, must match otherwise
in, out	<i>data_return</i>	Pointer to (void *) to receive the data value

**Returns**

non-zero if a timer was found and removed

## Return values

<i>0</i>	no matching timer was found
<i>1</i>	the last matching timeout was found and removed
<i>N &gt; 1</i>	a matching timeout was removed and there are (N - 1) matching timeouts pending

## See also

[Fl::remove\\_timeout\(Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

## Since

1.4.0

**33.7.3.51 remove\_timeout()**

```
void Fl::remove_timeout (
 Fl_Timeout_Handler cb,
 void * data = 0) [static]
```

Remove one or more matching timeout callbacks from the timer queue.

This method removes **all** matching timeouts, not just the first one.

If the *data* argument is NULL (the default!) only the callback *cb* must match, i.e. all timer entries with this callback are removed.

It is harmless to remove a timeout callback that no longer exists.

If you want to remove only the next matching timeout you can use [Fl::remove\\_next\\_timeout\(Fl\\_Timeout\\_Handler cb, void \\*data, void \\*\\*data\\_return\)](#) (available since FLTK 1.4.0).

## Parameters

in	<i>cb</i>	Timer callback to be removed (must match)
in	<i>data</i>	Wildcard if NULL (default), must match otherwise

## See also

[Fl::remove\\_next\\_timeout\(Fl\\_Timeout\\_Handler cb, void \\*data, void \\*\\*data\\_return\)](#)

**33.7.3.52 repeat\_timeout()**

```
void Fl::repeat_timeout (
 double time,
 Fl_Timeout_Handler cb,
 void * data = 0) [static]
```

Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.

You should call this method only inside a timeout callback of the same or a logically related timer from whose expiration time the new timeout shall be scheduled. Otherwise the timing accuracy can't be improved and the exact behavior is undefined.

If you call this outside a timeout callback the behavior is the same as [Fl::add\\_timeout\(\)](#).

Example: The following code will print "TICK" each second on stdout with a fair degree of accuracy:

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <stdio.h>
void callback(void *) {
 printf("TICK\n");
 Fl::repeat_timeout(1.0, callback); // retrigger timeout
}
int main() {
```

```

Fl_Window win(100, 100);
win.show();
Fl::add_timeout(1.0, callback); // set up first timeout
return Fl::run();
}

```

#### Parameters

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: NULL)

#### 33.7.3.53 run()

```
int Fl::run () [static]
```

Calls `Fl::wait()` repeatedly as long as any windows are displayed.

When all the windows are closed it returns zero (supposedly it would return non-zero on any errors, but FLTK calls `exit` directly for these). A normal program will end `main()` with `return Fl::run();`.

#### Note

`Fl::run()` and `Fl::wait()` (but not `Fl::wait(double)`) both return when all FLTK windows are closed. Therefore, a MacOS FLTK application possessing `Fl_Sys_Menu_Bar` items able to create new windows and expected to keep running without any open window cannot use these two functions. One solution is to run the event loop as follows:

```
while (!Fl::program_should_quit()) Fl::wait(1e20);
```

#### 33.7.3.54 scheme()

```
int Fl::scheme (
 const char * s) [static]
```

Sets the current widget scheme.

NULL will use the scheme defined in the `FLTK_SCHEME` environment variable or the scheme resource under X11. Otherwise, any of the following schemes can be used:

- "none" - This is the default look-n-feel which resembles old Windows (95/98/Me/NT/2000) and old GTK/KDE
- "base" - This is an alias for "none"
- "plastic" - This scheme is inspired by the Aqua user interface on macOS
- "gtk+" - This scheme is inspired by the Red Hat Bluecurve theme
- "gleam" - This scheme is inspired by the Clearlooks Glossy scheme. (Colin Jones and Edmanuel Torres).
- "oxy" - This is a subset of Dmitrij K's oxy scheme (STR 2675, 3477)

If the given scheme name is unknown, the default scheme will be used.

Setting the scheme (name) is case insensitive, but the stored scheme name will always be lowercase and `Fl::scheme()` will return this lowercase name or NULL if no scheme or the default scheme ("none" or "base") was set.

#### Parameters

in	<i>s</i>	Scheme name or NULL
----	----------	---------------------

#### Return values

0	if the scheme has not been set or is the default scheme
---	---------------------------------------------------------

## Return values

1	if a scheme other than "none"/"base" was set
---	----------------------------------------------

## See also

[Fl::scheme\(\)](#) to get the name of the current [scheme](#)

[Fl::is\\_scheme\(const char\\*\)](#) to test if the specified [scheme](#) is set

**33.7.3.55 scrollbar\_size()** [1/2]

```
int Fl::scrollbar_size () [static]
```

Gets the default scrollbar size used by [Fl\\_Browser\\_](#), [Fl\\_Help\\_View](#), [Fl\\_Scroll](#), and [Fl\\_Text\\_Display](#) widgets.

## Returns

The default size for widget scrollbars, in pixels.

**33.7.3.56 scrollbar\_size()** [2/2]

```
void Fl::scrollbar_size (
 int W) [static]
```

Sets the default scrollbar size that is used by the [Fl\\_Browser\\_](#), [Fl\\_Help\\_View](#), [Fl\\_Scroll](#), and [Fl\\_Text\\_Display](#) widgets.

## Parameters

in	<i>W</i>	The new default size for widget scrollbars, in pixels.
----	----------	--------------------------------------------------------

**33.7.3.57 seconds\_between()**

```
double Fl::seconds_between (
 Fl_Timestamp & back,
 Fl_Timestamp & further_back) [static]
```

Return the time in seconds between two time stamps.

## Parameters

in	<i>back</i>	a previously taken time stamp
in	<i>further_back</i>	an even earlier time stamp

## Returns

elapsed seconds and fractions of a second

## See also

[Fl::seconds\\_since\(Fl\\_Timestamp& then\)](#)

[Fl::now\(\)](#)

**33.7.3.58 seconds\_since()**

```
double Fl::seconds_since (
 Fl_Timestamp & then) [static]
```

Return the time in seconds between now and a previously taken time stamp.

**Parameters**

in	<i>then</i>	a previously taken time stamp
----	-------------	-------------------------------

**Returns**

elapsed seconds and fractions of a second

**See also**

[Fl::seconds\\_between\(Fl\\_Timestamp& back, Fl\\_Timestamp& further\\_back\)](#)

[Fl::now\(\)](#)

[Fl::distant\\_past\(\)](#)

**33.7.3.59 set\_box\_color()**

```
void Fl::set_box_color (
 Fl_Color c) [static]
```

Sets the drawing color for the box that is currently drawn.

This method sets the current drawing color [fl\\_color\(\)](#) depending on the widget's state to either *c* or [fl\\_inactive\(c\)](#).

It should be used whenever a box background is drawn in the box (type) drawing code instead of calling [fl\\_color\(Fl\\_Color bg\)](#) with the background color *bg*, usually [Fl\\_Widget::color\(\)](#).

This method is only useful inside box drawing code. Whenever a box is drawn with one of the standard box drawing methods, a static variable is set depending on the widget's current state - if the widget is [!active\\_r\(\)](#) then the internal variable is false (0), otherwise it is true (1). This is faster than calling [Fl\\_Widget::active\\_r\(\)](#) because the state is cached.

**See also**

[Fl::draw\\_box\\_active\(\)](#)

[Fl::box\\_color\(Fl\\_Color\)](#)

**33.7.3.60 set\_boxtype()**

```
void Fl::set_boxtype (
 Fl_Boxtype t,
 Fl_Box_Draw_F * f,
 uchar dx,
 uchar dy,
 uchar dw,
 uchar dh,
 Fl_Box_Draw_Focus_F * ff = NULL) [static]
```

Sets the function to call to draw a specific box type.

**Parameters**

in	<i>t</i>	index of the box type between 0 (FL_NO_BOX) and up to and including FL_MAX_BOXTYPE
in	<i>f</i>	callback function that draws the box
in	<i>dx,dy</i>	top left frame width, distance in pixels to box contents
in	<i>dw,dh</i>	left plus right frame width, top plus bottom frame width
in	<i>ff</i>	optional callback that draws the box focus, defaults to a rectangle, inset by dx, dy, dw, dh

**33.7.3.61 set\_idle()**

```
static void Fl::set_idle (
 Fl_Old_Idle_Handler cb) [inline], [static]
```

Sets an idle callback.

**Deprecated** This method is obsolete - use the [add\\_idle\(\)](#) method instead.

**33.7.3.62 ticks\_between()**

```
long Fl::ticks_between (
 Fl_Timestamp & back,
 Fl_Timestamp & further_back) [static]
```

Return the time in ticks (60Hz) between two time stamps.

**Parameters**

in	<i>back</i>	a previously taken time stamp
in	<i>further_back</i>	an even earlier time stamp

**Returns**

elapsed ticks in 60th of a second

**See also**

[Fl::ticks\\_since\(Fl\\_Timestamp& then\)](#)

[Fl::now\(\)](#)

**33.7.3.63 ticks\_since()**

```
long Fl::ticks_since (
 Fl_Timestamp & then) [static]
```

Return the time in ticks (60Hz) between now and a previously taken time stamp.

Ticks are a convenient way to time animations 'per frame'. Even though modern computers use all kinds of screen refresh rates, 60Hz is a very good base for animation that is typically shown in user interface graphics.

**Parameters**

in	<i>then</i>	a previously taken time stamp
----	-------------	-------------------------------

**Returns**

elapsed ticks in 60th of a second

**See also**

[Fl::ticks\\_between\(Fl\\_Timestamp& back, Fl\\_Timestamp& further\\_back\)](#)

[Fl::now\(\)](#)

**33.7.3.64 use\_high\_res\_GL()** [1/2]

```
static int Fl::use_high_res_GL () [inline], [static]
```

returns whether GL windows should be drawn at high resolution on Apple computers with retina displays. Default is no.

**Version**

1.3.4

**33.7.3.65 use\_high\_res\_GL()** [2/2]

```
static void Fl::use_high_res_GL (
 int val) [inline], [static]
```

sets whether GL windows should be drawn at high resolution on Apple computers with retina displays

**Version**

1.3.4

**33.7.3.66 version()**

```
double Fl::version () [static]
```

Returns the compiled-in value of the FL\_VERSION constant. This is useful for checking the version of a shared library.

**Deprecated** Use `int Fl::api_version()` instead.

**33.7.3.67 visible\_focus()** [1/2]

```
static int Fl::visible_focus () [inline], [static]
```

Gets or sets the visible keyboard focus on buttons and other non-text widgets. The default mode is to enable keyboard focus for all widgets.

**33.7.3.68 visible\_focus()** [2/2]

```
static void Fl::visible_focus (
 int v) [inline], [static]
```

Gets or sets the visible keyboard focus on buttons and other non-text widgets. The default mode is to enable keyboard focus for all widgets.

**33.7.3.69 visual()**

```
int Fl::visual (
 int flags) [static]
```

Selects a visual so that your graphics are drawn correctly.

This is only allowed before you call `show()` on any windows. This does nothing if the default visual satisfies the capabilities, or if no visual satisfies the capabilities, or on systems that don't have such brain-dead notions.

Only the following combinations do anything useful:

- `Fl::visual(FL_RGB)`  
Full/true color (if there are several depths FLTK chooses the largest). Do this if you use `fl_draw_image` for much better (non-dithered) output.

- `Fl::visual(FL_RGB8)`  
Full color with at least 24 bits of color. `FL_RGB` will always pick this if available, but if not it will happily return a less-than-24 bit deep visual. This call fails if 24 bits are not available.

This returns true if the system has the capabilities by default or FLTK succeeded in turning them on. Your program will still work even if this returns false (it just won't look as good).

### 33.7.3.70 `wait()` [1/2]

```
int Fl::wait () [static]
```

Waits until "something happens" and then returns.

Call this repeatedly to "run" your program. You can also check what happened each time after this returns, which is quite useful for managing program state.

What this really does is call all idle callbacks, all elapsed timeouts, call `Fl::flush()` to get the screen to update, and then wait some time (zero if there are idle callbacks, the shortest of all pending timeouts, or infinity), for any events from the user or any `Fl::add_fd()` callbacks. It then handles the events and calls the callbacks and then returns.

#### Returns

non-zero if there are any visible windows - this may change in future versions of FLTK.

### 33.7.3.71 `wait()` [2/2]

```
double Fl::wait (
 double time_to_wait) [static]
```

Waits a maximum of `time_to_wait` seconds or until "something happens".

See `Fl::wait()` for the description of operations performed when "something happens".

#### Returns

Always 1 on Windows. Otherwise, it is positive if an event or fd happens before the time elapsed. It is zero if nothing happens. It is negative if an error occurs (this will happen on X11 if a signal happens).

## 33.7.4 Member Data Documentation

### 33.7.4.1 `help`

```
const char *const Fl::help = helpmsg+13 [static]
```

Usage string displayed if `Fl::args()` detects an invalid argument.

This may be changed to point to customized text at run-time.

### 33.7.4.2 `idle`

```
void(* Fl::idle) () [static]
```

The currently executing idle callback function: DO NOT USE THIS DIRECTLY!

This is now used as part of a higher level system allowing multiple idle callback functions to be called.

  - Handles the specified event.*
- void [value\\_damage](#) () [FL\\_OVERRIDE](#)
  - Asks for partial redraw.*

## Additional Inherited Members

### 33.8.1 Detailed Description

The `Fl_Adjuster` widget was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range.

Figure 33.1 `Fl_Adjuster`

When you press a button and drag to the right the value increases. When you drag to the left it decreases. The largest button adjusts by  $100 * \text{step}()$ , the next by  $10 * \text{step}()$  and that smallest button by  $\text{step}()$ . Clicking on the buttons increments by 10 times the amount dragging by a pixel does. Shift + click decrements by 10 times the amount.

### 33.8.2 Constructor & Destructor Documentation

#### 33.8.2.1 `Fl_Adjuster()`

```
Fl_Adjuster::Fl_Adjuster (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Adjuster` widget using the given position, size, and label string. It looks best if one of the dimensions is 3 times the other. Inherited destructor destroys the Valuator.

### 33.8.3 Member Function Documentation

#### 33.8.3.1 `draw()`

```
void Fl_Adjuster::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

### 33.8.3.2 handle()

```
int Fl_Adjuster::handle (
 int event) [protected], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee's return value.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

### 33.8.3.3 soft() [1/2]

```
int Fl_Adjuster::soft () const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

### 33.8.3.4 soft() [2/2]

```
void Fl_Adjuster::soft (
 int s) [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

### 33.8.3.5 value\_damage()

```
void Fl_Adjuster::value_damage () [protected], [virtual]
```

Asks for partial redraw.

Reimplemented from [Fl\\_Valuator](#).

The documentation for this class was generated from the following files:

- [Fl\\_Adjuster.H](#)
- [Fl\\_Adjuster.cxx](#)

## 33.9 FI\_Anim\_GIF\_Image Class Reference

The [FI\\_Anim\\_GIF\\_Image](#) class supports loading, caching, and drawing of animated Compuserve GIF<sup>SM</sup> images. Inheritance diagram for [FI\\_Anim\\_GIF\\_Image](#):

### Public Types

- enum [Flags](#) {  
[DONT\\_START](#) = 1 , [DONT\\_RESIZE\\_CANVAS](#) = 2 , [DONT\\_SET\\_AS\\_IMAGE](#) = 4 , [OPTIMIZE\\_MEMORY](#) = 8 ,  
[LOG\\_FLAG](#) = 64 , [DEBUG\\_FLAG](#) = 128 }

When opening an [FI\\_Anim\\_GIF\\_Image](#) there are some options that can be passed in a *flags* value.

### Public Member Functions

- [FI\\_Widget](#) \* [canvas](#) () const  
*Gets the current widget, that is used to display the frame images.*
- void [canvas](#) ([FI\\_Widget](#) \**canvas*, unsigned short *flags*=0)  
*Link the image back to a widget for automated animation.*
- int [canvas\\_h](#) () const  
*Return the height of the animation canvas.*

*Return the width of the animation canvas.*
- void [color\\_average](#) ([FI\\_Color](#) *c*, float *i*) [FL\\_OVERRIDE](#)  
*Applies a color average to all frames.*
- [FI\\_Image](#) \* [copy](#) () const
- [FI\\_Image](#) \* [copy](#) (int *W*, int *H*) const [FL\\_OVERRIDE](#)  
*Copy and resize the animation frames.*
- int [debug](#) () const
- void [delay](#) (int *frame*, double *delay*)  
*Set the delay of frame [0-frames() -1] in seconds.*
- double [delay](#) (int *frame\_*) const  
*Return the delay of frame [0-frames() -1] in seconds.*
- void [desaturate](#) () [FL\\_OVERRIDE](#)  
*Desaturate to all frames of the animation.*
- void [draw](#) (int *x*, int *y*, int *w*, int *h*, int *cx*=0, int *cy*=0) [FL\\_OVERRIDE](#)  
*Draw the current frame of the animation.*
- [FI\\_Anim\\_GIF\\_Image](#) ()  
*Create an empty animated GIF image shell.*
- [FI\\_Anim\\_GIF\\_Image](#) (const char \**filename*, [FI\\_Widget](#) \**canvas*=0, unsigned short *flags*=0)  
*Load an animated GIF image from a file.*
- [FI\\_Anim\\_GIF\\_Image](#) (const char \**imagename*, const unsigned char \**data*, const size\_t *length*, [FI\\_Widget](#) \**canvas*=0, unsigned short *flags*=0)

- Load an animated GIF image from memory.*

  - int `frame` () const

*Return the current frame.*
- void `frame` (int frame)

*Set the current frame.*
- int `frame_h` (int frame) const

*Return the frame dimensions of a frame.*
- bool `frame_uncache` () const

*Return the active `frame_uncache()` setting.*
- void `frame_uncache` (bool uncache)

*Use `frame_uncache()` to set or forbid frame image uncaching.*
- int `frame_w` (int frame) const

*Return the frame dimensions of a frame.*
- int `frame_x` (int frame) const

*Return the frame position of a frame.*
- int `frame_y` (int frame) const

*Return the frame position of a frame.*
- int `frames` () const

*Get the number of frames in the animation.*
- `FI_Image * image` () const

*Return the current frame image.*
- `FI_Image * image` (int frame) const

*Return the image of the given frame index.*
- bool `is_animated` () const

*Check if this is a valid animation with more than one frame.*
- bool `load` (const char \*name, const unsigned char \*imgdata=NULL, size\_t imglength=0)

*Load an animation from a file or from a memory block.*
- const char \* `name` () const

*Return the name of the played file as specified in the constructor.*
- bool `next` ()

*Show the next frame if the animation is stopped.*
- bool `playing` () const

*Return if the animation is currently running or stopped.*
- `FI_Anim_GIF_Image & resize` (double scale)

*Resizes the image to the specified size, replacing the current image.*
- `FI_Anim_GIF_Image & resize` (int w, int h)

*Resizes the image to the specified size, replacing the current image.*
- double `speed` () const

*Get the animation speed factor.*
- void `speed` (double speed)

*Set the animation speed factor.*
- bool `start` ()

*The `start()` method (re-)starts the playing of the frames.*
- bool `stop` ()

*The `stop()` method stops the playing of the frames.*
- void `uncache` () `FL_OVERRIDE`

*Uncache all cached image data now.*
- bool `valid` () const

*Check if animation is valid.*
- `~FI_Anim_GIF_Image` () `FL_OVERRIDE`

*Release the image and all cached data.*

## Static Public Member Functions

- static int `frame_count` (const char \*`name`, const unsigned char \*`imgdata`=NULL, size\_t `imglength`=0)  
*Get the number of frames in a GIF file or in a GIF compressed data block.*

## Static Public Attributes

- static bool `loop` = true  
*The loop flag can be used to (dis-)allow loop count.*
- static double `min_delay` = 0.  
*The min\_delay value can be used to set a minimum value for the frame delay for playback.*

## Protected Member Functions

- void `clear_frames` ()
- bool `next_frame` ()
- void `on_extension_data` (Fl\_GIF\_Image::GIF\_FRAME &f) FL\_OVERRIDE
- void `on_frame_data` (Fl\_GIF\_Image::GIF\_FRAME &f) FL\_OVERRIDE
- void `scale_frame` ()
- void `set_frame` ()
- void `set_frame` (int `frame`)

## Static Protected Member Functions

- static void `cb_animate` (void \*`d`)

## Additional Inherited Members

### 33.9.1 Detailed Description

The `Fl_Anim_GIF_Image` class supports loading, caching, and drawing of animated Compuserve GIF<sup>SM</sup> images. The class loads all images contained in the file and animates them by cycling through them as defined by the delay times in the image file.

The user must supply an FLTK widget as "container" in order to see the animation by specifying it in the constructor or later using the `canvas()` method.

### 33.9.2 Member Enumeration Documentation

#### 33.9.2.1 Flags

enum `Fl_Anim_GIF_Image::Flags`

When opening an `Fl_Anim_GIF_Image` there are some options that can be passed in a `flags` value.

#### Enumerator

<code>DONT_START</code>	This flag indicates to the loader that it should not start the animation immediately after successful load, which is the default. It can be started later using the <code>start()</code> method.
<code>DONT_RESIZE_CANVAS</code>	This flag indicates to the loader that it should not resize the canvas widget of the animation to the dimensions of the animation, which is the default. Needed for special use cases.
<code>DONT_SET_AS_IMAGE</code>	This flag indicates to the loader that it should not set the animation as <code>image()</code> member of the canvas widget, which is the default. Needed for special use cases.

## Enumerator

OPTIMIZE_MEMORY	Often frames change just a small area of the animation canvas. This flag indicates to the loader to try using less memory by storing frame data not as canvas-sized images but use the sizes defined in the GIF file. The drawbacks are higher cpu usage during playback and maybe minor artifacts when resized.
LOG_FLAG	This flag can be used to print informations about the decoding process to the console.
DEBUG_FLAG	This flag can be used to print even more informations about the decoding process to the console.

### 33.9.3 Constructor & Destructor Documentation

#### 33.9.3.1 Fl\_Anim\_GIF\_Image() [1/2]

```
Fl_Anim_GIF_Image::Fl_Anim_GIF_Image (
 const char * filename,
 Fl_Widget * canvas = 0,
 unsigned short flags = 0)
```

Load an animated GIF image from a file.

This constructor creates an animated image from a GIF-formatted file. Optionally it applies the [canvas\(\)](#) method after successful load. If [DONT\\_START](#) is not specified in the `flags` parameter it calls [start\(\)](#) after successful load.

## Parameters

in	<i>filename</i>	path and name of GIF file in the file system
in	<i>canvas</i>	a widget that will show and animate the GIF, or NULL
in	<i>flags</i>	see <a href="#">Flags</a> for details, or 0

## Note

The GIF image must be decoupled from the canvas by calling `myGif->canvas (NULL) ;` before deleting the canvas.

#### 33.9.3.2 Fl\_Anim\_GIF\_Image() [2/2]

```
Fl_Anim_GIF_Image::Fl_Anim_GIF_Image (
 const char * imagename,
 const unsigned char * data,
 const size_t length,
 Fl_Widget * canvas = 0,
 unsigned short flags = 0)
```

Load an animated GIF image from memory.

This constructor creates an animated image from a GIF-formatted block in memory. Optionally it applies the [canvas\(\)](#) method after successful load. If [DONT\\_START](#) is not specified in the `flags` parameter it calls [start\(\)](#) after successful load.

`imagename` can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

## Parameters

in	<i>imagename</i>	a name given to this image or NULL
in	<i>data</i>	pointer to the start of the GIF image in memory

## Parameters

in	<i>length</i>	length of the GIF image in memory
in	<i>canvas</i>	a widget that will show and animate the GIF, or NULL
in	<i>flags</i>	see <a href="#">Flags</a> for details, or 0

## Note

The GIF image must be decoupled from the canvas by calling `myGif->canvas (NULL)` ; before deleting the canvas.

**33.9.3.3 ~Fl\_Anim\_GIF\_Image()**

```
Fl_Anim_GIF_Image::~Fl_Anim_GIF_Image ()
```

Release the image and all cached data.

Also removes the animation timer.

**33.9.4 Member Function Documentation****33.9.4.1 canvas() [1/2]**

```
Fl_Widget * Fl_Anim_GIF_Image::canvas () const
```

Gets the current widget, that is used to display the frame images.

## Returns

a pointer to a widget

**33.9.4.2 canvas() [2/2]**

```
void Fl_Anim_GIF_Image::canvas (
 Fl_Widget * canvas,
 unsigned short flags = 0)
```

Link the image back to a widget for automated animation.

This method sets current widget, that is used to display the frame images. The `flags` parameter specifies whether the canvas widget is resized to the animation dimensions and/or its `image()` method will be used to set the current frame image during animation.

## Parameters

in	<i>canvas</i>	a pointer to the widget that will show the animation
in	<i>flags</i>	see <a href="#">Flags</a>

## Note

The GIF image must be decoupled from the canvas by calling `myGif->canvas (NULL)` ; before deleting the canvas.

**33.9.4.3 canvas\_h()**

```
int Fl_Anim_GIF_Image::canvas_h () const
```

Return the height of the animation canvas.

**Returns**

the width in pixel units

**33.9.4.4 canvas\_w()**

```
int Fl_Anim_GIF_Image::canvas_w () const
```

Return the width of the animation canvas.

**Returns**

the width in pixel units

**33.9.4.5 color\_average()**

```
void Fl_Anim_GIF_Image::color_average (
 Fl_Color c,
 float i) [virtual]
```

Applies a color average to all frames.

The `color_average()` method averages the colors in the image with the provided FLTK color value.

**Parameters**

in	<i>c</i>	blend color
in	<i>i</i>	a value between 0.0 and 1.0 where 0 results in the blend color, and 1 returns the original image

Reimplemented from [Fl\\_Image](#).

**33.9.4.6 copy()**

```
Fl_Image * Fl_Anim_GIF_Image::copy (
 int W,
 int H) const [virtual]
```

Copy and resize the animation frames.

The virtual `copy()` method makes a copy of the animated image and resizes all of its frame images to W x H using the current resize method.

**Parameters**

in	<i>W,H</i>	new size in FLTK pixel units
----	------------	------------------------------

**Returns**

the resized copy of the animation

Reimplemented from [Fl\\_Image](#).

**33.9.4.7 delay() [1/2]**

```
void Fl_Anim_GIF_Image::delay (
 int frame,
 double delay)
```

Set the delay of frame [0-frames() -1] in seconds.

## Parameters

in	<i>frame</i>	index into frame list
in	<i>delay</i>	to next frame in seconds

**33.9.4.8 delay()** [2/2]

```
double Fl_Anim_GIF_Image::delay (
 int frame) const
```

Return the delay of frame [0-[frames\(\)](#) -1] in seconds.

## Parameters

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

## Returns

delay to next frame in seconds

**33.9.4.9 desaturate()**

```
void Fl_Anim_GIF_Image::desaturate () [virtual]
```

Desaturate to all frames of the animation.

Reimplemented from [Fl\\_Image](#).

**33.9.4.10 draw()**

```
void Fl_Anim_GIF_Image::draw (
 int x,
 int y,
 int w,
 int h,
 int cx = 0,
 int cy = 0) [virtual]
```

Draw the current frame of the animation.

## Parameters

in	<i>x,y,w,h</i>	target rectangle
in	<i>cx,cy</i>	source offset

Reimplemented from [Fl\\_Image](#).

**33.9.4.11 frame()** [1/2]

```
int Fl_Anim_GIF_Image::frame () const
```

Return the current frame.

## Returns

the current frame index in the range for 0 to [frames\(\)](#) -1.

-1 if the image has no frames.

**33.9.4.12 frame()** [2/2]

```
void Fl_Anim_GIF_Image::frame (
 int frame)
```

Set the current frame.

**Parameters**

in	<i>frame</i>	index into list of frames
----	--------------	---------------------------

**33.9.4.13 frame\_count()**

```
int Fl_Anim_GIF_Image::frame_count (
 const char * name,
 const unsigned char * imgdata = NULL,
 size_t imglength = 0) [static]
```

Get the number of frames in a GIF file or in a GIF compressed data block.

The static [frame\\_count\(\)](#) method is just a convenience method for getting the number of images (frames) stored in a GIF file.

As this count is not readily available in the GIF header, the whole GIF file has be parsed (which is done here by using a temporary [Fl\\_Anim\\_GIF\\_Image](#) object for simplicity). So this call may be slow with large files.

If *imgdata* is NULL, the image will be read from the file. Otherwise, it will be read from memory.

**Parameters**

in	<i>name</i>	path and name of GIF file in the file system, ignored when reading from memeory
in	<i>imgdata</i>	pointer to the start of the GIF image in memory, or NULL to read from a file
in	<i>imglength</i>	length of the GIF image in memory, or 0

**Returns**

the number of frames in the animation

**33.9.4.14 frame\_h()**

```
int Fl_Anim_GIF_Image::frame_h (
 int frame) const
```

Return the frame dimensions of a frame.

Usefull only if loaded with 'optimize\_mem' and the animation also has size optimized frames.

**Parameters**

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

**Returns**

height in FLTK pixle units

**33.9.4.15 frame\_uncache()** [1/2]

```
bool Fl_Anim_GIF_Image::frame_uncache () const
```

Return the active [frame\\_uncache\(\)](#) setting.

**Returns**

true if caching is disabled

**33.9.4.16 frame\_uncache() [2/2]**

```
void Fl_Anim_GIF_Image::frame_uncache (
 bool uncache)
```

Use [frame\\_uncache\(\)](#) to set or forbid frame image uncaching.

If frame uncaching is set, frame images are not offscreen cached for re-use and will be re-created every time they are displayed. This saves a lot of memory on the expense of cpu usage and should be carefully considered. Per default frame caching will be done.

**Parameters**

in	<i>uncache</i>	true to disable caching
----	----------------	-------------------------

**33.9.4.17 frame\_w()**

```
int Fl_Anim_GIF_Image::frame_w (
 int frame) const
```

Return the frame dimensions of a frame.

Usefull only if loaded with 'optimize\_mem' and the animation also has size optimized frames.

**Parameters**

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

**Returns**

width in FLTK pixle units

**33.9.4.18 frame\_x()**

```
int Fl_Anim_GIF_Image::frame_x (
 int frame) const
```

Return the frame position of a frame.

Usefull only if loaded with 'optimize\_mem' and the animation also has size optimized frames.

**Parameters**

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

**Returns**

x position in FLTK pixle units

**33.9.4.19 frame\_y()**

```
int Fl_Anim_GIF_Image::frame_y (
 int frame) const
```

Return the frame position of a frame.

Usefull only if loaded with 'optimize\_mem' and the animation also has size optimized frames.

#### Parameters

<code>in</code>	<code>frame</code>	index into frame list
-----------------	--------------------	-----------------------

#### Returns

y position in FLTK pixle units

#### 33.9.4.20 frames()

```
int Fl_Anim_GIF_Image::frames () const
```

Get the number of frames in the animation.

#### Returns

the number of frames

#### 33.9.4.21 image() [1/2]

```
Fl_Image * Fl_Anim_GIF_Image::image () const
```

Return the current frame image.

#### Returns

a pointer to the image or NULL if this is not an animation.

#### 33.9.4.22 image() [2/2]

```
Fl_Image * Fl_Anim_GIF_Image::image (
 int frame_) const
```

Return the image of the given frame index.

#### Parameters

<code>in</code>	<code>frame↔</code>	index into list of frames
	<code>_</code>	

#### Returns

image data or NULL if the frame number is not valid.

#### 33.9.4.23 is\_animated()

```
bool Fl_Anim_GIF_Image::is_animated () const
```

Check if this is a valid animation with more than one frame.

The `is_animated()` method is just a convenience method for testing the valid flag and the frame count beeing greater 1.

#### Returns

true if the animation is valid and has multiple frames.

**33.9.4.24 load()**

```
bool Fl_Anim_GIF_Image::load (
 const char * name,
 const unsigned char * imgdata = NULL,
 size_t imglength = 0)
```

Load an animation from a file or from a memory block.

The `load()` method is either used from the constructor to load the image from the given file, or to re-load an existing animation from another file.

**Parameters**

in	<i>name</i>	path and name of GIF file in the file system, or the image name when reading from memory
in	<i>imgdata</i>	pointer to the start of the GIF image in memory, or <code>NULL</code> to read from a file
in	<i>imglength</i>	length of the GIF image in memory, or 0

**Returns**

true if the animation loaded correctly

**33.9.4.25 name()**

```
const char * Fl_Anim_GIF_Image::name () const
```

Return the name of the played file as specified in the constructor.

If read from a memory block, this returns the name of the animation.

**Returns**

pointer to a C string

**33.9.4.26 next()**

```
bool Fl_Anim_GIF_Image::next ()
```

Show the next frame if the animation is stopped.

**Returns**

true if the animation has frames

**33.9.4.27 on\_extension\_data()**

```
void Fl_Anim_GIF_Image::on_extension_data (
 Fl_GIF_Image::GIF_FRAME & f) [protected], [virtual]
```

Reimplemented from [Fl\\_GIF\\_Image](#).

**33.9.4.28 on\_frame\_data()**

```
void Fl_Anim_GIF_Image::on_frame_data (
 Fl_GIF_Image::GIF_FRAME & f) [protected], [virtual]
```

Reimplemented from [Fl\\_GIF\\_Image](#).

**33.9.4.29 playing()**

```
bool Fl_Anim_GIF_Image::playing () const [inline]
```

Return if the animation is currently running or stopped.

**Returns**

true if the animation is running

**33.9.4.30 resize() [1/2]**

```
Fl_Anim_GIF_Image & Fl_Anim_GIF_Image::resize (
 double scale)
```

Resizes the image to the specified size, replacing the current image.  
If `DONT_RESIZE_CANVAS` is not set, the canvas widget will also be resized.

**Parameters**

in	<i>scale</i>	rescale factor in relation to current size
----	--------------	--------------------------------------------

**33.9.4.31 resize() [2/2]**

```
Fl_Anim_GIF_Image & Fl_Anim_GIF_Image::resize (
 int w,
 int h)
```

Resizes the image to the specified size, replacing the current image.  
If `DONT_RESIZE_CANVAS` is not set, the canvas widget will also be resized.

**Parameters**

in	<i>w,h</i>	new size of teh naimtion frames
----	------------	---------------------------------

**33.9.4.32 speed() [1/2]**

```
double Fl_Anim_GIF_Image::speed () const
```

Get the animation speed factor.

**Returns**

the current speed factor

**33.9.4.33 speed() [2/2]**

```
void Fl_Anim_GIF_Image::speed (
 double speed)
```

Set the animation speed factor.  
The `speed()` method changes the playing speed to `speed` x original speed. E.g. to play at half speed call it with 0.5, for double speed with 2.

**Parameters**

in	<i>speed</i>	floating point speed factor
----	--------------	-----------------------------

#### 33.9.4.34 start()

```
bool Fl_Anim_GIF_Image::start ()
```

The [start\(\)](#) method (re-)starts the playing of the frames.

##### Returns

true if the animation has frames

#### 33.9.4.35 stop()

```
bool Fl_Anim_GIF_Image::stop ()
```

The [stop\(\)](#) method stops the playing of the frames.

##### Returns

true if the animation has frames

#### 33.9.4.36 uncache()

```
void Fl_Anim_GIF_Image::uncache () [virtual]
```

Uncache all cached image data now.

Re-implemented from [Fl\\_Pixmap](#).

Reimplemented from [Fl\\_Image](#).

#### 33.9.4.37 valid()

```
bool Fl_Anim_GIF_Image::valid () const
```

Check if animation is valid.

##### Returns

true if the class has successfully loaded and the image has at least one frame.

### 33.9.5 Member Data Documentation

#### 33.9.5.1 loop

```
bool Fl_Anim_GIF_Image::loop = true [static]
```

The loop flag can be used to (dis-)allow loop count.

If set (which is the default), the animation will be stopped after the number of repeats specified in the GIF file (typically this count is set to 'forever' anyway). If cleared the animation will always be 'forever', regardless of what is specified in the GIF file.

#### 33.9.5.2 min\_delay

```
double Fl_Anim_GIF_Image::min_delay = 0. [static]
```

The min\_delay value can be used to set a minimum value for the frame delay for playback.

This is to prevent CPU hogs caused by images with very low delay rates. This is a global value for all [Fl\\_Anim\\_GIF\\_Image](#) objects.

The documentation for this class was generated from the following files:

- [Fl\\_Anim\\_GIF\\_Image.H](#)
- [Fl\\_Anim\\_GIF\\_Image.cxx](#)

## 33.10 FI\_Bitmap Class Reference

The [FI\\_Bitmap](#) class supports caching and drawing of mono-color (bitmap) images.

```
#include <FI_Bitmap.H>
```

Inheritance diagram for [FI\\_Bitmap](#):

## Additional Inherited Members

### 33.10.1 Detailed Description

The [Fl\\_Bitmap](#) class supports caching and drawing of mono-color (bitmap) images. Images are drawn using the current color.

### 33.10.2 Constructor & Destructor Documentation

#### 33.10.2.1 Fl\_Bitmap() [1/4]

```
Fl_Bitmap::Fl_Bitmap (
 const uchar * bits,
 int W,
 int H) [inline]
```

The constructors create a new bitmap from the specified bitmap data.

See also

[Fl\\_Bitmap\(const uchar \\*bits, int bits\\_length, int W, int H\)](#)

#### 33.10.2.2 Fl\_Bitmap() [2/4]

```
Fl_Bitmap::Fl_Bitmap (
 const char * bits,
 int W,
 int H) [inline]
```

The constructors create a new bitmap from the specified bitmap data.

See also

[Fl\\_Bitmap\(const char \\*bits, int bits\\_length, int W, int H\)](#)

#### 33.10.2.3 Fl\_Bitmap() [3/4]

```
Fl_Bitmap::Fl_Bitmap (
 const uchar * bits,
 int bits_length,
 int W,
 int H)
```

The constructors create a new bitmap from the specified bitmap data.

If the provided array is too small to contain all the image data, the constructor will not generate the bitmap to avoid illegal memory read access and instead set `data` to `NULL` and `ld` to `ERR_MEMORY_ACCESS`.

#### Parameters

<i>bits</i>	bitmap data, one pixel per bit, rows are rounded to the next byte
<i>bits_length</i>	length of the <code>bits</code> array in bytes
<i>W</i>	image width in pixels
<i>H</i>	image height in pixels

See also

[Fl\\_Bitmap\(const char \\*bits, int bits\\_length, int W, int H\)](#), [Fl\\_Bitmap\(const uchar \\*bits, int W, int H\)](#)

### 33.10.2.4 FI\_Bitmap() [4/4]

```
Fl_Bitmap::Fl_Bitmap (
 const char * bits,
 int bits_length,
 int W,
 int H)
```

The constructors create a new bitmap from the specified bitmap data.

If the provided array is too small to contain all the image data, the constructor will not generate the bitmap to avoid illegal memory read access and instead set `data` to `NULL` and `ld` to `ERR_MEMORY_ACCESS`.

#### Parameters

<i>bits</i>	bitmap data, one pixel per bit, rows are rounded to the next byte
<i>bits_length</i>	length of the <code>bits</code> array in bytes
<i>W</i>	image width in pixels
<i>H</i>	image height in pixels

#### See also

[FI\\_Bitmap\(const uchar \\*bits, int bits\\_length, int W, int H\)](#), [FI\\_Bitmap\(const char \\*bits, int W, int H\)](#)

## 33.10.3 Member Function Documentation

### 33.10.3.1 copy()

```
Fl_Image * Fl_Bitmap::copy (
 int W,
 int H) const [virtual]
```

Creates a resized copy of the image.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator `delete` for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

#### Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_Image](#).

### 33.10.3.2 draw()

```
void Fl_Bitmap::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the cx and cy arguments.

In other words: `fl_push_clip(X, Y, W, H)` is applied, the image is drawn with its upper-left corner at X-cx, Y-cy and its own width and height, `fl_pop_clip()` is applied.

Reimplemented from [Fl\\_Image](#).

### 33.10.3.3 label() [1/2]

```
void Fl_Bitmap::label (
 Fl_Menu_Item * m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use [Fl\\_Menu\\_Item::image\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

### 33.10.3.4 label() [2/2]

```
void Fl_Bitmap::label (
 Fl_Widget * widget) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use [Fl\\_Widget::image\(\)](#) or [Fl\\_Widget::deimage\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

### 33.10.3.5 uncache()

```
void Fl_Bitmap::uncache () [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented from [Fl\\_Image](#).

The documentation for this class was generated from the following files:

- [Fl\\_Bitmap.H](#)
- [Fl\\_Bitmap.cxx](#)

## 33.11 FI\_BMP\_Image Class Reference

The [Fl\\_BMP\\_Image](#) class supports loading, caching, and drawing of Windows Bitmap (BMP) image files.

```
#include <Fl_BMP_Image.H>
```

Inheritance diagram for [Fl\\_BMP\\_Image](#):

## Public Member Functions

- [FI\\_BMP\\_Image](#) (const char \*filename)  
*This constructor loads the named BMP image from the given BMP filename.*
- [FI\\_BMP\\_Image](#) (const char \*imagename, const unsigned char \*data, const long length=-1)  
*This constructor loads a BMP image from memory.*

## Protected Member Functions

- void [load\\_bmp\\_](#) (class [FI\\_Image\\_Reader](#) &rdr, int ico\_height=0, int ico\_width=0)

## Additional Inherited Members

### 33.11.1 Detailed Description

The [FI\\_BMP\\_Image](#) class supports loading, caching, and drawing of Windows Bitmap (BMP) image files.

### 33.11.2 Constructor & Destructor Documentation

#### 33.11.2.1 FI\_BMP\_Image() [1/2]

```
FI_BMP_Image::FI_BMP_Image (
 const char * filename)
```

This constructor loads the named BMP image from the given BMP filename.

The destructor frees all memory and server resources that are used by the image.

Use [FI\\_Image::fail\(\)](#) to check if [FI\\_BMP\\_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the BMP format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

#### Parameters

in	<i>filename</i>	a full path and name pointing to a BMP file.
----	-----------------	----------------------------------------------

#### See also

[FI\\_BMP\\_Image::FI\\_BMP\\_Image](#)(const char\* imagename, const unsigned char \*data, const long length = -1);

#### 33.11.2.2 FI\_BMP\_Image() [2/2]

```
FI_BMP_Image::FI_BMP_Image (
 const char * imagename,
 const unsigned char * data,
 const long length = -1)
```

This constructor loads a BMP image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary data" chunks as a great way to add image data into the C++ source code. `imagename` can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

The destructor frees all memory and server resources that are used by the image.

The (new and optional) third parameter `length` **should** be used so buffer overruns (i.e. truncated images) can be checked. See note below.

If `length` is not used

- it defaults to -1 (unlimited size)
- buffer overruns will not be checked.

#### Note

The optional parameter `length` is available since FLTK 1.4.0. Not using it is deprecated and old code should be modified to use it. This parameter will likely become mandatory in a future FLTK version.

Use `FI_Image::fail()` to check if `FI_BMP_Image` failed to load. `fail()` returns `ERR_FILE_ACCESS` if the image could not be read from memory, `ERR_FORMAT` if the BMP format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

#### Parameters

in	<code>imagename</code>	A name given to this image or NULL
in	<code>data</code>	Pointer to the start of the BMP image in memory.
in	<code>length</code>	Length of the BMP image in memory.

#### See also

[FI\\_BMP\\_Image::FI\\_BMP\\_Image\(const char \\*filename\)](#)  
[FI\\_Shared\\_Image](#)

The documentation for this class was generated from the following files:

- `FI_BMP_Image.H`
- `FI_BMP_Image.cxx`

## 33.12 FI\_Box Class Reference

This widget simply draws its box, and possibly its label.

```
#include <Fl_Box.H>
```

Inheritance diagram for `FI_Box`:

### Public Member Functions

- `FI_Box` ([FI\\_Boxtype](#) b, int X, int Y, int W, int H, const char \*)  
 See `FI_Box::FI_Box(int x, int y, int w, int h, const char * = 0)`
- `FI_Box` (int X, int Y, int W, int H, const char \*!=0)
- int `handle` (int) [FL\\_OVERRIDE](#)  
*Handles the specified event.*

## Protected Member Functions

- void `draw ()` [FL\\_OVERRIDE](#)

*Draws the widget.*

## Additional Inherited Members

### 33.12.1 Detailed Description

This widget simply draws its box, and possibly its label.

Putting it before some other widgets and making it big enough to surround them will let you draw a frame around them.

### 33.12.2 Constructor & Destructor Documentation

#### 33.12.2.1 Fl\_Box()

```
Fl_Box::Fl_Box (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

- The first constructor sets `box()` to `FL_NO_BOX`, which means it is invisible. However such widgets are useful as placeholders or `Fl_Group::resizable()` values. To change the box to something visible, use `box(n)`.
- The second form of the constructor sets the box to the specified box type.

The destructor removes the box.

### 33.12.3 Member Function Documentation

#### 33.12.3.1 draw()

```
void Fl_Box::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 33.12.3.2 handle()

```
int Fl_Box::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

The documentation for this class was generated from the following files:

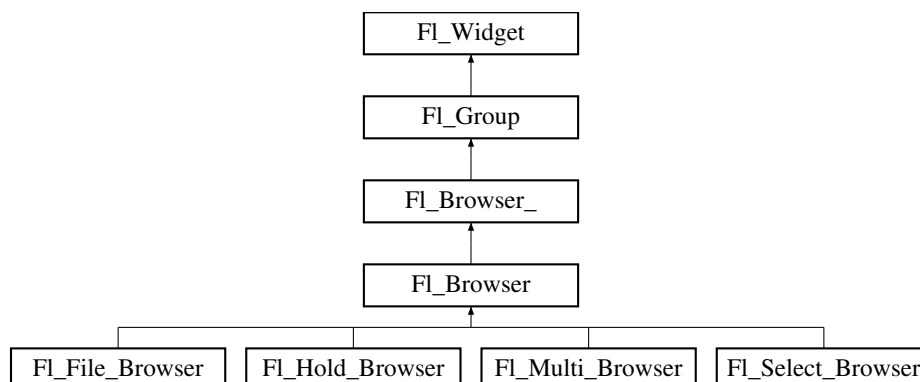

- [Fl\\_Box.H](#)
- [Fl\\_Box.cxx](#)

## 33.13 Fl\_Browser Class Reference

The [Fl\\_Browser](#) widget displays a scrolling list of text lines, and manages all the storage for the text.

```
#include <Fl_Browser.H>
```

Inheritance diagram for [Fl\\_Browser](#):

### Public Types

- enum [Fl\\_Line\\_Position](#) { `TOP` , `BOTTOM` , `MIDDLE` }
- For internal use only?*

### Public Member Functions

- void [add](#) (const char \*newtext, void \*d=0)
- Adds a new line to the end of the browser.*

- void **bottomline** (int line)  
*Scrolls the browser so the bottom item in the browser is showing the specified line.*
- void **clear** ()  
*Removes all the lines in the browser.*
- char **column\_char** () const  
*Gets the current column separator character.*
- void **column\_char** (char c)  
*Sets the column separator to c.*
- const int \* **column\_widths** () const  
*Gets the current column width array.*
- void **column\_widths** (const int \*arr)  
*Sets the current array to arr.*
- void \* **data** (int line) const  
*Returns the user data() for specified line.*
- void **data** (int line, void \*d)  
*Sets the user data for specified line to d.*
- void **display** (int line, int val=1)  
*For back compatibility.*
- int **displayed** (int line) const  
*Returns non-zero if line has been scrolled to a position where it is being displayed.*
- **FI\_Browser** (int X, int Y, int W, int H, const char \*L=0)  
*The constructor makes an empty browser.*
- char **format\_char** () const  
*Gets the current format code prefix character, which by default is '@'.*
- void **format\_char** (char c)  
*Sets the current format code prefix character to c.*
- void **hide** () **FL\_OVERRIDE**  
*Hides the entire FI\_Browser widget – opposite of show().*
- void **hide** (int line)  
*Makes line invisible, preventing selection by the user.*
- **FI\_Image** \* **icon** (int line) const  
*Returns the icon currently defined for line.*
- void **icon** (int line, **FI\_Image** \*icon)  
*Set the image icon for line to the value icon.*
- void **insert** (int line, const char \*newtext, void \*d=0)  
*Insert a new entry whose label is newtext above given line, optional data d.*
- void **lineposition** (int line, **FI\_Line\_Position** pos)  
*Updates the browser so that line is shown at position pos.*
- int **load** (const char \*filename)  
*Clears the browser and reads the file, adding each line from the file to the browser.*
- void **make\_visible** (int line)  
*Make the item at the specified line visible().*
- void **middleline** (int line)  
*Scrolls the browser so the middle item in the browser is showing the specified line.*
- void **move** (int to, int from)  
*Line from is removed and reinserted at to.*
- void **remove** (int line)  
*Remove entry for given line number, making the browser one line shorter.*
- void **remove\_icon** (int line)  
*Removes the icon for line.*
- void **replace** (int a, const char \*b)

- For back compatibility only.*

  - int **select** (int line, int val=1)
    - Sets the selection state of the item at line to the value val.*
  - int **selected** (int line) const
    - Returns 1 if specified line is selected, 0 if not.*
  - void **show** () **FL\_OVERRIDE**
    - Shows the entire FL\_Browser widget – opposite of hide().*
  - void **show** (int line)
    - Makes line visible, and available for selection by user.*
  - int **size** () const
    - Returns how many lines are in the browser.*
  - void **size** (int W, int H)
  - void **swap** (int a, int b)
    - Swaps two browser lines a and b.*
  - const char \* **text** (int line) const
    - Returns the label text for the specified line.*
  - void **text** (int line, const char \*newtext)
    - Sets the text for the specified line to newtext.*
  - **FL\_Fontsize** **textsize** () const
    - Gets the default text size (in pixels) for the lines in the browser.*
  - void **textsize** (**FL\_Fontsize** newSize)
    - Sets the default text size (in pixels) for the lines in the browser to newSize.*
  - int **topline** () const
    - Returns the line that is currently visible at the top of the browser.*
  - void **topline** (int line)
    - Scrolls the browser so the top item in the browser is showing the specified line.*
  - int **value** () const
    - Returns the line number of the currently selected line, or 0 if none selected.*
  - void **value** (int line)
    - Sets the browser's value(), which selects the specified line.*
  - int **visible** (int line) const
    - Returns non-zero if the specified line is visible, 0 if hidden.*
  - ~**FL\_Browser** ()
    - The destructor deletes all list items and destroys the browser.*

## Protected Member Functions

- **FL\_BLINE** \* **\_remove** (int line)
  - Removes the item at the specified line.*
- **FL\_BLINE** \* **find\_line** (int line) const
  - Returns the item for specified line.*
- int **full\_height** () const **FL\_OVERRIDE**
  - The height of the entire list of all visible() items in pixels.*
- int **incr\_height** () const **FL\_OVERRIDE**
  - The default 'average' item height (including inter-item spacing) in pixels.*
- void **insert** (int line, **FL\_BLINE** \*item)
  - Insert specified item above line.*
- void \* **item\_at** (int line) const **FL\_OVERRIDE**
  - Return the item at specified line.*
- void **item\_draw** (void \*item, int X, int Y, int W, int H) const **FL\_OVERRIDE**
  - Draws item at the position specified by X Y W H.*

- void \* [item\\_first](#) () const [FL\\_OVERRIDE](#)  
*Returns the very first item in the list.*
- int [item\\_height](#) (void \*item) const [FL\\_OVERRIDE](#)  
*Returns height of *item* in pixels.*
- void \* [item\\_last](#) () const [FL\\_OVERRIDE](#)  
*Returns the very last item in the list.*
- void \* [item\\_next](#) (void \*item) const [FL\\_OVERRIDE](#)  
*Returns the next item after *item*.*
- void \* [item\\_prev](#) (void \*item) const [FL\\_OVERRIDE](#)  
*Returns the previous item before *item*.*
- void [item\\_select](#) (void \*item, int val) [FL\\_OVERRIDE](#)  
*Change the selection state of *item* to the value *val*.*
- int [item\\_selected](#) (void \*item) const [FL\\_OVERRIDE](#)  
*See if *item* is selected.*
- void [item\\_swap](#) (void \*a, void \*b) [FL\\_OVERRIDE](#)  
*Swap the items *a* and *b*.*
- const char \* [item\\_text](#) (void \*item) const [FL\\_OVERRIDE](#)  
*Returns the label text for *item*.*
- int [item\\_width](#) (void \*item) const [FL\\_OVERRIDE](#)  
*Returns width of *item* in pixels.*
- int [lineno](#) (void \*item) const  
*Returns line number corresponding to *item*, or zero if not found.*
- void [swap](#) (FL\_BLINE \*a, FL\_BLINE \*b)  
*Swap the two items *a* and *b*.*

## Additional Inherited Members

### 33.13.1 Detailed Description

The [FI\\_Browser](#) widget displays a scrolling list of text lines, and manages all the storage for the text. This is not a text editor or spreadsheet! But it is useful for showing a vertical list of named objects to the user.

Figure 33.2 FI\_Hold\_Browser

Figure 33.3 FI\_Multi\_Browser

Each line in the browser is identified by number. *The numbers start at one* (this is so that zero can be reserved for "no line" in the selective browsers). *Unless otherwise noted, the methods do not check to see if the passed line number is in range and legal. It must always be greater than zero and  $\leq$  [size\(\)](#).*

Each line contains a null-terminated string of text and a void \* data pointer. The text string is displayed, the void \* pointer can be used by the callbacks to reference the object the text describes.

The base class does nothing when the user clicks on it. The subclasses [FI\\_Select\\_Browser](#), [FI\\_Hold\\_Browser](#), and [FI\\_Multi\\_Browser](#) react to user clicks to select lines in the browser and do callbacks.

The base class `Fl_Browser_` provides the scrolling and selection mechanisms of this and all the subclasses, but the dimensions and appearance of each item are determined by the subclass. You can use `Fl_Browser_` to display information other than text, or text that is dynamically produced from your own data structures. If you find that loading the browser is a lot of work or is inefficient, you may want to make a subclass of `Fl_Browser_`.

Some common coding patterns used for working with `Fl_Browser`:

```
// How to loop through all the items in the browser
for (int t=1; t<=browser->size(); t++) { // index 1 based..!
 printf("item #%d, label='%s'\n", t, browser->text(t));
}
```

Note: If you are *subclassing* `Fl_Browser`, it's more efficient to use the protected methods `item_first()` and `item_next()`, since `Fl_Browser` internally uses linked lists to manage the browser's items. For more info, see `find_item(int)`.

## 33.13.2 Constructor & Destructor Documentation

### 33.13.2.1 Fl\_Browser()

```
Fl_Browser::Fl_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor makes an empty browser.

#### Parameters

in	<i>X,Y,W,H</i>	position and size.
in	<i>L</i>	label string, may be NULL.

## 33.13.3 Member Function Documentation

### 33.13.3.1 \_remove()

```
FL_BLINE * Fl_Browser::_remove (
 int line) [protected]
```

Removes the item at the specified `line`.

Caveat: See efficiency note in `find_line()`. You must call `redraw()` to make any changes visible.

#### Parameters

in	<i>line</i>	The line number to be removed. (1 based) Must be in range!
----	-------------	------------------------------------------------------------

#### Returns

Pointer to browser item that was removed (and is no longer valid).

#### See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

### 33.13.3.2 add()

```
void Fl_Browser::add (
```

```
const char * newtext,
void * d = 0)
```

Adds a new line to the end of the browser.

The text string `newtext` may contain format characters; see [format\\_char\(\)](#) for details. `newtext` is copied using the `strdup()` function, and can be `NULL` to make a blank line.

The optional `void*` argument `d` will be the [data\(\)](#) for the new item.

#### Parameters

in	<i>newtext</i>	The label text used for the added item
in	<i>d</i>	Optional user <a href="#">data()</a> for the item (0 if unspecified)

#### See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

### 33.13.3.3 `bottomline()`

```
void Fl_Browser::bottomline (
 int line) [inline]
```

Scrolls the browser so the bottom item in the browser is showing the specified `line`.

#### Parameters

in	<i>line</i>	The line to be displayed at the bottom.
----	-------------	-----------------------------------------

#### See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#), [displayed\(\)](#), [lineposition\(\)](#)

### 33.13.3.4 `clear()`

```
void Fl_Browser::clear ()
```

Removes all the lines in the browser.

#### See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

### 33.13.3.5 `column_char()` [1/2]

```
char Fl_Browser::column_char () const [inline]
```

Gets the current column separator character.

The default is '\t' (tab).

#### See also

[column\\_char\(\)](#), [column\\_widths\(\)](#)

### 33.13.3.6 `column_char()` [2/2]

```
void Fl_Browser::column_char (
 char c) [inline]
```

Sets the column separator to `c`.

This will only have an effect if you also set [column\\_widths\(\)](#). The default is '\t' (tab).

See also

[column\\_char\(\)](#), [column\\_widths\(\)](#)

### 33.13.3.7 column\_widths() [1/2]

```
const int * Fl_Browser::column_widths () const [inline]
```

Gets the current column width array.

This array is zero-terminated and specifies the widths in pixels of each column. The text is split at each [column\\_char\(\)](#) and each part is formatted into it's own column. After the last column any remaining text is formatted into the space between the last column and the right edge of the browser, even if the text contains instances of [column\\_char\(\)](#). The default value is a one-element array of just a zero, which means there are no columns.

Example:

```
Fl_Browser *b = new Fl_Browser(..);
static int widths[] = { 50, 50, 50, 70, 70, 40, 40, 70, 70, 50, 0 }; // widths for each column
b->column_widths(widths); // assign array to widget
b->column_char('\t'); // use tab as the column character
b->add("USER\tPID\tCPU\tMEM\tVSZ\tRSS\tTTY\tSTAT\tSTART\tTIME\tCOMMAND");
b->add("root\t2888\t0.0\t0.0\t1352\t0\ttty3\tSW\tAug15\t0:00\t@b@f/sbin/mingetty tty3");
b->add("root\t13115\t0.0\t0.0\t1352\t0\ttty2\tSW\tAug30\t0:00\t@b@f/sbin/mingetty tty2");
[...]
```

See also

[column\\_char\(\)](#), [column\\_widths\(\)](#)

### 33.13.3.8 column\_widths() [2/2]

```
void Fl_Browser::column_widths (
 const int * arr) [inline]
```

Sets the current array to `arr`.

Make sure the last entry is zero.

See also

[column\\_char\(\)](#), [column\\_widths\(\)](#)

### 33.13.3.9 data() [1/2]

```
void * Fl_Browser::data (
 int line) const
```

Returns the user [data\(\)](#) for specified `line`.

Return value can be NULL if `line` is out of range or no user [data\(\)](#) was defined. The parameter `line` is 1 based (1 will be the first item in the list).

Parameters

<code>in</code>	<code>line</code>	The line number of the item whose <a href="#">data()</a> is returned. (1 based)
-----------------	-------------------	---------------------------------------------------------------------------------

Returns

The user data pointer (can be NULL)

### 33.13.3.10 data() [2/2]

```
void Fl_Browser::data (
 int line,
 void * d)
```

Sets the user data for specified `line` to `d`.  
Does nothing if `line` is out of range.

#### Parameters

in	<i>line</i>	The line of the item whose <a href="#">data()</a> is to be changed. (1 based)
in	<i>d</i>	The new data to be assigned to the item. (can be NULL)

#### 33.13.3.11 display()

```
void Fl_Browser::display (
 int line,
 int val = 1)
```

For back compatibility.

This calls `show(line)` if `val` is true, and `hide(line)` otherwise. If `val` is not specified, the default is 1 (makes the line visible).

#### See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make\\_visible\(\)](#)

#### 33.13.3.12 displayed()

```
int Fl_Browser::displayed (
 int line) const [inline]
```

Returns non-zero if `line` has been scrolled to a position where it is being displayed.

Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the `hide()/show()` status of the widget or item.

#### Parameters

in	<i>line</i>	The line to be checked
----	-------------	------------------------

#### Returns

1 if visible, 0 if not visible.

#### See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#), [displayed\(\)](#), [lineposition\(\)](#)

#### 33.13.3.13 find\_line()

```
FL_BLINE * Fl_Browser::find_line (
 int line) const [protected]
```

Returns the item for specified `line`.

Note: This call is slow. It's fine for e.g. responding to user clicks, but slow if called often, such as in a tight sorting loop. Finding an item 'by line' involves a linear lookup on the internal linked list. The performance hit can be significant if the browser's contents is large, and the method is called often (e.g. during a sort). If you're writing a subclass, use the protected methods `item_first()`, `item_next()`, etc. to access the internal linked list more efficiently.

#### Parameters

in	<i>line</i>	The line number of the item to return. (1 based)
----	-------------	--------------------------------------------------

## Return values

<i>item</i>	that was found.
<i>NULL</i>	if line is out of range.

## See also

[item\\_at\(\)](#), [find\\_line\(\)](#), [lineno\(\)](#)

**33.13.3.14 format\_char()** [1/2]

```
char Fl_Browser::format_char () const [inline]
```

Gets the current format code prefix character, which by default is '@'.

A string of formatting codes at the start of each column are stripped off and used to modify how the rest of the line is printed:

- '@.' Print rest of line, don't look for more '@' signs
- '@@' Doubling the format character prints the format character once, followed by the rest of line
- '@l' Use a LARGE (24 point) font
- '@m' Use a medium large (18 point) font
- '@s' Use a small (11 point) font
- '@b' Use a **bold** font (adds FL\_BOLD to font)
- '@i' Use an *italic* font (adds FL\_ITALIC to font)
- '@f' or '@t' Use a fixed-pitch font (sets font to FL\_COURIER)
- '@c' Center the line horizontally
- '@r' Right-justify the text
- '@N' Use fl\_inactive\_color() to draw the text
- '@B0', '@B1', ... '@B255' Fill the background with fl\_color(n)
- '@C0', '@C1', ... '@C255' Use fl\_color(n) to draw the text
- '@F0', '@F1', ... Use fl\_font(n) to draw the text
- '@S1', '@S2', ... Use point size n to draw the text
- '@u' or '@\_' Underline the text.
- '@-' draw an engraved line through the middle.

Notice that the '@.' command can be used to reliably terminate the parsing. To print a random string in a random color, use `sprintf("@C%d@.%s", color, string)` and it will work even if the string starts with a digit or has the format character in it.

**33.13.3.15 format\_char()** [2/2]

```
void Fl_Browser::format_char (
 char c) [inline]
```

Sets the current format code prefix character to c.

The default prefix is '@'. Set the prefix to 0 to disable formatting.

## See also

[format\\_char\(\)](#) for list of '@' codes

**33.13.3.16 full\_height()**

```
int Fl_Browser::full_height () const [protected], [virtual]
```

The height of the entire list of all [visible\(\)](#) items in pixels.

This returns the accumulated height of *all* the items in the browser that are not hidden with [hide\(\)](#), including items scrolled off screen.

**Returns**

The accumulated size of all the visible items in pixels.

**See also**

[item\\_height\(\)](#), [item\\_width\(\)](#),  
[incr\\_height\(\)](#), [full\\_height\(\)](#)

Reimplemented from [Fl\\_Browser\\_](#).

**33.13.3.17 hide() [1/2]**

```
void Fl_Browser::hide () [inline], [virtual]
```

Hides the entire [Fl\\_Browser](#) widget – opposite of [show\(\)](#).

Reimplemented from [Fl\\_Widget](#).

**33.13.3.18 hide() [2/2]**

```
void Fl_Browser::hide (
 int line)
```

Makes *line* invisible, preventing selection by the user.

The line can still be selected under program control. This changes the [full\\_height\(\)](#) if the state was changed. When a line is made invisible, lines below it are moved up in the display. [redraw\(\)](#) is called automatically if a change occurred.

**Parameters**

in	<i>line</i>	The line to be hidden. (1 based)
----	-------------	----------------------------------

**See also**

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make\\_visible\(\)](#)

**33.13.3.19 icon() [1/2]**

```
Fl_Image * Fl_Browser::icon (
 int line) const
```

Returns the icon currently defined for *line*.

If no icon is defined, NULL is returned.

**Parameters**

in	<i>line</i>	The line whose icon is returned.
----	-------------	----------------------------------

**Returns**

The icon defined, or NULL if none.

**33.13.3.20 icon()** [2/2]

```
void Fl_Browser::icon (
 int line,
 Fl_Image * icon)
```

Set the image icon for `line` to the value `icon`.

Caller is responsible for keeping the icon allocated. The `line` is automatically redrawn.

**Parameters**

in	<i>line</i>	The line to be modified. If out of range, nothing is done.
in	<i>icon</i>	The image icon to be assigned to the <code>line</code> . If NULL, any previous icon is removed.

**33.13.3.21 incr\_height()**

```
int Fl_Browser::incr_height () const [protected], [virtual]
```

The default 'average' item height (including inter-item spacing) in pixels.

This currently returns `textsize() + 2`.

**Returns**

The value in pixels.

**See also**

[item\\_height\(\)](#), [item\\_width\(\)](#),  
[incr\\_height\(\)](#), [full\\_height\(\)](#)

Reimplemented from [Fl\\_Browser\\_.](#)

**33.13.3.22 insert()** [1/2]

```
void Fl_Browser::insert (
 int line,
 const char * newtext,
 void * d = 0)
```

Insert a new entry whose label is `newtext` *above* given `line`, optional data `d`.

Text may contain format characters; see [format\\_char\(\)](#) for details. `newtext` is copied using the `strdup()` function, and can be NULL to make a blank line.

The optional `void *` argument `d` will be the [data\(\)](#) of the new item.

**Parameters**

in	<i>line</i>	Line position for insert. (1 based) If <code>line &gt; size()</code> , the entry will be added at the end.
in	<i>newtext</i>	The label text for the new line.
in	<i>d</i>	Optional pointer to user data to be associated with the new line.

**33.13.3.23 insert()** [2/2]

```
void Fl_Browser::insert (
 int line,
 FL_BLINE * item) [protected]
```

Insert specified `item` above `line`.

If `line > size()` then the line is added to the end.  
 Caveat: See efficiency note in [find\\_line\(\)](#).

#### Parameters

in	<i>line</i>	The new line will be inserted above this line (1 based).
in	<i>item</i>	The item to be added.

#### 33.13.3.24 item\_at()

```
void * Fl_Browser::item_at (
 int line) const [inline], [protected], [virtual]
```

Return the item at specified `line`.

#### Parameters

in	<i>line</i>	The line of the item to return. (1 based)
----	-------------	-------------------------------------------

#### Returns

The item, or NULL if line out of range.

#### See also

[item\\_at\(\)](#), [find\\_line\(\)](#), [lineno\(\)](#)

Reimplemented from [Fl\\_Browser\\_.](#)

#### 33.13.3.25 item\_draw()

```
void Fl_Browser::item_draw (
 void * item,
 int X,
 int Y,
 int W,
 int H) const [protected], [virtual]
```

Draws `item` at the position specified by X Y W H.

The W and H values are used for clipping. Should only be called within the context of an FLTK [draw\(\)](#).

#### Parameters

in	<i>item</i>	The item to be drawn
in	<i>X,Y,W,H</i>	position and size.

Implements [Fl\\_Browser\\_.](#)

#### 33.13.3.26 item\_first()

```
void * Fl_Browser::item_first () const [protected], [virtual]
```

Returns the very first item in the list.

Example of use:

```
// Walk the browser from beginning to end
for (void *i=item_first(); i; i=item_next(i)) {
 printf("item label='%s'\n", item_text(i));
}
```

**Returns**

The first item, or NULL if list is empty.

**See also**

[item\\_first\(\)](#), [item\\_last\(\)](#), [item\\_next\(\)](#), [item\\_prev\(\)](#)

Implements [Fl\\_Browser\\_.](#)

**33.13.3.27 item\_height()**

```
int Fl_Browser::item_height (
 void * item) const [protected], [virtual]
```

Returns height of *item* in pixels.

This takes into account embedded @ codes within the [text\(\)](#) label.

**Parameters**

<code>in</code>	<code><i>item</i></code>	The item whose height is returned.
-----------------	--------------------------	------------------------------------

**Returns**

The height of the item in pixels.

**See also**

[item\\_height\(\)](#), [item\\_width\(\)](#),  
[incr\\_height\(\)](#), [full\\_height\(\)](#)

Implements [Fl\\_Browser\\_.](#)

**33.13.3.28 item\_last()**

```
void * Fl_Browser::item_last () const [protected], [virtual]
```

Returns the very last item in the list.

Example of use:

```
// Walk the browser in reverse, from end to start
for (void *i=item_last(); i; i=item_prev(i)) {
 printf("item label='%s'\n", item_text(i));
}
```

**Returns**

The last item, or NULL if list is empty.

**See also**

[item\\_first\(\)](#), [item\\_last\(\)](#), [item\\_next\(\)](#), [item\\_prev\(\)](#)

Reimplemented from [Fl\\_Browser\\_.](#)

**33.13.3.29 item\_next()**

```
void * Fl_Browser::item_next (
 void * item) const [protected], [virtual]
```

Returns the next item after *item*.

## Parameters

in	<i>item</i>	The 'current' item
----	-------------	--------------------

## Returns

The next item after *item*, or NULL if there are none after this one.

## See also

[item\\_first\(\)](#), [item\\_last\(\)](#), [item\\_next\(\)](#), [item\\_prev\(\)](#)

Implements [Fl\\_Browser\\_](#).

**33.13.3.30 item\_prev()**

```
void * Fl_Browser::item_prev (
 void * item) const [protected], [virtual]
```

Returns the previous item before *item*.

## Parameters

in	<i>item</i>	The 'current' item
----	-------------	--------------------

## Returns

The previous item before *item*, or NULL if there are none before this one.

## See also

[item\\_first\(\)](#), [item\\_last\(\)](#), [item\\_next\(\)](#), [item\\_prev\(\)](#)

Implements [Fl\\_Browser\\_](#).

**33.13.3.31 item\_select()**

```
void Fl_Browser::item_select (
 void * item,
 int val) [protected], [virtual]
```

Change the selection state of *item* to the value *val*.

## Parameters

in	<i>item</i>	The item to be changed.
in	<i>val</i>	The new selection state: 1 selects, 0 de-selects.

## See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item\\_select\(\)](#), [item\\_selected\(\)](#)

Reimplemented from [Fl\\_Browser\\_](#).

**33.13.3.32 item\_selected()**

```
int Fl_Browser::item_selected (
 void * item) const [protected], [virtual]
```

See if `item` is selected.

## Parameters

in	<i>item</i>	The item whose selection state is to be checked.
----	-------------	--------------------------------------------------

## Returns

1 if selected, 0 if not.

## See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item\\_select\(\)](#), [item\\_selected\(\)](#)

Reimplemented from [Fl\\_Browser\\_.](#)

**33.13.3.33 item\_swap()**

```
void Fl_Browser::item_swap (
 void * a,
 void * b) [inline], [protected], [virtual]
```

Swap the items a and b.

You must call [redraw\(\)](#) to make any changes visible.

## Parameters

in	<i>a,b</i>	the items to be swapped.
----	------------	--------------------------

## See also

[swap\(int,int\)](#), [item\\_swap\(\)](#)

Reimplemented from [Fl\\_Browser\\_.](#)

**33.13.3.34 item\_text()**

```
const char * Fl_Browser::item_text (
 void * item) const [protected], [virtual]
```

Returns the label text for *item*.

## Parameters

in	<i>item</i>	The item whose label text is returned.
----	-------------	----------------------------------------

## Returns

The item's text string. (Can be NULL)

Reimplemented from [Fl\\_Browser\\_.](#)

**33.13.3.35 item\_width()**

```
int Fl_Browser::item_width (
 void * item) const [protected], [virtual]
```

Returns width of *item* in pixels.

This takes into account embedded @ codes within the [text\(\)](#) label.

## Parameters

in	<i>item</i>	The item whose width is returned.
----	-------------	-----------------------------------

## Returns

The width of the item in pixels.

## See also

[item\\_height\(\)](#), [item\\_width\(\)](#),  
[incr\\_height\(\)](#), [full\\_height\(\)](#)

Implements [Fl\\_Browser\\_](#).

**33.13.3.36 lineno()**

```
int Fl_Browser::lineno (
 void * item) const [protected]
```

Returns line number corresponding to *item*, or zero if not found.

Caveat: See efficiency note in [find\\_line\(\)](#).

## Parameters

in	<i>item</i>	The item to be found
----	-------------	----------------------

## Returns

The line number of the item, or 0 if not found.

## See also

[item\\_at\(\)](#), [find\\_line\(\)](#), [lineno\(\)](#)

**33.13.3.37 lineposition()**

```
void Fl_Browser::lineposition (
 int line,
 Fl_Line_Position pos)
```

Updates the browser so that *line* is shown at position *pos*.

## Parameters

in	<i>line</i>	line number. (1 based)
in	<i>pos</i>	position.

## See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#)

**33.13.3.38 load()**

```
int Fl_Browser::load (
 const char * filename)
```

Clears the browser and reads the file, adding each line from the file to the browser.

If the filename is NULL or a zero-length string then this just clears the browser. This returns zero if there was any error in opening or reading the file, in which case `errno` is set to the system error. The `data()` of each line is set to NULL.

#### Parameters

in	<i>filename</i>	The filename to load
----	-----------------	----------------------

#### Returns

1 if OK, 0 on error (`errno` has reason)

#### See also

[add\(\)](#)

#### 33.13.3.39 make\_visible()

```
void Fl_Browser::make_visible (
 int line) [inline]
```

Make the item at the specified `line` [visible\(\)](#).

Functionally similar to [show\(int line\)](#). If `line` is out of range, redisplay top or bottom of list as appropriate.

#### Parameters

in	<i>line</i>	The line to be made visible.
----	-------------	------------------------------

#### See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make\\_visible\(\)](#)

#### 33.13.3.40 middleline()

```
void Fl_Browser::middleline (
 int line) [inline]
```

Scrolls the browser so the middle item in the browser is showing the specified `line`.

#### Parameters

in	<i>line</i>	The line to be displayed in the middle.
----	-------------	-----------------------------------------

#### See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#), [displayed\(\)](#), [lineposition\(\)](#)

#### 33.13.3.41 move()

```
void Fl_Browser::move (
 int to,
 int from)
```

Line `from` is removed and reinserted at `to`.

Note: `to` is calculated *after* line `from` gets removed.

## Parameters

in	<i>to</i>	Destination line number (calculated <i>after</i> line <i>from</i> is removed)
in	<i>from</i>	Line number of item to be moved

**33.13.3.42 remove()**

```
void Fl_Browser::remove (
 int line)
```

Remove entry for given *line* number, making the browser one line shorter. You must call [redraw\(\)](#) to make any changes visible.

## Parameters

in	<i>line</i>	Line to be removed. (1 based) If <i>line</i> is out of range, no action is taken.
----	-------------	--------------------------------------------------------------------------------------

## See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

**33.13.3.43 remove\_icon()**

```
void Fl_Browser::remove_icon (
 int line)
```

Removes the icon for *line*. It's ok to remove an icon if none has been defined.

## Parameters

in	<i>line</i>	The line whose icon is to be removed.
----	-------------	---------------------------------------

**33.13.3.44 select()**

```
int Fl_Browser::select (
 int line,
 int val = 1)
```

Sets the selection state of the item at *line* to the value *val*. If *val* is not specified, the default is 1 (selects the item).

## Parameters

in	<i>line</i>	The line number of the item to be changed. (1 based)
in	<i>val</i>	The new selection state (1=select, 0=de-select).

## Returns

1 if the state changed, 0 if not.

See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item\\_select\(\)](#), [item\\_selected\(\)](#)

### 33.13.3.45 selected()

```
int Fl_Browser::selected (
 int line) const
```

Returns 1 if specified *line* is selected, 0 if not.

Parameters

in	<i>line</i>	The line being checked (1 based)
----	-------------	----------------------------------

Returns

1 if item selected, 0 if not.

See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item\\_select\(\)](#), [item\\_selected\(\)](#)

### 33.13.3.46 show() [1/2]

```
void Fl_Browser::show () [inline], [virtual]
```

Shows the entire [Fl\\_Browser](#) widget – opposite of [hide\(\)](#).

Reimplemented from [Fl\\_Widget](#).

### 33.13.3.47 show() [2/2]

```
void Fl_Browser::show (
 int line)
```

Makes *line* visible, and available for selection by user.

Opposite of [hide\(int\)](#). This changes the [full\\_height\(\)](#) if the state was changed. [redraw\(\)](#) is called automatically if a change occurred.

Parameters

in	<i>line</i>	The line to be shown. (1 based)
----	-------------	---------------------------------

See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make\\_visible\(\)](#)

### 33.13.3.48 size()

```
int Fl_Browser::size () const [inline]
```

Returns how many lines are in the browser.

The last line number is equal to this. Returns 0 if browser is empty.

### 33.13.3.49 swap() [1/2]

```
void Fl_Browser::swap (
```

```

 FL_BLINE * a,
 FL_BLINE * b) [protected]

```

Swap the two items `a` and `b`.

Uses [swapping\(\)](#) to ensure list updates correctly.

#### Parameters

in	<i>a,b</i>	The two items to be swapped.
----	------------	------------------------------

#### See also

[swap\(int,int\), item\\_swap\(\)](#)

### 33.13.3.50 swap() [2/2]

```

void Fl_Browser::swap (
 int a,
 int b)

```

Swaps two browser lines `a` and `b`.

You must call [redraw\(\)](#) to make any changes visible.

#### Parameters

in	<i>a,b</i>	The two lines to be swapped. (both 1 based)
----	------------	---------------------------------------------

#### See also

[swap\(int,int\), item\\_swap\(\)](#)

### 33.13.3.51 text() [1/2]

```

const char * Fl_Browser::text (
 int line) const

```

Returns the label text for the specified `line`.

Return value can be NULL if `line` is out of range or unset. The parameter `line` is 1 based.

#### Parameters

in	<i>line</i>	The line number of the item whose text is returned. (1 based)
----	-------------	---------------------------------------------------------------

#### Returns

The text string (can be NULL)

### 33.13.3.52 text() [2/2]

```

void Fl_Browser::text (
 int line,
 const char * newtext)

```

Sets the text for the specified `line` to `newtext`.

Text may contain format characters; see [format\\_char\(\)](#) for details. `newtext` is copied using the `strdup()` function, and can be NULL to make a blank line.

Does nothing if `line` is out of range.

## Parameters

in	<i>line</i>	The line of the item whose text will be changed. (1 based)
in	<i>newtext</i>	The new string to be assigned to the item.

**33.13.3.53** `textsize()`

```
void Fl_Browser::textsize (
 Fl_Fontsize newSize)
```

Sets the default text size (in pixels) for the lines in the browser to `newSize`.

This method recalculates all item heights and caches the total height internally for optimization of later item changes.

This can be slow if there are many items in the browser.

It returns immediately (w/o recalculation) if `newSize` equals the current `textsize()`.

You *may* need to call `redraw()` to see the effect and to have the scrollbar positions recalculated.

You should set the text size *before* populating the browser with items unless you really need to *change* the size later.

**33.13.3.54** `topline()` [1/2]

```
int Fl_Browser::topline () const
```

Returns the line that is currently visible at the top of the browser.

If there is no vertical scrollbar then this will always return 1.

## Returns

The `lineno()` of the `top()` of the browser.

**33.13.3.55** `topline()` [2/2]

```
void Fl_Browser::topline (
 int line) [inline]
```

Scrolls the browser so the top item in the browser is showing the specified `line`.

## Parameters

in	<i>line</i>	The line to be displayed at the top.
----	-------------	--------------------------------------

## See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#), [displayed\(\)](#), [lineposition\(\)](#)

**33.13.3.56** `value()` [1/2]

```
int Fl_Browser::value () const
```

Returns the line number of the currently selected line, or 0 if none selected.

## Returns

The line number of current selection, or 0 if none selected.

## See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item\\_select\(\)](#), [item\\_selected\(\)](#)

**33.13.3.57 value()** [2/2]

```
void Fl_Browser::value (
 int line) [inline]
```

Sets the browser's `value()`, which selects the specified `line`. This is the same as calling `select(line)`.

See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item\\_select\(\)](#), [item\\_selected\(\)](#)

**33.13.3.58 visible()**

```
int Fl_Browser::visible (
 int line) const
```

Returns non-zero if the specified `line` is visible, 0 if hidden. Use [show\(int\)](#), [hide\(int\)](#), or [make\\_visible\(int\)](#) to change an item's visible state.

Parameters

<code>in</code>	<i>line</i>	The line in the browser to be tested. (1 based)
-----------------	-------------	-------------------------------------------------

See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make\\_visible\(\)](#)

- `Fl_Browser.H`
- `Fl_Browser.cxx`
- `Fl_Browser_load.cxx`

**33.14 Fl\_Browser\_ Class Reference**

This is the base class for browsers.

```
#include <Fl_Browser_.H>
```

Inheritance diagram for `Fl_Browser_`:

**Public Types**

- enum {  
[HORIZONTAL](#) = 1 , [VERTICAL](#) = 2 , [BOTH](#) = 3 , [ALWAYS\\_ON](#) = 4 ,  
[HORIZONTAL\\_ALWAYS](#) = 5 , [VERTICAL\\_ALWAYS](#) = 6 , [BOTH\\_ALWAYS](#) = 7 }  
*Values for `has_scrollbar()`.*

## Public Member Functions

- int **deselect** (int docallbacks=0)  
*Deselects all items in the list and returns 1 if the state changed or 0 if it did not.*
- void **display** (void \*item)  
*Displays the *item*, scrolling the list as necessary.*
- int **handle** (int event) **FL\_OVERRIDE**  
*Handles the *event* within the normal widget bounding box.*
- **uchar has\_scrollbar** () const  
*Returns the current scrollbar mode, see [FI\\_Browser\\_::has\\_scrollbar\(uchar\)](#)*
- void **has\_scrollbar** (**uchar** mode)  
*Sets whether the widget should have scrollbars or not (default [FI\\_Browser\\_::BOTH](#)).*
- int **hposition** () const  
*Gets the horizontal scroll position of the list as a pixel position *pos*.*
- void **hposition** (int)  
*Sets the horizontal scroll position of the list to pixel position *pos*.*
- int **linespacing** () const  
*Return the height of additional spacing between browser lines.*
- void **linespacing** (int pixels)  
*Add some space between browser lines.*
- int **position** () const
- void **position** (int pos)
- void **position** (int x, int y)
- void **resize** (int X, int Y, int W, int H) **FL\_OVERRIDE**  
*Repositions and/or resizes the browser.*
- void **scrollbar\_left** ()  
*Moves the vertical scrollbar to the lefthand side of the list.*
- void **scrollbar\_right** ()  
*Moves the vertical scrollbar to the righthand side of the list.*
- int **scrollbar\_size** () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
- void **scrollbar\_size** (int newSize)  
*Sets the pixel size of the scrollbars' troughs to *newSize*, in pixels.*
- int **scrollbar\_width** () const  
*Returns the global value [FI::scrollbar\\_size\(\)](#).*
- void **scrollbar\_width** (int width)  
*Sets the global [FI::scrollbar\\_size\(\)](#), and forces this instance of the widget to use it.*
- int **select** (void \*item, int val=1, int docallbacks=0)  
*Sets the selection state of *item* to *val*, and returns 1 if the state changed or 0 if it did not.*
- int **select\_only** (void \*item, int docallbacks=0)  
*Selects *item* and returns 1 if the state changed or 0 if it did not.*
- void **sort** (int flags=0)  
*Sort the items in the browser based on *flags*.*
- **FI\_Color textcolor** () const  
*Gets the default text color for the lines in the browser.*
- void **textcolor** (**FI\_Color** col)  
*Sets the default text color for the lines in the browser to color *col*.*
- **FI\_Font textfont** () const  
*Gets the default text font for the lines in the browser.*
- void **textfont** (**FI\_Font** font)  
*Sets the default text font for the lines in the browser to *font*.*

- [Fl\\_Fontsize](#) **textsize** () const  
*Gets the default text size (in pixels) for the lines in the browser.*
- void **textsize** ([Fl\\_Fontsize](#) newSize)  
*Sets the default text size (in pixels) for the lines in the browser to *size*.*
- int [vposition](#) () const  
*Gets the vertical scroll position of the list as a pixel position *pos*.*
- void [vposition](#) (int pos)  
*Sets the vertical scroll position of the list to pixel position *pos*.*

## Public Attributes

- [Fl\\_Scrollbar](#) **hscrollbar**  
*Horizontal scrollbar.*
- [Fl\\_Scrollbar](#) **scrollbar**  
*Vertical scrollbar.*

## Protected Member Functions

- void **bbox** (int &X, int &Y, int &W, int &H) const  
*Returns the bounding box for the interior of the list's display window, inside the scrollbars.*
- void **deleting** (void \*item)  
*This method should be used when *item* is being deleted from the list.*
- int **displayed** (void \*item) const  
*Returns non-zero if *item* has been scrolled to a position where it is being displayed.*
- void **draw** () [FL\\_OVERRIDE](#)  
*Draws the list within the normal widget bounding box.*
- void \* **find\_item** (int ypos)  
*This method returns the item under mouse y position *ypos*.*
- [Fl\\_Browser\\_](#) (int X, int Y, int W, int H, const char \*L=0)  
*The constructor makes an empty browser.*
- virtual int **full\_height** () const  
*This method may be provided by the subclass to indicate the full height of the item list, in pixels.*
- virtual int **full\_width** () const  
*This method may be provided by the subclass to indicate the full width of the item list, in pixels.*
- virtual int **incr\_height** () const  
*This method may be provided to return the average height of all items to be used for scrolling.*
- void **inserting** (void \*a, void \*b)  
*This method should be used when an item is in the process of being inserted into the list.*
- virtual void \* **item\_at** (int index) const  
*This method must be provided by the subclass to return the item for the specified *index*.*
- virtual void **item\_draw** (void \*item, int X, int Y, int W, int H) const =0  
*This method must be provided by the subclass to draw the *item* in the area indicated by *X, Y, W, H*.*
- virtual void \* **item\_first** () const =0  
*This method must be provided by the subclass to return the first item in the list.*
- virtual int **item\_height** (void \*item) const =0  
*This method must be provided by the subclass to return the height of *item* in pixels.*
- virtual void \* **item\_last** () const  
*This method must be provided by the subclass to return the last item in the list.*
- virtual void \* **item\_next** (void \*item) const =0  
*This method must be provided by the subclass to return the item in the list after *item*.*
- virtual void \* **item\_prev** (void \*item) const =0

- This method must be provided by the subclass to return the item in the list before `item`.*

  - virtual int `item_quick_height` (void \*item) const
- This method may be provided by the subclass to return the height of the `item`, in pixels.*

  - virtual void `item_select` (void \*item, int val=1)
- This method must be implemented by the subclass if it supports multiple selections; sets the selection state to `val` for the `item`.*

  - virtual int `item_selected` (void \*item) const
- This method must be implemented by the subclass if it supports multiple selections; returns the selection state for `item`.*

  - virtual void `item_swap` (void \*a, void \*b)
- This optional method should be provided by the subclass to efficiently swap browser items `a` and `b`, such as for sorting.*

  - virtual const char \* `item_text` (void \*item) const
- This optional method returns a string (label) that may be used for sorting.*

  - virtual int `item_width` (void \*item) const =0
- This method must be provided by the subclass to return the width of the `item` in pixels.*

  - int `leftedge` () const
- This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.*

  - void `new_list` ()
- This method should be called when the list data is completely replaced or cleared.*

  - void `redraw_line` (void \*item)
- This method should be called when the contents of `item` has changed, but not its height.*

  - void `redraw_lines` ()
- This method will cause the entire list to be redrawn.*

  - void `replacing` (void \*a, void \*b)
- This method should be used when item `a` is being replaced by item `b`.*

  - void \* `selection` () const
- Returns the item currently selected, or NULL if there is no selection.*

  - void `swapping` (void \*a, void \*b)
- This method should be used when two items `a` and `b` are being swapped.*

  - void \* `top` () const
- Returns the item that appears at the top of the list.*

## Additional Inherited Members

### 33.14.1 Detailed Description

This is the base class for browsers.

To be useful it must be subclassed and several virtual functions defined. The Forms-compatible browser and the file chooser's browser are subclassed off of this.

This has been designed so that the subclass has complete control over the storage of the data, although because `next()` and `prev()` functions are used to index, it works best as a linked list or as a large block of characters in which the line breaks must be searched for.

A great deal of work has been done so that the "height" of a data object does not need to be determined until it is drawn. This is useful if actually figuring out the size of an object requires accessing image data or doing `stat()` on a file or doing some other slow operation.

Callbacks are called when the value changes with `FL_REASON_CHANGED`. If `FL_WHEN_RELEASE` is set, callbacks are called when the mouse button is released with `FL_REASON_CHANGED` or `FL_REASON_↔RESELECTED` if the selection did not change. If `FL_WHEN_ENTER_KEY` is set, callbacks are also called when key presses or double clicks change the selection.

### Keyboard navigation of browser items

The keyboard navigation of browser items is only possible if `visible_focus()` is enabled. If disabled, the widget rejects keyboard focus; Tab and Shift-Tab focus navigation will skip the widget.

In 'Select' and 'Normal' mode, the widget rejects keyboard focus; no navigation keys are supported (other than scrollbar positioning).

In 'Hold' mode, the widget accepts keyboard focus, and Up/Down arrow keys can navigate the selected item.

In 'Multi' mode, the widget accepts keyboard focus, and Up/Down arrow keys navigate the focus box; Space toggles the current item's selection, Enter selects only the current item (deselects all others). If Shift (or Ctrl) is combined with Up/Down arrow keys, the current item's selection state is extended to the next item. In this way one can extend a selection or de-selection.

## 33.14.2 Member Enumeration Documentation

### 33.14.2.1 anonymous enum

anonymous enum

Values for `has_scrollbar()`.

Anonymous enum bit flags for `has_scrollbar()`.

- bit 0: horizontal
- bit 1: vertical
- bit 2: 'always' (to be combined with bits 0 and 1)
- bit 3-31: reserved for future use

#### Enumerator

HORIZONTAL	Only show horizontal scrollbar.
VERTICAL	Only show vertical scrollbar.
BOTH	Show both scrollbars. (default)
ALWAYS_ON	Specified scrollbar(s) should 'always' be shown (to be used with HORIZONTAL/VERTICAL)
HORIZONTAL_ALWAYS	Horizontal scrollbar always on.
VERTICAL_ALWAYS	Vertical scrollbar always on.
BOTH_ALWAYS	Both scrollbars always on.

## 33.14.3 Constructor & Destructor Documentation

### 33.14.3.1 Fl\_Browser\_()

```
Fl_Browser_::Fl_Browser_ (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0) [protected]
```

The constructor makes an empty browser.

#### Parameters

in	X,Y,W,H	position and size.
----	---------	--------------------

## Parameters

in	<i>L</i>	The label string, may be NULL.
----	----------	--------------------------------

### 33.14.4 Member Function Documentation

#### 33.14.4.1 bbox()

```
void Fl_Browser_::bbox (
 int & X,
 int & Y,
 int & W,
 int & H) const [protected]
```

Returns the bounding box for the interior of the list's display window, inside the scrollbars.

## Parameters

out	<i>X,Y,W,H</i>	The returned bounding box. (The original contents of these parameters are overwritten)
-----	----------------	-------------------------------------------------------------------------------------------

#### 33.14.4.2 deleting()

```
void Fl_Browser_::deleting (
 void * item) [protected]
```

This method should be used when *item* is being deleted from the list.

It allows the `Fl_Browser_` to discard any cached data it has on the item. This method does not actually delete the item, but handles the follow up bookkeeping after the item has just been deleted.

## Parameters

in	<i>item</i>	The item being deleted.
----	-------------	-------------------------

#### 33.14.4.3 deselect()

```
int Fl_Browser_::deselect (
 int docallbacks = 0)
```

Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

If the optional `docallbacks` parameter is non-zero, `deselect` tries to call the callback function for the widget.

## Parameters

in	<i>docallbacks</i>	If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).
----	--------------------	-----------------------------------------------------------------------------------------------

#### 33.14.4.4 display()

```
void Fl_Browser_::display (
 void * item)
```

Displays the *item*, scrolling the list as necessary.

## Parameters

in	<i>item</i>	The item to be displayed.
----	-------------	---------------------------

## See also

[display\(\)](#), [displayed\(\)](#)

**33.14.4.5 displayed()**

```
int Fl_Browser_::displayed (
 void * item) const [protected]
```

Returns non-zero if *item* has been scrolled to a position where it is being displayed.

Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the [hide\(\)/show\(\)](#) status of the widget or item.

## Parameters

in	<i>item</i>	The item to check
----	-------------	-------------------

## Returns

1 if visible, 0 if not visible.

## See also

[display\(\)](#), [displayed\(\)](#)

**33.14.4.6 draw()**

```
void Fl_Browser_::draw (
 void) [protected], [virtual]
```

Draws the list within the normal widget bounding box.

Implements [FL\\_Widget](#).

**33.14.4.7 find\_item()**

```
void * Fl_Browser_::find_item (
 int ypos) [protected]
```

This method returns the item under mouse y position *ypos*.

NULL is returned if no item is displayed at that position.

## Parameters

in	<i>ypos</i>	The y position (eg. <a href="#">Fl::event_y()</a> ) to find an item under.
----	-------------	----------------------------------------------------------------------------

## Returns

The item, or NULL if not found

**33.14.4.8 full\_height()**

```
int Fl_Browser_::full_height () const [protected], [virtual]
```

This method may be provided by the subclass to indicate the full height of the item list, in pixels. The default implementation computes the full height from the item heights. Includes the items that are scrolled off screen.

#### Returns

The height of the entire list, in pixels.

Reimplemented in [Fl\\_Browser](#).

#### 33.14.4.9 full\_width()

```
int Fl_Browser_::full_width () const [protected], [virtual]
```

This method may be provided by the subclass to indicate the full width of the item list, in pixels. The default implementation computes the full width from the item widths.

#### Returns

The maximum width of all the items, in pixels.

#### 33.14.4.10 handle()

```
int Fl_Browser_::handle (
 int event) [virtual]
```

Handles the `event` within the normal widget bounding box.

#### Parameters

in	<i>event</i>	The event to process.
----	--------------	-----------------------

#### Returns

1 if event was processed, 0 if not.

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Check\\_Browser](#).

#### 33.14.4.11 has\_scrollbar()

```
void Fl_Browser_::has_scrollbar (
 uchar mode) [inline]
```

Sets whether the widget should have scrollbars or not (default [Fl\\_Browser\\_::BOTH](#)).

By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the widget. [has\\_scrollbar\(\)](#) changes this based on the value of `mode`:

- 0 - No scrollbars.
- [Fl\\_Browser\\_::HORIZONTAL](#) - Only a horizontal scrollbar.
- [Fl\\_Browser\\_::VERTICAL](#) - Only a vertical scrollbar.
- [Fl\\_Browser\\_::BOTH](#) - The default is both scrollbars.
- [Fl\\_Browser\\_::HORIZONTAL\\_ALWAYS](#) - Horizontal scrollbar always on, vertical always off.
- [Fl\\_Browser\\_::VERTICAL\\_ALWAYS](#) - Vertical scrollbar always on, horizontal always off.
- [Fl\\_Browser\\_::BOTH\\_ALWAYS](#) - Both always on.

**33.14.4.12 hposition()** [1/2]

```
int Fl_Browser_::hposition () const [inline]
```

Gets the horizontal scroll position of the list as a pixel position `pos`.

The position returned is how many pixels of the list are scrolled off the left edge of the screen. Example: A position of '18' indicates the left 18 pixels of the list are scrolled off the left edge of the screen.

See also

[position\(\)](#), [hposition\(\)](#)

**33.14.4.13 hposition()** [2/2]

```
void Fl_Browser_::hposition (
 int pos)
```

Sets the horizontal scroll position of the list to pixel position `pos`.

The position is how many pixels of the list are scrolled off the left edge of the screen. Example: A position of '18' scrolls the left 18 pixels of the list off the left edge of the screen.

Parameters

in	<i>pos</i>	The horizontal position (in pixels) to scroll the browser to.
----	------------	---------------------------------------------------------------

See also

[vposition\(\)](#), [hposition\(\)](#)

**33.14.4.14 incr\_height()**

```
int Fl_Browser_::incr_height () const [protected], [virtual]
```

This method may be provided to return the average height of all items to be used for scrolling.

The default implementation uses the height of the first item.

Returns

The average height of items, in pixels.

Reimplemented in [Fl\\_Browser](#).

**33.14.4.15 inserting()**

```
void Fl_Browser_::inserting (
 void * a,
 void * b) [protected]
```

This method should be used when an item is in the process of being inserted into the list.

It allows the [Fl\\_Browser\\_](#) to update its cache data as needed, scheduling a redraw for the affected lines. This method does not actually insert items, but handles the follow up bookkeeping after items have been inserted.

Parameters

in	<i>a</i>	The starting item position
in	<i>b</i>	The new item being inserted

**33.14.4.16 item\_at()**

```
virtual void * Fl_Browser_::item_at (
 int index) const [inline], [protected], [virtual]
```

This method must be provided by the subclass to return the item for the specified *index*.

**Parameters**

in	<i>index</i>	The <i>index</i> of the item to be returned
----	--------------	---------------------------------------------

**Returns**

The item at the specified *index*.

Reimplemented in [Fl\\_Check\\_Browser](#), and [Fl\\_Browser](#).

**33.14.4.17 item\_draw()**

```
virtual void Fl_Browser_::item_draw (
 void * item,
 int X,
 int Y,
 int W,
 int H) const [protected], [pure virtual]
```

This method must be provided by the subclass to draw the *item* in the area indicated by *X*, *Y*, *W*, *H*. Implemented in [Fl\\_Check\\_Browser](#), and [Fl\\_Browser](#).

**33.14.4.18 item\_first()**

```
virtual void * Fl_Browser_::item_first () const [protected], [pure virtual]
```

This method must be provided by the subclass to return the first item in the list.

**See also**

[item\\_first\(\)](#), [item\\_next\(\)](#), [item\\_last\(\)](#), [item\\_prev\(\)](#)

Implemented in [Fl\\_Browser](#), and [Fl\\_Check\\_Browser](#).

**33.14.4.19 item\_height()**

```
virtual int Fl_Browser_::item_height (
 void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the height of *item* in pixels. Allow for two additional pixels for the list selection box.

**Parameters**

in	<i>item</i>	The item whose height is returned.
----	-------------	------------------------------------

**Returns**

The height of the specified *item* in pixels.

**See also**

[item\\_height\(\)](#), [item\\_width\(\)](#), [item\\_quick\\_height\(\)](#)

Implemented in [Fl\\_Check\\_Browser](#), and [Fl\\_Browser](#).

**33.14.4.20 item\_last()**

```
virtual void * Fl_Browser_::item_last () const [inline], [protected], [virtual]
```

This method must be provided by the subclass to return the last item in the list.

See also

[item\\_first\(\)](#), [item\\_next\(\)](#), [item\\_last\(\)](#), [item\\_prev\(\)](#)

Reimplemented in [Fl\\_Browser](#).

**33.14.4.21 item\_next()**

```
virtual void * Fl_Browser_::item_next (
 void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the item in the list after *item*.

See also

[item\\_first\(\)](#), [item\\_next\(\)](#), [item\\_last\(\)](#), [item\\_prev\(\)](#)

Implemented in [Fl\\_Check\\_Browser](#), and [Fl\\_Browser](#).

**33.14.4.22 item\_prev()**

```
virtual void * Fl_Browser_::item_prev (
 void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the item in the list before *item*.

See also

[item\\_first\(\)](#), [item\\_next\(\)](#), [item\\_last\(\)](#), [item\\_prev\(\)](#)

Implemented in [Fl\\_Check\\_Browser](#), and [Fl\\_Browser](#).

**33.14.4.23 item\_quick\_height()**

```
int Fl_Browser_::item_quick_height (
 void * item) const [protected], [virtual]
```

This method may be provided by the subclass to return the height of the *item*, in pixels.

Allow for two additional pixels for the list selection box. This method differs from *item\_height* in that it is only called for selection and scrolling operations. The default implementation calls *item\_height*.

Parameters

in	<i>item</i>	The item whose height to return.
----	-------------	----------------------------------

Returns

The height, in pixels.

**33.14.4.24 item\_select()**

```
void Fl_Browser_::item_select (
 void * item,
 int val = 1) [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; sets the selection state to *val* for the *item*.

Sets the selection state for `item`, where optional `val` is 1 (select, the default) or 0 (de-select).

#### Parameters

in	<i>item</i>	The item to be selected
in	<i>val</i>	The optional selection state; 1=select, 0=de-select. The default is to select the item (1).

Reimplemented in [FI\\_Check\\_Browser](#), and [FI\\_Browser](#).

#### 33.14.4.25 item\_selected()

```
int Fl_Browser_::item_selected (
 void * item) const [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; returns the selection state for `item`.

The method should return 1 if `item` is selected, or 0 otherwise.

#### Parameters

in	<i>item</i>	The item to test.
----	-------------	-------------------

Reimplemented in [FI\\_Check\\_Browser](#), and [FI\\_Browser](#).

#### 33.14.4.26 item\_swap()

```
virtual void Fl_Browser_::item_swap (
 void * a,
 void * b) [inline], [protected], [virtual]
```

This optional method should be provided by the subclass to efficiently swap browser items `a` and `b`, such as for sorting.

#### Parameters

in	<i>a,b</i>	The two items to be swapped.
----	------------	------------------------------

Reimplemented in [FI\\_Browser](#), and [FI\\_Check\\_Browser](#).

#### 33.14.4.27 item\_text()

```
virtual const char * Fl_Browser_::item_text (
 void * item) const [inline], [protected], [virtual]
```

This optional method returns a string (label) that may be used for sorting.

#### Parameters

in	<i>item</i>	The item whose label text is returned.
----	-------------	----------------------------------------

#### Returns

The item's text label. (Can be NULL if blank)

Reimplemented in [FI\\_Browser](#), and [FI\\_Check\\_Browser](#).

**33.14.4.28 item\_width()**

```
virtual int Fl_Browser_::item_width (
 void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the width of the *item* in pixels. Allow for two additional pixels for the list selection box.

**Parameters**

in	<i>item</i>	The item whose width is returned.
----	-------------	-----------------------------------

**Returns**

The width of the item in pixels.

Implemented in [Fl\\_Check\\_Browser](#), and [Fl\\_Browser](#).

**33.14.4.29 leftedge()**

```
int Fl_Browser_::leftedge () const [protected]
```

This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

**Returns**

The X position of the left edge of the list, in pixels.

**See also**

[Fl\\_Browser\\_::bbox\(\)](#)

**33.14.4.30 linespacing() [1/2]**

```
int Fl_Browser_::linespacing () const [inline]
```

Return the height of additional spacing between browser lines.

**Returns**

spacing height in pixel units.

**33.14.4.31 linespacing() [2/2]**

```
void Fl_Browser_::linespacing (
 int pixels) [inline]
```

Add some space between browser lines.

**Parameters**

in	<i>pixels</i>	number of additional pixels between lines.
----	---------------	--------------------------------------------

**33.14.4.32 new\_list()**

```
void Fl_Browser_::new_list () [protected]
```

This method should be called when the list data is completely replaced or cleared.

It informs the [Fl\\_Browser\\_](#) widget that any cached information it has concerning the items is invalid. This method

does not clear the list, it just handles the follow up bookkeeping after the list has been cleared.

#### 33.14.4.33 position() [1/2]

```
int Fl_Browser_::position () const [inline]
```

**Deprecated** "in 1.4.0 - use vposition() instead"

#### 33.14.4.34 position() [2/2]

```
void Fl_Browser_::position (
 int pos) [inline]
```

**Deprecated** "in 1.4.0 - use vposition(pos) instead"

#### 33.14.4.35 redraw\_line()

```
void Fl_Browser_::redraw_line (
 void * item) [protected]
```

This method should be called when the contents of *item* has changed, but not its height.

##### Parameters

in	<i>item</i>	The item that needs to be redrawn.
----	-------------	------------------------------------

##### See also

[redraw\\_lines\(\)](#), [redraw\\_line\(\)](#)

#### 33.14.4.36 redraw\_lines()

```
void Fl_Browser_::redraw_lines () [inline], [protected]
```

This method will cause the entire list to be redrawn.

##### See also

[redraw\\_lines\(\)](#), [redraw\\_line\(\)](#)

#### 33.14.4.37 replacing()

```
void Fl_Browser_::replacing (
 void * a,
 void * b) [protected]
```

This method should be used when item *a* is being replaced by item *b*.

It allows the [Fl\\_Browser\\_](#) to update its cache data as needed, schedules a redraw for the item being changed, and tries to maintain the selection. This method does not actually replace the item, but handles the follow up bookkeeping after the item has just been replaced.

##### Parameters

in	<i>a</i>	Item being replaced
in	<i>b</i>	Item to replace 'a'

**33.14.4.38** `resize()`

```
void Fl_Browser_::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Repositions and/or resizes the browser.

**Parameters**

in	<code>X,Y,W,H</code>	The new position and size for the browser, in pixels.
----	----------------------	-------------------------------------------------------

Reimplemented from [Fl\\_Widget](#).

**33.14.4.39** `scrollbar_left()`

```
void Fl_Browser_::scrollbar_left () [inline]
```

Moves the vertical scrollbar to the lefthand side of the list.  
For back compatibility.

**33.14.4.40** `scrollbar_right()`

```
void Fl_Browser_::scrollbar_right () [inline]
```

Moves the vertical scrollbar to the righthand side of the list.  
For back compatibility.

**33.14.4.41** `scrollbar_size()` [1/2]

```
int Fl_Browser_::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.  
If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

**Returns**

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

**See also**

[Fl::scrollbar\\_size\(int\)](#)

**33.14.4.42** `scrollbar_size()` [2/2]

```
void Fl_Browser_::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare. Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

## Parameters

in	<i>newSize</i>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
----	----------------	-----------------------------------------------------------------------------------------------------------------------------

## See also

[Fl::scrollbar\\_size\(\)](#)

**33.14.4.43 scrollbar\_width()** [1/2]

```
int Fl_Browser_::scrollbar_width () const [inline]
```

Returns the global value [Fl::scrollbar\\_size\(\)](#).

**Deprecated** Use [scrollbar\\_size\(\)](#) instead.

**Todo** This method should eventually be removed in 1.4+

**33.14.4.44 scrollbar\_width()** [2/2]

```
void Fl_Browser_::scrollbar_width (
 int width) [inline]
```

Sets the global [Fl::scrollbar\\_size\(\)](#), and forces this instance of the widget to use it.

**Deprecated** Use [scrollbar\\_size\(\)](#) instead.

**Todo** This method should eventually be removed in 1.4+

**33.14.4.45 select()**

```
int Fl_Browser_::select (
 void * item,
 int val = 1,
 int docallbacks = 0)
```

Sets the selection state of *item* to *val*, and returns 1 if the state changed or 0 if it did not. If *docallbacks* is non-zero, *select* tries to call the callback function for the widget.

## Parameters

in	<i>item</i>	The item whose selection state is to be changed
in	<i>val</i>	The new selection state (1=select, 0=de-select)
in	<i>docallbacks</i>	If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).

## Returns

1 if state was changed, 0 if not.

**33.14.4.46 select\_only()**

```
int Fl_Browser_::select_only (
```

```
void * item,
int docallbacks = 0)
```

Selects `item` and returns 1 if the state changed or 0 if it did not.  
Any other items in the list are deselected.

#### Parameters

in	<i>item</i>	The <code>item</code> to select.
in	<i>docallbacks</i>	If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).

#### 33.14.4.47 selection()

```
void * Fl_Browser_::selection () const [inline], [protected]
```

Returns the item currently selected, or NULL if there is no selection.

For multiple selection browsers this call returns the currently focused item, even if it is not selected. To find all selected items, call [Fl\\_Multi\\_Browser::selected\(\)](#) for every item in question.

#### 33.14.4.48 sort()

```
void Fl_Browser_::sort (
int flags = 0)
```

Sort the items in the browser based on `flags`.

[item\\_swap\(void\\*, void\\*\)](#) and [item\\_text\(void\\*\)](#) must be implemented for this call.

#### Parameters

in	<i>flags</i>	FL_SORT_ASCENDING – sort in ascending order FL_SORT_DESCENDING – sort in descending order FL_SORT_CASEINSENSITIVE – add this to sort case-insensitively Values other than the above will cause undefined behavior Other flags may appear in the future.
----	--------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### 33.14.4.49 swapping()

```
void Fl_Browser_::swapping (
void * a,
void * b) [protected]
```

This method should be used when two items `a` and `b` are being swapped.

It allows the [Fl\\_Browser\\_](#) to update its cache data as needed, schedules a redraw for the two items, and tries to maintain the current selection. This method does not actually swap items, but handles the follow up bookkeeping after items have been swapped.

#### Parameters

in	<i>a,b</i>	Items being swapped.
----	------------	----------------------

#### 33.14.4.50 textfont()

```
Fl_Font Fl_Browser_::textfont () const [inline]
```

Gets the default text font for the lines in the browser.

See also

[textfont\(\)](#), [textsize\(\)](#), [textcolor\(\)](#)

#### 33.14.4.51 vposition() [1/2]

```
int Fl_Browser_::vposition () const [inline]
```

Gets the vertical scroll position of the list as a pixel position `pos`.

The position returned is how many pixels of the list are scrolled off the top edge of the screen. Example: A position of '3' indicates the top 3 pixels of the list are scrolled off the top edge of the screen.

See also

[position\(\)](#), [hposition\(\)](#)

#### 33.14.4.52 vposition() [2/2]

```
void Fl_Browser_::vposition (
 int pos)
```

Sets the vertical scroll position of the list to pixel position `pos`.

The position is how many pixels of the list are scrolled off the top edge of the screen. Example: A position of '3' scrolls the top three pixels of the list off the top edge of the screen.

Parameters

<code>in</code>	<code>pos</code>	The vertical position (in pixels) to scroll the browser to.
-----------------	------------------	-------------------------------------------------------------

See also

[vposition\(\)](#), [hposition\(\)](#)

### 33.14.5 Member Data Documentation

#### 33.14.5.1 hscrollbar

```
Fl_Scrollbar Fl_Browser_::hscrollbar
```

Horizontal scrollbar.

Public, so that it can be accessed directly.

#### 33.14.5.2 scrollbar

```
Fl_Scrollbar Fl_Browser_::scrollbar
```

Vertical scrollbar.

Public, so that it can be accessed directly.

Use [scrollbar\\_left\(\)](#) or [scrollbar\\_right\(\)](#) to change what side the vertical scrollbar is drawn on.

Use `scrollbar.align(int)` (see [Fl\\_Widget::align\(Fl\\_Align\)](#)) to change what side either of the scrollbars is drawn on.

If the `FL_ALIGN_LEFT` bit is on, the vertical scrollbar is on the left. If the `FL_ALIGN_TOP` bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbar are considered. The flags in hscrollbar however are ignored.

The documentation for this class was generated from the following files:

- `Fl_Browser_.H`
- `Fl_Browser_.cxx`

## 33.15 FL\_Button Class Reference

Buttons generate callbacks when they are clicked by the user.

```
#include <FL_Button.H>
```

### 33.15.1 Detailed Description

Buttons generate callbacks when they are clicked by the user.

You control exactly when and how by changing the values for `type(uchar)` and `when(uchar)`. Buttons can also generate callbacks in response to `FL_SHORTCUT` events. The button can either have an explicit `shortcut(int s)` value or a letter shortcut can be indicated in the `label()` with an '&' character before it. For the label shortcut it does not matter if *Alt* is held down, but if you have an input field in the same window, the user will have to hold down the *Alt* key so that the input field does not eat the event first as an `FL_KEYBOARD` event.

See also

`Fl_Widget::shortcut_label(int)`

For an `Fl_Button` object, the `type()` call returns one of:

- `FL_NORMAL_BUTTON` (0): `value()` remains unchanged after button press.
- `FL_TOGGLE_BUTTON`: `value()` is inverted after button press.
- `FL_RADIO_BUTTON`: `value()` is set to 1 after button press, and all other buttons in the current group with `type() == FL_RADIO_BUTTON` are set to zero.

For an `Fl_Button` object, the following `when()` values are useful, the default being `FL_WHEN_RELEASE`:

- 0: The callback is not done, instead `changed()` is turned on.
- `FL_WHEN_RELEASE`: The callback is done after the user successfully clicks the button, or when a shortcut is typed. The reason is `FL_REASON_RELEASED`.
- `FL_WHEN_CHANGED`: The callback is done each time the `value()` changes (when the user pushes and releases the button, and as the mouse is dragged around in and out of the button). The reason is set to `FL_REASON_CHANGED`
- `FL_WHEN_NOT_CHANGED`: The callback is done when the mouse button is released, but the value did not change. The reason is set to `FL_REASON_SELECTED`

## 33.15.2 Constructor & Destructor Documentation

### 33.15.2.1 Fl\_Button()

```
Fl_Button::Fl_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor creates the button using the given position, size, and label.

The default box type is `box(FL_UP_BOX)`.

You can control how the button is drawn when ON by setting `down_box()`. The default is `FL_NO_BOX` (0) which will select an appropriate box type using the normal (OFF) box type by using `fl_down(box())`.

Derived classes may handle this differently.

A button may request callbacks with `when()` `FL_WHEN_CHANGED`, `FL_WHEN_NOT_CHANGED`, and `FL↔_WHEN_RELEASE`, triggering the callback reasons `FL_REASON_CHANGED`, `FL_REASON_SELECTED`, and `FL_REASON_DESELECTED`.

## Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

### 33.15.3 Member Function Documentation

#### 33.15.3.1 clear()

```
int Fl_Button::clear () [inline]
Same as value(0).
```

## See also

[value\(int v\)](#)

#### 33.15.3.2 compact() [1/2]

```
uchar Fl_Button::compact () [inline]
Return true if buttons are rendered as compact buttons.
```

## Returns

0 if compact mode is off, 1 if it is on

## See also

[compact\(bool\)](#)

#### 33.15.3.3 compact() [2/2]

```
void Fl_Button::compact (
 uchar v)
```

Decide if buttons should be rendered in compact mode.

Figure 33.4 compact button keypad using GTK+ Scheme

Figure 33.5 compact buttons in Gleam

In compact mode, the button's surrounding border is altered to visually signal that multiple buttons are functionally linked together. To ensure the correct rendering of buttons in compact mode, all buttons must be part of the same group, positioned close to each other, and aligned with the edges of the group. Any button outlines not in contact with the parent group's outline will be displayed as separators.

#### Parameters

in	v	switch compact mode on (1) or off (0)
----	---	---------------------------------------

#### 33.15.3.4 down\_box() [1/2]

```
Fl_Boxtype Fl_Button::down_box () const [inline]
```

Returns the current down box type, which is drawn when `value()` is non-zero.

#### Return values

<i>Fl_Boxtype</i>	
-------------------	--

#### 33.15.3.5 down\_box() [2/2]

```
void Fl_Button::down_box (
 Fl_Boxtype b) [inline]
```

Sets the down box type.

The default value of 0 causes FLTK to figure out the correct matching down version of `box()`.

Some derived classes (e.g. `Fl_Round_Button` and `Fl_Light_Button` use `down_box()` for special purposes. See docs of these classes.

#### Parameters

in	<i>b</i>	down box type
----	----------	---------------

#### 33.15.3.6 draw()

```
void Fl_Button::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Light\\_Button](#), [Fl\\_Return\\_Button](#), and [Fl\\_Shortcut\\_Button](#).

### 33.15.3.7 `handle()`

```
int Fl_Button::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Light\\_Button](#), [Fl\\_Repeat\\_Button](#), [Fl\\_Return\\_Button](#), and [Fl\\_Shortcut\\_Button](#).

### 33.15.3.8 `set()`

```
int Fl_Button::set () [inline]
```

Same as `value(1)`.

#### See also

[value\(int v\)](#)

### 33.15.3.9 `shortcut()` [1/2]

```
int Fl_Button::shortcut () const [inline]
```

Returns the current shortcut key for the button.

## Return values

<code>int</code>	
------------------	--

**33.15.3.10 shortcut()** [2/2]

```
void Fl_Button::shortcut (
 int s) [inline]
```

Sets the shortcut key to `s`.

Setting this overrides the use of '&' in the [label\(\)](#). The value is a bitwise OR of a key and a set of shift flags, for example: `FL_ALT | 'a'`, or `FL_ALT | (FL_F + 10)`, or just `'a'`. A value of 0 disables the shortcut.

The key can be any value returned by [Fl::event\\_key\(\)](#), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.

The shift flags can be any set of values accepted by [Fl::event\\_state\(\)](#). If the bit is on, that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

## Parameters

<code>in</code>	<code>s</code>	bitwise OR of key and shift flags
-----------------	----------------	-----------------------------------

**33.15.3.11 value()**

```
int Fl_Button::value (
 int v)
```

Sets the current value of the button.

A non-zero value sets the button to 1 (ON), and zero sets it to 0 (OFF).

## Parameters

<code>in</code>	<code>v</code>	button value.
-----------------	----------------	---------------

**33.16 Fl\_Cairo\_State Class Reference**

Contains all the necessary info on the current cairo context.

```
#include <Fl_Cairo.H>
```

**Public Member Functions**

- `bool autolink () const`  
*Gets the autolink option. See [Fl::cairo\\_autolink\\_context\(bool\)](#)*
- `void autolink (bool b)`  
*Sets the autolink option, only available with `-enable-cairoext`.*
- `cairo_t* cc () const`

- Gets the current cairo context.*

  - void **cc** (cairo\_t \*c, bool own=true)

*Sets the current cairo context.*

  - void \* **gc** () const

*Gets the last gc attached to a cc.*

  - void **gc** (void \*c)

*Sets the gc c to keep track on.*

  - void \* **window** () const

*Gets the last window attached to a cc.*

  - void **window** (void \*w)

*Sets the window w to keep track on.*

### 33.16.1 Detailed Description

Contains all the necessary info on the current cairo context.

A private internal & unique corresponding object is created to permit cairo context state handling while keeping it opaque. For internal use only.

#### Note

Only available when configure has the `--enable-cairo` or `--enable-cairoext` option or one or both of the CMake options `FLTK_OPTION_CAIRO_WINDOW` or `FLTK_OPTION_CAIRO_EXT` is set (ON)

### 33.16.2 Member Function Documentation

#### 33.16.2.1 cc()

```
void Fl_Cairo_State::cc (
 cairo_t * c,
 bool own = true) [inline]
```

Sets the current cairo context.

`own == true` (the default) indicates that the cairo context `c` will be deleted by FLTK internally when another `cc` is set later.

`own == false` indicates `cc` deletion is handled externally by the user program.

The documentation for this class was generated from the following files:

- [Fl\\_Cairo.cxx](#)

## 33.17 Fl\_Cairo\_Window Class Reference

This defines an FLTK window with Cairo support.

```
#include <Fl_Cairo_Window.H>
```

Inheritance diagram for `Fl_Cairo_Window`:

## Public Types

- typedef void(\* **cairo\_draw\_cb**) ([Fl\\_Cairo\\_Window](#) \*self, cairo\_t \*def)  
*The Cairo draw callback prototype you need to implement.*

## Public Member Functions

- **Fl\_Cairo\_Window** (int W, int H, const char \*L=0)
- **Fl\_Cairo\_Window** (int X, int Y, int W, int H, const char \*L=0)
- void **set\_draw\_cb** ([cairo\\_draw\\_cb](#) cb)  
*You must provide a draw callback that implements your Cairo rendering.*

## Protected Member Functions

- void **draw** () **FL\_OVERRIDE**  
*Overloaded to provide Cairo callback support.*

## Additional Inherited Members

### 33.17.1 Detailed Description

This defines an FLTK window with Cairo support.

This class overloads the virtual [draw\(\)](#) method for you, so that the only thing you have to do is to provide your Cairo code. All Cairo context handling is achieved transparently.

The default coordinate system for Cairo drawing commands within [Fl\\_Cairo\\_Window](#) is FLTK's coordinate system, where the  $x, y, w, h$  values are relative to the top/left corner of the [Fl\\_Cairo\\_Window](#), as one would expect with regular FLTK drawing commands, e.g.: (0  $x$   $w-1$ ), (0  $y$   $h-1$ ). **Example:**

```

static void my_cairo_draw_cb(Fl_Cairo_Window *window, cairo_t *cr) {
 // Draw an "X"
 const double xmax = (window->w() - 1);
 const double ymax = (window->h() - 1);
 cairo_set_line_width(cr, 1.00); // line width for drawing
 cairo_set_source_rgb(cr, 1.0, 0.5, 0.0); // orange
 cairo_move_to(cr, 0.0, 0.0); cairo_line_to(cr, xmax, ymax); // draw diagonal "\"
 cairo_move_to(cr, 0.0, ymax); cairo_line_to(cr, xmax, 0.0); // draw diagonal "/"
 cairo_stroke(cr); // stroke the lines
}

```

The FLTK coordinate system differs from the default native Cairo coordinate system which uses normalized (0.0 ... 1.0) values for  $x$  and  $y$ , e.g.: (0  $x$  1.0), (0  $y$  1.0). So beware of this when copy/pasting Cairo example programs that assume normalized values. If need be, you can revert to the Cairo coordinate system by simply calling `cairo_scale()` with the widget's `w()` and `h()` values. **Example:**

```

static void my_cairo_draw_cb(Fl_Cairo_Window *window, cairo_t *cr) {
 cairo_scale(cr, window->w(), window->h()); // use Cairo's default coordinate system
 /*use 0.0 to 1.0 values from here on..*/
}

```

**See also**

[examples/cairo-draw-x.cxx](#)  
[test/cairo\\_test.cxx](#)

**Note**

Class [Fl\\_Cairo\\_Window](#) requires the FLTK library to have been built with CMake option `FLTK_OPTION_CAIRO_WINDOW` or configure `--enable-cairo`.

You can alternatively define your custom Cairo FLTK window, and thus at least override the [draw\(\)](#) method to provide custom Cairo support. In this case you will probably use [Fl::cairo\\_make\\_current\(Fl\\_Window\\*\)](#) to attach a context to your window. You should do this only when your window is the current window.

**See also**

[Fl\\_Window::current\(\)](#)

**33.17.2 Member Function Documentation****33.17.2.1 draw()**

```
void Fl_Cairo_Window::draw (
 void) [inline], [protected], [virtual]
```

Overloaded to provide Cairo callback support.

Implements [Fl\\_Widget](#).

**33.17.2.2 set\_draw\_cb()**

```
void Fl_Cairo_Window::set_draw_cb (
 cairo_draw_cb cb) [inline]
```

You must provide a draw callback that implements your Cairo rendering.

This method permits you to set your Cairo callback to `cb`.

The documentation for this class was generated from the following file:

- [Fl\\_Cairo\\_Window.H](#)

**33.18 FI\_Callback\_User\_Data Class Reference**

A class prototype that allows for additional data in callbacks.

```
#include <Fl_Widget.H>
```

**33.18.1 Detailed Description**

A class prototype that allows for additional data in callbacks.

Users can extend this class and pass it to widget callbacks. Widgets can take ownership of the callback data, deleting the data when the widget itself is deleted.

The destructor of this class is virtual, allowing for additional code to deallocate resources when the user data is deleted.

*Replaces a data value val at the given position ind.*
- int [size](#) () const  
*Returns the number of data values in the chart.*
- void [size](#) (int W, int H)  
*Sets the widget size (width, height).*
- [FI\\_Color textcolor](#) () const  
*Gets the chart's text color.*
- void [textcolor](#) ([FI\\_Color](#) n)  
*Sets the chart's text color to n.*
- [FI\\_Font textfont](#) () const  
*Gets the chart's text font.*
- void [textfont](#) ([FI\\_Font](#) s)  
*Sets the chart's text font to s.*
- [FI\\_Fontsize textsize](#) () const  
*Gets the chart's text size.*
- void [textsize](#) ([FI\\_Fontsize](#) s)  
*Sets the chart's text size to s.*
- [~FI\\_Chart](#) ()  
*Destroys the FI\_Chart widget and all of its data.*

## Protected Member Functions

- void `draw ()` **FL\_OVERRIDE**  
*Draws the `FL_Chart` widget.*

## Static Protected Member Functions

- static void `draw_barchart` (int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries[]`, double `min`, double `max`, int `autosize`, int `maxnumb`, `FL_Color` `textcolor`)  
*Draws a bar chart.*
- static void `draw_horbarchart` (int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries[]`, double `min`, double `max`, int `autosize`, int `maxnumb`, `FL_Color` `textcolor`)  
*Draws a horizontal bar chart.*
- static void `draw_linechart` (int `type`, int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries[]`, double `min`, double `max`, int `autosize`, int `maxnumb`, `FL_Color` `textcolor`)  
*Draws a line chart.*
- static void `draw_piechart` (int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries[]`, int `special`, `FL_Color` `textcolor`)  
*Draws a pie chart.*

## Additional Inherited Members

### 33.19.1 Detailed Description

`FL_Chart` displays simple charts.  
It is provided for Forms compatibility.

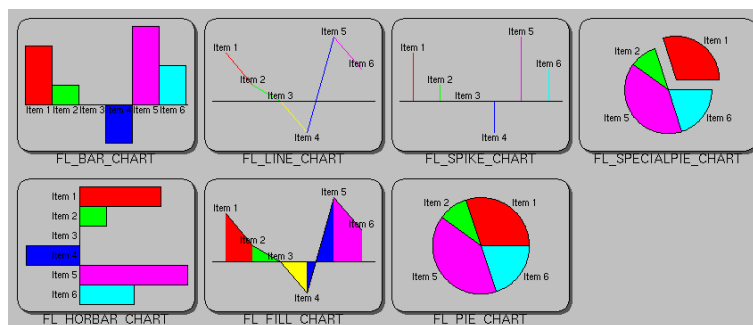

Figure 33.6 `FL_Chart`

**Todo** Refactor `FL_Chart::type()` information.

The type of an `FL_Chart` object can be set using `type(uchar t)` to:

Chart Type	Description
<code>FL_BAR_CHART</code>	Each sample value is drawn as a vertical bar.
<code>FL_FILLED_CHART</code>	The chart is filled from the bottom of the graph to the sample values.
<code>FL_HORBAR_CHART</code>	Each sample value is drawn as a horizontal bar.
<code>FL_LINE_CHART</code>	The chart is drawn as a polyline with vertices at each sample value.
<code>FL_PIE_CHART</code>	A pie chart is drawn with each sample value being drawn as a proportionate slice in the circle.
<code>FL_SPECIALPIE_CHART</code>	Like <code>FL_PIE_CHART</code> , but the first slice is separated from the pie.
<code>FL_SPIKE_CHART</code>	Each sample value is drawn as a vertical line.

## 33.19.2 Constructor & Destructor Documentation

### 33.19.2.1 Fl\_Chart()

```
Fl_Chart::Fl_Chart (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Create a new [Fl\\_Chart](#) widget using the given position, size and label string. The default boxstyle is `FL_NO_BOX`.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

## 33.19.3 Member Function Documentation

### 33.19.3.1 add()

```
void Fl_Chart::add (
 double val,
 const char * str = 0,
 unsigned col = 0)
```

Adds the data value `val` with optional label `str` and color `col` to the chart.

#### Parameters

in	<i>val</i>	data value
in	<i>str</i>	optional data label
in	<i>col</i>	optional data color

### 33.19.3.2 autosize() [1/2]

```
uchar Fl_Chart::autosize () const [inline]
```

Gets whether the chart will automatically adjust the bounds of the chart.

#### Returns

non-zero if auto-sizing is enabled and zero if disabled.

### 33.19.3.3 autosize() [2/2]

```
void Fl_Chart::autosize (
 uchar n) [inline]
```

Sets whether the chart will automatically adjust the bounds of the chart.

## Parameters

in	<i>n</i>	non-zero to enable automatic resizing, zero to disable.
----	----------	---------------------------------------------------------

**33.19.3.4 bounds() [1/2]**

```
void Fl_Chart::bounds (
 double * a,
 double * b) const [inline]
```

Gets the lower and upper bounds of the chart values.

## Parameters

out	<i>a,b</i>	are set to lower, upper
-----	------------	-------------------------

**33.19.3.5 bounds() [2/2]**

```
void Fl_Chart::bounds (
 double a,
 double b)
```

Sets the lower and upper bounds of the chart values.

## Parameters

in	<i>a,b</i>	are used to set lower, upper
----	------------	------------------------------

**33.19.3.6 draw()**

```
void Fl_Chart::draw (
 void) [protected], [virtual]
```

Draws the [Fl\\_Chart](#) widget.

Implements [Fl\\_Widget](#).

**33.19.3.7 draw\_barchart()**

```
void Fl_Chart::draw_barchart (
 int x,
 int y,
 int w,
 int h,
 int numb,
 FL_CHART_ENTRY entries[],
 double min,
 double max,
 int autosize,
 int maxnumb,
 Fl_Color textcolor) [static], [protected]
```

Draws a bar chart.

*x*, *y*, *w*, *h* is the bounding box, *entries* the array of *numb* entries, and *min* and *max* the boundaries.

## Parameters

in	<i>x,y,w,h</i>	Widget position and size
in	<i>numb</i>	Number of values
in	<i>entries</i>	Array of values
in	<i>min</i>	Lower boundary
in	<i>max</i>	Upper boundary
in	<i>autosize</i>	Whether the chart autosizes
in	<i>maxnumb</i>	Maximal number of entries
in	<i>textcolor</i>	Text color

**33.19.3.8 draw\_horbarchart()**

```
void Fl_Chart::draw_horbarchart (
 int x,
 int y,
 int w,
 int h,
 int numb,
 FL_CHART_ENTRY entries[],
 double min,
 double max,
 int autosize,
 int maxnumb,
 Fl_Color textcolor) [static], [protected]
```

Draws a horizontal bar chart.

*x*, *y*, *w*, *h* is the bounding box, *entries* the array of *numb* entries, and *min* and *max* the boundaries.

## Parameters

in	<i>x,y,w,h</i>	Widget position and size
in	<i>numb</i>	Number of values
in	<i>entries</i>	Array of values
in	<i>min</i>	Lower boundary
in	<i>max</i>	Upper boundary
in	<i>autosize</i>	Whether the chart autosizes
in	<i>maxnumb</i>	Maximal number of entries
in	<i>textcolor</i>	Text color

**33.19.3.9 draw\_linechart()**

```
void Fl_Chart::draw_linechart (
 int type,
 int x,
 int y,
 int w,
 int h,
 int numb,
 FL_CHART_ENTRY entries[],
 double min,
 double max,
 int autosize,
```

```

 int maxnumb,
 Fl_Color textcolor) [static], [protected]

```

Draws a line chart.

*x*, *y*, *w*, *h* is the bounding box, *entries* the array of *numb* entries, and *min* and *max* the boundaries.

#### Parameters

in	<i>type</i>	Chart type
in	<i>x,y,w,h</i>	Widget position and size
in	<i>numb</i>	Number of values
in	<i>entries</i>	Array of values
in	<i>min</i>	Lower boundary
in	<i>max</i>	Upper boundary
in	<i>autosize</i>	Whether the chart autosizes
in	<i>maxnumb</i>	Maximal number of entries
in	<i>textcolor</i>	Text color

#### 33.19.3.10 draw\_piechart()

```

void Fl_Chart::draw_piechart (
 int x,
 int y,
 int w,
 int h,
 int numb,
 FL_CHART_ENTRY entries[],
 int special,
 Fl_Color textcolor) [static], [protected]

```

Draws a pie chart.

#### Parameters

in	<i>x,y,w,h</i>	bounding box
in	<i>numb</i>	number of chart entries
in	<i>entries</i>	array of chart entries
in	<i>special</i>	special (?)
in	<i>textcolor</i>	text color

#### 33.19.3.11 insert()

```

void Fl_Chart::insert (
 int ind,
 double val,
 const char * str = 0,
 unsigned col = 0)

```

Inserts a data value *val* at the given position *ind*.  
Position 1 is the first data value.

#### Parameters

in	<i>ind</i>	insertion position
in	<i>val</i>	data value

## Parameters

in	<i>str</i>	optional data label
in	<i>col</i>	optional data color

**33.19.3.12 maxsize()**

```
void Fl_Chart::maxsize (
 int m)
```

Sets the maximum number of data values for a chart.

If you do not call this method then the chart will be allowed to grow to any size depending on available memory.

## Parameters

in	<i>m</i>	maximum number of data values allowed.
----	----------	----------------------------------------

**33.19.3.13 replace()**

```
void Fl_Chart::replace (
 int ind,
 double val,
 const char * str = 0,
 unsigned col = 0)
```

Replaces a data value *val* at the given position *ind*.

Position 1 is the first data value.

## Parameters

in	<i>ind</i>	insertion position
in	<i>val</i>	data value
in	<i>str</i>	optional data label
in	<i>col</i>	optional data color

**33.19.3.14 size()**

```
void Fl_Chart::size (
 int W,
 int H) [inline]
```

Sets the widget size (width, height).

This is the same as calling [Fl\\_Widget::size\(int W, int H\)](#);

## Parameters

in	<i>W,H</i>	new width and height of the widget
----	------------	------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Chart.H](#)
- [Fl\\_Chart.cxx](#)

## 33.20 FL\_CHART\_ENTRY Struct Reference

For internal use only.

```
#include <Fl_Chart.H>
```

### Public Attributes

- unsigned **col**  
*For internal use only.*
- char **str** [FL\_CHART\_LABEL\_MAX+1]  
*For internal use only.*
- float **val**  
*For internal use only.*

### 33.20.1 Detailed Description

For internal use only.

The documentation for this struct was generated from the following file:

- [Fl\\_Chart.H](#)

## 33.21 FI\_Check\_Browser Class Reference

The [Fl\\_Check\\_Browser](#) widget displays a scrolling list of text lines that may be selected and/or checked by the user.

```
#include <Fl_Check_Browser.H>
```

Inheritance diagram for [Fl\\_Check\\_Browser](#):

### Public Member Functions

- int **add** (char \*s)  
*Add a new unchecked line to the end of the browser.*
- int **add** (char \*s, int b)  
*Add a new line to the end of the browser.*

*This optional method returns a string (label) that may be used for sorting.*
- int **item\_width** (void \*) const **FL\_OVERRIDE**  
*This method must be provided by the subclass to return the width of the item in pixels.*

## Additional Inherited Members

### 33.21.1 Detailed Description

The [Fl\\_Check\\_Browser](#) widget displays a scrolling list of text lines that may be selected and/or checked by the user.

### 33.21.2 Member Function Documentation

#### 33.21.2.1 `add()` [1/2]

```
int Fl_Check_Browser::add (
 char * s)
```

Add a new unchecked line to the end of the browser.

See also

[add\(char \\*s, int b\)](#)

#### 33.21.2.2 `add()` [2/2]

```
int Fl_Check_Browser::add (
 char * s,
 int b)
```

Add a new line to the end of the browser.

The text is copied using the `strdup()` function. It may also be `NULL` to make a blank line. It can set the item checked if `b` is not 0.

#### 33.21.2.3 `handle()`

```
int Fl_Check_Browser::handle (
 int event) [protected], [virtual]
```

Handles the `event` within the normal widget bounding box.

Parameters

in	<i>event</i>	The event to process.
----	--------------	-----------------------

Returns

1 if event was processed, 0 if not.

Reimplemented from [Fl\\_Browser\\_](#).

#### 33.21.2.4 `item_at()`

```
void * Fl_Check_Browser::item_at (
 int index) const [virtual]
```

This method must be provided by the subclass to return the item for the specified `index`.

Parameters

in	<i>index</i>	The <code>index</code> of the item to be returned
----	--------------	---------------------------------------------------

**Returns**

The item at the specified `index`.

Reimplemented from [Fl\\_Browser\\_](#).

**33.21.2.5 item\_draw()**

```
void Fl_Check_Browser::item_draw (
 void * item,
 int X,
 int Y,
 int W,
 int H) const [protected], [virtual]
```

This method must be provided by the subclass to draw the `item` in the area indicated by `X`, `Y`, `W`, `H`.

Implements [Fl\\_Browser\\_](#).

**33.21.2.6 item\_first()**

```
void * Fl_Check_Browser::item_first () const [protected], [virtual]
```

This method must be provided by the subclass to return the first item in the list.

**See also**

[item\\_first\(\)](#), [item\\_next\(\)](#), [item\\_last\(\)](#), [item\\_prev\(\)](#)

Implements [Fl\\_Browser\\_](#).

**33.21.2.7 item\_height()**

```
int Fl_Check_Browser::item_height (
 void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the height of `item` in pixels.

Allow for two additional pixels for the list selection box.

**Parameters**

<code>in</code>	<i>item</i>	The item whose height is returned.
-----------------	-------------	------------------------------------

**Returns**

The height of the specified `item` in pixels.

**See also**

[item\\_height\(\)](#), [item\\_width\(\)](#), [item\\_quick\\_height\(\)](#)

Implements [Fl\\_Browser\\_](#).

**33.21.2.8 item\_next()**

```
void * Fl_Check_Browser::item_next (
 void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the item in the list after `item`.

**See also**

[item\\_first\(\)](#), [item\\_next\(\)](#), [item\\_last\(\)](#), [item\\_prev\(\)](#)

Implements [Fl\\_Browser\\_](#).

**33.21.2.9 item\_prev()**

```
void * Fl_Check_Browser::item_prev (
 void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the item in the list before *item*.

See also

[item\\_first\(\)](#), [item\\_next\(\)](#), [item\\_last\(\)](#), [item\\_prev\(\)](#)

Implements [Fl\\_Browser\\_.](#)

**33.21.2.10 item\_select()**

```
void Fl_Check_Browser::item_select (
 void * item,
 int val) [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; sets the selection state to *val* for the *item*.

Sets the selection state for *item*, where optional *val* is 1 (select, the default) or 0 (de-select).

Parameters

in	<i>item</i>	The item to be selected
in	<i>val</i>	The optional selection state; 1=select, 0=de-select. The default is to select the item (1).

Reimplemented from [Fl\\_Browser\\_.](#)

**33.21.2.11 item\_selected()**

```
int Fl_Check_Browser::item_selected (
 void * item) const [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; returns the selection state for *item*.

The method should return 1 if *item* is selected, or 0 otherwise.

Parameters

in	<i>item</i>	The item to test.
----	-------------	-------------------

Reimplemented from [Fl\\_Browser\\_.](#)

**33.21.2.12 item\_swap()**

```
void Fl_Check_Browser::item_swap (
 void * a,
 void * b) [virtual]
```

This optional method should be provided by the subclass to efficiently swap browser items *a* and *b*, such as for sorting.

Parameters

in	<i>a,b</i>	The two items to be swapped.
----	------------	------------------------------

Reimplemented from [Fl\\_Browser\\_.](#)

**33.21.2.13 item\_text()**

```
const char * Fl_Check_Browser::item_text (
 void * item) const [protected], [virtual]
```

This optional method returns a string (label) that may be used for sorting.

**Parameters**

<code>in</code>	<i>item</i>	The item whose label text is returned.
-----------------	-------------	----------------------------------------

**Returns**

The item's text label. (Can be NULL if blank)

Reimplemented from [Fl\\_Browser\\_](#).

**33.21.2.14 item\_width()**

```
int Fl_Check_Browser::item_width (
 void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the width of the *item* in pixels. Allow for two additional pixels for the list selection box.

**Parameters**

<code>in</code>	<i>item</i>	The item whose width is returned.
-----------------	-------------	-----------------------------------

**Returns**

The width of the item in pixels.

Implements [Fl\\_Browser\\_](#).

**33.21.2.15 nitems()**

```
int Fl_Check_Browser::nitems () const [inline]
```

Returns how many lines are in the browser.

The last line number is equal to this.

**33.21.2.16 remove()**

```
int Fl_Check_Browser::remove (
 int item)
```

Remove line *n* and make the browser one line shorter.

Returns the number of lines left in the browser.

The documentation for this class was generated from the following files:

- `Fl_Check_Browser.H`
- `Fl_Check_Browser.cxx`

**33.22 Fl\_Check\_Button Class Reference**

A button with a "checkmark" to show its status.

Inheritance diagram for `Fl_Check_Button`:

## Public Member Functions

- [Fl\\_Check\\_Button](#) (int X, int Y, int W, int H, const char \*L=0)  
Creates a new [Fl\\_Check\\_Button](#) widget using the given position, size, and label string.

## Additional Inherited Members

### 33.22.1 Detailed Description

A button with a "checkmark" to show its status.

Figure 33.7 Fl\_Check\_Button

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for [type\(\)](#) and [when\(\)](#).

The [Fl\\_Check\\_Button](#) subclass displays its "ON" state by showing a "checkmark" rather than drawing itself pushed in.

### 33.22.2 Constructor & Destructor Documentation

#### 33.22.2.1 Fl\_Check\_Button()

```

Fl_Check_Button::Fl_Check_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)

```

Creates a new [Fl\\_Check\\_Button](#) widget using the given position, size, and label string.

The default box type is `FL_NO_BOX`, which draws the label w/o a box right of the checkmark.

The [selection\\_color\(\)](#) sets the color of the checkmark. Default is `FL_FOREGROUND_COLOR` (usually black).

You can use [down\\_box\(\)](#) to change the box type of the checkmark. Default is `FL_DOWN_BOX`.

#### Parameters

in	<i>X, Y, W, H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

The documentation for this class was generated from the following files:

- [Fl\\_Check\\_Button.H](#)
- [Fl\\_Check\\_Button.cxx](#)

## 33.23 FL\_Choice Class Reference

A button that is used to pop up a menu.

```
#include <FL_Choice.H>
```

Inheritance diagram for FL\_Choice:

### Public Member Functions

- [FL\\_Choice](#) (int X, int Y, int W, int H, const char \*L=0)  
*Create a new [FL\\_Choice](#) widget using the given position, size and label string.*
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
*Handles the specified event.*
- int [value](#) () const  
*Gets the index of the last item chosen by the user.*
- int [value](#) (const [FL\\_Menu\\_Item](#) \*v)  
*Sets the currently selected value using a pointer to menu item.*
- int [value](#) (int v)  
*Sets the currently selected value using the index into the menu item array.*

### Protected Member Functions

- void [draw](#) () [FL\\_OVERRIDE](#)  
*Draws the widget.*

### Additional Inherited Members

#### 33.23.1 Detailed Description

A button that is used to pop up a menu.

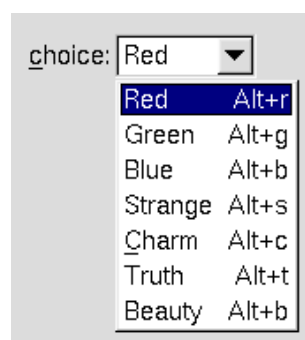

Figure 33.8 FL\_Choice

This is a button that, when pushed, pops up a menu (or hierarchy of menus) defined by an array of [FL\\_Menu\\_Item](#) objects. Motif calls this an `OptionButton`.

The only difference between this and a [Fl\\_Menu\\_Button](#) is that the name of the most recent chosen menu item is displayed inside the box, while the label is displayed outside the box. However, since the use of this is most often to control a single variable rather than do individual callbacks, some of the [Fl\\_Menu\\_Button](#) methods are redescribed here in those terms.

When the user clicks a menu item, [value\(\)](#) is set to that item and then:

- The item's callback is done if one has been set; the [Fl\\_Choice](#) is passed as the [Fl\\_Widget\\*](#) argument, along with any userdata configured for the callback.
- If the item does not have a callback, the [Fl\\_Choice](#) widget's callback is done instead, along with any userdata configured for it. The callback can determine which item was picked using [value\(\)](#), [mvalue\(\)](#), [item\\_pathname\(\)](#), etc.

All three mouse buttons pop up the menu. The Forms behavior of the first two buttons to increment/decrement the choice is not implemented. This could be added with a subclass, however.

The menu will also pop up in response to shortcuts indicated by putting a '&' character in the [label\(\)](#). See [Fl\\_Button::shortcut\(int s\)](#) for a description of this.

Typing the [shortcut\(\)](#) of any of the items will do exactly the same as when you pick the item with the mouse. The '&' character in item names are only looked at when the menu is popped up, however.

The inherited [Fl\\_Widget::changed\(\)](#) and related methods can be used as follows:

- `int Fl_Widget::changed() const` This value is true when the user picks a different value. *It is turned off by [value\(\)](#) and just before doing a callback (the callback can turn it back on if desired).*
- `void Fl_Widget::set_changed()` This method sets the [changed\(\)](#) flag.
- `void Fl_Widget::clear_changed()` This method clears the [changed\(\)](#) flag.

The inherited [Fl\\_Menu\\_::down\\_box\(\)](#) methods can be used as follows:

- `Fl_Boxtype Fl_Menu_::down_box() const` Gets the current down box, which is used when the menu is popped up. The default down box type is `FL_DOWN_BOX`.
- `void Fl_Menu_::down_box(Fl_Boxtype b)` Sets the current down box type to `b`.

Simple example:

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Choice.H>
int main() {
 Fl_Window *win = new Fl_Window(300,200);
 Fl_Choice *choice = new Fl_Choice(100,10,100,25,"Choice:");
 choice->add("Zero");
 choice->add("One");
 choice->add("Two");
 choice->add("Three");
 choice->value(2); // make "Two" selected by default (zero based!)
 win->end();
 win->show();
 return Fl::run();
}
```

## 33.23.2 Constructor & Destructor Documentation

### 33.23.2.1 Fl\_Choice()

```
Fl_Choice::Fl_Choice (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Create a new [Fl\\_Choice](#) widget using the given position, size and label string.

The default boxtype is `FL_UP_BOX`.

The constructor sets `menu()` to `NULL`. See [FI\\_Menu\\_](#) for the methods to set or change the menu.

## Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

### 33.23.3 Member Function Documentation

#### 33.23.3.1 draw()

```
void Fl_Choice::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 33.23.3.2 handle()

```
int Fl_Choice::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Scheme\\_Choice](#).

**33.23.3.3 value()** [1/3]

```
int Fl_Choice::value () const [inline]
```

Gets the index of the last item chosen by the user.  
The index is -1 initially.

**33.23.3.4 value()** [2/3]

```
int Fl_Choice::value (
 const Fl_Menu_Item * v)
```

Sets the currently selected value using a pointer to menu item.  
Changing the selected value causes a [redraw\(\)](#).

**Parameters**

in	v	pointer to menu item in the menu item array.
----	---	----------------------------------------------

**Returns**

non-zero if the new value is different to the old one.

**33.23.3.5 value()** [3/3]

```
int Fl_Choice::value (
 int v)
```

Sets the currently selected value using the index into the menu item array.  
Changing the selected value causes a [redraw\(\)](#).

**Parameters**

in	v	index of value in the menu item array.
----	---	----------------------------------------

**Returns**

non-zero if the new value is different to the old one.

The documentation for this class was generated from the following files:

- Fl\_Choice.H
- Fl\_Choice.cxx

**33.24 Fl\_Clock Class Reference**

This widget provides a round analog clock display.

```
#include <Fl_Clock.H>
```

Inheritance diagram for Fl\_Clock:

## Public Member Functions

- [FL\\_Clock](#) (int X, int Y, int W, int H, const char \*L=0)  
*Create an [FL\\_Clock](#) widget using the given position, size, and label string.*
- [FL\\_Clock](#) (uchar t, int X, int Y, int W, int H, const char \*L)  
*Create an [FL\\_Clock](#) widget using the given clock type t, position, size, and label string.*
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
*Handles the specified event.*
- [~FL\\_Clock](#) ()  
*The destructor removes the clock.*

## Additional Inherited Members

### 33.24.1 Detailed Description

This widget provides a round analog clock display.

[FL\\_Clock](#) is provided for Forms compatibility. It installs a 1-second timeout callback using [Fl::add\\_timeout\(\)](#). You can choose the rounded or square type of the clock with [type\(\)](#). Please see [FL\\_Clock\\_Output](#) widget for applicable values.

Figure 33.9 FL\_SQUARE\_CLOCK type

See also

class [FL\\_Clock\\_Output](#)

### 33.24.2 Constructor & Destructor Documentation

### 33.24.2.1 Fl\_Clock() [1/2]

```
Fl_Clock::Fl_Clock (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Create an [Fl\\_Clock](#) widget using the given position, size, and label string. The default clock type is `FL_SQUARE_CLOCK` and the default boxtype is `FL_UP_BOX`.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

### 33.24.2.2 Fl\_Clock() [2/2]

```
Fl_Clock::Fl_Clock (
 uchar t,
 int X,
 int Y,
 int W,
 int H,
 const char * L)
```

Create an [Fl\\_Clock](#) widget using the given clock type `t`, position, size, and label string. The default clock type `t` is `FL_SQUARE_CLOCK`. You can set the clock type to `FL_ROUND_CLOCK` or any other valid clock type. See [Fl\\_Clock\\_Output](#) widget for applicable values. The default boxtype is `FL_UP_BOX` for `FL_SQUARE_CLOCK` and `FL_NO_BOX` for `FL_ROUND_CLOCK`, if set by the constructor. If you change the clock type with [type\(\)](#) later you should also set the boxtype with [box\(\)](#).

#### Parameters

in	<i>t</i>	type of clock: <code>FL_ROUND_CLOCK</code> or <code>FL_SQUARE_CLOCK</code> (0)
in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

class [Fl\\_Clock\\_Output](#)

## 33.24.3 Member Function Documentation

### 33.24.3.1 handle()

```
int Fl_Clock::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

  - Draw clock with the given position and size.*

## Additional Inherited Members

### 33.25.1 Detailed Description

This widget can be used to display a program-supplied time.

The time shown on the clock is not updated. To display the current time, use `FL_Clock` instead.

Figure 33.11 `FL_SQUARE_CLOCK` type

Figure 33.12 `FL_ROUND_CLOCK` type

Values for clock `type()` (`#include <FL/Clock.H>`):

```
#define FL_SQUARE_CLOCK 0 // Square Clock variant
#define FL_ROUND_CLOCK 1 // Round Clock variant
#define FL_ANALOG_CLOCK FL_SQUARE_CLOCK // An analog clock is square
#define FL_DIGITAL_CLOCK FL_SQUARE_CLOCK // Not yet implemented
```

### 33.25.2 Constructor & Destructor Documentation

### 33.25.2.1 Fl\_Clock\_Output()

```
Fl_Clock_Output::Fl_Clock_Output (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Create a new [Fl\\_Clock\\_Output](#) widget with the given position, size and label.

The default clock type is `FL_SQUARE_CLOCK` and the default boxtype is `FL_UP_BOX`.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

## 33.25.3 Member Function Documentation

### 33.25.3.1 draw() [1/2]

```
void Fl_Clock_Output::draw (
 void) [protected], [virtual]
```

Draw clock with current position and size.

Implements [Fl\\_Widget](#).

### 33.25.3.2 draw() [2/2]

```
void Fl_Clock_Output::draw (
 int X,
 int Y,
 int W,
 int H) [protected]
```

Draw clock with the given position and size.

#### Parameters

in	<i>X,Y,W,H</i>	position and size
----	----------------	-------------------

### 33.25.3.3 hour()

```
int Fl_Clock_Output::hour () const [inline]
```

Returns the displayed hour (0 to 23).

#### See also

[value\(\)](#), [minute\(\)](#), [second\(\)](#)

### 33.25.3.4 minute()

```
int Fl_Clock_Output::minute () const [inline]
```

Returns the displayed minute (0 to 59).

See also

[value\(\)](#), [hour\(\)](#), [second\(\)](#)

### 33.25.3.5 second()

```
int Fl_Clock_Output::second () const [inline]
```

Returns the displayed second (0 to 60, 60=leap second).

See also

[value\(\)](#), [hour\(\)](#), [minute\(\)](#)

### 33.25.3.6 shadow() [1/2]

```
int Fl_Clock_Output::shadow () const [inline]
```

Returns the shadow drawing mode of the hands.

Returns

shadow drawing mode of the hands

Return values

0	no shadows
1	draw shadows of hands (default)

### 33.25.3.7 shadow() [2/2]

```
void Fl_Clock_Output::shadow (
 int mode) [inline]
```

Sets the shadow drawing mode of the hands.

Enables (1) or disables (0) drawing the hands with shadows.

Values except 0 and 1 are reserved for future extensions and yield undefined behavior.

The default is to draw the shadows (1).

Parameters

in	<i>mode</i>	1 = shadows (default), 0 = no shadows
----	-------------	---------------------------------------

### 33.25.3.8 value() [1/3]

```
ulong Fl_Clock_Output::value () const [inline]
```

Returns the displayed time.

Returns the time in seconds since the UNIX epoch (January 1, 1970).

See also

[value\(ulong\)](#)

### 33.25.3.9 value() [2/3]

```
void Fl_Clock_Output::value (
 int H,
 int m,
 int s)
```

Set the displayed time.

Set the time in hours, minutes, and seconds.

Parameters

in	<i>H,m,s</i>	displayed time
----	--------------	----------------

See also

[hour\(\)](#), [minute\(\)](#), [second\(\)](#)

### 33.25.3.10 value() [3/3]

```
void Fl_Clock_Output::value (
 ulong v)
```

Set the displayed time.

Set the time in seconds since the UNIX epoch (January 1, 1970).

Parameters

in	<i>v</i>	seconds since epoch
----	----------	---------------------

See also

[value\(\)](#)

*Pops up a window to let the user pick an arbitrary RGB color.*

## Additional Inherited Members

### 33.26.1 Detailed Description

The **FL\_Color\_Chooser** widget provides a standard RGB color chooser.

Figure 33.13 fl\_color\_chooser()

You can place any number of the widgets into a panel of your own design. The diagram shows the widget as part of a color chooser dialog created by the `fl_color_chooser()` function. The `Fl_Color_Chooser` widget contains the hue box, value slider, and rgb input fields from the above diagram (it does not have the color chips or the Cancel or OK buttons). The callback is done every time the user changes the rgb value. It is not done if they move the hue control in a way that produces the *same* rgb value, such as when saturation or value is zero.

The `fl_color_chooser()` function pops up a window to let the user pick an arbitrary RGB color. They can pick the hue and saturation in the "hue box" on the left (hold down CTRL to just change the saturation), and the brightness using the vertical slider. Or they can type the 8-bit numbers into the RGB `Fl_Value_Input` fields, or drag the mouse across them to adjust them. The pull-down menu lets the user set the input fields to show RGB, HSV, or 8-bit RGB (0 to 255).

The user can press CTRL-C to copy the currently selected color value as text in RGB hex format with leading zeroes to the clipboard, for instance `FL_GREEN` would be '00FF00' (since FLTK 1.4.0).

`fl_color_chooser()` returns non-zero if the user picks ok, and updates the RGB values. If the user picks cancel or closes the window this returns zero and leaves RGB unchanged.

If you use the color chooser on an 8-bit screen, it will allocate all the available colors, leaving you no space to exactly represent the color the user picks! You can however use `fl_rectf()` to fill a region with a simulated color using dithering.

Callback reasons can be `FL_REASON_DRAGGED`, `FL_REASON_CHANGED`, or `FL_REASON_RESELECTED`.

## 33.26.2 Constructor & Destructor Documentation

### 33.26.2.1 Fl\_Color\_Chooser()

```
Fl_Color_Chooser::Fl_Color_Chooser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Color_Chooser` widget using the given position, size, and label string. The recommended dimensions are 200x95. The color is initialized to black.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

## 33.26.3 Member Function Documentation

### 33.26.3.1 b()

```
double Fl_Color_Chooser::b () const [inline]
```

Returns the current blue value.

$0 \leq b \leq 1$ .

### 33.26.3.2 g()

```
double Fl_Color_Chooser::g () const [inline]
```

Returns the current green value.

$0 \leq g \leq 1$ .

### 33.26.3.3 handle()

```
int Fl_Color_Chooser::handle (
 int e) [virtual]
```

Handles all events received by this widget.

This specific [handle\(\)](#) method processes the standard 'copy' function as seen in other input widgets. It copies the current color value to the clipboard as a string in RGB format ('RRGGBB').

This format is independent of the [Fl\\_Color\\_Chooser](#) display format setting. No other formats are supplied.

The keyboard events handled are:

- ctrl-c
- ctrl-x
- ctrl-Insert

All other events are processed by the parent class [Fl\\_Group](#).

This enables the **user** to choose a color value, press `ctrl-c` to copy the value to the clipboard and paste it into a color selection widget in another application window or any other text input (e.g. a preferences dialog or an editor).

#### Note

Keyboard event handling by the current focus widget has priority, hence moving the focus to one of the buttons or selecting text in one of the input widgets effectively disables this special method.

#### Parameters

<i>i</i> n	<i>e</i>	current event
------------	----------	---------------

#### Returns

1 if event has been handled, 0 otherwise

#### See also

[Fl\\_Group::handle\(int\)](#)

Reimplemented from [Fl\\_Widget](#).

### 33.26.3.4 hsv()

```
int Fl_Color_Chooser::hsv (
 double H,
 double S,
 double V)
```

Set the hsv values.

The passed values are clamped (or for hue, modulus 6 is used) to get legal values. Does not do the callback.

**Parameters**

in	<i>H,S,V</i>	color components.
----	--------------	-------------------

**Returns**

1 if a new hsv value was set, 0 if the hsv value was the previous one.

**33.26.3.5 hsv2rgb()**

```
void Fl_Color_Chooser::hsv2rgb (
 double H,
 double S,
 double V,
 double & R,
 double & G,
 double & B) [static]
```

This *static* method converts HSV colors to RGB colorspace.

**Parameters**

in	<i>H,S,V</i>	color components
out	<i>R,G,B</i>	color components

**33.26.3.6 hue()**

```
double Fl_Color_Chooser::hue () const [inline]
```

Returns the current hue.

$0 \leq \text{hue} < 6$ . Zero is red, one is yellow, two is green, etc. *This value is convenient for the internal calculations - some other systems consider hue to run from zero to one, or from 0 to 360.*

**33.26.3.7 mode() [1/2]**

```
int Fl_Color_Chooser::mode () [inline]
```

Returns which [Fl\\_Color\\_Chooser](#) variant is currently active.

**Returns**

color modes are rgb(0), byte(1), hex(2), or hsv(3)

**33.26.3.8 mode() [2/2]**

```
void Fl_Color_Chooser::mode (
 int newMode)
```

Set which [Fl\\_Color\\_Chooser](#) variant is currently active.

**Parameters**

in	<i>newMode</i>	color modes are rgb(0), byte(1), hex(2), or hsv(3)
----	----------------	----------------------------------------------------

**33.26.3.9 r()**

```
double Fl_Color_Chooser::r () const [inline]
```

Returns the current red value.

$0 \leq r \leq 1$ .

**33.26.3.10 rgb()**

```
int Fl_Color_Chooser::rgb (
 double R,
 double G,
 double B)
```

Sets the current rgb color values.

Does not do the callback. Does not clamp (but out of range values will produce psychedelic effects in the hue selector).

**Parameters**

in	<i>R,G,B</i>	color components.
----	--------------	-------------------

**Returns**

1 if a new rgb value was set, 0 if the rgb value was the previous one.

**33.26.3.11 rgb2hsv()**

```
void Fl_Color_Chooser::rgb2hsv (
 double R,
 double G,
 double B,
 double & H,
 double & S,
 double & V) [static]
```

This *static* method converts RGB colors to HSV colorspace.

**Parameters**

in	<i>R,G,B</i>	color components
out	<i>H,S,V</i>	color components

**33.26.3.12 saturation()**

```
double Fl_Color_Chooser::saturation () const [inline]
```

Returns the saturation.

$0 \leq \text{saturation} \leq 1$ .

**33.26.3.13 value()**

```
double Fl_Color_Chooser::value () const [inline]
```

Returns the value/brightness.

$0 \leq \text{value} \leq 1$ .

The documentation for this class was generated from the following files:

- [Fl\\_Color\\_Chooser.H](#)
- [Fl\\_Color\\_Chooser.cxx](#)

## 33.27 Fl\_Copy\_Surface Class Reference

Supports copying of graphical data to the clipboard.

```
#include <Fl_Copy_Surface.H>
```

Inheritance diagram for Fl\_Copy\_Surface:

- void *untranslate* () [FL\\_OVERRIDE](#)  
*Undoes the effect of a previous [translate\(\)](#) call.*

### Additional Inherited Members

#### 33.27.1 Detailed Description

Supports copying of graphical data to the clipboard.

After creation of an [Fl\\_Copy\\_Surface](#) object, make it the current drawing surface calling [Fl\\_Surface\\_Device::push\\_current\(\)](#), and all subsequent graphics requests will be recorded in the clipboard. It's possible to draw widgets (using [Fl\\_Copy\\_Surface::draw\(\)](#) ) or to use any of the [Drawing functions](#) or the [Color & Font functions](#). Finally, delete the [Fl\\_Copy\\_Surface](#) object to load the clipboard with the graphical data.

[Fl\\_Gl\\_Window](#) 's can be copied to the clipboard as well.

Usage example:

```

Fl_Widget *g = ...; // a widget you want to copy to the clipboard
Fl_Copy_Surface *copy_surf = new Fl_Copy_Surface(g->w(), g->h()); // create an Fl_Copy_Surface object
Fl_Surface_Device::push_current(copy_surf); // direct graphics requests to the clipboard
fl_color(FL_WHITE); fl_rectf(0, 0, g->w(), g->h()); // draw a white background
copy_surf->draw(g); // draw the g widget in the clipboard
Fl_Surface_Device::pop_current(); // direct graphics requests back to their previous destination
delete copy_surf; // after this, the clipboard is loaded

```

Platform details:

- Windows: Transparent RGB images copy without transparency. The graphical data are copied to the clipboard in two formats: 1) as an 'enhanced metafile'; 2) as a color bitmap. Applications to which the clipboard content is pasted can use the format that suits them best.
- Mac OS: The graphical data are copied to the clipboard (a.k.a. pasteboard) in two 'flavors': 1) in vectorial form as PDF data; 2) in bitmap form as a TIFF image. Applications to which the clipboard content is pasted can use the flavor that suits them best.
- X11 and Wayland: the graphical data are copied to the clipboard as an image in BMP format.

## 33.27.2 Constructor & Destructor Documentation

### 33.27.2.1 Fl\_Copy\_Surface()

```

Fl_Copy_Surface::Fl_Copy_Surface (
 int w,
 int h)

```

the constructor

Parameters

<i>w,h</i>	Width and height of the drawing surface in FLTK units
------------	-------------------------------------------------------

## 33.27.3 Member Function Documentation

### 33.27.3.1 is\_current()

```
bool Fl_Copy_Surface::is_current () [virtual]
```

Is this surface the current drawing surface?

Reimplemented from [Fl\\_Surface\\_Device](#).

### 33.27.3.2 origin() [1/2]

```

void Fl_Copy_Surface::origin (
 int * x,
 int * y) [virtual]

```

Computes the coordinates of the current origin of graphics functions.

Parameters

out	<i>x,y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.27.3.3 origin()** [2/2]

```
void Fl_Copy_Surface::origin (
 int x,
 int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.27.3.4 printable\_rect()**

```
int Fl_Copy_Surface::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.27.3.5 set\_current()**

```
void Fl_Copy_Surface::set_current (
 void) [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

**Note**

It's recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#); . Don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [Fl\\_Surface\\_Device](#).

### 33.27.3.6 translate()

```
void Fl_Copy_Surface::translate (
 int x,
 int y) [protected], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each `translate()` call must be matched by an `untranslate()` call. Successive `translate()` calls add up their effects.

Reimplemented from `Fl_Widget_Surface`.

### 33.27.3.7 untranslate()

```
void Fl_Copy_Surface::untranslate (
 void) [protected], [virtual]
```

Undoes the effect of a previous `translate()` call.

Reimplemented from `Fl_Widget_Surface`.

The documentation for this class was generated from the following files:

- `Fl_Copy_Surface.H`
- `Fl_Copy_Surface.cxx`

## 33.28 Fl\_Counter Class Reference

Controls a single floating point value with button (or keyboard) arrows.

```
#include <Fl_Counter.H>
```

Inheritance diagram for `Fl_Counter`:

### Public Member Functions

- `Fl_Counter` (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new `Fl_Counter` widget using the given position, size, and label string.*
- int `handle` (int) `FL_OVERRIDE`  
*Handles the specified event.*
- void `lstep` (double a)  
*Sets the increment for the large step buttons.*
- double `step` () const  
*Returns the increment for normal step buttons.*
- void `step` (double a)  
*Sets the increment for the normal step buttons.*
- void `step` (double a, double b)  
*Sets the increments for the normal and large step buttons.*
- `Fl_Color` `textcolor` () const  
*Gets the font color.*
- void `textcolor` (`Fl_Color` s)  
*Sets the font color to s.*

*Gets the font size.*
- void **textsize** ([FI\\_Fontsize](#) s)  
*Sets the font size to s.*
- **~FI\_Counter** ()  
*Destroys the valuator.*

## Protected Member Functions

- void **arrow\_widths** (int &w1, int &w2)  
*Compute sizes (widths) of arrow boxes.*
- void **draw** () [FL\\_OVERRIDE](#)  
*Draws the widget.*

## Additional Inherited Members

### 33.28.1 Detailed Description

Controls a single floating point value with button (or keyboard) arrows. Double arrows buttons achieve larger steps than simple arrows.

See also

[FI\\_Spinner](#) for *value* input with vertical [step](#) arrows.

Figure 33.14 FI\_Counter

The type of an [FI\\_Counter](#) object can be set using [FI\\_Widget::type\(uchar\)](#) to:

- `FL_NORMAL_COUNTER`: Displays a counter with 4 arrow buttons.
- `FL_SIMPLE_COUNTER`: Displays a counter with only 2 arrow buttons.

## 33.28.2 Constructor & Destructor Documentation

### 33.28.2.1 FI\_Counter()

```
FI_Counter::FI_Counter (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [FI\\_Counter](#) widget using the given position, size, and label string. The default type is `FL_NORMAL_COUNTER`.

## Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

### 33.28.3 Member Function Documentation

#### 33.28.3.1 arrow\_widths()

```
void Fl_Counter::arrow_widths (
 int & w1,
 int & w2) [protected]
```

Compute sizes (widths) of arrow boxes.

This method computes the two sizes of the arrow boxes of [Fl\\_Counter](#). You can override it in a subclass if you want to draw fancy arrows or change the layout. However, the basic layout is fixed and can't be changed w/o overriding the [draw\(\)](#) and [handle\(\)](#) methods.

Basic layout:

```
+-----+-----+-----+-----+-----+
| « | < | value | > | » |
+-----+-----+-----+-----+-----+
```

The returned value *w2* should be zero if the counter [type\(\)](#) is `FL_SIMPLE_COUNTER`.

## Parameters

out	<i>w1</i>	width of single arrow box
out	<i>w2</i>	width of double arrow box

#### 33.28.3.2 draw()

```
void Fl_Counter::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 33.28.3.3 handle()

```
int Fl_Counter::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses)

in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

#### 33.28.3.4 lstep()

```
void Fl_Counter::lstep (
 double a) [inline]
```

Sets the increment for the large step buttons.

The default value is 1.0.

#### Parameters

in	<i>a</i>	large step increment.
----	----------	-----------------------

#### 33.28.3.5 step() [1/2]

```
void Fl_Counter::step (
 double a) [inline]
```

Sets the increment for the normal step buttons.

#### Parameters

in	<i>a</i>	normal step increment.
----	----------	------------------------

#### 33.28.3.6 step() [2/2]

```
void Fl_Counter::step (
 double a,
 double b) [inline]
```

Sets the increments for the normal and large step buttons.

#### Parameters

in	<i>a,b</i>	normal and large step increments.
----	------------	-----------------------------------

The documentation for this class was generated from the following files:

- `Fl_Counter.H`
- `Fl_Counter.cxx`

## 33.29 Fl\_Device\_Plugin Class Reference

This plugin socket allows the integration of new device drivers for special window or screen types.

```
#include <Fl_Device.H>
```

Inheritance diagram for `Fl_Device_Plugin`:

### Public Member Functions

- **Fl\_Device\_Plugin** (const char \*pluginName)  
*The constructor.*
- virtual const char \* **klass** ()  
*Returns the class name.*
- virtual const char \* **name** ()=0  
*Returns the plugin name.*
- virtual int **print** (Fl\_Widget \*w)=0  
*Prints a widget.*
- virtual `Fl_RGB_Image * rectangle_capture` (Fl\_Widget \*widget, int x, int y, int w, int h)=0  
*Captures a rectangle of a widget as an image.*

### Static Public Member Functions

- static `Fl_Device_Plugin * opengl_plugin` ()  
*Returns the OpenGL plugin.*

#### 33.29.1 Detailed Description

This plugin socket allows the integration of new device drivers for special window or screen types.

This class is not intended for use outside the FLTK library. It is currently used to provide an automated printing service and screen capture for OpenGL windows, if linked with `fltk_gl`.

#### 33.29.2 Member Function Documentation

##### 33.29.2.1 rectangle\_capture()

```
virtual Fl_RGB_Image * Fl_Device_Plugin::rectangle_capture (
 Fl_Widget * widget,
 int x,
 int y,
 int w,
 int h) [pure virtual]
```

Captures a rectangle of a widget as an image.

**Returns**

The captured pixels as an RGB image

The documentation for this class was generated from the following files:

- [Fl\\_Device.H](#)
- [Fl\\_Device.cxx](#)

## 33.30 Fl\_Dial Class Reference

The [Fl\\_Dial](#) widget provides a circular dial to control a single floating point value.

```
#include <Fl_Dial.H>
```

Inheritance diagram for Fl\_Dial:

### Public Member Functions

- short [angle1](#) () const  
*Sets Or gets the angles used for the minimum and maximum values.*
- void [angle1](#) (short a)  
*See short [angle1\(\)](#) const.*
- short [angle2](#) () const  
*See short [angle1\(\)](#) const.*
- void [angle2](#) (short a)  
*See short [angle1\(\)](#) const.*
- void [angles](#) (short a, short b)  
*See short [angle1\(\)](#) const.*
- [Fl\\_Dial](#) (int x, int y, int w, int h, const char \*l=0)  
*Creates a new [Fl\\_Dial](#) widget using the given position, size, and label string.*
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
*Allow subclasses to handle event based on current position and size.*

### Protected Member Functions

- void [draw](#) () [FL\\_OVERRIDE](#)  
*Draws dial at current position and size.*
- void [draw](#) (int X, int Y, int W, int H)  
*Draws dial at given position and size.*
- int [handle](#) (int event, int X, int Y, int W, int H)  
*Allows subclasses to handle event based on given position and size.*

## Additional Inherited Members

### 33.30.1 Detailed Description

The [Fl\\_Dial](#) widget provides a circular dial to control a single floating point value.

Figure 33.15 [Fl\\_Dial](#)

Use [type\(\)](#) to set the type of the dial to:

- `FL_NORMAL_DIAL` - Draws a normal dial with a knob.
- `FL_LINE_DIAL` - Draws a dial with a line.
- `FL_FILL_DIAL` - Draws a dial with a filled arc.

### 33.30.2 Constructor & Destructor Documentation

#### 33.30.2.1 [Fl\\_Dial\(\)](#)

```
Fl_Dial::Fl_Dial (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Dial](#) widget using the given position, size, and label string. The default type is `FL_NORMAL_DIAL`.

### 33.30.3 Member Function Documentation

#### 33.30.3.1 [angle1\(\)](#)

```
short Fl_Dial::angle1 () const [inline]
```

Sets Or gets the angles used for the minimum and maximum values.

The default values are 45 and 315 (0 degrees is straight down and the angles progress clockwise). Normally `angle1` is less than `angle2`, but if you reverse them the dial moves counter-clockwise.

#### 33.30.3.2 [draw\(\)](#) [1/2]

```
void Fl_Dial::draw (
 void) [protected], [virtual]
```

Draws dial at current position and size.

Implements [Fl\\_Widget](#).

#### 33.30.3.3 [draw\(\)](#) [2/2]

```
void Fl_Dial::draw (
 int X,
 int Y,
```

```

 int W,
 int H) [protected]

```

Draws dial at given position and size.

#### Parameters

in	<i>X,Y,W,H</i>	position and size
----	----------------	-------------------

#### 33.30.3.4 handle() [1/2]

```

int Fl_Dial::handle (
 int event,
 int X,
 int Y,
 int W,
 int H) [protected]

```

Allows subclasses to handle event based on given position and size.

#### Parameters

in	<i>event,X,Y,W,H</i>	event to handle, related position and size.
----	----------------------	---------------------------------------------

#### 33.30.3.5 handle() [2/2]

```

int Fl_Dial::handle (
 int e) [virtual]

```

Allow subclasses to handle event based on current position and size.

Reimplemented from [Fl\\_Widget](#).

The documentation for this class was generated from the following files:

- Fl\_Dial.H
- Fl\_Dial.cxx

## 33.31 Fl\_Display\_Device Class Reference

The computer's display.

```
#include <Fl_Device.H>
```

Inheritance diagram for Fl\_Display\_Device:

### Static Public Member Functions

- static [Fl\\_Display\\_Device](#) \* **display\_device** ()  
Returns a pointer to the unique display device.

## Additional Inherited Members

### 33.31.1 Detailed Description

The computer's display.

When FLTK begins to access the computer's display, it creates an object of class [Fl\\_Display\\_Device](#) and makes it the current drawing surface.

The documentation for this class was generated from the following files:

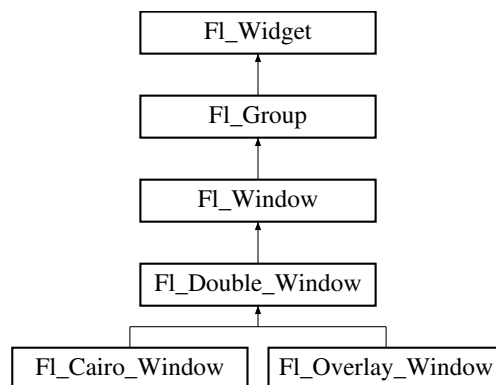

- [Fl\\_Device.H](#)
- [Fl\\_Device.cxx](#)

## 33.32 Fl\_Double\_Window Class Reference

The [Fl\\_Double\\_Window](#) provides a double-buffered window.

```
#include <Fl_Double_Window.H>
```

Inheritance diagram for [Fl\\_Double\\_Window](#):

### Public Member Functions

- [Fl\\_Double\\_Window \\* as\\_double\\_window \(\)](#) **FL\_OVERRIDE**  
Return non-null if this is an [Fl\\_Double\\_Window](#) object.
- **Fl\_Double\_Window** (int W, int H, const char \*l=0)  
Creates a new [Fl\\_Double\\_Window](#) widget using the given position, size, and label (title) string.
- **Fl\_Double\_Window** (int X, int Y, int W, int H, const char \*l=0)  
See [Fl\\_Double\\_Window::Fl\\_Double\\_Window\(int w, int h, const char \\*label = 0\)](#)
- void [flush \(\)](#) **FL\_OVERRIDE**  
Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).
- void [hide \(\)](#) **FL\_OVERRIDE**  
Makes a widget invisible.
- void [resize](#) (int, int, int, int) **FL\_OVERRIDE**  
Changes the size or position of the widget.
- void [show \(\)](#) **FL\_OVERRIDE**  
Makes a widget visible.
- void **show** (int a, char \*\*b)  
Same as [Fl\\_Window::show\(int a, char \\*\\*b\)](#)
- [~Fl\\_Double\\_Window \(\)](#)  
The destructor also deletes all the children.

## Additional Inherited Members

### 33.32.1 Detailed Description

The [Fl\\_Double\\_Window](#) provides a double-buffered window. It will draw the window data into an off-screen pixmap, and then copy it to the on-screen window.

### 33.32.2 Constructor & Destructor Documentation

#### 33.32.2.1 ~Fl\_Double\_Window()

```
Fl_Double_Window::~Fl_Double_Window ()
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code.

### 33.32.3 Member Function Documentation

#### 33.32.3.1 as\_double\_window()

```
Fl_Double_Window * Fl_Double_Window::as_double_window () [inline], [virtual]
```

Return non-null if this is an [Fl\\_Double\\_Window](#) object.

Reimplemented from [Fl\\_Window](#).

#### 33.32.3.2 flush()

```
void Fl_Double_Window::flush () [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented from [Fl\\_Window](#).

Reimplemented in [Fl\\_Overlay\\_Window](#).

#### 33.32.3.3 hide()

```
void Fl_Double_Window::hide () [virtual]
```

Makes a widget invisible.

See also

[show\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Overlay\\_Window](#).

#### 33.32.3.4 resize()

```
void Fl_Double_Window::resize (
 int x,
 int y,
 int w,
 int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations. `position(X, Y)` is a shortcut for `resize(X, Y, w\(\), h\(\))`, and `size(W, H)` is a shortcut for `resize(x\(\), y\(\), W, H)`.

#### Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

#### See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Overlay\\_Window](#).

### 33.32.3.5 show()

```
void Fl_Double_Window::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like `FL_SHOW`.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send `FL_SHOW` or `FL_HIDE` events to the widget. *Do not change it if the parent is not visible, as this will send false `FL_SHOW` or `FL_HIDE` events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

#### See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Overlay\\_Window](#).

The documentation for this class was generated from the following files:

- [Fl\\_Double\\_Window.H](#)
- [Fl\\_Double\\_Window.cxx](#)

## 33.33 Fl\_End Class Reference

This is a dummy class that allows you to end a [Fl\\_Group](#) in a constructor list of a class:

```
#include <Fl_Group.H>
```

### Public Member Functions

- [Fl\\_End \(\)](#)

*All it does is calling `Fl_Group::current()->end()`*

### 33.33.1 Detailed Description

This is a dummy class that allows you to end a [Fl\\_Group](#) in a constructor list of a class:

```
class MyClass {
 Fl_Group group;
 Fl_Button button_in_group;
 Fl_End end;
 Fl_Button button_outside_group;
 MyClass();
};
MyClass::MyClass() :
 group(10,10,100,100),
 button_in_group(20,20,60,30),
```

```

end(),
button_outside_group(10,120,60,30) {
 [..ctor code..]
}

```

The documentation for this class was generated from the following file:

- [FI\\_Group.H](#)

## 33.34 FI\_EPS\_File\_Surface Class Reference

Encapsulated PostScript drawing surface.

```
#include <Fl_PostScript.H>
```

Inheritance diagram for FI\_EPS\_File\_Surface:

### Public Member Functions

- int [close](#) ()  
*Completes all EPS output.*
- FILE \* [file](#) ()  
*Returns the underlying FILE pointer.*
- [FI\\_EPS\\_File\\_Surface](#) (int width, int height, FILE \*eps\_output, [FI\\_Color](#) background=FL\_WHITE, [FI\\_PostScript\\_Close\\_Command](#) closef=NULL)  
*Constructor.*
- void [origin](#) (int \*px, int \*py) [FL\\_OVERRIDE](#)  
*Computes the coordinates of the current origin of graphics functions.*
- void [origin](#) (int x, int y) [FL\\_OVERRIDE](#)  
*Sets the position of the origin of graphics in the drawable part of the drawing surface.*
- int [printable\\_rect](#) (int \*w, int \*h) [FL\\_OVERRIDE](#)  
*Computes the width and height of the drawable area of the drawing surface.*
- void [translate](#) (int x, int y) [FL\\_OVERRIDE](#)  
*Translates the current graphics origin accounting for the current rotation.*
- void [untranslate](#) () [FL\\_OVERRIDE](#)  
*Undoes the effect of a previous [translate\(\)](#) call.*
- [~FI\\_EPS\\_File\\_Surface](#) ()  
*Destructor.*

### Protected Member Functions

- Fl\_PostScript\_Graphics\_Driver \* [driver](#) ()  
*Returns the PostScript driver of this drawing surface.*

### Additional Inherited Members

#### 33.34.1 Detailed Description

Encapsulated PostScript drawing surface.

This drawing surface allows to store any FLTK graphics in vectorial form in an "Encapsulated PostScript" file.

Usage example:

```
Fl_Window *win = ...// Window to draw to an .eps file
int ww = win->decorated_w();
int wh = win->decorated_h();
FILE *eps = fl_fopen("/path/to/mywindow.eps", "w");
if (eps) {
 Fl_EPS_File_Surface *surface = new Fl_EPS_File_Surface(ww, wh, eps, win->color());
 Fl_Surface_Device::push_current(surface);
 surface->draw_decorated_window(win);
 Fl_Surface_Device::pop_current();
 delete surface; // the .eps file is not complete until the destructor was run
}
```

## 33.34.2 Constructor & Destructor Documentation

### 33.34.2.1 Fl\_EPS\_File\_Surface()

```
Fl_EPS_File_Surface::Fl_EPS_File_Surface (
 int width,
 int height,
 FILE * eps_output,
 Fl_Color background = FL_WHITE,
 Fl_PostScript_Close_Command closef = NULL)
```

Constructor.

Parameters

<i>width,height</i>	Width and height of the EPS drawing area
<i>eps_output</i>	A writable FILE pointer where the Encapsulated PostScript data will be sent
<i>background</i>	Color expected to cover the background of the EPS drawing area. This parameter affects only the drawing of transparent <a href="#">Fl_RGB_Image</a> objects: transparent areas of RGB images are blended with the <code>background</code> color. Under the X11 + pango platform, transparent RGB images are correctly blended to their background, thus this parameter has no effect.
<i>closef</i>	If not NULL, the destructor or <a href="#">close()</a> will call <code>closef(eps_output)</code> after all EPS data has been sent. If NULL, <code>fclose(eps_output)</code> is called instead. This allows to close the FILE pointer by, e.g., <code>pclose</code> , or, using a function such as <code>"int keep_open(FILE*) {return 0;}"</code> , to keep it open after completion of all output to <code>eps_output</code> . Function <code>closef</code> should return non zero to indicate an error.

### 33.34.2.2 ~Fl\_EPS\_File\_Surface()

```
Fl_EPS_File_Surface::~~Fl_EPS_File_Surface ()
```

Destructor.

By default, the destructor closes with function `fclose()` the underlying FILE. See the constructor for how to close it differently or to keep it open. Use [close\(\)](#) before object destruction to receive the status code of output operations. If [close\(\)](#) is not used and if EPS output results in error, the destructor displays an alert message with [fl\\_alert\(\)](#).

## 33.34.3 Member Function Documentation

### 33.34.3.1 close()

```
int Fl_EPS_File_Surface::close ()
```

Completes all EPS output.

The only operation possible with the [Fl\\_EPS\\_File\\_Surface](#) object after calling [close\(\)](#) is its destruction.

**Returns**

The status code of output operations to the FILE object. 0 indicates success.

**33.34.3.2 origin() [1/2]**

```
void Fl_EPS_File_Surface::origin (
 int * x,
 int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

out	<i>x,y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.34.3.3 origin() [2/2]**

```
void Fl_EPS_File_Surface::origin (
 int x,
 int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	------------	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.34.3.4 printable\_rect()**

```
int Fl_EPS_File_Surface::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.34.3.5 translate()**

```
void Fl_EPS_File_Surface::translate (
 int x,
 int y) [virtual]
```

Translates the current graphics origin accounting for the current rotation. Each `translate()` call must be matched by an `untranslate()` call. Successive `translate()` calls add up their effects. Reimplemented from `Fl_Widget_Surface`.

### 33.34.3.6 untranslate()

```
void Fl_EPS_File_Surface::untranslate (
 void) [virtual]
```

Undoes the effect of a previous `translate()` call.

Reimplemented from `Fl_Widget_Surface`.

The documentation for this class was generated from the following file:

- [Fl\\_PostScript.H](#)

## 33.35 Fl\_File\_Browser Class Reference

The `Fl_File_Browser` widget displays a list of filenames, optionally with file-specific icons.

```
#include <Fl_File_Browser.H>
```

Inheritance diagram for `Fl_File_Browser`:

### Public Types

- enum { **FILES** , **DIRECTORIES** }

### Public Member Functions

- `const char * errmsg () const`  
*Returns OS error messages, or NULL if none.*
- `void errmsg (const char *emsg)`  
*Sets OS error message to a string, which can be NULL.*
- `int filetype () const`  
*Sets or gets the file browser type, FILES or DIRECTORIES.*
- `void filetype (int t)`  
*Sets or gets the file browser type, FILES or DIRECTORIES.*
- `const char * filter () const`  
*Sets or gets the filename filter.*
- `void filter (const char *pattern)`  
*Sets or gets the filename filter.*
- `Fl_File_Browser (int, int, int, int, const char *=0)`  
*The constructor creates the Fl\_File\_Browser widget at the specified position and size.*
- `uchar iconsize () const`

*Sets or gets the size of the icons.*

- void `iconsize` (`uchar s`)

*Sets or gets the size of the icons.*

- int `load` (`const char *directory`, `Fl_File_Sort_F *sort=fl_numericsort`)

*Loads the specified directory into the browser.*

- `Fl_Fontsize` `textsize` () const
- void `textsize` (`Fl_Fontsize s`)

## Additional Inherited Members

### 33.35.1 Detailed Description

The `Fl_File_Browser` widget displays a list of filenames, optionally with file-specific icons.

### 33.35.2 Constructor & Destructor Documentation

#### 33.35.2.1 Fl\_File\_Browser()

```
Fl_File_Browser::Fl_File_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

The constructor creates the `Fl_File_Browser` widget at the specified position and size.

The destructor destroys the widget and frees all memory that has been allocated.

### 33.35.3 Member Function Documentation

#### 33.35.3.1 errmsg() [1/2]

```
const char * Fl_File_Browser::errmsg () const [inline]
```

Returns OS error messages, or NULL if none.

Use when advised.

#### 33.35.3.2 errmsg() [2/2]

```
void Fl_File_Browser::errmsg (
 const char * msg)
```

Sets OS error message to a string, which can be NULL.

Frees previous if any. void `errmsg(const char *msg)`;

#### 33.35.3.3 filetype() [1/2]

```
int Fl_File_Browser::filetype () const [inline]
```

Sets or gets the file browser type, FILES or DIRECTORIES.

When set to FILES, both files and directories are shown. Otherwise only directories are shown.

#### 33.35.3.4 filetype() [2/2]

```
void Fl_File_Browser::filetype (
 int t) [inline]
```

Sets or gets the file browser type, FILES or DIRECTORIES.

When set to FILES, both files and directories are shown. Otherwise only directories are shown.

**33.35.3.5 filter()** [1/2]

```
const char * Fl_File_Browser::filter () const [inline]
```

Sets or gets the filename filter.

The pattern matching uses the [fl\\_filename\\_match\(\)](#) function in FLTK.

**33.35.3.6 filter()** [2/2]

```
void Fl_File_Browser::filter (
 const char * pattern)
```

Sets or gets the filename filter.

The pattern matching uses the [fl\\_filename\\_match\(\)](#) function in FLTK.

**33.35.3.7 iconsize()** [1/2]

```
uchar Fl_File_Browser::iconsize () const [inline]
```

Sets or gets the size of the icons.

The default size is 20 pixels.

**33.35.3.8 iconsize()** [2/2]

```
void Fl_File_Browser::iconsize (
 uchar s) [inline]
```

Sets or gets the size of the icons.

The default size is 20 pixels.

**33.35.3.9 load()**

```
int Fl_File_Browser::load (
 const char * directory,
 Fl_File_Sort_F * sort = fl_numeric_sort)
```

Loads the specified directory into the browser.

If icons have been loaded then the correct icon is associated with each file in the list.

If directory is "", all mount points (unix) or drive letters (Windows) are listed.

The sort argument specifies a sort function to be used with [fl\\_filename\\_list\(\)](#).

Return value is the number of filename entries, or 0 if none. On error, 0 is returned, and [errmsg\(\)](#) has OS error string if non-NULL.

The documentation for this class was generated from the following files:

- [Fl\\_File\\_Browser.H](#)
- [Fl\\_File\\_Browser.cxx](#)

**33.36 Fl\_File\_Chooser Class Reference**

The [Fl\\_File\\_Chooser](#) widget displays a standard file selection dialog that supports various selection modes.

**Public Types**

- enum [Type](#) { [SINGLE](#) = 0 , [MULTI](#) = 1 , [CREATE](#) = 2 , [DIRECTORY](#) = 4 }

*Determines the type of file chooser presented to the user.*

**Public Member Functions**

- [Fl\\_Widget](#) \* [add\\_extra](#) ([Fl\\_Widget](#) \*gr)  
*Adds an extra widget at the bottom of the [Fl\\_File\\_Chooser](#) window.*
- void [callback](#) (void(\*cb)([Fl\\_File\\_Chooser](#) \*, void \*), void \*d=0)

- Sets the file chooser callback cb and associated data d.*
- **FI\_Color color** ()
  - Gets the background color of the FI\_File\_Browser list.*
- void **color** (FI\_Color c)
  - Sets the background color of the FI\_File\_Browser list.*
- int **count** ()
  - Returns the number of selected files.*
- char \* **directory** ()
  - Gets the current directory.*
- void **directory** (const char \*d)
  - Sets the current directory.*
- const char \* **filter** ()
  - Gets the current filename filter patterns.*
- void **filter** (const char \*p)
  - Sets the current filename filter patterns.*
- int **filter\_value** ()
  - Gets the current filename filter selection.*
- void **filter\_value** (int f)
  - Sets the current filename filter selection.*
- **FI\_File\_Chooser** (const char \*pathname, const char \*pattern, int type\_val, const char \*title)
  - The constructor creates the FI\_File\_Chooser dialog shown.*
- int **h** () const
- void **hide** ()
  - Hides the FI\_File\_Chooser window.*
- **uchar iconsize** ()
  - Gets the size of the icons in the FI\_File\_Browser.*
- void **iconsize** (uchar s)
  - Sets the size of the icons in the FI\_File\_Browser.*
- const char \* **label** ()
  - Gets the title bar text for the FI\_File\_Chooser.*
- void **label** (const char \*l)
  - Sets the title bar text for the FI\_File\_Chooser.*
- const char \* **ok\_label** ()
  - Gets the label for the "ok" button in the FI\_File\_Chooser.*
- void **ok\_label** (const char \*l)
  - Sets the label for the "ok" button in the FI\_File\_Chooser.*
- void **position** (int x, int y)
- int **preview** () const
  - Returns the current state of the preview box.*
- void **preview** (int e)
  - Enable or disable the preview tile.*
- void **rescan** ()
  - Reloads the current directory in the FI\_File\_Browser.*
- void **rescan\_keep\_filename** ()
  - Rescan the current directory without clearing the filename, then select the file if it is in the list.*
- void **resize** (int x, int y, int w, int h)
- void **show** ()
  - Shows the FI\_File\_Chooser window.*
- int **shown** ()
  - Returns non-zero if the file chooser main window show() has been called, but not hide().*
- void **size** (int w, int h)

- [FI\\_Color](#) **textcolor** ()  
*Gets the current [FI\\_File\\_Browser](#) text color.*
- void **textcolor** ([FI\\_Color](#) c)  
*Sets the current [FI\\_File\\_Browser](#) text color.*
- [FI\\_Font](#) **textfont** ()  
*Gets the current [FI\\_File\\_Browser](#) text font.*
- void **textfont** ([FI\\_Font](#) f)  
*Sets the current [FI\\_File\\_Browser](#) text font.*
- [FI\\_Fontsize](#) **textsize** ()  
*Gets the current [FI\\_File\\_Browser](#) text size.*
- void **textsize** ([FI\\_Fontsize](#) s)  
*Sets the current [FI\\_File\\_Browser](#) text size.*
- int **type** ()  
*Gets the current type of [FI\\_File\\_Chooser](#).*
- void **type** (int t)  
*Sets the current type of [FI\\_File\\_Chooser](#).*
- void \* **user\_data** () const  
*Gets the file chooser user data.*
- void **user\_data** (void \*d)  
*Sets the file chooser user data d.*
- void **value** (const char \*filename)  
*Sets the current value of the selected file.*
- const char \* **value** (int f=1)  
*Gets the current value of the selected file(s).*
- int **visible** ()  
*Returns 1 if the [FI\\_File\\_Chooser](#) window is visible.*
- int **w** () const
- int **x** () const
- int **y** () const
- ~[FI\\_File\\_Chooser](#) ()  
*Destroys the widget and frees all memory used by it.*

## Public Attributes

- [FI\\_Button](#) \* **newButton**  
*The "new directory" button is exported so that application developers can control the appearance and use.*
- [FI\\_Check\\_Button](#) \* **previewButton**  
*The "preview" button is exported so that application developers can control the appearance and use.*
- [FI\\_Check\\_Button](#) \* **showHiddenButton**  
*When checked, hidden files (i.e., filename begins with dot) are displayed.*

*Set the "OK" button label.*

#### 33.36.1 Detailed Description

The [Fl\\_File\\_Chooser](#) widget displays a standard file selection dialog that supports various selection modes.

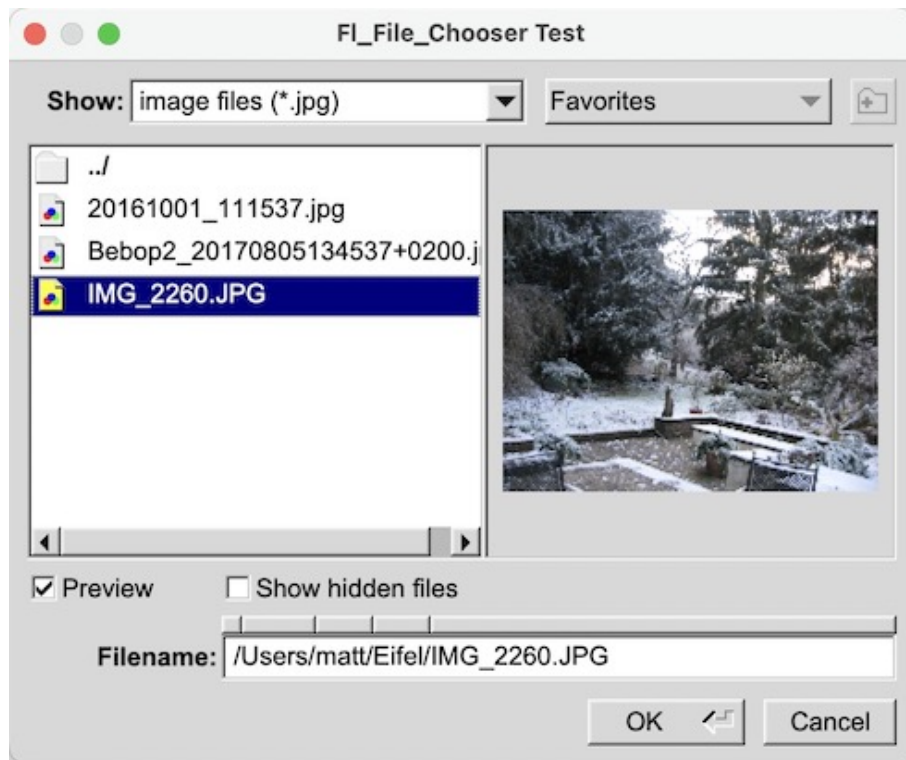

Figure 33.16 FI\_File\_Chooser

Features include:

- Multiple filter patterns can be specified, with parenthesis around filters, and tabs to separate each pattern, e.g.:
 

```
char pattern[] = "Image Files (*.{bmp,gif,jpg,png,xbm,xpm})\t"
 "Web Files (*.{htm,html,php})\t"
 "All Files (*)";
```
- If no "\*" pattern is provided, then an entry for "All Files (\*)" is automatically added.
- An optional file preview box is provided which can be toggled by programmer or user showing images, or the first 2048 bytes of printable text.
- Preview image loading functions can be registered to provide custom file previews.
- The favorites button shows up to 100 user-saved favorite directories, the user's home directory, and a filesystems item.
- A simple dialog is provided for managing saved directories.
- Shortcut keys are provided:

Shortcut	Description
Alt+a	Adds a directory to the favorites list
Alt+m	Manages the favorites list
Alt+f	Shows the filesystem list
Alt+h	Go to the home directory
Alt+0..9	going to any of the first 10 favorites

The [FI\\_File\\_Chooser](#) widget transmits UTF-8 encoded filenames to its user. It is recommended to open files that may have non-ASCII names with the [fl\\_fopen\(\)](#) or [fl\\_open\(\)](#) utility functions that handle these names in a cross-

platform way (whereas the standard `fopen()/open()` functions fail on the Windows platform to open files with a non-ASCII name).

The `Fl_File_Chooser` class also exports several static values that may be used to localize or customize the appearance of all file chooser dialogs:

Member	Default value
<code>add_favorites_label</code>	"Add to Favorites"
<code>all_files_label</code>	"All Files (*)"
<code>custom_filter_label</code>	"Custom Filter"
<code>existing_file_label</code>	"Please choose an existing file!"
<code>favorites_label</code>	"Favorites"
<code>filename_label</code>	"Filename:"
<code>filesystems_label</code>	"My Computer" (Windows) "File Systems" (all others)
<code>hidden_label</code>	"Show hidden files:"
<code>manage_favorites_label</code>	"Manage Favorites"
<code>new_directory_label</code>	"New Directory?"
<code>new_directory_tooltip</code>	"Create a new directory."
<code>preview_label</code>	"Preview"
<code>save_label</code>	"Save"
<code>show_label</code>	"Show:"
<code>sort</code>	<code>fl_numericsort</code>

The `Fl_File_Chooser::sort` member specifies the sort function that is used when loading the contents of a directory and can be customized at run-time.

The `Fl_File_Chooser` class also exports the `Fl_File_Chooser::newButton` and `Fl_File_Chooser::previewButton` widgets so that application developers can control their appearance and use.

## 33.36.2 Member Enumeration Documentation

### 33.36.2.1 Type

enum `Fl_File_Chooser::Type`

Determines the type of file chooser presented to the user.

Enumerator

SINGLE	Select a single, existing file.
MULTI	Select one or more existing files.
CREATE	When used alone, select a single, existing file or specify a new filename. Can be combined with DIRECTORY (e.g. CREATE DIRECTORY) to have the same effect for directories.
DIRECTORY	Select a single, existing directory. Can be combined with CREATE.

## 33.36.3 Constructor & Destructor Documentation

### 33.36.3.1 FI\_File\_Chooser()

```
Fl_File_Chooser::Fl_File_Chooser (
 const char * pathname,
 const char * pattern,
 int type_val,
 const char * title)
```

The constructor creates the [FI\\_File\\_Chooser](#) dialog shown.

- The `pathname` argument can be a directory name or a complete file name (in which case the corresponding file is highlighted in the list and in the filename input field.)
- The `pattern` argument can be a NULL string or "\*" to list all files, or it can be a series of descriptions and filter strings separated by tab characters (`\t`). The format of filters is either "Description text (patterns)" or just "patterns". A file chooser that provides filters for HTML and image files might look like:  

```
"HTML Files (*.html)\tImage Files (*.{bmp,gif,jpg,png})"
```

The file chooser will automatically add the "All Files (\*)" pattern to the end of the string you pass if you do not provide one. The first filter in the string is the default filter. See the FLTK documentation on [fl\\_filename\\_match\(\)](#) for the kinds of pattern strings that are supported.
- The `type_val` argument can be one of the [FI\\_File\\_Chooser::Type](#) values.
- The `title` argument is used to set the title bar text for the [FI\\_File\\_Chooser](#) window.

## 33.36.4 Member Function Documentation

### 33.36.4.1 add\_extra()

```
Fl_Widget * Fl_File_Chooser::add_extra (
 Fl_Widget * extra)
```

Adds an extra widget at the bottom of the [FI\\_File\\_Chooser](#) window.

You can use any [Fl\\_Widget](#) or [Fl\\_Group](#). If you use an [Fl\\_Group](#), set its (x, y) coordinates to (0, 0) and position its children relative to (0, 0) inside the [Fl\\_Group](#) container widget. Make sure that all child widgets of the [Fl\\_Group](#) are entirely included inside the bounding box of their parents, i.e. the [Fl\\_Group](#) widget, and the [FI\\_File\\_Chooser](#) window, respectively.

#### Note

The width of the [FI\\_File\\_Chooser](#) window is an undocumented implementation detail and may change in the future.

If `extra` is NULL any previous extra widget is removed.

#### Parameters

<code>in</code>	<code>extra</code>	Custom widget or group to be added to the <a href="#">FI_File_Chooser</a> window.
-----------------	--------------------	-----------------------------------------------------------------------------------

#### Returns

Pointer to previous extra widget or NULL if not set previously.

#### Note

[FI\\_File\\_Chooser](#) does **not** delete the extra widget in its destructor! The extra widget is removed from the [FI\\_File\\_Chooser](#) window before the [FI\\_File\\_Chooser](#) widget gets destroyed. To prevent memory leakage, don't forget to delete unused extra widgets.

### 33.36.4.2 filter()

```
void Fl_File_Chooser::filter (
 const char * p)
```

Sets the current filename filter patterns.

The filter patterns use [fl\\_filename\\_match\(\)](#). Multiple patterns can be used by separating them with tabs, like `"*.jpg\t*.png\t*.gif\t*"`. In addition, you can provide human-readable labels with the patterns inside parenthesis, like `"JPEG Files (*.jpg)\tPNG Files (*.png)\tGIF Files (*.gif)\tAll Files (*)"`.

Use `filter(NULL)` to show all files.

### 33.36.4.3 iconsize() [1/2]

```
uchar Fl_File_Chooser::iconsize ()
```

Gets the size of the icons in the [Fl\\_File\\_Browser](#).

By default the icon size is set to 1.5 times the [textsize\(\)](#).

### 33.36.4.4 iconsize() [2/2]

```
void Fl_File_Chooser::iconsize (
 uchar s)
```

Sets the size of the icons in the [Fl\\_File\\_Browser](#).

By default the icon size is set to 1.5 times the [textsize\(\)](#).

### 33.36.4.5 preview()

```
void Fl_File_Chooser::preview (
 int e)
```

Enable or disable the preview tile.

1 = enable preview, 0 = disable preview.

### 33.36.4.6 shown()

```
int Fl_File_Chooser::shown ()
```

Returns non-zero if the file chooser main window [show\(\)](#) has been called, but not [hide\(\)](#).

See also

[Fl\\_Window::shown\(\)](#)

### 33.36.4.7 value() [1/2]

```
void Fl_File_Chooser::value (
 const char * filename)
```

Sets the current value of the selected file.

If a relative path is provided in `filename` it is converted to an absolute path.

If `NULL` or an empty string is provided, the working directory is changed to the user's current directory and the filename is set to `""`.

After assigning the filename the entire string (if any) is selected, i.e.

- `insert_position()` is 0 (zero)
- `mark()` is `strlen(<expanded filename>)`.

Note

The selection of the entire string may not always be desired but it is kept for backwards compatibility.

## Parameters

in	<i>filename</i>	relative or absolute filename, may be NULL or ""
----	-----------------	--------------------------------------------------

**33.36.4.8 value() [2/2]**

```
const char * Fl_File_Chooser::value (
 int f = 1)
```

Gets the current value of the selected file(s).

*f* is a 1-based index into a list of file names. The number of selected files is returned by [Fl\\_File\\_Chooser::count\(\)](#).

This sample code loops through all selected files:

```
// Get list of filenames user selected from a MULTI chooser
for (int t=1; t<=chooser->count(); t++) {
 const char *filename = chooser->value(t);
 ...
}
```

**33.36.5 Member Data Documentation****33.36.5.1 showHiddenButton**

```
Fl_File_Chooser::showHiddenButton
```

When checked, hidden files (i.e., filename begins with dot) are displayed.

The "showHiddenButton" button is exported so that application developers can control its appearance.

The documentation for this class was generated from the following files:

- [Fl\\_File\\_Chooser.H](#)
- [Fl\\_File\\_Chooser.cxx](#)
- [Fl\\_File\\_Chooser2.cxx](#)
- [fl\\_file\\_dir.cxx](#)

**33.37 Fl\_File\_Icon Class Reference**

The [Fl\\_File\\_Icon](#) class manages icon images that can be used as labels in other widgets and as icons in the [FileBrowser](#) widget.

```
#include <Fl_File_Icon.H>
```

**Public Types**

- enum {  
  **ANY** , **PLAIN** , **FIFO** , **DEVICE** ,  
  **LINK** , **DIRECTORY** }
- enum {  
  **END** , **COLOR** , **LINE** , **CLOSEDLINE** ,  
  **POLYGON** , **OUTLINEPOLYGON** , **VERTEX** }

**Public Member Functions**

- short \* [add](#) (short d)  
  *Adds a keyword value to the icon array, returning a pointer to it.*
- short \* [add\\_color](#) ([Fl\\_Color](#) c)  
  *Adds a color value to the icon array, returning a pointer to it.*
- short \* [add\\_vertex](#) (float x, float y)  
  *Adds a vertex value to the icon array, returning a pointer to it.*

- short \* `add_vertex` (int x, int y)  
*Adds a vertex value to the icon array, returning a pointer to it.*
- void `clear` ()  
*Clears all icon data from the icon.*
- void `draw` (int x, int y, int w, int h, `Fl_Color` ic, int active=1)  
*Draws an icon in the indicated area.*
- `Fl_File_Icon` (const char \*p, int t, int nd=0, short \*d=0)  
*Creates a new `Fl_File_Icon` with the specified information.*
- void `label` (`Fl_Widget` \*w)  
*Applies the icon to the widget, registering the `Fl_File_Icon` label type as needed.*
- void `load` (const char \*f)  
*Loads the specified icon image.*
- int `load_fti` (const char \*fti)  
*Loads an SGI icon file.*
- int `load_image` (const char \*i)  
*Load an image icon file from an image filename.*
- `Fl_File_Icon` \* `next` ()  
*Returns next file icon object.*
- const char \* `pattern` ()  
*Returns the filename matching pattern for the icon.*
- int `size` ()  
*Returns the number of words of data used by the icon.*
- int `type` ()  
*Returns the filetype associated with the icon, which can be one of the following:*
- short \* `value` ()  
*Returns the data array for the icon.*
- ~`Fl_File_Icon` ()  
*The destructor destroys the icon and frees all memory that has been allocated for it.*

### Static Public Member Functions

- static `Fl_File_Icon` \* `find` (const char \*filename, int filetype=ANY)  
*Finds an icon that matches the given filename and file type.*
- static `Fl_File_Icon` \* `first` ()  
*Returns a pointer to the first icon in the list.*
- static void `labeltype` (const `Fl_Label` \*o, int x, int y, int w, int h, `Fl_Align` a)  
*Draw the icon label.*
- static void `load_system_icons` (void)  
*Loads all system-defined icons.*

#### 33.37.1 Detailed Description

The `Fl_File_Icon` class manages icon images that can be used as labels in other widgets and as icons in the `FileBrowser` widget.

#### 33.37.2 Constructor & Destructor Documentation

### 33.37.2.1 Fl\_File\_Icon()

```
Fl_File_Icon::Fl_File_Icon (
 const char * p,
 int t,
 int nd = 0,
 short * d = 0)
```

Creates a new [Fl\\_File\\_Icon](#) with the specified information.

#### Parameters

in	<i>p</i>	filename pattern
in	<i>t</i>	file type
in	<i>nd</i>	number of data values
in	<i>d</i>	data values

## 33.37.3 Member Function Documentation

### 33.37.3.1 add()

```
short * Fl_File_Icon::add (
 short d)
```

Adds a keyword value to the icon array, returning a pointer to it.

#### Parameters

in	<i>d</i>	data value
----	----------	------------

### 33.37.3.2 add\_color()

```
short * Fl_File_Icon::add_color (
 Fl_Color c) [inline]
```

Adds a color value to the icon array, returning a pointer to it.

#### Parameters

in	<i>c</i>	color value
----	----------	-------------

### 33.37.3.3 add\_vertex() [1/2]

```
short * Fl_File_Icon::add_vertex (
 float x,
 float y) [inline]
```

Adds a vertex value to the icon array, returning a pointer to it.

The floating point version goes from 0.0 to 1.0. The origin (0.0) is in the lower-lefthand corner of the icon.

#### Parameters

in	<i>x,y</i>	vertex coordinates
----	------------	--------------------

**33.37.3.4 add\_vertex()** [2/2]

```
short * Fl_File_Icon::add_vertex (
 int x,
 int y) [inline]
```

Adds a vertex value to the icon array, returning a pointer to it.

The integer version accepts coordinates from 0 to 10000. The origin (0.0) is in the lower-left hand corner of the icon.

**Parameters**

in	<i>x,y</i>	vertex coordinates
----	------------	--------------------

**33.37.3.5 draw()**

```
void Fl_File_Icon::draw (
 int x,
 int y,
 int w,
 int h,
 Fl_Color ic,
 int active = 1)
```

Draws an icon in the indicated area.

**Parameters**

in	<i>x,y,w,h</i>	position and size
in	<i>ic</i>	icon color
in	<i>active</i>	status, default is active [non-zero]

**33.37.3.6 find()**

```
Fl_File_Icon * Fl_File_Icon::find (
 const char * filename,
 int filetype = ANY) [static]
```

Finds an icon that matches the given filename and file type.

**Parameters**

in	<i>filename</i>	name of file
in	<i>filetype</i>	enumerated file type

**Returns**

matching file icon or NULL

**33.37.3.7 label()**

```
void Fl_File_Icon::label (
 Fl_Widget * w)
```

Applies the icon to the widget, registering the [Fl\\_File\\_Icon](#) label type as needed.

## Parameters

in	<i>w</i>	widget for which this icon will become the label
----	----------	--------------------------------------------------

**33.37.3.8 labeltype()**

```
void Fl_File_Icon::labeltype (
 const Fl_Label * o,
 int x,
 int y,
 int w,
 int h,
 Fl_Align a) [static]
```

Draw the icon label.

## Parameters

in	<i>o</i>	label data
in	<i>x,y,w,h</i>	position and size of label
in	<i>a</i>	label alignment [not used]

**33.37.3.9 load()**

```
void Fl_File_Icon::load (
 const char * f)
```

Loads the specified icon image.

The format is deduced from the filename.

## Parameters

in	<i>f</i>	filename
----	----------	----------

**33.37.3.10 load\_fti()**

```
int Fl_File_Icon::load_fti (
 const char * fti)
```

Loads an SGI icon file.

## Parameters

in	<i>fti</i>	icon filename
----	------------	---------------

## Returns

0 on success, non-zero on error

**33.37.3.11 load\_image()**

```
int Fl_File_Icon::load_image (
 const char * ifile)
```

---

Load an image icon file from an image filename.

## Parameters

in	<i>ifile</i>	image filename
----	--------------	----------------

## Returns

0 on success, non-zero on error

**33.37.3.12 load\_system\_icons()**

```
void Fl_File_Icon::load_system_icons (
 void) [static]
```

Loads all system-defined icons.

This call is useful when using the FileChooser widget and should be used when the application starts:

```
Fl_File_Icon::load_system_icons();
```

**33.37.3.13 next()**

```
Fl_File_Icon * Fl_File_Icon::next () [inline]
```

Returns next file icon object.

See [Fl\\_File\\_Icon::first\(\)](#)

**33.37.3.14 type()**

```
int Fl_File_Icon::type () [inline]
```

Returns the filetype associated with the icon, which can be one of the following:

- `Fl_File_Icon::ANY`, any kind of file.
- `Fl_File_Icon::PLAIN`, plain files.
- `Fl_File_Icon::FIFO`, named pipes.
- `Fl_File_Icon::DEVICE`, character and block devices.
- `Fl_File_Icon::LINK`, symbolic links.
- `Fl_File_Icon::DIRECTORY`, directories.

The documentation for this class was generated from the following files:

- `Fl_File_Icon.H`
- `Fl_File_Icon.cxx`
- `Fl_File_Icon2.cxx`

**33.38 FI\_File\_Input Class Reference**

This widget displays a pathname in a text input field.

```
#include <Fl_File_Input.H>
```

Inheritance diagram for `Fl_File_Input`:

## Public Member Functions

- [Fl\\_Boxtype](#) **down\_box** () const  
*Gets the box type used for the navigation bar.*
- void **down\_box** ([Fl\\_Boxtype](#) b)  
*Sets the box type to use for the navigation bar.*
- [Fl\\_Color](#) **errorcolor** () const  
*Gets the current error color.*
- void **errorcolor** ([Fl\\_Color](#) c)  
*Sets the current error color to c.*
- [Fl\\_File\\_Input](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_File\\_Input](#) widget using the given position, size, and label string.*
- int **handle** (int event) [FL\\_OVERRIDE](#)  
*Handle events in the widget.*
- const char \* **value** ()  
*Returns the current value, which is a pointer to an internal buffer and is valid only until the next event is handled.*
- int **value** (const char \*str)  
*Sets the value of the widget given a new string value.*
- int **value** (const char \*str, int len)  
*Sets the value of the widget given a new string value and its length.*

## Protected Member Functions

- void **draw** () [FL\\_OVERRIDE](#)  
*Draws the file input widget.*

## Additional Inherited Members

### 33.38.1 Detailed Description

This widget displays a pathname in a text input field.

A navigation bar located above the input field allows the user to navigate upward in the directory tree. You may want to handle `FL_WHEN_CHANGED` events for tracking text changes and also `FL_WHEN_RELEASE` for button release when changing to parent dir. `FL_WHEN_RELEASE` callback won't be called if the directory clicked is the same as the current one.

**Figure 33.17** Fl\_File\_Input

#### Note

As all [Fl\\_Input](#) derived objects, [Fl\\_File\\_Input](#) may call its callback when losing focus (see `FL_UNFOCUS`) to update its state like its cursor shape. One resulting side effect is that you should call `clear_changed()` early in your callback to avoid reentrant calls if you plan to show another window or dialog box in the callback.

## 33.38.2 Constructor & Destructor Documentation

### 33.38.2.1 Fl\_File\_Input()

```
Fl_File_Input::Fl_File_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_File\\_Input](#) widget using the given position, size, and label string. The default boxtype is FL\_DOWN\_BOX.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

## 33.38.3 Member Function Documentation

### 33.38.3.1 down\_box()

```
void Fl_File_Input::down_box (
 Fl_Boxtype b) [inline]
```

Sets the box type to use for the navigation bar.

### 33.38.3.2 draw()

```
void Fl_File_Input::draw (
 void) [protected], [virtual]
```

Draws the file input widget.

Implements [Fl\\_Widget](#).

### 33.38.3.3 errorcolor() [1/2]

```
Fl_Color Fl_File_Input::errorcolor () const [inline]
```

Gets the current error color.

Returns FL\_RED since FLTK 1.4.0 (default in 1.3.x). Retained for backwards compatibility.

**Deprecated** Will be removed in FLTK 1.5.0 or higher.

**Todo** Remove [Fl\\_File\\_Input::errorcolor\(\)](#) in FLTK 1.5.0 or higher.

### 33.38.3.4 errorcolor() [2/2]

```
void Fl_File_Input::errorcolor (
 Fl_Color c) [inline]
```

Sets the current error color to *c*.

Does nothing since FLTK 1.4.0. Retained for backwards compatibility.

**Deprecated** Will be removed in FLTK 1.5.0 or higher.

**Todo** Remove `FI_File_Input::errorcolor(FI_Color)` in FLTK 1.5.0 or higher.

### 33.38.3.5 handle()

```
int Fl_File_Input::handle (
 int event) [virtual]
```

Handle events in the widget.  
Return non zero if event is handled.

#### Parameters

in	<i>event</i>	
----	--------------	--

Reimplemented from [FI\\_Widget](#).

### 33.38.3.6 value() [1/2]

```
int Fl_File_Input::value (
 const char * str)
```

Sets the value of the widget given a new string value.  
Returns non 0 on success.

#### Parameters

in	<i>str</i>	new string value
----	------------	------------------

### 33.38.3.7 value() [2/2]

```
int Fl_File_Input::value (
 const char * str,
 int len)
```

Sets the value of the widget given a new string value and its length.  
Returns non 0 on success.

#### Parameters

in	<i>str</i>	new string value
in	<i>len</i>	length of value

The documentation for this class was generated from the following files:

- `FI_File_Input.H`
- `FI_File_Input.cxx`

## 33.39 FI\_Fill\_Dial Class Reference

Draws a dial with a filled arc.

```
#include <FI_Fill_Dial.H>
```

Inheritance diagram for `FI_Fill_Dial`:

## Public Member Functions

- **Fl\_Fill\_Dial** (int X, int Y, int W, int H, const char \*L=NULL)  
*Creates a filled dial, also setting its type to FL\_FILL\_DIAL.*

## Additional Inherited Members

### 33.39.1 Detailed Description

Draws a dial with a filled arc.

The documentation for this class was generated from the following files:

- Fl\_Fill\_Dial.H
- Fl\_Dial.cxx

## 33.40 Fl\_Fill\_Slider Class Reference

Widget that draws a filled horizontal slider, useful as a progress or value meter.

```
#include <Fl_Fill_Slider.H>
```

Inheritance diagram for Fl\_Fill\_Slider:

## Public Member Functions

- **Fl\_Fill\_Slider** (int X, int Y, int W, int H, const char \*L=0)  
*Creates the slider from its position, size and optional title.*

## Additional Inherited Members

### 33.40.1 Detailed Description

Widget that draws a filled horizontal slider, useful as a progress or value meter.

The documentation for this class was generated from the following files:

- Fl\_Fill\_Slider.H
- Fl\_Slider.cxx

## 33.41 Fl\_Flex Class Reference

[Fl\\_Flex](#) is a container (layout) widget for one row or one column of widgets.

```
#include <Fl_Flex.H>
```

Inheritance diagram for [Fl\\_Flex](#):

### Public Types

- enum { [VERTICAL](#) = 0 , [HORIZONTAL](#) = 1 , [COLUMN](#) = 0 , [ROW](#) = 1 }

### Public Member Functions

- virtual void [end](#) ()  
*Ends automatic child addition and resizes all children.*
- void [fixed](#) ([Fl\\_Widget](#) &[w](#), int [size](#))  
*Set the horizontal or vertical size of a child widget.*
- int [fixed](#) ([Fl\\_Widget](#) \*[w](#)) const  
*Return whether the given widget has a fixed size or resizes dynamically.*
- void [fixed](#) ([Fl\\_Widget](#) \*[w](#), int [size](#))  
*Set the horizontal or vertical size of a child widget.*
- [Fl\\_Flex](#) (int [direction](#))  
*Construct a new [Fl\\_Flex](#) widget specifying its layout.*
- [Fl\\_Flex](#) (int [w](#), int [h](#), int [direction](#))  
*Construct a new [Fl\\_Flex](#) widget specifying its layout and size.*
- [Fl\\_Flex](#) (int [X](#), int [Y](#), int [W](#), int [H](#), const char \*[L](#)=0)  
*Construct a new [Fl\\_Flex](#) widget with the given position, size, and label.*
- [Fl\\_Flex](#) (int [x](#), int [y](#), int [w](#), int [h](#), int [direction](#))  
*Construct a new [Fl\\_Flex](#) widget specifying its layout, position, and size.*
- int [gap](#) () const  
*Return the gap size of the widget.*
- void [gap](#) (int [g](#))  
*Set the gap size of the widget.*
- int [horizontal](#) () const  
*Returns non-zero (true) if [Fl\\_Flex](#) alignment is horizontal (row mode).*
- void [layout](#) ()  
*Calculates the layout of the widget and redraws it.*
- int [margin](#) () const  
*Returns the left margin size of the widget.*
- int [margin](#) (int \*[left](#), int \*[top](#), int \*[right](#), int \*[bottom](#)) const  
*Returns all (four) margin sizes of the widget.*
- void [margin](#) (int [left](#), int [top](#), int [right](#), int [bottom](#))  
*Set the margin sizes at all four edges of the [Fl\\_Flex](#) widget.*
- void [margin](#) (int [m](#), int [g](#)=-1)  
*Set the margin and optionally the gap size of the widget.*

- bool `need_layout ()` const  
*Returns whether layout calculation is required.*
- void `need_layout (int set)`  
*Set or reset the request to calculate the layout of children.*
- void `resize (int x, int y, int w, int h) FL_OVERRIDE`  
*Resize the container and calculate all child positions and sizes.*
- int `spacing ()` const  
*Gets the number of extra pixels of blank space that are added between the children.*
- void `spacing (int i)`  
*Sets the number of extra pixels of blank space that are added between the children.*

## Protected Member Functions

- virtual int `alloc_size (int size)` const  
*Return new size to be allocated for array of fixed size widgets.*
- void `draw () FL_OVERRIDE`  
*Draw the widget.*
- void `init (int t=VERTICAL)`
- void `on_remove (int) FL_OVERRIDE`  
*Allow derived groups to act when a child widget is removed from the group.*

## Additional Inherited Members

### 33.41.1 Detailed Description

`Fl_Flex` is a container (layout) widget for one row or one column of widgets.

It provides flexible positioning of its children either in one row or in one column.

`Fl_Flex` is designed to be as simple as possible. You can set individual widget sizes or let `Fl_Flex` position and size the widgets to fit in the container. All "flexible" (i.e. non-fixed size) widgets are assigned the same width or height, respectively. For details see below.

You can set the margins **around** all children at the inner side of the box frame (if any). `Fl_Flex` supports setting different margin sizes on top, bottom, left, and right sides. The default margin size is 0 on all edges of the container. You can set the gap size **between** all children. The gap size is always the same between all of its children. This is similar to the 'spacing' of `Fl_Pack`. The default gap size is 0.

`Fl_Flex` can either consist of a single row, i.e. `type(Fl_Flex::HORIZONTAL)` or a single column, i.e. `type(Fl_Flex::VERTICAL)`. The default value is `Fl_Flex::VERTICAL` for consistency with `Fl_Pack` but you can use `type ()` to assign a row (`Fl_Flex::HORIZONTAL`) layout.

If `type() == Fl_Flex::HORIZONTAL` widgets are resized horizontally to fit in the container and their height is the full `Fl_Flex` height minus border size and margins. You can set a fixed widget width by using `fixed()`.

If `type() == Fl_Flex::VERTICAL` widgets are resized vertically to fit in the container and their width is the full `Fl_Flex` width minus border size and margins. You can set a fixed widget height by using `fixed()`.

To create arbitrary spacing you can use invisible boxes of flexible or fixed sizes (see example below).

Alternate constructors let you specify the layout as `Fl_Flex::HORIZONTAL` or `Fl_Flex::VERTICAL` directly. `Fl_Flex::ROW` is an alias of `Fl_Flex::HORIZONTAL` and `Fl_Flex::COLUMN` is an alias of `Fl_Flex::VERTICAL`.

The default box type is `FL_NO_BOX` as inherited from `Fl_Group`. You **may** need to set a box type with a solid background depending on your layout.

**Important:** You should always make sure that the `Fl_Flex` container cannot be resized smaller than its designed minimal size. This can usually be done by setting a `size_range()` on the window as shown in the example below. `Fl_Flex` does not take care of sensible sizes. If it is resized too small the behavior is undefined, i.e. widgets may overlap and/or shrink to zero size.

**Hint:** In many cases `Fl_Flex` can be used as a drop-in replacement for `Fl_Pack`. This is the recommended single row/column container since FLTK 1.4.0. Its resizing behavior is much more predictable (as expected) than that of `Fl_Pack` which "resizes itself to shrink-wrap itself around all of the children".

`Fl_Flex` containers can be nested so you can create flexible layouts with multiple columns and rows. However, if your UI design is more complex you may want to use `Fl_Grid` instead.

Example:

Figure 33.18 Fl\_Flex

## Example code:

```
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Flex.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_Button.H>
int main(int argc, char **argv) {
 Fl_Double_Window window(410, 40, "Simple Fl_Flex Demo");
 Fl_Flex flex(5, 5, 400, 30, Fl_Flex::HORIZONTAL);
 Fl_Button b1(0, 0, 0, 0, "File");
 Fl_Button b2(0, 0, 0, 0, "Save");
 Fl_Box bx(0, 0, 0, 0);
 Fl_Button b3(0, 0, 0, 0, "Exit");
 flex.fixed(bx, 60); // set fix width of invisible box
 flex.gap(10);
 flex.end();
 window.resizable(flex);
 window.end();
 window.size_range(300, 30);
 window.show(argc, argv);
 return Fl::run();
}
```

## Since

1.4.0

## 33.41.2 Member Enumeration Documentation

## 33.41.2.1 anonymous enum

anonymous enum

## Enumerator

VERTICAL	vertical layout (one column)
HORIZONTAL	horizontal layout (one row)
COLUMN	alias for VERTICAL
ROW	alias for HORIZONTAL

## 33.41.3 Constructor &amp; Destructor Documentation

## 33.41.3.1 Fl\_Flex() [1/4]

```
Fl_Flex::Fl_Flex (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Construct a new [Fl\\_Flex](#) widget with the given position, size, and label.

You can set type ([Fl\\_Flex::HORIZONTAL](#)) or type ([Fl\\_Flex::VERTICAL](#)). The default is type ([Fl\\_Flex::VERTICAL](#)).

Alternate constructors let you specify the layout as [Fl\\_Flex::HORIZONTAL](#) or [Fl\\_Flex::VERTICAL](#) directly. [Fl\\_Flex::ROW](#) is an alias of [Fl\\_Flex::HORIZONTAL](#) and [Fl\\_Flex::COLUMN](#) is an alias of [Fl\\_Flex::VERTICAL](#).

## Parameters

in	<i>X,Y</i>	position
in	<i>W,H</i>	size (width and height)
in	<i>L</i>	label (optional)

## See also

[FI\\_Flex::FI\\_Flex\(int direction\)](#)

[FI\\_Flex::FI\\_Flex\(int w, int h, int direction\)](#)

[FI\\_Flex::FI\\_Flex\(int x, int y, int w, int h, int direction\)](#)

[FI\\_Flex::FI\\_Flex\(int x, int y, int w, int h, const char \\*L\)](#)

**33.41.3.2 FI\_Flex()** [2/4]

```
FI_Flex::FI_Flex (
 int direction)
```

Construct a new [FI\\_Flex](#) widget specifying its layout.

Use [FI\\_Flex::HORIZONTAL](#) (aka [FI\\_Flex::ROW](#)) or [FI\\_Flex::VERTICAL](#) (aka [FI\\_Flex::COLUMN](#)) as the *direction* argument.

This constructor sets the position and size to (0, 0, 0, 0) which is suitable for nested [FI\\_Flex](#) widgets. Use one of the other constructors to set the desired position and size as well.

## Parameters

in	<i>direction</i>	horizontal (row) or vertical (column) layout
----	------------------	----------------------------------------------

## See also

[FI\\_Flex::FI\\_Flex\(int w, int h, int direction\)](#)

[FI\\_Flex::FI\\_Flex\(int x, int y, int w, int h, int direction\)](#)

[FI\\_Flex::FI\\_Flex\(int x, int y, int w, int h, const char \\*L\)](#)

**33.41.3.3 FI\_Flex()** [3/4]

```
FI_Flex::FI_Flex (
 int w,
 int h,
 int direction)
```

Construct a new [FI\\_Flex](#) widget specifying its layout and size.

Use [FI\\_Flex::HORIZONTAL](#) (aka [FI\\_Flex::ROW](#)) or [FI\\_Flex::VERTICAL](#) (aka [FI\\_Flex::COLUMN](#)) as the *direction* argument.

This constructor sets the position to (x = 0, y = 0) which is suitable for nested [FI\\_Flex](#) widgets. Use one of the other constructors to set the desired position as well.

## Parameters

in	<i>w,h</i>	widget size
in	<i>direction</i>	horizontal (row) or vertical (column) layout

## See also

[FI\\_Flex::FI\\_Flex\(int direction\)](#)  
[FI\\_Flex::FI\\_Flex\(int x, int y, int w, int h, int direction\)](#)  
[FI\\_Flex::FI\\_Flex\(int x, int y, int w, int h, const char \\*L\)](#)

**33.41.3.4 FI\_Flex()** [4/4]

```

FI_Flex::FI_Flex (
 int x,
 int y,
 int w,
 int h,
 int direction)

```

Construct a new [FI\\_Flex](#) widget specifying its layout, position, and size.

Use [FI\\_Flex::HORIZONTAL](#) (aka [FI\\_Flex::ROW](#)) or [FI\\_Flex::VERTICAL](#) (aka [FI\\_Flex::COLUMN](#)) as the `direction` argument.

This constructor sets the position and size of the widget which is suitable for top level [FI\\_Flex](#) widgets but does not set a widget label. Use [FI\\_Widget::label\(\)](#) to set one if desired.

## Parameters

in	<i>x,y</i>	widget position
in	<i>w,h</i>	widget size
in	<i>direction</i>	horizontal (row) or vertical (column) layout

## See also

[FI\\_Flex::FI\\_Flex\(int direction\)](#)  
[FI\\_Flex::FI\\_Flex\(int w, int h, int direction\)](#)  
[FI\\_Flex::FI\\_Flex\(int x, int y, int w, int h, const char \\*L\)](#)

**33.41.4 Member Function Documentation****33.41.4.1 alloc\_size()**

```

int FI_Flex::alloc_size (
 int size) const [protected], [virtual]

```

Return new size to be allocated for array of fixed size widgets.

This method is called when the array of fixed size widgets needs to be expanded. The current `size` is provided (size can be 0). The default method adds 8 to the current size.

This can be used in derived classes to change the allocation strategy. Note that this method only `queries` the new size which shall be allocated but does not allocate the memory.

## Parameters

in	<i>size</i>	current size
----	-------------	--------------

## Returns

int new size (to be allocated)

**33.41.4.2 draw()**

```
void Fl_Flex::draw (
 void) [protected], [virtual]
```

Draw the widget.

This will finally calculate the layout of the widget and of all its children if necessary and draw the widget. Some changes of included children may require a new layout to be calculated. If this is the case the user may need to call [layout\(\)](#) to make sure everything is calculated properly.

See also

[layout\(\)](#)

Implements [Fl\\_Widget](#).

**33.41.4.3 end()**

```
void Fl_Flex::end () [virtual]
```

Ends automatic child addition and resizes all children.

This marks the [Fl\\_Flex](#) widget as changed (`need_layout(1)`) which forces the widget to calculate its layout depending on all children and whether they have been assigned fix sizes or not right before it is drawn.

See also

[need\\_layout\(int\)](#)

[draw\(\)](#)

**33.41.4.4 fixed() [1/3]**

```
void Fl_Flex::fixed (
 Fl_Widget & w,
 int size) [inline]
```

Set the horizontal or vertical size of a child widget.

Parameters

in	<i>w</i>	widget to be affected
in	<i>size</i>	width ( <a href="#">Fl_Flex::HORIZONTAL</a> ) or height ( <a href="#">Fl_Flex::VERTICAL</a> )

See also

[fixed\(Fl\\_Widget \\*w, int size\)](#)

**33.41.4.5 fixed() [2/3]**

```
int Fl_Flex::fixed (
 Fl_Widget * w) const
```

Return whether the given widget has a fixed size or resizes dynamically.

Parameters

in	<i>w</i>	widget
----	----------	--------

**Returns**

whether the widget has a fixed size

**Return values**

1	the widget has a fixed size
0	the widget resizes dynamically

**33.41.4.6 fixed() [3/3]**

```
void Fl_Flex::fixed (
 Fl_Widget * child,
 int size)
```

Set the horizontal or vertical size of a child widget.

This sets either the width or height of a child widget, depending on the `type()` of the `Fl_Flex` container (`Fl_Flex::HORIZONTAL` or `Fl_Flex::VERTICAL`). The other dimension is set to the full width or height of the `Fl_Flex` widget minus border and margin sizes.

This can be used to set a fixed widget width or height of children of `Fl_Flex` so they are not resized dynamically.

If `size` is 0 (zero) or negative the widget size is reset to flexible size.

**Parameters**

in	<i>child</i>	widget to be affected
in	<i>size</i>	width ( <code>Fl_Flex::HORIZONTAL</code> ) or height ( <code>Fl_Flex::VERTICAL</code> )

**33.41.4.7 gap() [1/2]**

```
int Fl_Flex::gap () const [inline]
```

Return the gap size of the widget.

**Returns**

gap size between all child widgets.

**33.41.4.8 gap() [2/2]**

```
void Fl_Flex::gap (
 int g) [inline]
```

Set the gap size of the widget.

The gap size is some free space **between** child widgets. The size must be  $\geq 0$ . Negative values are clamped to 0.

**Parameters**

in	<i>g</i>	gap size
----	----------	----------

**33.41.4.9 horizontal()**

```
int Fl_Flex::horizontal () const [inline]
```

Returns non-zero (true) if `Fl_Flex` alignment is horizontal (row mode).

**Returns**

non-zero if [Fl\\_Flex](#) alignment is horizontal

**Return values**

1	if <code>type() == Fl_Flex::HORIZONTAL</code>
0	if <code>type() == Fl_Flex::VERTICAL</code>

See class [Fl\\_Flex](#) documentation for details.

**33.41.4.10 layout()**

```
void Fl_Flex::layout ()
```

Calculates the layout of the widget and redraws it.

If you change widgets in the [Fl\\_Flex](#) container you should call this method to force recalculation of child widget sizes and positions. This can be useful (necessary) if you [hide\(\)](#), [show\(\)](#), [add\(\)](#) or [remove\(\)](#) children.

Call this method if you need to recalculate widget positions for usage in an algorithm that places widgets at certain positions or when you need to display (show) or hide one or more children depending on the current layout (for instance a side bar).

This method also calls [redraw\(\)](#) on the [Fl\\_Flex](#) widget.

**33.41.4.11 margin() [1/4]**

```
int Fl_Flex::margin () const [inline]
```

Returns the left margin size of the widget.

This returns the **left** margin of the widget which is not necessarily the same as all other margins.

**Note**

This method is useful if you never set different margin sizes.

**See also**

`int margin(int *left, int *top, int *right, int *bottom)` to get all four [margin](#) values.

**Returns**

size of left margin.

**33.41.4.12 margin() [2/4]**

```
int Fl_Flex::margin (
 int * left,
 int * top,
 int * right,
 int * bottom) const [inline]
```

Returns all (four) margin sizes of the widget.

All margin sizes are returned in the given arguments. If any argument is `NULL` the respective value is not returned.

**Parameters**

in	<i>left</i>	returns left margin if not <code>NULL</code>
in	<i>top</i>	returns top margin if not <code>NULL</code>
in	<i>right</i>	returns right margin if not <code>NULL</code>
in	<i>bottom</i>	returns bottom margin if not <code>NULL</code>

**Returns**

whether all margins are equal

**Return values**

1	all margins have the same size
0	at least one margin has a different size

**33.41.4.13 margin() [3/4]**

```
void Fl_Flex::margin (
 int left,
 int top,
 int right,
 int bottom) [inline]
```

Set the margin sizes at all four edges of the [Fl\\_Flex](#) widget.

The margin is the free space inside the widget border **around** all child widgets.

You must use all four parameters of this method to set the four margins in the order `left, top, right, bottom`.

Negative values are set to 0 (zero).

To set all margins to equal sizes, use `margin(int m)` which sets all four margins to the same size.

**Parameters**

in	<i>left, top, right, bottom</i>	margin sizes, must be $\geq 0$
----	---------------------------------	--------------------------------

**See also**

[margin\(int, int\)](#)

**33.41.4.14 margin() [4/4]**

```
void Fl_Flex::margin (
 int m,
 int g = -1) [inline]
```

Set the margin and optionally the gap size of the widget.

This method can be used to set both the margin and the gap size.

If you don't use the second parameter `g` or supply a negative value the gap size is not changed.

The margin is the free space inside the widget border **around** all child widgets.

This method sets the margin to the same size at all four edges of the [Fl\\_Flex](#) widget.

The gap size `g` is the free space **between** child widgets. Negative values do not change the gap value. This is the default if this argument is omitted.

**Parameters**

in	<i>m</i>	margin size, must be $\geq 0$
in	<i>g</i>	gap size (ignored, if negative)

**See also**

[gap\(int\)](#)

**33.41.4.15 need\_layout()** [1/2]

```
bool Fl_Flex::need_layout () const [inline]
```

Returns whether layout calculation is required.

This should rarely be needed by user code. Used internally in [draw\(\)](#).

**33.41.4.16 need\_layout()** [2/2]

```
void Fl_Flex::need_layout (
 int set) [inline]
```

Set or reset the request to calculate the layout of children.

This is intended for internal use but can also be used by user code to request layout calculation before the widget is drawn.

Call this if you changed attributes or sizes of children to ensure that the layout is calculated properly. Changing other [Fl\\_Flex](#) attributes or resizing the widget does this automatically.

**Note**

Never call this with 'set == 0' because this would defeat its purpose to recalculate the layout before the widget is drawn.

**33.41.4.17 on\_remove()**

```
void Fl_Flex::on_remove (
 int index) [protected], [virtual]
```

Allow derived groups to act when a child widget is removed from the group.

Widgets derived from [Fl\\_Group](#) may store additional data for their children. Overriding this method will allow derived classes to remove these data structures just before the child is removed.

**Parameters**

<i>index</i>	remove the child at this position in the array_
--------------	-------------------------------------------------

Reimplemented from [Fl\\_Group](#).

**33.41.4.18 resize()**

```
void Fl_Flex::resize (
 int x,
 int y,
 int w,
 int h) [virtual]
```

Resize the container and calculate all child positions and sizes.

**Parameters**

in	<i>x,y</i>	position
in	<i>w,h</i>	width and height

Reimplemented from [Fl\\_Widget](#).

**33.41.4.19 spacing()** [1/2]

```
int Fl_Flex::spacing () const [inline]
```

Gets the number of extra pixels of blank space that are added between the children.

This method is the same as 'int [gap\(\)](#)' and is defined to enable using [Fl\\_Flex](#) as a drop-in replacement of [Fl\\_Pack](#).

See also

int [gap\(\)](#)

#### 33.41.4.20 spacing() [2/2]

```
void Fl_Flex::spacing (
 int i) [inline]
```

Sets the number of extra pixels of blank space that are added between the children.

This method is the same as '[gap\(int\)](#)' and is defined to enable using [Fl\\_Flex](#) as a drop-in replacement of [Fl\\_Pack](#).

See also

void [gap\(int\)](#)

The documentation for this class was generated from the following files:

- [Fl\\_Flex.H](#)
- [Fl\\_Flex.cxx](#)

## 33.42 Fl\_Float\_Input Class Reference

The [Fl\\_Float\\_Input](#) class is a subclass of [Fl\\_Input](#) that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits).

```
#include <Fl_Float_Input.H>
```

Inheritance diagram for [Fl\\_Float\\_Input](#):

### Public Member Functions

- [Fl\\_Float\\_Input](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Float\\_Input](#) widget using the given position, size, and label string.*

### Additional Inherited Members

#### 33.42.1 Detailed Description

The [Fl\\_Float\\_Input](#) class is a subclass of [Fl\\_Input](#) that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits).

#### 33.42.2 Constructor & Destructor Documentation

### 33.42.2.1 Fl\_Float\_Input()

```
Fl_Float_Input::Fl_Float_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Float\\_Input](#) widget using the given position, size, and label string.

The default boxtype is FL\_DOWN\_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [Fl\\_Float\\_Input.H](#)
- [Fl\\_Input.cxx](#)

## 33.43 Fl\_FormsBitmap Class Reference

Forms compatibility Bitmap Image Widget.

```
#include <Fl_FormsBitmap.H>
```

Inheritance diagram for Fl\_FormsBitmap:

Forms pixmap drawing routines.

## 33.44.2 Constructor & Destructor Documentation

### 33.44.2.1 Fl\_FormsPixmap()

```
Fl_FormsPixmap::Fl_FormsPixmap (
 Fl_Boxtype t,
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_FormsPixmap](#) widget using the given box type, position, size and label string.

#### Parameters

in	<i>t</i>	box type
in	<i>X,Y,W,H</i>	position and size
in	<i>L</i>	widget label, default is no label

## 33.44.3 Member Function Documentation

### 33.44.3.1 draw()

```
void Fl_FormsPixmap::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 33.44.3.2 Pixmap()

```
void Fl_FormsPixmap::Pixmap (
 Fl_Pixmap * B) [inline]
```

Set the internal pixmap pointer to an existing pixmap.

#### Parameters

in	<i>B</i>	existing pixmap
----	----------	-----------------

### 33.44.3.3 set()

```
void Fl_FormsPixmap::set (
 char *const * bits)
```

Set/create the internal pixmap using raw data.

## Parameters

in	bits	raw data
----	------	----------

The documentation for this class was generated from the following files:

- Fl\_FormsPixmap.H
- forms\_pixmap.cxx

## 33.45 Fl\_FormsText Class Reference

Inheritance diagram for Fl\_FormsText:

### Public Member Functions

- **Fl\_FormsText** ([Fl\\_Boxtype](#) b, int X, int Y, int W, int H, const char \*l=0)

### Protected Member Functions

- void **draw** () [FL\\_OVERRIDE](#)  
*Draws the widget.*

### Additional Inherited Members

#### 33.45.1 Member Function Documentation

##### 33.45.1.1 draw()

```
void Fl_FormsText::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

The documentation for this class was generated from the following file:

- forms.H

## 33.46 Fl\_Free Class Reference

Emulation of the Forms "free" widget.

```
#include <Fl_Free.H>
```

Inheritance diagram for Fl\_Free:

## Public Member Functions

- `Fl_Free` (`uchar t`, `int X`, `int Y`, `int W`, `int H`, `const char *L`, `FL_HANDLEPTR hdl`)  
Create a new `Fl_Free` widget with type, position, size, label and handler.
- `int handle` (`int e`) `FL_OVERRIDE`  
Handles the specified event.
- `~Fl_Free` ()  
The destructor will call the handle function with the event `FL_FREE_MEM`.

## Protected Member Functions

- `void draw` () `FL_OVERRIDE`  
Draws the widget.

## Additional Inherited Members

### 33.46.1 Detailed Description

Emulation of the Forms "free" widget.

This emulation allows the free demo to run, and appears to be useful for porting programs written in Forms which use the free widget or make subclasses of the Forms widgets.

There are five types of free, which determine when the handle function is called:

- `FL_NORMAL_FREE` normal event handling.
- `FL_SLEEPING_FREE` deactivates event handling (widget is inactive).
- `FL_INPUT_FREE` accepts `FL_FOCUS` events.
- `FL_CONTINUOUS_FREE` sets a timeout callback 100 times a second and provides an `FL_STEP` event. This has obvious detrimental effects on machine performance.
- `FL_ALL_FREE` same as `FL_INPUT_FREE` and `FL_CONTINUOUS_FREE`.

### 33.46.2 Constructor & Destructor Documentation

#### 33.46.2.1 Fl\_Free()

```

Fl_Free::Fl_Free (
 uchar t,
 int X,
 int Y,
 int W,
 int H,
 const char * L,
 FL_HANDLEPTR hdl)

```

Create a new `Fl_Free` widget with type, position, size, label and handler.

#### Parameters

in	<i>t</i>	type
----	----------	------

## Parameters

in	<i>X,Y,W,H</i>	position and size
in	<i>L</i>	widget label
in	<i>hdl</i>	handler function

The constructor takes both the type and the handle function. The handle function should be declared as follows:

```
int handle_function(Fl_Widget *w,
 int event,
 float event_x,
 float event_y,
 char key)
```

This function is called from the [handle\(\)](#) method in response to most events, and is called by the [draw\(\)](#) method.

The event argument contains the event type:

```
// old event names for compatibility:
#define FL_MOUSE FL_DRAG
#define FL_DRAW 0
#define FL_STEP 9
#define FL_FREEMEM 12
#define FL_FREEZE FL_UNMAP
#define FL_THAW FL_MAP
```

### 33.46.3 Member Function Documentation

#### 33.46.3.1 draw()

```
void Fl_Free::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 33.46.3.2 handle()

```
int Fl_Free::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## Additional Inherited Members

### 33.47.1 Detailed Description

The `Fl_GIF_Image` class supports loading, caching, and drawing of Compuserve GIF<sup>SM</sup> images. The class loads the first image and supports transparency.

### 33.47.2 Constructor & Destructor Documentation

#### 33.47.2.1 Fl\_GIF\_Image() [1/3]

```
Fl_GIF_Image::Fl_GIF_Image (
 const char * filename)
```

This constructor loads a GIF image from the given file.

If a GIF image is animated, `Fl_GIF_Image` will only read and display the first frame of the animation.

The destructor frees all memory and server resources that are used by the image.

Use `Fl_Image::fail()` to check if `Fl_GIF_Image` failed to load. `fail()` returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the GIF format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

#### Parameters

in	<i>filename</i>	a full path and name pointing to a GIF image file.
----	-----------------	----------------------------------------------------

#### See also

`Fl_GIF_Image::Fl_GIF_Image(const char *imagename, const unsigned char *data, const long length)`

#### 33.47.2.2 Fl\_GIF\_Image() [2/3]

```
Fl_GIF_Image::Fl_GIF_Image (
 const char * imagename,
 const unsigned char * data)
```

This constructor loads a GIF image from memory (deprecated).

**Deprecated** Please use `Fl_GIF_Image(const char *imagename, const unsigned char *data, const size_t length)` instead.

**Note**

Buffer overruns will not be checked.

This constructor should not be used because the caller can't supply the memory size and the image reader can't check for "end of memory" errors.

**Note**

A new constructor with parameter `length` is available since FLTK 1.4.0.

**Parameters**

in	<i>imagename</i>	A name given to this image or NULL
in	<i>data</i>	Pointer to the start of the GIF image in memory.

**See also**

[Fl\\_GIF\\_Image\(const char \\*filename\)](#)

[Fl\\_GIF\\_Image\(const char \\*imagename, const unsigned char \\*data, const size\\_t length\)](#)

**33.47.2.3 Fl\_GIF\_Image() [3/3]**

```
Fl_GIF_Image::Fl_GIF_Image (
 const char * imagename,
 const unsigned char * data,
 const size_t length)
```

This constructor loads a GIF image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary data" chunks as a great way to add image data into the C++ source code. `imagename` can be `NULL`. If a name is given, the image is added to the list of shared images and will be available by that name.

If a GIF image is animated, [Fl\\_GIF\\_Image](#) will only read and display the first frame of the animation.

The destructor frees all memory and server resources that are used by the image.

The third parameter `length` is used to test for buffer overruns, i.e. truncated images.

Use [Fl\\_Image::fail\(\)](#) to check if [Fl\\_GIF\\_Image](#) failed to load. `fail()` returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the GIF format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

**Parameters**

in	<i>imagename</i>	A name given to this image or NULL
in	<i>data</i>	Pointer to the start of the GIF image in memory.
in	<i>length</i>	Length of the GIF image in memory.

**See also**

[Fl\\_GIF\\_Image::Fl\\_GIF\\_Image\(const char \\*filename\)](#)

[Fl\\_Shared\\_Image](#)

**Since**

1.4.0

**33.47.3 Member Data Documentation**

### 33.47.3.1 animate

```
bool Fl_GIF_Image::animate = false [static]
```

Sets how the shared image core routine should treat animated GIF files.

The default is to treat them as ordinary GIF's e.g. it creates a [Fl\\_GIF\\_Image](#) object. If this variable is set, then an animated GIF object [Fl\\_Anim\\_GIF\\_Image](#) is created.

## Additional Inherited Members

### 33.49.1 Detailed Description

The [FI\\_GI\\_Window](#) widget sets things up so OpenGL works.

It also keeps an OpenGL "context" for that window, so that changes to the lighting and projection may be reused between redraws. [FI\\_GI\\_Window](#) also flushes the OpenGL streams and swaps buffers after [draw\(\)](#) returns.

OpenGL hardware typically provides some overlay bit planes, which are very useful for drawing UI controls atop your 3D graphics. If the overlay hardware is not provided, FLTK tries to simulate the overlay. This works pretty well if your graphics are double buffered, but not very well for single-buffered.

Please note that the FLTK drawing and clipping functions will not work inside an [FI\\_GI\\_Window](#). All drawing should be done using OpenGL calls exclusively.

See also

[OpenGL and support of HighDPI displays](#)

Note

FLTK 1.4 introduces a driver system for graphic calls. It is now possible to add a selection of widgets to an OpenGL window. The widgets will draw on top of any OpenGL rendering. The number of supported widgets will increase as the driver development improves. Program `test/cube.cxx` illustrates how to do that.

FLTK expects that when an [FI\\_GI\\_Window](#) is a child of a parent [FI\\_Window](#), the child window lies entirely inside its parent window. If that's not the case, what happens to the part of the GL subwindow which leaks outside its parent is undefined and susceptible to be platform-specific.

### 33.49.2 Constructor & Destructor Documentation

**33.49.2.1 FI\_Gl\_Window()** [1/2]

```
Fl_Gl_Window::Fl_Gl_Window (
 int W,
 int H,
 const char * l = 0) [inline]
```

Creates a new [FI\\_Gl\\_Window](#) widget using the given size, and label string.  
The default boxtype is FL\_NO\_BOX. The default mode is FL\_RGB|FL\_DOUBLE|FL\_DEPTH.

**33.49.2.2 FI\_Gl\_Window()** [2/2]

```
Fl_Gl_Window::Fl_Gl_Window (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0) [inline]
```

Creates a new [FI\\_Gl\\_Window](#) widget using the given position, size, and label string.  
The default boxtype is FL\_NO\_BOX. The default mode is FL\_RGB|FL\_DOUBLE|FL\_DEPTH.

**33.49.3 Member Function Documentation****33.49.3.1 as\_gl\_window()** [1/2]

```
Fl_Gl_Window const * Fl_Gl_Window::as_gl_window () const [inline], [virtual]
```

Reimplemented from [FI\\_Widget](#).

**33.49.3.2 as\_gl\_window()** [2/2]

```
Fl_Gl_Window * Fl_Gl_Window::as_gl_window () [inline], [virtual]
```

Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).  
Use this method if you have a widget (pointer) and need to know whether this widget is derived from [FI\\_Gl\\_Window](#).  
If it returns non-NULL, then the widget in question is derived from [FI\\_Gl\\_Window](#).

**Return values**

NULL	if this widget is not derived from <a href="#">FI_Gl_Window</a> .
------	-------------------------------------------------------------------

**Note**

This method is provided to avoid `dynamic_cast`.

**See also**

[FI\\_Widget::as\\_group\(\)](#), [FI\\_Widget::as\\_window\(\)](#)

Reimplemented from [FI\\_Widget](#).

**33.49.3.3 can\_do()**

```
static int Fl_Gl_Window::can_do (
 const int * m) [inline], [static]
```

Returns non-zero if the hardware supports the given OpenGL mode.

**See also**

[FI\\_Gl\\_Window::mode\(const int \\*a\)](#)

### 33.49.3.4 can\_do\_overlay()

```
int Fl_Gl_Window::can_do_overlay ()
```

Returns true if the hardware overlay is possible.

If this is false, FLTK will try to simulate the overlay, with significant loss of update speed. Calling this will cause FLTK to open the display.

### 33.49.3.5 context() [1/2]

```
GLContext Fl_Gl_Window::context () const [inline]
```

Returns a pointer to the window's OpenGL rendering context.

See also

```
void context(GLContext c, int destroy_flag)
```

### 33.49.3.6 context() [2/2]

```
void Fl_Gl_Window::context (
 GLContext v,
 int destroy_flag = 0)
```

Sets a pointer to the GLContext that this window is using.

This is a system-dependent structure, but it is portable to copy the context from one window to another. You can also set it to NULL, which will force FLTK to recreate the context the next time `make_current()` is called, this is useful for getting around bugs in OpenGL implementations.

If `destroy_flag` is true the context will be destroyed by fltk when the window is destroyed, or when the `mode()` is changed, or the next time `context(x)` is called.

### 33.49.3.7 context\_valid()

```
char Fl_Gl_Window::context_valid () const [inline]
```

Will only be set if the OpenGL context is created or recreated.

It differs from `Fl_Gl_Window::valid()` which is also set whenever the context changes size.

### 33.49.3.8 draw()

```
void Fl_Gl_Window::draw (
 void) [protected], [virtual]
```

Draws the `Fl_Gl_Window`.

You **must subclass** `Fl_Gl_Window` and provide an implementation for `draw()`. You may also provide an implementation of `draw_overlay()` if you want to draw into the overlay planes. You can avoid reinitializing the viewport and lights and other things by checking `valid()` at the start of `draw()` and only doing the initialization if it is false.

The `draw()` method can *only* use OpenGL calls. Do not attempt to call X, any of the functions in `<FL/fl_draw.H>`, or GLX directly. Do not call `gl_start()` or `gl_finish()`.

If double-buffering is enabled in the window, the back and front buffers are swapped after this function is completed.

The following pseudo-code shows how to use "if (!valid())" to initialize the viewport:

```
void mywindow::draw() {
 if (!valid()) {
 glViewport(0,0,pixel_w(),pixel_h());
 glFrustum(...) or glOrtho(...)
 ...other initialization...
 }
 if (!context_valid()) {
 ...load textures, etc. ...
 }
 // clear screen
 glClearColor(...);
 glClear(...);
 ... draw your geometry here ...
}
```

Actual example code to clear screen to black and draw a 2D white "X":

```
void mywindow::draw() {
 if (!valid()) {
 glLoadIdentity();
```

```

 glVertex(0,0,pixel_w(),pixel_h());
 glOrtho(-w(),w(),-h(),h(),-1,1);
 }
 // Clear screen
 glClear(GL_COLOR_BUFFER_BIT);
 // Draw white 'X'
 glColor3f(1.0, 1.0, 1.0);
 glBegin(GL_LINE_STRIP); glVertex2f(w(), h()); glVertex2f(-w(),-h()); glEnd();
 glBegin(GL_LINE_STRIP); glVertex2f(w(),-h()); glVertex2f(-w(), h()); glEnd();
}

```

Regular FLTK widgets can be added as children to the [Fl\\_Gl\\_Window](#). To correctly overlay the widgets, [Fl\\_Gl\\_Window::draw\(\)](#) must be called after rendering the main scene.

```

void mywindow::draw() {
 // draw 3d graphics scene
 Fl_Gl_Window::draw();
 // -- or --
 draw_begin();
 Fl_Window::draw();
 // other 2d drawing calls, overlays, etc.
 draw_end();
}

```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Glut\\_Window](#).

### 33.49.3.9 draw\_begin()

```
void Fl_Gl_Window::draw_begin () [protected]
```

Supports drawing to an [Fl\\_Gl\\_Window](#) with the FLTK 2D drawing API.

See also

[Using FLTK widgets in OpenGL Windows](#)

### 33.49.3.10 draw\_end()

```
void Fl_Gl_Window::draw_end () [protected]
```

To be used as a match for a previous call to [Fl\\_Gl\\_Window::draw\\_begin\(\)](#).

See also

[Using FLTK widgets in OpenGL Windows](#)

### 33.49.3.11 flush()

```
void Fl_Gl_Window::flush () [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented from [Fl\\_Window](#).

### 33.49.3.12 handle()

```
int Fl_Gl_Window::handle (
 int event) [virtual]
```

Handle some FLTK events as needed.

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Glut\\_Window](#).

### 33.49.3.13 hide()

```
void Fl_Gl_Window::hide () [virtual]
```

Hides the window and destroys the OpenGL context.

Reimplemented from [Fl\\_Widget](#).

**33.49.3.14 make\_current()**

```
void Fl_Gl_Window::make_current ()
```

The [make\\_current\(\)](#) method selects the OpenGL context for the widget.

It is called automatically prior to the [draw\(\)](#) method being called and can also be used to implement feedback and/or selection within the [handle\(\)](#) method.

**33.49.3.15 make\_overlay\_current()**

```
void Fl_Gl_Window::make_overlay_current ()
```

Selects the OpenGL context for the widget's overlay.

This method is called automatically prior to the [draw\\_overlay\(\)](#) method being called and can also be used to implement feedback and/or selection within the [handle\(\)](#) method.

**33.49.3.16 mode() [1/3]**

```
Fl_Mode Fl_Gl_Window::mode () const [inline]
```

Returns the current OpenGL capabilities of the window.

Don't use this if capabilities were set through [Fl\\_Gl\\_Window::mode\(const int \\*a\)](#).

**33.49.3.17 mode() [2/3]**

```
int Fl_Gl_Window::mode (
 const int * a) [inline]
```

Set the OpenGL capabilities of the window using platform-specific data.

**Parameters**

<b>a</b>	zero-ending array of platform-specific attributes and attribute values
----------	------------------------------------------------------------------------

**Unix/Linux platform:** attributes are GLX attributes adequate for the 3rd argument of the `glXChooseVisual()` function (e.g., `GLX_DOUBLEBUFFER`, defined by including `<GL/glx.h>`).

**Note**

What attributes are adequate here is subject to change. The preferred, stable public API is [Fl\\_Gl\\_Window::mode\(int a\)](#).

**Windows platform:** this member function is of no use.

**Mac OS X platform:** attributes belong to the `CGLPixelFormatAttribute` enumeration (defined by including `<OpenGL/OpenGL.h>`, e.g., `kCGLPFADoubleBuffer`) and may be followed by adequate attribute values.

**33.49.3.18 mode() [3/3]**

```
int Fl_Gl_Window::mode (
 int a) [inline]
```

Set or change the OpenGL capabilities of the window.

The value can be any of the following OR'd together:

- `FL_RGB` - RGB color (not indexed)
- `FL_RGB8` - RGB color with at least 8 bits of each color
- `FL_INDEX` - Indexed mode
- `FL_SINGLE` - not double buffered
- `FL_DOUBLE` - double buffered
- `FL_ACCUM` - accumulation buffer
- `FL_ALPHA` - alpha channel in color

- `FL_DEPTH` - depth buffer
- `FL_STENCIL` - stencil buffer
- `FL_MULTISAMPLE` - multisample antialiasing
- `FL_OPENGL3` - use OpenGL version 3.0 or more.

`FL_RGB` and `FL_SINGLE` have a value of zero, so they are "on" unless you give `FL_INDEX` or `FL_DOUBLE`.

If the desired combination cannot be done, FLTK will try turning off `FL_MULTISAMPLE`. If this also fails the `show()` will call `Fl::error()` and not show the window.

You can change the mode while the window is displayed. This is most useful for turning double-buffering on and off. Under X this will cause the old X window to be destroyed and a new one to be created. If this is a top-level window this will unfortunately also cause the window to blink, raise to the top, and be de-iconized, and the `xid()` will change, possibly breaking other code. It is best to make the GL window a child of another window if you wish to do this! `mode()` must not be called within `draw()` since it changes the current context.

The `FL_OPENGL3` flag is recommended to use OpenGL version 3 or more. This flag is required (not just recommended) if GL 3.0 is in use and at least one of these conditions applies:

- the program runs on the macOS platform;
- the `Fl_Gl_Window` has child widgets.

See more details in [Using OpenGL 3.0 \(or higher versions\)](#).

#### Version

the `FL_OPENGL3` flag appeared in version 1.3.4

#### 33.49.3.19 ortho()

```
void Fl_Gl_Window::ortho ()
```

Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.

If you are drawing 2D images, your `draw()` method may want to call this if `valid()` is false.

#### 33.49.3.20 pixel\_h()

```
int Fl_Gl_Window::pixel_h () [inline]
```

Gives the window height in OpenGL pixels.

When an `Fl_Gl_Window` is mapped to a HighDPI display, the value given by `Fl_Gl_Window::h()` which is expressed in FLTK units, may differ from the window height in pixels. Calls to OpenGL functions expecting pixel values (e.g., `glViewport`) should therefore use `pixel_h()` rather than `h()`. Method `pixel_h()` detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

#### Version

1.3.4

#### 33.49.3.21 pixel\_w()

```
int Fl_Gl_Window::pixel_w () [inline]
```

Gives the window width in OpenGL pixels.

When an `Fl_Gl_Window` is mapped to a HighDPI display, the value given by `Fl_Gl_Window::w()` which is expressed in FLTK units, may differ from the window width in pixels. Calls to OpenGL functions expecting pixel values (e.g., `glViewport`) should therefore use `pixel_w()` rather than `w()`. Method `pixel_w()` detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

#### Version

1.3.4

**33.49.3.22 pixels\_per\_unit()**

```
float Fl_Gl_Window::pixels_per_unit ()
```

The number of pixels per FLTK unit of length for the window.

This method dynamically adjusts its value when the GUI is rescaled or when the window is moved to/from displays of distinct resolutions. This method is useful, e.g., to convert, in a window's [handle\(\)](#) method, the FLTK units returned by [Fl::event\\_x\(\)](#) and [Fl::event\\_y\(\)](#) to the pixel units used by the OpenGL source code.

**Version**

1.3.4

**33.49.3.23 redraw\_overlay()**

```
void Fl_Gl_Window::redraw_overlay ()
```

Causes [draw\\_overlay\(\)](#) to be called at a later time.

Initially the overlay is clear. If you want the window to display something in the overlay when it first appears, you must call this immediately after you [show\(\)](#) your window.

**33.49.3.24 resize()**

```
void Fl_Gl_Window::resize (
 int x,
 int y,
 int w,
 int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

[position\(X, Y\)](#) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#), and [size\(W, H\)](#) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

**Parameters**

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

**See also**

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl\\_Widget](#).

**33.49.3.25 show()**

```
void Fl_Gl_Window::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like `FL_SHOW`.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send `FL_SHOW` or `FL_HIDE` events to the widget. *Do not change it if the parent is not visible, as this will send false `FL_SHOW` or `FL_HIDE` events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Widget](#).

### 33.49.3.26 `swap_buffers()`

```
void Fl_Gl_Window::swap_buffers ()
```

The `swap_buffers()` method swaps the back and front buffers.

It is called automatically after the `draw()` method is called.

### 33.49.3.27 `swap_interval()` [1/2]

```
int Fl_Gl_Window::swap_interval () const
```

Gets the rate at which the GL windows swaps buffers.

This method can be called after the OpenGL context was created, typically within the user overridden `Fl_Gl_Window::draw()` method that will be overridden by the user.

**Note**

This method depends highly on the underlying OpenGL contexts and driver implementation. Some drivers return no information, most drivers don't support intervals with multiple frames and return only 0 or 1.

Some drivers have the ability to set the swap interval but no way to query it, hence this method may return -1 even though the interval was set correctly. Conversely a return value greater zero does not guarantee that the driver actually honors the setting.

**Returns**

an integer greater zero if vertical blanking is taken into account when swapping OpenGL buffers

0 if the vertical blanking is ignored

-1 if the information can not be retrieved

### 33.49.3.28 `swap_interval()` [2/2]

```
void Fl_Gl_Window::swap_interval (
 int frames)
```

Sets the rate at which the GL windows swaps buffers.

This method can be called after the OpenGL context was created, typically within the user overridden `Fl_Gl_Window::draw()` method that will be overridden by the user.

**Note**

This method depends highly on the underlying OpenGL contexts and driver implementation. Most driver seem to accept only 0 and 1 to swap buffer asynchronously or in sync with the vertical blank.

**Parameters**

<code>in</code>	<code>frames</code>	set the number of vertical frame blanks between OpenGL buffer swaps
-----------------	---------------------	---------------------------------------------------------------------

### 33.49.3.29 `valid()`

```
char Fl_Gl_Window::valid () const [inline]
```

Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on *after* `draw()` is called.

You can use this inside your `draw()` method to avoid unnecessarily initializing the OpenGL context. Just do this:

```
void mywindow::draw() {
 if (!valid()) {
 glViewport(0,0,pixel_w(),pixel_h());
 glFrustum(...);
 ...other initialization...
 }
 if (!context_valid()) {
 ...load textures, etc. ...
 }
 ... draw your geometry here ...
}
```

You can turn `valid()` on by calling `valid(1)`. You should only do this after fixing the transformation inside a `draw()` or after `make_current()`. This is done automatically after `draw()` returns.

### 33.55.1 Detailed Description

GLUT is emulated using this window class and these static variables (plus several more static variables hidden in `glut_compatibility.cxx`):

### 33.55.2 Member Function Documentation

#### 33.55.2.1 draw()

```
void Fl_Glut_Window::draw (
 void) [protected], [virtual]
```

Draws the [Fl\\_Gl\\_Window](#).

You **must subclass** [Fl\\_Gl\\_Window](#) and provide an implementation for `draw()`. You may also provide an implementation of `draw_overlay()` if you want to draw into the overlay planes. You can avoid reinitializing the viewport and lights and other things by checking `valid()` at the start of `draw()` and only doing the initialization if it is false.

The `draw()` method can *only* use OpenGL calls. Do not attempt to call X, any of the functions in `<FL/fl_draw.H>`, or GLX directly. Do not call `gl_start()` or `gl_finish()`.

If double-buffering is enabled in the window, the back and front buffers are swapped after this function is completed.

The following pseudo-code shows how to use "if (!valid())" to initialize the viewport:

```
void mywindow::draw() {
 if (!valid()) {
 glViewport(0,0,pixel_w(),pixel_h());
 glFrustum(...) or glOrtho(...)
 ...other initialization...
 }
 if (!context_valid()) {
 ...load textures, etc. ...
 }
 // clear screen
 glClearColor(...);
 glClear(...);
 ... draw your geometry here ...
}
```

Actual example code to clear screen to black and draw a 2D white "X":

```
void mywindow::draw() {
 if (!valid()) {
 glLoadIdentity();
 glViewport(0,0,pixel_w(),pixel_h());
 glOrtho(-w(),w(),-h(),h(),-1,1);
 }
}
```

```

// Clear screen
glClear(GL_COLOR_BUFFER_BIT);
// Draw white 'X'
glColor3f(1.0, 1.0, 1.0);
glBegin(GL_LINE_STRIP); glVertex2f(w(), h()); glVertex2f(-w(),-h()); glEnd();
glBegin(GL_LINE_STRIP); glVertex2f(w(),-h()); glVertex2f(-w(), h()); glEnd();
}

```

Regular FLTK widgets can be added as children to the [Fl\\_Gl\\_Window](#). To correctly overlay the widgets, [Fl\\_Gl\\_Window::draw\(\)](#) must be called after rendering the main scene.

```

void mywindow::draw() {
// draw 3d graphics scene
Fl_Gl_Window::draw();
// -- or --
draw_begin();
Fl_Window::draw();
// other 2d drawing calls, overlays, etc.
draw_end();
}

```

Reimplemented from [Fl\\_Gl\\_Window](#).

### 33.55.2.2 draw\_overlay()

```
void Fl_Glut_Window::draw_overlay () [protected], [virtual]
```

You must implement this virtual function if you want to draw into the overlay.

The overlay is cleared before this is called. You should draw anything that is not clear using OpenGL. You must use `gl_color(i)` to choose colors (it allocates them from the colormap using system-specific calls), and remember that you are in an indexed OpenGL mode and drawing anything other than flat-shaded will probably not work.

Both this function and [Fl\\_Gl\\_Window::draw\(\)](#) should check [Fl\\_Gl\\_Window::valid\(\)](#) and set the same transformation. If you don't your code may not work on other systems. Depending on the OS, and on whether overlays are real or simulated, the OpenGL context may be the same or different between the overlay and main window.

Reimplemented from [Fl\\_Gl\\_Window](#).

### 33.55.2.3 handle()

```
int Fl_Glut_Window::handle (
 int event) [protected], [virtual]
```

Handle some FLTK events as needed.

Reimplemented from [Fl\\_Gl\\_Window](#).

The documentation for this class was generated from the following files:

- `glut.H`
- `glut_compatibility.cxx`

## 33.56 Fl\_Grid Class Reference

[Fl\\_Grid](#) is a container (layout) widget with multiple columns and rows.

### 33.56.1 Detailed Description

`FL_Grid` is a container (layout) widget with multiple columns and rows.

This container widget features very flexible layouts in columns and rows w/o the need to position each child widget in x/y coordinates.

Widgets are assigned to grid cells (column, row) with their minimal sizes in `w()` and `h()`. The `x()` and `y()` positions are ignored and can be (0, 0). `FL_Grid` calculates widget positions and resizes the widgets to fit into the grid. It is possible to create a single row or column of widgets with `FL_Grid`.

You should design your grid with the smallest possible sizes of all widgets in mind. `FL_Grid` will automatically assign additional space to cells according to some rules (described later) when resizing the `FL_Grid` widget.

**Hint:** You should set a minimum window size to make sure the `Fl_Grid` is never resized below its minimal sizes. Resizing below the given widget sizes results in undefined behavior.

`Fl_Grid` and other container widgets (e.g. `Fl_Group`) can be nested. One main advantage of this usage is that widget coordinates in embedded `Fl_Group` widgets become relative to the group and will be positioned as expected.

**Todo** This (relative group coordinates of nested groups of `Fl_Grid`) needs explanation and maybe an example.

`Fl_Grid` child widgets are handled by its base class `Fl_Group` but `Fl_Grid` stores additional data corresponding to each widget in internal grid cells.

`Fl_Grid` children are allowed to span multiple columns and rows like HTML `<table>` cells. Individual children can have fixed sizes or be aligned inside their cells (left, right, top, bottom, and more) and/or follow their cell sizes when the `Fl_Grid` container is resized.

Note to resizing: since `Fl_Grid` uses its own layout algorithm the normal `Fl_Group::resizable()` widget is ignored (if set). Calling `init_sizes()` is not necessary.

#### Note

`Fl_Grid` is, as of FLTK 1.4.0, still in experimental state and should be used with caution. The API can still be changed although it is assumed to be almost stable - as stable as possible for a first release.

Example: Simple 3x3 `Fl_Grid` with five buttons:

```
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Grid.H>
#include <FL/Fl_Button.H>
int main(int argc, char **argv) {
 Fl_Double_Window *win = new Fl_Double_Window(320, 180, "3x3 Fl_Grid with Buttons");
 // create the Fl_Grid container with five buttons
 Fl_Grid *grid = new Fl_Grid(0, 0, win->w(), win->h());
 grid->layout(3, 3, 10, 10);
 grid->color(FL_WHITE);
 Fl_Button *b0 = new Fl_Button(0, 0, 0, 0, "New");
 Fl_Button *b1 = new Fl_Button(0, 0, 0, 0, "Options");
 Fl_Button *b3 = new Fl_Button(0, 0, 0, 0, "About");
 Fl_Button *b4 = new Fl_Button(0, 0, 0, 0, "Help");
 Fl_Button *b6 = new Fl_Button(0, 0, 0, 0, "Quit");
 // assign buttons to grid positions
 grid->widget(b0, 0, 0);
 grid->widget(b1, 0, 2);
 grid->widget(b3, 1, 1);
 grid->widget(b4, 2, 0);
 grid->widget(b6, 2, 2);
 grid->show_grid(0); // 1 to display grid helper lines
 grid->end();
 win->end();
 win->resizable(grid);
 win->size_range(300, 100);
 win->show(argc, argv);
 return Fl::run();
}
```

Figure 33.19 Simple 3x3 `Fl_Grid`

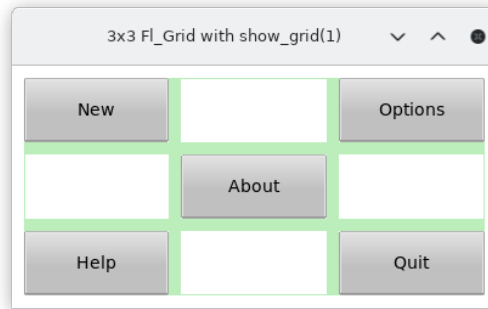

Figure 33.20 `show_grid()` set to 1

## 33.56.2 Constructor & Destructor Documentation

### 33.56.2.1 `Fl_Grid()`

```
Fl_Grid::Fl_Grid (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Create a new `Fl_Grid` widget.

**Todo** More documentation of `Fl_Grid` constructor?

## 33.56.3 Member Function Documentation

### 33.56.3.1 `cell()` [1/2]

```
Fl_Grid::Cell * Fl_Grid::cell (
 Fl_Widget * widget) const
```

Get the grid cell of widget `widget`.

The pointer to the cell can be used for further assignment of properties like alignment etc.

Hint: If you know the row and column index of the cell you should use `Fl_Grid::cell(int row, int col)` instead because it is **much** faster.

Please see `Fl_Grid::cell(int row, int col)` for details and the validity of cell pointers.

#### Parameters

in	<i>widget</i>	widget whose cell is requested
----	---------------	--------------------------------

#### Return values

<code>NULL</code>	if <code>widget</code> is not assigned to a cell
-------------------	--------------------------------------------------

### 33.56.3.2 `cell()` [2/2]

```
Fl_Grid::Cell * Fl_Grid::cell (
 int row,
```

```
int col) const
```

Get the grid cell of row `row` and column `col`.

Widgets and other attributes are organized in cells ([Fl\\_Grid::Cell](#)).

This cell is an opaque structure (class) with some public methods. **Don't** assume anything about grid cell sizes and ordering in memory. These are implementation details that can be changed without notice.

The validity of an [Fl\\_Grid::Cell](#) pointer is limited. It will definitely be invalidated when the overall grid layout is changed, for instance by calling `layout(int, int)`.

Adding new cells beyond the current layout limits will also invalidate cell pointers but this is not (yet) implemented. Attempts to assign widgets to out-of-bounds cells are currently ignored.

The only well-defined usage of cell pointers is to set one or more properties like widget alignment of a cell after retrieving the cell pointer. Don't store cell pointers in your program for later reference.

#### Parameters

in	<i>row</i>	row index
in	<i>col</i>	column index

#### Returns

pointer to cell

#### Return values

<i>NULL</i>	if <code>row</code> or <code>col</code> is out of bounds or no widget was assigned
-------------	------------------------------------------------------------------------------------

### 33.56.3.3 clear\_layout()

```
void Fl_Grid::clear_layout () [virtual]
```

Reset the layout w/o removing widgets.

Removes all cells and sets rows and cols to zero. Existing widgets are kept as children of the [Fl\\_Group](#) (base class) but are hidden.

This method should be rarely used. You may want to call [Fl\\_Grid::clear\(\)](#) to remove all widgets and reset the layout to zero rows and columns.

You must call `layout(int rows, int cols, ...)` to set a new layout, allocate new cells, and assign widgets to new cells.

**Todo** [Fl\\_Grid::clear\(\)](#) needs to be implemented as documented above!

### 33.56.3.4 col\_gap() [1/2]

```
void Fl_Grid::col_gap (
 const int * value,
 size_t size)
```

Set more than one column gaps at once.

#### See also

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the value `array` and `size`.

### 33.56.3.5 col\_gap() [2/2]

```
void Fl_Grid::col_gap (
 int col,
 int value)
```

Set the gap of column `col`.

Note that the gap is right of each column except the last one which is ignored. Use `margin()` for the right most column.

#### Parameters

in	<i>col</i>	column
in	<i>value</i>	gap size after the column

### 33.56.3.6 `col_weight()` [1/2]

```
void Fl_Grid::col_weight (
 const int * value,
 size_t size)
```

Set the weight of more than one column.

The values are taken from the array `value` and assigned sequentially to columns, starting from column 0. If the array `size` is too large extraneous values are ignored.

Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.

Example:

```
int val[] = { 0, 0, 50, -1, -1, 50, 0 };
grid->col_weight(val, sizeof(val)/sizeof(val[0]));
```

#### Parameters

in	<i>value</i>	an array of column weights
in	<i>size</i>	the size of the array (number of values)

### 33.56.3.7 `col_weight()` [2/2]

```
void Fl_Grid::col_weight (
 int col,
 int value)
```

Set the weight of a column.

Column and row weights are used to distribute additional space when the grid is resized beyond its defined (minimal) size. All weight values are relative and can be chosen freely. Suggested weights are in the range {0 .. 100}, 0 (zero) disables resizing of the column.

How does it work?

Whenever additional space (say: `SPACE` in pixels) is to be distributed to a set of columns the weights of all columns are added to a value `SUM`, then every single column width is increased by the value (in pseudo code):

```
col.width += SPACE * col.weight / SUM
```

Resulting pixel values are rounded to the next integer and rounding differences are added to or subtracted from the column with the highest weight. If more columns have the same weight one of them is chosen.

#### Note

If none of the columns considered for resizing have weights  $> 0$  then `Fl_Grid` assigns the remaining space to an arbitrary column or to all considered columns evenly. This is implementation defined and can be changed without notice. You can avoid this situation by designing your grid with sensible sizes and weights.

#### Parameters

in	<i>col</i>	column number (counting from 0)
in	<i>value</i>	weight, must be $\geq 0$

**33.56.3.8 col\_width()** [1/2]

```
void Fl_Grid::col_width (
 const int * value,
 size_t size)
```

Set minimal widths of more than one column.

The values are taken from the array `value` and assigned sequentially to columns, starting from column 0. If the array `size` is too large extraneous values are ignored.

Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.

Example:

```
int widths[] = { 0, 0, 50, -1, -1, 50, 0 };
grid->col_width(widths, sizeof(width)/sizeof(width[0]));
```

**Parameters**

in	<i>value</i>	an array of column widths
in	<i>size</i>	the size of the array (number of values)

**33.56.3.9 col\_width()** [2/2]

```
void Fl_Grid::col_width (
 int col,
 int value)
```

Set the minimal width of a column.

Column widths are calculated by using the maximum of all widget widths in that column and the given column width.

After calculating the width additional space is added when resizing according to the `weight` of the column.

You can set one or more column widths in one call by using [Fl\\_Grid::col\\_width\(const int \\*value, size\\_t size\)](#).

**Parameters**

in	<i>col</i>	column number (counting from 0)
in	<i>value</i>	minimal column width, must be $\geq 0$

See also

[Fl\\_Grid::col\\_width\(const int \\*value, size\\_t size\)](#)

**33.56.3.10 debug()**

```
void Fl_Grid::debug (
 int level = 127)
```

Output layout information of this [Fl\\_Grid](#) to `stderr`.

Parameter `level` will be used to define the amount of output.

- 0 = nothing
- 127 = everything
- other values not yet defined

**Note**

It is not yet defined which kind of values `level` will have, either a numerical value (127 = maximum, 0 = nothing) or a bit mask that determines what to output.

**Todo** Add more information about cells and children.

Control output by using `level`.

**Parameters**

in	<i>level</i>	not yet used (0-127, default = 127)
----	--------------	-------------------------------------

**33.56.3.11 draw()**

```
void Fl_Grid::draw (
 void) [protected], [virtual]
```

Draws the `Fl_Grid` widget and all children.

If the layout has been changed `layout()` is called before the widget is drawn so all children are arranged as designed.

**See also**

[layout\(\)](#)

[need\\_layout\(\)](#)

Implements `Fl_Widget`.

**33.56.3.12 draw\_grid()**

```
void Fl_Grid::draw_grid () [protected], [virtual]
```

Draws the grid helper lines for design and debugging purposes.

This method is protected so it can be modified in subclasses.

**33.56.3.13 gap() [1/2]**

```
void Fl_Grid::gap (
 int * row_gap,
 int * col_gap) const
```

Get the default gaps for rows and columns.

**Parameters**

out	<i>row_gap</i>	pointer to int to receive column gap, may be NULL
out	<i>col_gap</i>	pointer to int to receive column gap, may be NULL

**33.56.3.14 gap() [2/2]**

```
void Fl_Grid::gap (
 int row_gap,
 int col_gap = -1) [virtual]
```

Set default gaps for rows and columns.

All gaps are positioned below the rows and right of their columns.

The bottom row and the right-most column don't have a gap, i.e. the gap sizes of these columns and rows are ignored. You can use a right or bottom margin instead.

You have to specify at least one argument, `col_gap` is optional. If you don't specify an argument or use a negative value (e.g. -1) then that margin is not affected.

You can also initialize the default gaps with `layout(int, int, int, int)`.

#### Parameters

in	<code>row_gap</code>	default gap for all rows
in	<code>col_gap</code>	default gap for all columns

#### See also

[Fl\\_Grid::layout\(int rows, int cols, int margin, int gap\)](#)

### 33.56.3.15 layout() [1/2]

```
void Fl_Grid::layout () [virtual]
```

Calculate the grid layout and resize and position all widgets.

This is called automatically when the `Fl_Grid` is resized. You need to call it once after you added widgets or moved widgets between cells.

Calling it once after all modifications are completed is enough.

**Todo** Document when and why to call `layout()` w/o args. See [Fl\\_Flex::layout\(\)](#)

#### See also

[Fl\\_Grid::layout\(int rows, int cols, int margin, int gap\)](#)

### 33.56.3.16 layout() [2/2]

```
void Fl_Grid::layout (
 int rows,
 int cols,
 int margin = -1,
 int gap = -1) [virtual]
```

Set the basic layout parameters of the `Fl_Grid` widget.

You need to specify at least `rows` and `cols` to define a layout before you can add widgets to the grid.

Parameters `margin` and `gap` are optional.

You can call `layout(int rows, int cols, int margin, int gap)` again to change the layout but this is inefficient since all cells are reallocated if the layout changed.

Calling this with the same values of `rows` and `cols` is fast and can be used to change `margin` and `gap` w/o reallocating the cells.

`margin` sets all margins (left, top, right, bottom) to the same value. Negative values (e.g. -1) don't change the established margins. The default value set by the constructor is 0.

`gap` sets row and column gaps to the same value. Negative values (e.g. -1) do not affect the established gaps. The default value set by the constructor is 0.

After you added all widgets you must call `layout()` once without arguments to calculate the actual layout and to position and resize all widgets.

**Todo** Document when and why to call `layout()` w/o args. See [Fl\\_Flex::layout\(\)](#)

#### Parameters

in	<code>rows</code>	number of rows
in	<code>cols</code>	number of columns
in	<code>margin</code>	margin size inside the <code>Fl_Grid</code> 's border
in	<code>gap</code>	gap size between cells

See also

[Fl\\_Grid::layout\(\)](#)

### 33.56.3.17 margin() [1/2]

```
int Fl_Grid::margin (
 int * left,
 int * top,
 int * right,
 int * bottom) const
```

Returns all outside margin sizes of the grid.

All margin sizes are returned in the given arguments. If any argument is `NULL` the respective value is not returned.

#### Parameters

out	<i>left</i>	returns left margin if not <code>NULL</code>
out	<i>top</i>	returns top margin if not <code>NULL</code>
out	<i>right</i>	returns right margin if not <code>NULL</code>
out	<i>bottom</i>	returns bottom margin if not <code>NULL</code>

#### Returns

whether all margins are equal

#### Return values

1	all margins have the same size
0	at least one margin has a different size

### 33.56.3.18 margin() [2/2]

```
void Fl_Grid::margin (
 int left,
 int top = -1,
 int right = -1,
 int bottom = -1) [virtual]
```

Set all margins (left, top, right, bottom).

All margins are measured in pixels inside the box borders. You need to specify at least one argument, all other arguments are optional. If you don't specify an argument or use a negative value (e.g. -1) then that particular margin is not affected.

#### Parameters

in	<i>left</i>	left margin
in	<i>top</i>	top margin
in	<i>right</i>	right margin
in	<i>bottom</i>	bottom margin

**33.56.3.19 need\_layout()**

```
void Fl_Grid::need_layout (
 int set) [inline]
```

Request or reset the request to calculate the layout of children.

If called with `true` (1) this calls [redraw\(\)](#) to schedule a full [draw\(\)](#). When draw is eventually called, the layout is (re)calculated before actually drawing the widget.

**Parameters**

in	set	1 to request layout calculation, 0 to reset the request
----	-----	------------------------------------------------------------

**33.56.3.20 on\_remove()**

```
void Fl_Grid::on_remove (
 int index) [protected], [virtual]
```

[Fl\\_Group](#) calls this method when a child widget is about to be removed.

Make sure that the widget is also removed from our internal list of children.

Reimplemented from [Fl\\_Group](#).

**33.56.3.21 resize()**

```
void Fl_Grid::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Recalculate the layout and position and resize all widgets.

This method overrides [Fl\\_Group::resize\(\)](#) and calculates all positions and sizes of its children according to its own rules.

**Parameters**

in	X,Y	new widget position
in	W,H	new widget size

Reimplemented from [Fl\\_Widget](#).

**33.56.3.22 row\_gap() [1/2]**

```
void Fl_Grid::row_gap (
 const int * value,
 size_t size)
```

Set more than one row gaps at once.

**See also**

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the value [array](#) and [size](#).

**33.56.3.23 row\_gap() [2/2]**

```
void Fl_Grid::row_gap (
 int row,
 int value)
```

Set the gap of row `row`.

Note that the gap is below each row except the last one which is ignored. Use [margin\(\)](#) for the bottom row.

#### Parameters

in	<i>row</i>	row
in	<i>value</i>	gap size below the row

#### 33.56.3.24 `row_height()` [1/2]

```
void Fl_Grid::row_height (
 const int * value,
 size_t size)
```

Set the minimal row height of more than one row.

#### Parameters

in	<i>value</i>	array of height values
in	<i>size</i>	size of array value

#### See also

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the value `array` and `size`.

#### 33.56.3.25 `row_height()` [2/2]

```
void Fl_Grid::row_height (
 int row,
 int value)
```

Set the minimal row height of row `row`.

#### Parameters

in	<i>row</i>	row
in	<i>value</i>	minimal height of the row

#### 33.56.3.26 `row_weight()` [1/2]

```
void Fl_Grid::row_weight (
 const int * value,
 size_t size)
```

Set the weight of more than one row.

#### Parameters

in	<i>value</i>	array of height values
in	<i>size</i>	size of array value

See also

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the `value` array and `size`.

### 33.56.3.27 row\_weight() [2/2]

```
void Fl_Grid::row_weight (
 int row,
 int value)
```

Set the row weight of row `row`.

Parameters

in	<i>row</i>	row
in	<i>value</i>	weight of the row

### 33.56.3.28 show\_grid() [1/2]

```
void Fl_Grid::show_grid (
 int set) [inline]
```

Enable or disable drawing of the grid helper lines for visualization.

Use this method during the design stage of your [Fl\\_Grid](#) widget or for debugging if widgets are not positioned as intended.

The default is a light green color but you can change it for better contrast if needed, see [show\\_grid\(int set, Fl\\_Color col\)](#).

Note

You can define the environment variable `FLTK_GRID_DEBUG=1` to set `show_grid(1)` for all [Fl\\_Grid](#) widgets at construction time. This enables you to debug the grid layout w/o changing code.

Parameters

in	<i>set</i>	1 (true) = draw, 0 = don't draw the grid
----	------------	------------------------------------------

See also

[show\\_grid\(int set, Fl\\_Color col\)](#)

### 33.56.3.29 show\_grid() [2/2]

```
void Fl_Grid::show_grid (
 int set,
 Fl_Color col) [inline]
```

Enable or disable drawing of the grid helper lines for visualization.

This method also sets the color used for the helper lines.

The default is a light green color but you can change it to any color for better contrast if needed.

Parameters

in	<i>set</i>	1 (true) = draw, 0 = don't draw the grid
in	<i>col</i>	color to use for the grid helper lines

See also

[show\\_grid\(int set\)](#)

### 33.56.3.30 widget() [1/2]

```
Fl_Grid::Cell * Fl_Grid::widget (
 Fl_Widget * wi,
 int row,
 int col,
 Fl_Grid_Align align = FL_GRID_FILL)
```

Assign a widget to a grid cell and set its alignment.

This short form sets row and column spanning attributes to (1, 1).

For more information see [Fl\\_Grid::widget\(Fl\\_Widget \\*wi, int row, int col, int rowspan, int colspan, Fl\\_Grid\\_Align align\)](#)

#### Parameters

in	<i>wi</i>	widget to be assigned to the cell
in	<i>row</i>	row
in	<i>col</i>	column
in	<i>align</i>	widget alignment inside the cell

#### Returns

assigned cell

#### Return values

<i>NULL</i>	if <i>row</i> or <i>col</i> is out of bounds
-------------	----------------------------------------------

See also

[Fl\\_Grid::widget\(Fl\\_Widget \\*wi, int row, int col, int rowspan, int colspan, Fl\\_Grid\\_Align align\)](#)

### 33.56.3.31 widget() [2/2]

```
Fl_Grid::Cell * Fl_Grid::widget (
 Fl_Widget * wi,
 int row,
 int col,
 int rowspan,
 int colspan,
 Fl_Grid_Align align = FL_GRID_FILL)
```

Assign a widget to a grid cell and set cell spanning and alignment.

Default alignment is `FL_GRID_FILL` which stretches the widget in horizontal and vertical directions to fill the whole cell(s) given by `colspan` and `rowspan`.

You can use this method to move a widget from one cell to another; it is automatically removed from its old cell. If the new cell is already assigned to another widget that widget is deassigned but kept as a child of the group.

Before you can assign a widget to a cell it must have been created as a child of the `Fl_Grid` widget (i.e. its `Fl_Group`).

#### Parameters

in	<i>wi</i>	widget to be assigned to the cell
in	<i>row</i>	row

## Parameters

in	<i>col</i>	column
in	<i>rowspan</i>	vertical span in cells, default 1
in	<i>colspan</i>	horizontal span in cells, default 1
in	<i>align</i>	widget alignment inside the cell

## Returns

assigned cell

## Return values

<i>NULL</i>	if <code>row</code> or <code>col</code> is out of bounds or <code>wi</code> is not a child
-------------	--------------------------------------------------------------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Grid.H](#)
- [Fl\\_Grid.cxx](#)

## 33.57 Fl\_Group Class Reference

The `Fl_Group` class is the FLTK container widget.

```
#include <Fl_Group.H>
```

- void `draw_children` ()
  - Draws all children of the group.*
- void `draw_outside_label` (const `FI_Widget &widget`) const
  - Parents normally call this to draw outside labels of child widgets.*
- virtual int `on_insert` (`FI_Widget *`, int)
  - Allow derived groups to act when a widget is added as a child.*
- virtual int `on_move` (int, int)
  - Allow derived groups to act when a widget is moved within the group.*
- virtual void `on_remove` (int)
  - Allow derived groups to act when a child widget is removed from the group.*
- int \* `sizes` ()
  - Returns the internal array of widget sizes and positions.*
- void `update_child` (`FI_Widget &widget`) const
  - Draws a child only if it needs it.*

### Additional Inherited Members

#### 33.57.1 Detailed Description

The `FI_Group` class is the FLTK container widget.

It maintains an array of child widgets. These children can themselves be any widget including `FI_Group`. The most important subclass of `FI_Group` is `FI_Window`, however groups can also be used to control radio buttons or to enforce resize behavior.

The tab and arrow keys are used to move the focus between widgets of this group, and to other groups. The only modifier grabbed is shift (for shift-tab), so that ctrl-tab, alt-up, and such are free for the app to use as shortcuts.

To remove a widget from the group and destroy it, in 1.3.x (and up) you can simply use:

```
delete some_widget;
```

..and this will trigger proper scheduling of the widget's removal from its parent group.

If used as a child of `Fl_Tabs`, setting `when (FL_WHEN_CLOSED)` will enable the Close button in the corresponding tab. If the user clicks the Close button, the callback of this group will be called with the callback reason `FL_REASON_CLOSED`.

## 33.57.2 Constructor & Destructor Documentation

### 33.57.2.1 Fl\_Group()

```
Fl_Group::Fl_Group (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Group` widget using the given position, size, and label string.

The default boxtype is `FL_NO_BOX`.

### 33.57.2.2 ~Fl\_Group()

```
Fl_Group::~Fl_Group () [virtual]
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code.

It is allowed that the `Fl_Group` and all of its children are automatic (local) variables, but you must declare the `Fl_Group` *first*, so that it is destroyed last.

If you add static or automatic (local) variables to an `Fl_Group`, then it is your responsibility to remove (or delete) all such static or automatic child widgets *before destroying* the group - otherwise the group will attempt to call delete operator on them leading to undefined behavior!

## 33.57.3 Member Function Documentation

### 33.57.3.1 array()

```
Fl_Widget *const * Fl_Group::array () const
```

Returns a pointer to the array of children.

#### Note

This pointer is only valid until the next time a child is added or removed.

### 33.57.3.2 as\_group() [1/2]

```
Fl_Group const * Fl_Group::as_group () const [inline], [virtual]
```

Reimplemented from `Fl_Widget`.

### 33.57.3.3 as\_group() [2/2]

```
Fl_Group * Fl_Group::as_group () [inline], [virtual]
```

Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [FI\\_Group](#). If it returns non-NULL, then the widget in question is derived from [FI\\_Group](#), and you can use the returned pointer to access its children or other [FI\\_Group](#)-specific methods.

Example:

```
void my_callback (FI_Widget *w, void *) {
 FI_Group *g = w->as_group();
 if (g)
 printf ("This group has %d children\n", g->children());
 else
 printf ("This widget is not a group!\n");
}
```

Return values

NULL	if this widget is not derived from <a href="#">FI_Group</a> .
------	---------------------------------------------------------------

Note

This method is provided to avoid `dynamic_cast`.

See also

[FI\\_Widget::as\\_window\(\)](#), [FI\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented from [FI\\_Widget](#).

### 33.57.3.4 begin()

```
void FI_Group::begin ()
```

Sets the current group so you can build the widget tree by just constructing the widgets.

[begin\(\)](#) is automatically called by the constructor for [FI\\_Group](#) (and thus for [FI\\_Window](#) as well). [begin\(\)](#) is *exactly the same as* `current(this)`. *Don't forget to [end\(\)](#) the group or window!*

### 33.57.3.5 bounds()

```
FI_Rect * FI_Group::bounds () [protected]
```

Returns the internal array of widget sizes and positions.

If the [bounds\(\)](#) array does not exist, it will be allocated and filled with the current widget sizes and positions.

The [bounds\(\)](#) array stores the initial positions of widgets as [FI\\_Rect](#)'s. The size of the array is [children\(\)](#) + 2.

- The first [FI\\_Rect](#) is the group,
- the second is the resizable (clipped to the group),
- the rest are the children.

This is a convenient order for the resize algorithm.

If the group and/or the [resizable\(\)](#) is a [FI\\_Window](#) (or subclass) then the `x()` and `y()` coordinates of their respective [FI\\_Rect](#)'s are zero.

Note

You should never need to use this *protected* method directly, unless you have special needs to rearrange the children of a [FI\\_Group](#). [FI\\_Tile](#) uses this to rearrange its widget positions. The returned array should be considered read-only. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call [init\\_sizes\(\)](#).

`#include <FI/FI_Rect.H>` if you want to access the [bounds\(\)](#) array in your derived class. [FI\\_Rect.H](#) is intentionally not included by [FI\\_Group.H](#) to avoid unnecessary dependencies.

Returns

Array of [FI\\_Rect](#)'s with widget positions and sizes. The returned array is only valid until [init\\_sizes\(\)](#) is called or widgets are added to or removed from the group.

See also

[init\\_sizes\(\)](#)

Since

FLTK 1.4.0

### 33.57.3.6 child()

```
Fl_Widget * Fl_Group::child (
 int n) const [inline]
```

Returns [array\(\)](#)[n].

*No range checking is done!*

### 33.57.3.7 clear()

```
void Fl_Group::clear (
 void)
```

Deletes all child widgets from memory recursively.

This method differs from the [remove\(\)](#) method in that it affects all child widgets and deletes them from memory.

The [resizable\(\)](#) widget of the [Fl\\_Group](#) is set to the [Fl\\_Group](#) itself.

### 33.57.3.8 clip\_children() [1/2]

```
unsigned int Fl_Group::clip_children () [inline]
```

Returns the current clipping mode.

Returns

true, if clipping is enabled, false otherwise.

See also

void [Fl\\_Group::clip\\_children\(int c\)](#)

### 33.57.3.9 clip\_children() [2/2]

```
void Fl_Group::clip_children (
 int c) [inline]
```

Controls whether the group widget clips the drawing of child widgets to its bounding box.

Set *c* to 1 if you want to clip the child widgets to the bounding box.

The default is to not clip (0) the drawing of child widgets.

### 33.57.3.10 current() [1/2]

```
Fl_Group * Fl_Group::current () [static]
```

Returns the currently active group.

The [Fl\\_Widget](#) constructor automatically does [current\(\)](#)->[add\(widget\)](#) if this is not null. To prevent new widgets from being added to a group, call [Fl\\_Group::current\(0\)](#).

### 33.57.3.11 current() [2/2]

```
void Fl_Group::current (
 Fl_Group * g) [static]
```

Sets the current group.

See also

[Fl\\_Group::current\(\)](#)

**33.57.3.12 delete\_child()**

```
int Fl_Group::delete_child (
 int index) [virtual]
```

Removes the widget at `index` from the group and deletes it.

This method does nothing if `index` is out of bounds.

This method differs from the [remove\(\)](#) method in that it deletes the widget from memory. Since this method is virtual it can be reimplemented in subclasses with additional requirements and consequences. See the documentation of subclasses.

Many subclasses don't need to reimplement this method.

**Note**

This method **may** refuse to remove and delete the widget if it is an essential part of the [Fl\\_Group](#), for instance a scrollbar in an [Fl\\_Scroll](#) group. In this case the widget is neither removed nor deleted.

This method does not call [init\\_sizes\(\)](#) or [redraw\(\)](#). This is left to user code if necessary.

Returns 0 if the widget was removed and deleted. Return values > 0 are reserved for use by FLTK core widgets. Return values < 0 are free to be used by user defined widgets.

**Todo** Reimplementation of [Fl\\_Group::delete\\_child\(int\)](#) in more FLTK subclasses. This is not yet complete.

**Parameters**

<code>in</code>	<code>index</code>	index of child to be removed
-----------------	--------------------	------------------------------

**Returns**

success (0) or error code

**Return values**

0	success
1	index out of range
2	widget not allowed to be removed (see note)
>2	reserved for FLTK use

**Since**

FLTK 1.4.0

Reimplemented in [Fl\\_Scroll](#).

**33.57.3.13 draw()**

```
void Fl_Group::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Help\\_View](#), [Fl\\_Input\\_Choice](#), [Fl\\_Pack](#), [Fl\\_Scroll](#), [Fl\\_Spinner](#), [Fl\\_Table](#), [Fl\\_Tabs](#), [Fl\\_Text\\_Display](#), [Fl\\_Tree](#), [Fl\\_Window](#), [Fl\\_Wizard](#), [Fl\\_Glut\\_Window](#), and [Fl\\_Terminal](#).

**33.57.3.14 draw\_child()**

```
void Fl_Group::draw_child (
 Fl_Widget & widget) const [protected]
```

Forces a child to redraw.

This draws a child widget, if it is not clipped. The damage bits are cleared after drawing.

**33.57.3.15 draw\_children()**

```
void Fl_Group::draw_children () [protected]
```

Draws all children of the group.

This is useful, if you derived a widget from [Fl\\_Group](#) and want to draw a special border or background. You can call [draw\\_children\(\)](#) from the derived [draw\(\)](#) method after drawing the box, border, or background.

**33.57.3.16 end()**

```
void Fl_Group::end ()
```

*Exactly the same as* [current\(this->parent\(\)\)](#).

Any new widgets added to the widget tree will be added to the parent of the group.

**33.57.3.17 find()**

```
int Fl_Group::find (
 const Fl_Widget * o) const
```

Searches the child array for the widget and returns the index.

Returns [children\(\)](#) if the widget is NULL or not found.

**33.57.3.18 focus()**

```
void Fl_Group::focus (
 Fl_Widget * W) [inline]
```

**Deprecated** This is for backwards compatibility only. You should use *W->take\_focus()* instead.

See also

[Fl\\_Widget::take\\_focus\(\)](#);

**33.57.3.19 handle()**

```
int Fl_Group::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Table](#), [Fl\\_Terminal](#), [Fl\\_Text\\_Display](#), [Fl\\_Text\\_Editor](#), [Fl\\_Tree](#), [Fl\\_Spinner](#), [Fl\\_Table\\_Row](#), [Fl\\_Tile](#), [Fl\\_Help\\_View](#), [Fl\\_Scroll](#), [Fl\\_Tabs](#), [Fl\\_Window](#), and [Fl\\_Glut\\_Window](#).

**33.57.3.20** `init_sizes()`

```
void Fl_Group::init_sizes ()
```

Resets the internal array of widget sizes and positions.

The [Fl\\_Group](#) widget keeps track of the original widget sizes and positions when resizing occurs so that if you resize a window back to its original size the widgets will be in the correct places. If you rearrange the widgets in your group, call this method to register the new arrangement with the [Fl\\_Group](#) that contains them.

If you add or remove widgets, this will be done automatically.

## Note

The internal array of widget sizes and positions will be allocated and filled when the next [resize\(\)](#) occurs. For more information on the contents and structure of the [bounds\(\)](#) array see [bounds\(\)](#).

## See also

[bounds\(\)](#)

[sizes\(\)](#) (deprecated)

**33.57.3.21** `insert()` [1/2]

```
void Fl_Group::insert (
 Fl_Widget & o,
 int index)
```

The widget is removed from its current group (if any) and then inserted into this group.

It is put at index *n* - or at the end, if *n* >= [children\(\)](#). This can also be used to rearrange the widgets inside a group.

**33.57.3.22** `insert()` [2/2]

```
void Fl_Group::insert (
 Fl_Widget & o,
 Fl_Widget * before) [inline]
```

This does `insert(w, find(before))`.

This will append the widget if `before` is not in the group.

**33.57.3.23** `on_insert()`

```
int Fl_Group::on_insert (
 Fl_Widget * candidate,
 int index) [protected], [virtual]
```

Allow derived groups to act when a widget is added as a child.

Widgets derived from [Fl\\_Group](#) may store additional data for their children. Overriding this method will allow derived classes to generate these data structures just before the child is added.

This method usually returns the same index that was given in the parameters. By setting a new index, the position of other widgets in the child pointer array can be preserved (e.g. [FI\\_Scroll](#) keeps its scroll bars as the last two children).

By returning -1, [FI\\_Group::insert](#) will not add the child to `array_`. This is not recommended, but [FI\\_Table](#) does something similar to forward children to a hidden group.

#### Parameters

<i>candidate</i>	the candidate will be added to the child <code>array_</code> after this method returns.
<i>index</i>	add the child at this position in the <code>array_</code>

#### Returns

- index to position the child as planned
- a new index to force the child to a different position
- 1 to keep the group from adding the candidate

Reimplemented in [FI\\_Scroll](#), [FI\\_Tabs](#), and [FI\\_Tile](#).

### 33.57.3.24 `on_move()`

```
int FI_Group::on_move (
 int oldIndex,
 int newIndex) [protected], [virtual]
```

Allow derived groups to act when a widget is moved within the group.

Widgets derived from [FI\\_Group](#) may store additional data for their children. Overriding this method will allow derived classes to move these data structures just before the child itself is moved.

This method usually returns the new index that was given in the parameters. By setting a different destination index, the position of other widgets in the child pointer array can be preserved.

By returning -1, [FI\\_Group::insert](#) will not move the child.

#### Parameters

<i>oldIndex</i>	the current index of the child that will be moved
<i>newIndex</i>	the new index of the child

#### Returns

- `newIndex` to position the child as planned
- a different index to force the child to a different position
- 1 to keep the group from moving the child

Reimplemented in [FI\\_Scroll](#), [FI\\_Tabs](#), and [FI\\_Tile](#).

### 33.57.3.25 `on_remove()`

```
void FI_Group::on_remove (
 int index) [protected], [virtual]
```

Allow derived groups to act when a child widget is removed from the group.

Widgets derived from [FI\\_Group](#) may store additional data for their children. Overriding this method will allow derived classes to remove these data structures just before the child is removed.

#### Parameters

<i>index</i>	remove the child at this position in the <code>array_</code>
--------------	--------------------------------------------------------------

Reimplemented in [Fl\\_Flex](#), [Fl\\_Grid](#), [Fl\\_Tabs](#), and [Fl\\_Tile](#).

### 33.57.3.26 remove() [1/3]

```
void Fl_Group::remove (
 Fl_Widget & o)
```

Removes a widget from the group but does not delete it.

This method does nothing if the widget is not a child of the group.

This method differs from the [clear\(\)](#) method in that it only affects a single widget and does not delete it from memory.

#### Note

If you have the child's index anyway, use [remove\(int index\)](#) instead, because this doesn't need a child lookup in the group's table of children. This can be much faster, if there are lots of children.

### 33.57.3.27 remove() [2/3]

```
void Fl_Group::remove (
 Fl_Widget * o) [inline]
```

Removes the widget `o` from the group.

#### See also

void [remove\(Fl\\_Widget&\)](#)

### 33.57.3.28 remove() [3/3]

```
void Fl_Group::remove (
 int index)
```

Removes the widget at `index` from the group but does not delete it.

This method does nothing if `index` is out of bounds.

This method differs from the [clear\(\)](#) method in that it only affects a single widget and does not delete it from memory.

#### Since

FLTK 1.3.0

### 33.57.3.29 resizable() [1/3]

```
Fl_Widget * Fl_Group::resizable () const [inline]
```

Returns the group's resizable widget.

See void [Fl\\_Group::resizable\(Fl\\_Widget \\*o\)](#)

### 33.57.3.30 resizable() [2/3]

```
void Fl_Group::resizable (
 Fl_Widget & o) [inline]
```

Sets the group's resizable widget.

See void [Fl\\_Group::resizable\(Fl\\_Widget \\*o\)](#)

### 33.57.3.31 resizable() [3/3]

```
void Fl_Group::resizable (
 Fl_Widget * o) [inline]
```

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

If the `resizable` is `NULL` the group's size is fixed and all of the widgets in the group remain a fixed size and distance from the top-left corner. This is the default for groups derived from `Fl_Window` and `Fl_Pack`.

The `resizable` may be set to the group itself, in which case all of the widgets that are its direct children are resized proportionally. This is the default value for `Fl_Group`.

The `resizable` widget defines the resizing box for the group, which could be the group itself or one of the group's direct children. When the group is resized it calculates a new size and position for all of its children. Widgets that are horizontally or vertically inside the dimensions of the box are scaled to the new size. Widgets outside the box are moved.

#### Note

The `resizable` of a group **must** be one of

- `NULL`
- the group itself
- a direct child of the group.

If you set any other widget that is not a direct child of the group as its `resizable` then the behavior is undefined. This is **not** checked by `Fl_Group` for historical reasons.

In these examples the gray area is the `resizable`:

Figure 33.21 before resize

Figure 33.22 after resize

It is possible to achieve any type of resize behavior by using an invisible `Fl_Box` as the `resizable` and/or by using a hierarchy of `Fl_Group` widgets, each with their own resizing strategies.

See the [How Does Resizing Work?](#) chapter for more examples and detailed explanation.

**Note**

The [resizable\(\)](#) widget of a window can also affect the window's resizing behavior if [FI\\_Window::size\\_range\(\)](#) is not called. Please see [FI\\_Window::default\\_size\\_range\(\)](#) for more information on how the default size range is calculated.

**See also**

[FI\\_Window::size\\_range\(\)](#)

[FI\\_Window::default\\_size\\_range\(\)](#)

**33.57.3.32 resize()**

```
void Fl_Group::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Resizes the [FI\\_Group](#) widget and all of its children.

The [FI\\_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [FI\\_Group::resizable\(FI\\_Widget\\*\)](#)

**See also**

[FI\\_Group::resizable\(FI\\_Widget\\*\)](#)

[FI\\_Group::resizable\(\)](#)

[FI\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [FI\\_Widget](#).

Reimplemented in [FI\\_Input\\_Choice](#), [FI\\_Pack](#), [FI\\_Scroll](#), [FI\\_Spinner](#), [FI\\_Table](#), [FI\\_Terminal](#), [FI\\_Text\\_Display](#), [FI\\_Tile](#), [FI\\_Window](#), [FI\\_Help\\_View](#), [FI\\_Overlay\\_Window](#), [FI\\_Tabs](#), and [FI\\_Tree](#).

**33.57.3.33 sizes()**

```
int * Fl_Group::sizes () [protected]
```

Returns the internal array of widget sizes and positions.

For backward compatibility with FLTK versions before 1.4.

The [sizes\(\)](#) array stores the initial positions of widgets as (left, right, top, bottom) quads. The first quad is the group, the second is the resizable (clipped to the group), and the rest are the children. If the group and/or the [resizable\(\)](#) is a [FI\\_Window](#), then the first (left) and third (top) entries of their respective quads (x,y) are zero.

**Deprecated** Deprecated since 1.4.0. Please use [bounds\(\)](#) instead.

**Note**

This method will be removed in a future FLTK version (1.5.0 or higher).

**Returns**

Array of int's with widget positions and sizes. The returned array is only valid until [init\\_sizes\(\)](#) is called or widgets are added to or removed from the group.

**Note**

Since FLTK 1.4.0 the returned array is a **read-only** and re-ordered copy of the internal [bounds\(\)](#) array. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call [init\\_sizes\(\)](#).

**See also**

[bounds\(\)](#)

### 33.57.3.34 update\_child()

```
void Fl_Group::update_child (
 Fl_Widget & widget) const [protected]
```

Draws a child only if it needs it.

This draws a child widget, if it is not clipped *and* if any [damage\(\)](#) bits are set. The damage bits are cleared after drawing.

*Returns the position and size of the help dialog.*
- **~FI\_Help\_Dialog** ()
 

*The destructor destroys the widget and frees all memory that has been allocated for the current file.*

### 33.59.1 Detailed Description

The [FI\\_Help\\_Dialog](#) widget displays a standard help dialog window using the [FI\\_Help\\_View](#) widget.

The [FI\\_Help\\_Dialog](#) class is not part of the FLTK core library, but instead of *fltk\_images*. Use `--use-images` when compiling with `fltk-config`.

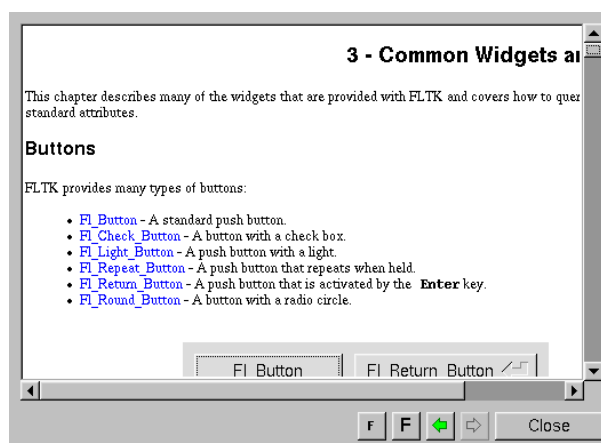

Figure 33.23 [FI\\_Help\\_Dialog](#)

### 33.59.2 Member Function Documentation

### 33.59.2.1 load()

```
int Fl_Help_Dialog::load (
 const char * f)
```

Loads the specified HTML file into the [Fl\\_Help\\_View](#) widget.

The filename can also contain a target name ("filename.html#target"). Always use forward slashes as path delimiters, MSWindows-style backslashes are not supported here

#### Parameters

in	f	the name and path of an HTML file
----	---	-----------------------------------

#### Returns

0 on success, -1 on error

#### See also

[Fl\\_Help\\_View::load\(\)](#), [fl\\_load\\_uri\(\)](#)

### 33.59.2.2 show()

```
void Fl_Help_Dialog::show ()
```

Shows the [Fl\\_Help\\_Dialog](#) window.

Shows the main Help Dialog Window Delegates call to encapsulated window\_ void [Fl\\_Window::show\(\)](#) method.

### 33.59.2.3 textsize()

```
void Fl_Help_Dialog::textsize (
 Fl_Fontsize s)
```

Sets or gets the default text size for the help view.

Sets the internal [Fl\\_Help\\_View](#) instance text size.

Delegates call to encapsulated view\_ void [Fl\\_Help\\_View::textsize\(Fl\\_Fontsize s\)](#) instance method

### 33.59.2.4 value() [1/2]

```
const char * Fl_Help_Dialog::value () const
```

The first form sets the current buffer to the string provided and reformats the text.

It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

### 33.59.2.5 value() [2/2]

```
void Fl_Help_Dialog::value (
 const char * v)
```

The first form sets the current buffer to the string provided and reformats the text.

It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

The documentation for this class was generated from the following files:

- [Fl\\_Help\\_Dialog.H](#)
- [Fl\\_Help\\_Dialog.cxx](#)
- [Fl\\_Help\\_Dialog\\_Dox.cxx](#)

*Scrolls the text to the indicated position, given a pixel column.*
- void **link** (FI\_Help\_Func \*fn)  
*This method assigns a callback function to use when a link is followed or a file is loaded (via FI\_Help\_View::load()) that requires a different file or path.*
- int **load** (const char \*f)  
*Loads the specified file.*
- void **resize** (int, int, int, int) **FL\_OVERRIDE**  
*Resizes the help widget.*
- int **scrollbar\_size** () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
- void **scrollbar\_size** (int newSize)  
*Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
- void **select\_all** ()  
*Selects all the text in the view.*
- int **size** () const  
*Gets the size of the help view.*
- void **size** (int W, int H)
- int **text\_selected** ()  
*Check if the user selected text in this view.*
- **FI\_Color textcolor** () const  
*Returns the current default text color.*
- void **textcolor** (FI\_Color c)  
*Sets the default text color.*
- **FI\_Font textfont** () const  
*Returns the current default text font.*
- void **textfont** (FI\_Font f)  
*Sets the default text font.*
- **FI\_Fontsize textsize** () const  
*Gets the default text size.*
- void **textsize** (FI\_Fontsize s)  
*Sets the default text size.*
- const char \* **title** ()

- Returns the current document title, or NULL if there is no title.*

    - int **topline** () const

*Returns the current top line in pixels.*

  - void **topline** (const char \*n)
- Scrolls the text to the indicated position, given a named destination.*
- void **topline** (int)
- Scrolls the text to the indicated position, given a pixel line.*
- const char \* **value** () const
- Returns the current buffer contents.*
- void **value** (const char \*val)
- Sets the current help text buffer to the string provided and reformats the text.*
- **~FI\_Help\_View** ()
- Destroys the [FI\\_Help\\_View](#) widget.*

### Additional Inherited Members

#### 33.64.1 Detailed Description

The [FI\\_Help\\_View](#) widget displays HTML text.

Most HTML 2.0 elements are supported, as well as a primitive implementation of tables. GIF, JPEG, and PNG images are displayed inline.

Supported HTML tags:

- A: HREF/NAME
- B
- BODY: BGCOLOR/TEXT/LINK
- BR
- CENTER
- CODE
- DD
- DL
- DT
- EM
- FONT: COLOR/SIZE/FACE=(helvetica/arial/sans/times/serif/symbol/courier)
- H1/H2/H3/H4/H5/H6
- HEAD
- HR
- I

- IMG: SRC/WIDTH/HEIGHT/ALT
- KBD
- LI
- OL
- P
- PRE
- STRONG
- TABLE: TH/TD/TR/BORDER/BGCOLOR/COLSPAN/ALIGN=CENTER|RIGHT|LEFT
- TITLE
- TT
- U
- UL
- VAR

Supported color names:

- black,red,green,yellow,blue,magenta,fuchsia,cyan,aqua,white,gray,grey,lime,maroon,navy,olive,purple,silver,teal.

Supported urls:

- Internal: file:
- External: http: ftp: https: ipp: mailto: news:

Quoted char names:

- Aacute aacute Acirc acirc acute AElig aelig Agrave agrave amp Aring aring Atilde atilde Auml auml

- Uacute uacute Ucirc ucirc Ugrave ugrave uml Uuml uuml
- Yacute yacute
- yen Yuml yuml

#### Note

You can't effectively set the `box()` to `FL_NO_BOX`, this would result in `FL_DOWN_BOX` being used as the `boxtype` of the widget. This is unexpected but can't be changed for backwards compatibility. If you don't want a frame around the widget you can use `FL_FLAT_BOX` instead.

## 33.64.2 Constructor & Destructor Documentation

### 33.64.2.1 `~Fl_Help_View()`

```
Fl_Help_View::~Fl_Help_View ()
```

Destroys the `Fl_Help_View` widget.

The destructor destroys the widget and frees all memory that has been allocated for the current document.

## 33.64.3 Member Function Documentation

### 33.64.3.1 `copy()`

```
int Fl_Help_View::copy (
 int clipboard = 1)
```

If text is selected in this view, copy it to a clipboard.

#### Parameters

in	<i>clipboard</i>	for x11 only, 0=selection buffer, 1=clipboard, 2=both
----	------------------	-------------------------------------------------------

#### Returns

1 if text is selected, 0 if no text is selected

### 33.64.3.2 `draw()`

```
void Fl_Help_View::draw (
 void) [protected], [virtual]
```

Draws the `Fl_Help_View` widget.

Reimplemented from `Fl_Group`.

### 33.64.3.3 `find()`

```
int Fl_Help_View::find (
 const char * s,
 int p = 0)
```

Finds the specified string `s` at starting position `p`.

The argument `p` and the return value are offsets in `Fl_Help_View::value()`, counting from 0. If `p` is out of range, 0 is used.

The string comparison is simple but honors some special cases:

- the specified string `s` must be in UTF-8 encoding

- HTML tags in `value()` are filtered (not compared as such, they never match)
- HTML entities like '&lt;' or '&#20ac;' are converted to Unicode (UTF-8)
- ASCII characters (7-bit, < 0x80) are compared case insensitive
- every newline (LF, '\n') in `value()` is treated like a single space
- all other strings are compared as-is (byte by byte)

**Todo** complex HTML entities for Unicode code points > 0x80 are currently treated like one byte (not character!) and do not (yet) match correctly ("`<`" matches "`<`" but "`€`" doesn't match "`€`", and "`ü`" doesn't match "`ü`")

#### Parameters

in	<i>s</i>	search string in UTF-8 encoding
in	<i>p</i>	starting position for search (0,...), Default = 0

#### Returns

the matching position or -1 if not found

#### 33.64.3.4 handle()

```
int Fl_Help_View::handle (
 int event) [virtual]
```

Handles events in the widget.

Reimplemented from [Fl\\_Group](#).

#### 33.64.3.5 leftline()

```
void Fl_Help_View::leftline (
 int left)
```

Scrolls the text to the indicated position, given a pixel column.

If the given pixel value `left` is out of range, then the text is scrolled to the left or right side of the document, resp.

#### Parameters

in	<i>left</i>	left column number in pixels (0 = left side)
----	-------------	----------------------------------------------

#### 33.64.3.6 link()

```
void Fl_Help_View::link (
 Fl_Help_Func * fn) [inline]
```

This method assigns a callback function to use when a link is followed or a file is loaded (via [Fl\\_Help\\_View::load\(\)](#)) that requires a different file or path.

The callback function receives a pointer to the [Fl\\_Help\\_View](#) widget and the URI or full pathname for the file in question. It must return a pathname that can be opened as a local file or NULL:

```
const char *fn(Fl_Widget *w, const char *uri);
```

The link function can be used to retrieve remote or virtual documents, returning a temporary file that contains the actual data. If the link function returns NULL, the value of the [Fl\\_Help\\_View](#) widget will remain unchanged.

If the link callback cannot handle the URI scheme, it should return the uri value unchanged or set the `value()` of the widget before returning NULL.

### 33.64.3.7 load()

```
int Fl_Help_View::load (
 const char * f)
```

Loads the specified file.

This method loads the specified file or URL. The filename may end in a `#name` style target.

If the URL starts with *ftp*, *http*, *https*, *ipp*, *mailto*, or *news*, followed by a colon, FLTK will use [fl\\_open\\_uri\(\)](#) to show the requested page in an external browser.

In all other cases, the URL is interpreted as a filename. The file is read and displayed in this browser. Note that MSWindows style backslashes are not supported in the file name.

#### Parameters

in	f	filename or URL
----	---	-----------------

#### Returns

0 on success, -1 on error

#### See also

[fl\\_open\\_uri\(\)](#)

### 33.64.3.8 resize()

```
void Fl_Help_View::resize (
 int xx,
 int yy,
 int ww,
 int hh) [virtual]
```

Resizes the help widget.

Reimplemented from [Fl\\_Group](#).

### 33.64.3.9 scrollbar\_size() [1/2]

```
int Fl_Help_View::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

#### Returns

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

#### See also

[Fl::scrollbar\\_size\(int\)](#)

### 33.64.3.10 scrollbar\_size() [2/2]

```
void Fl_Help_View::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

## Parameters

in	<i>newSize</i>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
----	----------------	-----------------------------------------------------------------------------------------------------------------------------

## See also

[Fl::scrollbar\\_size\(\)](#)

**33.64.3.11 text\_selected()**

```
int Fl_Help_View::text_selected ()
```

Check if the user selected text in this view.

## Returns

1 if text is selected, 0 if no text is selected

**33.64.3.12 topline() [1/2]**

```
void Fl_Help_View::topline (
 const char * n)
```

Scrolls the text to the indicated position, given a named destination.

## Parameters

in	<i>n</i>	target name
----	----------	-------------

**33.64.3.13 topline() [2/2]**

```
void Fl_Help_View::topline (
 int top)
```

Scrolls the text to the indicated position, given a pixel line.

If the given pixel value `top` is out of range, then the text is scrolled to the top or bottom of the document, resp.

## Parameters

in	<i>top</i>	top line number in pixels (0 = start of document)
----	------------	---------------------------------------------------

**33.64.3.14 value()**

```
void Fl_Help_View::value (
 const char * val)
```

Sets the current help text buffer to the string provided and reformats the text.

The provided character string `val` is copied internally and will be freed when [value\(\)](#) is called again, or when the widget is destroyed.

If `val` is NULL, then the widget is cleared.

The documentation for this class was generated from the following files:

- Fl\_Help\_View.H
- Fl\_Help\_View.cxx

## 33.65 FI\_Hold\_Browser Class Reference

The [FI\\_Hold\\_Browser](#) is a subclass of [FI\\_Browser](#) which lets the user select a single item, or no items by clicking on the empty space.

```
#include <Fl_Hold_Browser.H>
```

Inheritance diagram for [FI\\_Hold\\_Browser](#):

### Public Member Functions

- [FI\\_Hold\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)  
Creates a new [FI\\_Hold\\_Browser](#) widget using the given position, size, and label string.

### Additional Inherited Members

#### 33.65.1 Detailed Description

The [FI\\_Hold\\_Browser](#) is a subclass of [FI\\_Browser](#) which lets the user select a single item, or no items by clicking on the empty space.

Figure 33.24 [FI\\_Hold\\_Browser](#)

As long as the mouse button is held down the item pointed to by it is highlighted, and this highlighting remains on when the mouse button is released. Normally the callback is done when the user releases the mouse, but you can change this with [when\(\)](#).

See [FI\\_Browser](#) for methods to add and remove lines from the browser.

#### 33.65.2 Constructor & Destructor Documentation

##### 33.65.2.1 FI\_Hold\_Browser()

```
Fl_Hold_Browser::Fl_Hold_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [FI\\_Hold\\_Browser](#) widget using the given position, size, and label string.

The default boxtype is `FL_DOWN_BOX`. The constructor specializes [FI\\_Browser\(\)](#) by setting the type to `FL_HOLD_BROWSER`. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- Fl\_Hold\_Browser.H
- Fl\_Browser.cxx

## 33.70 FI\_ICO\_Image Class Reference

The `FI_ICO_Image` class supports loading, caching, and drawing of Windows icon (.ico) files.

```
#include <FI_ICO_Image.H>
```

Inheritance diagram for FI\_ICO\_Image:

### Classes

- struct `IconDirEntry`  
*Windows ICONDIRENTRY structure*

### Public Member Functions

- `FI_ICO_Image` (const char \*filename, int id=-1, const unsigned char \*data=NULL, const size\_t datasize=0)  
*Loads the named icon image from the given .ico filename or from memory.*
- const `IconDirEntry` \* `icondirentry` () const  
*Returns the array of `idcount()` loaded `IconDirEntry` structures.*
- int `idcount` () const  
*Returns the number of icons of various resolutions present in the ICO object.*

- `~Fl_ICO_Image()`

*Destructor.*

## Additional Inherited Members

### 33.70.1 Detailed Description

The `Fl_ICO_Image` class supports loading, caching, and drawing of Windows icon (.ico) files.

### 33.70.2 Constructor & Destructor Documentation

#### 33.70.2.1 Fl\_ICO\_Image()

```
Fl_ICO_Image::Fl_ICO_Image (
 const char * filename,
 int id = -1,
 const unsigned char * data = NULL,
 const size_t datasize = 0)
```

Loads the named icon image from the given .ico filename or from memory.

#### Parameters

<i>filename</i>	Name of a .ico file, or of the in-memory image
<i>id</i>	When id is -1 (default), the highest-resolution icon is loaded; when id 0, load the icon with this ID; when id = -2, load all <code>IconDirEntry</code> structures but no image.
<i>data</i>	NULL, or in-memory icon data
<i>datasize</i>	Size in bytes of the <code>data</code> byte array (used when <code>data</code> is not NULL)

The documentation for this class was generated from the following files:

- `Fl_ICO_Image.H`
- `Fl_ICO_Image.cxx`

## 33.71 Fl\_Image Class Reference

Base class for image caching, scaling and drawing.

```
#include <Fl_Image.H>
```

Inheritance diagram for `Fl_Image`:

## Public Member Functions

- virtual class `Fl_Shared_Image * as_shared_image ()`  
*Returns whether an image is an `Fl_Shared_Image` or not.*
- virtual void `color_average (Fl_Color c, float i)`  
*The `color_average()` method averages the colors in the image with the provided FLTK color value.*
- `Fl_Image * copy () const`  
*Creates a copy of the image in the same size.*
- virtual `Fl_Image * copy (int W, int H) const`  
*Creates a resized copy of the image.*
- int `count () const`  
*Returns the number of data values associated with the image.*
- int `d () const`  
*Returns the image depth.*
- const char \*const \* `data () const`  
*Returns a pointer to the current image data array.*
- int `data_h () const`  
*Returns the height of the image data.*
- int `data_w () const`  
*Returns the width of the image data.*
- virtual void `desaturate ()`  
*The `desaturate()` method converts an image to grayscale.*
- void `draw (int X, int Y)`  
*Draws the image to the current drawing surface.*

- static void **measure** (const [FI\\_Label](#) \*lo, int &lw, int &lh)

## Friends

- class [FI\\_Graphics\\_Driver](#)

### 33.71.1 Detailed Description

Base class for image caching, scaling and drawing.

[FI\\_Image](#) is the base class used for caching, scaling and drawing all kinds of images in FLTK. This class keeps track of common image data such as the pixels, colormap, width, height, and depth. Virtual methods are used to provide type-specific image handling.

Each image possesses two (width, height) pairs:

1. The width and height of the raw image data are returned by [data\\_w\(\)](#) and [data\\_h\(\)](#). These values are set when the image is created and remain unchanged.
2. The width and height of the area filled by the image when it gets drawn are returned by [w\(\)](#) and [h\(\)](#). These values are equal to [data\\_w\(\)](#) and [data\\_h\(\)](#) when the image is created and can be changed by the [scale\(\)](#) member function.

Since the [FI\\_Image](#) class does not support image drawing by itself, calling the [FI\\_Image::draw\(\)](#) method results in a box with an X in it being drawn instead.

## 33.71.2 Constructor & Destructor Documentation

### 33.71.2.1 FI\_Image()

```
FI_Image::FI_Image (
 int W,
 int H,
 int D)
```

The constructor creates an empty image with the specified width, height, and depth.

The width and height are in pixels. The depth is 0 for bitmaps, 1 for pixmap (colormap) images, and 1 to 4 for color images.

## 33.71.3 Member Function Documentation

### 33.71.3.1 as\_shared\_image()

```
virtual class FI_Shared_Image * FI_Image::as_shared_image () [inline], [virtual]
```

Returns whether an image is an [FI\\_Shared\\_Image](#) or not.

This virtual method returns a pointer to an [FI\\_Shared\\_Image](#) if this object is an instance of [FI\\_Shared\\_Image](#) or NULL if not. This can be used to detect if a given [FI\\_Image](#) object is a shared image, i.e. derived from [FI\\_Shared\\_Image](#).

Since

1.4.0

Reimplemented in [FI\\_Shared\\_Image](#).

### 33.71.3.2 color\_average()

```
void FI_Image::color_average (
 FI_Color c,
 float i) [virtual]
```

The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented in [FI\\_Anim\\_GIF\\_Image](#), [FI\\_RGB\\_Image](#), [FI\\_Pixmap](#), [FI\\_Shared\\_Image](#), [FI\\_SVG\\_Image](#), and [FI\\_Tiled\\_Image](#).

### 33.71.3.3 `copy()` [1/2]

```
Fl_Image * Fl_Image::copy () const [inline]
```

Creates a copy of the image in the same size.

The new image should be released when you are done with it.

This does exactly the same as '[Fl\\_Image::copy\(int W, int H\) const](#)' where *W* and *H* are the width and height of the source image, respectively. This applies also to all subclasses of [Fl\\_Image](#) in the FLTK library.

The following two `copy()` calls are equivalent:

```
Fl_Image *img1 = new Fl_Image(...);
// ...
Fl_Image *img2 = img1->copy();
Fl_Image *img3 = img1->copy(img1->w(), img1->h());
```

For details see '[Fl\\_Image::copy\(int w, int h\) const](#)'.

See also

[Fl\\_Image::release\(\)](#)

Note

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

### 33.71.3.4 `copy()` [2/2]

```
Fl_Image * Fl_Image::copy (
 int W,
 int H) const [virtual]
```

Creates a resized copy of the image.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator `delete` for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented in [Fl\\_Anim\\_GIF\\_Image](#), [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Shared\\_Image](#), [Fl\\_SVG\\_Image](#), and [Fl\\_Tiled\\_Image](#).

### 33.71.3.5 count()

```
int Fl_Image::count () const [inline]
```

Returns the number of data values associated with the image.

The value will be 0 for images with no associated data, 1 for bitmap and color images, and greater than 2 for pixmap images.

See also

[data\(\)](#)

### 33.71.3.6 d()

```
int Fl_Image::d () const [inline]
```

Returns the image depth.

The return value will be 0 for bitmaps, 1 for pixmaps, and 1 to 4 for color images.

### 33.71.3.7 data() [1/2]

```
const char *const * Fl_Image::data () const [inline]
```

Returns a pointer to the current image data array.

There can be 0, 1, or more pointers to actual image data in an image.

Use the [count\(\)](#) method to find the size of the data array. You must not dereference the [data\(\)](#) pointer if [count\(\)](#) equals zero.

Note

[data\(\)](#) may return NULL.

Example:

[Fl\\_RGB\\_Image](#) has exactly one pointer which points at the R, G, B [, A] data array of the image. The total size of this array depends on several attributes like [data\\_w\(\)](#), [data\\_h\(\)](#), [d\(\)](#) and [ld\(\)](#) and is basically [data\\_w\(\)](#) \* [data\\_h\(\)](#) \* [d\(\)](#) but there are exceptions if [ld\(\)](#) is non-zero: see description of [ld\(\)](#). Since FLTK 1.4.0 [w\(\)](#) and [h\(\)](#) are no longer significant for the image data size if [scale\(\)](#) has been called on the image to set a different display size.

Other image types have different numbers and types of data pointers which are implementation details and not documented here.

See also

[count\(\)](#), [w\(\)](#), [h\(\)](#), [data\\_w\(\)](#), [data\\_h\(\)](#), [d\(\)](#), [ld\(\)](#)

### 33.71.3.8 data() [2/2]

```
void Fl_Image::data (
 const char *const * p,
 int c) [inline], [protected]
```

Sets the current data pointer and count of pointers in the array.

There can be 0, 1, or more pointers to actual image data in an image.

See also

[const char\\* const\\* data\(\)](#), [count\(\)](#), [w\(\)](#), [h\(\)](#), [data\\_w\(\)](#), [data\\_h\(\)](#), [d\(\)](#), [ld\(\)](#)

### 33.71.3.9 desaturate()

```
void Fl_Image::desaturate () [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented in [Fl\\_Anim\\_GIF\\_Image](#), [Fl\\_RGB\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Shared\\_Image](#), [Fl\\_SVG\\_Image](#), and [Fl\\_Tiled\\_Image](#).

### 33.71.3.10 draw() [1/2]

```
void Fl_Image::draw (
 int X,
 int Y) [inline]
```

Draws the image to the current drawing surface.

#### Parameters

<i>X, Y</i>	specify the upper-lefthand corner of the image.
-------------	-------------------------------------------------

### 33.71.3.11 draw() [2/2]

```
void Fl_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments *X*, *Y*, *W*, *H* specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the *cx* and *cy* arguments.

In other words: `fl_push_clip(X, Y, W, H)` is applied, the image is drawn with its upper-left corner at  $X-cx$ ,  $Y-cy$  and its own width and height, `fl_pop_clip()` is applied.

Reimplemented in [Fl\\_Anim\\_GIF\\_Image](#), [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Shared\\_Image](#), [Fl\\_SVG\\_Image](#), and [Fl\\_Tiled\\_Image](#).

### 33.71.3.12 draw\_empty()

```
void Fl_Image::draw_empty (
 int X,
 int Y) [protected]
```

The protected method `draw_empty()` draws a box with an X in it.

It can be used to draw any image that lacks image data.

### 33.71.3.13 draw\_scaled()

```
int Fl_Image::draw_scaled (
 int X,
 int Y,
 int W,
 int H) [protected]
```

Draw the image to the current drawing surface rescaled to a given width and height.

Intended for internal use by the FLTK library.

#### Parameters

<i>X, Y</i>	position of the image's top-left
<i>W, H</i>	width and height for the drawn image

**Returns**

1

**Deprecated** Only for API compatibility with FLTK 1.3.4.**33.71.3.14 fail()**

```
int Fl_Image::fail () const
```

Returns a value that is not 0 if there is currently no image available.

Example use:

```
// [...]
Fl_Box box(X, Y, W, H);
Fl_JPEG_Image jpg("/tmp/foo.jpg");
switch (jpg.fail()) {
case Fl_Image::ERR_NO_IMAGE:
case Fl_Image::ERR_FILE_ACCESS:
 fl_alert("/tmp/foo.jpg: %s", strerror(errno)); // shows actual os error to user
 exit(1);
case Fl_Image::ERR_FORMAT:
 fl_alert("/tmp/foo.jpg: couldn't decode image");
 exit(1);
}
box.image(jpg);
```

**Returns**

Image load failure if non-zero

**Return values**

0	the image was loaded successfully
<i>ERR_NO_IMAGE</i>	no image was found
<i>ERR_FILE_ACCESS</i>	there was a file access related error (errno should be set)
<i>ERR_FORMAT</i>	image decoding failed
<i>ERR_MEMORY_ACCESS</i>	image decoder tried to access memory outside of given memory block

**33.71.3.15 h() [1/2]**

```
int Fl_Image::h () const [inline]
```

Returns the current image drawing height in FLTK units.

The values of `h()` and `data_h()` are identical unless `scale()` has been called after which they may differ.**33.71.3.16 h() [2/2]**

```
void Fl_Image::h (
 int H) [inline], [protected]
```

Sets the height of the image data.

This protected function sets both image heights: the height of the image data returned by `data_h()` and the image drawing height in FLTK units returned by `h()`.**33.71.3.17 inactive()**

```
void Fl_Image::inactive () [inline]
```

The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.

An internal copy is made of the original image before changes are applied, to avoid modifying the original image.

## Note

The RGB color of [FL\\_BACKGROUND\\_COLOR](#) may change when the connection to the display is made. See [fl\\_open\\_display\(\)](#).

**33.71.3.18 label()** [1/2]

```
void Fl_Image::label (
 Fl_Menu_Item * m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use [Fl\\_Menu\\_Item::image\(\)](#) instead.

Reimplemented in [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), and [Fl\\_Pixmap](#).

**33.71.3.19 label()** [2/2]

```
void Fl_Image::label (
 Fl_Widget * widget) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use [Fl\\_Widget::image\(\)](#) or [Fl\\_Widget::deimage\(\)](#) instead.

Reimplemented in [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), and [Fl\\_Pixmap](#).

**33.71.3.20 ld()** [1/2]

```
int Fl_Image::ld () const [inline]
```

Returns the current line data size in bytes.

See also

[ld\(int\)](#)

**33.71.3.21 ld()** [2/2]

```
void Fl_Image::ld (
 int LD) [inline], [protected]
```

Sets the current line data size in bytes.

Color images may contain extra data (padding) that is included after every line of color image data and is normally not present.

If `LD` is zero, then line data size is assumed to be `data_w() * d()` bytes.

If `LD` is non-zero, then it must be positive and larger than `data_w() * d()` to account for the extra data per line.

**33.71.3.22 release()**

```
virtual void Fl_Image::release () [inline], [virtual]
```

Releases an [Fl\\_Image](#) - the same as 'delete this'.

This virtual method is for almost all image classes the same as calling `delete image;`

where `image` is an [Fl\\_Image \\* pointer](#).

However, for subclass [Fl\\_Shared\\_Image](#) and its subclasses this virtual method is reimplemented and maintains shared images.

This virtual method makes it possible to destroy all image types in the same way by calling `image->release();`

Reasoning: If you have an '[Fl\\_Image \\*](#)' base class pointer and don't know if the object is one of the class [Fl\\_Shared\\_Image](#) or any other subclass of [Fl\\_Image](#) (for instance [Fl\\_RGB\\_Image](#)) then you can't just use operator delete since this is not appropriate for [Fl\\_Shared\\_Image](#) objects.

The virtual method [release\(\)](#) handles this properly.

Since

1.4.0 in the base class [Fl\\_Image](#) and virtual in [Fl\\_Shared\\_Image](#)

Reimplemented in [Fl\\_Shared\\_Image](#).

### 33.71.3.23 RGB\_scaling()

```
void Fl_Image::RGB_scaling (
 Fl_RGB_Scaling method) [static]
```

Sets the RGB image scaling method used for copy(int, int).

Applies to all RGB images, defaults to FL\_RGB\_SCALING\_NEAREST.

### 33.71.3.24 scale()

```
void Fl_Image::scale (
 int width,
 int height,
 int proportional = 1,
 int can_expand = 0) [virtual]
```

Sets the drawing size of the image.

This function controls the values returned by member functions [w\(\)](#) and [h\(\)](#) which in turn control how the image is drawn: the full image data (whose size is given by [data\\_w\(\)](#) and [data\\_h\(\)](#)) are drawn scaled to an area of the drawing surface sized at [w\(\)](#) x [h\(\)](#) FLTK units. This can make a difference if the drawing surface has more than 1 pixel per FLTK unit because the image can be drawn at the full resolution of the drawing surface. Examples of such drawing surfaces: HiDPI displays, laser printers, PostScript files, PDF printers.

#### Parameters

<i>width,height</i>	maximum values, in FLTK units, that <a href="#">w()</a> and <a href="#">h()</a> should return
<i>proportional</i>	if not null, keep the values returned by <a href="#">w()</a> and <a href="#">h()</a> proportional to <a href="#">data_w()</a> and <a href="#">data_h()</a>
<i>can_expand</i>	if null, the values returned by <a href="#">w()</a> and <a href="#">h()</a> will not be larger than <a href="#">data_w()</a> and <a href="#">data_h()</a> , respectively

#### Note

This function generally changes the values returned by the [w\(\)](#) and [h\(\)](#) member functions. In contrast, the values returned by [data\\_w\(\)](#) and [data\\_h\(\)](#) remain unchanged.

#### Version

1.4 (1.3.4 and FL\_ABI\_VERSION for [Fl\\_Shared\\_Image](#) only)

Example code: scale an image to fit in a box

```
Fl_Box *b = ... // a box
Fl_Image *img = new Fl_PNG_Image("/path/to/picture.png"); // read a picture file
// set the drawing size of the image to the size of the box keeping its aspect ratio
img->scale(b->w(), b->h());
b->image(img); // use the image as the box image
```

### 33.71.3.25 scaling\_algorithm()

```
static void Fl_Image::scaling_algorithm (
 Fl_RGB_Scaling algorithm) [inline], [static]
```

Sets what algorithm is used when resizing a source image to draw it.

The default algorithm is FL\_RGB\_SCALING\_BILINEAR. Drawing an [Fl\\_Image](#) is sometimes performed by first resizing the source image and then drawing the resized copy. This occurs, e.g., when drawing to screen under X11 without Xrender support after having called [scale\(\)](#). This function controls what method is used when the image to be resized is an [Fl\\_RGB\\_Image](#).

## Version

1.4

**33.71.3.26 uncache()**

```
void Fl_Image::uncache () [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented in [Fl\\_Anim\\_GIF\\_Image](#), [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), [Fl\\_Pixmap](#), and [Fl\\_Shared\\_Image](#).

**33.71.3.27 w() [1/2]**

```
int Fl_Image::w () const [inline]
```

Returns the current image drawing width in FLTK units.

The values of [w\(\)](#) and [data\\_w\(\)](#) are identical unless [scale\(\)](#) has been called after which they may differ.

**33.71.3.28 w() [2/2]**

```
void Fl_Image::w (
 int W) [inline], [protected]
```

Sets the width of the image data.

This protected function sets both image widths: the width of the image data returned by [data\\_w\(\)](#) and the image drawing width in FLTK units returned by [w\(\)](#).

The documentation for this class was generated from the following files:

- [Fl\\_Image.H](#)
- [Fl\\_Image.cxx](#)

## Additional Inherited Members

### 33.73.1 Detailed Description

Directs all graphics requests to an [Fl\\_Image](#).

After creation of an [Fl\\_Image\\_Surface](#) object, make it the current drawing surface calling [Fl\\_Surface\\_Device::push\\_current\(\)](#), and all subsequent graphics requests will be recorded in the image. It's possible to draw widgets (using [Fl\\_Image\\_Surface::draw\(\)](#)) or to use any of the [Drawing functions](#) or the [Color & Font functions](#). Finally, call [image\(\)](#) on the object to obtain a newly allocated [Fl\\_RGB\\_Image](#) object. [Fl\\_Gl\\_Window](#) objects can be drawn in the image as well.

Usage example:

```
// this is the widget that you want to draw into an image
Fl_Widget *g = ...;
// create an Fl_Image_Surface object
Fl_Image_Surface *image_surface = new Fl_Image_Surface(g->w(), g->h());
// direct all further graphics requests to the image
Fl_Surface_Device::push_current(image_surface);
// draw a white background
fl_color(FL_WHITE);
fl_rectf(0, 0, g->w(), g->h());
// draw the g widget in the image
image_surface->draw(g);
// get the resulting image
Fl_RGB_Image* image = image_surface->image();
// direct graphics requests back to their previous destination
Fl_Surface_Device::pop_current();
// delete the image_surface object, but not the image itself
delete image_surface;
```

### 33.73.2 Constructor & Destructor Documentation

#### 33.73.2.1 Fl\_Image\_Surface()

```
Fl_Image_Surface::Fl_Image_Surface (
 int w,
 int h,
 int high_res = 0,
 Fl_Offscreen off = 0)
```

Constructor with optional high resolution.

#### Parameters

<i>w,h</i>	Width and height of the resulting image. The value of the <code>high_res</code> parameter controls whether <code>w</code> and <code>h</code> are interpreted as pixels or FLTK units.
<i>high_res</i>	If zero, the created image surface is sized at <code>w x h</code> pixels. If non-zero, the pixel size of the created image surface depends on the value of the display scale factor (see <a href="#">Fl::screen_scale(int)</a> ): the resulting image has the same number of pixels as an area of the display of size <code>w x h</code> expressed in FLTK units.
<i>off</i>	If not null, the image surface is constructed around a pre-existing <code>Fl_Offscreen</code> . The caller is responsible for both construction and destruction of this <code>Fl_Offscreen</code> object. Is mostly intended for internal use by FLTK.

#### Version

1.3.4 (1.3.3 without the `highres` parameter)

### 33.73.3 Member Function Documentation

#### 33.73.3.1 highres\_image()

```
Fl_Shared_Image * Fl_Image_Surface::highres_image ()
```

Returns a possibly high resolution image made of all drawings sent to the [Fl\\_Image\\_Surface](#) object. The [Fl\\_Image\\_Surface](#) object should have been constructed with [Fl\\_Image\\_Surface\(W, H, 1\)](#). The returned [Fl\\_Shared\\_Image](#) object is scaled to a size of WxH FLTK units and may have a pixel size larger than these values. The returned object should be deallocated with [Fl\\_Shared\\_Image::release\(\)](#) after use.

**Deprecated** Use [image\(\)](#) instead.

#### Version

1.4 (1.3.4 for MacOS platform only)

### 33.73.3.2 image()

```
Fl_RGB_Image * Fl_Image_Surface::image ()
```

Returns a depth-3 image made of all drawings sent to the [Fl\\_Image\\_Surface](#) object. The returned object contains its own copy of the RGB data; the caller is responsible for deleting it.

#### See also

[Fl\\_Image\\_Surface::mask\(Fl\\_RGB\\_Image\\*\)](#)

### 33.73.3.3 is\_current()

```
bool Fl_Image_Surface::is_current () [virtual]
```

Is this surface the current drawing surface?

Reimplemented from [Fl\\_Surface\\_Device](#).

### 33.73.3.4 mask()

```
void Fl_Image_Surface::mask (
 const Fl_RGB_Image * mask)
```

Defines a mask applied to drawings made after use of this function.

The mask is an [Fl\\_RGB\\_Image](#) made of a white scene drawn on a solid black background; the drawable part of the image surface is reduced to the white areas of the mask after this member function gets called. If necessary, the `mask` image is internally replaced by a copy resized to the surface's pixel size. Overall, the image returned by [Fl\\_Image\\_Surface::image\(\)](#) contains all drawings made until the [mask\(\)](#) method assigned a mask, at which point subsequent drawing operations to the image surface were passed through the white areas of the mask. On some platforms, shades of gray in the mask image control the blending of foreground and background pixels; mask pixels closer in color to white produce image pixels closer to the image surface pixel, those closer to black produce image pixels closer to what the image surface pixel was before the call to [mask\(\)](#).

The mask is easily constructed using an [Fl\\_Image\\_Surface](#) object, drawing white areas on a black background there, and calling [Fl\\_Image\\_Surface::image\(\)](#).

#### Parameters

<i>mask</i>	A depth-3 image determining the drawable areas of the image surface. The <code>mask</code> object is not used after return from this member function.
-------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

#### Note

- The image surface must not be the current drawing surface when this function gets called.
- The mask can have any size but is best when it has the size of the image surface.
- It's possible to use several masks in succession on the same image surface provided member function [Fl\\_Image\\_Surface::image\(\)](#) is called between successive calls to [Fl\\_Image\\_Surface::mask\(const Fl\\_RGB\\_Image\\*\)](#).

Example of procedure to construct a masked image:

```

int W = ..., H = ...; // width and height of the image under construction
Fl_Image_Surface *surf = new Fl_Image_Surface(W, H, 1);
// first, construct the mask
Fl_Surface_Device::push_current(surf);
fl_color(FL_BLACK); // draw a black background
fl_rectf(0, 0, W, H);
fl_color(FL_WHITE); // next, draw in white what the mask should not filter out
fl_pie(0, 0, W, H, 0, 360); // here, an ellipse with axes lengths WxH
Fl_RGB_Image *mask = surf->image(); // get the mask
// second, draw the image background
fl_color(FL_YELLOW); // here, draw a yellow background
fl_rectf(0, 0, W, H);
// third, apply the mask
Fl_Surface_Device::pop_current();
surf->mask(mask);
delete mask; // the mask image can be safely deleted at this point
Fl_Surface_Device::push_current(surf);
// fourth, draw the image foreground, part of which will be filtered out by the mask
surf->draw(widget, 0, 0); // here the foreground is a drawn widget
// fifth, get the final result, masked_image, as a depth-3 Fl_RGB_Image
Fl_RGB_Image *masked_image = surf->image();
// Only the part of the foreground, here a drawn widget, that has not been
// filtered out by the mask, here the white ellipse, is in masked_image;
// the background, here solid yellow, shows up in the remaining areas of masked_image.
Fl_Surface_Device::pop_current();
delete surf;

```

Since

1.4.0

### 33.73.3.5 offscreen()

```
Fl_Offscreen Fl_Image_Surface::offscreen ()
```

Returns the `Fl_Offscreen` object associated to the image surface.

The returned `Fl_Offscreen` object is deleted when the `Fl_Image_Surface` object is deleted, unless the `Fl_Image_Surface` was constructed with non-null `Fl_Offscreen` argument.

### 33.73.3.6 origin() [1/2]

```

void Fl_Image_Surface::origin (
 int * x,
 int * y) [virtual]

```

Computes the coordinates of the current origin of graphics functions.

Parameters

out	x,y	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	-----	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 33.73.3.7 origin() [2/2]

```

void Fl_Image_Surface::origin (
 int x,
 int y) [virtual]

```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive `origin()` calls don't combine their effects. `Origin()` calls are not affected by `rotate()` calls (for classes derived from `Fl_Paged_Device`).

Parameters

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 33.73.3.8 printable\_rect()

```
int Fl_Image_Surface::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

#### Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 33.73.3.9 rescale()

```
void Fl_Image_Surface::rescale ()
```

Adapts the [Fl\\_Image\\_Surface](#) object to the new value of the GUI scale factor.

The [Fl\\_Image\\_Surface](#) object must not be the current drawing surface. This function is useful only for an object constructed with non-zero `high_res` parameter.

#### Version

1.4

### 33.73.3.10 set\_current()

```
void Fl_Image_Surface::set_current (
 void) [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

It's recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#); . Don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [Fl\\_Surface\\_Device](#).

### 33.73.3.11 translate()

```
void Fl_Image_Surface::translate (
 int x,
 int y) [protected], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each `translate()` call must be matched by an `untranslate()` call. Successive `translate()` calls add up their effects. Reimplemented from `Fl_Widget_Surface`.

### 33.73.3.12 untranslate()

```
void Fl_Image_Surface::untranslate (
 void) [protected], [virtual]
```

Undoes the effect of a previous `translate()` call.

Reimplemented from `Fl_Widget_Surface`.

The documentation for this class was generated from the following files:

- `Fl_Image_Surface.H`
- `Fl_Image_Surface.cxx`

## 33.74 Fl\_Input Class Reference

This is the FLTK text input widget.

```
#include <Fl_Input.H>
```

Inheritance diagram for `Fl_Input`:

### Public Member Functions

### 33.74.1 Detailed Description

This is the FLTK text input widget.

It displays a single line of text and lets the user edit it. Normally it is drawn with an inset box and a white background. The text may contain any characters, and will correctly display any UTF text, using  $\wedge X$  notation for unprintable control characters. It assumes the font can draw any characters of the used scripts, which is true for standard fonts under Windows and Mac OS X. Characters can be input using the keyboard or the character palette/map. Character composition is done using dead keys and/or a compose key as defined by the operating system.

**Table 33.301 Keyboard and mouse bindings.**

<b>Mouse button 1</b>	Moves the cursor to this point. Drag selects characters. Double click selects words. Triple click selects all line. Shift+click extends the selection. When you select text it is automatically copied to the selection buffer.
<b>Mouse button 2</b>	Insert the selection buffer at the point clicked. You can also select a region and replace it with the selection buffer by selecting the region with mouse button 2.
<b>Mouse button 3</b>	Currently acts like button 1.
<b>Backspace</b>	Deletes one character to the left, or deletes the selected region.
<b>Delete</b>	Deletes one character to the right, or deletes the selected region. Combine with Shift for equivalent of $\wedge X$ (copy+cut).
<b>Enter</b>	May cause the callback, see <a href="#">when()</a> .

**Table 33.302 Platform specific keyboard bindings.**

Windows/Linux	Mac	Function
$\wedge A$	<b>Command-A</b>	<b>Selects all text in the widget.</b>
$\wedge C$	<b>Command-C</b>	<b>Copy the current selection to the clipboard.</b>
$\wedge I$	$\wedge I$	<b>Insert a tab.</b>
$\wedge J$	$\wedge J$	<b>Insert a Line Feed.</b> (Similar to literal 'Enter' character)
$\wedge L$	$\wedge L$	<b>Insert a Form Feed.</b>
$\wedge M$	$\wedge M$	<b>Insert a Carriage Return.</b>
$\wedge V$ , <b>Shift-Insert</b>	<b>Command-V</b>	<b>Paste the clipboard.</b> (Macs keyboards don't have "Insert" keys, but if they did, Shift-Insert would work)
$\wedge X$ , <b>Shift-Delete</b>	<b>Command-X</b> , <b>Shift-Delete</b>	<b>Cut.</b> Copy the selection to the clipboard and delete it. (If there's no selection, Shift-Delete acts like Delete)

<b>^Z</b>	<b>Command-Z</b>	<b>Undo.</b> This is a single-level undo mechanism, but all adjacent deletions and insertions are concatenated into a single "undo". Often this will undo a lot more than you expected.
<b>Shift-^Z</b>	<b>Shift-Command-Z</b>	<b>Redo.</b> Currently same behavior as ^Z. Reserved for future multilevel undo/redo.
<b>Arrow Keys</b>	<b>Arrow Keys</b>	<b>Standard cursor movement.</b> Can be combined with Shift to extend selection.
<b>Home</b>	<b>Command-Up, Command-Left</b>	<b>Move to start of line.</b> Can be combined with Shift to extend selection.
<b>End</b>	<b>Command-Down, Command-Right</b>	<b>Move to end of line.</b> Can be combined with Shift to extend selection.
<b>Ctrl-Home</b>	<b>Command-Up, Command-PgUp, Ctrl-Left</b>	<b>Move to top of document/field.</b> In single line input, moves to start of line. In multiline input, moves to start of top line. Can be combined with Shift to extend selection.
<b>Ctrl-End</b>	<b>Command-End, Command-PgDn, Ctrl-Right</b>	<b>Move to bottom of document/field.</b> In single line input, moves to end of line. In multiline input, moves to end of last line. Can be combined with Shift to extend selection.
<b>Ctrl-Left</b>	<b>Alt-Left</b>	<b>Word left.</b> Can be combined with Shift to extend selection.
<b>Ctrl-Right</b>	<b>Alt-Right</b>	<b>Word right.</b> Can be combined with Shift to extend selection.
<b>Ctrl-Backspace</b>	<b>Alt-Backspace</b>	<b>Delete word left.</b>
<b>Ctrl-Delete</b>	<b>Alt-Delete</b>	<b>Delete word right.</b>

## 33.74.2 Constructor & Destructor Documentation

### 33.74.2.1 Fl\_Input()

```
Fl_Input::Fl_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Input](#) widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`.

## 33.74.3 Member Function Documentation

### 33.74.3.1 draw()

```
void Fl_Input::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 33.74.3.2 [handle\(\)](#)

```
int Fl_Input::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Spinner::Fl\\_Spinner\\_Input](#), and [Fl\\_Secret\\_Input](#).

### 33.74.3.3 [handle\\_key\(\)](#)

```
int Fl_Input::handle_key () [protected]
```

Handles a keystroke.

This `protected` method handles a keystroke in an [Fl\\_Input](#) or derived class. It handles compose key sequences and can also be used e.g. in [Fl\\_Multiline\\_Input](#), [Fl\\_Float\\_Input](#) and several more derived classes.

The method first checks in [Fl::compose](#) if the keystroke is a text entry or a control key. If it is text, the method inserts the composed characters into the input field, taking into account the input type (e.g., numeric fields).

If the keystroke is a control key as determined by [Fl::compose](#), the method handles key combinations for Insert, Enter, and Tab depending on the widget's [input\\_type\(\)](#).

The method then checks for Ctrl combinations, such as Ctrl-A, Ctrl-C, Ctrl-V, Ctrl-X, and Ctrl-Z, which are commonly used for select all, copy, paste, cut, and undo operations.

Finally, the method checks for ASCII control characters, such as Ctrl-H, Ctrl-I, Ctrl-J, Ctrl-L, and Ctrl-M, which can be used to insert literal control characters into the input field.

If none of the above cases match, the method returns 0, indicating that the keystroke was not handled.

**Returns**

1 if the keystroke is handled by us, 0 if not.

**33.74.3.4 handle\_rmb()**

```
int Fl_Input::handle_rmb () [protected]
```

Handle right mouse button down events.

**Returns**

1

The documentation for this class was generated from the following files:

- Fl\_Input.H
- Fl\_Input.cxx

**33.75 Fl\_Input\_ Class Reference**

This class provides a low-overhead text input field.

```
#include <Fl_Input_.H>
```

## Additional Inherited Members

### 33.75.1 Detailed Description

This class provides a low-overhead text input field.

This is a virtual base class below `Fl_Input`. It has all the same interfaces, but lacks the `handle()` and `draw()` method. You may want to subclass it if you are one of those people who likes to change how the editing keys work. It may also be useful for adding scrollbars to the input field.

This can act like any of the subclasses of `Fl_Input`, by setting `type()` to one of the following values:

```
#define FL_NORMAL_INPUT 0
#define FL_FLOAT_INPUT 1
#define FL_INT_INPUT 2
#define FL_MULTILINE_INPUT 4
#define FL_SECRET_INPUT 5
#define FL_INPUT_TYPE 7
#define FL_INPUT_READONLY 8
#define FL_NORMAL_OUTPUT (FL_NORMAL_INPUT | FL_INPUT_READONLY)
#define FL_MULTILINE_OUTPUT (FL_MULTILINE_INPUT | FL_INPUT_READONLY)
#define FL_INPUT_WRAP 16
#define FL_MULTILINE_INPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_WRAP)
#define FL_MULTILINE_OUTPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_READONLY | FL_INPUT_WRAP)
```

All variables that represent an index into a text buffer are byte-oriented, not character oriented, counting from 0 (at or before the first character) to `size()` (at the end of the buffer, after the last byte). Since UTF-8 characters can be up to six bytes long, simply incrementing such an index will not reliably advance to the next character in the text buffer. Indices and pointers into the text buffer should always point at a 7 bit ASCII character or the beginning of a UTF-8 character sequence. Behavior for false UTF-8 sequences and pointers into the middle of a sequence are undefined.

[Fl\\_Widget::shortcut\\_label\(int\)](#)

### 33.75.2 Constructor & Destructor Documentation

#### 33.75.2.1 Fl\_Input\_()

```
Fl_Input_::Fl_Input_ (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Input` widget.

This function creates a new `Fl_Input` widget and adds it to the current `Fl_Group`. The `value()` is set to `NULL`. The default boxtype is `FL_DOWN_BOX`.

#### Parameters

<code>X, Y, W, H</code>	the dimensions of the new widget
<code>l</code>	an optional label text

### 33.75.2.2 ~Fl\_Input\_()

```
Fl_Input_::~~Fl_Input_ ()
```

Destroys the widget.

The destructor clears all allocated buffers and removes the widget from the parent [Fl\\_Group](#).

## 33.75.3 Member Function Documentation

### 33.75.3.1 append()

```
int Fl_Input_::append (
 const char * t,
 int l = 0,
 char keep_selection = 0)
```

Append text at the end.

This function appends the string in `t` to the end of the text. It does not moves the new position or mark.

#### Parameters

in	<code>t</code>	text that will be appended
in	<code>l</code>	length of text, or 0 if the string is terminated by <code>nul</code> .
in	<code>keep_selection</code>	if this is 1, the current text selection will remain, if 0, the cursor will move to the end of the inserted text.

#### Returns

0 if no text was appended

### 33.75.3.2 apply\_undo()

```
int Fl_Input_::apply_undo () [protected]
```

Apply the current undo/redo operation.

It's up to [undo\(\)](#) and [redo\(\)](#) to push and pop actions to and from the lists.

#### Returns

1 if the current action changed any text.

#### See also

[undo\(\)](#), [redo\(\)](#)

### 33.75.3.3 can\_redo()

```
bool Fl_Input_::can_redo () const
```

Check if there is a redo action available.

#### Returns

true if the widget can redo the last undo action

### 33.75.3.4 can\_undo()

```
bool Fl_Input_::can_undo () const
```

Check if the last operation can be undone.

#### Returns

true if the widget can unod the last change

### 33.75.3.5 copy()

```
int Fl_Input_::copy (
 int clipboard)
```

Put the current selection into the clipboard.

This function copies the current selection between [mark\(\)](#) and [position\(\)](#) into the specified `clipboard`. This does not replace the old clipboard contents if [position\(\)](#) and [mark\(\)](#) are equal. Clipboard 0 maps to the current text selection and clipboard 1 maps to the cut/paste clipboard.

#### Parameters

<i>clipboard</i>	the clipboard destination 0 or 1
------------------	----------------------------------

#### Returns

0 if no text is selected, 1 if the selection was copied

#### See also

`Fl::copy(const char *, int, int)`

### 33.75.3.6 copy\_cuts()

```
int Fl_Input_::copy_cuts ()
```

Copies the *yank* buffer to the clipboard.

This method copies all the previous contiguous cuts from the undo information to the clipboard. This function implements the  $\text{^K}$  shortcut key.

#### Returns

0 if the operation did not change the clipboard

#### See also

[copy\(int\)](#), [cut\(\)](#)

### 33.75.3.7 cursor\_color() [1/2]

```
Fl_Color Fl_Input_::cursor_color () const [inline]
```

Gets the color of the cursor.

#### Returns

the current cursor color

**33.75.3.8 cursor\_color()** [2/2]

```
void Fl_Input_::cursor_color (
 Fl_Color n) [inline]
```

Sets the color of the cursor.

The default color for the cursor is `FL_BLACK`.

**Parameters**

<code>in</code>	<code>n</code>	the new cursor color
-----------------	----------------	----------------------

**33.75.3.9 cut()** [1/3]

```
int Fl_Input_::cut () [inline]
```

Deletes the current selection.

This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call [copy\(\)](#) first or [copy\\_cuts\(\)](#) after this call.

**Returns**

0 if no data was copied

**33.75.3.10 cut()** [2/3]

```
int Fl_Input_::cut (
 int a,
 int b) [inline]
```

Deletes all characters between index `a` and `b`.

This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call [copy\(\)](#) first or [copy\\_cuts\(\)](#) after this call.

**Parameters**

<code>a,b</code>	range of bytes rounded to full characters and clamped to the buffer
------------------	---------------------------------------------------------------------

**Returns**

0 if no data was copied

**33.75.3.11 cut()** [3/3]

```
int Fl_Input_::cut (
 int n) [inline]
```

Deletes the next `n` bytes rounded to characters before or after the cursor.

This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call [copy\(\)](#) first or [copy\\_cuts\(\)](#) after this call.

**Parameters**

<code>n</code>	number of bytes rounded to full characters and clamped to the buffer. A negative number will cut characters to the left of the cursor.
----------------	----------------------------------------------------------------------------------------------------------------------------------------

**Returns**

0 if no data was copied

**33.75.3.12 drawtext() [1/2]**

```
void Fl_Input_::drawtext (
 int X,
 int Y,
 int W,
 int H) [protected]
```

Draws the text in the passed bounding box.

If `damage ()` & `FL_DAMAGE_ALL` is true, this assumes the area has already been erased to `color()`. Otherwise it does minimal update and erases the area itself.

**Parameters**

<code>X,Y,W,H</code>	area that must be redrawn
----------------------	---------------------------

**33.75.3.13 drawtext() [2/2]**

```
void Fl_Input_::drawtext (
 int X,
 int Y,
 int W,
 int H,
 bool draw_active) [protected]
```

Draws the text in the passed bounding box.

This version of `drawtext` allows the user to control whether the widget is drawn as active, i.e. with the text cursor, or inactive. This is useful for compound widgets where the input should be shown as active when actually the container widget is the active one.

A caller should not draw the widget with `active` set if another text widget may indeed be the active widget.

**Parameters**

<code>X,Y,W,H</code>	area that must be redrawn
<code>draw_active</code>	if set, the cursor will be drawn, even if the widget is not active

**See also**

[Fl\\_Input\\_::drawtext\(int X, int Y, int W, int H\)](#)

**33.75.3.14 dvalue()**

```
double Fl_Input_::dvalue () const
```

Returns the widget text interpreted as a floating point number.

**Returns**

double precision floating point value

**See also**

[Fl\\_Input\\_::ivalue\(\)](#)

[Fl\\_Input\\_::value\(double\)](#)

**33.75.3.15 handle\_mouse()**

```
void Fl_Input_::handle_mouse (
 int X,
 int Y,
 int ,
 int ,
 int drag = 0) [protected]
```

Handles mouse clicks and mouse moves.

**Todo** Add comment and parameters

**33.75.3.16 handletext()**

```
int Fl_Input_::handletext (
 int event,
 int X,
 int Y,
 int W,
 int H) [protected]
```

Handles all kinds of text field related events.

This is called by derived classes.

**Todo** Add comment and parameters

**33.75.3.17 index()**

```
unsigned int Fl_Input_::index (
 int i) const
```

Returns the character at index *i*.

This function returns the UTF-8 character at *i* as a ucs4 character code.

**Parameters**

in	<i>i</i>	index into the value field
----	----------	----------------------------

**Returns**

the character at index *i*

**33.75.3.18 input\_type() [1/2]**

```
int Fl_Input_::input_type () const [inline]
```

Gets the input field type.

**Returns**

the current input type

**33.75.3.19 input\_type() [2/2]**

```
void Fl_Input_::input_type (
 int t) [inline]
```

Sets the input field type.

A [redraw\(\)](#) is required to reformat the input field.

## Parameters

<code>in</code>	<code>t</code>	new input type
-----------------	----------------	----------------

**33.75.3.20 insert()**

```
int Fl_Input_::insert (
 const char * t,
 int l = 0) [inline]
```

Inserts text at the cursor position.

This function inserts the string in `t` at the cursor [position\(\)](#) and moves the new position and mark to the end of the inserted text.

## Parameters

<code>in</code>	<code>t</code>	text that will be inserted
<code>in</code>	<code>l</code>	length of text, or 0 if the string is terminated by <code>nul</code> .

## Returns

0 if no text was inserted

**33.75.3.21 insert\_position() [1/3]**

```
int Fl_Input_::insert_position () const [inline]
```

Gets the position of the text cursor.

## Returns

the cursor position as an index in the range `0..size()`

## See also

[insert\\_position\(int, int\)](#)

**33.75.3.22 insert\_position() [2/3]**

```
int Fl_Input_::insert_position (
 int p) [inline]
```

Sets the cursor position and mark.

`position(n)` is the same as `position(n, n)`.

## Parameters

<code>p</code>	new index for cursor and mark
----------------	-------------------------------

## Returns

0 if no positions changed

## See also

[insert\\_position\(int, int\)](#), [insert\\_position\(\)](#), [mark\(int\)](#)

**33.75.3.23 insert\_position()** [3/3]

```
int Fl_Input_::insert_position (
 int p,
 int m)
```

Sets the index for the cursor and mark.

The input widget maintains two pointers into the string. The *position* (*p*) is where the cursor is. The *mark* (*m*) is the other end of the selected text. If they are equal then there is no selection. Changing this does not affect the clipboard (use [copy\(\)](#) to do that).

Changing these values causes a [redraw\(\)](#). The new values are bounds checked.

**Parameters**

<i>p</i>	index for the cursor position
<i>m</i>	index for the mark

**Returns**

0 if no positions changed

**See also**

[position\(int\)](#), [position\(\)](#), [mark\(int\)](#)

**33.75.3.24 ivalue()**

```
int Fl_Input_::ivalue () const
```

Returns the widget text interpreted as a signed integer.

**Returns**

signed integer value

**See also**

[Fl\\_Input\\_::dvalue\(\)](#)

[Fl\\_Input\\_::value\(int\)](#)

**33.75.3.25 line\_end()**

```
int Fl_Input_::line_end (
 int i) const [protected]
```

Finds the end of a line.

This call calculates the end of a line based on the given index *i*.

**Parameters**

<i>in</i>	<i>i</i>	starting index for the search
-----------	----------	-------------------------------

**Returns**

end of the line

**33.75.3.26 line\_start()**

```
int Fl_Input_::line_start (
 int i) const [protected]
```

Finds the start of a line.

This call calculates the start of a line based on the given index *i*.

**Parameters**

<i>in</i>	<i>i</i>	starting index for the search
-----------	----------	-------------------------------

**Returns**

start of the line

**33.75.3.27 mark() [1/2]**

```
int Fl_Input_::mark () const [inline]
```

Gets the current selection mark.

**Returns**

index into the text

**33.75.3.28 mark() [2/2]**

```
int Fl_Input_::mark (
 int m) [inline]
```

Sets the current selection mark.

mark(*n*) is the same as `insert_position(insert_position(),n)`.

**Parameters**

<i>m</i>	new index of the mark
----------	-----------------------

**Returns**

0 if the mark did not change

**See also**

[insert\\_position\(\)](#), [insert\\_position\(int, int\)](#)

**33.75.3.29 maximum\_size() [1/2]**

```
int Fl_Input_::maximum_size () const [inline]
```

Gets the maximum length of the input field in characters.

**See also**

[maximum\\_size\(int\)](#).

**33.75.3.30 maximum\_size()** [2/2]

```
void Fl_Input_::maximum_size (
 int m) [inline]
```

Sets the maximum length of the input field in characters.

This limits the number of **characters** that can be inserted in the widget.

Since FLTK 1.3 this is different than the buffer size, since one character can be more than one byte in UTF-8 encoding. In FLTK 1.1 this was the same (one byte = one character).

**33.75.3.31 position()** [1/3]

```
int Fl_Input_::position () const [inline]
```

**Deprecated** "in 1.4.0 - use insert\_position() instead"

**33.75.3.32 position()** [2/3]

```
int Fl_Input_::position (
 int p) [inline]
```

**Deprecated** "in 1.4.0 - use insert\_position(p) instead"

**33.75.3.33 position()** [3/3]

```
int Fl_Input_::position (
 int p,
 int m) [inline]
```

**Deprecated** "in 1.4.0 - use insert\_position(p, m) or Fl\_Widget::position(x, y) instead"

**33.75.3.34 readonly()** [1/2]

```
int Fl_Input_::readonly () const [inline]
```

Gets the read-only state of the input field.

**Returns**

non-zero if this widget is read-only

**33.75.3.35 readonly()** [2/2]

```
void Fl_Input_::readonly (
 int b) [inline]
```

Sets the read-only state of the input field.

**Parameters**

<code>in</code>	<code>b</code>	if <code>b</code> is 0, the text in this widget can be edited by the user
-----------------	----------------	---------------------------------------------------------------------------

**33.75.3.36 redo()**

```
int Fl_Input_::redo ()
```

Redo previous undo operation.

This call reapplies previously executed undo operations.

**Returns**

non-zero if any change was made.

**33.75.3.37 replace()**

```
int Fl_Input_::replace (
 int b,
 int e,
 const char * text,
 int ilen = 0)
```

Deletes text from `b` to `e` and inserts the new string `text`.

All changes to the text buffer go through this function. It deletes the region between `b` and `e` (either one may be less or equal to the other), and then inserts the string `text` at that point and moves the [mark\(\)](#) and [position\(\)](#) to the end of the insertion. Does the callback if [when\(\)](#) & `FL_WHEN_CHANGED` and there is a change.

Set `b` and `e` equal to not delete anything. Set `text` to `NULL` to not insert anything.

`ilen` can be zero or `strlen(text)`, which saves a tiny bit of time if you happen to already know the length of the insertion, or can be used to insert a portion of a string. If `ilen` is zero, `strlen(text)` is used instead.

`b` and `e` are clamped to the `0..size()` range, so it is safe to pass any values. `b`, `e`, and `ilen` are used as numbers of bytes (not characters), where `b` and `e` count from 0 to `size()` (end of buffer).

If `b` and/or `e` don't point to a valid UTF-8 character boundary, they are adjusted to the previous (`b`) or the next (`e`) valid UTF-8 character boundary, resp..

If the current number of characters in the buffer minus deleted characters plus inserted characters in `text` would overflow the number of allowed characters ([maximum\\_size\(\)](#)), then only the first characters of the string are inserted, so that [maximum\\_size\(\)](#) is not exceeded.

[cut\(\)](#) and [insert\(\)](#) are just inline functions that call [replace\(\)](#).

**Parameters**

in	<i>b</i>	beginning index of text to be deleted
in	<i>e</i>	ending index of text to be deleted and insertion position
in	<i>text</i>	string that will be inserted
in	<i>ilen</i>	length of <code>text</code> or 0 for nul terminated strings

**Returns**

0 if nothing changed

**Note**

If `text` does not point to a valid UTF-8 character or includes invalid UTF-8 sequences, the text is inserted nevertheless (counting invalid UTF-8 bytes as one character each).

**33.75.3.38 resize()**

```
void Fl_Input_::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Changes the size of the widget.  
This call updates the text layout so that the cursor is visible.

#### Parameters

in	<i>X,Y,W,H</i>	new size of the widget
----	----------------	------------------------

#### See also

[Fl\\_Widget::resize\(int, int, int, int\)](#)

Reimplemented from [Fl\\_Widget](#).

#### 33.75.3.39 shortcut() [1/2]

```
int Fl_Input_::shortcut () const [inline]
```

Return the shortcut key associated with this widget.

#### Returns

shortcut keystroke

#### See also

[Fl\\_Button::shortcut\(\)](#)

#### 33.75.3.40 shortcut() [2/2]

```
void Fl_Input_::shortcut (
 int s) [inline]
```

Sets the shortcut key associated with this widget.  
Pressing the shortcut key gives text editing focus to this widget.

#### Parameters

in	<i>s</i>	new shortcut keystroke
----	----------	------------------------

#### See also

[Fl\\_Button::shortcut\(\)](#)

#### 33.75.3.41 size() [1/2]

```
int Fl_Input_::size () const [inline]
```

Returns the number of bytes in [value\(\)](#).  
This may be greater than `strlen(value())` if there are nul characters in the text.

#### Returns

number of bytes in the text

#### 33.75.3.42 size() [2/2]

```
void Fl_Input_::size (
 int W,
 int H) [inline]
```

Sets the width and height of this widget.

#### Parameters

in	<i>W,H</i>	new width and height
----	------------	----------------------

See also

[Fl\\_Widget::size\(int, int\)](#)

#### 33.75.3.43 static\_value() [1/2]

```
int Fl_Input_::static_value (
 const char * str)
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is *not* copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the [Fl\\_Input](#) is destroyed or [value\(\)](#) is called again.

#### Parameters

in	<i>str</i>	the new text
----	------------	--------------

#### Returns

non-zero if the new value is different than the current one

#### 33.75.3.44 static\_value() [2/2]

```
int Fl_Input_::static_value (
 const char * str,
 int len)
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is *not* copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the [Fl\\_Input](#) is destroyed or [value\(\)](#) is called again.

You can use the `len` parameter to directly set the length if you know it already or want to put `nul` characters in the text.

#### Parameters

in	<i>str</i>	the new text
in	<i>len</i>	the length of the new text

#### Returns

non-zero if the new value is different than the current one

#### 33.75.3.45 tab\_nav() [1/2]

```
int Fl_Input_::tab_nav () const [inline]
```

Gets whether the Tab key causes focus navigation in multiline input fields or not. If enabled (default), hitting Tab causes focus navigation to the next widget. If disabled, hitting Tab inserts a tab character into the text field.

#### Returns

1 if Tab advances focus (default), 0 if Tab inserts tab characters.

#### See also

[tab\\_nav\(int\)](#), [FL::OPTION\\_ARROW\\_FOCUS](#).

### 33.75.3.46 tab\_nav() [2/2]

```
void Fl_Input_::tab_nav (
 int val) [inline]
```

Sets whether the Tab key does focus navigation, or inserts tab characters into [FL\\_Multiline\\_Input](#).

By default this flag is enabled to provide the 'normal' behavior most users expect; Tab navigates focus to the next widget. To inserting an actual Tab character, users can use Ctrl-I or copy/paste.

Disabling this flag gives the old FLTK behavior where Tab inserts a tab character into the text field, in which case only the mouse can be used to navigate to the next field.

History: This flag was provided for backwards support of FLTK's old 1.1.x behavior where Tab inserts a tab character instead of navigating focus to the next widget. This behavior was unique to [FL\\_Multiline\\_Input](#). With the advent of [FL\\_Text\\_Editor](#), this old behavior has been deprecated.

#### Parameters

in	val	If val is 1, Tab advances focus (default). If val is 0, Tab inserts a tab character (old FLTK behavior).
----	-----	-------------------------------------------------------------------------------------------------------------

#### See also

[tab\\_nav\(\)](#), [FL::OPTION\\_ARROW\\_FOCUS](#).

### 33.75.3.47 textcolor() [1/2]

```
Fl_Color Fl_Input_::textcolor () const [inline]
```

Gets the color of the text in the input field.

#### Returns

the text color

#### See also

[textcolor\(Fl\\_Color\)](#)

### 33.75.3.48 textcolor() [2/2]

```
void Fl_Input_::textcolor (
 Fl_Color n) [inline]
```

Sets the color of the text in the input field.

The text color defaults to `FL_FOREGROUND_COLOR`.

## Parameters

in	n	new text color
----	---	----------------

## See also

[textcolor\(\)](#)

**33.75.3.49 textfont()** [1/2]

`Fl_Font Fl_Input_::textfont ( ) const [inline]`  
 Gets the font of the text in the input field.

## Returns

the current Fl\_Font index

**33.75.3.50 textfont()** [2/2]

`void Fl_Input_::textfont (`  
     `Fl_Font s ) [inline]`  
 Sets the font of the text in the input field.  
 The text font defaults to FL\_HELVETICA.

## Parameters

in	s	the new text font
----	---	-------------------

**33.75.3.51 textsize()** [1/2]

`Fl_Fontsize Fl_Input_::textsize ( ) const [inline]`  
 Gets the size of the text in the input field.

## Returns

the text height in pixels

**33.75.3.52 textsize()** [2/2]

`void Fl_Input_::textsize (`  
     `Fl_Fontsize s ) [inline]`  
 Sets the size of the text in the input field.  
 The text height defaults to FL\_NORMAL\_SIZE.

## Parameters

in	s	the new font height in pixel units
----	---	------------------------------------

**33.75.3.53 undo()**

`int Fl_Input_::undo ( )`

Undoes previous changes to the text buffer.  
This call undoes a number of previous calls to [replace\(\)](#).

#### Returns

non-zero if any change was made.

#### 33.75.3.54 `up_down_position()`

```
int Fl_Input_::up_down_position (
 int i,
 int keepmark = 0) [protected]
```

Moves the cursor to the column given by `up_down_pos`.  
This function is helpful when implementing up and down cursor movement. It moves the cursor from the beginning of a line to the column indicated by the global variable `up_down_pos` in pixel units.

#### Parameters

in	<i>i</i>	index into the beginning of a line of text
in	<i>keepmark</i>	if set, move only the cursor, but not the mark

#### Returns

index to new cursor position

#### 33.75.3.55 `value()` [1/5]

```
const char * Fl_Input_::value () const [inline]
```

Returns the text displayed in the widget.  
This function returns the current value, which is a pointer to the internal buffer and is valid only until the next event is handled.

#### Returns

pointer to an internal buffer - do not free() this

#### See also

[Fl\\_Input\\_::value\(const char\\*\)](#)

#### 33.75.3.56 `value()` [2/5]

```
int Fl_Input_::value (
 const char * str)
```

Changes the widget text.  
This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal buffer. Passing NULL is the same as "".

#### Parameters

in	<i>str</i>	the new text
----	------------	--------------

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str, int len\)](#), [Fl\\_Input\\_::value\(\)](#)

**33.75.3.57 value() [3/5]**

```
int Fl_Input_::value (
 const char * str,
 int len)
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal buffer. Passing NULL is the same as "".

You can use the `length` parameter to directly set the length if you know it already or want to put `nul` characters in the text.

**Parameters**

in	<i>str</i>	the new text
in	<i>len</i>	the length of the new text

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str\)](#), [Fl\\_Input\\_::value\(\)](#)

**33.75.3.58 value() [4/5]**

```
int Fl_Input_::value (
 double v)
```

Changes the widget text to a floating point number ("%g").

**Parameters**

in	<i>v</i>	the new value
----	----------	---------------

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str\)](#), [Fl\\_Input\\_::ivalue\(\)](#)

**33.75.3.59 value() [5/5]**

```
int Fl_Input_::value (
 int v)
```

Changes the widget text to a signed integer number.

**Parameters**

in	v	the new value
----	---	---------------

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str\)](#), [Fl\\_Input\\_::ivalue\(\)](#)

**33.75.3.60 word\_end()**

```
int Fl_Input_::word_end (
 int i) const [protected]
```

Finds the end of a word.

Returns the index after the last byte of a word. If the index is already at the end of a word, it will find the end of the following word, so if you call it repeatedly you will move forwards to the end of the text.

Note that this is inconsistent with [line\\_end\(\)](#).

**Parameters**

in	i	starting index for the search
----	---	-------------------------------

**Returns**

end of the word

**33.75.3.61 word\_start()**

```
int Fl_Input_::word_start (
 int i) const [protected]
```

Finds the start of a word.

Returns the index of the first byte of a word. If the index is already at the beginning of a word, it will find the beginning of the previous word, so if you call it repeatedly you will move backwards to the beginning of the text.

Note that this is inconsistent with [line\\_start\(\)](#).

**Parameters**

in	i	starting index for the search
----	---	-------------------------------

**Returns**

start of the word, or previous word

**33.75.3.62 wrap() [1/2]**

```
int Fl_Input_::wrap () const [inline]
```

Gets the word wrapping state of the input field.

Word wrap is only functional with multi-line input fields.

**33.75.3.63 wrap()** [2/2]

```
void Fl_Input_::wrap (
 int b) [inline]
```

Sets the word wrapping state of the input field.

Word wrap is only functional with multi-line input fields.

The documentation for this class was generated from the following files:

- Fl\_Input\_.H
- Fl\_Input\_.cxx

**33.76 Fl\_Input\_Choice Class Reference**

A combination of the input widget and a menu button.

Inheritance diagram for Fl\_Input\_Choice:

**Public Member Functions**

- virtual int **menu\_y** () const
  - See [menu\\_x\(\)](#) for info.*

## Additional Inherited Members

### 33.76.1 Detailed Description

A combination of the input widget and a menu button.

Figure 33.26 Fl\_Input\_Choice widget

The user can either type into the input area, or use the menu button chooser on the right to choose an item which loads the input area with the selected text.

The application can directly access both the internal `Fl_Input` and `Fl_Menu_Button` widgets respectively using the `input()` and `menubutton()` accessor methods.

The default behavior is to invoke the `Fl_Input_Choice::callback()` if the user changes the input field's contents, either by typing, pasting, or clicking a different item in the choice menu.

The callback can determine if an item was picked vs. typing into the input field by checking the value of `menubutton()->changed()`, which will be:

- 1: the user picked a different item in the choice menu
- 0: the user typed or pasted directly into the input field

### Example Use of Fl\_Input\_Choice

```
#include <stdio.h>
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Input_Choice.H>
// Fl_Input_Choice callback()
void choice_cb(Fl_Widget *w, void *userdata) {
 // Show info about the picked item
 Fl_Input_Choice *choice = (Fl_Input_Choice*)w;
 printf("*** Choice Callback:\n");
 printf(" widget's text value='%s'\n", choice->value()); // normally all you need
 // Access the menu via menubutton()..
 const Fl_Menu_Item *item = choice->menubutton()->mvalue();
 printf(" item label()='%s'\n", item ? item->label() : "(No item)");
 printf(" item value()=%d\n", choice->menubutton()->value());
 printf(" input value()='%s'\n", choice->input()->value());
 printf(" The user %s\n", choice->menubutton()->changed()
 ? "picked a menu item"
 : "typed text");
}

int main() {
 Fl_Double_Window win(200,100,"Input Choice");
 win.begin();
 Fl_Input_Choice choice(10,10,100,30);
 choice.callback(choice_cb, 0);
 choice.add("Red");
 choice.add("Orange");
 choice.add("Yellow");
 //choice.value("Red"); // uncomment to make "Red" default
 win.end();
 win.show();
 return Fl::run();
}
```

### Subclassing Example

One can subclass `Fl_Input_Choice` to override the virtual methods `inp_x/y/w/h()` and `menu_x/y/w/h()` to take control of the internal `Fl_Input` and `Fl_Menu_Button` widget positioning. In this example, input and menubutton's positions are swapped:

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Input_Choice.H>
class MyInputChoice : public Fl_Input_Choice {
protected:
 virtual int inp_x()const { return x() + Fl::box_dx(box()) + menu_w(); } // override to reposition
 virtual int menu_x()const { return x() + Fl::box_dx(box()); } // override to reposition
public:
 MyInputChoice(int X,int Y,int W,int H,const char*L=0) : Fl_Input_Choice(X,Y,W,H,L) {
 resize(X,Y,W,H); // necessary for ctor to trigger our overrides
 }
};

int main(int argc, char **argv) {
```

```

 Fl_Window *win = new Fl_Window(400,300);
 MyInputChoice *mychoice = new MyInputChoice(150,40,150,25,"Right Align Input");
 mychoice->add("Aaa");
 mychoice->add("Bbb");
 mychoice->add("Ccc");
 win->end();
 win->resizable(win);
 win->show();
 return Fl::run();
}

```

## 33.76.2 Constructor & Destructor Documentation

### 33.76.2.1 Fl\_Input\_Choice()

```

Fl_Input_Choice::Fl_Input_Choice (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)

```

Creates a new [Fl\\_Input\\_Choice](#) widget using the given position, size, and label string. Inherited destructor destroys the widget and any values associated with it.

## 33.76.3 Member Function Documentation

### 33.76.3.1 add()

```

void Fl_Input_Choice::add (
 const char * s) [inline]

```

Adds an item to the menu.

When any item is selected, the [Fl\\_Input\\_Choice callback\(\)](#) is invoked, which can do something with the selected item.

You can access the more complex [Fl\\_Menu\\_Button::add\(\)](#) methods (setting item-specific callbacks, userdata, etc), via [menubutton\(\)](#). Example:

```

Fl_Input_Choice *choice = new Fl_Input_Choice(100,10,120,25,"Fonts");
Fl_Menu_Button *mb = choice->menubutton(); // use Fl_Input_Choice's Fl_Menu_Button
mb->add("Helvetica", 0, MyFont_CB, (void*)mydata); // use Fl_Menu_Button's add() methods
mb->add("Courier", 0, MyFont_CB, (void*)mydata);
mb->add("More..", 0, FontDialog_CB, (void*)mydata);

```

### 33.76.3.2 draw()

```

void Fl_Input_Choice::draw () [protected], [virtual]

```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```

Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()

```

Reimplemented from [Fl\\_Group](#).

### 33.76.3.3 inp\_x()

```

virtual int Fl_Input_Choice::inp_x () const [inline], [protected], [virtual]

```

The methods [inp\\_x\(\)](#), [inp\\_y\(\)](#), [inp\\_w\(\)](#) and [inp\\_h\(\)](#) return the desired position and size of the internal [Fl\\_Input](#) widget.

These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

### 33.76.3.4 input()

```
Fl_Input * Fl_Input_Choice::input () [inline]
```

Returns a pointer to the internal [Fl\\_Input](#) widget.

This can be used to directly access all of the [Fl\\_Input](#) widget's methods.

### 33.76.3.5 menu\_x()

```
virtual int Fl_Input_Choice::menu_x () const [inline], [protected], [virtual]
```

The methods [menu\\_x\(\)](#), [menu\\_y\(\)](#), [menu\\_w\(\)](#) and [menu\\_h\(\)](#) return the desired position and size of the internal [Fl\\_Menu\\_Button](#) widget.

These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

### 33.76.3.6 menubutton()

```
Fl_Menu_Button * Fl_Input_Choice::menubutton () [inline]
```

Returns a pointer to the internal [Fl\\_Menu\\_Button](#) widget.

This can be used to access any of the methods of the menu button, e.g.

```
Fl_Input_Choice *choice = new Fl_Input_Choice(100,10,120,25,"Choice:");
[...]
```

```
// Print all the items in the choice menu
for (int t=0; t<choice->menubutton()->size(); t++) {
 const Fl_Menu_Item &item = choice->menubutton()->menu()[t];
 printf("item %d -- label=%s\n", t, item.label() ? item.label() : "(Null)");
}
```

### 33.76.3.7 resize()

```
void Fl_Input_Choice::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Resizes the [Fl\\_Input\\_Choice](#) widget.

Reimplemented from [Fl\\_Group](#).

### 33.76.3.8 update\_menubutton()

```
int Fl_Input_Choice::update_menubutton ()
```

Updates the menubutton with the string value in [Fl\\_Input](#).

If the string value currently in [Fl\\_Input](#) matches one of the menu items in [menubutton\(\)](#), that menu item will become the current item selected.

Call this method after setting [value\(const char\\*\)](#) if you need the [menubutton\(\)](#) to be synchronized with the [Fl\\_Input](#) field.

```
// Add items
choice->add(".25");
choice->add(".50");
choice->add("1.0");
choice->add("2.0");
choice->add("4.0");
choice->value("1.0"); // sets Fl_Input to "1.0"
choice->update_menubutton(); // cause menubutton to reflect this value too
// (returns 1 if match was found, 0 if not)

// Verify menubutton()'s value.
printf("menu button choice index=%d, value=%s\n",
 choice->menubutton()->value(), // would be -1 if update not done
 choice->menubutton()->text()); // would be NULL if update not done
```

**Returns**

1 if a matching menuitem was found and value set, 0 if not.

**Version**

1.4.0

**33.76.3.9 value() [1/2]**

```
void Fl_Input_Choice::value (
 const char * val) [inline]
```

Sets the [Fl\\_Input](#) text field's contents to `val`.

Note it is possible to set the `value()` to one that is not in the menubutton's list of choices.

Setting the `value()` does NOT affect the menubutton's selection. If that's needed, call `update_menubutton()` after setting `value()`.

**See also**

void [value\(int val\)](#), [update\\_menubutton\(\)](#)

**33.76.3.10 value() [2/2]**

```
void Fl_Input_Choice::value (
 int val)
```

Chooses item# `val` in the menu, and sets the [Fl\\_Input](#) text field to that value.

Any previous text is cleared.

**See also**

void [value\(const char \\*val\)](#)

- [Fl\\_Input\\_Choice.cxx](#)

## 33.77 Fl\_Int\_Input Class Reference

The [Fl\\_Int\\_Input](#) class is a subclass of [Fl\\_Input](#) that only allows the user to type decimal digits (or hex numbers of the form 0xae).

```
#include <Fl_Int_Input.H>
```

Inheritance diagram for [Fl\\_Int\\_Input](#):

### Public Member Functions

- [Fl\\_Int\\_Input](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Int\\_Input](#) widget using the given position, size, and label string.*

## Additional Inherited Members

### 33.77.1 Detailed Description

The [FI\\_Int\\_Input](#) class is a subclass of [FI\\_Input](#) that only allows the user to type decimal digits (or hex numbers of the form 0xae).

### 33.77.2 Constructor & Destructor Documentation

#### 33.77.2.1 FI\_Int\_Input()

```
FI_Int_Input::FI_Int_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [FI\\_Int\\_Input](#) widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [FI\\_Int\\_Input.H](#)
- [FI\\_Input.cxx](#)

## 33.78 FI\_JPEG\_Image Class Reference

The [FI\\_JPEG\\_Image](#) class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images.

```
#include <FI_JPEG_Image.H>
```

Inheritance diagram for [FI\\_JPEG\\_Image](#):

### Public Member Functions

- [FI\\_JPEG\\_Image](#) (const char \*filename)  
*The constructor loads the JPEG image from the given jpeg filename.*
- [FI\\_JPEG\\_Image](#) (const char \*name, const unsigned char \*data, int data\_length=-1)  
*The constructor loads the JPEG image from memory.*

### Protected Member Functions

- void [load\\_jpg\\_](#) (const char \*filename, const char \*sharename, const unsigned char \*data, int data\_length=-1)

## Additional Inherited Members

### 33.78.1 Detailed Description

The [FI\\_JPEG\\_Image](#) class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images.

The class supports grayscale and color (RGB) JPEG image files.

### 33.78.2 Constructor & Destructor Documentation

#### 33.78.2.1 FI\_JPEG\_Image() [1/2]

```
FI_JPEG_Image::FI_JPEG_Image (
 const char * filename)
```

The constructor loads the JPEG image from the given jpeg filename.

The inherited destructor frees all memory and server resources that are used by the image.

Use [FI\\_Image::fail\(\)](#) to check if [FI\\_JPEG\\_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the JPEG format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason. If the image has loaded correctly, [w\(\)](#), [h\(\)](#), and [d\(\)](#) should return values greater than zero.

#### Parameters

<i>in</i>	<i>filename</i>	a full path and name pointing to a valid jpeg file.
-----------	-----------------	-----------------------------------------------------

#### See also

`FI_JPEG_Image::FI_JPEG_Image(const char *imagename, const unsigned char *data)`

#### 33.78.2.2 FI\_JPEG\_Image() [2/2]

```
FI_JPEG_Image::FI_JPEG_Image (
 const char * name,
 const unsigned char * data,
 int data_length = -1)
```

The constructor loads the JPEG image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. `name_png` can be NULL. If a name is given, the image is added to the list of shared images (see: [FI\\_Shared\\_Image](#)) and will be available by that name.

The inherited destructor frees all memory and server resources that are used by the image.

Use [FI\\_Image::fail\(\)](#) to check if [FI\\_JPEG\\_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the JPEG format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason. If the image has loaded correctly, [w\(\)](#), [h\(\)](#), and [d\(\)](#) should return values greater than zero.

#### Parameters

<i>name</i>	A unique name or NULL
<i>data</i>	A pointer to the memory location of the JPEG image
<i>data_length</i>	optional length of <i>data</i> . This will protect memory outside of the <i>data</i> array from illegal read operations

See also

[FI\\_JPEG\\_Image::FI\\_JPEG\\_Image\(const char \\*filename\)](#)  
[FI\\_Shared\\_Image](#)

The documentation for this class was generated from the following files:

## 33.79 FI\_Label Struct Reference

This struct stores all information for a text or mixed graphics label.

```
#include <Fl_Widget.H>
```

### Public Member Functions

- void [draw](#) (int, int, int, int, [FI\\_Align](#)) const  
*Draws the label aligned to the given box.*
- void [measure](#) (int &w, int &h) const  
*Measures the size of the label.*

### Public Attributes

- [FI\\_Align](#) **align\_**  
*alignment of label*
- [FI\\_Color](#) **color**  
*text color*
- [FI\\_Image](#) \* **deimage**  
*optional image for a deactivated label*
- [FI\\_Font](#) **font**  
*label font used in text*
- [FI\\_Image](#) \* **image**  
*optional image for an active label*
- [FI\\_Fontsize](#) **size**  
*size of label font*
- [uchar](#) **spacing**  
*Spacing between an image and the label text.*
- [uchar](#) **type**  
*type of label.*
- const char \* **value**  
*label text*

### 33.79.1 Detailed Description

This struct stores all information for a text or mixed graphics label.

**Todo** There is an aspiration that the [FI\\_Label](#) type will become a widget by itself. That way we will be avoiding a lot of code duplication by handling labels in a similar fashion to widgets containing text. We also provide an easy interface for very complex labels, containing html or vector graphics. However, this re-factoring is not in place in this release.

### 33.79.2 Member Function Documentation

### 33.79.2.1 draw()

```
void Fl_Label::draw (
 int X,
 int Y,
 int W,
 int H,
 Fl_Align align) const
```

Draws the label aligned to the given box.

Draws a label with arbitrary alignment in an arbitrary box.

### 33.79.2.2 measure()

```
void Fl_Label::measure (
 int & W,
 int & H) const
```

Measures the size of the label.

#### Parameters

<code>in, out</code>	<code>W,H</code>	: this is the requested size for the label text plus image; on return, this will contain the size needed to fit the label
----------------------	------------------	---------------------------------------------------------------------------------------------------------------------------

## 33.79.3 Member Data Documentation

### 33.79.3.1 type

```
uchar Fl_Label::type
```

type of label.

## 33.80 Fl\_Light\_Button Class Reference

This subclass displays the "on" state by turning on a light, rather than drawing pushed in.

```
#include <Fl_Light_Button.H>
```

Inheritance diagram for Fl\_Light\_Button:

## Public Member Functions

- [Fl\\_Light\\_Button](#) (int *x*, int *y*, int *w*, int *h*, const char \**l*=0)  
*Creates a new Fl\_Light\_Button widget using the given position, size, and label string.*
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
*Handles the specified event.*

## Protected Member Functions

- void [draw](#) () [FL\\_OVERRIDE](#)  
*Draws the widget.*

## Additional Inherited Members

### 33.80.1 Detailed Description

This subclass displays the "on" state by turning on a light, rather than drawing pushed in.

The shape of the "light" is initially set to [FL\\_DOWN\\_BOX](#). The color of the light when on is controlled with [selection\\_color\(\)](#), which defaults to [FL\\_YELLOW](#).

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for [type\(\)](#) and [when\(\)](#).

Figure 33.27 Fl\_Light\_Button

### 33.80.2 Constructor & Destructor Documentation

#### 33.80.2.1 Fl\_Light\_Button()

```
Fl_Light_Button::Fl_Light_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Light\\_Button](#) widget using the given position, size, and label string.

The default box type is [FL\\_UP\\_BOX](#) and the default down box type [down\\_box\(\)](#) is [FL\\_NO\\_BOX](#) (0).

The [selection\\_color\(\)](#) sets the color of the "light". Default is [FL\\_YELLOW](#).

The default label alignment is ' [FL\\_ALIGN\\_LEFT](#)|[FL\\_ALIGN\\_INSIDE](#) ' so the label is drawn inside the button area right of the "light".

#### Note

Do not change the default box types of [Fl\\_Light\\_Button](#). The box types determine how the button is drawn. If you change the [down\\_box\(\)](#) type the drawing behavior is undefined.

### 33.80.3 Member Function Documentation

#### 33.80.3.1 draw()

```
void Fl_Light_Button::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Button](#).

### 33.80.3.2 `handle()`

```
int Fl_Light_Button::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Button](#).

The documentation for this class was generated from the following files:

- `Fl_Light_Button.H`
- `Fl_Light_Button.cxx`

Inheritance diagram for `Fl_Line_Dial`:

## Public Member Functions

- `FI_Line_Dial` (int X, int Y, int W, int H, const char \*L=0)

## Additional Inherited Members

The documentation for this class was generated from the following files:

- `FI_Line_Dial.H`
- `FI_Dial.cxx`

## 33.82 FI\_Mac\_App\_Menu Class Reference

### Static Public Member Functions

- static void `custom_application_menu_items` (const `FI_Menu_Item` \*m)  
*Adds custom menu item(s) to the application menu of the system menu bar.*

### Static Public Attributes

- static const char \* **about**  
*Localizable text for the "About xxx" application menu item.*
- static const char \* **hide**  
*Localizable text for the "Hide xxx" application menu item.*
- static const char \* **hide\_others**  
*Localizable text for the "Hide Others" application menu item.*
- static const char \* **print**  
*Localizable text for the "Print Front Window" application menu item.*
- static const char \* **print\_no\_titlebar**  
*Localizable text for the "Print Front Window" application menu item.*
- static const char \* **quit**  
*Localizable text for the "Quit xxx" application menu item.*
- static const char \* **services**  
*Localizable text for the "Services" application menu item.*
- static const char \* **show**  
*Localizable text for the "Show All" application menu item.*
- static const char \* **toggle\_print\_titlebar**  
*Localizable text for the "Toggle print titlebar" application menu item.*

### 33.82.1 Member Function Documentation

#### 33.82.1.1 `custom_application_menu_items()`

```
static void FI_Mac_App_Menu::custom_application_menu_items (
 const FI_Menu_Item * m) [static]
```

Adds custom menu item(s) to the application menu of the system menu bar.

They are positioned after the "Print Front Window / Toggle printing of titlebar" items, or at their place if they were removed with `FI_Mac_App_Menu::print = ""`.

#### Parameters

<i>m</i>	zero-ending array of <code>FI_Menu_Item</code> 's.
----------	----------------------------------------------------

## 33.82.2 Member Data Documentation

### 33.82.2.1 print

```
const char* Fl_Mac_App_Menu::print [static]
```

Localizable text for the "Print Front Window" application menu item.

This menu item and next one won't be displayed if `Fl_Mac_App_Menu::print` is set to an empty string.

The documentation for this class was generated from the following file:

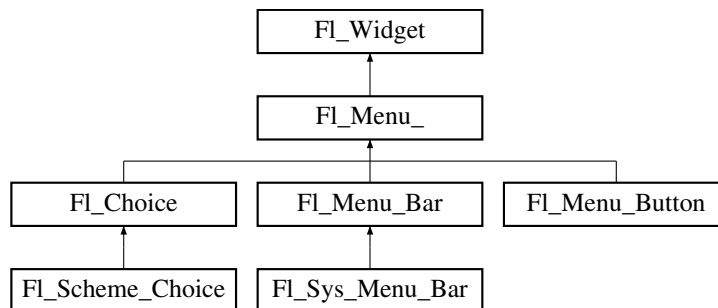

- [mac.H](#)

## 33.83 Fl\_Menu\_ Class Reference

Base class of all widgets that have a menu in FLTK.

```
#include <Fl_Menu_.H>
```

Inheritance diagram for `Fl_Menu_`:

### Public Member Functions

- `int add (const char *)`  
*This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.*
- `int add (const char *, int shortcut, Fl_Callback *, void *=0, int=0)`  
*Adds a new menu item.*
- `int add (const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)`  
*See int Fl\_Menu\_::add(const char\* label, int shortcut, Fl\_Callback\*, void \*user\_data=0, int flags=0)*
- `void clear ()`  
*Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.*
- `int clear_submenu (int index)`  
*Clears the specified submenu pointed to by index of all menu items.*
- `void copy (const Fl_Menu_Item *m, void *user_data=0)`  
*Sets the menu array pointer with a copy of m that will be automatically deleted.*
- `Fl_Boxtype down_box () const`  
*This box type is used to surround the currently-selected items in the menus.*
- `void down_box (Fl_Boxtype b)`  
*Sets the box type used to surround the currently-selected items in the menus.*
- `Fl_Color down_color () const`  
*For back compatibility, same as selection\_color()*
- `void down_color (unsigned c)`  
*For back compatibility, same as selection\_color()*
- `int find_index (const char *name) const`  
*Find the menu item index for a given menu pathname, such as "Edit/Copy".*

- int `find_index` (const `FI_Menu_Item` \*item) const  
*Find the index into the menu array for a given `item`.*
- int `find_index` (`FI_Callback` \*cb) const  
*Find the index into the menu array for a given callback `cb`.*
- const `FI_Menu_Item` \* `find_item` (const char \*name)  
*Find the menu item for a given menu `pathname`, such as "Edit/Copy".*
- const `FI_Menu_Item` \* `find_item` (`FI_Callback` \*)  
*Find the menu item for the given callback `cb`.*
- const `FI_Menu_Item` \* `find_item_with_argument` (long)  
*Find the menu item for the given user argument `v`.*
- const `FI_Menu_Item` \* `find_item_with_user_data` (void \*)  
*Find the menu item for the given user data `v`.*
- `FI_Menu_` (int, int, int, int, const char \* =0)  
*Creates a new `FI_Menu_` widget using the given position, size, and label string.*
- void `global` ()  
*Make the shortcuts for this menu work no matter what window has the focus when you type it.*
- int `insert` (int index, const char \*, int `shortcut`, `FI_Callback` \*, void \* =0, int =0)  
*Inserts a new menu item at the specified `index` position.*
- int `insert` (int index, const char \*a, const char \*b, `FI_Callback` \*c, void \*d =0, int e =0)  
*See int `FI_Menu_::insert`(const char\* label, int shortcut, FI\_Callback\*, void \*user\_data=0, int flags=0)*
- int `item_pathname` (char \*name, int namelen, const `FI_Menu_Item` \*finditem =0) const  
*Get the menu 'pathname' for the specified menuitem.*
- const `FI_Menu_Item` \* `menu` () const  
*Returns a pointer to the array of `FI_Menu_Items`.*
- void `menu` (const `FI_Menu_Item` \*m)  
*Sets the menu array pointer directly.*
- `FI_Boxtype` `menu_box` () const  
*Get the box type for the menu popup windows.*
- void `menu_box` (`FI_Boxtype` b)  
*Set the box type for the menu popup windows.*
- const `FI_Menu_Item` \* `menu_end` ()  
*Finishes menu modifications and returns `menu()`.*
- int `mode` (int i) const  
*Get the flags of item `i`.*
- void `mode` (int i, int fl)  
*Set the flags of item `i`.*
- const `FI_Menu_Item` \* `mvalue` () const  
*Return a pointer to the last menu item that was picked.*
- const `FI_Menu_Item` \* `picked` (const `FI_Menu_Item` \*)  
*When user picks a menu item, call this.*
- const `FI_Menu_Item` \* `prev_mvalue` () const  
*Return a pointer to the menu item that was picked before the current one was picked.*
- void `remove` (int)  
*Deletes item `i` from the menu.*
- void `replace` (int, const char \*)  
*Changes the text of item `i`.*
- void `setonly` (`FI_Menu_Item` \*item)  
*Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.*
- void `shortcut` (int i, int s)  
*Change the shortcut of item `i` to `s`.*
- int `size` () const

This returns the number of [FI\\_Menu\\_Item](#) structures that make up the menu, correctly counting submenus.

- void **size** (int W, int H)
- const [FI\\_Menu\\_Item](#) \* **test\_shortcut** ()
 

Returns the menu item with the entered shortcut (key value).
- const char \* **text** () const
 

Returns the title of the last item chosen.
- const char \* **text** (int i) const
 

Returns the title of item *i*.
- [FI\\_Color](#) **textcolor** () const
 

Get the current color of menu item labels.
- void **textcolor** ([FI\\_Color](#) c)
 

Sets the current color of menu item labels.
- [FI\\_Font](#) **textfont** () const
 

Gets the current font of menu item labels.
- void **textfont** ([FI\\_Font](#) c)
 

Sets the current font of menu item labels.
- [FI\\_Fontsize](#) **textsize** () const
 

Gets the font size of menu item labels.
- void **textsize** ([FI\\_Fontsize](#) c)
 

Sets the font size of menu item labels.
- int **value** () const
 

Return the index into the [menu\(\)](#) of the last item chosen by the user.
- int **value** (const [FI\\_Menu\\_Item](#) \*)
 

Set the value of a menu to the menu item *m*.
- int **value** (int i)
 

Set the value of the menu to index *i*.

## Protected Member Functions

- int **item\_pathname\_** (char \*name, int namelen, const [FI\\_Menu\\_Item](#) \*finditem, const [FI\\_Menu\\_Item](#) \*menu=0) const

## Protected Attributes

- [FI\\_Color](#) **textcolor\_**
- [FI\\_Font](#) **textfont\_**
- [FI\\_Fontsize](#) **textsize\_**

## Additional Inherited Members

### 33.83.1 Detailed Description

Base class of all widgets that have a menu in FLTK.

Currently FLTK provides you with [FI\\_Menu\\_Button](#), [FI\\_Menu\\_Bar](#), and [FI\\_Choice](#).

The class contains a pointer to an array of structures of type [FI\\_Menu\\_Item](#). The array may either be supplied directly by the user program, or it may be "private": a dynamically allocated array managed by the [FI\\_Menu\\_](#).

When the user clicks a menu item, [value\(\)](#) is set to that item and then:

- If the [FI\\_Menu\\_Item](#) has a callback set, that callback is invoked with any userdata configured for it. (The [FI\\_Menu\\_](#) widget's callback is NOT invoked.)

- For any Fl\_Menu\_Items that **don't** have a callback set, the Fl\_Menu\_ widget's callback is invoked with any userdata configured for it. The callback can determine which item was picked using [value\(\)](#), [mvalue\(\)](#), [item\\_pathname\(\)](#), etc.

The line spacing between menu items can be controlled with the global setting [Fl::menu\\_linespacing\(\)](#).

[Fl\\_Widget::shortcut\\_label\(int\)](#)

## 33.83.2 Constructor & Destructor Documentation

### 33.83.2.1 Fl\_Menu\_()

```
Fl_Menu_::Fl_Menu_ (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Menu\\_](#) widget using the given position, size, and label string. [menu\(\)](#) is initialized to null.

## 33.83.3 Member Function Documentation

### 33.83.3.1 add() [1/2]

```
int Fl_Menu_::add (
 const char * str)
```

This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.

The passed string is split at any '|' characters and then `add(s,0,0,0,0)` is done with each section. This is often useful if you are just using the value, and is compatible with Forms and other GL programs. The section strings use the same special characters as described for the long version of [add\(\)](#).

No items must be added to a menu during a callback to the same menu.

#### Parameters

<i>str</i>	string containing multiple menu labels as described above
------------	-----------------------------------------------------------

#### Returns

the index into the [menu\(\)](#) array, where the entry was added

### 33.83.3.2 add() [2/2]

```
int Fl_Menu_::add (
 const char * label,
 int shortcut,
 Fl_Callback * callback,
 void * userdata = 0,
 int flags = 0)
```

Adds a new menu item.

**Parameters**

in	<i>label</i>	The text label for the menu item.
in	<i>shortcut</i>	Optional keyboard shortcut that can be an int or string: (FL_CTRL+'a') or "^a". Default 0 if none.
in	<i>callback</i>	Optional callback invoked when user clicks the item. Default 0 if none.
in	<i>userdata</i>	Optional user data passed as an argument to the callback. Default 0 if none.
in	<i>flags</i>	Optional flags that control the type of menu item; see below. Default is 0 for none.

**Returns**

The index into the [menu\(\)](#) array, where the entry was added.

**Description**

If the menu array was directly set with [menu\(x\)](#), then [copy\(\)](#) is done to make a private array.

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

A menu item's callback must not [add\(\)](#) items to its parent menu during the callback.

Due to backwards compatibility and historical restrictions we recommend to use either

- static menu arrays that are not extended during runtime or
- dynamic, extendable menu item arrays that are entirely created by using [add\(\)](#) or [insert\(\)](#).

This ensures that all menu arrays and strings are copied to internal storage and released when required.

**Note**

If you create menus from static [Fl\\_Menu\\_Item](#) arrays and [add\(\)](#) or [insert\(\)](#) more menu items later, then the menu array is copied to local storage but some local (static) strings may appear to "leak memory". This is a known issue and discouraged usage (see description above) but the impact on memory usage should typically be small.

**Detailed Description of Parameters****label**

The menu item's label. This argument is required and must not be NULL.

The characters "&", "/", "\", and "\_" are treated as special characters in the label string. The "&" character specifies that the following character is an accelerator and will be underlined. The "/" character is used to escape the next character in the string. Labels starting with the "\_" character cause a divider to be placed after that menu item.

A label of the form "File/Quit" will create the submenu "File" with a menu item called "Quit".

The label string is copied to new memory and can be freed. The other arguments (including the shortcut) are copied into the menu item unchanged.

If an item exists already with that name then it is replaced with this new one. Otherwise this new one is added to the end of the correct menu or submenu. The return value is the offset into the array that the new entry was placed at.

#### shortcut

The keyboard shortcut for this menu item.

This parameter is optional, and defaults to 0 to indicate no shortcut.

The shortcut can either be a raw integer value (eg. `FL_CTRL+'A'`) or a string (eg. `"^c"` or `"^97"`).

Raw integer shortcuts can be a combination of keyboard chars (eg. `'A'`) and optional keyboard modifiers (see [Fl::event\\_state\(\)](#), e.g. `FL_SHIFT`, etc). In addition, `FL_COMMAND` can be used to denote `FL_META` under Mac OS X and `FL_CTRL` under other platforms.

String shortcuts can be specified in one of two ways:

```
[#+^]<ascii_value> e.g. "97", "^97", "+97", "#97"
[#+^]<ascii_char> e.g. "a", "^a", "+a", "#a"
```

..where `<ascii_value>` is a decimal value representing an ASCII character (eg. 97 is the ascii code for 'a'), and the optional prefixes enhance the value that follows. Multiple prefixes must appear in the order below.

```
- Alt
+ - Shift
^ - Control
```

Internally, the text shortcuts are converted to integer values using [fl\\_old\\_shortcut\(const char\\*\)](#).

#### callback

The callback to invoke when this menu item is selected.

This parameter is optional, and defaults to 0 for no callback.

#### userdata

The callback's 'user data' that is passed to the callback.

This parameter is optional, and defaults to 0.

#### flags

These are bit flags to define what kind of menu item this is.

This parameter is optional, and defaults to 0 to define a 'regular' menu item.

These flags can be 'OR'ed together:

```
FL_MENU_INACTIVE // Deactivate menu item (gray out)
FL_MENU_TOGGLE // Item is a checkbox toggle (shows checkbox for on/off state)
FL_MENU_VALUE // The on/off state for checkbox/radio buttons (if set, state is 'on')
FL_MENU_RADIO // Item is a radio button (one checkbox of many can be on)
FL_MENU_INVISIBLE // Item will not show up (shortcut will work)
FL_SUBMENU_POINTER // Indicates user_data() is a pointer to another menu array
FL_SUBMENU // This item is a submenu to other items
FL_MENU_DIVIDER // Creates divider line below this item. Also ends a group of radio buttons.
```

**All other bits in 'flags' are reserved and must not be used.**

If FL\_SUBMENU is set in an item's flags, then actually two items are added:

- the first item is the menu item (submenu title), as expected, and
- the second item is the submenu terminating item with the label and all other members set to 0.

If you add submenus with the 'path' technique, then the corresponding submenu terminators (maybe more than one) are added as well.

**Todo** Raw integer shortcut needs examples. Dependent on responses to <https://www.fltk.org/newsgroups.php?gfltk.coredev+v:10086> and results of STR#2344

### 33.83.3.3 clear()

```
void Fl_Menu_::clear (
 void)
```

Same as menu(NULL), set the array pointer to null, indicating a zero-length menu. Menus must not be cleared during a callback to the same menu.

### 33.83.3.4 clear\_submenu()

```
int Fl_Menu_::clear_submenu (
 int index)
```

Clears the specified submenu pointed to by `index` of all menu items.

This method is useful for clearing a submenu so that it can be re-populated with new items. Example: a "File/Recent Files/..." submenu that shows the last few files that have been opened.

The specified `index` must point to a submenu.

The submenu is cleared with `remove()`. If the menu array was directly set with `menu(x)`, then `copy()` is done to make a private array.

#### Warning

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

#### Example:

```
int index = menubar->find_index("File/Recent"); // get index of "File/Recent" submenu
if (index != -1) menubar->clear_submenu(index); // clear the submenu
menubar->add("File/Recent/Aaa");
menubar->add("File/Recent/Bbb");
[...]
```

#### Parameters

<i>index</i>	The index of the submenu to be cleared
--------------	----------------------------------------

**Returns**

0 on success, -1 if the index is out of range or not a submenu

**See also**

[remove\(int\)](#)

**33.83.3.5 copy()**

```
void Fl_Menu_::copy (
 const Fl_Menu_Item * m,
 void * ud = 0)
```

Sets the menu array pointer with a copy of *m* that will be automatically deleted.

If userdata *ud* is not NULL, then all user data pointers are changed in the menus as well. See `void Fl_Menu_::menu(const Fl_Menu_Item* m)`.

**33.83.3.6 down\_box()**

```
void Fl_Menu_::down_box (
 Fl_Boxtype b) [inline]
```

Sets the box type used to surround the currently-selected items in the menus.

**33.83.3.7 find\_index() [1/3]**

```
int Fl_Menu_::find_index (
 const char * pathname) const
```

Find the menu item index for a given menu *pathname*, such as "Edit/Copy".

This method finds a menu item's index position for the given menu *pathname*, also traversing submenus, but **not** submenu pointers (FL\_SUBMENU\_POINTER).

To get the menu item pointer for a *pathname*, use `find_item()`

**Parameters**

in	<i>pathname</i>	The path and name of the menu item to find
----	-----------------	--------------------------------------------

**Returns**

The index of the matching item, or -1 if not found.

**See also**

[item\\_pathname\(\)](#)

**33.83.3.8 find\_index() [2/3]**

```
int Fl_Menu_::find_index (
 const Fl_Menu_Item * item) const
```

Find the index into the menu array for a given *item*.

A way to convert a menu item pointer into an index.

Does **not** handle items that are in submenu pointers (FL\_SUBMENU\_POINTER).

-1 is returned if the item is not in this menu or is part of an FL\_SUBMENU\_POINTER submenu.

Current implementation is fast and not expensive.

```
// Convert an index-to-item
int index = 12;
```

```
const Fl_Menu_Item *item = mymenu->menu() + index;
// Convert an item-to-index
int index = mymenu->find_index(item);
if (index == -1) { ..error.. }
```

#### Parameters

in	<i>item</i>	The item to be found
----	-------------	----------------------

#### Returns

The index of the item, or -1 if not found.

#### See also

[menu\(\)](#)

### 33.83.3.9 find\_index() [3/3]

```
int Fl_Menu_::find_index (
 Fl_Callback * cb) const
```

Find the index into the menu array for a given callback *cb*.

This method finds a menu item's index position, also traversing submenus, but **not** submenu pointers (FL\_↔SUBMENU\_POINTER). This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

#### Parameters

<i>cb</i>	Find the first item with this callback
-----------	----------------------------------------

#### Returns

The index of the item with the specific callback, or -1 if not found

#### See also

[find\\_index\(const char\\*\)](#)

### 33.83.3.10 find\_item() [1/2]

```
const Fl_Menu_Item * Fl_Menu_::find_item (
 const char * pathname)
```

Find the menu item for a given menu *pathname*, such as "Edit/Copy".

This method finds a menu item in the menu array, also traversing submenus, but not submenu pointers (FL\_↔SUBMENU\_POINTER).

To get the menu item's index, use [find\\_index\(const char\\*\)](#)

#### Example:

```
Fl_Menu_Bar *menubar = new Fl_Menu_Bar(..);
menubar->add("File/&Open");
menubar->add("File/&Save");
menubar->add("Edit/&Copy");
// [...]
Fl_Menu_Item *item;
if ((item = (Fl_Menu_Item*)menubar->find_item("File/&Open")) != NULL) {
 item->labelcolor(FL_RED);
}
if ((item = (Fl_Menu_Item*)menubar->find_item("Edit/&Copy")) != NULL) {
 item->labelcolor(FL_GREEN);
}
```

## Parameters

<i>pathname</i>	The path and name of the menu item
-----------------	------------------------------------

## Returns

The item found, or NULL if not found

## See also

[find\\_index\(const char\\*\)](#), [find\\_item\(Fl\\_Callback\\*\)](#), [item\\_pathname\(\)](#)

**33.83.3.11 find\_item()** [2/2]

```
const Fl_Menu_Item * Fl_Menu_::find_item (
 Fl_Callback * cb)
```

Find the menu item for the given callback *cb*.

This method finds a menu item in a menu array, also traversing submenus, but not submenu pointers. This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

## Parameters

<i>in</i>	<i>cb</i>	find the first item with this callback
-----------	-----------	----------------------------------------

## Returns

The item found, or NULL if not found

## See also

[find\\_item\(const char\\*\)](#)

**33.83.3.12 find\_item\_with\_argument()**

```
const Fl_Menu_Item * Fl_Menu_::find_item_with_argument (
 long v)
```

Find the menu item for the given user argument *v*.

## Parameters

<i>in</i>	<i>v</i>	find the first item with this user argument
-----------	----------	---------------------------------------------

## Returns

The item found, or NULL if not found

## See also

[find\\_item\(const char\\*\)](#)

**33.83.3.13 find\_item\_with\_user\_data()**

```
const Fl_Menu_Item * Fl_Menu_::find_item_with_user_data (
 void * v)
```

Find the menu item for the given user data `v`.

#### Parameters

in	v	find the first item with this user data
----	---	-----------------------------------------

#### Returns

The item found, or NULL if not found

#### See also

[find\\_item\(const char\\*\)](#)

### 33.83.3.14 global()

```
void Fl_Menu_::global ()
```

Make the shortcuts for this menu work no matter what window has the focus when you type it.

This is done by using [Fl::add\\_handler\(\)](#). This `Fl_Menu_` widget does not have to be visible (ie the window it is in can be hidden, or it does not have to be put in a window at all).

Currently there can be only one [global\(\)](#) menu. Setting a new one will replace the old one. There is no way to remove the [global\(\)](#) setting (so don't destroy the widget!)

### 33.83.3.15 insert()

```
int Fl_Menu_::insert (
 int index,
 const char * label,
 int shortcut,
 Fl_Callback * callback,
 void * userdata = 0,
 int flags = 0)
```

Inserts a new menu item at the specified `index` position.

If `index` is -1, the menu item is appended; same behavior as [add\(\)](#).

To properly insert a menu item, `label` must be the name of the item (eg. "Quit"), and not a 'menu pathname' (eg. "File/Quit"). If a menu pathname is specified, the value of `index` is *ignored*, the new item's position defined by the pathname.

For more details, see [add\(\)](#). Except for the `index` parameter, [add\(\)](#) has more detailed information on parameters and behavior, and is functionally equivalent.

#### Parameters

in	<i>index</i>	The menu array's index position where the new item is inserted. If -1, behavior is the same as <a href="#">add()</a> .
in	<i>label</i>	The text label for the menu item. If the label is a menu pathname, <code>index</code> is ignored, and the pathname indicates the position of the new item.
in	<i>shortcut</i>	Optional keyboard shortcut. Can be an int (FL_CTRL+'a') or a string ("^a"). Default is 0.
in	<i>callback</i>	Optional callback invoked when user clicks the item. Default 0 if none.
in	<i>userdata</i>	Optional user data passed as an argument to the callback. Default 0 if none.
in	<i>flags</i>	Optional flags that control the type of menu item; see <a href="#">add()</a> for more info. Default is 0 for none.

**Returns**

The index into the `menu()` array, where the entry was added.

**See also**

[add\(\)](#)

**33.83.3.16 item\_pathname()**

```
int Fl_Menu_::item_pathname (
 char * name,
 int namelen,
 const Fl_Menu_Item * finditem = 0) const
```

Get the menu 'pathname' for the specified menuitem.

If `finditem==NULL`, `mvalue()` is used (the most recently picked menuitem).

**Example:**

```
Fl_Menu_Bar *menubar = 0;
void my_menu_callback(Fl_Widget*,void*) {
 char name[80];
 if (menubar->item_pathname(name, sizeof(name)-1) == 0) { // recently picked item
 if (strcmp(name, "File/&Open") == 0) { .. } // open invoked
 if (strcmp(name, "File/&Save") == 0) { .. } // save invoked
 if (strcmp(name, "Edit/&Copy") == 0) { .. } // copy invoked
 }
}
int main() {
 [...]
 menubar = new Fl_Menu_Bar(..);
 menubar->add("File/&Open", 0, my_menu_callback);
 menubar->add("File/&Save", 0, my_menu_callback);
 menubar->add("Edit/&Copy", 0, my_menu_callback);
 [...]
}
```

**Returns**

- 0 : OK (name has menuitem's pathname)
- -1 : item not found (name="")
- -2 : 'name' not large enough (name="")

**See also**

[find\\_item\(\)](#)

**33.83.3.17 menu() [1/2]**

```
const Fl_Menu_Item * Fl_Menu_::menu () const [inline]
```

Returns a pointer to the array of `Fl_Menu_Items`.

This will either be the value passed to `menu(value)` or the private copy or an internal (temporary) location (see note below).

**Note**

**Implementation details - may be changed in the future.** All modifications of the menu array are done by copying the entire menu array to an internal storage for optimization of memory allocations, for instance when using `add()` or `insert()`. While this is done, `menu()` returns the pointer to this internal location. The entire menu will be copied back to private storage when needed, i.e. when **another** `Fl_Menu_` is modified. You can force this reallocation after you're done with all menu modifications by calling `Fl_Menu_::menu_end()` to make sure `menu()` returns a permanent pointer to private storage (until the menu is modified again). Note also that some menu methods (e.g. `Fl_Menu_Button::popup()`) call `menu_end()` internally to ensure a consistent menu array while the menu is open.

## See also

[size\(\)](#) – returns the [size](#) of the [Fl\\_Menu\\_Item](#) array.

[menu\\_end\(\)](#) – finish menu modifications (optional)

**Example:** How to walk the array:

```
for (int t=0; t<menubar->size(); t++) { // walk array of items
 const Fl_Menu_Item &item = menubar->menu()[t]; // get each item
 fprintf(stderr, "item #d -- label=%s, value=%s type=%s\n",
 t,
 item.label() ? item.label() : "(Null)", // menu terminators have NULL labels
 (item.flags & FL_MENU_VALUE) ? "set" : "clear", // value of toggle or radio items
 (item.flags & FL_SUBMENU) ? "Submenu" : "Item"); // see if item is a submenu or actual item
}
```

**33.83.3.18 menu()** [2/2]

```
void Fl_Menu_::menu (
 const Fl_Menu_Item * m)
```

Sets the menu array pointer directly.

If the old menu is private it is deleted. NULL is allowed and acts the same as a zero-length menu. If you try to modify the array (with [add\(\)](#), [replace\(\)](#), or [remove\(\)](#)) a private copy is automatically done.

**33.83.3.19 menu\_box()** [1/2]

```
Fl_Boxtype Fl_Menu_::menu_box () const [inline]
```

Get the box type for the menu popup windows.

## Returns

the box type, or FL\_NO\_BOX if [Fl\\_Menu\\_::box\(\)](#) is to be used instead

**33.83.3.20 menu\_box()** [2/2]

```
void Fl_Menu_::menu_box (
 Fl_Boxtype b) [inline]
```

Set the box type for the menu popup windows.

If `menu_box` set to FL\_NO\_BOX, the menu window will use [Fl\\_Menu\\_::box\(\)](#) instead.

## Parameters

in	<i>b</i>	new box type or FL_NO_BOX
----	----------	---------------------------

**33.83.3.21 menu\_end()**

```
const Fl_Menu_Item * Fl_Menu_::menu_end ()
```

Finishes menu modifications and returns [menu\(\)](#).

Call [menu\\_end\(\)](#) after using [add\(\)](#), [insert\(\)](#), [remove\(\)](#), or any other methods that may change the menu array if you want to access the menu array anytime later with [menu\(\)](#). This should be called only once after the **last** menu modification for performance reasons.

Does nothing if the menu array is already in a private location.

Some methods like [Fl\\_Menu\\_Button::popup\(\)](#) call this method before their menu is opened.

## Note

After menu changes like [add\(\)](#), [insert\(\)](#), etc. [menu\(\)](#) would return a pointer to a temporary internal menu array that may be relocated at unexpected times. This is due to performance considerations and may be changed w/o further notice.

**Since**

1.4.0

**Returns**New [Fl\\_Menu\\_Item](#) array pointer.**See also**[Fl\\_Menu\\_::menu\(\)](#)**33.83.3.22 mode() [1/2]**

```
int Fl_Menu_::mode (
 int i) const [inline]
```

Get the flags of item i.

For a list of the flags, see [Fl\\_Menu\\_Item](#).**33.83.3.23 mode() [2/2]**

```
void Fl_Menu_::mode (
 int i,
 int fl) [inline]
```

Set the flags of item i.

For a list of the flags, see [Fl\\_Menu\\_Item](#).**33.83.3.24 mvalue()**

```
const Fl_Menu_Item * Fl_Menu_::mvalue () const [inline]
```

Return a pointer to the last menu item that was picked.

**33.83.3.25 picked()**

```
const Fl_Menu_Item * Fl_Menu_::picked (
 const Fl_Menu_Item * v)
```

When user picks a menu item, call this.

It will do the callback.

Unfortunately this also casts away const for the checkboxes, but this was necessary so non-checkbox menus can really be declared 'const'.

**Parameters**

in	v	The menu item that was picked by the user.
----	---	--------------------------------------------

**Returns**The same [Fl\\_Menu\\_Item\\*](#) that was set (v).**33.83.3.26 prev\_mvalue()**

```
const Fl_Menu_Item * Fl_Menu_::prev_mvalue () const [inline]
```

Return a pointer to the menu item that was picked before the current one was picked. This call gives developers additional details how a user changed a choice in the [Fl\\_Choice](#) widget.

### 33.83.3.27 remove()

```
void Fl_Menu_::remove (
 int i)
```

Deletes item *i* from the menu.

If the menu array was directly set with `menu(x)` then `copy()` is done to make a private array.

No items must be removed from a menu during a callback to the same menu.

#### Parameters

<i>i</i>	index into menu array
----------	-----------------------

### 33.83.3.28 replace()

```
void Fl_Menu_::replace (
 int i,
 const char * str)
```

Changes the text of item *i*.

This is the only way to get slash into an `add()`'ed menu item. If the menu array was directly set with `menu(x)` then `copy()` is done to make a private array.

#### Parameters

<i>i</i>	index into menu array
<i>str</i>	new label for menu item at index <i>i</i>

### 33.83.3.29 size()

```
int Fl_Menu_::size () const
```

This returns the number of [Fl\\_Menu\\_Item](#) structures that make up the menu, correctly counting submenus.

This includes the "terminator" item at the end. To copy a menu array you need to copy `size()*sizeof(Fl_Menu_Item)` bytes. If the menu is NULL this returns zero (an empty menu will return 1).

### 33.83.3.30 test\_shortcut()

```
const Fl_Menu_Item * Fl_Menu_::test_shortcut () [inline]
```

Returns the menu item with the entered shortcut (key value).

This searches the complete `menu()` for a shortcut that matches the entered key value. It must be called for a `FL_KEYBOARD` or `FL_SHORTCUT` event.

If a match is found, the menu's callback will be called.

#### Returns

matched [Fl\\_Menu\\_Item](#) or NULL.

### 33.83.3.31 text() [1/2]

```
const char * Fl_Menu_::text () const [inline]
```

Returns the title of the last item chosen.

**33.83.3.32 text()** [2/2]

```
const char * Fl_Menu_::text (
 int i) const [inline]
```

Returns the title of item i.

**33.83.3.33 textcolor()**

```
Fl_Color Fl_Menu_::textcolor () const [inline]
```

Get the current color of menu item labels.

**33.83.3.34 textfont()** [1/2]

```
Fl_Font Fl_Menu_::textfont () const [inline]
```

Gets the current font of menu item labels.

**33.83.3.35 textfont()** [2/2]

```
void Fl_Menu_::textfont (
 Fl_Font c) [inline]
```

Sets the current font of menu item labels.

**33.83.3.36 textsize()** [1/2]

```
Fl_Fontsize Fl_Menu_::textsize () const [inline]
```

Gets the font size of menu item labels.

**33.83.3.37 textsize()** [2/2]

```
void Fl_Menu_::textsize (
 Fl_Fontsize c) [inline]
```

Sets the font size of menu item labels.

**33.83.3.38 value()** [1/3]

```
int Fl_Menu_::value () const
```

Return the index into the [menu\(\)](#) of the last item chosen by the user.

The *value* of the menu is the index into the [menu\(\)](#) of the last item chosen by the user or -1.

It is -1 initially (if no item has been chosen) or if the chosen menu item is part of a submenu addressed by an `FL_SUBMENU_POINTER`.

**Note**

All menu items are located in a contiguous array of [Fl\\_Menu\\_Item](#)'s unless an item has the `FL_SUBMENU_POINTER` flag which redirects the submenu to an independent submenu array. This submenu array is not counted in the [size\(\)](#) of the menu, and menu items in this submenu can't return a valid index into the **main** menu. Therefore menu items that are located in such a submenu return -1 when [value\(\)](#) is called. This may be changed in a future version.

You can use [mvalue\(\)](#) instead to retrieve the last picked menu item directly.

#### Returns

Index of the last chosen menu item or -1 (see description).

#### See also

const [Fl\\_Menu\\_Item](#) \*mvalue()

### 33.83.3.39 value() [2/3]

```
int Fl_Menu_::value (
 const Fl_Menu_Item * m)
```

Set the value of a menu to the menu item *m*.

The *value* of the menu is the index into the [menu\(\)](#) of the last item chosen by the user or -1.

It is -1 initially (if no item has been chosen) or if the chosen menu item is part of a submenu addressed by an `FL_SUBMENU_POINTER`.

#### Note

All menu items are located in a contiguous array of [Fl\\_Menu\\_Item](#)'s unless an item has the `FL_SUBMENU_POINTER` flag which redirects the submenu to an independent submenu array. This submenu array is not counted in the [size\(\)](#) of the menu, and menu items in this submenu can't return a valid index into the **main** menu. Therefore menu items that are located in such a submenu return -1 when [value\(\)](#) is called. This may be changed in a future version.

The menu item can be any menu item, even one in a detached submenu (see note about `FL_SUBMENU_POINTER` above).

#### Parameters

in	<i>m</i>	Pointer to any menu item.
----	----------	---------------------------

#### Returns

Whether the new value is different than the old one.

#### Return values

0	The value didn't change.
1	The value was changed.

#### See also

int [value\(int\)](#)

int [value\(\)](#)

const [Fl\\_Menu\\_Item](#) \*mvalue()

### 33.83.3.40 value() [3/3]

```
int Fl_Menu_::value (
 int i) [inline]
```

Set the value of the menu to index *i*.

The *value* of the menu is the index into the [menu\(\)](#) of the last item chosen by the user or -1.

It is `-1` initially (if no item has been chosen) or if the chosen menu item is part of a submenu addressed by an `FL_SUBMENU_POINTER`.

#### Note

All menu items are located in a contiguous array of `FI_Menu_Item`'s unless an item has the `FL_SUBMENU_POINTER` flag which redirects the submenu to an independent submenu array. This submenu array is not counted in the `size()` of the menu, and menu items in this submenu can't return a valid index into the **main** menu. Therefore menu items that are located in such a submenu return `-1` when `value()` is called. This may be changed in a future version.

You can set the value as an integer or with a pointer to a menu item. The integer value is restricted to the main menu array (`0..size()-1`) whereas the menu item can be any menu item, even one in a detached submenu (see note about `FL_SUBMENU_POINTER` above).

#### Parameters

<code>in</code>	<code>i</code>	Index of the menu item in the main menu array. Values outside <code>0..size()-1</code> are ignored (return 0).
-----------------	----------------	----------------------------------------------------------------------------------------------------------------

#### Returns

Whether the new value is different than the old one.

#### Return values

<code>0</code>	The value didn't change.
<code>1</code>	The value was changed.

## Additional Inherited Members

### 33.84.1 Detailed Description

This widget provides a standard menubar interface.

Usually you will put this widget along the top edge of your window. The height of the widget should be 30 for the menu titles to draw correctly with the default font.

The items on the bar and the menus they bring up are defined by a single [FI\\_Menu\\_Item](#) array. Because a [FI\\_Menu\\_Item](#) array defines a hierarchy, the top level menu defines the items in the menubar, while the submenus define the pull-down menus. Sub-sub menus and lower pop up to the right of the submenus.

**Figure 33.28** menubar

If there is an item in the top menu that is not a title of a submenu, then it acts like a "button" in the menubar. Clicking on it will pick it.

When the user clicks a menu item, [value\(\)](#) is set to that item and then:

- The item's callback is done if one has been set; the [FI\\_Menu\\_Bar](#) is passed as the [FI\\_Widget\\*](#) argument, along with any userdata configured for the callback.
- If the item does not have a callback, the [FI\\_Menu\\_Bar](#)'s callback is done instead, along with any userdata configured for the callback. The callback can determine which item was picked using [value\(\)](#), [mvalue\(\)](#), [item\\_pathname\(\)](#), etc.

Submenus will also pop up in response to shortcuts indicated by putting a '&' character in the name field of the menu item. If you put a '&' character in a top-level "button" then the shortcut picks it. The '&' character in submenus is ignored until the menu is popped up.

Typing the [shortcut\(\)](#) of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse.

### 33.84.2 Constructor & Destructor Documentation

### 33.84.2.1 Fl\_Menu\_Bar()

```
Fl_Menu_Bar::Fl_Menu_Bar (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Menu\\_Bar](#) widget using the given position, size, and label string.

The default boxtype is FL\_UP\_BOX.

The constructor sets [menu\(\)](#) to NULL. See [Fl\\_Menu\\_](#) for the methods to set or change the menu.

[labelsize\(\)](#), [labelfont\(\)](#), and [labelcolor\(\)](#) are used to control how the menubar items are drawn. They are initialized from the Fl\_Menu static variables, but you can change them if desired.

[label\(\)](#) is ignored unless you change [align\(\)](#) to put it outside the menubar.

The destructor removes the [Fl\\_Menu\\_Bar](#) widget and all of its menu items.

## 33.84.3 Member Function Documentation

### 33.84.3.1 draw()

```
void Fl_Menu_Bar::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Sys\\_Menu\\_Bar](#).

### 33.84.3.2 handle()

```
int Fl_Menu_Bar::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
---	-----------------------------------------

## Return values

1	if the event was used and can be deleted
---	------------------------------------------

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

**33.84.3.3 play\_menu()**

```
void Fl_Menu_Bar::play_menu (
 const Fl_Menu_Item * item) [virtual]
```

Opens the 1st level submenu of the menubar corresponding to *item*.

## Since

1.4.0

Reimplemented in [Fl\\_Sys\\_Menu\\_Bar](#).

**33.84.3.4 update()**

```
virtual void Fl_Menu_Bar::update () [inline], [virtual]
```

Updates the menu bar after any change to its items.

This is useful when the menu bar can be an [Fl\\_Sys\\_Menu\\_Bar](#) object.

Reimplemented in [Fl\\_Sys\\_Menu\\_Bar](#).

The documentation for this class was generated from the following files:

- [Fl\\_Menu\\_Bar.H](#)
- [Fl\\_Menu\\_Bar.cxx](#)

**33.85 Fl\_Menu\_Button Class Reference**

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of [Fl\\_Menu\\_Item](#) objects.

```
#include <Fl_Menu_Button.H>
```

Inheritance diagram for [Fl\\_Menu\\_Button](#):

**Public Types**

- enum [popup\\_buttons](#) {  
[POPUP1](#) = 1 , [POPUP2](#) , [POPUP12](#) , [POPUP3](#) ,  
[POPUP13](#) , [POPUP23](#) , [POPUP123](#) }

*indicate what mouse buttons pop up the menu.*

## Public Member Functions

- [FI\\_Menu\\_Button](#) (int, int, int, int, const char \**l*=0)  
*Creates a new FI\_Menu\_Button widget using the given position, size, and label string.*

*Draws the widget.*

## Static Protected Attributes

- static [FI\\_Menu\\_Button](#) \* [pressed\\_menu\\_button\\_](#) = NULL

## Additional Inherited Members

### 33.85.1 Detailed Description

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of [FI\\_Menu\\_Item](#) objects.

Figure 33.29 menu\_button

Normally any mouse button will pop up a menu and it is lined up below the button as shown in the picture. However an [FI\\_Menu\\_Button](#) may also control a pop-up menu. This is done by setting the [type\(\)](#). If [type\(\)](#) is zero a normal menu button is produced. If it is nonzero then this is a pop-up menu. The bits in [type\(\)](#) indicate what mouse buttons pop up the menu (see [FI\\_Menu\\_Button::popup\\_buttons](#)).

The menu will also pop up in response to shortcuts indicated by putting a '&' character in the [label\(\)](#).

Typing the [shortcut\(\)](#) of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse. The '&' character in menu item names are only looked at when the menu is popped up, however.

When the user clicks a menu item, [value\(\)](#) is set to that item and then:

- The item's callback is done if one has been set; the [FI\\_Menu\\_Button](#) is passed as the [FI\\_Widget\\*](#) argument, along with any userdata configured for the callback.
- If the item does not have a callback, the [FI\\_Menu\\_Button](#)'s callback is done instead, along with any userdata configured for it. The callback can determine which item was picked using [value\(\)](#), [mvalue\(\)](#), [item\\_pathname\(\)](#), etc.

## 33.85.2 Member Enumeration Documentation

### 33.85.2.1 popup\_buttons

enum `Fl_Menu_Button::popup_buttons`

indicate what mouse buttons pop up the menu.

Values for `type()` used to indicate what mouse buttons pop up the menu. `Fl_Menu_Button::POPUP3` is usually what you want.

Enumerator

POPUP1	pops up with the mouse 1st button.
POPUP2	pops up with the mouse 2nd button.
POPUP12	pops up with the mouse 1st or 2nd buttons.
POPUP3	pops up with the mouse 3rd button.
POPUP13	pops up with the mouse 1st or 3rd buttons.
POPUP23	pops up with the mouse 2nd or 3rd buttons.
POPUP123	pops up with any mouse button.

## 33.85.3 Constructor & Destructor Documentation

### 33.85.3.1 Fl\_Menu\_Button()

```
Fl_Menu_Button::Fl_Menu_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Menu_Button` widget using the given position, size, and label string.

The default boxtype is `FL_UP_BOX`.

The constructor sets `menu()` to `NULL`. See `Fl_Menu_` for the methods to set or change the menu.

## 33.85.4 Member Function Documentation

### 33.85.4.1 draw()

```
void Fl_Menu_Button::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

### 33.85.4.2 handle()

```
int Fl_Menu_Button::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

### 33.85.4.3 popup()

```
const Fl_Menu_Item * Fl_Menu_Button::popup ()
```

Act exactly as though the user clicked the button or typed the shortcut key.

The menu appears, it waits for the user to pick an item, and if they pick one it sets [value\(\)](#) and does the callback or sets [changed\(\)](#) as described above. The menu item is returned or NULL if the user dismisses the menu.

#### Note

Since FLTK 1.4.0 [Fl\\_Menu\\_::menu\\_end\(\)](#) is called before the menu pops up to make sure the menu array is located in private storage.

#### See also

[Fl\\_Menu\\_::menu\\_end\(\)](#)

The documentation for this class was generated from the following files:

- [Fl\\_Menu\\_Button.H](#)
- [Fl\\_Menu\\_Button.cxx](#)

## 33.86 Fl\_Menu\_Item Struct Reference

The [Fl\\_Menu\\_Item](#) structure defines a single menu item that is used by the [Fl\\_Menu\\_](#) class.

```
#include <Fl_Menu_Item.H>
```

## Public Member Functions

- void **activate** ()  
*Allows a menu item to be picked.*
- int **active** () const  
*Gets whether or not the item can be picked.*
- int **activevisible** () const  
*Returns non 0 if FL\_INACTIVE and FL\_INVISIBLE are cleared, 0 otherwise.*
- int **add** (const char \*, int **shortcut**, **FI\_Callback** \*, void \*=0, int=0)  
*Adds a menu item.*
- int **add** (const char \*a, const char \*b, **FI\_Callback** \*c, void \*d=0, int e=0)  
*See int add(const char\*, int shortcut, FI\_Callback\*, void\*, int)*
- long **argument** () const  
*Gets the `user_data()` argument that is sent to the callback function.*
- void **argument** (long v)  
*Sets the `user_data()` argument that is sent to the callback function.*
- **FI\_Callback\_p** **callback** () const  
*Returns the callback function that is set for the menu item.*
- void **callback** (**FI\_Callback** \*c)  
*Sets the menu item's callback function.*
- void **callback** (**FI\_Callback** \*c, void \*p)  
*Sets the menu item's callback function and userdata() argument.*
- void **callback** (**FI\_Callback0** \*c)  
*Sets the menu item's callback function.*
- void **callback** (**FI\_Callback1** \*c, long p=0)  
*Sets the menu item's callback function and userdata() argument.*
- void **check** ()  
*Back compatibility only.*
- int **checkbox** () const  
*Returns true if a checkbox will be drawn next to this item.*
- int **checked** () const  
*Back compatibility only.*
- void **clear** ()  
*Turns the check or radio item "off" for the menu item.*
- void **deactivate** ()  
*Prevents a menu item from being picked.*
- void **do\_callback** (**FI\_Widget** \*o) const

- Hides an item in the menu.*

  - void **image** (**FI\_Image** &image)
  - Compatibility API for FLUID, same as image.label(this).*
  - void **image** (**FI\_Image** \*image)
  - Compatibility API for FLUID, same as image->label(this).*
  - void **image\_label** (const **FI\_Image** \*image)
  - Sets the title (label()) to an icon or image.*
  - int **insert** (int, const char \*, int, **FI\_Callback** \*, void \*=0, int=0)
  - Inserts an item at position index.*
  - const char \* **label** () const
  - Returns the title (label) of the menu item.*
  - void **label** (const char \*a)
  - Sets the title (label) of the menu item.*
  - void **label** (**FI\_Labeltype** a, const char \*b)
  - Sets the title (label) and the label type of the menu item.*
  - **FI\_Color** **labelcolor** () const
  - Gets the menu item's label color.*
  - void **labelcolor** (**FI\_Color** a)
  - Sets the menu item's label color.*
  - **FI\_Font** **labelfont** () const
  - Gets the menu item's label font.*
  - void **labelfont** (**FI\_Font** a)
  - Sets the menu item's label font.*
  - **FI\_Fontsize** **labelsize** () const
  - Gets the label font pixel size/height.*
  - void **labelsize** (**FI\_Fontsize** a)
  - Sets the label font pixel size/height.*
  - **FI\_Labeltype** **labeltype** () const
  - Returns the menu item's labeltype.*
  - void **labeltype** (**FI\_Labeltype** a)
  - Sets the menu item's labeltype.*
  - int **measure** (int \*h, const **FI\_Menu\_\***) const
  - Measures width of label, including effect of & characters.*
  - void **multi\_label** (const **FI\_Multi\_Label** \*ml)
  - Sets the title (label()) and labeltype() to an FI\_Multi\_Label.*
  - **FI\_Menu\_Item** \* **next** (int i=1)
  - Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items.*
  - const **FI\_Menu\_Item** \* **next** (int=1) const
  - Advance a pointer by n items through a menu array, skipping the contents of submenus and invisible items.*
  - const **FI\_Menu\_Item** \* **popup** (int X, int Y, const char \*title=0, const **FI\_Menu\_Item** \*picked=0, const **FI\_Menu\_\***=0) const
  - This method is called by widgets that want to display menus.*
  - const **FI\_Menu\_Item** \* **pulldown** (int X, int Y, int W, int H, const **FI\_Menu\_Item** \*picked=0, const **FI\_Menu\_\***=0, const **FI\_Menu\_Item** \*title=0, int menubar=0) const
  - Pulldown() is similar to popup(), but a rectangle is provided to position the menu.*
  - int **radio** () const
  - Returns true if this item is a radio item.*
  - void **set** ()
  - Turns the check or radio item "on" for the menu item.*
  - void **setonly** (**FI\_Menu\_Item** const \*first=NULL)
  - Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.*

- int **shortcut** () const  
*Gets what key combination shortcut will trigger the menu item.*
- void **shortcut** (int s)  
*Sets exactly what key combination will trigger the menu item.*
- void **show** ()  
*Makes an item visible in the menu.*
- int **size** () const  
*Size of the menu starting from this menu item.*
- int **submenu** () const  
*Returns true if either FL\_SUBMENU or FL\_SUBMENU\_POINTER is on in the flags.*
- const **FI\_Menu\_Item** \* **test\_shortcut** () const  
*This is designed to be called by a widgets handle() method in response to a FL\_SHORTCUT event.*
- void **uncheck** ()  
*Back compatibility only.*
- void \* **user\_data** () const  
*Gets the user\_data() argument that is sent to the callback function.*
- void **user\_data** (void \*v)  
*Sets the user\_data() argument that is sent to the callback function.*
- int **value** () const  
*Returns the current value of the check or radio item.*
- void **value** (int v)  
*Sets the current value of the check or radio item.*
- int **visible** () const  
*Gets the visibility of an item.*

## Public Attributes

- **FI\_Callback** \* **callback\_**  
*menu item callback*
- int **flags**  
*menu item flags like FL\_MENU\_TOGGLE, FL\_MENU\_RADIO*
- **FI\_Color** **labelcolor\_**  
*menu item text color*
- **FI\_Font** **labelfont\_**  
*which font for this menu item text*
- **FI\_Fontsize** **labelsize\_**  
*size of menu item text*
- **uchar** **labeltype\_**  
*how the menu item text looks like*
- int **shortcut\_**  
*menu item shortcut*
- const char \* **text**  
*menu item text, returned by label()*
- void \* **user\_data\_**  
*menu item user\_data for the menu's callback*

### 33.86.1 Detailed Description

The `Fl_Menu_Item` structure defines a single menu item that is used by the `Fl_Menu_` class.

```
struct Fl_Menu_Item {
 const char* text; // label()
 int shortcut_;
 Fl_Callback* callback_;
 void* user_data_;
 int flags;
 uchar labeltype_;
 uchar labelfont_;
 uchar labelsize_;
 uchar labelcolor_;
};

enum { // values for flags:
 FL_MENU_INACTIVE = 1, // Deactivate menu item (gray out)
 FL_MENU_TOGGLE = 2, // Item is a checkbox toggle (shows checkbox for on/off state)
 FL_MENU_VALUE = 4, // The on/off state for checkbox/radio buttons (if set, state is 'on')
 FL_MENU_RADIO = 8, // Item is a radio button (one checkbox of many can be on)
 FL_MENU_INVISIBLE = 0x10, // Item will not show up (shortcut will work)
 FL_SUBMENU_POINTER = 0x20, // Indicates user_data() is a pointer to another menu array
 FL_SUBMENU = 0x40, // This item is a submenu to other items
 FL_MENU_DIVIDER = 0x80, // Creates divider line below this item. Also ends a group of radio
 buttons.
 FL_MENU_HORIZONTAL = 0x100, // ??? -- reserved, internal (do not use)
 FL_MENU_RESERVED = 0xfffff00 // These bits are reserved for internal or future usage (do not use)
};
```

Typically menu items are statically defined; for example:

```
Fl_Menu_Item popup[] = {
 {"&alpha", FL_ALT+'a', the_cb, (void*)1},
 {"&beta", FL_ALT+'b', the_cb, (void*)2},
 {"&gamma", FL_ALT+'c', the_cb, (void*)3, FL_MENU_DIVIDER},
 {"&strange", 0, strange_cb},
 {"&charm", 0, charm_cb},
 {"&truth", 0, truth_cb},
 {"b&eauty", 0, beauty_cb},
 {"sub&menu", 0, 0, 0, FL_SUBMENU},
 {"one"},
 {"two"},
 {"three"},
 {0},
 {"inactive", FL_ALT+'i', 0, 0, FL_MENU_INACTIVE|FL_MENU_DIVIDER},
 {"invisible",FL_ALT+'i', 0, 0, FL_MENU_INVISIBLE},
 {"check", FL_ALT+'i', 0, 0, FL_MENU_TOGGLE|FL_MENU_VALUE},
 {"box", FL_ALT+'i', 0, 0, FL_MENU_TOGGLE},
 {0};
```

produces:

Figure 33.30 menu

A submenu title is identified by the bit `FL_SUBMENU` in the flags field, and ends with a `label()` that is `NULL`. You can nest menus to any depth. A pointer to the first item in the submenu can be treated as an `Fl_Menu` array itself. It is also possible to make separate submenu arrays with `FL_SUBMENU_POINTER` flags.

You should use the method functions to access structure members and not access them directly to avoid compatibility problems with future releases of FLTK.

#### Note

Adding menu items with `insert()`, `add()`, or any of its overloaded variants copies the entire menu to internal storage. Using the memory of a static menu array after that would access unused (but not released) memory and thus have no effect.

## 33.86.2 Member Function Documentation

### 33.86.2.1 `add()`

```
int Fl_Menu_Item::add (
 const char * mytext,
 int sc,
 Fl_Callback * cb,
 void * data = 0,
 int myflags = 0)
```

Adds a menu item.

The text is split at `'/'` characters to automatically produce submenus (actually a totally unnecessary feature as you can now add submenu titles directly by setting `FL_SUBMENU` in the flags).

**Returns**

the index into the menu() array, where the entry was added

**See also**

[Fl\\_Menu\\_Item::insert\(int, const char\\*, int, Fl\\_Callback\\*, void\\*, int\)](#)

**33.86.2.2 argument() [1/2]**

```
long Fl_Menu_Item::argument () const [inline]
```

Gets the [user\\_data\(\)](#) argument that is sent to the callback function.

For convenience you can also define the callback as taking a long argument. This method casts the stored userdata() argument to long and returns it as a *long* value.

**33.86.2.3 argument() [2/2]**

```
void Fl_Menu_Item::argument (
 long v) [inline]
```

Sets the [user\\_data\(\)](#) argument that is sent to the callback function.

For convenience you can also define the callback as taking a long argument. This method casts the given argument *v* to void\* and stores it in the menu item's userdata() member. This may not be portable to some machines.

**33.86.2.4 callback() [1/5]**

```
Fl_Callback_p Fl_Menu_Item::callback () const [inline]
```

Returns the callback function that is set for the menu item.

Each item has space for a callback function and an argument for that function. Due to back compatibility, the [Fl\\_Menu\\_Item](#) itself is not passed to the callback, instead you have to get it by calling ((Fl\_Menu\_\*)w)->mvalue() where *w* is the widget argument.

**33.86.2.5 callback() [2/5]**

```
void Fl_Menu_Item::callback (
 Fl_Callback * c) [inline]
```

Sets the menu item's callback function.

This method does not set the userdata() argument.

**See also**

[Fl\\_Callback\\_p Fl\\_MenuItem::callback\(\) const](#)

**33.86.2.6 callback() [3/5]**

```
void Fl_Menu_Item::callback (
 Fl_Callback * c,
 void * p) [inline]
```

Sets the menu item's callback function and userdata() argument.

**See also**

[Fl\\_Callback\\_p Fl\\_MenuItem::callback\(\) const](#)

**33.86.2.7 callback()** [4/5]

```
void Fl_Menu_Item::callback (
 Fl_Callback0 * c) [inline]
```

Sets the menu item's callback function.  
This method does not set the `userdata()` argument.

See also

[Fl\\_Callback\\_p](#) `Fl_MenuItem::callback() const`

**33.86.2.8 callback()** [5/5]

```
void Fl_Menu_Item::callback (
 Fl_Callback1 * c,
 long p = 0) [inline]
```

Sets the menu item's callback function and `userdata()` argument.  
The argument `is` is cast to `void*` and stored as the `userdata()` for the menu item's callback function.

See also

[Fl\\_Callback\\_p](#) `Fl_MenuItem::callback() const`

**33.86.2.9 check()**

```
void Fl_Menu_Item::check () [inline]
```

Back compatibility only.

**Deprecated** Please use `Fl_Menu_Item::set()` instead. This method will be removed in FLTK 1.5.0 or later.

See also

[set\(\)](#)

**33.86.2.10 checkbox()**

```
int Fl_Menu_Item::checkbox () const [inline]
```

Returns true if a checkbox will be drawn next to this item.  
This is true if `FL_MENU_TOGGLE` or `FL_MENU_RADIO` is set in the flags.

**33.86.2.11 checked()**

```
int Fl_Menu_Item::checked () const [inline]
```

Back compatibility only.

**Deprecated** Please use `Fl_Menu_Item::value()` instead. This method will be removed in FLTK 1.5.0 or later.

See also

[value\(\)](#)

**33.86.2.12 deactivate()**

```
void Fl_Menu_Item::deactivate () [inline]
```

Prevents a menu item from being picked.  
Note that this will also cause the menu item to appear grayed-out.

**33.86.2.13 do\_callback()** [1/3]

```
void Fl_Menu_Item::do_callback (
 Fl_Widget * o) const [inline]
```

Calls the [Fl\\_Menu\\_Item](#) item's callback, and provides the [Fl\\_Widget](#) argument.

The callback is called with the stored [user\\_data\(\)](#) as its second argument. You must first check that [callback\(\)](#) is non-zero before calling this.

**33.86.2.14 do\_callback()** [2/3]

```
void Fl_Menu_Item::do_callback (
 Fl_Widget * o,
 long arg) const [inline]
```

Calls the [Fl\\_Menu\\_Item](#) item's callback, and provides the [Fl\\_Widget](#) argument.

This call overrides the callback's second argument with the given value `arg`. `long arg` is cast to `void*` when calling the callback. You must first check that [callback\(\)](#) is non-zero before calling this.

**33.86.2.15 do\_callback()** [3/3]

```
void Fl_Menu_Item::do_callback (
 Fl_Widget * o,
 void * arg) const [inline]
```

Calls the [Fl\\_Menu\\_Item](#) item's callback, and provides the [Fl\\_Widget](#) argument.

This call overrides the callback's second argument with the given value `arg`. You must first check that [callback\(\)](#) is non-zero before calling this.

**33.86.2.16 find\_shortcut()**

```
const Fl_Menu_Item * Fl_Menu_Item::find_shortcut (
 int * ip = 0,
 const bool require_alt = false) const
```

Search only the top level menu for a shortcut.

Either `&x` in the label or the shortcut fields are used.

This tests the current event, which must be an `FL_KEYBOARD` or `FL_SHORTCUT`, against a shortcut value.

**Parameters**

<code>ip</code>	returns the index of the item, if <code>ip</code> is not NULL.
<code>require_alt</code>	if true: match only if Alt key is pressed.

**Returns**

found [Fl\\_Menu\\_Item](#) or NULL

**33.86.2.17 image()** [1/2]

```
void Fl_Menu_Item::image (
 Fl_Image & image) [inline]
```

Compatibility API for FLUID, same as `image.label(this)`.

**Note**

This method is intended for internal use by fluid and may not do what you expect.

**33.86.2.18 image()** [2/2]

```
void Fl_Menu_Item::image (
 Fl_Image * image) [inline]
```

Compatibility API for FLUID, same as `image->label(this)`.

#### Note

This method is intended for internal use by fluid and may not do what you expect.

### 33.86.2.19 `image_label()`

```
void Fl_Menu_Item::image_label (
 const Fl_Image * image) [inline]
```

Sets the title (`label()`) to an icon or image.

This sets the `labeltype()` to `_FL_IMAGE_LABEL` (note the leading underscore).

#### See also

`const char* Fl_Menu_Item::label() const`

#### Since

1.4.0

### 33.86.2.20 `insert()`

```
int Fl_Menu_Item::insert (
 int index,
 const char * mytext,
 int sc,
 Fl_Callback * cb,
 void * data = 0,
 int myflags = 0)
```

Inserts an item at position `index`.

If `index` is -1, the item is added the same way as `Fl_Menu_Item::add()`.

If 'mytext' contains any un-escaped front slashes (`/`), it's assumed a menu pathname is being specified, and the value of `index` will be ignored.

In all other aspects, the behavior of `insert()` is the same as `add()`.

#### Parameters

in	<i>index</i>	insert new items here
in	<i>mytext</i>	new label string, details see above
in	<i>sc</i>	keyboard shortcut for new item
in	<i>cb</i>	callback function for new item
in	<i>data</i>	user data for new item
in	<i>myflags</i>	menu flags as described in <a href="#">Fl_Menu_Item</a>

#### Returns

the index into the `menu()` array, where the entry was added

### 33.86.2.21 `label()` [1/3]

```
const char * Fl_Menu_Item::label () const [inline]
```

Returns the title (`label()`) of the menu item.

A NULL here indicates the end of the menu (or of a submenu). A '&' in the item will print an underscore under the next letter, and if the menu is popped up that letter will be a "shortcut" to pick that item. To get a real '&' put two in a row.

The returned value depends on the [labeltype\(\)](#) that has been used to store the label.

#### Returns

A pointer to the label cast to (const char \*)

#### Return values

(a)	A pointer to text (const char *)
(b)	A pointer to an image ( <a href="#">Fl_Image</a> *)
(c)	A pointer to a "multi label" ( <a href="#">Fl_Multi_Label</a> *)
NULL	End of menu or submenu

#### See also

[Fl\\_Menu\\_Item::label\(const char \\*\)](#)  
[Fl\\_Menu\\_Item::label\(Fl\\_Labeltype, const char \\*\)](#)  
[Fl\\_Menu\\_Item::image\\_label\(const Fl\\_Image \\*\)](#)  
[Fl\\_Menu\\_Item::multi\\_label\(const Fl\\_Multi\\_Label \\*\)](#)  
[Fl\\_Multi\\_Label::label\(Fl\\_Menu\\_Item \\*\)](#)

#### 33.86.2.22 label() [2/3]

```
void Fl_Menu_Item::label (
 const char * a) [inline]
```

Sets the title (label) of the menu item.

#### Note

This does **not** change the [labeltype\(\)](#) for backwards compatibility. Take care to assign the correct [labeltype\(\)](#) if you assign different label types to the same menu item sequentially.

The default [labeltype\(\)](#) is FL\_NORMAL\_LABEL.

#### See also

[label\(Fl\\_Labeltype, const char\\*\)](#)  
const char\* [Fl\\_Menu\\_Item::label\(\)](#) const

#### 33.86.2.23 label() [3/3]

```
void Fl_Menu_Item::label (
 Fl_Labeltype a,
 const char * b) [inline]
```

Sets the title (label) and the label type of the menu item.

The default Fl\_Labeltype when using [Fl\\_Menu\\_Item::label\(const char\\* a\)](#) is FL\_NORMAL\_LABEL but you can set any other label type, for instance FL\_EMBOSSSED\_LABEL.

Special labeltypes are:

- FL\_ICON\_LABEL: draws the icon ([Fl\\_Image](#)) associated with the text
- FL\_IMAGE\_LABEL: draws the image ([Fl\\_Image](#)) associated with the text
- FL\_MULTI\_LABEL: draws multiple parts side by side, see [Fl\\_Multi\\_Label](#)

See also

`const char* Fl_Menu_Item::label() const`

### 33.86.2.24 labelcolor() [1/2]

`Fl_Color Fl_Menu_Item::labelcolor ( ) const [inline]`

Gets the menu item's label color.

This color is passed to the `labeltype` routine, and is typically the color of the label text. This defaults to `FL_BLACK`. If this color is not black fltk will **not** use overlay bitplanes to draw the menu - this is so that images put in the menu draw correctly.

### 33.86.2.25 labelcolor() [2/2]

`void Fl_Menu_Item::labelcolor (   
 Fl_Color a ) [inline]`

Sets the menu item's label color.

See also

`Fl_Color Fl_Menu_Item::labelcolor() const`

### 33.86.2.26 labelfont() [1/2]

`Fl_Font Fl_Menu_Item::labelfont ( ) const [inline]`

Gets the menu item's label font.

Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function `Fl::set_font()` can define new fonts.

### 33.86.2.27 labelfont() [2/2]

`void Fl_Menu_Item::labelfont (   
 Fl_Font a ) [inline]`

Sets the menu item's label font.

Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function `Fl::set_font()` can define new fonts.

### 33.86.2.28 labeltype() [1/2]

`Fl_Labeltype Fl_Menu_Item::labeltype ( ) const [inline]`

Returns the menu item's labeltype.

A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as emboss, or to use the `label()` pointer as another form of data such as a bitmap. The value `FL_NORMAL_LABEL` prints the label as text.

### 33.86.2.29 labeltype() [2/2]

`void Fl_Menu_Item::labeltype (   
 Fl_Labeltype a ) [inline]`

Sets the menu item's labeltype.

A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as emboss, or to use the `label()` pointer as another form of data such as a bitmap. The value `FL_NORMAL_LABEL` prints the label as text.

**33.86.2.30 measure()**

```
int Fl_Menu_Item::measure (
 int * hp,
 const Fl_Menu_ * m) const
```

Measures width of label, including effect of & characters.  
Optionally, can get height if hp is not NULL.

**33.86.2.31 multi\_label()**

```
void Fl_Menu_Item::multi_label (
 const Fl_Multi_Label * ml) [inline]
```

Sets the title ([label\(\)](#)) and [labeltype\(\)](#) to an [Fl\\_Multi\\_Label](#).  
This sets the [labeltype\(\)](#) to `_FL_MULTI_LABEL` (note the leading underscore).

See also

```
const char* Fl_Menu_Item::label() const
```

Since

1.4.0

**33.86.2.32 next() [1/2]**

```
Fl_Menu_Item * Fl_Menu_Item::next (
 int i = 1) [inline]
```

Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items.  
There are two calls so that you can advance through const and non-const data.

**33.86.2.33 next() [2/2]**

```
const Fl_Menu_Item * Fl_Menu_Item::next (
 int n = 1) const
```

Advance a pointer by n items through a menu array, skipping the contents of submenus and invisible items.  
There are two calls so that you can advance through const and non-const data.

**33.86.2.34 popup()**

```
const Fl_Menu_Item * Fl_Menu_Item::popup (
 int X,
 int Y,
 const char * title = 0,
 const Fl_Menu_Item * picked = 0,
 const Fl_Menu_ * menu_button = 0) const
```

This method is called by widgets that want to display menus.

The menu stays up until the user picks an item or dismisses it. The selected item (or NULL if none) is returned. *This does not do the callbacks or change the state of check or radio items.*

The menu is positioned so the cursor is centered over the item picked. This will work even if `picked` is in a submenu. If `picked` is zero or not in the menu item table the menu is positioned with the cursor in the top-left corner.

Parameters

in	<i>X,Y</i>	the position of the mouse cursor, relative to the window that got the most recent event (usually you can pass <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a> unchanged here).
in	<i>title</i>	a character string title for the menu. If non-zero a small box appears above the menu with the title in it.

## Parameters

in	<i>picked</i>	if this pointer is not NULL, the popup menu will appear so that the picked menu is under the mouse pointer.
in	<i>menu_button</i>	is a pointer to an <a href="#">Fl_Menu_</a> from which the color and boxtypes for the menu are pulled. If NULL then defaults are used.

## Returns

a pointer to the menu item selected by the user, or NULL

**33.86.2.35 pulldown()**

```
const Fl_Menu_Item * Fl_Menu_Item::pulldown (
 int X,
 int Y,
 int W,
 int H,
 const Fl_Menu_Item * initial_item = 0,
 const Fl_Menu_ * pbutton = 0,
 const Fl_Menu_Item * title = 0,
 int menubar = 0) const
```

Pulldown() is similar to [popup\(\)](#), but a rectangle is provided to position the menu.

The menu is made at least W wide, and the picked item `initial_item` is centered over the rectangle (like [Fl\\_Choice](#) uses).

If `initial_item` is NULL or not found, the menu is aligned just below the rectangle (like a pulldown menu).

The `title` and `menubar` arguments are used internally by the [Fl\\_Menu\\_Bar](#) widget.

**33.86.2.36 radio()**

```
int Fl_Menu_Item::radio () const [inline]
```

Returns true if this item is a radio item.

When a radio button is selected all "adjacent" radio buttons are turned off. A set of radio items is delimited by an item that has [radio\(\)](#) false, or by an item with `FL_MENU_DIVIDER` turned on.

**33.86.2.37 set()**

```
void Fl_Menu_Item::set () [inline]
```

Turns the check or radio item "on" for the menu item.

Note that this does not turn off any adjacent radio items like [setonly\(\)](#) does.

**33.86.2.38 setonly()**

```
void Fl_Menu_Item::setonly (
 Fl_Menu_Item const * first = NULL)
```

Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.

## Note

This method is dangerous if radio items are first in the menu. Make sure that `first` is set correctly or use [Fl\\_Menu\\_::setonly\(Fl\\_Menu\\_Item\\*\)](#) instead.

## Parameters

in	<i>first</i>	start of menu array or NULL (default) if the radio group is not the first item
----	--------------	--------------------------------------------------------------------------------

**33.86.2.39 shortcut()**

```
void Fl_Menu_Item::shortcut (
 int s) [inline]
```

Sets exactly what key combination will trigger the menu item.

The value is a logical 'or' of a key and a set of shift flags, for instance FL\_ALT+'a' or FL\_ALT+FL\_F+10 or just 'a'. A value of zero disables the shortcut.

The key can be any value returned by [Fl::event\\_key\(\)](#), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.

The shift flags can be any set of values accepted by [Fl::event\\_state\(\)](#). If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

**33.86.2.40 size()**

```
int Fl_Menu_Item::size () const
```

Size of the menu starting from this menu item.

This method counts all menu items starting with `this` menu item, including all menu items in the same (sub)menu level, all nested submenus, **and** the terminating empty (0) menu item.

It does **not** count menu items referred to by FL\_SUBMENU\_POINTER menu items (except the single menu item with FL\_SUBMENU\_POINTER).

All menu items counted are consecutive in memory (one array).

Example:

```
schemechoice = new Fl_Choice(X+125,Y,140,25,"FLTK Scheme");
schemechoice->add("none");
schemechoice->add("plastic");
schemechoice->add("gtk+");
schemechoice->add("gleam");
printf("schemechoice->menu()->size() = %d\n", schemechoice->menu()->size());
```

Output:

```
schemechoice->menu()->size() = 5
```

**33.86.2.41 submenu()**

```
int Fl_Menu_Item::submenu () const [inline]
```

Returns true if either FL\_SUBMENU or FL\_SUBMENU\_POINTER is on in the flags.

FL\_SUBMENU indicates an embedded submenu that goes from the next item through the next one with a NULL [label\(\)](#). FL\_SUBMENU\_POINTER indicates that [user\\_data\(\)](#) is a pointer to another menu array.

**33.86.2.42 test\_shortcut()**

```
const Fl_Menu_Item * Fl_Menu_Item::test_shortcut () const
```

This is designed to be called by a widget's `handle()` method in response to a FL\_SHORTCUT event.

If the current event matches one of the items shortcut, that item is returned. If the keystroke does not match any shortcuts then NULL is returned. This only matches the [shortcut\(\)](#) fields, not the letters in the title preceeded by '

**33.86.2.43 uncheck()**

```
void Fl_Menu_Item::uncheck () [inline]
```

Back compatibility only.

**Deprecated** Please use [Fl\\_Menu\\_Item::clear\(\)](#) instead. This method will be removed in FLTK 1.5.0 or later.

See also

[clear\(\)](#)

### 33.86.2.44 value()

```
int Fl_Menu_Item::value () const [inline]
```

Returns the current value of the check or radio item.

This is zero (0) if the menu item is not checked and non-zero otherwise.

Since

1.4.0 this method returns 1 if the item is checked but you should not rely on a particular value, only zero or non-zero.

Note

The returned value for a checked menu item was FL\_MENU\_VALUE (4) before FLTK 1.4.0.

The documentation for this struct was generated from the following files:

- [Fl\\_Menu\\_Item.H](#)
- [Fl\\_Menu.cxx](#)
- [Fl\\_Menu\\_.cxx](#)
- [Fl\\_Menu\\_add.cxx](#)

## 33.87 FI\_Menu\_Window Class Reference

The [Fl\\_Menu\\_Window](#) widget is a window type used for menus.

```
#include <Fl_Menu_Window.H>
```

Inheritance diagram for [Fl\\_Menu\\_Window](#):

### Public Member Functions

- **Fl\_Menu\_Window** (int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Menu\\_Window](#) widget using the given size, and label string.*
- **Fl\_Menu\_Window** (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Menu\\_Window](#) widget using the given position, size, and label string.*
- **~Fl\_Menu\_Window** ()  
*Destroys the window and all of its children.*

### Additional Inherited Members

#### 33.87.1 Detailed Description

The [Fl\\_Menu\\_Window](#) widget is a window type used for menus.

By default the window is drawn in the hardware overlay planes if they are available so that the menu don't force the rest of the window to redraw.

The documentation for this class was generated from the following files:

- [Fl\\_Menu\\_Window.H](#)
- [Fl\\_Menu\\_Window.cxx](#)

## 33.88 FI\_Multi\_Browser Class Reference

The [FI\\_Multi\\_Browser](#) class is a subclass of [FI\\_Browser](#) which lets the user select any set of the lines.

```
#include <Fl_Multi_Browser.H>
```

Inheritance diagram for [FI\\_Multi\\_Browser](#):

### Public Member Functions

- [FI\\_Multi\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)  
Creates a new [FI\\_Multi\\_Browser](#) widget using the given position, size, and label string.

### Additional Inherited Members

#### 33.88.1 Detailed Description

The [FI\\_Multi\\_Browser](#) class is a subclass of [FI\\_Browser](#) which lets the user select any set of the lines.

Figure 33.31 [FI\\_Multi\\_Browser](#)

The user interface is Macintosh style: clicking an item turns off all the others and selects that one, dragging selects all the items the mouse moves over, and ctrl + click (Cmd+click on the Mac OS platform) toggles the items. Shift + click extends the selection until the clicked item. This is different from how forms did it. Normally the callback is done when the user releases the mouse, but you can change this with [when\(\)](#).

See [FI\\_Browser](#) for methods to add and remove lines from the browser.

#### 33.88.2 Constructor & Destructor Documentation

##### 33.88.2.1 FI\_Multi\_Browser()

```
Fl_Multi_Browser::Fl_Multi_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [FI\\_Multi\\_Browser](#) widget using the given position, size, and label string.

The default boxtype is `FL_DOWN_BOX`. The constructor specializes [FI\\_Browser\(\)](#) by setting the type to `FL_↔MULTI_BROWSER`. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- [FI\\_Multi\\_Browser.H](#)
- [FI\\_Browser.cxx](#)

## 33.89 FI\_Multi\_Label Struct Reference

Allows a mixed text and/or graphics label to be applied to an [FI\\_Menu\\_Item](#) or [FI\\_Widget](#).

```
#include <FI_Multi_Label.H>
```

### Public Member Functions

- void [label](#) ([FI\\_Menu\\_Item](#) \*)  
*Associate an [FI\\_Multi\\_Label](#) with an [FI\\_Menu\\_Item](#).*
- void [label](#) ([FI\\_Widget](#) \*)  
*Associate an [FI\\_Multi\\_Label](#) with an [FI\\_Widget](#).*

### Public Attributes

- const char \* [labela](#)  
*Holds the "leftmost" of the two elements in the composite label.*
- const char \* [labelb](#)  
*Holds the "rightmost" of the two elements in the composite label.*
- [uchar](#) [typea](#)  
*Holds the "type" of [labela](#).*
- [uchar](#) [typeb](#)  
*Holds the "type" of [labelb](#).*

### 33.89.1 Detailed Description

Allows a mixed text and/or graphics label to be applied to an [FI\\_Menu\\_Item](#) or [FI\\_Widget](#).

Most regular FLTK widgets now support the ability to associate both images and text with a label but some special cases, notably the non-widget [FI\\_Menu\\_Item](#) objects, do not. [FI\\_Multi\\_Label](#) may be used to create menu items that have an icon and text, which would not normally be possible for an [FI\\_Menu\\_Item](#). For example, [FI\\_Multi\\_Label](#) is used in the New->Code submenu in fluid, and others.

Figure 33.32 Menu items with icons using [FI\\_Multi\\_Label](#)

Each [FI\\_Multi\\_Label](#) holds two elements, [labela](#) and [labelb](#); each may hold either a text label (const char\*) or an image ([FI\\_Image](#)\*). When displayed, [labela](#) is drawn first and [labelb](#) is drawn immediately to its right. More complex labels can be constructed by setting [labelb](#) as another [FI\\_Multi\\_Label](#) and thus chaining up a series of label elements.

When assigning a label element to one of [labela](#) or [labelb](#), they should be explicitly cast to (const char\*) if they are not of that type already.

**Note**

An [Fl\\_Multi\\_Label](#) object and all its components (label text, images, chained [Fl\\_Multi\\_Label](#)'s and their linked objects) must exist during the lifetime of the widget or menu item they are assigned to. It is the responsibility of the user's code to release these linked objects if necessary after the widget or menu is deleted.

**Example Use: [Fl\\_Menu\\_Bar](#)**

```
Fl_Pixmap *image = new Fl_Pixmap(..); // image for menu item; any Fl_Image based widget
Fl_Menu_Bar *menu = new Fl_Menu_Bar(..); // can be any Fl_Menu_ oriented widget (Fl_Choice,
 Fl_Menu_Button..)
// Create a menu item
int i = menu->add("File/New", ..);
Fl_Menu_Item *item = (Fl_Menu_Item*)&(menu->menu()[i]);
// Create a multi label, assign it an image + text
Fl_Multi_Label *ml = new Fl_Multi_Label;
// Left side of label is an image
ml->typea = FL_IMAGE_LABEL;
ml->labela = (const char*)image; // any Fl_Image widget: Fl_Pixmap, Fl_PNG_Image, etc..
// Right side of label is label text
ml->typeb = FL_NORMAL_LABEL;
ml->labelb = item->label();
// Assign the multilabel to the menu item
// ml->label(item); // deprecated since 1.4.0; backwards compatible with 1.3.x
item->label(ml); // new method since 1.4.0
```

**See also**

[Fl\\_Label](#) and [Fl\\_Labeltype](#) and examples/howto-menu-with-images.cxx

**33.89.2 Member Function Documentation****33.89.2.1 [label\(\)](#) [1/2]**

```
void Fl_Multi_Label::label (
 Fl_Menu_Item * o)
```

Associate an [Fl\\_Multi\\_Label](#) with an [Fl\\_Menu\\_Item](#).

This uses [Fl\\_Menu\\_Item::label\(Fl\\_Labeltype a, const char \\*b\)](#) internally to set the *label* and the label type of the menu item, i.e. it stores a *pointer* to the [Fl\\_Multi\\_Label](#) object (*this*). An existing label (pointer) will be overwritten.

This sets the type of the menu item's label to `_FL_MULTI_LABEL` - note the leading underscore ('\_').

There is no way to use a method like [Fl\\_Widget::copy\\_label\(\)](#) that transfers ownership of the [Fl\\_Multi\\_Label](#) and its linked objects (images, text, and chained [Fl\\_Multi\\_Label](#)'s) to the menu item.

The [Fl\\_Multi\\_Label](#) and all linked images, text labels, or chained [Fl\\_Multi\\_Label](#) objects must exist during the lifetime of the menu and will not be released when the menu item is destroyed.

**Note**

The user's code is responsible for releasing the [Fl\\_Multi\\_Label](#) and all linked objects (images, text, chained [Fl\\_Multi\\_Label](#)'s) after the menu has been deleted. This may cause memory leaks if [Fl\\_Multi\\_Label](#) is used and reassigned w/o releasing the objects assigned to it.

**Deprecated** since 1.4.0: please use [Fl\\_Menu\\_Item::label\(Fl\\_Multi\\_Label \\*\)](#)

**See also**

[Fl\\_Menu\\_Item::label\(Fl\\_Multi\\_Label \\*\)](#)

**33.89.2.2 [label\(\)](#) [2/2]**

```
void Fl_Multi_Label::label (
 Fl_Widget * o)
```

Associate an [Fl\\_Multi\\_Label](#) with an [Fl\\_Widget](#).

This method uses [Fl\\_Widget::label\(Fl\\_Labeltype, const char \\*\)](#) internally to set the *label* of the widget, i.e. it stores a *pointer* to the [Fl\\_Multi\\_Label](#) object (*this*). An existing label that has been set using [Fl\\_Widget::copy\\_label\(\)](#) will be released prior to the assignment of the new label.

This sets the type of the widget's label to `_FL_MULTI_LABEL` - note the leading underscore ('\_').

There is no way to use a method like `Fl_Widget::copy_label()` that transfers ownership of the `Fl_Multi_Label` and its linked objects (images, text, and chained `Fl_Multi_Label`'s) to the widget.

The `Fl_Multi_Label` and all linked images, text labels, or chained `Fl_Multi_Label` objects must exist during the lifetime of the widget and will not be released when the widget is destroyed.

#### Note

The user's code is responsible for releasing the `Fl_Multi_Label` and all linked objects (images, text, chained `Fl_Multi_Label`'s) after the widget has been deleted. This may cause memory leaks if `Fl_Multi_Label` is used and reassigned w/o releasing the objects assigned to it.

### 33.89.3 Member Data Documentation

#### 33.89.3.1 `labela`

```
const char* Fl_Multi_Label::labela
```

Holds the "leftmost" of the two elements in the composite label.

Typically this would be assigned either a text string (`const char*`), a (`Fl_Image*`) or a (`Fl_Multi_Label*`).

#### 33.89.3.2 `labelb`

```
const char* Fl_Multi_Label::labelb
```

Holds the "rightmost" of the two elements in the composite label.

Typically this would be assigned either a text string (`const char*`), a (`Fl_Image*`) or a (`Fl_Multi_Label*`).

#### 33.89.3.3 `typea`

```
uchar Fl_Multi_Label::typea
```

Holds the "type" of `labela`.

Typically this is set to `FL_NORMAL_LABEL` for a text label, `FL_IMAGE_LABEL` for an image (based on `Fl_image`) or `FL_MULTI_LABEL` if "chaining" multiple `Fl_Multi_Label` elements together.

#### 33.89.3.4 `typeb`

```
uchar Fl_Multi_Label::typeb
```

Holds the "type" of `labelb`.

Typically this is set to `FL_NORMAL_LABEL` for a text label, `FL_IMAGE_LABEL` for an image (based on `Fl_image`) or `FL_MULTI_LABEL` if "chaining" multiple `Fl_Multi_Label` elements together.

The documentation for this struct was generated from the following files:

- `Fl_Multi_Label.H`
- `Fl_Multi_Label.cxx`

## 33.90 `Fl_Multiline_Input` Class Reference

This input field displays '\n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys.

```
#include <Fl_Multiline_Input.H>
```

Inheritance diagram for `Fl_Multiline_Input`:

## Public Member Functions

- [Fl\\_Multiline\\_Input](#) (int X, int Y, int W, int H, const char \*l=0)

*Creates a new [Fl\\_Multiline\\_Input](#) widget using the given position, size, and label string.*

## Additional Inherited Members

### 33.90.1 Detailed Description

This input field displays '\n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys.

This is for editing multiline text.

This is far from the nirvana of text editors, and is probably only good for small bits of text, 10 lines at most. Note that this widget does not support scrollbars or per-character color control.

If you are presenting large amounts of text and need scrollbars or full color control of characters, you probably want [Fl\\_Text\\_Editor](#) instead.

In FLTK 1.3.x, the default behavior of the 'Tab' key was changed to support consistent focus navigation. To get the older FLTK 1.1.x behavior, set [Fl\\_Input\\_::tab\\_nav\(\)](#) to 0. Newer programs should consider using [Fl\\_Text\\_Editor](#).

### 33.90.2 Constructor & Destructor Documentation

#### 33.90.2.1 Fl\_Multiline\_Input()

```

Fl_Multiline_Input::Fl_Multiline_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)

```

Creates a new [Fl\\_Multiline\\_Input](#) widget using the given position, size, and label string.

The default boxtype is FL\_DOWN\_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [Fl\\_Multiline\\_Input.H](#)
- [Fl\\_Input.cxx](#)

## 33.91 Fl\_Multiline\_Output Class Reference

This widget is a subclass of [Fl\\_Output](#) that displays multiple lines of text.

```
#include <Fl_Multiline_Output.H>
```

Inheritance diagram for [Fl\\_Multiline\\_Output](#):

## Public Member Functions

- [FI\\_Multiline\\_Output](#) (int X, int Y, int W, int H, const char \*l=0)  
Creates a new [FI\\_Multiline\\_Output](#) widget using the given position, size, and label string.

## Additional Inherited Members

### 33.91.1 Detailed Description

This widget is a subclass of [FI\\_Output](#) that displays multiple lines of text. It also displays tab characters as whitespace to the next column. Note that this widget does not support scrollbars, or per-character color control. If you are presenting large amounts of read-only text and need scrollbars, or full color control of characters, then use [FI\\_Text\\_Display](#). If you want to display HTML text, use [FI\\_Help\\_View](#). A caret cursor (^) shows the keyboard navigation mark for keyboard selection of the output text, e.g. Arrow Keys to move the cursor, Shift + Arrow Keys to create a text selection, and '^C' to copy the selected text to the paste buffer. The caret cursor can be disabled by disabling the widget's "visible focus" using [clear\\_visible\\_focus\(\)](#), inherited from the [FI\\_Widget](#) base class. Doing this also disables the widget's keyboard navigation.

### 33.91.2 Constructor & Destructor Documentation

#### 33.91.2.1 FI\_Multiline\_Output()

```

Fl_Multiline_Output::Fl_Multiline_Output (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)

```

Creates a new [FI\\_Multiline\\_Output](#) widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`. Inherited destructor destroys the widget and any value associated with it. The documentation for this class was generated from the following files:

- [FI\\_Multiline\\_Output.H](#)
- [FI\\_Input.cxx](#)

## 33.92 FI\_Native\_File\_Chooser Class Reference

This class lets an FLTK application easily and consistently access the operating system's native file chooser.  
`#include <Fl_Native_File_Chooser.H>`

## Public Types

- enum `Option` {  
`NO_OPTIONS` = 0x0000 , `SAVEAS_CONFIRM` = 0x0001 , `NEW_FOLDER` = 0x0002 , `PREVIEW` = 0x0004 ,  
`USE_FILTER_EXT` = 0x0008 }
- enum `Type` {  
`BROWSE_FILE` = 0 , `BROWSE_DIRECTORY` , `BROWSE_MULTI_FILE` , `BROWSE_MULTI_DIRECTORY` ,  
`BROWSE_SAVE_FILE` , `BROWSE_SAVE_DIRECTORY` }

## Public Member Functions

- int `count` () const  
*Returns the number of filenames (or directory names) the user selected.*
- const char \* `directory` () const  
*Returns the current preset `directory()` value.*
- void `directory` (const char \*val)  
*Preset the directory the browser will show when opened.*
- const char \* `errmsg` () const  
*Returns a system dependent error message for the last method that failed.*
- const char \* `filename` () const  
*Return the filename the user chose.*
- const char \* `filename` (int i) const  
*Return one of the filenames the user selected.*
- const char \* `filter` () const  
*Returns the filter string last set.*
- void `filter` (const char \*f)  
*Sets the filename filters used for browsing.*
- int `filter_value` () const  
*Returns which filter value was last selected by the user.*
- void `filter_value` (int i)  
*Sets which filter will be initially selected.*
- int `filters` () const  
*Gets how many filters were available, not including "All Files".*
- `FI_Native_File_Chooser` (int val=`BROWSE_FILE`)  
*The constructor.*
- int `options` () const  
*Gets the platform specific `FI_Native_File_Chooser::Option` flags.*
- void `options` (int o)  
*Sets the platform specific chooser options to `val`.*
- const char \* `preset_file` () const  
*Get the preset filename.*
- void `preset_file` (const char \*f)  
*Sets the default filename for the chooser.*
- int `show` ()  
*Post the chooser's dialog.*
- const char \* `title` () const  
*Get the title of the file chooser's dialog window.*
- void `title` (const char \*t)  
*Set the title of the file chooser's dialog window.*
- int `type` () const  
*Gets the current `FI_Native_File_Chooser::Type` of browser.*
- void `type` (int t)  
*Sets the current `FI_Native_File_Chooser::Type` of browser.*
- `~FI_Native_File_Chooser` ()  
*Destructor.*

## Static Public Attributes

- static const char \* **file\_exists\_message** = "File exists. Are you sure you want to overwrite?"  
*Localizable message.*

### 33.92.1 Detailed Description

This class lets an FLTK application easily and consistently access the operating system's native file chooser. Some operating systems have very complex and specific file choosers that many users want access to specifically, instead of FLTK's default file chooser(s).

In cases where there is no native file browser, FLTK's own file browser is used instead.

To use this widget, use the following include in your code:

```
#include <FL/Fl_Native_File_Chooser.H>
```

The following example shows how to pick a single file:

```
// Create and post the local native file chooser
#include <FL/Fl_Native_File_Chooser.H>
[...
Fl_Native_File_Chooser fnfc;
fnfc.title("Pick a file");
fnfc.type(Fl_Native_File_Chooser::BROWSE_FILE);
fnfc.filter("Text*.txt\n"
 "C Files*.{cxx,h,c}");
fnfc.directory("/var/tmp"); // default directory to use
// Show native chooser
switch (fnfc.show()) {
 case -1: printf("ERROR: %s\n", fnfc.errmsg()); break; // ERROR
 case 1: printf("CANCEL\n"); break; // CANCEL
 default: printf("PICKED: %s\n", fnfc.filename()); break; // FILE CHOSEN
}
]
```

The `Fl_Native_File_Chooser` widget transmits UTF-8 encoded filenames to its user. It is recommended to open files that may have non-ASCII names with the `fl_fopen()` or `fl_open()` utility functions that handle these names in a cross-platform way (whereas the standard `fopen()/open()` functions fail on the Windows platform to open files with a non-ASCII name).

#### Platform Specific Caveats

- Under X11/Wayland the dialog is chosen as follows:
  1. If command `zenity` is available at run-time and if `Fl::option(OPTION_FNFC_USES_ZENITY)` is turned on, the `zenity`-based dialog opens. This is expected to be more appropriate than other dialog forms for sandboxed apps, but member function `filter_value()` is not effective.
  2. Else if the app runs under the KDE desktop and if `Fl::option(OPTION_FNFC_USES_KDIALOG)` is turned on, and if command `kdiallog` is available at run-time, the `kdiallog`-based dialog opens. Member function `filter_value()` is not effective with this dialog.
  3. Else if the GTK library is available at run-time on the computer and if `Fl::option(OPTION_FNFC_USES_GTK)` is not turned off, the GTK-styled dialog opens. Call `fl_register_images()` to add a "Preview" button to this dialog. Use the static public attributes of class `Fl_File_Chooser` to localize the browser.
  4. Otherwise, FLTK's own dialog produced by the `Fl_File_Chooser` class opens. Call `fl_register_images()` to add a "Preview" button to it. It's best if you also call `Fl_File_Icon::load_system_icons()` at the start of `main()`, to enable the nicer looking file browser widgets. Use the static public attributes of class `Fl_File_Chooser` to localize the browser.
- Some operating systems support certain OS specific options; see `Fl_Native_File_Chooser::options()` for a list.

Figure 33.33 The FI\_Native\_File\_Chooser on different platforms

## 33.92.2 Member Enumeration Documentation

### 33.92.2.1 Option

```
enum Fl_Native_File_Chooser::Option
```

Enumerator

NO_OPTIONS	no options enabled
SAVEAS_CONFIRM	Show native 'Save As' overwrite confirm dialog.
NEW_FOLDER	Show 'New Folder' icon (if supported)
PREVIEW	enable preview mode (if supported)
USE_FILTER_EXT	Chooser filter presets the output file extension (if supported)

### 33.92.2.2 Type

```
enum Fl_Native_File_Chooser::Type
```

Enumerator

BROWSE_FILE	browse files (lets user choose one file)
BROWSE_DIRECTORY	browse directories (lets user choose one directory)
BROWSE_MULTI_FILE	browse files (lets user choose multiple files)
BROWSE_MULTI_DIRECTORY	browse directories (lets user choose multiple directories)

## Enumerator

BROWSE_SAVE_FILE	browse to save a file
BROWSE_SAVE_DIRECTORY	browse to save a directory

### 33.92.3 Constructor & Destructor Documentation

#### 33.92.3.1 Fl\_Native\_File\_Chooser()

```
Fl_Native_File_Chooser::Fl_Native_File_Chooser (
 int val = BROWSE_FILE)
```

The constructor.

Internally allocates the native widgets. Optional `val` presets the type of browser this will be, which can also be changed with `type()`.

#### 33.92.3.2 ~Fl\_Native\_File\_Chooser()

```
Fl_Native_File_Chooser::~Fl_Native_File_Chooser ()
```

Destructor.

Deallocates any resources allocated to this widget.

### 33.92.4 Member Function Documentation

#### 33.92.4.1 count()

```
int Fl_Native_File_Chooser::count () const
```

Returns the number of filenames (or directory names) the user selected.

##### Example:

```
if (fnfc->show() == 0) {
 // Print all filenames user selected
 for (int n=0; n<fnfc->count(); n++) {
 printf("%d) '%s'\n", n, fnfc->filename(n));
 }
}
```

#### 33.92.4.2 directory()

```
void Fl_Native_File_Chooser::directory (
 const char * val)
```

Preset the directory the browser will show when opened.

If `val` is NULL, or no directory is specified, the chooser will attempt to use the last non-cancelled folder.

#### 33.92.4.3 errmsg()

```
const char * Fl_Native_File_Chooser::errmsg () const
```

Returns a system dependent error message for the last method that failed.

This message should at least be flagged to the user in a dialog box, or to some kind of error log. Contents will be valid only for methods that document `errmsg()` will have info on failures.

#### 33.92.4.4 filename() [1/2]

```
const char * Fl_Native_File_Chooser::filename () const
```

Return the filename the user chose.

Use this if only expecting a single filename. If more than one filename is expected, use `filename(int)` instead. Return value may be "" if no filename was chosen (eg. user cancelled).

### 33.92.4.5 filename() [2/2]

```
const char * Fl_Native_File_Chooser::filename (
 int i) const
```

Return one of the filenames the user selected.

Use [count\(\)](#) to determine how many filenames the user selected.

#### Example:

```
if (fnfc->show() == 0) {
 // Print all filenames user selected
 for (int n=0; n<fnfc->count(); n++) {
 printf("%d) '%s'\n", n, fnfc->filename(n));
 }
}
```

### 33.92.4.6 filter() [1/2]

```
const char * Fl_Native_File_Chooser::filter () const
```

Returns the filter string last set.

Can be NULL if no filter was set.

### 33.92.4.7 filter() [2/2]

```
void Fl_Native_File_Chooser::filter (
 const char * f)
```

Sets the filename filters used for browsing.

The default is NULL, which browses all files.

The filter string can be any of:

- A single wildcard (eg. "\*.txt")
- Multiple wildcards (eg. ".\*{cxx,h,H}")
- A descriptive name followed by a "\t" and a wildcard (eg. "Text Files\t\*.txt")
- A list of separate wildcards with a "\n" between each (eg. ".\*{cxx,H}\n\*.txt")
- A list of descriptive names and wildcards (eg. "C++ Files\t\*.{cxx,H}\nTxt Files\t\*.txt")

The format of each filter is a wildcard, or an optional user description followed by '\t' and the wildcard.

On most platforms, each filter is available to the user via a pulldown menu in the file chooser. The 'All Files' option is always available to the user.

### 33.92.4.8 filter\_value() [1/2]

```
int Fl_Native_File_Chooser::filter_value () const
```

Returns which filter value was last selected by the user.

This is only valid if the chooser returns success and if the particular file chooser supports it. Otherwise the value is not changed.

Some "native" file choosers don't support returning the filter selection by the user, particularly the system dialog based browsers:

- kdialog (KDE system dialog)
- zenity (another system dialog based chooser).

Note: this list may not be complete.

These system file chooser dialogs don't return the filter value chosen by the user.

See also

[filter\(const char \\*f\)](#)

### 33.92.4.9 filter\_value() [2/2]

```
void Fl_Native_File_Chooser::filter_value (
 int i)
```

Sets which filter will be initially selected.

The first filter is indexed as 0. If `filter_value() == filters()`, then "All Files" was chosen. If `filter_value() > filters()`, then a custom filter was set.

Some "native" file choosers don't support this way to set the initial filter type, particularly the system dialog based browsers:

- `kdialog` (KDE system dialog)
- `zenity` (another system dialog based chooser).

Note: this list may not be complete.

As far as we know these dialogs use the **first** item in the list of filter values as the initial filter presented to the user.

See also

[filter\(const char \\*f\)](#)

### 33.92.4.10 options()

```
void Fl_Native_File_Chooser::options (
 int o)
```

Sets the platform specific chooser options to `val`.

`val` is expected to be one or more [Fl\\_Native\\_File\\_Chooser::Option](#) flags ORed together. Some platforms have OS-specific functions that can be enabled/disabled via this method.

Flag	Description	Win	Mac	Other
<code>NEW_FOLDER</code> Used	Shows the 'New Folder' button.			Ignored Used
<code>PREVIEW</code>	Enables the 'Preview' mode by default.		Ignored	Ignored Used
<code>SAVEAS_CONFIRM</code>	Confirm dialog if <code>BROWSE_SAVE_FILE</code> file exists.	Used	Used	Used
<code>USE_FILTER_EXT</code>	Chooser <code>filter</code> presets the output file extension.	Ignored	Used	Used (GTK)

### 33.92.4.11 preset\_file()

```
void Fl_Native_File_Chooser::preset_file (
 const char * f)
```

Sets the default filename for the chooser.

Use [directory\(\)](#) to set the default directory. Mainly used to preset the filename for save dialogs, and on most platforms can be used for opening files as well.

### 33.92.4.12 show()

```
int Fl_Native_File_Chooser::show ()
```

Post the chooser's dialog.

Blocks until dialog has been completed or cancelled.

Returns

- 0 – user picked a file
- 1 – user cancelled
- -1 – failed; [errmsg\(\)](#) has reason

### 33.92.4.13 title() [1/2]

```
const char * Fl_Native_File_Chooser::title () const
```

Get the title of the file chooser's dialog window.

Return value may be NULL if no title was set.

**33.92.4.14 title()** [2/2]

```
void Fl_Native_File_Chooser::title (
 const char * t)
```

Set the title of the file chooser's dialog window.

Can be NULL if no title desired. The default title varies according to the platform, so you are advised to set the title explicitly.

The documentation for this class was generated from the following files:

- [Fl\\_Native\\_File\\_Chooser.H](#)
- [Fl\\_Native\\_File\\_Chooser.cxx](#)
- [Fl\\_Native\\_File\\_Chooser\\_GTK.cxx](#)

**33.93 Fl\_Nice\_Slider Class Reference**

Inheritance diagram for Fl\_Nice\_Slider:

**Public Member Functions**

- **Fl\_Nice\_Slider** (int X, int Y, int W, int H, const char \*L=0)

**Additional Inherited Members**

The documentation for this class was generated from the following files:

- [Fl\\_Nice\\_Slider.H](#)
- [Fl\\_Slider.cxx](#)

**33.94 Fl\_Output Class Reference**

This widget displays a piece of text.

```
#include <Fl_Output.H>
```

Inheritance diagram for Fl\_Output:

## Public Member Functions

- [FI\\_Output](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [FI\\_Output](#) widget using the given position, size, and label string.*

## Additional Inherited Members

### 33.94.1 Detailed Description

This widget displays a piece of text.

When you set the [value\(\)](#) , [FI\\_Output](#) does a `strcpy()` to its own storage, which is useful for program-generated values. The user may select portions of the text using the mouse and paste the contents into other fields or programs.

Figure 33.34 [FI\\_Output](#)

There is a single subclass, [FI\\_Multiline\\_Output](#), which allows you to display multiple lines of text. [FI\\_Multiline\\_Output](#) does not provide scroll bars. If a more complete text editing widget is needed, use [FI\\_Text\\_Display](#) instead.

The text may contain any characters except `\0`, and will correctly display anything, using `^X` notation for unprintable control characters and `\nnn` notation for unprintable characters with the high bit set. It assumes the font can draw any characters in the ISO-Latin1 character set.

### 33.94.2 Constructor & Destructor Documentation

#### 33.94.2.1 [FI\\_Output\(\)](#)

```
FI_Output::FI_Output (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [FI\\_Output](#) widget using the given position, size, and label string.

The default boxttype is `FL_DOWN_BOX`.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [FI\\_Output.H](#)
- [FI\\_Input.cxx](#)

## 33.95 FL\_Overlay\_Window Class Reference

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.

```
#include <FL_Overlay_Window.H>
```

Inheritance diagram for FL\_Overlay\_Window:

### Public Member Functions

- `FL_Overlay_Window * as_overlay_window ()` **FL\_OVERRIDE**  
Return non-null if this is an *FL\_Overlay\_Window* object.
- `int can_do_overlay ()`  
Returns non-zero if there's hardware overlay support.
- `virtual void draw_overlay ()=0`  
You must subclass *FL\_Overlay\_Window* and provide this method.
- `void flush ()` **FL\_OVERRIDE**  
Forces the window to be drawn, this window is also made current and calls *draw()*.
- `void hide ()` **FL\_OVERRIDE**  
Makes a widget invisible.
- `void redraw_overlay ()`  
Call this to indicate that the overlay data has changed and needs to be redrawn.
- `void resize (int, int, int, int)` **FL\_OVERRIDE**  
Changes the size or position of the widget.
- `void show ()` **FL\_OVERRIDE**  
Makes a widget visible.
- `void show (int a, char **b)`  
Same as *FL\_Window::show(int a, char \*\*b)*
- `~FL_Overlay_Window ()`  
Destroys the window and all child widgets.

### Protected Member Functions

- `FL_Overlay_Window (int W, int H, const char *l=0)`  
See *FL\_Overlay\_Window::FL\_Overlay\_Window(int X, int Y, int W, int H, const char \*l=0)*
- `FL_Overlay_Window (int X, int Y, int W, int H, const char *l=0)`  
Creates a new *FL\_Overlay\_Window* widget using the given position, size, and label (title) string.

## Additional Inherited Members

### 33.95.1 Detailed Description

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.

The overlay is designed to be a rapidly-changing but simple graphic such as a mouse selection box. [Fl\\_Overlay\\_Window](#) uses the overlay planes provided by your graphics hardware if they are available.

If no hardware support is found the overlay is simulated by drawing directly into the on-screen copy of the double-buffered window, and "erased" by copying the backbuffer over it again. This means the overlay will blink if you change the image in the window.

### 33.95.2 Constructor & Destructor Documentation

#### 33.95.2.1 Fl\_Overlay\_Window()

```
Fl_Overlay_Window::Fl_Overlay_Window (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0) [protected]
```

Creates a new [Fl\\_Overlay\\_Window](#) widget using the given position, size, and label (title) string. If the positions (x,y) are not given, then the window manager will choose them.

### 33.95.3 Member Function Documentation

#### 33.95.3.1 as\_overlay\_window()

```
Fl_Overlay_Window * Fl_Overlay_Window::as_overlay_window () [inline], [virtual]
```

Return non-null if this is an [Fl\\_Overlay\\_Window](#) object.

Reimplemented from [Fl\\_Window](#).

#### 33.95.3.2 draw\_overlay()

```
virtual void Fl_Overlay_Window::draw_overlay () [pure virtual]
```

You must subclass [Fl\\_Overlay\\_Window](#) and provide this method.

It is just like a [draw\(\)](#) method, except it draws the overlay. The overlay will have already been "cleared" when this is called. You can use any of the routines described in [<FL/fl\\_draw.H>](#).

#### 33.95.3.3 flush()

```
void Fl_Overlay_Window::flush () [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented from [Fl\\_Double\\_Window](#).

#### 33.95.3.4 hide()

```
void Fl_Overlay_Window::hide () [virtual]
```

Makes a widget invisible.

See also

[show\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Double\\_Window](#).

### 33.95.3.5 redraw\_overlay()

```
void Fl_Overlay_Window::redraw_overlay ()
```

Call this to indicate that the overlay data has changed and needs to be redrawn.

The overlay will be clear until the first time this is called, so if you want an initial display you must call this after calling [show\(\)](#).

### 33.95.3.6 resize()

```
void Fl_Overlay_Window::resize (
 int x,
 int y,
 int w,
 int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#), and size(W, H) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl\\_Double\\_Window](#).

### 33.95.3.7 show()

```
void Fl_Overlay_Window::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL\_SHOW.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send FL\_SHOW or FL\_HIDE events to the widget. *Do not change it if the parent is not visible, as this will send false FL\_SHOW or FL\_HIDE events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Double\\_Window](#).

The documentation for this class was generated from the following files:

- Fl\_Overlay\_Window.H
- Fl\_Overlay\_Window.cxx

## 33.96 FI\_Pack Class Reference

This widget was designed to add the functionality of compressing and aligning widgets.

```
#include <FI_Pack.H>
```

Inheritance diagram for FI\_Pack:

### Public Types

- enum { **VERTICAL** = 0 , **HORIZONTAL** = 1 }

### Public Member Functions

- void **clear** ()  
*Deletes all child widgets with `FI_Group::clear()`.*
- **FI\_Pack** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new `FI_Pack` widget using the given position, size, and label string.*
- **uchar horizontal** () const  
*Returns non-zero if `FI_Pack` alignment is horizontal.*
- void **resize** (int X, int Y, int W, int H) **FL\_OVERRIDE**  
*Override `FI_Group` resize behavior.*
- int **spacing** () const  
*Gets the number of extra pixels of blank space that are added between the children.*
- void **spacing** (int i)  
*Sets the number of extra pixels of blank space that are added between the children.*

### Protected Member Functions

- void **draw** () **FL\_OVERRIDE**  
*Draws the widget.*

### Additional Inherited Members

#### 33.96.1 Detailed Description

This widget was designed to add the functionality of compressing and aligning widgets.

If `type()` is `FI_Pack::HORIZONTAL` all the children are resized to the height of the `FI_Pack`, and are moved next to each other horizontally. If `type()` is not `FI_Pack::HORIZONTAL` then the children are resized to the width and are stacked below each other. Then the `FI_Pack` resizes itself to surround the child widgets.

You may want to put the `FI_Pack` inside an `FI_Scroll`.

The '`resizable()`' for `FI_Pack` is set to `NULL` by default. Its behavior is slightly different than in a normal `FI_Group` widget: only if the `resizable()` widget is the last widget in the group it is extended to take the full available width or height, respectively, of the `FI_Pack` group.

**Note**

You can nest [FI\\_Pack](#) widgets or put them inside [FI\\_Scroll](#) widgets or inside other group widgets but their behavior can sometimes be *"surprising"*. This is partly due to the fact that [FI\\_Pack](#) widgets resize themselves during their `draw()` operation, trying to react on their child widgets resizing themselves during **their** `draw()` operations which can be confusing. If you want to achieve special resize behavior of nested group widgets it can sometimes be easier to derive your own specialized group widget than to try to make nested [FI\\_Pack](#) widgets behave as expected.

**See also**

[FI\\_Group::resizable\(\)](#)

**33.96.2 Constructor & Destructor Documentation****33.96.2.1 FI\_Pack()**

```
Fl_Pack::Fl_Pack (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [FI\\_Pack](#) widget using the given position, size, and label string.

The default boxtype is `FL_NO_BOX`.

The default `type()` is `FI_Pack::VERTICAL`.

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the [FI\\_Pack](#) and all of its children can be automatic (local) variables, but you must declare the [FI\\_Pack](#) *first*, so that it is destroyed last.

**Parameters**

in	<i>X,Y</i>	X and Y coordinates (position)
in	<i>W,H</i>	width and height, respectively
in	<i>L</i>	label (optional)

**33.96.3 Member Function Documentation****33.96.3.1 clear()**

```
void Fl_Pack::clear (
 void) [inline]
```

Deletes all child widgets with [FI\\_Group::clear\(\)](#).

And sets to NULL the [resizable\(\)](#) widget.

**33.96.3.2 draw()**

```
void Fl_Pack::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

### 33.96.3.3 horizontal()

```
uchar Fl_Pack::horizontal () const [inline]
```

Returns non-zero if [Fl\\_Pack](#) alignment is horizontal.

#### Returns

non-zero if [Fl\\_Pack](#) alignment is horizontal ([Fl\\_Pack::HORIZONTAL](#))

#### Note

Currently the return value is the same as [Fl\\_Group::type\(\)](#), but this may change in the future. Do not set any other values than the following with [Fl\\_Pack::type\(\)](#):

- [Fl\\_Pack::VERTICAL](#) (Default)
- [Fl\\_Pack::HORIZONTAL](#)

See class [Fl\\_Pack](#) documentation for details.

### 33.96.3.4 resize()

```
void Fl_Pack::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Override [Fl\\_Group](#) resize behavior.

Resizing an [Fl\\_Pack](#) will not resize any of its children, but trigger a redraw, which in turn recalculates the dimensions of all children.

#### Parameters

in	<i>X,Y,W,H</i>	new position and size of the <a href="#">Fl_Pack</a> widget
----	----------------	-------------------------------------------------------------

Reimplemented from [Fl\\_Group](#).

The documentation for this class was generated from the following files:

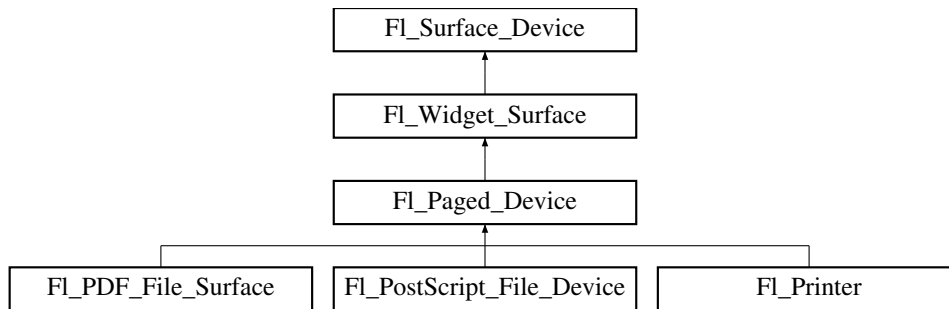

- [Fl\\_Pack.H](#)
- [Fl\\_Pack.cxx](#)

## 33.97 FI\_Paged\_Device Class Reference

Represents page-structured drawing surfaces.

```
#include <Fl_Paged_Device.H>
```

Inheritance diagram for [Fl\\_Paged\\_Device](#):

## Classes

- struct [page\\_format](#)  
*width, height and name of a page format*

## Public Types

- enum [Page\\_Format](#) {  
A0 = 0 , A1 , A2 , A3 ,

*Changes the scaling of page coordinates.*
- int [start\\_job](#) (int pagecount=0, int \*frompage=NULL, int \*topage=NULL, char \*\*perr\_message=NULL)

Synonym of [begin\\_job\(int pagecount, int \\*frompage, int \\*topage, char \\*\\*perr\\_message\)](#).

- int [start\\_page](#) ()

Synonym of [begin\\_page\(\)](#).

- virtual [~FI\\_Paged\\_Device](#) ()

The destructor.

## Static Public Attributes

- static const [page\\_format](#) [page\\_formats](#) [[NO\\_PAGE\\_FORMATS](#)]

width, height and name of all elements of the enum [Page\\_Format](#).

## Protected Member Functions

- [FI\\_Paged\\_Device](#) ()

The constructor.

## Additional Inherited Members

### 33.97.1 Detailed Description

Represents page-structured drawing surfaces.

This class has no public constructor: don't instantiate it; use [FI\\_Printer](#) or [FI\\_PostScript\\_File\\_Device](#) instead.

### 33.97.2 Member Enumeration Documentation

#### 33.97.2.1 Page\_Format

enum [FI\\_Paged\\_Device::Page\\_Format](#)

Possible page formats.

All paper formats with pre-defined width and height. The [FI\\_Paged\\_Device::page\\_formats](#) array gives these widths and heights.

#### Enumerator

A0	A0 format.
A1	A1 format.
A2	A2 format.
A3	A3 format.
A4	A4 format.
A5	A5 format.
A6	A6 format.
A7	A7 format.
A8	A8 format.
A9	A9 format.
B0	B0 format.
B1	B1 format.
B2	B2 format.
B3	B3 format.
B4	B4 format.
B5	B5 format.
B6	B6 format.
B7	B7 format.
B8	B8 format.
B9	B9 format.

## Enumerator

B10	B10 format.
EXECUTIVE	Executive format.
FOLIO	Folio format.
LEDGER	Ledger format.
LEGAL	Legal format.
LETTER	Letter format.
TABLOID	Tabloid format.

## 33.97.2.2 Page\_Layout

enum [Fl\\_Paged\\_Device::Page\\_Layout](#)

Possible page layouts.

## Enumerator

PORTRAIT	Portrait orientation.
LANDSCAPE	Landscape orientation.
REVERSED	Reversed orientation.
ORIENTATION	orientation

## 33.97.3 Member Function Documentation

## 33.97.3.1 begin\_job()

```
int Fl_Paged_Device::begin_job (
 int pagecount = 0,
 int * frompage = NULL,
 int * topage = NULL,
 char ** perr_message = NULL) [virtual]
```

Begins a print job.

## Parameters

in	<i>pagecount</i>	the total number of pages of the job (or 0 if you don't know the number of pages)
out	<i>frompage</i>	if non-null, *frompage is set to the first page the user wants printed
out	<i>topage</i>	if non-null, *topage is set to the last page the user wants printed
out	<i>perr_message</i>	if non-null and if the returned value is 2, *perr_message is set to a string describing the error. That string can be deleted after use.

## Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented in [Fl\\_PostScript\\_File\\_Device](#), [Fl\\_Printer](#), and [Fl\\_PDF\\_File\\_Surface](#).

## 33.97.3.2 begin\_page()

```
int Fl_Paged_Device::begin_page (
 void) [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with [FI\\_Surface\\_Device::push\\_current\(\)](#).

#### Note

[begin\\_page\(\)](#) calls [FI\\_Surface\\_Device::push\\_current\(\)](#) and leaves this device as the active surface. If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [FI\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [FI\\_Surface\\_Device::push\\_current\(\)](#), or the content of the dialog box will be rendered to the printer instead of the screen.

#### Returns

0 if OK, non-zero if any error

Reimplemented in [FI\\_PDF\\_File\\_Surface](#), [FI\\_PostScript\\_File\\_Device](#), and [FI\\_Printer](#).

### 33.97.3.3 end\_job()

```
void Fl_Paged_Device::end_job (
 void) [virtual]
```

To be called at the end of a print job.

Reimplemented in [FI\\_PDF\\_File\\_Surface](#), [FI\\_PostScript\\_File\\_Device](#), and [FI\\_Printer](#).

### 33.97.3.4 end\_page()

```
int Fl_Paged_Device::end_page (
 void) [virtual]
```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with [FI\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

[end\\_page\(\)](#) calls [FI\\_Surface\\_Device::pop\\_current\(\)](#). If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [FI\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [FI\\_Surface\\_Device::push\\_current\(\)](#).

#### Returns

0 if OK, non-zero if any error.

Reimplemented in [FI\\_PDF\\_File\\_Surface](#), [FI\\_PostScript\\_File\\_Device](#), and [FI\\_Printer](#).

### 33.97.3.5 margins()

```
void Fl_Paged_Device::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page.

Values are in the same unit as that used by FLTK drawing functions. They are changed by [scale\(\)](#) calls.

#### Parameters

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
out	<i>right</i>	If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 33.97.3.6 rotate()

```
void Fl_Paged_Device::rotate (
 float angle) [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

#### Parameters

<i>angle</i>	Rotation angle in counter-clockwise degrees.
--------------	----------------------------------------------

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 33.97.3.7 scale()

```
void Fl_Paged_Device::scale (
 float scale_x,
 float scale_y = 0.) [virtual]
```

Changes the scaling of page coordinates.

This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine their effects.

#### Parameters

<i>scale_x</i>	Horizontal dimensions of plot are multiplied by this quantity.
<i>scale_y</i>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor);</code> is equivalent to <code>scale(factor, factor);</code>

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 33.97.3.8 start\_job()

```
int Fl_Paged_Device::start_job (
 int pagecount = 0,
 int * frompage = NULL,
 int * topage = NULL,
 char ** perr_message = NULL) [inline]
```

Synonym of [begin\\_job\(int pagecount, int \\*frompage, int \\*topage, char \\*\\*perr\\_message\)](#).

For API compatibility with FLTK 1.3.x

### 33.97.3.9 start\_page()

```
int Fl_Paged_Device::start_page () [inline]
```

Synonym of [begin\\_page\(\)](#).

For API compatibility with FLTK 1.3.x

The documentation for this class was generated from the following files:

- [Fl\\_Paged\\_Device.H](#)
- [Fl\\_Paged\\_Device.cxx](#)

## 33.98 FI\_PDF\_File\_Surface Class Reference

To send graphical output to a PDF file.

```
#include <Fl_PDF_File_Surface.H>
```

Inheritance diagram for `Fl_PDF_File_Surface`:

### Public Member Functions

- int `begin_document` (const char \*pathname, enum `Fl_Paged_Device::Page_Format` format=`Fl_Paged_Device::A4`, enum `Fl_Paged_Device::Page_Layout` layout=`Fl_Paged_Device::PORTRAIT`, char \*\*perr=NULL)
  - Prepare to draw to a PDF document identified by its pathname.*
- int `begin_job` (const char \*defaultfilename, char \*\*perr=NULL)
  - Prepare to draw to a PDF document identified with a file chooser.*
- int `begin_job` (int, int \*, int \*, char \*\*) `FL_OVERRIDE`
  - Don't use for this class.*
- int `begin_page` (void) `FL_OVERRIDE`
  - Begins a new printed page.*
- void `end_job` (void) `FL_OVERRIDE`
  - To be called at the end of a print job.*
- int `end_page` (void) `FL_OVERRIDE`
  - To be called at the end of each page.*
- bool `is_current` () `FL_OVERRIDE`
  - Is this surface the current drawing surface?*
- void `margins` (int \*left, int \*top, int \*right, int \*bottom) `FL_OVERRIDE`

- void `origin` (int \*x, int \*y) `FL_OVERRIDE`
  - Computes the coordinates of the current origin of graphics functions.*
- void `origin` (int x, int y) `FL_OVERRIDE`
  - Sets the position of the origin of graphics in the drawable part of the drawing surface.*
- const char \* `pdf_filename` ()
  - Returns the name of the PDF document.*
- int `printable_rect` (int \*w, int \*h) `FL_OVERRIDE`
  - Computes the width and height of the drawable area of the drawing surface.*
- void `rotate` (float angle) `FL_OVERRIDE`
  - Rotates the graphics operations relatively to paper.*
- void `scale` (float s\_x, float s\_y=0) `FL_OVERRIDE`
  - Changes the scaling of page coordinates.*
- void `set_current` () `FL_OVERRIDE`
  - Make this surface the current drawing surface.*
- void `translate` (int x, int y) `FL_OVERRIDE`
  - Translates the current graphics origin accounting for the current rotation.*
- void `untranslate` () `FL_OVERRIDE`
  - Undoes the effect of a previous `translate()` call.*

## Static Public Attributes

These attributes are useful for the Wayland/X11 platform only.

- static const char \* **format\_dialog\_title** = "PDF document settings"  
*Localizable text of the "PDF document settings" dialog.*
- static const char \* **format\_dialog\_page\_size** = "Page Size:"  
*Localizable text of the "PDF document settings" dialog.*
- static const char \* **format\_dialog\_orientation** = "Orientation:"  
*Localizable text of the "PDF document settings" dialog.*
- static const char \* **format\_dialog\_default** = "Set as default"  
*Localizable text of the "PDF document settings" dialog.*

## Additional Inherited Members

### 33.98.1 Detailed Description

To send graphical output to a PDF file.

Class [Fl\\_PDF\\_File\\_Surface](#) is used exactly as the [Fl\\_Printer](#) class except for its 2 member functions [begin\\_job\(\)](#) and [begin\\_document\(\)](#).

#### Platform notes:

- Windows: requires "Microsoft Print to PDF" available in Windows 10 and later.
- Wayland/X11: requires the FLTK library was built with FLTK\_USE\_PANGO=1.
- macOS: requires macOS 10.9 or later.

If the running platform doesn't fulfill the requirement above, the program runs but doesn't output any PDF.

### 33.98.2 Member Function Documentation

#### 33.98.2.1 begin\_document()

```
int Fl_PDF_File_Surface::begin_document (
 const char * pathname,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT,
 char ** perr = NULL)
```

Prepare to draw to a PDF document identified by its pathname.

#### Parameters

<i>pathname</i>	Path name for the PDF document
<i>format</i>	The paper format for the PDF document
<i>layout</i>	The orientation for the PDF document
<i>perr</i>	NULL or address of a string that receives a message in case of error. To be deleted[] after use.

#### Returns

0 for success, 2 when an error occurred.

#### 33.98.2.2 begin\_job() [1/2]

```
int Fl_PDF_File_Surface::begin_job (
 const char * defaultfilename,
 char ** perr = NULL)
```

Prepare to draw to a PDF document identified with a file chooser. A dialog opens to select the location and name of the output PDF document as well as its page format and orientation.

#### Parameters

<i>defaultfilename</i>	Default name for the PDF document
<i>perr</i>	NULL or address of a string that receives a message in case of error. To be deleted[] after use.

#### Returns

0 for success, 1 when the user cancelled the operation, 2 when an error occurred.

#### 33.98.2.3 `begin_job()` [2/2]

```
int Fl_PDF_File_Surface::begin_job (
 int ,
 int * ,
 int * ,
 char **) [inline], [virtual]
```

Don't use for this class.

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 33.98.2.4 `begin_page()`

```
int Fl_PDF_File_Surface::begin_page (
 void) [inline], [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with [Fl\\_Surface\\_Device::push\\_current\(\)](#).

#### Note

[begin\\_page\(\)](#) calls [Fl\\_Surface\\_Device::push\\_current\(\)](#) and leaves this device as the active surface. If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#), or the content of the dialog box will be rendered to the printer instead of the screen.

#### Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 33.98.2.5 `end_job()`

```
void Fl_PDF_File_Surface::end_job (
 void) [inline], [virtual]
```

To be called at the end of a print job.

Reimplemented from [Fl\\_Paged\\_Device](#).

### 33.98.2.6 end\_page()

```
int Fl_PDF_File_Surface::end_page (
 void) [inline], [virtual]
```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

[end\\_page\(\)](#) calls [Fl\\_Surface\\_Device::pop\\_current\(\)](#). If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#).

#### Returns

0 if OK, non-zero if any error.

Reimplemented from [Fl\\_Paged\\_Device](#).

### 33.98.2.7 is\_current()

```
bool Fl_PDF_File_Surface::is_current () [inline], [virtual]
```

Is this surface the current drawing surface?

Reimplemented from [Fl\\_Surface\\_Device](#).

### 33.98.2.8 margins()

```
void Fl_PDF_File_Surface::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [inline], [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page.

Values are in the same unit as that used by FLTK drawing functions. They are changed by [scale\(\)](#) calls.

#### Parameters

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
out	<i>right</i>	If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented from [Fl\\_Paged\\_Device](#).

### 33.98.2.9 origin() [1/2]

```
void Fl_PDF_File_Surface::origin (
 int * x,
 int * y) [inline], [virtual]
```

Computes the coordinates of the current origin of graphics functions.

#### Parameters

out	<i>x,y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.98.2.10 origin()** [2/2]

```
void Fl_PDF_File_Surface::origin (
 int x,
 int y) [inline], [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. [Origin\(\)](#) calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	------------	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.98.2.11 printable\_rect()**

```
int Fl_PDF_File_Surface::printable_rect (
 int * w,
 int * h) [inline], [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.98.2.12 rotate()**

```
void Fl_PDF_File_Surface::rotate (
 float angle) [inline], [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

**Parameters**

<i>angle</i>	Rotation angle in counter-clockwise degrees.
--------------	----------------------------------------------

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.98.2.13 scale()**

```
void Fl_PDF_File_Surface::scale (
 float scale_x,
 float scale_y = 0) [inline], [virtual]
```

Changes the scaling of page coordinates.

This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine

their effects.

#### Parameters

<code>scale↔ _x</code>	Horizontal dimensions of plot are multiplied by this quantity.
<code>scale↔ _y</code>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor)</code> ; is equivalent to <code>scale(factor, factor)</code> ;

Reimplemented from [FI\\_Paged\\_Device](#).

#### 33.98.2.14 set\_current()

```
void Fl_PDF_File_Surface::set_current (
 void) [inline], [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is [FI\\_Surface\\_Device::push\\_current\(\)](#) / [FI\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

It's recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [FI\\_Printer](#) or an [FI\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [FI\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#); . Don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [FI\\_Surface\\_Device::push\\_current\(\)](#) / [FI\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [FI\\_Surface\\_Device](#).

#### 33.98.2.15 translate()

```
void Fl_PDF_File_Surface::translate (
 int x,
 int y) [inline], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [FI\\_Widget\\_Surface](#).

#### 33.98.2.16 untranslate()

```
void Fl_PDF_File_Surface::untranslate (
 void) [inline], [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [FI\\_Widget\\_Surface](#).

The documentation for this class was generated from the following files:

- [FI\\_PDF\\_File\\_Surface.H](#)
- [FI\\_Device.cxx](#)

## 33.99 FI\_Pixmap Class Reference

The [FI\\_Pixmap](#) class supports caching and drawing of colormap (pixmap) images, including transparency.

```
#include <Fl_Pixmap.H>
```

## Additional Inherited Members

### 33.99.1 Detailed Description

The `Fl_Pixmap` class supports caching and drawing of colormap (pixmap) images, including transparency.

### 33.99.2 Constructor & Destructor Documentation

#### 33.99.2.1 `Fl_Pixmap()` [1/4]

```
Fl_Pixmap::Fl_Pixmap (
 char *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

#### 33.99.2.2 `Fl_Pixmap()` [2/4]

```
Fl_Pixmap::Fl_Pixmap (
 uchar *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

#### 33.99.2.3 `Fl_Pixmap()` [3/4]

```
Fl_Pixmap::Fl_Pixmap (
 const char *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

#### 33.99.2.4 `Fl_Pixmap()` [4/4]

```
Fl_Pixmap::Fl_Pixmap (
 const uchar *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

### 33.99.3 Member Function Documentation

#### 33.99.3.1 `color_average()`

```
void Fl_Pixmap::color_average (
 Fl_Color c,
 float i) [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

### 33.99.3.2 copy()

```
Fl_Image * Fl_Pixmap::copy (
 int W,
 int H) const [virtual]
```

Creates a resized copy of the image.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator *delete* for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

#### Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_Image](#).

### 33.99.3.3 desaturate()

```
void Fl_Pixmap::desaturate () [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

### 33.99.3.4 draw()

```
void Fl_Pixmap::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments  $X$ ,  $Y$ ,  $W$ ,  $H$  specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the  $cx$  and  $cy$  arguments.

In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at  $X-cx$ ,  $Y-cy$  and its own width and height, `fl_pop_clip()` is applied.

Reimplemented from [FI\\_Image](#).

### 33.99.3.5 label() [1/2]

```
void Fl_Pixmap::label (
 Fl_Menu_Item * m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use [Fl\\_Menu\\_Item::image\(\)](#) instead.

Reimplemented from [FI\\_Image](#).

### 33.99.3.6 label() [2/2]

```
void Fl_Pixmap::label (
 Fl_Widget * widget) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use [Fl\\_Widget::image\(\)](#) or [Fl\\_Widget::deimage\(\)](#) instead.

Reimplemented from [FI\\_Image](#).

### 33.99.3.7 uncache()

```
void Fl_Pixmap::uncache () [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented from [FI\\_Image](#).

The documentation for this class was generated from the following files:

- [FI\\_Pixmap.H](#)
- [FI\\_Pixmap.cxx](#)

## 33.100 FI\_Plugin Class Reference

[FI\\_Plugin](#) allows link-time and run-time integration of binary modules.

```
#include <FI_Plugin.H>
```

Inheritance diagram for [FI\\_Plugin](#):

### Public Member Functions

- [FI\\_Plugin](#) (const char \*class, const char \*name)  
*Create a plugin.*
- virtual `~FI_Plugin` ()  
*Clear the plugin and remove it from the database.*

### 33.100.1 Detailed Description

[FI\\_Plugin](#) allows link-time and run-time integration of binary modules.

[FI\\_Plugin](#) and [FI\\_Plugin\\_Manager](#) provide a small and simple solution for linking C++ classes at run-time, or optionally linking modules at compile time without the need to change the main application.

[FI\\_Plugin\\_Manager](#) uses static initialization to create the plugin interface early during startup. Plugins are stored in a temporary database, organized in classes.

Plugins should derive a new class from [FI\\_Plugin](#) as a base:

```
class My_Plugin : public FI_Plugin {
public:
 My_Plugin() : FI_Plugin("effects", "blur") { }
 void do_something(...);
};
My_Plugin blur_plugin();
```

Plugins can be put into modules and either linked before distribution, or loaded from dynamically linkable files. An [FI\\_Plugin\\_Manager](#) is used to list and access all currently loaded plugins.

```
FI_Plugin_Manager mgr("effects");
int i, n = mgr.plugins();
for (i=0; i<n; i++) {
 My_Plugin *pin = (My_Plugin*)mgr.plugin(i);
 pin->do_something();
}
```

### 33.100.2 Constructor & Destructor Documentation

#### 33.100.2.1 FI\_Plugin()

```
FI_Plugin::FI_Plugin (
 const char * class,
 const char * name)
```

Create a plugin.

#### Parameters

in	<i>class</i>	plugins are grouped in classes
in	<i>name</i>	every plugin should have a unique name

The documentation for this class was generated from the following files:

- [FI\\_Plugin.H](#)
- [FI\\_Preferences.cxx](#)

## 33.101 FI\_Plugin\_Manager Class Reference

[FI\\_Plugin\\_Manager](#) manages link-time and run-time plugin binaries.

```
#include <FI_Plugin.H>
```

Inheritance diagram for [FI\\_Plugin\\_Manager](#):

### Public Member Functions

- [FI\\_Preferences::ID addPlugin](#) (const char \*name, [FI\\_Plugin](#) \*plugin)  
*This function adds a new plugin to the database.*
- [FI\\_Plugin\\_Manager](#) (const char \*class)

- Manage all plugins belonging to one class.*

  - [FI\\_Plugin](#) \* **plugin** (const char \**name*)  
*Return the address of a plugin by name.*
  - [FI\\_Plugin](#) \* **plugin** (int *index*)  
*Return the address of a plugin by index.*
  - int **plugins** ()  
*Return the number of plugins in the class.*
  - [~FI\\_Plugin\\_Manager](#) ()  
*Remove the plugin manager.*

## Static Public Member Functions

- static int **load** (const char \**filename*)  
*Load a module from disk.*
- static int **loadAll** (const char \**dirpath*, const char \**pattern*=0)  
*Use this function to load a whole directory full of modules.*
- static void **removePlugin** ([FI\\_Preferences::ID](#) *id*)  
*Remove any plugin.*

## Additional Inherited Members

### 33.101.1 Detailed Description

[FI\\_Plugin\\_Manager](#) manages link-time and run-time plugin binaries.

See also

[FI\\_Plugin](#)

### 33.101.2 Constructor & Destructor Documentation

#### 33.101.2.1 ~FI\_Plugin\_Manager()

```
FI_Plugin_Manager::~FI_Plugin_Manager ()
```

Remove the plugin manager.

Calling this does not remove the database itself or any plugins. It just removes the reference to the database.

### 33.101.3 Member Function Documentation

#### 33.101.3.1 addPlugin()

```
FI_Preferences::ID FI_Plugin_Manager::addPlugin (
 const char * name,
 FI_Plugin * plugin)
```

This function adds a new plugin to the database.

There is no need to call this function explicitly. Every [FI\\_Plugin](#) constructor will call this function at initialization time.

### 33.101.3.2 load()

```
int Fl_Plugin_Manager::load (
 const char * filename) [static]
```

Load a module from disk.

A module must be a dynamically linkable file for the given operating system. When loading a module, its +init function will be called which in turn calls the constructor of all statically initialized [Fl\\_Plugin](#) classes and adds them to the database.

### 33.101.3.3 loadAll()

```
int Fl_Plugin_Manager::loadAll (
 const char * dirpath,
 const char * pattern = 0) [static]
```

Use this function to load a whole directory full of modules.

#### Parameters

<i>dirpath</i>	Pathname of a directory. It <b>must</b> end with the platform's directory separator character (i.e., '\' under Windows, '/' otherwise).
<i>pattern</i>	A filename pattern to catch all modules of interest in the targeted directory (e.g., "{*.so,*.dll,*.dylib}"), or NULL to catch all files in the directory.

### 33.101.3.4 removePlugin()

```
void Fl_Plugin_Manager::removePlugin (
 Fl_Preferences::ID id) [static]
```

Remove any plugin.

There is no need to call this function explicitly. Every [Fl\\_Plugin](#) destructor will call this function at destruction time. The documentation for this class was generated from the following files:

- [Fl\\_Plugin.H](#)
- [Fl\\_Preferences.cxx](#)

## 33.102 FI\_PNG\_Image Class Reference

The [Fl\\_PNG\\_Image](#) class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files.

```
#include <Fl_PNG_Image.H>
```

Inheritance diagram for [Fl\\_PNG\\_Image](#):

### Public Member Functions

- [Fl\\_PNG\\_Image](#) (const char \*filename)  
*The constructor loads the named PNG image from the given png filename.*
- [Fl\\_PNG\\_Image](#) (const char \*name\_png, const unsigned char \*buffer, int datasize)  
*Constructor that reads a PNG image from memory.*

## Friends

- class [FI\\_ICO\\_Image](#)

## Additional Inherited Members

### 33.102.1 Detailed Description

The [FI\\_PNG\\_Image](#) class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files. The class loads color-mapped and full-color images and handles color- and alpha-based transparency.

### 33.102.2 Constructor & Destructor Documentation

#### 33.102.2.1 FI\_PNG\_Image() [1/2]

```
FI_PNG_Image::FI_PNG_Image (
 const char * filename)
```

The constructor loads the named PNG image from the given png filename.

The destructor frees all memory and server resources that are used by the image.

Use [FI\\_Image::fail\(\)](#) to check if [FI\\_PNG\\_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the PNG format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

#### Parameters

in	<i>filename</i>	Name of PNG file to read
----	-----------------	--------------------------

#### 33.102.2.2 FI\_PNG\_Image() [2/2]

```
FI_PNG_Image::FI_PNG_Image (
 const char * name_png,
 const unsigned char * buffer,
 int maxsize)
```

Constructor that reads a PNG image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. `name_png` can be NULL. If a name is given, the image is added to the list of shared images (see: [FI\\_Shared\\_Image](#)) and will be available by that name.

#### Parameters

<i>name_png</i>	A name given to this image or NULL
<i>buffer</i>	Pointer to the start of the PNG image in memory
<i>maxsize</i>	Size in bytes of the memory buffer containing the PNG image

The documentation for this class was generated from the following files:

- [FI\\_PNG\\_Image.H](#)
- [FI\\_PNG\\_Image.cxx](#)

## 33.103 FI\_PNM\_Image Class Reference

The [FI\\_PNM\\_Image](#) class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.

```
#include <FI_PNM_Image.H>
```

Inheritance diagram for `Fl_PNM_Image`:

## Public Member Functions

- `Fl_PNM_Image` (const char \*filename)  
*The constructor loads the named PNM image.*

## Additional Inherited Members

### 33.103.1 Detailed Description

The `Fl_PNM_Image` class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.

The class loads bitmap, grayscale, and full-color images in both ASCII and binary formats.

### 33.103.2 Constructor & Destructor Documentation

#### 33.103.2.1 `Fl_PNM_Image()`

```
Fl_PNM_Image::Fl_PNM_Image (
 const char * filename)
```

The constructor loads the named PNM image.

The destructor frees all memory and server resources that are used by the image.

Use `Fl_Image::fail()` to check if `Fl_PNM_Image` failed to load. `fail()` returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the PNM format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

#### Parameters

in	<i>filename</i>	a full path and name pointing to a valid jpeg file.
----	-----------------	-----------------------------------------------------

The documentation for this class was generated from the following files:

- `Fl_PNM_Image.H`
- `Fl_PNM_Image.cxx`

## 33.104 `Fl_Positioner` Class Reference

This class is provided for Forms compatibility.

```
#include <Fl_Positioner.H>
```

Inheritance diagram for `Fl_Positioner`:

## Public Member Functions

- [Fl\\_Positioner](#) (int *x*, int *y*, int *w*, int *h*, const char \**l*=0)
  - Creates a new Fl\_Positioner widget using the given position, size, and label string.*
- int [handle](#) (int) [FL\\_OVERRIDE](#)
  - Handles the specified event.*

- double [ymaximum](#) () const
  - Gets the Y axis maximum.*
- void [ymaximum](#) (double *a*)
  - Same as ybounds(yminimum(), a)*
- double [yminimum](#) () const
  - Gets the Y axis minimum.*
- void [yminimum](#) (double *a*)
  - Same as ybounds(a, ymaximum())*
- void [ystep](#) (double *a*)
  - Sets the stepping value for the Y axis.*
- double [yvalue](#) () const
  - Gets the Y axis coordinate.*
- int [yvalue](#) (double)
  - Sets the Y axis coordinate.*

## Protected Member Functions

- void [draw](#) () [FL\\_OVERRIDE](#)
  - Draws the widget.*
- void [draw](#) (int, int, int, int)
- int [handle](#) (int, int, int, int, int)

## Additional Inherited Members

### 33.104.1 Detailed Description

This class is provided for Forms compatibility.

It provides 2D input. It would be useful if this could be put atop another widget so that the crosshairs are on top, but this is not implemented. The color of the crosshairs is [selection\\_color\(\)](#).

Figure 33.35 Fl\_Positioner

### 33.104.2 Constructor & Destructor Documentation

#### 33.104.2.1 Fl\_Positioner()

```
Fl_Positioner::Fl_Positioner (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Positioner](#) widget using the given position, size, and label string. The default boxtype is FL\_NO\_BOX.

### 33.104.3 Member Function Documentation

#### 33.104.3.1 draw()

```
void Fl_Positioner::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 33.104.3.2 handle()

```
int Fl_Positioner::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

- Returns the PostScript driver of this drawing surface.*

## Additional Inherited Members

### 33.105.1 Detailed Description

To send graphical output to a PostScript file.

This class is used exactly as the [Fl\\_Printer](#) class except for the [begin\\_job\(\)](#) call, two variants of which are usable and allow to specify what page format and layout are desired.

**Processing of text:** Text uses vectorial fonts under the X11 + Pango and the Wayland platforms. With other platforms, only text restricted to the Latin alphabet (and a few other characters listed in the table below) and to FLTK standard fonts is vectorized. All other unicode characters or all other fonts (FL\_FREE\_FONT and above) are output as a bitmap. FLTK standard fonts are output using the corresponding PostScript standard fonts. The latin alphabet means all unicode characters between U+0020 and U+017F, or, in other words, the ASCII, Latin-1 Supplement and Latin Extended-A charts.

Char	Codepoint	Name	Char	Codepoint	Name	Char	Codepoint	Name
<i>f</i>	U+0192	florin	,	U+201A	quotesinglbase	™	U+2122	trademark
^	U+02C6	circumflex	“	U+201C	quotedblleft	∂	U+2202	partialdiff

’	U+2019	quoteright	€	U+20AC	Euro	🍏	U+F8FF	apple (macOS only)

Figure 33.36 Extra characters supported by standard PostScript fonts

**Processing of transparent [Fl\\_RGB\\_Image](#) objects:** Under the X11 + Pango and the Wayland platforms, these objects are output with their exact transparency. With other platforms, these objects are drawn blended to white color. Class [Fl\\_EPS\\_File\\_Surface](#)'s constructor allows to set another background color for blending.

### 33.105.2 Member Function Documentation

#### 33.105.2.1 begin\_job() [1/3]

```
int Fl_PostScript_File_Device::begin_job (
 FILE * ps_output,
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT)
```

Begins the session where all graphics requests will go to FILE pointer.

This member function prevents [end\\_job\(\)](#) from closing `ps_output`, so the user can check with `ferror(ps_output)` for output errors.

## Parameters

## Parameters

<i>ps_output</i>	A writable FILE pointer that will receive PostScript output and that should not be closed until after <a href="#">end_job()</a> has been called.
<i>pagecount</i>	The total number of pages to be created. Use 0 if this number is unknown when this function is called.
<i>format</i>	Desired page format.
<i>layout</i>	Desired page layout.

## Returns

always 0.

**33.105.2.2 begin\_job() [2/3]**

```
int Fl_PostScript_File_Device::begin_job (
 int pagecount,
 int * from,
 int * to,
 char ** perr_message) [virtual]
```

Don't use with this class.

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.105.2.3 begin\_job() [3/3]**

```
int Fl_PostScript_File_Device::begin_job (
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT)
```

Begins the session where all graphics requests will go to a local PostScript file.

Opens a file dialog to select an output PostScript file. This member function makes [end\\_job\(\)](#) close the resulting PostScript file and display an alert message with [fl\\_alert\(\)](#) in case of any output error.

## Parameters

<i>pagecount</i>	The total number of pages to be created. Use 0 if this number is unknown when this function is called.
<i>format</i>	Desired page format.
<i>layout</i>	Desired page layout.

## Returns

0 if OK, 1 if user cancelled the file dialog, 2 if fopen failed on user-selected output file.

**33.105.2.4 begin\_page()**

```
int Fl_PostScript_File_Device::begin_page (
 void) [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with [Fl\\_Surface\\_Device::push\\_current\(\)](#).

**Note**

`begin_page()` calls `FI_Surface_Device::push_current()` and leaves this device as the active surface. If any calls between `begin_page()` and `end_page()` open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to `FI_Surface_Device::pop_current()` and a call to `FI_Surface_Device::push_current()`, or the content of the dialog box will be rendered to the printer instead of the screen.

**Returns**

0 if OK, non-zero if any error

Reimplemented from `FI_Paged_Device`.

**33.105.2.5 end\_current()**

```
void Fl_PostScript_File_Device::end_current () [virtual]
```

FLTK calls this each time a surface ceases to be the current drawing surface.

This member function is mostly of interest to developers of new `FI_Surface_Device` derived classes. It allows to perform surface-specific operations necessary when this surface ceases to be current. Each implementation should end with a call to `FI_Surface_Device::end_current()`.

Reimplemented from `FI_Surface_Device`.

**33.105.2.6 end\_job()**

```
void Fl_PostScript_File_Device::end_job (
 void) [virtual]
```

Completes all PostScript output.

This also closes with `fclose()` the underlying `file()` unless `close_command()` was used to set another function.

Reimplemented from `FI_Paged_Device`.

**33.105.2.7 end\_page()**

```
int Fl_PostScript_File_Device::end_page (
 void) [virtual]
```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with `FI_Surface_Device::pop_current()`.

**Note**

`end_page()` calls `FI_Surface_Device::pop_current()`. If any calls between `begin_page()` and `end_page()` open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to `FI_Surface_Device::pop_current()` and a call to `FI_Surface_Device::push_current()`.

**Returns**

0 if OK, non-zero if any error.

Reimplemented from `FI_Paged_Device`.

**33.105.2.8 margins()**

```
void Fl_PostScript_File_Device::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page.

Values are in the same unit as that used by FLTK drawing functions. They are changed by `scale()` calls.

## Parameters

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
out	<i>right</i>	If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.105.2.9 origin() [1/2]**

```
void Fl_PostScript_File_Device::origin (
 int * x,
 int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

## Parameters

out	<i>x,y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.105.2.10 origin() [2/2]**

```
void Fl_PostScript_File_Device::origin (
 int x,
 int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

## Parameters

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	------------	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.105.2.11 printable\_rect()**

```
int Fl_PostScript_File_Device::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

## Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.105.2.12 rotate()**

```
void Fl_PostScript_File_Device::rotate (
 float angle) [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

**Parameters**

<i>angle</i>	Rotation angle in counter-clockwise degrees.
--------------	----------------------------------------------

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.105.2.13 scale()**

```
void Fl_PostScript_File_Device::scale (
 float scale_x,
 float scale_y = 0.) [virtual]
```

Changes the scaling of page coordinates.

This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine their effects.

**Parameters**

<i>scale_x</i>	Horizontal dimensions of plot are multiplied by this quantity.
<i>scale_y</i>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor);</code> is equivalent to <code>scale(factor, factor);</code>

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.105.2.14 set\_current()**

```
void Fl_PostScript_File_Device::set_current (
 void) [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

**Note**

It's recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#); . Don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [Fl\\_Surface\\_Device](#).

**33.105.2.15 start\_job()** [1/2]

```
int Fl_PostScript_File_Device::start_job (
 FILE * ps_output,
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT) [inline]
```

Synonym of [begin\\_job\(\)](#).

For API compatibility with FLTK 1.3.x

**33.105.2.16 start\_job()** [2/2]

```
int Fl_PostScript_File_Device::start_job (
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT) [inline]
```

Synonym of [begin\\_job\(\)](#).

For API compatibility with FLTK 1.3.x

**33.105.2.17 translate()**

```
void Fl_PostScript_File_Device::translate (
 int x,
 int y) [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.105.2.18 untranslate()**

```
void Fl_PostScript_File_Device::untranslate (
 void) [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl\\_Widget\\_Surface](#).

The documentation for this class was generated from the following file:

- [Fl\\_PostScript.H](#)

**33.106 Fl\_Preferences Class Reference**

[Fl\\_Preferences](#) store user settings between application starts.

```
#include <Fl_Preferences.H>
```

Inheritance diagram for [Fl\\_Preferences](#):

**Classes**

- struct [Entry](#)
- class [Name](#)

*'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.*

- class [Node](#)

*Reads an entry from the group.*
- char [get](#) (const char \*[entry](#), float &value, float defaultValue)

*Reads an entry from the group.*
- char [get](#) (const char \*[entry](#), int &value, int defaultValue)

*Reads an entry from the group.*
- char [get](#) (const char \*[entry](#), void \*&value, const void \*defaultValue, int defaultSize)

*Reads an entry from the group.*
- char [get](#) (const char \*[entry](#), void \*value, const void \*defaultValue, int defaultSize, int \*size)

*Reads a binary entry from the group, encoded in hexadecimal blocks.*
- char [get](#) (const char \*[entry](#), void \*value, const void \*defaultValue, int defaultSize, int maxSize)

*Reads a binary entry from the group, encoded in hexadecimal blocks.*
- char [get\\_userdata\\_path](#) (char \*[path](#), int pathlen)

*Creates a path that is related to the preference file and that is usable for additional application data.*
- const char \* [group](#) (int num\_group)

*Returns the name of the Nth (*num\_group*) group.*
- char [group\\_exists](#) (const char \*key)

*Returns non-zero if a group with this name exists.*
- int [groups](#) ()

*Returns the number of groups that are contained within a group.*
- ID [id](#) ()

*Return an ID that can later be reused to open more references to this dataset.*
- const char \* [name](#) ()

*Return the name of this entry.*
- const char \* [path](#) ()

*Return the full path to this entry.*
- char [set](#) (const char \*[entry](#), const char \*value)

*Sets an entry (name/value pair).*
- char [set](#) (const char \*[entry](#), const void \*value, int size)

*Sets an entry (name/value pair).*
- char [set](#) (const char \*[entry](#), double value)

*Sets an entry (name/value pair).*
- char [set](#) (const char \*[entry](#), double value, int precision)

*Sets an entry (name/value pair).*
- char [set](#) (const char \*[entry](#), float value)

*Sets an entry (name/value pair).*
- char [set](#) (const char \*[entry](#), float value, int precision)

*Sets an entry (name/value pair).*
- char [set](#) (const char \*[entry](#), int value)

*Sets an entry (name/value pair).*
- int [size](#) (const char \*[entry](#))

*Returns the size of the value part of an entry.*
- virtual [~FI\\_Preferences](#) ()

*The destructor removes allocated resources.*

## Static Public Member Functions

- static unsigned int [file\\_access](#) ()  
*Return the current file access permissions for the FLTK preferences system.*
- static void [file\\_access](#) (unsigned int flags)  
*Tell the FLTK preferences system which files in the file system it may read, create, or write.*
- static [Root filename](#) (char \*buffer, size\_t buffer\_size, [Root](#) root, const char \*vendor, const char \*application)  
*Determine the file name and path to preferences that would be opened with these parameters.*
- static const char \* [new\\_UUID](#) ()  
*Returns a UUID as generated by the system.*
- static char [remove](#) (ID id\_)  
*Remove the group with this ID from a database.*

## Static Public Attributes

- static const unsigned int **ALL** = [ALL\\_READ\\_OK](#) | [ALL\\_WRITE\\_OK](#)  
*Set this to give FLTK and applications permission to read, write, and create preference files.*
- static const unsigned int **ALL\_READ\_OK** = [USER\\_READ\\_OK](#) | [SYSTEM\\_READ\\_OK](#) | [CORE\\_READ\\_OK](#)  
*Set this to allow FLTK and applications to read preference files.*
- static const unsigned int **ALL\_WRITE\_OK** = [USER\\_WRITE\\_OK](#) | [SYSTEM\\_WRITE\\_OK](#) | [CORE\\_WRITE\\_OK](#)  
*Set this to allow FLTK and applications to create and write preference files.*

### 33.106.1 Detailed Description

[Fl\\_Preferences](#) store user settings between application starts.

[Fl\\_Preferences](#) are similar to the Registry on Windows and Preferences on MacOS, providing a simple method to store customizable user settings between app launches, for instance the previous window position or a history of previously used documents.

Preferences are organized in a hierarchy of groups. Every group can contain more groups and any number of key/value pairs. Keys can be text strings containing ASCII letters, digits, periods, and underscores. Forward slashes in a key name are treated as subgroups, i.e. the key 'window/width' would actually refer to the key 'width' inside the group 'window'.

Keys usually have a unique name within their group. Duplicate keys are possible though and can be accessed using the index based functions.

A value can be an UTF-8 string. Control characters and UTF-8 sequences are stored as octal values. Long strings are wrapped at the line ending and will be reassembled when reading the file back.

Several methods allow setting and getting numerical values and binary data.

Preferences are stored in text files that can be edited manually if needed. The file format is easy to read and relatively forgiving. Preference files are the same on all platforms. User comments in preference files are preserved. Filenames are unique for each application by using a vendor/application naming scheme. The user must provide default values for all entries to ensure proper operation should preferences be corrupted or not yet exist.

FLTK preferences are not meant to replace a fully features database. No merging of data takes place. If several instances of an app access the same database at the same time, only the most recent changes will persist.

Preferences should no be used to store document data. The .prefs file should be kept small for performance reasons. One application can have multiple preference files. Extensive binary data however should be stored in separate files: see [Fl\\_Preferences::get\\_userdata\\_path\(\)](#).

[Fl\\_Preferences](#) are not thread-safe. They can temporarily change the locale on some platforms during read and write access, which also changes it temporarily in other threads of the same app.

Typically a preferences database is read at startup, and then reopened and written at app shutdown:

```
int appWindowWidth, appWindowHeight;
void launch() {
 Fl_Preferences app(Fl_Preferences::USER_L, "matthiasm.com", "hello");
 // 'app' constructor will be called, reading data from .prefs file
 Fl_Preferences window(app, "window");
 window.get("width", appWindowWidth, 800);
 window.get("height", appWindowHeight, 600);
 // 'app' destructor will be called. This will write data to the
 // .prefs file if any preferences were changed or added
}
void quit() {
 Fl_Preferences app(Fl_Preferences::USER_L, "matthiasm.com", "hello");
 Fl_Preferences window(app, "window");
 window.set("width", appWindowWidth);
 window.set("height", appWindowHeight);
}
```

See also

[Fl\\_Preferences::Fl\\_Preferences\(Root root, const char \\*vendor, const char \\*application\)](#)

As a special case, [Fl\\_Preferences](#) can be memory mapped and not be associated with a file on disk.

See also

[Fl\\_Preferences::Fl\\_Preferences\(Fl\\_Preferences \\*parent, const char \\*group\)](#) for more details on memory mapped preferences.

Note

Starting with FLTK 1.3, preference databases are expected to be in UTF-8 encoding. Previous databases were stored in the current character set or code page which renders them incompatible for text entries using international characters.

Starting with FLTK 1.4, searching a valid path to store the preference files has changed slightly. Please see [Fl\\_Preferences::Fl\\_Preferences\(Root, const char\\*, const char\\*\)](#) for details.

Starting with FLTK 1.4, preference files should be created with `SYSTEM_L` or `USER_L` to be interchangeable between computers with differing locale settings. The legacy modes, `LOCAL` and `SYSTEM`, will read and write floating point values using the decimal point of the current locale. As a result, a fp-value would be written '3,1415' on a German machine, and would be read back as '3.0' on a US machine because the comma would not be recognized as an alternative decimal point.

## 33.106.2 Member Typedef Documentation

### 33.106.2.1 ID

```
typedef void* Fl_Preferences::ID
```

Every Fl\_Preferences-Group has a unique ID.

ID's can be retrieved from an Fl\_Preferences-Group and can then be used to create more Fl\_Preference references to the same data set, as long as the database remains open.

## 33.106.3 Member Enumeration Documentation

### 33.106.3.1 Root

```
enum Fl_Preferences::Root
```

Define the scope of the preferences.

#### Enumerator

UNKNOWN_ROOT_TYPE	Returned if storage could not be determined.
SYSTEM	Preferences are used system-wide. Deprecated, see SYSTEM_L.
USER	Preferences apply only to the current user. Deprecated, see USER_L.
MEMORY	Returned if querying memory mapped preferences.
ROOT_MASK	Mask for the values above.
CORE	OR'd by FLTK to read and write core library preferences and options.
C_LOCALE	This flag should always be set, it makes sure that floating point.
CLEAR	Don't read a possibly existing database. Instead, start with an empty set of preferences. values are written correctly independently of the current locale
SYSTEM_L	Preferences are used system-wide, locale independent.
USER_L	Preferences apply only to the current user, locale independent.
CORE_SYSTEM_L	Same as CORE   SYSTEM   C_LOCALE.
CORE_USER_L	Same as CORE   USER   C_LOCALE.
CORE_SYSTEM	Deprecated, same as CORE   SYSTEM. Use CORE_SYSTEM_L instead.
CORE_USER	Deprecated, same as CORE   USER. Use CORE_USER_L instead.

## 33.106.4 Constructor & Destructor Documentation

### 33.106.4.1 Fl\_Preferences() [1/8]

```
Fl_Preferences::Fl_Preferences (
 Root root,
 const char * vendor,
 const char * application)
```

The constructor creates a group that manages key/value pairs and child groups.

Preferences can be stored per user using the root type `Fl_Preferences::USER_L`, or stored system-wide using `Fl_Preferences::SYSTEM_L`.

Groups and key/value pairs can be read and written randomly. Reading undefined values will return the default value. Writing undefined values will create all required groups and key/value pairs.

This constructor creates the *base* instance for all following entries and reads the database from disk into memory if it exists. The vendor argument is a unique text string identifying the development team or vendor of an application. A

domain name or an EMail address (replacing the '@' with a '.') are great unique names, e.g. "research.matthiasm.com" or "fluid.fltk.org". The application argument can be the working title or final name of your application. Both vendor and application must be valid UNIX path segments as they become parts of the preference file path and may contain forward slashes to create deeper file structures.

#### Note

On **Windows**, the directory is constructed by querying the *Common AppData* or *AppData* key of the Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders registry entry. The filename and path is then constructed as `$(query)/$(vendor)/$(application).prefs`. If the query call fails, data will be stored in RAM only. It will be lost when the app exits.

In FLTK versions before 1.4.0, if querying the registry failed,

preferences would be written to `C:\FLTK\$(vendor)\$(application).prefs`.

#### Note

On **Linux**, the USER directory is constructed by reading `$HOME`. If `$HOME` is not set or not pointing to an existing directory, FLTK will check the path member of the passwd struct returned by `getpwuid(getuid())`. If all attempts fail, data will be stored in RAM only and be lost when the app exits.

The SYSTEM preference filename is hardcoded as `/etc/fltk/$(vendor)/$(application).prefs`.

For backward compatibility, the old USER .prefs file naming scheme `$(directory)/.fltk/$(vendor)/$(application).prefs` is checked first. If that file does not exist, the environment variable `$XDG_CONFIG_HOME` is read as a base directory. If `$XDG_CONFIG_HOME` not set, the base directory defaults to `$HOME/.config/`.

The user preferences will be stored in `$(directory)/$(vendor)/$(application).prefs`. The user data path will be `$(directory)/$(vendor)/$(application)/`.

In FLTK versions before 1.4.0, if `$HOME` was not set, the USER path would be empty, generating `$(vendor)/$(application).prefs`, which was used relative to the current working directory.

#### Note

On **macOS**, the USER directory is constructed by reading `$HOME`. If `$HOME` is not set or not pointing to an existing directory, we check the path returned by `NSHomeDirectory()`, and finally checking the path member of the passwd struct returned by `getpwuid(getuid())`. If all attempts fail, data will be stored in RAM only and be lost when the app exits. The filename and path is then constructed as `$(directory)/Library/Preferences/$(vendor)/$(application).prefs`. The SYSTEM directory is hardcoded as `/Library/Preferences/$(vendor)/$(application).prefs`.

In FLTK versions before 1.4.0, if `$HOME` was not set, the USER path

would be NULL, generating `<null>/Library/Preferences/$(vendor)/$(application).prefs`, which would silently fail to create a preference file.

#### Parameters

in	<i>root</i>	can be <code>USER_L</code> or <code>SYSTEM_L</code> for user specific or system wide preferences, add the <code>CLEAR</code> flag to start with a clean set of preferences instead of reading them from a preexisting database
in	<i>vendor</i>	unique text describing the company or author of this file, must be a valid filepath segment
in	<i>application</i>	unique text describing the application, must be a valid filepath segment

#### See also

[FI\\_Preferences\(FI\\_Preferences \\*parent, const char \\*group\)](#) with parent set to NULL

**33.106.4.2 Fl\_Preferences()** [2/8]

```
Fl_Preferences::Fl_Preferences (
 const char * path,
 const char * vendor,
 const char * application,
 Root flags)
```

Use this constructor to create or read a preference file at an arbitrary position in the file system.

The file name is generated in the form \$(path)/\$(application).prefs. If application is NULL, path is taken literally as the file path and name.

```
// Example: read from an existing database and write modifications when flushed
// or destructor is called
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL,
 Fl_Preferences::C_LOCALE);
// Example: create a new preferences file with an empty data set
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL,
 (Fl_Preferences::Root)(Fl_Preferences::C_LOCALE|Fl_Preferences::CLEAR));
```

**Note**

the C\_LOCALE flag is not set by default for backward compatibility, but it is highly recommended to set it when opening a database.

**Parameters**

in	<i>path</i>	path to the directory that contains the preference file
in	<i>vendor</i>	unique text describing the company or author of this file, must be a valid file path segment
in	<i>application</i>	unique text describing the application, must be a valid filename or NULL
in	<i>flags</i>	C_LOCALE to make the preferences file independent of the current locale, add the CLEAR flag to start with a clean set of preferences instead of reading from the database

**33.106.4.3 Fl\_Preferences()** [3/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences & parent,
 const char * group)
```

Generate or read a new group of entries within another group.

Use the group argument to name the group that you would like to access. Group can also contain a path to a group further down the hierarchy by separating group names with a forward slash '/'.

**Parameters**

in	<i>parent</i>	reference object for the new group
in	<i>group</i>	name of the group to access (may contain '/')

**33.106.4.4 Fl\_Preferences()** [4/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences * parent,
 const char * group)
```

Create or access a group of preferences using a name.

Parent should point to a previously created parent preferences group to create a preferences hierarchy.

If parent is set to NULL, an unnamed database will be accessed that exists only in local memory and is not associated with a file on disk. The root type of this database is set to `Fl_Preferences::MEMORY`.

- the memory database is *not* shared among multiple instances of the same app

- memory databases are *not* thread safe
- all data will be lost when the app quits

```
void some_function() {
 Fl_Preferences guide(NULL, "Guide");
 guide.set("answer", 42);
}
void other_function() {
 int x;
 Fl_Preferences guide(NULL, "Guide");
 guide.get("answer", x, -1);
}
```

FLTK uses the memory database to manage plugins. See [Fl\\_Plugin](#).

#### Parameters

in	<i>parent</i>	the parameter <i>parent</i> is a pointer to the parent group. If <i>parent</i> is NULL, the new preferences item refers to an application internal database ("runtime prefs") which exists only once, and remains in RAM only until the application quits. This database is used to manage plugins and other data indexes by strings. Runtime prefs are <i>not</i> thread-safe.
in	<i>group</i>	a group name that is used as a key into the database

#### See also

[Fl\\_Preferences\( Fl\\_Preferences&, const char \\*group \)](#)

#### 33.106.4.5 Fl\_Preferences() [5/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences & parent,
 int groupIndex)
```

Open a child group using a given index.

Use the *groupIndex* argument to find the group that you would like to access. If the given index is invalid (negative or too high), a new group is created with a UUID as a name.

The index needs to be fixed. It is currently backward. Index 0 points to the last member in the 'list' of preferences.

#### Parameters

in	<i>parent</i>	reference object for the new group
in	<i>groupIndex</i>	zero based index into child groups

#### 33.106.4.6 Fl\_Preferences() [6/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences * parent,
 int groupIndex)
```

#### See also

[Fl\\_Preferences\( Fl\\_Preferences&, int groupIndex \)](#)

#### 33.106.4.7 Fl\_Preferences() [7/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences::ID id)
```

Create a new dataset access point using a dataset ID.

ID's are a great way to remember shortcuts to database entries that are deeply nested in a preferences database, as long as the database root is not deleted. An ID can be retrieved from any [Fl\\_Preferences](#) dataset, and can then be used to create multiple new references to the same dataset.

ID's can be very helpful when put into the `user_data()` field of widget callbacks.

#### 33.106.4.8 ~Fl\_Preferences()

```
Fl_Preferences::~Fl_Preferences () [virtual]
```

The destructor removes allocated resources.

When used on the *base* preferences group, the destructor flushes all changes to the preference file and deletes all internal databases.

The destructor does not remove any data from the database. It merely deletes your reference to the database.

#### 33.106.4.9 Fl\_Preferences() [8/8]

```
Fl_Preferences::Fl_Preferences (
 const char * path,
 const char * vendor,
 const char * application)
```

Deprecated: Use this constructor to create or read a preference file at an arbitrary position in the file system.

**Deprecated** "in 1.4.0 - use `Fl_Preferences(path, vendor, application, flags)` instead"

This constructor should no longer be used because the generated database uses the current locale, making it impossible to exchange floating point settings between machines with different language settings.

Use `Fl_Preferences(path, vendor, application, Fl_Preferences::C_LOCALE)` in new projects and `Fl_Preferences(path, vendor, application, 0)` if you must keep backward compatibility.

See also

[Fl\\_Preferences\(const char \\*path, const char \\*vendor, const char \\*application, Root flags\)](#)

### 33.106.5 Member Function Documentation

#### 33.106.5.1 delete\_entry()

```
char Fl_Preferences::delete_entry (
 const char * key)
```

Deletes a single name/value pair.

This function removes the entry `key` from the database.

##### Parameters

in	<i>key</i>	name of entry to delete
----	------------	-------------------------

##### Returns

0 if deleting the entry failed

#### 33.106.5.2 delete\_group()

```
char Fl_Preferences::delete_group (
 const char * group)
```

Deletes a group.

Removes a group and all keys and groups within that group from the database.

**Parameters**

in	<i>group</i>	name of the group to delete
----	--------------	-----------------------------

**Returns**

0 if call failed

**33.106.5.3 dirty()**

```
int Fl_Preferences::dirty ()
```

Check if there were changes to the database that need to be written to disk.

**Returns**

1 if the database will be written to disk by `flush` or destructor.

0 if the database is unchanged since the last write operation.

-1 if there is an internal database error.

**33.106.5.4 entries()**

```
int Fl_Preferences::entries ()
```

Returns the number of entries (name/value pairs) in a group.

**Returns**

number of entries

**33.106.5.5 entry()**

```
const char * Fl_Preferences::entry (
 int index)
```

Returns the name of an entry.

There is no guaranteed order of entry names. The index must be within the range given by [entries\(\)](#).

**Parameters**

in	<i>index</i>	number indexing the requested entry
----	--------------	-------------------------------------

**Returns**

pointer to value cstring

**33.106.5.6 entry\_exists()**

```
char Fl_Preferences::entry_exists (
 const char * key)
```

Returns non-zero if an entry with this name exists.

**Parameters**

in	<i>key</i>	name of entry that is searched for
----	------------	------------------------------------

**Returns**

0 if entry was not found

**33.106.5.7 file\_access()** [1/2]

```
unsigned int Fl_Preferences::file_access () [static]
```

Return the current file access permissions for the FLTK preferences system.

**See also**

[Fl\\_Preferences::file\\_access\(unsigned int\)](#)

**33.106.5.8 file\_access()** [2/2]

```
void Fl_Preferences::file_access (
 unsigned int flags) [static]
```

Tell the FLTK preferences system which files in the file system it may read, create, or write.

The FLTK core library will try to read or even create or write preference files when calling [Fl::option\(\)](#), [Fl\\_File\\_Chooser](#), the printing panel, and possibly some other internal functions. If your application wants to keep FLTK from touching the file system, call this function before making any other FLTK calls:

```
// neither FLTK nor the app may read, create, or write preference files
Fl_Preferences::file_access(Fl_Preferences::NONE);
```

or

```
// FLTK may not read, create, or write preference files, but the application may
Fl_Preferences::file_access(Fl_Preferences::APP_OK);
```

All flags can be combined using an OR operator. If flags are not set, that specific access to the file system will not be allowed. By default, all access is granted. To clear one or more flags from the default setting, use:

```
Fl_Preferences::file_access(Fl_Preferences::file_access()
 &~ Fl_Preferences::SYSTEM_WRITE);
```

If preferences are created using a filename (instead of [Fl\\_Preferences::USER](#) or [Fl\\_Preferences::SYSTEM](#)), file access is handled as if the [Fl\\_Preferences::USER](#) flag was set.

**See also**

[Fl\\_Preferences::NONE](#) and others for a list of flags.

[Fl\\_Preferences::file\\_access\(\)](#)

**33.106.5.9 filename()** [1/2]

```
Fl_Preferences::Root Fl_Preferences::filename (
 char * buffer,
 size_t buffer_size)
```

Return the file name and path to the preference file.

If the preferences have not changed or have not been flushed, the file or directory may not have been created yet.

**Parameters**

out	<i>buffer</i>	write the resulting path into this buffer
in	<i>buffer_size</i>	size of the buffer in bytes

**Returns**

the root type at creation type, or MEMORY for runtime prefs, it does not return CORE or LOCALE flags.

**33.106.5.10 filename() [2/2]**

```
Fl_Preferences::Root Fl_Preferences::filename (
 char * buffer,
 size_t buffer_size,
 Root root,
 const char * vendor,
 const char * application) [static]
```

Determine the file name and path to preferences that would be opened with these parameters.

Find the possible location of a preference file on disk without touching any of the pathname components. This can be used to check if a preference file already exists.

**Parameters**

out	<i>buffer</i>	write the resulting path into this buffer
in	<i>buffer_size</i>	size of the <i>buffer</i> in bytes
in	<i>root</i>	can be USER_L or SYSTEM_L for user specific or system wide preferences
in	<i>vendor</i>	unique text describing the company or author of this file, must be a valid filepath segment
in	<i>application</i>	unique text describing the application, must be a valid filepath segment

**Returns**

the input root value, or [Fl\\_Preferences::UNKNOWN\\_ROOT\\_TYPE](#) if the path could not be determined.

**See also**

[Fl\\_Preferences\( Root root, const char \\*vendor, const char \\*application \)](#)

**33.106.5.11 flush()**

```
int Fl_Preferences::flush ()
```

Writes preferences to disk if they were modified.

This method can be used to verify that writing a preference file went well. Deleting the base preferences object will also write the contents of the database to disk.

**Returns**

-1 if anything went wrong, i.e. file could not be opened, permissions blocked writing, etc.

0 if the file was written to disk. This does not check if the disk ran out of space and the file is truncated.

1 if no data was written to the database and no write attempt to disk was made.

**33.106.5.12 get() [1/8]**

```
char Fl_Preferences::get (
 const char * key,
 char *& text,
 const char * defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). [get\(\)](#) allocates memory of sufficient size to hold the value. The buffer must be free'd by the developer using 'free(value)'.

**Parameters**

in	<i>key</i>	name of entry
out	<i>text</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

**Returns**

0 if the default value was used

**33.106.5.13 get() [2/8]**

```
char Fl_Preferences::get (
 const char * key,
 char * text,
 const char * defaultValue,
 int maxSize)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). 'maxSize' is the maximum length of text that will be read. The text buffer must allow for one additional byte for a trailing zero.

**Parameters**

in	<i>key</i>	name of entry
out	<i>text</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set
in	<i>maxSize</i>	maximum length of value plus one byte for a trailing zero

**Returns**

0 if the default value was used

**33.106.5.14 get() [3/8]**

```
char Fl_Preferences::get (
 const char * key,
 double & value,
 double defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

**Parameters**

in	<i>key</i>	name of entry
out	<i>value</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

**Returns**

0 if the default value was used

**33.106.5.15 get() [4/8]**

```
char Fl_Preferences::get (
 const char * key,
 float & value,
 float defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

**Parameters**

in	<i>key</i>	name of entry
out	<i>value</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

**Returns**

0 if the default value was used

**33.106.5.16 get() [5/8]**

```
char Fl_Preferences::get (
 const char * key,
 int & value,
 int defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

**Parameters**

in	<i>key</i>	name of entry
out	<i>value</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

**Returns**

0 if the default value was used

**33.106.5.17 get() [6/8]**

```
char Fl_Preferences::get (
 const char * key,
 void *& data,
 const void * defaultValue,
 int defaultSize)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). [get\(\)](#) allocates memory of sufficient size to hold the value. The buffer must be free'd by the developer using 'free(value)'.

**Parameters**

in	<i>key</i>	name of entry
----	------------	---------------

**Parameters**

out	<i>data</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set
in	<i>defaultSize</i>	size of default value array

**Returns**

0 if the default value was used

**33.106.5.18 get() [7/8]**

```
char Fl_Preferences::get (
 const char * key,
 void * data,
 const void * defaultValue,
 int defaultSize,
 int * maxSize)
```

Reads a binary entry from the group, encoded in hexadecimal blocks.

A binary (not hex) default value can be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). *maxSize* is the maximum length of text that will be read and returns the actual number of bytes read.

**Parameters**

in	<i>key</i>	name of entry
out	<i>data</i>	value returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set
in	<i>defaultSize</i>	size of default value array
in, out	<i>maxSize</i>	maximum length of value and actual number of bytes set

**Returns**

0 if the default value was used

**33.106.5.19 get() [8/8]**

```
char Fl_Preferences::get (
 const char * key,
 void * data,
 const void * defaultValue,
 int defaultSize,
 int maxSize)
```

Reads a binary entry from the group, encoded in hexadecimal blocks.

**Parameters**

in	<i>key</i>	name of entry
out	<i>data</i>	value returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value
in	<i>defaultSize</i>	size of default value array
in	<i>maxSize</i>	maximum length of value, to receive the number of bytes read, use the function below instead.

**Returns**

0 if the default value was used

**See also**

[Fl\\_Preferences::get\( const char \\*key, void \\*data, const void \\*defaultValue, int defaultSize, int \\*maxSize \)](#)

**33.106.5.20 get\_userdata\_path()**

```
char Fl_Preferences::get_userdata_path (
 char * path,
 int pathlen)
```

Creates a path that is related to the preference file and that is usable for additional application data.

This function creates a directory that is named after the preferences database without the .prefs extension and located in the same directory. It then fills the given buffer with the complete path name.

There is no way to verify that the path name fit into the buffer. If the name is too long, it will be clipped.

This function can be used with direct paths that don't end in .prefs . *getUserDataPath()* will remove any extension and end the path with a / . If the file name has no extension, *getUserDataPath()* will append .data/ to the path name.

**Example:**

```
Fl_Preferences prefs(USER, "matthiasm.com", "test");
char path[FL_PATH_MAX];
prefs.getUserdataPath(path, FL_PATH_MAX);
```

creates the preferences database in the directory (User 'matt' on Linux):

```
/Users/matt/.fltk/matthiasm.com/test.prefs
```

..and returns the userdata path:

```
/Users/matt/.fltk/matthiasm.com/test/
```

**Parameters**

out	<i>path</i>	buffer for user data path
in	<i>pathlen</i>	size of path buffer (should be at least FL_PATH_MAX )

**Returns**

1 if there is no filename (*path* will be unmodified)

1 if *pathlen* is 0 (*path* will be unmodified)

1 if a path was created successfully, *path* will contain the path name ending in a '/'

0 if path was not created for some reason; *path* will contain the pathname that could not be created

**See also**

[Fl\\_Preferences::Fl\\_Preferences\(Root, const char\\*, const char\\*\)](#)

**33.106.5.21 group()**

```
const char * Fl_Preferences::group (
 int num_group)
```

Returns the name of the Nth (*num\_group*) group.

There is no guaranteed order of group names. The index must be within the range given by [groups\(\)](#).

**Parameters**

in	<i>num_group</i>	number indexing the requested group
----	------------------	-------------------------------------

**Returns**

'C' string pointer to the group name

**33.106.5.22 group\_exists()**

```
char Fl_Preferences::group_exists (
 const char * key)
```

Returns non-zero if a group with this name exists.

Group names are relative to the [Fl\\_Preferences](#) node and can contain a path. "." describes the current node, "/" describes the topmost node. By preceding a groupname with a "/" its path becomes relative to the topmost node.

**Parameters**

in	<i>key</i>	name of group that is searched for
----	------------	------------------------------------

**Returns**

0 if no group by that name was found

**33.106.5.23 groups()**

```
int Fl_Preferences::groups ()
```

Returns the number of groups that are contained within a group.

**Returns**

0 for no groups at all

**33.106.5.24 new\_UUID()**

```
const char * Fl_Preferences::new_UUID () [static]
```

Returns a UUID as generated by the system.

A UUID is a "universally unique identifier" which is commonly used in configuration files to create identities. A UUID in ASCII looks like this: 937C4900-51AA-4C11-8DD3-7AB59944F03E. It has always 36 bytes plus a trailing zero.

**Returns**

a pointer to a static buffer containing the new UUID in ASCII format. The buffer is overwritten during every call to this function!

**33.106.5.25 set() [1/7]**

```
char Fl_Preferences::set (
 const char * key,
 const char * text)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>text</i>	set this entry to value

**Returns**

0 if setting the value failed

**33.106.5.26 set() [2/7]**

```
char Fl_Preferences::set (
 const char * key,
 const void * data,
 int dsize)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>data</i>	set this entry to value
in	<i>dsize</i>	size of data array

**Returns**

0 if setting the value failed

**33.106.5.27 set() [3/7]**

```
char Fl_Preferences::set (
 const char * key,
 double value)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to value

**Returns**

0 if setting the value failed

**33.106.5.28 set() [4/7]**

```
char Fl_Preferences::set (
 const char * key,
 double value,
 int precision)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to <i>value</i>
in	<i>precision</i>	number of decimal digits to represent value

**Returns**

0 if setting the value failed

**33.106.5.29 set() [5/7]**

```
char Fl_Preferences::set (
 const char * key,
 float value)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to <i>value</i>

**Returns**

0 if setting the value failed

**33.106.5.30 set() [6/7]**

```
char Fl_Preferences::set (
 const char * key,
 float value,
 int precision)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to <i>value</i>
in	<i>precision</i>	number of decimal digits to represent value

**Returns**

0 if setting the value failed

**33.106.5.31 set() [7/7]**

```
char Fl_Preferences::set (
 const char * key,
```

```
int value)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

#### Parameters

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to <i>value</i>

#### Returns

0 if setting the value failed

#### 33.106.5.32 size()

```
int Fl_Preferences::size (
 const char * key)
```

Returns the size of the value part of an entry.

#### Parameters

in	<i>key</i>	name of entry
----	------------	---------------

#### Returns

size of value

### 33.106.6 Member Data Documentation

#### 33.106.6.1 CORE\_READ\_OK

```
const unsigned int Fl_Preferences::CORE_READ_OK = 0x0010 [static]
```

Set this if it is OK for FLTK to read preference files.

USER\_READ\_OK and/or SYSTEM\_READ\_OK must also be set.

#### 33.106.6.2 CORE\_WRITE\_OK

```
const unsigned int Fl_Preferences::CORE_WRITE_OK = 0x0020 [static]
```

Set this if it is OK for FLTK to create or write preference files.

USER\_WRITE\_OK and/or SYSTEM\_WRITE\_OK must also be set.

#### 33.106.6.3 NONE

```
const unsigned int Fl_Preferences::NONE = 0x0000 [static]
```

Set this if no call to [Fl\\_Preferences](#) shall access the file system.

#### See also

[Fl\\_Preferences::file\\_access\(unsigned int\)](#)

[Fl\\_Preferences::file\\_access\(\)](#)

## Additional Inherited Members

### 33.107.1 Detailed Description

OS-independent print support.

[Fl\\_Printer](#) allows to use all drawing, color, text, image, and clip FLTK functions, and to have them operate on printed page(s). There are two main, non exclusive, ways to use it.

- Print any widget (standard, custom, [Fl\\_Window](#), [Fl\\_Gl\\_Window](#)) as it appears on screen, with optional translation, scaling and rotation. This is done by calling [print\\_widget\(\)](#), [print\\_window\(\)](#) or [print\\_window\\_part\(\)](#).
- Use a series of FLTK graphics commands (e.g., font, text, lines, colors, clip, image) to compose a page appropriately shaped for printing.

In both cases, begin by [begin\\_job\(\)](#), [begin\\_page\(\)](#), [printable\\_rect\(\)](#) and [origin\(\)](#) calls and finish by [end\\_page\(\)](#) and [end\\_job\(\)](#) calls.

Example of use: print a widget centered in a page

```
#include <FL/Fl_Printer.H>
```

```

#include <FL/fl_draw.H>
int width, height;
Fl_Widget *widget = ... // a widget we want printed
Fl_Printer *printer = new Fl_Printer();
if (printer->begin_job(1) == 0) {
 printer->begin_page();
 printer->printable_rect(&width, &height);
 fl_color(FL_BLACK);
 fl_line_style(FL_SOLID, 2);
 fl_rect(0, 0, width, height);
 fl_font(FL_COURIER, 12);
 time_t now; time(&now); fl_draw(ctime(&now), 0, fl_height());
 printer->origin(width/2, height/2);
 printer->print_widget(widget, -widget->w()/2, -widget->h()/2);
 printer->end_page();
 printer->end_job();
}
delete printer;

```

Recommended method to refresh GUI while printing :

```

printer->begin_job(0);
.....
Fl_Surface_Device::push_current(Fl_Display_Device::display_device());
Fl::check(); // or any operation that draws to display
Fl_Surface_Device::pop_current();
.....
printer->end_job();

```

### Platform specifics

- X11 and Wayland platforms:
  - FLTK expresses all graphics data using (Level 2) PostScript and sends that to the selected printer. See class [Fl\\_PostScript\\_File\\_Device](#) for a description of how text and transparent images appear in print.
  - If the GTK library is available at run-time, class [Fl\\_Printer](#) runs GTK's printer dialog which allows to set printer, paper size and orientation.
  - If the GTK library is not available, or if `Fl::option(Fl::OPTION_PRINTER_USES_GTK)` has been turned off, class [Fl\\_Printer](#) runs FLTK's print dialog.
    - \* Unless it has been previously changed, the default paper size is A4. To change that, press the "Properties" button of the "Print" dialog window opened by an `Fl_Printer::begin_job()` call. This opens a "Printer Properties" window where it's possible to select the adequate paper size. Finally press the "Save" button therein to assign the chosen paper size to the chosen printer for this and all further print operations.
    - \* Use the static public attributes of this class to set the print dialog to other languages than English. For example, the "Printer:" dialog item `Fl_Printer::dialog_printer` can be set to French with:
 

```
Fl_Printer::dialog_printer = "Imprimante:";
```

 before creation of the `Fl_Printer` object.
    - \* Use `Fl_PostScript_File_Device::file_chooser_title` to customize the title of the file chooser dialog that opens when using the "Print To File" option of the print dialog.
- Windows platform: Transparent [Fl\\_RGB\\_Image](#) 's don't print with exact transparency on most printers (a workaround is to use `print_window_part()`). [Fl\\_RGB\\_Image](#) 's don't `rotate()` well.
- Mac OS X platform: all graphics requests print as on display and accept rotation and scaling.

## 33.107.2 Member Function Documentation

### 33.107.2.1 begin\_job()

```

int Fl_Printer::begin_job (
 int pagecount = 0,
 int * frompage = NULL,
 int * topage = NULL,
 char ** perr_message = NULL) [virtual]

```

Begins a print job.

## Parameters

in	<i>pagecount</i>	the total number of pages of the job (or 0 if you don't know the number of pages)
out	<i>frompage</i>	if non-null, *frompage is set to the first page the user wants printed
out	<i>topage</i>	if non-null, *topage is set to the last page the user wants printed
out	<i>perr_message</i>	if non-null and if the returned value is 2, *perr_message is set to a string describing the error. That string can be deleted after use.

## Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.107.2.2 begin\_page()**

```
int Fl_Printer::begin_page (
 void) [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with [Fl\\_Surface\\_Device::push\\_current\(\)](#).

## Note

[begin\\_page\(\)](#) calls [Fl\\_Surface\\_Device::push\\_current\(\)](#) and leaves this device as the active surface. If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#), or the content of the dialog box will be rendered to the printer instead of the screen.

## Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.107.2.3 end\_job()**

```
void Fl_Printer::end_job (
 void) [virtual]
```

To be called at the end of a print job.

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.107.2.4 end\_page()**

```
int Fl_Printer::end_page (
 void) [virtual]
```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

## Note

[end\\_page\(\)](#) calls [Fl\\_Surface\\_Device::pop\\_current\(\)](#). If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#).

## Returns

0 if OK, non-zero if any error.

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.107.2.5 is\_current()**

```
bool Fl_Printer::is_current () [virtual]
```

Is this surface the current drawing surface?

Reimplemented from [Fl\\_Surface\\_Device](#).

**33.107.2.6 margins()**

```
void Fl_Printer::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page.

Values are in the same unit as that used by FLTK drawing functions. They are changed by [scale\(\)](#) calls.

**Parameters**

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
out	<i>right</i>	If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.107.2.7 origin() [1/2]**

```
void Fl_Printer::origin (
 int * x,
 int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

out	<i>x,y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.107.2.8 origin() [2/2]**

```
void Fl_Printer::origin (
 int x,
 int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0)`; sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. [Origin\(\)](#) calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	------------	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.107.2.9 printable\_rect()**

```
int Fl_Printer::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.107.2.10 rotate()**

```
void Fl_Printer::rotate (
 float angle) [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

**Parameters**

<i>angle</i>	Rotation angle in counter-clockwise degrees.
--------------	----------------------------------------------

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.107.2.11 scale()**

```
void Fl_Printer::scale (
 float scale_x,
 float scale_y = 0.) [virtual]
```

Changes the scaling of page coordinates.

This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine their effects.

**Parameters**

<i>scale</i> <sub>↔</sub> <i>_x</i>	Horizontal dimensions of plot are multiplied by this quantity.
<i>scale</i> <sub>↔</sub> <i>_y</i>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor)</code> ; is equivalent to <code>scale(factor, factor)</code> ;

Reimplemented from [Fl\\_Paged\\_Device](#).

**33.107.2.12 set\_current()**

```
void Fl_Printer::set_current (
 void) [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

**Note**

It's recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [FI\\_Printer](#) or an [FI\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [FI\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#); . Don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [FI\\_Surface\\_Device::push\\_current\(\)](#) / [FI\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [FI\\_Surface\\_Device](#).

**33.107.2.13 translate()**

```
void Fl_Printer::translate (
 int x,
 int y) [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [FI\\_Widget\\_Surface](#).

**33.107.2.14 untranslate()**

```
void Fl_Printer::untranslate (
 void) [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [FI\\_Widget\\_Surface](#).

The documentation for this class was generated from the following files:

- [FI\\_Printer.H](#)
- [FI\\_Printer.cxx](#)

**33.108 FI\_Progress Class Reference**

Displays a progress bar for the user.

```
#include <Fl_Progress.H>
```

Inheritance diagram for [FI\\_Progress](#):

**Public Member Functions**

- [FI\\_Progress](#) (int *x*, int *y*, int *w*, int *h*, const char \**l*=0)

## Additional Inherited Members

### 33.108.1 Detailed Description

Displays a progress bar for the user.

### 33.108.2 Constructor & Destructor Documentation

#### 33.108.2.1 Fl\_Progress()

```
Fl_Progress::Fl_Progress (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor creates the progress bar using the position, size, and label.

You can set the background color with `color()` and the progress bar color with `selection_color()`, or you can set both colors together with `color(unsigned bg, unsigned sel)`.

The default colors are `FL_BACKGROUND2_COLOR` and `FL_YELLOW`, resp.

### 33.108.3 Member Function Documentation

#### 33.108.3.1 draw()

```
void Fl_Progress::draw (
 void) [protected], [virtual]
```

Draws the progress bar.

Implements `Fl_Widget`.

#### 33.108.3.2 maximum() [1/2]

```
float Fl_Progress::maximum () const [inline]
```

Gets the maximum value in the progress widget.

**33.108.3.3 maximum()** [2/2]

```
void Fl_Progress::maximum (
 float v) [inline]
```

Sets the maximum value in the progress widget.

**33.108.3.4 minimum()** [1/2]

```
float Fl_Progress::minimum () const [inline]
```

Gets the minimum value in the progress widget.

**33.108.3.5 minimum()** [2/2]

```
void Fl_Progress::minimum (
 float v) [inline]
```

Sets the minimum value in the progress widget.

**33.108.3.6 value()** [1/2]

```
float Fl_Progress::value () const [inline]
```

Gets the current value in the progress widget.

**33.108.3.7 value()** [2/2]

```
void Fl_Progress::value (
 float v) [inline]
```

Sets the current value in the progress widget.

- Fl\_Progress.H
- Fl\_Progress.cxx

**33.109 FI\_Radio\_Button Class Reference**

Inheritance diagram for Fl\_Radio\_Button:

**Public Member Functions**

- [Fl\\_Radio\\_Button](#) (int X, int Y, int W, int H, const char \*L=0)

*The constructor creates the button using the given position, size, and label.*

## Additional Inherited Members

### 33.109.1 Constructor & Destructor Documentation

#### 33.109.1.1 Fl\_Radio\_Button()

```
Fl_Radio_Button::Fl_Radio_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor creates the button using the given position, size, and label. The Button `type()` is set to FL\_RADIO\_BUTTON.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

The documentation for this class was generated from the following files:

- Fl\_Radio\_Button.H
- Fl\_Button.cxx

## 33.110 Fl\_Radio\_Light\_Button Class Reference

Inheritance diagram for Fl\_Radio\_Light\_Button:

### Public Member Functions

- `Fl_Radio_Light_Button` (int X, int Y, int W, int H, const char \*l=0)

### Additional Inherited Members

The documentation for this class was generated from the following files:

- int **x** () const  
*gets the  $x$  coordinate (left edge)*
- void **x** (int X)  
*sets the  $x$  coordinate (left edge)*
- int **y** () const  
*gets the  $y$  coordinate (top edge)*
- void **y** (int Y)  
*sets the  $y$  coordinate (top edge)*

## Friends

- bool **operator!=** (const [FI\\_Rect](#) &lhs, const [FI\\_Rect](#) &rhs)
- bool **operator==** (const [FI\\_Rect](#) &lhs, const [FI\\_Rect](#) &rhs)

### 33.112.1 Detailed Description

Rectangle with standard FLTK coordinates (X, Y, W, H).

This may be used internally, for overloaded widget constructors and other overloaded methods like [fl\\_measure\(\)](#), [fl\\_text\\_extents\(\)](#), [fl\\_rect\(\)](#), [fl\\_rectf\(\)](#), and maybe more.

## 33.112.2 Constructor & Destructor Documentation

### 33.112.2.1 Fl\_Rect()

```
Fl_Rect::Fl_Rect (
 int X,
 int Y,
 int W,
 int H,
 Fl_Boxtype bt) [inline]
```

This constructor creates a rectangle with the given x,y coordinates and the given width and height reduced by the box frame size.

This is the same as using the constructor w/o `bt` and subsequently calling `inset(bt)`.

## 33.112.3 Member Function Documentation

### 33.112.3.1 b()

```
int Fl_Rect::b () const [inline]
```

gets the bottom edge (`y + h`).

#### Note

`r()` and `b()` are coordinates **outside** the area of the rectangle.

### 33.112.3.2 inset() [1/3]

```
void Fl_Rect::inset (
 Fl_Boxtype bt) [inline]
```

Move all edges in by the frame size of box type `bt`.

Shrinks the rectangle at all sides by the frame width or height of the given box type `bt`.

This method uses the frame sizes given by the box type `bt` using

- `Fl::box_dx(bt)`
- `Fl::box_dy(bt)`
- `Fl::box_dw(bt)`
- `Fl::box_dh(bt)`

If the rectangle is smaller than the frame sizes the result is undefined, i.e. an invalid or empty rectangle.

### 33.112.3.3 inset() [2/3]

```
void Fl_Rect::inset (
 int d) [inline]
```

Move all edges in by `d`.

Shrinks the rectangle by `d` at all sides keeping the center of the rectangle at the same spot.

If `d` is negative, the rectangle is enlarged.

If `d`  $\geq$  `w()` or `h()` the result is undefined, i.e. an invalid or empty rectangle.

**33.112.3.4 inset()** [3/3]

```
void Fl_Rect::inset (
 int left,
 int top,
 int right,
 int bottom) [inline]
```

Move all edges in by left, top, right, bottom.

Shrinks the rectangle on all sides keeping the center of the rectangle at the same spot.

If any value is negative, the rectangle is enlarged.

Values are not range checked; it is possible to create an invalid or empty rectangle.

**33.112.3.5 r()**

```
int Fl_Rect::r () const [inline]
```

gets the right edge (x + w).

**Note**

**r()** and **b()** are coordinates **outside** the area of the rectangle.

The documentation for this class was generated from the following file:

- FI\_Rect.H

**33.113 FI\_Scroll::FI\_Region\_LRTB Struct Reference**

## 33.115 `Fl_Repeat_Button` Class Reference

The `Fl_Repeat_Button` is a subclass of `Fl_Button` that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.

```
#include <Fl_Repeat_Button.H>
```

Inheritance diagram for `Fl_Repeat_Button`:

### Public Member Functions

- void `deactivate` ()
- `Fl_Repeat_Button` (int X, int Y, int W, int H, const char \*l=0)
  - Creates a new `Fl_Repeat_Button` widget using the given position, size, and label string.*
- int `handle` (int) `FL_OVERRIDE`
  - Handles the specified event.*

### Additional Inherited Members

#### 33.115.1 Detailed Description

The `Fl_Repeat_Button` is a subclass of `Fl_Button` that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.

The speed of the repeat is fixed and depends on the implementation.

#### 33.115.2 Constructor & Destructor Documentation

##### 33.115.2.1 `Fl_Repeat_Button()`

```
Fl_Repeat_Button::Fl_Repeat_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Repeat_Button` widget using the given position, size, and label string. The default boxtype is `FL_UP_BOX`. Deletes the button.

#### 33.115.3 Member Function Documentation

### 33.115.3.1 handle()

```
int Fl_Repeat_Button::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee's return value.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

## 33.116 Fl\_Return\_Button Class Reference

The [Fl\\_Return\\_Button](#) is a subclass of [Fl\\_Button](#) that generates a callback when it is pressed or when the user presses the Enter key.

```
#include <Fl_Return_Button.H>
```

Inheritance diagram for [Fl\\_Return\\_Button](#):

### Public Member Functions

- [Fl\\_Return\\_Button](#) (int X, int Y, int W, int H, const char \*l=0)  
Creates a new [Fl\\_Return\\_Button](#) widget using the given position, size, and label string.
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
Handles the specified event.

## Protected Member Functions

- void `draw ()` [FL\\_OVERRIDE](#)

*Draws the widget.*

## Additional Inherited Members

### 33.116.1 Detailed Description

The `Fl_Return_Button` is a subclass of `Fl_Button` that generates a callback when it is pressed or when the user presses the Enter key.

A carriage-return symbol is drawn next to the button label.

Figure 33.37 `Fl_Return_Button`

### 33.116.2 Constructor & Destructor Documentation

#### 33.116.2.1 `Fl_Return_Button()`

```
Fl_Return_Button::Fl_Return_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Return_Button` widget using the given position, size, and label string.

The default boxtype is `FL_UP_BOX`.

The inherited destructor deletes the button.

### 33.116.3 Member Function Documentation

#### 33.116.3.1 `draw()`

```
void Fl_Return_Button::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from `Fl_Button`.

#### 33.116.3.2 `handle()`

```
int Fl_Return_Button::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

## Friends

- class [FI\\_Graphics\\_Driver](#)

## Additional Inherited Members

### 33.117.1 Detailed Description

The [FI\\_RGB\\_Image](#) class supports caching and drawing of full-color images with 1 to 4 channels of color information.

Images with an even number of channels are assumed to contain alpha information, which is used to blend the image with the contents of the screen.

[FI\\_RGB\\_Image](#) is defined in [<FL/FI\\_Image.H>](#), however for compatibility reasons [<FL/FI\\_RGB\\_Image.H>](#) should be included.

## 33.117.2 Constructor & Destructor Documentation

### 33.117.2.1 FI\_RGB\_Image() [1/3]

```
FI_RGB_Image::FI_RGB_Image (
 const uchar * bits,
 int W,
 int H,
 int D = 3,
 int LD = 0)
```

The constructor creates a new image from the specified data.

The data array `bits` must contain sufficient data to provide  $W * H * D$  image bytes and optional line padding, see `LD`.

`W` and `H` are the width and height of the image in pixels, resp.

`D` is the image depth and can be:

- `D=1`: each uchar in `bits[]` is a grayscale pixel value
- `D=2`: each uchar pair in `bits[]` is a grayscale + alpha pixel value
- `D=3`: each uchar triplet in `bits[]` is an R/G/B pixel value
- `D=4`: each uchar quad in `bits[]` is an R/G/B/A pixel value

`LD` specifies the line data size of the array, see [FI\\_Image::ld\(int\)](#). If `LD` is zero, then  $W * D$  is assumed, otherwise `LD` must be greater than or equal to  $W * D$  to account for (unused) extra data per line (padding).

The caller is responsible that the image data array `bits` persists as long as the image is used.

This constructor sets [FI\\_RGB\\_Image::alloc\\_array](#) to 0. To have the image object control the deallocation of the data array `bits`, set `alloc_array` to non-zero after construction.

#### Parameters

in	<i>bits</i>	The image data array.
in	<i>W</i>	The width of the image in pixels.
in	<i>H</i>	The height of the image in pixels.
in	<i>D</i>	The image depth, or 'number of channels' (default=3).
in	<i>LD</i>	Line data size (default=0).

#### See also

[FI\\_Image::data\(\)](#), [FI\\_Image::w\(\)](#), [FI\\_Image::h\(\)](#), [FI\\_Image::d\(\)](#), [FI\\_Image::ld\(int\)](#)

### 33.117.2.2 FI\_RGB\_Image() [2/3]

```
FI_RGB_Image::FI_RGB_Image (
 const uchar * bits,
 int bits_length,
 int W,
 int H,
 int D,
 int LD)
```

The constructor creates a new image from the specified data.

If the provided array is too small to contain all the image data, the constructor will not generate the image to avoid illegal memory read access and instead set `data` to `NULL` and `ld` to `ERR_MEMORY_ACCESS`.

## Parameters

<i>bits</i>	image data
<i>bits_length</i>	length of the <i>bits</i> array in bytes
<i>W</i>	image width in pixels
<i>H</i>	image height in pixels
<i>D</i>	image depth in bytes, 1 for gray scale, 2 for gray with alpha, 3 for RGB, and 4 for RGB plus alpha
<i>LD</i>	line length in bytes, or 0 to use $W * D$ .

## See also

[Fl\\_RGB\\_Image\(const uchar \\*bits, int W, int H, int D, int LD\)](#)

**33.117.2.3 Fl\_RGB\_Image() [3/3]**

```
Fl_RGB_Image::Fl_RGB_Image (
 const Fl_Pixmap * pxm,
 Fl_Color bg = FL_GRAY)
```

The constructor creates a new RGBA image from the specified [Fl\\_Pixmap](#).

The RGBA image is built fully opaque except for the transparent area of the pixmap that is assigned the *bg* color with full transparency.

This constructor creates a new internal data array and sets [Fl\\_RGB\\_Image::alloc\\_array](#) to 1 so the data array is deleted when the image is destroyed.

**33.117.3 Member Function Documentation****33.117.3.1 as\_svg\_image()**

```
virtual Fl_SVG_Image * Fl_RGB_Image::as_svg_image () [inline], [virtual]
```

Returns whether an image is an [Fl\\_SVG\\_Image](#) or not.

This virtual method returns a pointer to the [Fl\\_SVG\\_Image](#) if this object is an instance of [Fl\\_SVG\\_Image](#) or NULL if not.

Reimplemented in [Fl\\_SVG\\_Image](#).

**33.117.3.2 color\_average()**

```
void Fl_RGB_Image::color_average (
 Fl_Color c,
 float i) [virtual]
```

The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

Reimplemented in [Fl\\_SVG\\_Image](#).

**33.117.3.3 copy()**

```
Fl_Image * Fl_RGB_Image::copy (
 int W,
 int H) const [virtual]
```

Creates a resized copy of the image.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use `FI_Image::release()` for all types of images (i.e. all subclasses of `FI_Image`) instead of operator `delete` for `FI_Image`'s and `FI_Image::release()` for `FI_Shared_Image`'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by `FI_Image::RGB_scaling()`.

For the new image the following equations are true:

- $w() == \text{data\_}w() == \bar{W}$
- $h() == \text{data\_}h() == \bar{H}$

#### Parameters

in	$W,H$	Requested width and height of the new image
----	-------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of `FI_RGB_Image`, `FI_SVG_Image`, `FI_Pixmap`, `FI_Bitmap`, `FI_Tiled_Image`, `FI_Anim_GIF_Image` and `FI_Shared_Image`. Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an `FI_GIF_Image` is an object of class `FI_Pixmap`.

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from `FI_Image` or any subclass your overridden methods of '`FI_Image::copy() const`' and '`FI_Image::copy(int, int) const`' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from `FI_Image`.

Reimplemented in `FI_SVG_Image`.

#### 33.117.3.4 desaturate()

```
void FI_RGB_Image::desaturate () [virtual]
```

The `desaturate()` method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from `FI_Image`.

Reimplemented in `FI_SVG_Image`.

#### 33.117.3.5 draw()

```
void FI_RGB_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments  $X, Y, W, H$  specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the  $cx$  and  $cy$  arguments.

In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at  $X-cx, Y-cy$  and its own width and height, `fl_pop_clip()` is applied.

Reimplemented from `FI_Image`.

Reimplemented in `FI_SVG_Image`.

**33.117.3.6 label()** [1/2]

```
void Fl_RGB_Image::label (
 Fl_Menu_Item * m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use [Fl\\_Menu\\_Item::image\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

**33.117.3.7 label()** [2/2]

```
void Fl_RGB_Image::label (
 Fl_Widget * widget) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use [Fl\\_Widget::image\(\)](#) or [Fl\\_Widget::deimage\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

**33.117.3.8 max\_size()** [1/2]

```
static size_t Fl_RGB_Image::max_size () [inline], [static]
```

Returns the maximum allowed image size in bytes when creating an [Fl\\_RGB\\_Image](#) object.

See also

```
void Fl_RGB_Image::max_size\(size_t\)
```

**33.117.3.9 max\_size()** [2/2]

```
static void Fl_RGB_Image::max_size (
 size_t size) [inline], [static]
```

Sets the maximum allowed image size in bytes when creating an [Fl\\_RGB\\_Image](#) object.

The image size in bytes of an [Fl\\_RGB\\_Image](#) object is the value of the product  $w() * h() * d()$ . If this product exceeds size, the created object of a derived class of [Fl\\_RGB\\_Image](#) won't be loaded with the image data. This does not apply to direct RGB image creation with [Fl\\_RGB\\_Image::Fl\\_RGB\\_Image\(const uchar \\*bits, int W, int H, int D, int LD\)](#). The default [max\\_size\(\)](#) value is essentially infinite.

**33.117.3.10 normalize()**

```
virtual void Fl_RGB_Image::normalize () [inline], [virtual]
```

Makes sure the object is fully initialized.

In particular, makes sure member variable [array](#) is non-null.

Reimplemented in [Fl\\_SVG\\_Image](#).

**33.117.3.11 uncache()**

```
void Fl_RGB_Image::uncache () [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented from [Fl\\_Image](#).

**33.117.4 Member Data Documentation**

### 33.117.4.1 array

```
const uchar* Fl_RGB_Image::array
```

Points to the start of the object's data array.

## 33.118 Fl\_Roller Class Reference

The [Fl\\_Roller](#) widget is a "dolly" control commonly used to move 3D objects.

```
#include <Fl_Roller.H>
```

Inheritance diagram for [Fl\\_Roller](#):

### Public Member Functions

- [Fl\\_Roller](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Roller](#) widget using the given position, size, and label string.*
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
*Handles the specified event.*

### Protected Member Functions

- void [draw](#) () [FL\\_OVERRIDE](#)  
*Draws the widget.*

### Additional Inherited Members

#### 33.118.1 Detailed Description

The [Fl\\_Roller](#) widget is a "dolly" control commonly used to move 3D objects.

The roller can be controlled by clicking and dragging the mouse, by the corresponding arrow keys when the roller has the keyboard focus, or by the mouse wheels when the mouse pointer is positioned over the roller widget.

Figure 33.38 [Fl\\_Roller](#)

## 33.118.2 Constructor & Destructor Documentation

### 33.118.2.1 Fl\_Roller()

```
Fl_Roller::Fl_Roller (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Roller](#) widget using the given position, size, and label string. The default boxtype is FL\_NO\_BOX.

Inherited destructor destroys the valuator.

## 33.118.3 Member Function Documentation

### 33.118.3.1 draw()

```
void Fl_Roller::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 33.118.3.2 handle()

```
int Fl_Roller::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

## 33.119 Fl\_Round\_Button Class Reference

Buttons generate callbacks when they are clicked by the user.

```
#include <Fl_Round_Button.H>
```

Inheritance diagram for Fl\_Round\_Button:

### Public Member Functions

- [Fl\\_Round\\_Button](#) (int *x*, int *y*, int *w*, int *h*, const char \**l*=0)

*Creates a new [Fl\\_Round\\_Button](#) widget using the given position, size, and label string.*

### Additional Inherited Members

#### 33.119.1 Detailed Description

Buttons generate callbacks when they are clicked by the user.

You control exactly when and how by changing the values for [type\(\)](#) and [when\(\)](#).

**Figure 33.39** Fl\_Round\_Button

The [Fl\\_Round\\_Button](#) subclass displays the "on" state by turning on a light, rather than drawing pushed in. The shape of the "light" is initially set to `FL_ROUND_DOWN_BOX`. The color of the light when on is controlled with [selection\\_color\(\)](#), which defaults to `FL_FOREGROUND_COLOR`.

#### 33.119.2 Constructor & Destructor Documentation

##### 33.119.2.1 Fl\_Round\_Button()

```
Fl_Round_Button::Fl_Round_Button (
 int X,
```

```

int Y,
int W,
int H,
const char * L = 0)

```

Creates a new [Fl\\_Round\\_Button](#) widget using the given position, size, and label string.

○ Fl\_Round\_Button

Figure 33.40 Fl\_Round\_Button

The [Fl\\_Round\\_Button](#) subclass displays the "ON" state by turning on a light, rather than drawing pushed in. The default box type is `FL_NO_BOX`, which draws the label w/o a box right of the checkmark. The shape of the "light" is set with [down\\_box\(\)](#) and its default value is `FL_ROUND_DOWN_BOX`. The color of the light when on is controlled with [selection\\_color\(\)](#), which defaults to `FL_FOREGROUND_COLOR` (usually black).

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

The documentation for this class was generated from the following files:

- [Fl\\_Round\\_Button.H](#)
- [Fl\\_Round\\_Button.cxx](#)

## 33.120 Fl\_Round\_Clock Class Reference

A clock widget of type `FL_ROUND_CLOCK`.

```
#include <Fl_Round_Clock.H>
```

Inheritance diagram for [Fl\\_Round\\_Clock](#):

### Public Member Functions

- [Fl\\_Round\\_Clock](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates the clock widget, setting his type and box.*

### Additional Inherited Members

#### 33.120.1 Detailed Description

A clock widget of type `FL_ROUND_CLOCK`.

Has no box.

## 33.120.2 Constructor & Destructor Documentation

### 33.120.2.1 Fl\_Round\_Clock()

```
Fl_Round_Clock::Fl_Round_Clock (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates the clock widget, setting his type and box.

Create an [Fl\\_Round\\_Clock](#) widget using the given position, size, and label string.

The clock type is `FL_ROUND_CLOCK` and the boxtype is `FL_NO_BOX`.

This constructor is the same as [Fl\\_Clock\(FL\\_ROUND\\_CLOCK, X, Y, W, H, L\)](#).

See also

[Fl\\_Clock\(uchar, int, int, int, int, const char \\*\)](#)

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

The documentation for this class was generated from the following files:

## 33.121 Fl\_Scheme Class Reference

### Static Public Member Functions

- static int [add\\_scheme\\_name](#) (const char \*name)  
*Add a scheme name to the list of known schemes.*
- static const char \*\* [names](#) ()  
*Return a list of all known scheme names.*
- static int [num\\_schemes](#) ()  
*Return the number of currently registered schemes.*

### 33.121.1 Member Function Documentation

#### 33.121.1.1 add\_scheme\_name()

```
int Fl_Scheme::add_scheme_name (
 const char * name) [static]
```

Add a scheme name to the list of known schemes.

This method is public in FLTK 1.4.0 because derived classes of [Fl\\_Scheme](#) are not yet implemented. Thus, users implementing their own schemes can use this method to add the scheme name to the list of known schemes which is for instance used in [Fl\\_Scheme::names\(\)](#).

**Note**

**Attention!** In a future version, when subclasses of `Fl_Scheme` will be implemented, this method will either be replaced by another `protected` method or it will no longer do anything (kept only for ABI reasons).

The new scheme name must consist of valid ASCII characters as described below:

- lowercase letters 'a' - 'z'
- numbers '0' - '9'
- any character in "\$+\_" (w/o the quotes).

The name must not be longer than 12 ASCII characters (bytes). The new scheme name is added to the **end** of the **unordered** list.

**Note**

Call this method only once for each scheme name. If the returned value is  $\leq 0$  you should check the scheme name.

The given scheme `name` is copied and may be freed directly after the call to `add_scheme_name()`.

**Parameters**

<code>in</code>	<code>name</code>	New scheme name
-----------------	-------------------	-----------------

**Returns**

The new number of schemes if the name was successfully added. This is the same as the index of the scheme + 1.

**Return values**

0	Scheme <code>name</code> already exists
-1	Invalid character(s) in <code>name</code>
-2	The <code>name</code> is too long

**Since**

1.4.0

**33.121.1.2 names()**

```
const char ** Fl_Scheme::names () [static]
```

Return a list of all known scheme names.

This list is only valid until a new scheme is added or one is removed. It is possible that scheme names are appended to the list during the runtime of the program but schemes can't be removed.

Getting the list of known schemes can be useful to populate a menu of scheme choices to let the user select a scheme. You should process the names immediately and you should never store a pointer to the list or any individual name for later reference because the location of the list can be changed (reallocated) when schemes are added.

The list of scheme names is nul-terminated.

**Note**

Currently (in FLTK 1.4.0) schemes can only be added to the list and not removed from the list. This may change in a later version.

**Returns**

List of currently known scheme names.

**33.121.1.3 num\_schemes()**

```
static int FI_Scheme::num_schemes () [inline], [static]
```

Return the number of currently registered schemes.

**Returns**

Number of registered schemes.

The documentation for this class was generated from the following files:

- FI\_Scheme.H
- FI\_Scheme.cxx

**33.122 FI\_Scheme\_Choice Class Reference**

Inheritance diagram for FI\_Scheme\_Choice:

**Public Member Functions**

- [FI\\_Scheme\\_Choice](#) (int X, int Y, int W, int H, const char \*L=0)  
*The constructor initializes the [FI\\_Scheme\\_Choice](#) object with all known schemes.*
- int [handle](#) (int event) [FL\\_OVERRIDE](#)  
*Handle FLTK events.*
- virtual void [init\\_value](#) ()  
*Public method to initialize the value of the [FI\\_Scheme\\_Choice](#) widget.*

**Static Protected Member Functions**

- static void [scheme\\_cb\\_](#) (FI\_Widget \*w, void \*)  
*Internal [FI\\_Scheme\\_Choice](#) callback function (protected).*

**Additional Inherited Members****33.122.1 Constructor & Destructor Documentation**

### 33.122.1.1 Fl\_Scheme\_Choice()

```
Fl_Scheme_Choice::Fl_Scheme_Choice (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor initializes the [Fl\\_Scheme\\_Choice](#) object with all known schemes.

#### Parameters

in	<i>X,Y</i>	Widget coordinates
in	<i>W,H</i>	Widget size (width, height)
in	<i>L</i>	Widget label (default: NULL, no label)

## 33.122.2 Member Function Documentation

### 33.122.2.1 handle()

```
int Fl_Scheme_Choice::handle (
 int event) [virtual]
```

Handle FLTK events.

This widget uses FL\_SHOW and some other events to initialize its [value\(\)](#) according to the current scheme.

All events are also handled by the base class [Fl\\_Choice](#).

#### Parameters

in	<i>event</i>	
----	--------------	--

#### Returns

1 if the event was used, 0 otherwise

Reimplemented from [Fl\\_Choice](#).

### 33.122.2.2 init\_value()

```
void Fl_Scheme_Choice::init_value () [virtual]
```

Public method to initialize the value of the [Fl\\_Scheme\\_Choice](#) widget.

Normally you don't need to call this unless you change the current scheme by calling [Fl::scheme\(const char \\*\)](#).

The [Fl\\_Scheme\\_Choice](#) widget does this automatically when the widget is shown (when receiving the FL\_SHOW event) which should always be after [Fl\\_Window::show\(argc, argv\)](#) which may set the current scheme by interpreting the commandline.

#### Since

1.4.0

### 33.122.2.3 scheme\_cb\_()

```
void Fl_Scheme_Choice::scheme_cb_ (
 Fl_Widget * w,
 void *) [static], [protected]
```

Internal [Fl\\_Scheme\\_Choice](#) callback function (protected).

You don't need to set a callback for this widget. The default callback changes the scheme ([Fl::scheme\(\)](#)) and redraws all open windows.

You may override the callback if changing the scheme shall redraw other windows or don't redraw the window at all.

#### Parameters

in	w	The <a href="#">Fl_Scheme_Choice</a> widget
----	---	---------------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Scheme\\_Choice.H](#)
- [Fl\\_Scheme\\_Choice.cxx](#)

## 33.123 Fl\_Scroll Class Reference

This container widget lets you maneuver around a set of widgets much larger than your window.

```
#include <Fl_Scroll.H>
```

Inheritance diagram for [Fl\\_Scroll](#):

### Classes

- struct [Fl\\_Region\\_LRTB](#)  
A local struct to manage a region defined by left/right/top/bottom.
- struct [Fl\\_Region\\_XYWH](#)  
A local struct to manage a region defined by xywh.
- struct [Fl\\_Scrollbar\\_Data](#)  
A local struct to manage a scrollbar's xywh region and tab values.
- struct [ScrollInfo](#)  
Structure to manage scrollbar and widget interior sizes.

### Public Types

- enum {  
**HORIZONTAL = 1** , **VERTICAL = 2** , **BOTH = 3** , **ALWAYS\_ON = 4** ,  
**HORIZONTAL\_ALWAYS = 5** , **VERTICAL\_ALWAYS = 6** , **BOTH\_ALWAYS = 7** }

### Public Member Functions

- void **clear** ()  
Clear all but the scrollbars...
- int **delete\_child** (int n) [FL\\_OVERRIDE](#)  
Removes the widget at *index* from the group and deletes it.

*Ensure the scrollbars are the last children.*
- int `on_insert` (`FL_Widget` \*, int) `FL_OVERRIDE`  
*Change insert position of a child before it is added.*
- int `on_move` (int, int) `FL_OVERRIDE`  
*Change new position of a child before it is moved.*
- void `recalc_scrollbars` (`ScrollInfo` &si) const  
*Calculate visibility/size/position of scrollbars, find children's bounding box.*

## Additional Inherited Members

### 33.123.1 Detailed Description

This container widget lets you maneuver around a set of widgets much larger than your window.

If the child widgets are larger than the size of this object then scrollbars will appear so that you can scroll over to them:

Figure 33.41 `FL_Scroll`

If all of the child widgets are packed together into a solid rectangle then you want to set `box()` to `FL_NO_BOX` or one of the `_FRAME` types. This will result in the best output. However, if the child widgets are a sparse arrangement you must set `box()` to a real `_BOX` type. This can result in some blinking during redrawing, but that can be solved by using a `Fl_Double_Window`.

The `Fl_Scroll` widget calculates the bounding box of all its children by using their widget positions and sizes (x, y, w, h). Outside labels are not considered. If you need outside labels of any widgets or free space outside of this bounding box you can add a tiny invisible `Fl_Box` at the relevant corner(s) of the `Fl_Scroll` widget, for instance:

```
Fl_Scroll scroll(100, 100, 200, 200); // Fl_Scroll at (100, 100)
Fl_Box(100, 100, 1, 1); // Fl_Box in top left corner
Fl_Input(150, 120, 60, 30, "Input:"); // left most widget with label
// ... more widgets ...
scroll.end();
```

By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the area of the scroll.

Use `Fl_Scroll::type()` to change this as follows :

- 0 - No scrollbars
- `Fl_Scroll::HORIZONTAL` - Only a horizontal scrollbar.
- `Fl_Scroll::VERTICAL` - Only a vertical scrollbar.
- `Fl_Scroll::BOTH` - The default is both scrollbars.
- `Fl_Scroll::HORIZONTAL_ALWAYS` - Horizontal scrollbar always on, vertical always off.
- `Fl_Scroll::VERTICAL_ALWAYS` - Vertical scrollbar always on, horizontal always off.
- `Fl_Scroll::BOTH_ALWAYS` - Both always on.

Use `scrollbar.align(int)` ( see void `Fl_Widget::align(Fl_Align)` ) : to change what side the scrollbars are drawn on.

If the `FL_ALIGN_LEFT` bit is on, the vertical scrollbar is on the left. If the `FL_ALIGN_TOP` bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbar are considered. The flags in `hscrollbar` however are ignored.

This widget can also be used to pan around a single child widget "canvas". This child widget should be of your own class, with a `draw()` method that draws the contents. The scrolling is done by changing the `x()` and `y()` of the widget, so this child must use the `x()` and `y()` to position its drawing. To speed up drawing it should test `fl_not_clipped(int x,int y,int w,int h)` to find out if a particular area of the widget must be drawn.

Another very useful child is a single `Fl_Pack`, which is itself a group that packs its children together and changes size to surround them. Filling the `Fl_Pack` with `Fl_Tabs` groups (and then putting normal widgets inside those) gives you a very powerful scrolling list of individually-openable panels.

Fluid lets you create these, but you can only lay out objects that fit inside the `Fl_Scroll` without scrolling. Be sure to leave space for the scrollbars, as Fluid won't show these either.

*You cannot use `Fl_Window` as a child of this since the clipping is not conveyed to it when drawn, and it will draw over the scrollbars and neighboring objects.*

## 33.123.2 Constructor & Destructor Documentation

### 33.123.2.1 Fl\_Scroll()

```
Fl_Scroll::Fl_Scroll (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Scroll` widget using the given position, size, and label string.

The default boxtype is `FL_NO_BOX`.

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the `Fl_Scroll` and all of its children can be automatic (local) variables, but you must declare the `Fl_Scroll` *first*, so that it is destroyed last.

### 33.123.2.2 ~Fl\_Scroll()

```
Fl_Scroll::~~Fl_Scroll () [virtual]
```

The destructor also deletes all the children.

See also

[Fl\\_Group::~~Fl\\_Group\(\)](#)

## 33.123.3 Member Function Documentation

### 33.123.3.1 bbox()

```
void Fl_Scroll::bbox (
 int & X,
 int & Y,
 int & W,
 int & H) const [protected]
```

Returns the bounding box for the interior of the scrolling area, inside the scrollbars.

This method does not change the scrollbars or their visibility. First the scrollbar positions and visibility are calculated as they **should** be, according to the positions and sizes of the children. Then the bounding box is calculated.

You may need to call [redraw\(\)](#) to make sure the widget gets updated.

See also

[recalc\\_scrollbars\(\)](#)

### 33.123.3.2 delete\_child()

```
int Fl_Scroll::delete_child (
 int index) [virtual]
```

Removes the widget at `index` from the group and deletes it.

This method does nothing if `index` is out of bounds or if `Fl_Group::child(index)` is one of the scrollbars.

Parameters

<code>in</code>	<code>index</code>	index of child to be removed
-----------------	--------------------	------------------------------

Returns

success (0) or error code

Return values

<code>0</code>	success
<code>1</code>	index out of range
<code>2</code>	widget not allowed to be removed (see note)

See also

[Fl\\_Group::delete\\_child\(int index\)](#)

Since

FLTK 1.4.0

Reimplemented from [Fl\\_Group](#).

### 33.123.3.3 draw()

```
void Fl_Scroll::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

### 33.123.3.4 fix\_scrollbar\_order()

```
void Fl_Scroll::fix_scrollbar_order () [protected]
```

Ensure the scrollbars are the last children.

When [Fl\\_Scroll](#) is instantiated the first child of the [Fl\\_Group](#) is the vertical scrollbar `scrollbar` and the second child is the horizontal scrollbar `hscrollbar`.

These two widgets must always be the last two widgets and in this order to guarantee the correct drawing order and event delivery.

Since FLTK 1.4.0 the new method [on\\_insert\(\)](#) modifies the insert position of other children if it would be after the scrollbars.

### 33.123.3.5 handle()

```
int Fl_Scroll::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[FI\\_Event](#)

Reimplemented from [FI\\_Group](#).

### 33.123.3.6 on\_insert()

```
int Fl_Scroll::on_insert (
 Fl_Widget * candidate,
 int index) [protected], [virtual]
```

Change insert position of a child before it is added.

Fix insert position if the new child is planned to be inserted after the scrollbars. We can assume that the scrollbars are always the last two children!

[FI\\_Group](#) calls this when a new widget is added. We return the new index if the new widget would be added after the scrollbars.

#### Parameters

in	<i>candidate</i>	the candidate will be added to the child array_ after this method returns.
in	<i>index</i>	add the child at this position in the array_

#### Returns

index to position the child as planned

a new index to force the child to a different position

-1 to keep the group from adding the candidate

#### Version

1.4.0

See also

[FI\\_Group::on\\_insert\(Fl\\_Widget \\*candidate, int index\)](#)

Reimplemented from [FI\\_Group](#).

### 33.123.3.7 on\_move()

```
int Fl_Scroll::on_move (
 int old_index,
 int new_index) [protected], [virtual]
```

Change new position of a child before it is moved.

Fix new position if the new child is planned to be moved after the scrollbars. We can assume that the scrollbars are always the last two children!

[FI\\_Group](#) calls this when a widget is moved within the list of children. We return a new index if the widget would be moved after the scrollbars.

#### Parameters

<i>old_index</i>	the current index of the child that will be moved
<i>new_index</i>	the new index of the child

**Returns**

new index, possibly corrected to avoid last two scrollbar entries

Reimplemented from [Fl\\_Group](#).

**33.123.3.8 recalc\_scrollbars()**

```
void Fl_Scroll::recalc_scrollbars (
 ScrollInfo & si) const [protected]
```

Calculate visibility/size/position of scrollbars, find children's bounding box.

The `si` parameter will be filled with data from the calculations. Derived classes can make use of this call to figure out the scrolling area eg. during [resize\(\)](#) handling.

This method does not change the scrollbars or their visibility. It calculates the scrollbar positions and visibility as they **should** be, according to the positions and sizes of the children.

You may need to call [redraw\(\)](#) to make sure the widget gets updated.

**Parameters**

<code>in, out</code>	<code>si</code>	– <a href="#">ScrollInfo</a> structure, filled with data
----------------------	-----------------	----------------------------------------------------------

**See also**

[bbox\(\)](#)

**33.123.3.9 resize()**

```
void Fl_Scroll::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Resizes the [Fl\\_Scroll](#) widget and moves its children if necessary.

The [Fl\\_Scroll](#) widget first resizes itself, and then it moves all its children if (and only if) the [Fl\\_Scroll](#) widget has been moved. The children are moved by the same amount as the [Fl\\_Scroll](#) widget has been moved, hence all children keep their relative positions.

**Note**

[Fl\\_Scroll::resize\(\)](#) does **not** call [Fl\\_Group::resize\(\)](#), and child widgets are **not** resized.

Since children of an [Fl\\_Scroll](#) are not resized, the [resizable\(\)](#) widget is ignored (if it is set).

The scrollbars are moved to their proper positions, as given by [Fl\\_Scroll::scrollbar.align\(\)](#), and switched on or off as necessary.

**Note**

Due to current (FLTK 1.3.x) implementation constraints some of this may effectively be postponed until the [Fl\\_Scroll](#) is drawn the next time. This may change in a future release.

**See also**

[Fl\\_Group::resizable\(\)](#)

[Fl\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [Fl\\_Group](#).

**33.123.3.10 scroll\_to()**

```
void Fl_Scroll::scroll_to (
 int X,
 int Y)
```

Moves the contents of the scroll group to a new position.

This is like moving the scrollbars of the [Fl\\_Scroll](#) around. For instance:

```
Fl_Scroll scroll (10,10,200,200);
Fl_Box b1 (10, 10,50,50,"b1"); // relative (x,y) = (0,0)
Fl_Box b2 (60, 60,50,50,"b2"); // relative (x,y) = (50,50)
Fl_Box b3 (60,110,50,50,"b3"); // relative (x,y) = (50,100)
// populate scroll with more children ...
scroll.end();
scroll.scroll_to(50,100);
```

will move the logical origin of the internal scroll area to (-50,-100) relative to the origin of the [Fl\\_Scroll](#) (10,10), i.e. [Fl\\_Box](#) b3 will be visible in the top left corner of the scroll area.

**33.123.3.11 scrollbar\_size() [1/2]**

```
int Fl_Scroll::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

**Returns**

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

**See also**

[Fl::scrollbar\\_size\(int\)](#)

**33.123.3.12 scrollbar\_size() [2/2]**

```
void Fl_Scroll::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

**Parameters**

in	<i>newSize</i>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
----	----------------	-----------------------------------------------------------------------------------------------------------------------------

**See also**

[Fl::scrollbar\\_size\(\)](#)

**33.123.3.13 xposition()**

```
int Fl_Scroll::xposition () const [inline]
```

Gets the current horizontal scrolling position.

### 33.123.3.14 yposition()

```
int Fl_Scroll::yposition () const [inline]
```

Gets the current vertical scrolling position.

The documentation for this class was generated from the following files:

- Fl\_Scroll.H
- Fl\_Scroll.cxx

## 33.124 Fl\_Scrollbar Class Reference

The [Fl\\_Scrollbar](#) widget displays a slider with arrow buttons at the ends of the scrollbar.

```
#include <Fl_Scrollbar.H>
```

## Additional Inherited Members

### 33.124.1 Detailed Description

The `Fl_Scrollbar` widget displays a slider with arrow buttons at the ends of the scrollbar.

Clicking on the arrows move up/left and down/right by `linesize()`. Scrollbars also accept `FL_SHORTCUT` events: the arrows move by `linesize()`, and vertical scrollbars take Page Up/Down (they move by the page size minus `linesize()`) and Home/End (they jump to the top or bottom).

Scrollbars have `step(1)` preset (they always return integers). If desired you can set the `step()` to non-integer values. You will then have to use casts to get at the floating-point versions of `value()` from `Fl_Slider`.

Figure 33.42 `Fl_Scrollbar`

### 33.124.2 Constructor & Destructor Documentation

#### 33.124.2.1 `Fl_Scrollbar()`

```
Fl_Scrollbar::Fl_Scrollbar (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Scrollbar` widget with given position, size, and label. You need to do `type(FL_HORIZONTAL)` if you want a horizontal scrollbar.

### 33.124.3 Member Function Documentation

#### 33.124.3.1 `draw()`

```
void Fl_Scrollbar::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

#### 33.124.3.2 `handle()`

```
int Fl_Scrollbar::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

#### 33.124.3.3 linesize()

```
void Fl_Scrollbar::linesize (
 int i) [inline]
```

This number controls how big the steps are that the arrow keys do.

In addition page up/down move by the size last sent to [value\(\)](#) minus one [linesize\(\)](#). The default is 16.

#### 33.124.3.4 value() [1/3]

```
int Fl_Scrollbar::value () const [inline]
```

Gets the integer value (position) of the slider in the scrollbar.

You can get the floating point value with [Fl\\_Slider::value\(\)](#).

#### See also

[Fl\\_Scrollbar::value\(int p\)](#)

[Fl\\_Scrollbar::value\(int pos, int size, int first, int total\)](#)

#### 33.124.3.5 value() [2/3]

```
int Fl_Scrollbar::value (
 int p) [inline]
```

Sets the value (position) of the slider in the scrollbar.

#### See also

[Fl\\_Scrollbar::value\(\)](#)

[Fl\\_Scrollbar::value\(int pos, int size, int first, int total\)](#)

### 33.124.3.6 value() [3/3]

```
int Fl_Scrollbar::value (
 int pos,
 int windowSize,
 int first_line,
 int total_lines) [inline]
```

Sets the position, size and range of the slider in the scrollbar.

#### Parameters

in	<i>pos</i>	position, first line displayed
in	<i>windowSize</i>	number of lines displayed
in	<i>first_line</i>	number of first line
in	<i>total_lines</i>	total number of lines

You should call this every time your window changes size, your data changes size, or your scroll position changes (even if in response to a callback from this scrollbar). All necessary calls to [redraw\(\)](#) are done.

Calls [Fl\\_Slider::scrollvalue\(int pos, int size, int first, int total\)](#).

The documentation for this class was generated from the following files:

- [Fl\\_Scrollbar.H](#)
- [Fl\\_Scrollbar.cxx](#)

## 33.125 Fl\_Scroll::Fl\_Scrollbar\_Data Struct Reference

A local struct to manage a scrollbar's xywh region and tab values.

```
#include <Fl_Scroll.H>
```

### Public Attributes

- int **first**  
*scrollbar tab's "number of first line"*
- int **h**
- int **pos**  
*scrollbar tab's "position of first line displayed"*
- int **size**  
*scrollbar tab's "size of window in lines"*
- int **total**  
*scrollbar tab's "total number of lines"*
- int **w**
- int **x**
- int **y**

### 33.125.1 Detailed Description

A local struct to manage a scrollbar's xywh region and tab values.

The documentation for this struct was generated from the following file:

- [Fl\\_Scroll.H](#)

## 33.126 Fl\_Secret\_Input Class Reference

The [Fl\\_Secret\\_Input](#) class is a subclass of [Fl\\_Input](#) that displays its input as a string of placeholders.

```
#include <Fl_Secret_Input.H>
```

Inheritance diagram for [Fl\\_Secret\\_Input](#):

## Public Member Functions

- [Fl\\_Secret\\_Input](#) (int X, int Y, int W, int H, const char \*l=0)  
Creates a new [Fl\\_Secret\\_Input](#) widget using the given position, size, and label string.
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
Handles the specified event.

## Additional Inherited Members

### 33.126.1 Detailed Description

The [Fl\\_Secret\\_Input](#) class is a subclass of [Fl\\_Input](#) that displays its input as a string of placeholders. Depending on the platform this placeholder is either the asterisk (\*) or the Unicode bullet character (U+2022). This subclass is usually used to receive passwords and other "secret" information.

### 33.126.2 Constructor & Destructor Documentation

#### 33.126.2.1 Fl\_Secret\_Input()

```
Fl_Secret_Input::Fl_Secret_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Secret\\_Input](#) widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`. Inherited destructor destroys the widget and any value associated with it.

### 33.126.3 Member Function Documentation

#### 33.126.3.1 handle()

```
int Fl_Secret_Input::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Input](#).

The documentation for this class was generated from the following files:

- `Fl_Secret_Input.H`
- `Fl_Input.cxx`

## 33.127 Fl\_Select\_Browser Class Reference

The class is a subclass of [Fl\\_Browser](#) which lets the user select a single item, or no items by clicking on the empty space.

```
#include <Fl_Select_Browser.H>
```

Inheritance diagram for `Fl_Select_Browser`:

### Public Member Functions

- [Fl\\_Select\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)  
Creates a new *Fl\_Select\_Browser* widget using the given position, size, and label string.

### Additional Inherited Members

#### 33.127.1 Detailed Description

The class is a subclass of [Fl\\_Browser](#) which lets the user select a single item, or no items by clicking on the empty space.

As long as the mouse button is held down on an unselected item it is highlighted. Normally the callback is done when the user presses the mouse, but you can change this with [when\(\)](#). See [Fl\\_Browser](#) for methods to add and remove lines from the browser.

## 33.127.2 Constructor & Destructor Documentation

### 33.127.2.1 Fl\_Select\_Browser()

```
Fl_Select_Browser::Fl_Select_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Select\\_Browser](#) widget using the given position, size, and label string.

The default boxtype is FL\_DOWN\_BOX. The constructor specializes [Fl\\_Browser\(\)](#) by setting the type to FL\_SELECT\_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- [Fl\\_Select\\_Browser.H](#)
- [Fl\\_Browser.cxx](#)

## 33.128 Fl\_Shared\_Image Class Reference

This class supports caching, loading, and drawing of image files.

```
#include <Fl_Shared_Image.H>
```

Inheritance diagram for Fl\_Shared\_Image:

### Public Member Functions

- [Fl\\_Shared\\_Image \\* as\\_shared\\_image \(\)](#) [FL\\_OVERRIDE](#)  
*Returns whether an image is an [Fl\\_Shared\\_Image](#) or not.*

- class [FI\\_PNG\\_Image](#)
- class [FI\\_SVG\\_Image](#)

## Additional Inherited Members

### 33.128.1 Detailed Description

This class supports caching, loading, and drawing of image files.

Most applications will also want to link against the `fltk_images` library and call the [fl\\_register\\_images\(\)](#) function to support standard image formats such as BMP, GIF, JPEG, PNG, and SVG (unless the library was built with the option removing SVG support).

Images can be requested (loaded) with [FI\\_Shared\\_Image::get\(\)](#), [find\(\)](#), and some other methods. All images are cached in an internal list of shared images and should be released when they are no longer needed. A `refcount` is used to determine if a released image is to be destroyed with `delete`.

See also

[fl\\_register\\_image\(\)](#)  
[FI\\_Shared\\_Image::get\(\)](#)  
[FI\\_Shared\\_Image::find\(\)](#)  
[FI\\_Shared\\_Image::release\(\)](#)

### 33.128.2 Constructor & Destructor Documentation

#### 33.128.2.1 FI\_Shared\_Image() [1/2]

```
FI_Shared_Image::FI_Shared_Image () [protected]
```

Creates an empty shared image.

The constructors create a new shared image record in the image cache.

The constructors are protected and cannot be used directly from a program. Use the [get\(\)](#) method instead.

### 33.128.2.2 FI\_Shared\_Image() [2/2]

```
Fl_Shared_Image::Fl_Shared_Image (
 const char * n,
 Fl_Image * img = 0) [protected]
```

Creates a shared image from its filename and its corresponding `Fl_Image*` `img`.

The constructors create a new shared image record in the image cache.

The constructors are protected and cannot be used directly from a program. Use the [get\(\)](#) method instead.

#### Parameters

in	<i>n</i>	filename or pool name of the image, must be unique among shared images
in	<i>img</i>	the image that is made available using the name

### 33.128.2.3 ~FI\_Shared\_Image()

```
Fl_Shared_Image::~Fl_Shared_Image () [protected], [virtual]
```

The destructor frees all memory and server resources that are used by the image.

The destructor is protected and cannot be used directly from a program. Use the [Fl\\_Shared\\_Image::release\(\)](#) method instead.

## 33.128.3 Member Function Documentation

### 33.128.3.1 add()

```
void Fl_Shared_Image::add () [protected]
```

Adds a shared image to the image pool.

This **protected** method adds an image to the pool, an ordered list of shared images. The pool is searched for a matching image whenever one is requested, for instance with [Fl\\_Shared\\_Image::get\(\)](#) or [Fl\\_Shared\\_Image::find\(\)](#).

This method does not increase or decrease reference counts!

### 33.128.3.2 add\_handler()

```
void Fl_Shared_Image::add_handler (
 Fl_Shared_Handler f) [static]
```

Adds a shared image handler, which is basically a test function for adding new image formats.

This function will be called when an [Fl\\_Shared\\_Image](#) is to be loaded (for instance with [Fl\\_Shared\\_Image::get\(\)](#)) and the image type is not known to FLTK.

All registered image handlers will be called in the order of registration. You should always call [fl\\_register\\_images\(\)](#) before adding your own handlers - unless you need to override a known image file type which should be rare.

#### See also

[Fl\\_Shared\\_Handler](#) for more information of the function you need to define.

### 33.128.3.3 as\_shared\_image()

```
Fl_Shared_Image * Fl_Shared_Image::as_shared_image () [inline], [virtual]
```

Returns whether an image is an [Fl\\_Shared\\_Image](#) or not.

This virtual method returns a pointer to an [Fl\\_Shared\\_Image](#) if this object is an instance of [Fl\\_Shared\\_Image](#) or NULL if not. This can be used to detect if a given [Fl\\_Image](#) object is a shared image, i.e. derived from [Fl\\_Shared\\_Image](#).

Since

1.4.0

Reimplemented from [Fl\\_Image](#).

### 33.128.3.4 color\_average()

```
void Fl_Shared_Image::color_average (
 Fl_Color c,
 float i) [virtual]
```

Averages the colors in the image with the provided FLTK color value. This method changes the pixel data of this specific image.

Note

It does not change any of the resized copies of this image, nor does it necessarily apply the color changes if this image is resized later.

Parameters

in	<i>c</i>	blend with this color
in	<i>i</i>	blend fraction

See also

[Fl\\_Image::color\\_average\(Fl\\_Color c, float i\)](#)

Reimplemented from [Fl\\_Image](#).

### 33.128.3.5 compare()

```
int Fl_Shared_Image::compare (
 Fl_Shared_Image ** i0,
 Fl_Shared_Image ** i1) [static], [protected]
```

Compares two shared images. The order of comparison is:

1. Image name, usually the filename used to load it
2. Image width
3. Image height

Binary search in a sorted array works only if we search for the same parameters that were also used for sorting. No special cases are possible here.

[Fl\\_Shared\\_Image::find\(\)](#) requires a search for an element with a matching name and the `original_` flags set. This is not implemented via binary search, but by a simple run of the array inside [Fl\\_Shared\\_Image::find\(\)](#).

Parameters

in	<i>i0,i1</i>	image pointer pointer for sorting
----	--------------	-----------------------------------

Returns

Whether the images match or their relative sort order (see text).

## Return values

0	the images match
<0	Image i0 is <i>less</i> than image i1
>0	Image i0 is <i>greater</i> than image i1

**33.128.3.6 copy()** [1/2]

```
Fl_Image * Fl_Shared_Image::copy ()
```

Increments the reference counter and returns a pointer to itself.

When the image is no longer used, call `Fl_Shared_Image::release()`.

To get a copy of the image data, call `this->image()->copy()` instead.

## Returns

pointer to an `Fl_Shared_Image` that can be safely cast

**33.128.3.7 copy()** [2/2]

```
Fl_Image * Fl_Shared_Image::copy (
 int W,
 int H) const [virtual]
```

Return a shared image of this image with the requested size.

This is the same as calling `Fl_Shared_Image::get(this->name(), W, H)`.

If a shared image of the desired size already exists in the shared image pool, the existing image is returned and no copy is made. But the reference counter is incremented. When the image is no longer used, call `Fl_Shared_Image::release()`.

To get a copy of the image data, call `this->image()->copy(W, H)` instead.

## Parameters

in	<i>W,H</i>	size of requested image
----	------------	-------------------------

## Returns

pointer to an `Fl_Shared_Image` that can be safely cast, or NULL if the image can't be found and can't be created.

Reimplemented from `Fl_Image`.

**33.128.3.8 copy\_()**

```
Fl_Shared_Image * Fl_Shared_Image::copy_ (
 int W,
 int H) const [protected]
```

Create a resized copy of the image and wrap it into the share image class.

This function is usually followed by a call to `returned_image->add()` to add the image to the pool, and `this->refcounter_++` to make sure that the original shared image keeps a reference to the copy. Don't call this function if an image of the given size is already in the pool.

## Parameters

in	<i>W,H</i>	new image size
----	------------	----------------

**Returns**

a new shared image pointer that is not yet in the pool

**33.128.3.9 desaturate()**

```
void Fl_Shared_Image::desaturate () [virtual]
```

Convert the image to gray scale.

This method changes the pixel data of this specific image.

**Note**

It does not change any of the resized copies of this image, nor does it necessarily apply the color changes if this image is resized later.

**See also**

[Fl\\_Image::desaturate\(\)](#)

Reimplemented from [Fl\\_Image](#).

**33.128.3.10 draw()**

```
void Fl_Shared_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draw this image to the current graphics context.

**Parameters**

in	<i>X,Y,W,H</i>	draw at this position and size
in	<i>cx,cy</i>	image origin

Reimplemented from [Fl\\_Image](#).

**33.128.3.11 find()**

```
Fl_Shared_Image * Fl_Shared_Image::find (
 const char * name,
 int W = 0,
 int H = 0) [static]
```

Finds a shared image from its name and size specifications.

This uses a binary search in the image cache.

If the image *name* exists with the exact width *W* and height *H*, then it is returned.

If *W* == 0 and the image *name* exists with another size, then the **original** image with that *name* is returned.

In either case the refcount of the returned image is increased. The found image should be released with [Fl\\_Shared\\_Image::release\(\)](#) when no longer needed.

An image is marked `original` if it was directly loaded from a file or from memory as opposed to copied and resized images.

This comparison is used in [Fl\\_Shared\\_Image::find\(\)](#) to find an image that matches the requested one or to find the position where a new image should be entered into the sorted list of shared images.

It is used in two steps by [Fl\\_Shared\\_Image::add\(\)](#):

1. search with exact width and height
2. if not found, search again with width = 0 (and height = 0)

The first step will only return a match if the image exists with the same width and height. The second step will match if there is an image marked `original` with the same name, regardless of width and height.

### 33.128.3.12 `get()` [1/2]

```
Fl_Shared_Image * Fl_Shared_Image::get (
 const char * name,
 int W = 0,
 int H = 0) [static]
```

Find or load an image that can be shared by multiple widgets.

If the image exists with the requested size, this image will be returned.

If the image exists, but only with another size, then a new copy with the requested size (width `W` and height `H`) will be created as a resized copy of the original image. The new image is added to the internal list of shared images.

If the image does not yet exist, then a new image of the proper dimension is created from the filename `name`. The original image from filename `name` is always added to the list of shared images in its original size. If the requested size differs, then the resized copy with width `W` and height `H` is also added to the list of shared images.

#### Note

If the sizes differ, then *two* images are created as mentioned above. This is intentional so the original image is cached and preserved. If you request the same image with another size later, then the **original** image will be found, copied, resized, and returned.

Shared JPEG and PNG images can also be created from memory by using their named memory access constructor. You should `release()` the image when you're done with it.

#### Parameters

<i>name</i>	name of the image
<i>W,H</i>	desired size

#### Returns

the image at the requested size, or NULL if the image could not be found or generated

#### See also

[Fl\\_Shared\\_Image::find\(const char \\*name, int W, int H\)](#)

[Fl\\_Shared\\_Image::release\(\)](#)

[Fl\\_JPEG\\_Image::Fl\\_JPEG\\_Image\(const char \\*name, const unsigned char \\*data\)](#)

[Fl\\_PNG\\_Image::Fl\\_PNG\\_Image\(const char \\*name\\_png, const unsigned char \\*buffer, int maxsize\)](#)

### 33.128.3.13 `get()` [2/2]

```
Fl_Shared_Image * Fl_Shared_Image::get (
 Fl_RGB_Image * rgb,
 int own_it = 1) [static]
```

Builds a shared image from a pre-existing [Fl\\_RGB\\_Image](#).

#### Parameters

in	<i>rgb</i>	an <a href="#">Fl_RGB_Image</a> used to build a new shared image.
in	<i>own</i> ↔ <i>_it</i>	1 if the shared image should delete <code>rgb</code> when it is itself deleted, 0 otherwise

## Version

1.3.4

**33.128.3.14 image()**

```
const FI_Image * FI_Shared_Image::image () const [inline]
```

Returns a pointer to the internal [FI\\_Image](#) object.

The output is a pointer to the `internal` image ('[FI\\_Image](#)' or subclass) which can be used to inspect or copy the image.

**Do not try to modify the image!** You can copy the image though if you want or need to change any attributes, size etc. If all you need to do is to resize the image you should use `FI_Shared_Image::copy(int, int)` instead.

## Note

The internal image (pointer) is protected for good reasons, e.g. to prevent access to the image so it can't be modified by user code. **DO NOT** cast away the 'const' attribute to modify the image.

User code should rarely need this method. Use with caution.

## Returns

const FI\_Image\* image, the internal [FI\\_Image](#)

## Since

1.4.0

**33.128.3.15 images()**

```
FI_Shared_Image ** FI_Shared_Image::images () [static]
```

Returns the `FI_Shared_Image*` array.

## Returns

a pointer to an array of shared image pointers, sorted by name and size

## See also

[FI\\_Shared\\_Image::num\\_images\(\)](#)

**33.128.3.16 num\_images()**

```
int FI_Shared_Image::num_images () [static]
```

Number of shared images in their various cached sizes.

## Returns

number of entries in the array

## See also

[FI\\_Shared\\_Image::images\(\)](#)

### 33.128.3.17 original()

```
int Fl_Shared_Image::original () [inline]
```

Returns whether this is an original image.

Images loaded from a file or from memory are marked `original` as opposed to images created as a copy of another image with different size (width or height).

#### Note

This is useful for debugging (rarely used in user code).

#### Since

FLTK 1.4.0

### 33.128.3.18 refcount()

```
int Fl_Shared_Image::refcount () [inline]
```

Returns the number of references of this shared image.

When reference is below 1, the image is deleted.

### 33.128.3.19 release()

```
void Fl_Shared_Image::release () [virtual]
```

Releases and possibly destroys (if `refcount <= 0`) a shared image.

In the latter case, it will reorganize the shared image array so that no hole will occur.

Reimplemented from [Fl\\_Image](#).

### 33.128.3.20 uncache()

```
void Fl_Shared_Image::uncache () [virtual]
```

Remove the cached device specific image data.

#### See also

[Fl\\_Image::uncache\(\)](#)

Reimplemented from [Fl\\_Image](#).

### 33.128.3.21 update()

```
void Fl_Shared_Image::update () [protected]
```

Update the dimensions of the shared images.

Internal method to synchronize shared image data with the actual image data.

The documentation for this class was generated from the following files:

- [Fl\\_Shared\\_Image.H](#)
- [Fl\\_Shared\\_Image.cxx](#)

## 33.129 FI\_Shortcut\_Button Class Reference

A button that allows the user to type a key combination to create shortcuts.

Inheritance diagram for `FI_Shortcut_Button`:

## Public Member Functions

- [Fl\\_Shortcut\\_Button](#) (int X, int Y, int W, int H, const char \*l=0)  
*Construct a shortcut button.*
- [Fl\\_Shortcut value](#) ()  
*Return the user selected shortcut.*
- void [value](#) ([Fl\\_Shortcut shortcut](#))  
*Set the displayed shortcut.*

## Protected Member Functions

- void [do\\_end\\_hot\\_callback](#) ()  
*Call the callback if the user is interested.*
- void [draw](#) () [FL\\_OVERRIDE](#)  
*Draw the textual representation of the shortcut button.*
- int [handle](#) (int) [FL\\_OVERRIDE](#)  
*Handle keystrokes to catch the user's shortcut.*

## Protected Attributes

- [Fl\\_Shortcut shortcut\\_value](#)

## Additional Inherited Members

### 33.129.1 Detailed Description

A button that allows the user to type a key combination to create shortcuts.

After clicked once, the button catches the following keyboard events and records the pressed keys and all modifiers. It draws a text representation of the shortcut.

The backspace key deletes the current shortcut. A second click on the button or moving focus makes the last shortcut permanent.

The Shortcut button calls the user callback after every change if `FL_WHEN_CHANGED` is set, and when the button is no longer recording shortcuts if `FL_WHEN_RELEASE` is set.

### 33.129.2 Constructor & Destructor Documentation

#### 33.129.2.1 Fl\_Shortcut\_Button()

```

Fl_Shortcut_Button::Fl_Shortcut_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)

```

Construct a shortcut button.

## Parameters

<i>X,Y,W,H</i>	position and size of the button
<i>l</i>	label text when no shortcut is set

### 33.129.3 Member Function Documentation

#### 33.129.3.1 draw()

```
void Fl_Shortcut_Button::draw (
 void) [protected], [virtual]
```

Draw the textual representation of the shortcut button.

When the button can receive shortcut key events, it's "hot". A hot button is drawn in selection color. A cold button is drawn as a regular text box containing a human readable version of the shortcut key.

Reimplemented from [Fl\\_Button](#).

#### 33.129.3.2 handle()

```
int Fl_Shortcut_Button::handle (
 int e) [protected], [virtual]
```

Handle keystrokes to catch the user's shortcut.

Reimplemented from [Fl\\_Button](#).

#### 33.129.3.3 value() [1/2]

```
Fl_Shortcut Fl_Shortcut_Button::value ()
```

Return the user selected shortcut.

## Returns

shortcut encoded as key and modifier

#### 33.129.3.4 value() [2/2]

```
void Fl_Shortcut_Button::value (
 Fl_Shortcut shortcut)
```

Set the displayed shortcut.

## Parameters

in	<i>shortcut</i>	encoded as key and modifier
----	-----------------	-----------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Shortcut\\_Button.H](#)
- [Fl\\_Shortcut\\_Button.cxx](#)

## 33.130 FI\_Simple\_Counter Class Reference

This widget creates a counter with only 2 arrow buttons.

```
#include <Fl_Simple_Counter.H>
```

Inheritance diagram for [Fl\\_Simple\\_Counter](#):

## Public Member Functions

- **Fl\_Simple\_Counter** (int X, int Y, int W, int H, const char \*L=0)

## Additional Inherited Members

### 33.130.1 Detailed Description

This widget creates a counter with only 2 arrow buttons.

Figure 33.43 Fl\_Simple\_Counter

The documentation for this class was generated from the following files:

- Fl\_Simple\_Counter.H
- Fl\_Counter.cxx

## 33.131 Fl\_Single\_Window Class Reference

This is the same as [Fl\\_Window](#).

```
#include <Fl_Single_Window.H>
```

Inheritance diagram for Fl\_Single\_Window:

## Public Member Functions

- **Fl\_Single\_Window** (int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Single\\_Window](#) widget using the given size, and label (title) string.*

- **Fl\_Single\_Window** (int X, int Y, int W, int H, const char \*l=0)  
Creates a new *Fl\_Single\_Window* widget using the given position, size, and label (title) string.
- void **show** () **FL\_OVERRIDE**  
Makes a widget visible.
- void **show** (int a, char \*\*b)  
Same as *Fl\_Window::show(int a, char \*\*b)*

## Additional Inherited Members

### 33.131.1 Detailed Description

This is the same as [Fl\\_Window](#).

However, it is possible that some implementations will provide double-buffered windows by default. This subclass can be used to force single-buffering. This may be useful for modifying existing programs that use incremental update, or for some types of image data, such as a movie flipbook.

### 33.131.2 Member Function Documentation

#### 33.131.2.1 show()

```
void Fl_Single_Window::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL\_SHOW.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send FL\_SHOW or FL\_HIDE events to the widget. *Do not change it if the parent is not visible, as this will send false FL\_SHOW or FL\_HIDE events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Widget](#).

The documentation for this class was generated from the following files:

- Fl\_Single\_Window.H
- Fl\_Single\_Window.cxx

## 33.132 Fl\_Slider Class Reference

The [Fl\\_Slider](#) widget contains a sliding knob inside a box.

```
#include <Fl_Slider.H>
```

Inheritance diagram for [Fl\\_Slider](#):

## Public Member Functions

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- **FI\_Slider** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new FI\_Slider widget using the given position, size, and label string.*
- **FI\_Slider** (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Slider widget using the given type, position, size, and label string.*
- int **handle** (int) **FL\_OVERRIDE**  
*Handles the specified event.*
- int **scrollvalue** (int pos, int size, int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- **FI\_Boxtype slider** () const  
*Gets the slider box type.*
- void **slider** (FI\_Boxtype c)  
*Sets the slider box type.*
- float **slider\_size** () const  
*Get the dimensions of the moving piece of slider.*
- void **slider\_size** (double v)  
*Set the dimensions of the moving piece of slider.*

## Protected Member Functions

- void **draw** () **FL\_OVERRIDE**  
*Draws the widget.*
- void **draw** (int, int, int, int)
- int **handle** (int, int, int, int, int)

## Additional Inherited Members

### 33.132.1 Detailed Description

The **FI\_Slider** widget contains a sliding knob inside a box.

It is often used as a scrollbar. Moving the box all the way to the top/left sets it to the **minimum()**, and to the bottom/right to the **maximum()**. The **minimum()** may be greater than the **maximum()** to reverse the slider direction.

Use void FI\_Widget::type(int) to set how the slider is drawn, which can be one of the following:

- **FL\_VERTICAL** - Draws a vertical slider (this is the default).
- **FL\_HORIZONTAL** - Draws a horizontal slider.
- **FL\_VERT\_FILL\_SLIDER** - Draws a filled vertical slider, useful as a progress or value meter.
- **FL\_HOR\_FILL\_SLIDER** - Draws a filled horizontal slider, useful as a progress or value meter.
- **FL\_VERT\_NICE\_SLIDER** - Draws a vertical slider with a nice looking control knob.
- **FL\_HOR\_NICE\_SLIDER** - Draws a horizontal slider with a nice looking control knob.

Figure 33.44 FI\_Slider

## 33.132.2 Constructor & Destructor Documentation

### 33.132.2.1 Fl\_Slider()

```
Fl_Slider::Fl_Slider (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Slider](#) widget using the given position, size, and label string. The default boxtype is FL\_DOWN\_BOX.

## 33.132.3 Member Function Documentation

### 33.132.3.1 bounds()

```
void Fl_Slider::bounds (
 double a,
 double b)
```

Sets the minimum (a) and maximum (b) values for the valuator widget. if at least one of the values is changed, a partial redraw is asked.

### 33.132.3.2 draw()

```
void Fl_Slider::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Value\\_Slider](#).

### 33.132.3.3 handle()

```
int Fl_Slider::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Value\\_Slider](#).

**33.132.3.4 scrollvalue()**

```
int Fl_Slider::scrollvalue (
 int pos,
 int size,
 int first,
 int total)
```

Sets the size and position of the sliding knob in the box.

## Parameters

in	<i>pos</i>	position of first line displayed
in	<i>size</i>	size of window in lines
in	<i>first</i>	number of first line
in	<i>total</i>	total number of lines Returns Fl_Valuator::value(p)

**33.132.3.5 slider\_size()**

```
void Fl_Slider::slider_size (
 double v)
```

Set the dimensions of the moving piece of slider.

This is the fraction of the size of the entire widget. If you set this to 1 then the slider cannot move. The default value is .08.

For the "fill" sliders this is the size of the area around the end that causes a drag effect rather than causing the slider to jump to the mouse.

The documentation for this class was generated from the following files:

- Fl\_Slider.H
- Fl\_Slider.cxx

**33.133 Fl\_Spinner Class Reference**

This widget is a combination of a numerical input widget and repeat buttons.

```
#include <Fl_Spinner.H>
```

Inheritance diagram for Fl\_Spinner:

## Classes

- class [Fl\\_Spinner\\_Input](#)

## Public Member Functions

- [Fl\\_Color](#) **color** () const  
*Returns the background color of the spinner widget's input field.*
- void **color** ([Fl\\_Color](#) v)  
*Sets the background color of the spinner widget's input field.*
- [Fl\\_Spinner](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Spinner](#) widget using the given position, size, and label string.*
- const char \* **format** () const  
*Returns the format string for the value.*

*Sets the size of the text in the input field.*
- [uchar](#) **type** () const

*Gets the numeric representation in the input field.*
- void **type** ([uchar](#) v)

*Sets the numeric representation in the input field.*
- double **value** () const

*Gets the current value of the widget.*
- void **value** (double v)

*Sets the current value of the input widget.*
- int **wrap** () const

*Gets the wrap mode of the [FL\\_Spinner](#) widget.*
- void **wrap** (int set)

*Sets whether the spinner wraps around at upper and lower bounds.*

## Protected Member Functions

- void **draw** () [FL\\_OVERRIDE](#)
- Draws the widget.*

## Protected Attributes

- [FL\\_Repeat\\_Button](#) **down\_button\_**
- [FL\\_Spinner\\_Input](#) **input\_**
- [FL\\_Repeat\\_Button](#) **up\_button\_**

## Additional Inherited Members

### 33.133.1 Detailed Description

This widget is a combination of a numerical input widget and repeat buttons. The user can either type into the input area or use the buttons to change the value.

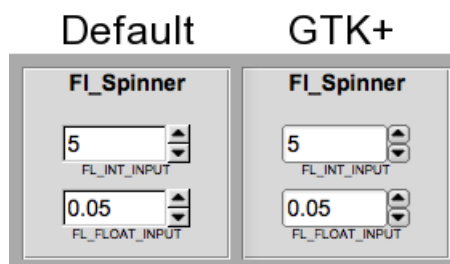

Figure 33.45 FL\_Spinner widget

## 33.133.2 Constructor & Destructor Documentation

### 33.133.2.1 Fl\_Spinner()

```
Fl_Spinner::Fl_Spinner (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Spinner](#) widget using the given position, size, and label string. The inherited destructor destroys the widget and any value associated with it.

## 33.133.3 Member Function Documentation

### 33.133.3.1 draw()

```
void Fl_Spinner::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

### 33.133.3.2 handle()

```
int Fl_Spinner::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[FI\\_Event](#)

Reimplemented from [FI\\_Group](#).

### 33.133.3.3 `resize()`

```
void FI_Spinner::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Resizes the [FI\\_Group](#) widget and all of its children.

The [FI\\_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [FI\\_Group::resizable\(FI\\_Widget\\*\)](#)

See also

[FI\\_Group::resizable\(FI\\_Widget\\*\)](#)

[FI\\_Group::resizable\(\)](#)

[FI\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [FI\\_Group](#).

### 33.133.3.4 `step()` [1/2]

```
double FI_Spinner::step () const [inline]
```

Gets the amount to change the value when the user clicks a button.

See also

[FI\\_Spinner::step\(double\)](#)

### 33.133.3.5 `step()` [2/2]

```
void FI_Spinner::step (
 double s)
```

Sets or returns the amount to change the value when the user clicks a button.

Before setting `step` to a non-integer value, the spinner [type\(\)](#) should be changed to floating point.

See also

`double FI\_Spinner::step\(\) const`

### 33.133.3.6 `type()` [1/2]

```
uchar FI_Spinner::type () const [inline]
```

Gets the numeric representation in the input field.

See also

[FI\\_Spinner::type\(uchar\)](#)

### 33.133.3.7 type() [2/2]

```
void Fl_Spinner::type (
 uchar v)
```

Sets the numeric representation in the input field.

Valid values are `FL_INT_INPUT` and `FL_FLOAT_INPUT`. Also changes the `format()` template. Setting a new spinner type via a superclass pointer will not work.

#### Note

`type()` is not a virtual function.

### 33.133.3.8 value()

```
void Fl_Spinner::value (
 double v) [inline]
```

Sets the current value of the input widget.

Before setting value to a non-integer value, the spinner `type()` should be changed to floating point.

### 33.133.3.9 wrap() [1/2]

```
int Fl_Spinner::wrap () const [inline]
```

Gets the wrap mode of the `Fl_Spinner` widget.

#### See also

void `wrap(int)`

#### Since

1.4.0

### 33.133.3.10 wrap() [2/2]

```
void Fl_Spinner::wrap (
 int set) [inline]
```

Sets whether the spinner wraps around at upper and lower bounds.

If wrap mode is on the spinner value is set to the `minimum()` or `maximum()` if the value exceeds the upper or lower bounds, resp., if it was changed by one of the buttons or the `FL_Up` or `FL_Down` keys.

The spinner stops at the upper and lower bounds if wrap mode is off.

The default wrap mode is on for backwards compatibility with FLTK 1.3.x and older versions.

#### Note

Wrap mode does not apply to the input field if the input value is edited directly as a number. The input value is always clipped to the allowed range as if wrap mode was off when the input field is left (i.e. loses focus).

#### See also

`minimum()`, `maximum()`

#### Parameters

<code>in</code>	<code>set</code>	non-zero sets wrap mode, zero resets wrap mode
-----------------	------------------	------------------------------------------------

Since

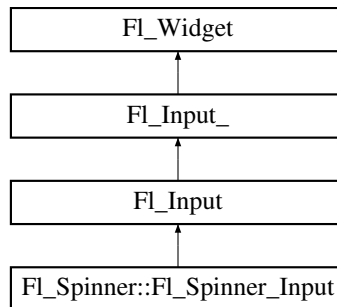

1.4.0

*Constructor that sets the graphics driver to use for the created surface.*

### 33.135.1 Detailed Description

A drawing surface that's susceptible to receive graphical output.

Any FLTK application has at any time a current drawing surface to which all drawing requests are directed. The current surface is given by `Fl_Surface_Device::surface()`. When `main()` begins running, the current drawing surface has been set to the computer's display, an instance of the `Fl_Display_Device` class.

A drawing surface other than the computer's display, is typically used as follows:

1. Create `surface`, an object from an `Fl_Surface_Device` derived class (e.g., `Fl_Image_Surface`, `Fl_Printer`, `Fl_Copy_Surface`).
2. Call `Fl_Surface_Device::push_current(surface)`; to redirect all graphics requests to `surface` which becomes the new current drawing surface (not necessary with classes `Fl_Printer` / `Fl_PostScript_File_Device` / `Fl_PDF_File_Surface` because it is done by `Fl_Paged_Device::begin_page()`).
3. At this point all of the [Drawing functions](#) (e.g., `fl_rect()`) or the [Color & Font functions](#) or [Drawing Images functions](#) (e.g., `fl_draw_image()`, `Fl_Image::draw()`) operate on the new current drawing surface. It's also possible to draw to the current surface any widget with `Fl_Widget_Surface::draw(Fl_Widget*, int, int)`, a window and its titlebar with `Fl_Widget_Surface::draw_decorated_window()`, or the content of a rectangular zone of a window with `Fl_Widget_Surface::print_window_part()`.

4. After all drawing requests have been performed, redirect graphics requests back to their previous destination with `Fl_Surface_Device::pop_current()`; (not necessary with classes `Fl_Printer` / `Fl_PostScript_File_Device` / `Fl_PDF_File_Surface`).
5. Delete surface.

For back-compatibility, it is also possible to use the `Fl_Surface_Device::set_current()` member function to change the current drawing surface, once to the new surface, once to the previous one.

## 33.135.2 Member Function Documentation

### 33.135.2.1 end\_current()

```
virtual void Fl_Surface_Device::end_current () [inline], [protected], [virtual]
```

FLTK calls this each time a surface ceases to be the current drawing surface.

This member function is mostly of interest to developers of new `Fl_Surface_Device` derived classes. It allows to perform surface-specific operations necessary when this surface ceases to be current. Each implementation should end with a call to `Fl_Surface_Device::end_current()`.

Reimplemented in `Fl_PostScript_File_Device`.

### 33.135.2.2 is\_current()

```
bool Fl_Surface_Device::is_current () [virtual]
```

Is this surface the current drawing surface?

Reimplemented in `Fl_Copy_Surface`, `Fl_Image_Surface`, `Fl_PDF_File_Surface`, and `Fl_Printer`.

### 33.135.2.3 pop\_current()

```
Fl_Surface_Device * Fl_Surface_Device::pop_current () [static]
```

Removes the top element from the current drawing surface stack, and makes the new top element current.

#### Returns

A pointer to the new current drawing surface.

#### See also

[Fl\\_Surface\\_Device::push\\_current\(Fl\\_Surface\\_Device \\*\)](#)

#### Version

1.4.0

### 33.135.2.4 push\_current()

```
void Fl_Surface_Device::push_current (
 Fl_Surface_Device * new_current) [static]
```

Pushes `new_current` on top of the stack of current drawing surfaces, and makes it current.

`new_current` will receive all future graphics requests.

Any call to `push_current()` must be matched by a subsequent call to `Fl_Surface_Device::pop_current()`. The max height of this stack is 16.

#### Version

1.4.0

### 33.135.2.5 set\_current()

```
void Fl_Surface_Device::set_current (
 void) [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests. Starting from FLTK 1.4.0, the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

It's recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#); . Don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 33.135.2.6 surface()

```
static Fl_Surface_Device * Fl_Surface_Device::surface () [inline], [static]
```

The current drawing surface.

In other words, the [Fl\\_Surface\\_Device](#) object that currently receives all graphics requests.

#### Note

It's possible to transiently remove the GUI scaling factor in place in the current drawing surface with [fl\\_override\\_scale\(\)](#).

The documentation for this class was generated from the following files:

- [Fl\\_Device.H](#)
- [Fl\\_Device.cxx](#)

## 33.136 Fl\_SVG\_File\_Surface Class Reference

A drawing surface producing a Scalable Vector Graphics (SVG) file.

```
#include <Fl_SVG_File_Surface.H>
```

Inheritance diagram for [Fl\\_SVG\\_File\\_Surface](#):

## Public Member Functions

- `int close ()`  
*Closes the FILE pointer where SVG data is output.*
- `FILE * file ()`  
*Returns the underlying FILE pointer.*

- `void untranslate () FL_OVERRIDE`  
*Undoes the effect of a previous translate() call.*
- `~Fl_SVG_File_Surface ()`  
*Destructor.*

## Additional Inherited Members

### 33.136.1 Detailed Description

A drawing surface producing a Scalable Vector Graphics (SVG) file.

This drawing surface allows to store any FLTK graphics in vectorial form in a "Scalable Vector Graphics" file.

Usage example:

```
Fl_Window *win = ...// Window to draw to a .svg file
int ww = win->decorated_w();
int wh = win->decorated_h();
FILE *svg = fl_fopen("/path/to/mywindow.svg", "w");
if (svg) {
 Fl_SVG_File_Surface *surface = new Fl_SVG_File_Surface(ww, wh, svg);
 Fl_Surface_Device::push_current(surface);
 fl_color(FL_WHITE);
 fl_rectf(0, 0, ww, wh);
 surface->draw_decorated_window(win);
 Fl_Surface_Device::pop_current();
 delete surface; // the .svg file is not complete until the destructor was run
 fclose(svg);
}
```

#### Note

FLTK uses the PNG and JPEG libraries to encode images to the SVG format. For this reason, class [Fl\\_SVG\\_File\\_Surface](#) is placed in the `fltk_images` library. If JPEG is not available at application build time, PNG is enough (but produces a quite larger output). If PNG isn't available either, images don't appear in the SVG output.

### 33.136.2 Constructor & Destructor Documentation

#### 33.136.2.1 Fl\_SVG\_File\_Surface()

```
Fl_SVG_File_Surface::Fl_SVG_File_Surface (
 int width,
 int height,
 FILE * svg,
 int(*) (FILE *) closef = NULL)
```

Constructor of the SVG drawing surface.

## Parameters

<i>width,height</i>	Width and height of the graphics area in FLTK drawing units
<i>svg</i>	A writable FILE pointer where the SVG data are to be sent. The resulting SVG data are not complete until after destruction of the <a href="#">Fl_SVG_File_Surface</a> object or after calling <a href="#">close()</a> .
<i>closef</i>	If not NULL, the destructor and <a href="#">close()</a> will call <code>closef(svg)</code> after all SVG data has been sent. If NULL, <code>fclose(svg)</code> is called instead. This allows to close the FILE pointer by, e.g., <code>pclose</code> , or, using a function such as <code>"int keep_open(FILE*) {return 0;}"</code> , to keep it open after completion of all output to <i>svg</i> . Function <code>closef</code> should return non zero to indicate an error.

**33.136.2.2** [~Fl\\_SVG\\_File\\_Surface\(\)](#)

```
Fl_SVG_File_Surface::~Fl_SVG_File_Surface ()
```

Destructor.

The underlying FILE pointer is processed as by [close\(\)](#).

**33.136.3 Member Function Documentation****33.136.3.1** [close\(\)](#)

```
int Fl_SVG_File_Surface::close ()
```

Closes the FILE pointer where SVG data is output.

The underlying FILE is closed by function `fclose()` unless another function was set at object's construction time. The only operation possible after this on the [Fl\\_SVG\\_File\\_Surface](#) object is its destruction.

## Returns

The value returned by the closing function call.

**33.136.3.2** [origin\(\)](#) [1/2]

```
void Fl_SVG_File_Surface::origin (
 int * x,
 int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

## Parameters

out	<i>x,y</i>	If non-null, <i>*x</i> and <i>*y</i> are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	-----------------------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**33.136.3.3** [origin\(\)](#) [2/2]

```
void Fl_SVG_File_Surface::origin (
 int x,
 int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. [Origin\(\)](#) calls are not affected by [rotate\(\)](#) calls (for classes derived

from [Fl\\_Paged\\_Device](#)).

#### Parameters

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

#### 33.136.3.4 printable\_rect()

```
int Fl_SVG_File_Surface::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

#### Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

#### 33.136.3.5 translate()

```
void Fl_SVG_File_Surface::translate (
 int x,
 int y) [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl\\_Widget\\_Surface](#).

#### 33.136.3.6 untranslate()

```
void Fl_SVG_File_Surface::untranslate (
 void) [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl\\_Widget\\_Surface](#).

The documentation for this class was generated from the following file:

- [Fl\\_SVG\\_File\\_Surface.H](#)

## 33.137 Fl\_SVG\_Image Class Reference

The [Fl\\_SVG\\_Image](#) class supports loading, caching and drawing of scalable vector graphics (SVG) images.

```
#include <Fl_SVG_Image.H>
```

Inheritance diagram for [Fl\\_SVG\\_Image](#):

## Public Member Functions

- `FI_SVG_Image * as_svg_image () FL_OVERRIDE`  
*Returns whether an image is an `FI_SVG_Image` or not.*
- `void color_average (FI_Color c, float i) FL_OVERRIDE`  
*The `color_average()` method averages the colors in the image with the provided FLTK color value.*
- `FI_Image * copy () const`
- `FI_Image * copy (int W, int H) const FL_OVERRIDE`  
*Creates a resized copy of the image.*
- `void desaturate () FL_OVERRIDE`  
*The `desaturate()` method converts an image to grayscale.*
- `void draw (int X, int Y)`
- `void draw (int X, int Y, int W, int H, int cx=0, int cy=0) FL_OVERRIDE`  
*Draws the image to the current drawing surface with a bounding box.*
- `FI_SVG_Image (const char *filename)`  
*Load an SVG image from a file.*
- `FI_SVG_Image (const char *sharedname, const char *svg_data)`  
*Load an SVG image from memory.*
- `FI_SVG_Image (const char *sharedname, const unsigned char *svg_data, size_t length)`  
*Load an SVG image from memory.*
- `void normalize () FL_OVERRIDE`  
*Makes sure the object is fully initialized.*
- `void resize (int width, int height)`  
*Have the svg data (re-)rasterized using the given width and height values.*
- `virtual ~FI_SVG_Image ()`  
*The destructor frees all memory and server resources that are used by the SVG image.*

## Public Attributes

- `bool proportional`  
*Set this to `false` to allow image re-scaling that alters the image aspect ratio.*

## Additional Inherited Members

### 33.137.1 Detailed Description

The `FI_SVG_Image` class supports loading, caching and drawing of scalable vector graphics (SVG) images. The FLTK library performs parsing and rasterization of SVG data using a modified version of the `nanosvg` software (<https://github.com/memononen/nanosvg>). The software modification allows the option to change the image ratio while performing rasterization.

Use `FI_Image::fail()` to check if the `FI_SVG_Image` failed to load. `fail()` returns `ERR_FILE_ACCESS` if the file could not be opened or read, and `ERR_FORMAT` if the SVG format could not be decoded. If the image has loaded correctly, `w()`, `h()`, and `d()` should return values greater than zero.

Rasterization is not done until the image is first drawn or `resize()` or `normalize()` is called. Therefore, `array` is `NULL` until then. The delayed rasterization ensures an `FI_SVG_Image` is always rasterized to the exact screen resolution at which it is drawn.

The `FI_SVG_Image` class draws images computed by `nanosvg` with the following known limitations

- text between `<text>` and `</text>` marks,
- `image` elements, and
- `<use>` statements

are not rendered.

The FLTK library can optionally be built without SVG support; in that case, class `Fl_SVG_Image` is unavailable.

Example of displaying a hard-coded svg file:

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>
// A black rotated rectangle
const char *svg_data = "<svg viewBox=\"0 0 200 200\" version = \"1.1\">\n"
 "<rect x=\"25\" y=\"50\" width=\"150\" height=\"100\" fill=\"black\" \"
 \"ttransform=\"rotate(45 100 100)\"> </svg>\n";

int main(int argc, char **argv) {
 Fl_SVG_Image *svg = new Fl_SVG_Image(0, svg_data); // create SVG object
 Fl_Window *win = new Fl_Window(720, 486, "svg test");
 Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());
 box->image(svg); // assign svg object to Fl_Box
 win->end();
 win->show(argc, argv);
 return(Fl::run());
}
```

Example of displaying an svg image from a file:

```
#include <errno.h> // errno
#include <string.h> // strerror
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/fl_message.H>

int main(int argc, char **argv) {
 Fl_Window *win = new Fl_Window(720, 486, "svg test");
 Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());
 // Load svg image from disk, assign to a box
 const char *svgpath = "/var/tmp/simple.svg";
 Fl_SVG_Image *svg = new Fl_SVG_Image(svgpath); // load SVG object from disk
 switch (svg->fail()) {
 case Fl_Image::ERR_FILE_ACCESS:
 // File couldn't load? show path + os error to user
 fl_alert("%s: %s", svgpath, strerror(errno));
 return 1;
 case Fl_Image::ERR_FORMAT:
 // Parsing error
 fl_alert("%s: couldn't decode image", svgpath);
 return 1;
 }
 box->image(svg); // assign svg object to box
 win->end();
 win->show(argc, argv);
 return(Fl::run());
}
```

Example of fitting an svg image to a resizable `Fl_Box`:

```
#include <FL/Fl_Window.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/Fl_Box.H>
class resizable_box : public Fl_Box {
public:
 resizable_box(int w, int h) : Fl_Box(0, 0, w, h, NULL) {}
 virtual void resize(int x, int y, int w, int h) {
 image()->scale(w, h, 1, 1); // p3 = proportional, p4 = can_expand
 Fl_Box::resize(x, y, w, h);
 }
};

int main(int argc, char **argv) {
 Fl_Window *win = new Fl_Window(130, 130);
 resizable_box *box = new resizable_box(win->w(), win->h());
 Fl_SVG_Image *svg = new Fl_SVG_Image("/path/to/image.svg");
 box->image(svg);
 svg->scale(box->w(), box->h());
 win->end();
 win->resizable(win);
 win->show(argc, argv);
 return Fl::run();
}
```

## 33.137.2 Constructor & Destructor Documentation

### 33.137.2.1 Fl\_SVG\_Image() [1/3]

```
Fl_SVG_Image::Fl_SVG_Image (
 const char * filename)
```

Load an SVG image from a file.

This constructor loads the SVG image from a .svg or .svgz file. The reader recognizes if the data is compressed, and decompresses it if zlib is available (HAVE\_LIBZ).

#### Parameters

<i>filename</i>	the filename for a .svg or .svgz file
-----------------	---------------------------------------

### 33.137.2.2 Fl\_SVG\_Image() [2/3]

```
Fl_SVG_Image::Fl_SVG_Image (
 const char * sharedname,
 const char * svg_data)
```

Load an SVG image from memory.

This constructor loads the SVG image from a block of memory. This version is commonly used for uncompressed text data, but the reader recognizes if the data is compressed, and decompresses it if zlib is available (HAVE\_LIBZ).

#### Parameters

<i>sharedname</i>	if not NULL, a shared image will be generated with this name
<i>svg_data</i>	a pointer to the memory location of the SVG image data

#### Note

In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

### 33.137.2.3 Fl\_SVG\_Image() [3/3]

```
Fl_SVG_Image::Fl_SVG_Image (
 const char * name,
 const unsigned char * svg_data,
 size_t length)
```

Load an SVG image from memory.

This constructor loads the SVG image from a block of memory. This version is commonly used for compressed binary data, but the reader recognizes if the data is uncompressed, and reads it as a text block.

#### Parameters

<i>name</i>	if not NULL, a shared image will be generated with this name
<i>svg_data</i>	a pointer to the memory location of the SVG image data
<i>length</i>	of <i>svg_data</i> or 0 if the length is unknown. This will protect memory outside of the <i>svg_data</i> array from illegal read operations for compressed SVG data

#### Note

In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

## 33.137.3 Member Function Documentation

### 33.137.3.1 as\_svg\_image()

```
Fl_SVG_Image * Fl_SVG_Image::as_svg_image () [inline], [virtual]
```

Returns whether an image is an [Fl\\_SVG\\_Image](#) or not.

This virtual method returns a pointer to the [Fl\\_SVG\\_Image](#) if this object is an instance of [Fl\\_SVG\\_Image](#) or NULL if not.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 33.137.3.2 color\_average()

```
void Fl_SVG_Image::color_average (
 Fl_Color c,
 float i) [virtual]
```

The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 33.137.3.3 copy()

```
Fl_Image * Fl_SVG_Image::copy (
 int W,
 int H) const [virtual]
```

Creates a resized copy of the image.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator *delete* for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

#### Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 33.137.3.4 desaturate()

```
void Fl_SVG_Image::desaturate () [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 33.137.3.5 draw()

```
void Fl_SVG_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the cx and cy arguments.

In other words: `fl_push_clip(X, Y, W, H)` is applied, the image is drawn with its upper-left corner at X-cx, Y-cy and its own width and height, `fl_pop_clip()` is applied.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 33.137.3.6 normalize()

```
void Fl_SVG_Image::normalize () [virtual]
```

Makes sure the object is fully initialized.

This function rasterizes the SVG image, and consequently initializes its [array](#) member, if that was not done before.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 33.137.3.7 resize()

```
void Fl_SVG_Image::resize (
 int width,
 int height)
```

Have the svg data (re-)rasterized using the given width and height values.

By default, the resulting image `w()` and `h()` will be close to width and height while preserving the width/height ratio of the SVG data. If `proportional` was set to `false`, the image is rasterized to the exact width and height values. In both cases, `data_w()` and `data_h()` values are set to `w()` and `h()`, respectively.

## 33.137.4 Member Data Documentation

### 33.137.4.1 proportional

```
bool Fl_SVG_Image::proportional
```

Set this to `false` to allow image re-scaling that alters the image aspect ratio.

Upon object creation, `proportional` is set to `true`, and the aspect ratio is kept constant.

The documentation for this class was generated from the following files:

- `Fl_SVG_Image.H`
- `Fl_SVG_Image.cxx`

## 33.138 Fl\_Sys\_Menu\_Bar Class Reference

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

```
#include <Fl_Sys_Menu_Bar.H>
```

Inheritance diagram for Fl\_Sys\_Menu\_Bar:

## Public Types

- enum `window_menu_style_enum` { `no_window_menu` = 0 , `tabbing_mode_none` , `tabbing_mode_automatic` , `tabbing_mode_preferred` }

*Possible styles of the Window menu in the system menu bar.*

## Public Member Functions

- int `add` (const char \*label, const char \*shortcut, `Fl_Callback` \*cb, void \*user\_data=0, int flags=0)  
*Adds a new menu item.*
- int `add` (const char \*label, int shortcut, `Fl_Callback` \*, void \*user\_data=0, int flags=0)  
*Add a new menu item to the system menu bar.*
- int `add` (const char \*str)  
*Forms-compatible procedure to add items to the system menu bar.*
- void `clear` ()  
*Set the `Fl_Menu_Item` array pointer to null, indicating a zero-length menu.*
- int `clear_submenu` (int index)  
*Clears the specified submenu pointed to by index of all menu items.*
- `Fl_Sys_Menu_Bar` (int x, int y, int w, int h, const char \*l=0)  
*The constructor.*
- int `insert` (int index, const char \*label, const char \*shortcut, `Fl_Callback` \*cb, void \*user\_data=0, int flags=0)  
*Insert a new menu item.*
- int `insert` (int index, const char \*label, int shortcut, `Fl_Callback` \*cb, void \*user\_data=0, int flags=0)  
*insert in the system menu bar a new menu item*
- const `Fl_Menu_Item` \* `menu` () const  
*Return the system menu's array of `Fl_Menu_Item`'s.*
- void `menu` (const `Fl_Menu_Item` \*m)  
*create a system menu bar using the given list of menu structs*
- int `mode` (int i) const  
*Gets the flags of item i.*
- void `mode` (int i, int fl)  
*Sets the flags of item i.*
- void `play_menu` (const `Fl_Menu_Item` \*) `FL_OVERRIDE`  
*Opens the 1st level submenu of the menubar corresponding to item.*
- void `remove` (int n)  
*remove an item from the system menu bar*
- void `replace` (int index, const char \*name)  
*rename an item from the system menu bar*
- void `setonly` (`Fl_Menu_Item` \*item)

- Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.*
- void **shortcut** (int i, int s)
  - Changes the shortcut of item i to n.*
- void **update** () **FL\_OVERRIDE**
  - Updates the menu bar after any change to its items.*
- virtual **~FI\_Sys\_Menu\_Bar** ()
  - The destructor.*

## Static Public Member Functions

- static void **about** (**FI\_Callback** \*cb, void \*data)
  - Attaches a callback to the "About myprog" item of the system application menu.*
- static void **create\_window\_menu** ()
  - Adds a Window menu, to the end of the system menu bar.*
- static **window\_menu\_style\_enum** **window\_menu\_style** ()
  - Get the style of the Window menu in the system menu bar.*
- static void **window\_menu\_style** (**window\_menu\_style\_enum** style)
  - Set the desired style of the Window menu in the system menu bar.*

## Protected Member Functions

- void **draw** () **FL\_OVERRIDE**
  - Draws the widget.*

## Additional Inherited Members

### 33.138.1 Detailed Description

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

On other than macOS platforms, **FI\_Sys\_Menu\_Bar** is a synonym of class **FI\_Menu\_Bar**.

On the macOS platform, replace **FI\_Menu\_Bar** with **FI\_Sys\_Menu\_Bar**, and a system menu at the top of the screen will be available. This menu will match an array of **FI\_Menu\_Item**'s exactly as in all other FLTK menus (except for the submenu with the application's own name and the 'Window' menu; see below). There is, though, an important difference between an **FI\_Sys\_Menu\_Bar** object under macOS and under other platforms: only a single object from this class can be created, because macOS uses a single system menu bar. Therefore, porting to macOS an app that creates, on other platforms, several **FI\_Menu\_Bar** objects, one for each of several windows, is more complex than just replacing **FI\_Menu\_Bar** by **FI\_Sys\_Menu\_Bar**.

On the macOS platform, the system menu bar of any FLTK app begins with the Application menu which the FLTK library automatically constructs. Functions **FI\_Mac\_App\_Menu::custom\_application\_menu\_items()** and **FI\_Sys\_Menu\_Bar::about()** can be used to further customize the Application menu. The FLTK library also automatically constructs and handles a Window menu which can be further customized (or even removed) calling **FI\_Sys\_Menu\_Bar::window\_menu\_style(window\_menu\_style\_enum style)**. Other member functions of this class allow the app to generate the rest of the system menu bar. It is recommended to localize the system menu bar using the standard Mac OS X localization procedure (see [Internationalization](#)).

Changes to the menu state are immediately visible in the menubar when they are made using member functions of the **FI\_Sys\_Menu\_Bar** class. Other changes (e.g., by a call to **FI\_Menu\_Item::set()**) should be followed by a call to **update()** to be visible in the menubar across all platforms. macOS global variable **fl\_sys\_menu\_bar** points to the unique, current system menu bar.

A few FLTK menu features are not supported by the Mac System menu:

- no symbolic labels
- no embossed labels
- no font sizes

As described above, the submenu with the application's own name (usually the second submenu from the left, immediately following the "Apple" submenu) is a special case, and can be managed with `Fl_Mac_App_Menu::custom_application_menu_items()`. For example, to make your own "Appname -> Preferences" dialog, you might use:

```
#include <FL/platform.H> // for Fl_Mac_App_Menu class
#include <FL/Fl_Sys_Menu_Bar.H> // for Fl_Menu_Item
:
void prefs_cb(Fl_Widget *w, void *data) {
 // ..Open your preferences dialog here..
}
:
int main(..) {
 :
 // Items to add to the application menu
 static Fl_Menu_Item appitems[] = {
 { "Preferences", 0, prefs_cb, 0, 0 },
 { 0 }, { 0 }
 };
 Fl_Mac_App_Menu::custom_application_menu_items(appitems); // adds it
}
}
```

..the result being:

Figure 33.46 Mac Application submenu

## 33.138.2 Member Enumeration Documentation

### 33.138.2.1 window\_menu\_style\_enum

```
enum Fl_Sys_Menu_Bar::window_menu_style_enum
```

Possible styles of the Window menu in the system menu bar.

#### Enumerator

<code>no_window_menu</code>	No Window menu in the system menu bar.
<code>tabbing_mode_none</code>	No tabbed windows, but the system menu bar contains a Window menu.
<code>tabbing_mode_automatic</code>	Windows are created by themselves but can be tabbed later.
<code>tabbing_mode_preferred</code>	Windows are tabbed when created.

## 33.138.3 Constructor & Destructor Documentation

### 33.138.3.1 Fl\_Sys\_Menu\_Bar()

```
Fl_Sys_Menu_Bar::Fl_Sys_Menu_Bar (
 int x,
 int y,
 int w,
 int h,
 const char * l = 0)
```

The constructor.

On Mac OS X, all arguments are unused. On other platforms they are used as by `Fl_Menu_Bar::Fl_Menu_Bar()`.

### 33.138.4 Member Function Documentation

#### 33.138.4.1 about()

```
void Fl_Sys_Menu_Bar::about (
 Fl_Callback * cb,
 void * data) [static]
```

Attaches a callback to the "About myprog" item of the system application menu. This cross-platform function is effective only under the MacOS platform.

##### Parameters

<i>cb</i>	a callback that will be called by "About myprog" menu item with NULL 1st argument.
<i>data</i>	a pointer transmitted as 2nd argument to the callback.

#### 33.138.4.2 add() [1/3]

```
int Fl_Sys_Menu_Bar::add (
 const char * label,
 const char * shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0) [inline]
```

Adds a new menu item.

##### See also

[Fl\\_Menu\\_::add\(const char\\* label, int shortcut, Fl\\_Callback\\*, void \\*user\\_data=0, int flags=0\)](#)

#### 33.138.4.3 add() [2/3]

```
int Fl_Sys_Menu_Bar::add (
 const char * label,
 int shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0)
```

Add a new menu item to the system menu bar.

Add to the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

##### Parameters

<i>label</i>	- new menu item's label
<i>shortcut</i>	- new menu item's integer shortcut (can be 0 for none, or e.g. FL_ALT+'x')
<i>cb</i>	- callback to be invoked when item selected (can be 0 for none, in which case the menubar's <a href="#">callback()</a> can be used instead)
<i>user_data</i>	- argument to the callback
<i>flags</i>	- item's flags, e.g. <a href="#">FL_MENU_TOGGLE</a> , etc.

**Returns**

the index into the [menu\(\)](#) array, where the entry was added

**See also**

[Fl\\_Menu\\_::add\(const char\\* label, int shortcut, Fl\\_Callback \\*cb, void \\*user\\_data, int flags\)](#)

**33.138.4.4 add()** [3/3]

```
int Fl_Sys_Menu_Bar::add (
 const char * str)
```

Forms-compatible procedure to add items to the system menu bar.

**Returns**

the index into the [menu\(\)](#) array, where the entry was added

**See also**

[Fl\\_Menu\\_::add\(const char\\* str\)](#)

**33.138.4.5 clear()**

```
void Fl_Sys_Menu_Bar::clear (
 void)
```

Set the [Fl\\_Menu\\_Item](#) array pointer to null, indicating a zero-length menu.

**See also**

[Fl\\_Menu\\_::clear\(\)](#)

**33.138.4.6 clear\_submenu()**

```
int Fl_Sys_Menu_Bar::clear_submenu (
 int index)
```

Clears the specified submenu pointed to by index of all menu items.

**See also**

[Fl\\_Menu\\_::clear\\_submenu\(int index\)](#)

**33.138.4.7 create\_window\_menu()**

```
void Fl_Sys_Menu_Bar::create_window_menu () [static]
```

Adds a Window menu, to the end of the system menu bar.

FLTK apps typically don't need to call this function which is automatically called by the library the first time a window is shown. The default system menu bar contains a Window menu with a "Merge All Windows" item. Other Window menu styles can be obtained calling [Fl\\_Sys\\_Menu\\_Bar::window\\_menu\\_style\(window\\_menu\\_style\\_enum\)](#) before the first [Fl\\_Window::show\(\)](#). Alternatively, an app can call [create\\_window\\_menu\(\)](#) after having populated the system menu bar, for example with [menu\(const Fl\\_Menu\\_Item \\*\)](#), and before the first [Fl\\_Window::show\(\)](#).

This function does nothing on non MacOS platforms.

**Version**

1.4

**33.138.4.8 draw()**

```
void Fl_Sys_Menu_Bar::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Menu\\_Bar](#).

**33.138.4.9 insert()** [1/2]

```
int Fl_Sys_Menu_Bar::insert (
 int index,
 const char * label,
 const char * shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0) [inline]
```

Insert a new menu item.

See also

[Fl\\_Menu\\_::insert\(int index, const char\\* label, const char\\* shortcut, Fl\\_Callback \\*cb, void \\*user\\_data=0, int flags=0\)](#)

**33.138.4.10 insert()** [2/2]

```
int Fl_Sys_Menu_Bar::insert (
 int index,
 const char * label,
 int shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0)
```

insert in the system menu bar a new menu item

Insert in the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

Returns

the index into the [menu\(\)](#) array, where the entry was inserted

See also

[Fl\\_Menu\\_::insert\(int index, const char\\* label, int shortcut, Fl\\_Callback \\*cb, void \\*user\\_data, int flags\)](#)

**33.138.4.11 menu()**

```
void Fl_Sys_Menu_Bar::menu (
 const Fl_Menu_Item * m)
```

create a system menu bar using the given list of menu structs

Author

Matthias Melcher

## Parameters

<i>m</i>	Zero-ending list of <a href="#">Fl_Menu_Item</a> 's
----------	-----------------------------------------------------

**33.138.4.12 mode()**

```
void Fl_Sys_Menu_Bar::mode (
 int i,
 int fl)
```

Sets the flags of item *i*.

## See also

[Fl\\_Menu\\_::mode\(int i, int fl\)](#)

**33.138.4.13 play\_menu()**

```
void Fl_Sys_Menu_Bar::play_menu (
 const Fl_Menu_Item * item) [virtual]
```

Opens the 1st level submenu of the menubar corresponding to *item*.

## Since

1.4.0

Reimplemented from [Fl\\_Menu\\_Bar](#).

**33.138.4.14 remove()**

```
void Fl_Sys_Menu_Bar::remove (
 int index)
```

remove an item from the system menu bar

## Parameters

<i>index</i>	the index of the item to remove
--------------	---------------------------------

**33.138.4.15 replace()**

```
void Fl_Sys_Menu_Bar::replace (
 int index,
 const char * name)
```

rename an item from the system menu bar

## Parameters

<i>index</i>	the index of the item to rename
<i>name</i>	the new item name as a UTF8 string

### 33.138.4.16 update()

```
void Fl_Sys_Menu_Bar::update () [virtual]
```

Updates the menu bar after any change to its items.

This is useful when the menu bar can be an [Fl\\_Sys\\_Menu\\_Bar](#) object.

Reimplemented from [Fl\\_Menu\\_Bar](#).

### 33.138.4.17 window\_menu\_style()

```
void Fl_Sys_Menu_Bar::window_menu_style (
 Fl_Sys_Menu_Bar::window_menu_style_enum style) [static]
```

Set the desired style of the Window menu in the system menu bar.

This function, to be called before the first call to [Fl\\_Window::show\(\)](#), allows to control whether the system menu bar should contain a Window menu, and if yes, whether new windows should be displayed in tabbed form. These are the effects of various values for *style* :

- `no_window_menu` : don't add a Window menu to the system menu bar
- `tabbing_mode_none` : add a simple Window menu to the system menu bar
- `tabbing_mode_automatic` : the window menu also contains "Merge All Windows" to group all windows in a single tabbed display mode. This is the **default** Window menu style for FLTK apps.
- `tabbing_mode_preferred` : new windows are displayed in tabbed mode when first created

The Window menu, if present, is entirely created and controlled by the FLTK library. Mac OS version 10.12 or later must be running for windows to be displayed in tabbed form. Under non MacOS platforms, this function does nothing.

#### Version

1.4

The documentation for this class was generated from the following files:

- [Fl\\_Sys\\_Menu\\_Bar.H](#)
- [Fl\\_Sys\\_Menu\\_Bar.cxx](#)

## 33.139 Fl\_Table Class Reference

A table of widgets or other content.

```
#include <Fl_Table.H>
```

Inheritance diagram for [Fl\\_Table](#):

### Public Types

- enum [TableContext](#) {
  - `CONTEXT_NONE = 0` , `CONTEXT_STARTPAGE = 0x01` , `CONTEXT_ENDPAGE = 0x02` , `CONTEXT_ROW_HEADER = 0x04` ,
  - `CONTEXT_COL_HEADER = 0x08` , `CONTEXT_CELL = 0x10` , `CONTEXT_TABLE = 0x20` , `CONTEXT_RC_RESIZE = 0x40` }

The context bit flags for [FI\\_Table](#) related callbacks.

## Public Member Functions

- void **add** ([FI\\_Widget](#) &wgt)
 

The specified widget is removed from its current group (if any) and added to the end of [FI\\_Table](#)'s group.
- void **add** ([FI\\_Widget](#) \*wgt)
 

The specified widget is removed from its current group (if any) and added to the end of [FI\\_Table](#)'s group.
- [FI\\_Widget](#) \*const \* **array** ()
 

Returns a pointer to the array of children.
- void **begin** ()
- void **callback** ([FI\\_Widget](#) \*, void \*)
 

Callbacks will be called depending on the setting of [FI\\_Widget::when\(\)](#).
- int **callback\_col** ()
 

Returns the current column the event occurred on.
- [TableContext](#) **callback\_context** ()
 

Returns the current 'table context'.
- int **callback\_row** ()
 

Returns the current row the event occurred on.
- [FI\\_Widget](#) \* **child** (int n) const
 

Returns the child widget by an index.
- int **children** () const
 

Returns the number of children in the table.
- virtual void **clear** ()
 

Clears the table to zero rows (`rows(0)`), zero columns (`cols(0)`), and clears any widgets (`table->clear()`) that were added with `begin()/end()` or `add()/insert()/etc.`
- int **col\_header** ()
 

Returns if column headers are enabled or not.
- void **col\_header** (int flag)
 

Enable or disable column headers.
- [FI\\_Color](#) **col\_header\_color** ()
 

Gets the color for column headers.
- void **col\_header\_color** ([FI\\_Color](#) val)
 

Sets the color for column headers and redraws the table.
- int **col\_header\_height** ()
 

Gets the column header height.
- void **col\_header\_height** (int height)
 

Sets the height in pixels for column headers and redraws the table.
- int **col\_position** ()
 

Returns the current column scroll position as a column number.
- void **col\_position** (int col)
 

Sets the horizontal scroll position so 'col' is at the left, and causes the screen to redraw.
- int **col\_resize** ()
 

Returns if column resizing by the user is allowed.
- void **col\_resize** (int flag)
 

Allows/disallows column resizing by the user.
- int **col\_resize\_min** ()
 

Returns the current column minimum resize value.
- void **col\_resize\_min** (int val)
 

Sets the current column minimum resize value.
- int **col\_width** (int col)

- Returns the current width of the specified column in pixels.*

  - void `col_width` (int col, int width)

*Sets the width of the specified column in pixels, and the table is redrawn.*
- void `col_width_all` (int width)

*Convenience method to set the width of all columns to the same value, in pixels.*
- int `cols` ()

*Get the number of columns in the table.*
- virtual void `cols` (int val)

*Set the number of columns in the table and redraw.*
- void `do_callback` (`TableContext` context, int row, int col)

*Calls the widget callback.*
- void `end` ()
- int `find` (const `FI_Widget` &wgt) const
- int `find` (const `FI_Widget` \*wgt) const
- `FI_Table` (int X, int Y, int W, int H, const char \*l=0)

*The constructor for `FI_Table`.*
- void `get_selection` (int &row\_top, int &col\_left, int &row\_bot, int &col\_right)

*Gets the region of cells selected (highlighted).*
- void `init_sizes` ()

*Resets the internal array of widget sizes and positions.*
- void `insert` (`FI_Widget` &wgt, `FI_Widget` \*w2)

*The specified widget is removed from its current group (if any) and inserted into `FI_Table`'s group before widget 'w2'.*
- void `insert` (`FI_Widget` &wgt, int n)

*The specified widget is removed from its current group (if any) and inserted into the `FI_Table`'s group at position 'n'.*
- int `is_interactive_resize` ()

*Returns 1 if someone is interactively resizing a row or column.*
- int `is_selected` (int r, int c)

*See if the cell at row *r* and column *c* is selected.*
- int `move_cursor` (int R, int C)

*Same as `move_cursor(R,C,1)`;*
- int `move_cursor` (int R, int C, int shiftselect)

*Moves the selection cursor a relative number of rows/columns specified by R/C.*
- void `remove` (`FI_Widget` &wgt)

*The specified widget is removed from `FI_Table`'s group.*
- void `resize` (int X, int Y, int W, int H) `FL_OVERRIDE`

*Handle resize events if user resizes parent window.*
- int `row_header` ()

*Returns if row headers are enabled or not.*
- void `row_header` (int flag)

*Enables/disables showing the row headers.*
- `FI_Color` `row_header_color` ()

*Returns the current row header color.*
- void `row_header_color` (`FI_Color` val)

*Sets the row header color and causes the screen to redraw.*
- int `row_header_width` ()

*Returns the current row header width (in pixels).*
- void `row_header_width` (int width)

*Sets the row header width to *n* and causes the screen to redraw.*
- int `row_height` (int row)

*Returns the current height of the specified row as a value in pixels.*
- void `row_height` (int row, int height)

- Sets the height of the specified row in pixels, and the table is redrawn.*
- void `row_height_all` (int height)
  - Convenience method to set the height of all rows to the same value, in pixels.*
- int `row_position` ()
  - Returns the current row scroll position as a row number.*
- void `row_position` (int row)
  - Sets the vertical scroll position so 'row' is at the top, and causes the screen to redraw.*
- int `row_resize` ()
  - Returns if row resizing by the user is allowed.*
- void `row_resize` (int flag)
  - Allows/disallows row resizing by the user.*
- int `row_resize_min` ()
  - Returns the current row minimum resize value.*
- void `row_resize_min` (int val)
  - Sets the current row minimum resize value.*
- int `rows` ()
  - Returns the number of rows in the table.*
- virtual void `rows` (int val)
  - Sets the number of rows in the table, and the table is redrawn.*
- int `scrollbar_size` () const
  - Gets the current size of the scrollbars' troughs, in pixels.*
- void `scrollbar_size` (int newSize)
  - Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
- void `set_selection` (int row\_top, int col\_left, int row\_bot, int col\_right)
  - Sets the region of cells to be selected (highlighted).*
- int `tab_cell_nav` () const
  - Get state of table's 'Tab' key cell navigation flag.*
- void `tab_cell_nav` (int val)
  - Flag to control if Tab navigates table cells or not.*
- void `table_box` (Fl\_Boxtype val)
  - Sets the kind of box drawn around the data table, the default being FL\_NO\_BOX.*
- Fl\_Boxtype `table_box` (void)
  - Returns the current box type used for the data table.*
- int `top_row` ()
  - Returns the current top row shown in the table.*
- void `top_row` (int row)
  - Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.*
- void `visible_cells` (int &r1, int &r2, int &c1, int &c2)
  - Returns the range of row and column numbers for all visible and partially visible cells in the table.*
- void `when` (Fl\_When flags)
  - The Fl\_Widget::when() function is used to set a group of flags, determining when the widget callback is called:*
- ~Fl\_Table ()
  - The destructor for Fl\_Table.*

## Protected Types

- enum `ResizeFlag` {
  - `RESIZE_NONE = 0` , `RESIZE_COL_LEFT = 1` , `RESIZE_COL_RIGHT = 2` , `RESIZE_ROW_ABOVE = 3` , `RESIZE_ROW_BELOW = 4` }

## Protected Member Functions

- void **change\_cursor** ([Fl\\_Cursor](#) newcursor)  
*Change mouse cursor to different type.*
- long **col\_scroll\_position** (int col)  
*Returns the scroll position (in pixels) of the specified column 'col'.*
- [TableContext](#) **cursor2rowcol** (int &R, int &C, [ResizeFlag](#) &resizeflag)  
*Find row/col for the recent mouse event.*
- void **damage\_zone** (int r1, int c1, int r2, int c2, int r3=0, int c3=0)  
*Sets the damage zone to the specified row/col values.*
- void **draw** () [FL\\_OVERRIDE](#)  
*Draws the entire [Fl\\_Table](#).*
- virtual void **draw\_cell** ([TableContext](#) context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)  
*Subclass should override this method to handle drawing the cells.*
- int **find\_cell** ([TableContext](#) context, int R, int C, int &X, int &Y, int &W, int &H)  
*Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.*
- void **get\_bounds** ([TableContext](#) context, int &X, int &Y, int &W, int &H)  
*Returns the (X,Y,W,H) bounding region for the specified 'context'.*
- int **handle** (int e) [FL\\_OVERRIDE](#)  
*Handle FLTK events.*
- int **is\_fltk\_container** ()  
*Does the table contain any child fltk widgets?*
- void **recalc\_dimensions** ()  
*Recalculate the dimensions of the table, and affect any children.*
- void **redraw\_range** (int topRow, int botRow, int leftCol, int rightCol)  
*Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE\_CHILD).*
- int **row\_col\_clamp** ([TableContext](#) context, int &R, int &C)  
*Return specified row/col values R and C to within the table's current row/col limits.*
- long **row\_scroll\_position** (int row)  
*Returns the scroll position (in pixels) of the specified 'row'.*
- void **table\_resized** ()  
*Call this if table was resized, to recalculate internal data.*
- void **table\_scrolled** ()  
*Recalculate internals after a scroll.*

## Static Protected Member Functions

- static void **scroll\_cb** ([Fl\\_Widget](#) \*, void \*)  
*Callback for when someone moves a scrollbar.*

## Protected Attributes

- int **botrow**  
*bottom row# of currently visible table on screen*
- int **current\_col**  
*selection cursor's current column (-1 if none)*
- int **current\_row**  
*selection cursor's current row (-1 if none)*
- [Fl\\_Scrollbar](#) \* **hscrollbar**  
*child horizontal scrollbar widget*
- int **leftcol**  
*left column# of currently visible table on screen*

- int **leftcol\_scrollpos**  
*precomputed scroll position for left column*
- int **rightcol**  
*right column# of currently visible table on screen*
- int **select\_col**  
*extended selection column (-1 if none)*
- int **select\_row**  
*extended selection row (-1 if none)*
- [FI\\_Scroll](#) \* **table**  
*child [FI\\_Scroll](#) widget container for child fltk widgets (if any)*
- int **table\_h**  
*table's virtual height (in pixels)*
- int **table\_w**  
*table's virtual width (in pixels)*
- int **tih**  
*Data table's inner h dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **tiw**  
*Data table's inner w dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **tix**  
*Data table's inner x dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **tiy**  
*Data table's inner y dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **toh**  
*Data table's outer h dimension, outside bounding box. See [Table Dimension Diagram](#).*
- int **toprow**  
*top row# of currently visible table on screen*
- int **toprow\_scrollpos**  
*precomputed scroll position for top row*
- int **tow**  
*Data table's outer w dimension, outside bounding box. See [Table Dimension Diagram](#).*
- int **tox**  
*Data table's outer x dimension, outside bounding box. See [Table Dimension Diagram](#).*
- int **toy**  
*Data table's outer y dimension, outside bounding box. See [Table Dimension Diagram](#).*
- [FI\\_Scrollbar](#) \* **vscrollbar**  
*child vertical scrollbar widget*
- int **wih**  
*Table widget's inner h dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **wiw**  
*Table widget's inner w dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **wix**  
*Table widget's inner x dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **wiy**  
*Table widget's inner y dimension, inside bounding box. See [Table Dimension Diagram](#).*

## Additional Inherited Members

### 33.139.1 Detailed Description

A table of widgets or other content.

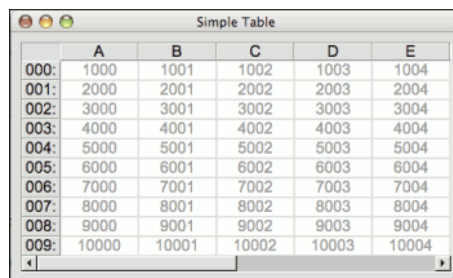

This is the base class for table widgets.

To be useful it must be subclassed and several virtual functions defined. Normally applications use widgets derived from this widget, and do not use this widget directly; this widget is usually too low level to be used directly by applications.

This widget does *not* handle the data in the table. The `draw_cell()` method must be overridden by a subclass to manage drawing the contents of the cells.

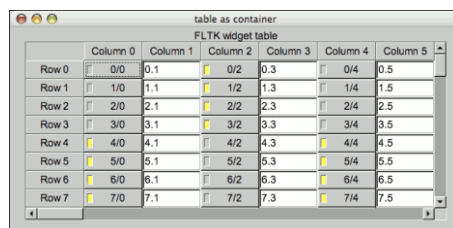

This widget can be used in several ways:

- As a custom widget; see examples/table-simple.cxx and test/table.cxx. Very optimal for even extremely large tables.
- As a table made up of a single FLTK widget instanced all over the table, simulating a numeric spreadsheet. See examples/table-spreadsheet.cxx and examples/table-spreadsheet-with-keyboard-nav.cxx. Optimal for large tables.
- As a regular container of FLTK widgets, one widget per cell. See examples/table-as-container.cxx. *Not* recommended for large tables.

009:	10000	10001	10002	10003	10004

Figure 33.47 table-simple example

	Column 0	Column 1	Column 2	Column 3	Column 4	Column 5
Row 0	0/0	0.1	0/2	0.3	0/4	0.5
Row 1	1/0	1.1	1/2	1.3	1/4	1.5
Row 2	2/0	2.1	2/2	2.3	2/4	2.5
Row 3	3/0	3.1	3/2	3.3	3/4	3.5
Row 4	4/0	4.1	4/2	4.3	4/4	4.5
Row 5	5/0	5.1	5/2	5.3	5/4	5.5
Row 6	6/0	6.1	6/2	6.3	6/4	6.5
Row 7	7/0	7.1	7/2	7.3	7/4	7.5

Figure 33.48 table-as-container example

When acting as part of a custom widget, events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the setting for `FL_Table::when()`.

When acting as a container for FLTK widgets, the FLTK widgets maintain themselves. Although the `draw_cell()` method must be overridden, its contents can be very simple. See the `draw_cell()` code in examples/table-simple.cxx.

The following variables are available to classes deriving from [FI\\_Table](#):

Figure 33.49 FI\_Table Dimensions

<code>x()/y()/w()/h()</code>	<a href="#">FI_Table</a> widget's outer dimension. The outer edge of the border of the <a href="#">FI_Table</a> . (Red in the diagram above)
<code>wix/wiy/wiw/wih</code>	<a href="#">FI_Table</a> widget's inner dimension. The inner edge of the border of the <a href="#">FI_Table</a> . eg. if the <a href="#">FI_Table</a> 's <code>box()</code> is <code>FL_NO_BOX</code> , these values are the same as <code>x()/y()/w()/h()</code> . (Yellow in the diagram above)
<code>tox/toy/tow/toh</code>	The table's outer dimension. The outer edge of the border around the cells, but inside the row/col headings and scrollbars. (Green in the diagram above)
<code>tix/tiy/tiw/tih</code>	The table's inner dimension. The inner edge of the border around the cells, but inside the row/col headings and scrollbars. AKA the table's clip region. eg. if the <code>table_box()</code> is <code>FL_↔NO_BOX</code> , these values are the same as <code>tox/toy/tow/toh</code> . (Blue in the diagram above)

#### CORE DEVELOPERS

- Greg Ercolano : 12/16/2002 - initial implementation 12/16/02. [FI\\_Table](#), [FI\\_Table\\_Row](#), docs.
- Jean-Marc Lienher : 02/22/2004 - added keyboard nav + mouse selection, and ported [FI\\_Table](#) into fltk-utf8-1.1.4

#### OTHER CONTRIBUTORS

- Inspired by the Feb 2000 version of FLVW's `Flvw_Table` widget. Mucho thanks to those folks.
- Mister Satan : 04/07/2003 - MinGW porting mods, and `singleinput.cxx`; a cool [FI\\_Input](#) oriented spreadsheet example
- Marek Paliwoda : 01/08/2003 - Porting mods for Borland
- Ori Berger : 03/16/2006 - Optimizations for >500k rows/cols

#### LICENSE

Greg kindly gave his permission to integrate [FI\\_Table](#) and [FI\\_Table\\_Row](#) into FLTK, allowing FLTK license to apply while his widgets are part of the library. [updated by Greg, 04/26/17]

### 33.139.2 Member Enumeration Documentation

### 33.139.2.1 TableContext

enum `Fl_Table::TableContext`

The context bit flags for `Fl_Table` related callbacks.

Should be used in `draw_cell()` to determine what's being drawn, or in a `callback()` to determine where a recent event occurred.

Enumerator

<code>CONTEXT_NONE</code>	no known context
<code>CONTEXT_STARTPAGE</code>	before the table is redrawn
<code>CONTEXT_ENDPAGE</code>	after the table is redrawn
<code>CONTEXT_ROW_HEADER</code>	drawing or event occurred in the row header
<code>CONTEXT_COL_HEADER</code>	drawing or event occurred in the col header
<code>CONTEXT_CELL</code>	drawing or event occurred in a cell
<code>CONTEXT_TABLE</code>	drawing or event occurred in a dead zone of table
<code>CONTEXT_RC_RESIZE</code>	column or row is being resized

## 33.139.3 Constructor & Destructor Documentation

### 33.139.3.1 Fl\_Table()

```
Fl_Table::Fl_Table (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

The constructor for `Fl_Table`.

This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

### 33.139.3.2 ~Fl\_Table()

```
Fl_Table::~Fl_Table ()
```

The destructor for `Fl_Table`.

Destroys the table and its associated widgets.

## 33.139.4 Member Function Documentation

### 33.139.4.1 array()

```
Fl_Widget *const * Fl_Table::array () [inline]
```

Returns a pointer to the array of children.

*This pointer is only valid until the next time a child is added or removed.*

### 33.139.4.2 callback()

```
void Fl_Table::callback (
 Fl_Widget * ,
 void *)
```

Callbacks will be called depending on the setting of `Fl_Widget::when()`.

Callback functions should use the following functions to determine the context/row/column:

- `Fl_Table::callback_row()` returns current row
- `Fl_Table::callback_col()` returns current column
- `Fl_Table::callback_context()` returns current table context

`callback_row()` and `callback_col()` will be set to the row and column number the event occurred on. If someone clicked on a row header, `col` will be 0. If someone clicked on a column header, `row` will be 0.

`callback_context()` will return one of the following:

<code>Fl_Table::CONTEXT_ROW_HEADER</code>	Someone clicked on a row header. Excludes resizing.
<code>Fl_Table::CONTEXT_COL_HEADER</code>	Someone clicked on a column header. Excludes resizing.
<code>Fl_Table::CONTEXT_CELL</code>	Someone clicked on a cell. To receive callbacks for FL_RELEASE events, you must set <code>when(FL_WHEN_RELEASE)</code> .
<code>Fl_Table::CONTEXT_RC_RESIZE</code>	Someone is resizing rows/columns either interactively, or via the <code>col_width()</code> or <code>row_height()</code> API. Use <code>is_interactive_resize()</code> to determine interactive resizing. If resizing a column, R=0 and C=column being resized. If resizing a row, C=0 and R=row being resized. NOTE: To receive resize events, you must set <code>when(FL_WHEN_CHANGED)</code> .

```
class MyTable : public Fl_Table {
[...]
```

```
private:
// Handle events that happen on the table
void event_callback2() {
 int R = callback_row(), // row where event occurred
 C = callback_col(); // column where event occurred
 TableContext context = callback_context(); // which part of table
 fprintf(stderr, "callback: Row=%d Col=%d Context=%d Event=%d\n",
 R, C, (int)context, (int)Fl::event());
}
// Actual static callback
static void event_callback(Fl_Widget*, void* data) {
 MyTable *o = (MyTable*)data;
 o->event_callback2();
}
public:
// Constructor
MyTable() {
[...]
```

```
 table.callback(&event_callback, (void*)this); // setup callback
 table.when(FL_WHEN_CHANGED|FL_WHEN_RELEASE); // when to call it
}
};
```

#### 33.139.4.3 callback\_col()

```
int Fl_Table::callback_col () [inline]
```

Returns the current column the event occurred on.

This function should only be used from within the user's callback function.

#### 33.139.4.4 callback\_context()

```
TableContext Fl_Table::callback_context () [inline]
```

Returns the current 'table context'.

This function should only be used from within the user's callback function.

#### 33.139.4.5 callback\_row()

```
int Fl_Table::callback_row () [inline]
```

Returns the current row the event occurred on.

This function should only be used from within the user's callback function.

### 33.139.4.6 child()

```
Fl_Widget * Fl_Table::child (
 int n) const [inline]
```

Returns the child widget by an index.

When using the [Fl\\_Table](#) as a container for FLTK widgets, this method returns the widget pointer from the internal array of widgets in the container.

Typically used in loops, eg:

```
for (int i=0; i<children(); i++) {
 Fl_Widget *w = child(i);
 [...]
}
```

### 33.139.4.7 children()

```
int Fl_Table::children () const [inline]
```

Returns the number of children in the table.

When using the [Fl\\_Table](#) as a container for FLTK widgets, this method returns how many child widgets the table has.

See also

[child\(int\)](#)

### 33.139.4.8 clear()

```
virtual void Fl_Table::clear (
 void) [inline], [virtual]
```

Clears the table to zero rows ([rows\(0\)](#)), zero columns ([cols\(0\)](#)), and clears any widgets ([table->clear\(\)](#)) that were added with [begin\(\)/end\(\)](#) or [add\(\)/insert\(\)/etc.](#)

See also

[rows\(int\)](#), [cols\(int\)](#)

Reimplemented in [Fl\\_Table\\_Row](#).

### 33.139.4.9 col\_header()

```
void Fl_Table::col_header (
 int flag) [inline]
```

Enable or disable column headers.

If changed, the table is redrawn.

### 33.139.4.10 col\_resize()

```
void Fl_Table::col_resize (
 int flag) [inline]
```

Allows/disallows column resizing by the user.

1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the column headers, [col\\_header\(\)](#) must also be enabled to allow resizing.

### 33.139.4.11 col\_resize\_min()

```
void Fl_Table::col_resize_min (
 int val) [inline]
```

Sets the current column minimum resize value.

This is used to prevent the user from interactively resizing any column to be smaller than 'pixels'. Must be a value  $\geq 1$ .

#### 33.139.4.12 col\_width()

```
void Fl_Table::col_width (
 int col,
 int width)
```

Sets the width of the specified column in pixels, and the table is redrawn.

[callback\(\)](#) will be invoked with `CONTEXT_RC_RESIZE` if the column's width was actually changed, and [when\(\)](#) is `FL_WHEN_CHANGED`.

#### 33.139.4.13 col\_width\_all()

```
void Fl_Table::col_width_all (
 int width) [inline]
```

Convenience method to set the width of all columns to the same value, in pixels.

The screen is redrawn.

#### 33.139.4.14 cursor2rowcol()

```
Fl_Table::TableContext Fl_Table::cursor2rowcol (
 int & R,
 int & C,
 ResizeFlag & resizeflag) [protected]
```

Find row/col for the recent mouse event.

Returns the context, and the row/column values in R/C. Also returns 'resizeflag' if mouse is hovered over a resize boundary.

#### 33.139.4.15 damage\_zone()

```
void Fl_Table::damage_zone (
 int r1,
 int c1,
 int r2,
 int c2,
 int r3 = 0,
 int c3 = 0) [protected]
```

Sets the damage zone to the specified row/col values.

Calls [redraw\\_range\(\)](#).

#### 33.139.4.16 do\_callback()

```
void Fl_Table::do_callback (
 TableContext context,
 int row,
 int col) [inline]
```

Calls the widget callback.

Saves the specified 'context', 'row', and 'col' values, so that the user's callback can then access them with the member functions [callback\\_context\(\)](#), [callback\\_row\(\)](#) and [callback\\_col\(\)](#).

#### 33.139.4.17 draw()

```
void Fl_Table::draw (
 void) [protected], [virtual]
```

Draws the entire [Fl\\_Table](#).

Lets fltk widgets draw themselves first, followed by the cells via calls to [draw\\_cell\(\)](#).

Reimplemented from [Fl\\_Group](#).

**33.139.4.18 draw\_cell()**

```
virtual void Fl_Table::draw_cell (
 TableContext context,
 int R = 0,
 int C = 0,
 int X = 0,
 int Y = 0,
 int W = 0,
 int H = 0) [inline], [protected], [virtual]
```

Subclass should override this method to handle drawing the cells.

This method will be called whenever the table is redrawn, once per cell.

Only cells that are completely (or partially) visible will be told to draw.

context will be one of the following:

<code>Fl_Table::CONTEXT_STARTPAGE</code>	When table, or parts of the table, are about to be redrawn. Use to initialize static data, such as font selections. R/C will be zero, X/Y/W/H will be the dimensions of the table's entire data area. (Useful for locking a database before accessing; see also <a href="#">visible_cells()</a> )
<code>Fl_Table::CONTEXT_ENDPAGE</code>	When table has completed being redrawn. R/C will be zero, X/Y/W/H dimensions of table's data area. (Useful for unlocking a database after accessing)
<code>Fl_Table::CONTEXT_ROW_HEADER</code>	Whenever a row header cell needs to be drawn. R will be the row number of the header being redrawn, C will be zero, X/Y/W/H will be the fltk drawing area of the row header in the window
<code>Fl_Table::CONTEXT_COL_HEADER</code>	Whenever a column header cell needs to be drawn. R will be zero, C will be the column number of the header being redrawn, X/Y/W/H will be the fltk drawing area of the column header in the window
<code>Fl_Table::CONTEXT_CELL</code>	Whenever a data cell in the table needs to be drawn. R/C will be the row/column of the cell to be drawn, X/Y/W/H will be the fltk drawing area of the cell in the window
<code>Fl_Table::CONTEXT_RC_RESIZE</code>	Whenever table or row/column is resized or scrolled, either interactively or via <a href="#">col_width()</a> or <a href="#">row_height()</a> . R/C/X/Y/W/H will all be zero. Useful for fltk containers that need to resize or move the child fltk widgets.

R and C will be set to the row and column number of the cell being drawn. In the case of row headers, C will be 0. In the case of column headers, R will be 0.

X/Y/W/H will be the position and dimensions of where the cell should be drawn.

In the case of custom widgets, a minimal [draw\\_cell\(\)](#) override might look like the following. With custom widgets it is up to the caller to handle drawing everything within the dimensions of the cell, including handling the selection color. Note all clipping must be handled as well; this allows drawing outside the dimensions of the cell if so desired for 'custom effects'.

```
// This is called whenever Fl_Table wants you to draw a cell
void MyTable::draw_cell(TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0) {
 static char s[40];
 sprintf(s, "%d/%d", R, C); // text for each cell
 switch (context) {
 case CONTEXT_STARTPAGE: // Fl_Table telling us it's starting to draw page
 fl_font(FL_HELVETICA, 16);
 return;
 case CONTEXT_ROW_HEADER: // Fl_Table telling us to draw row/col headers
 case CONTEXT_COL_HEADER:
 fl_push_clip(X, Y, W, H);
 {
 fl_draw_box(FL_THIN_UP_BOX, X, Y, W, H, color());
 }
 }
}
```

```

 fl_color(FL_BLACK);
 fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);
 }
 fl_pop_clip();
 return;
case CONTEXT_CELL: // Fl_Table telling us to draw cells
 fl_push_clip(X, Y, W, H);
 {
 // BG COLOR
 fl_color(row_selected(R) ? selection_color() : FL_WHITE);
 fl_rectf(X, Y, W, H);
 // TEXT
 fl_color(FL_BLACK);
 fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);
 // BORDER
 fl_color(FL_LIGHT2);
 fl_rect(X, Y, W, H);
 }
 fl_pop_clip();
 return;
default:
 return;
}
//NOTREACHED
}

```

#### 33.139.4.19 find\_cell()

```

int Fl_Table::find_cell (
 TableContext context,
 int R,
 int C,
 int & X,
 int & Y,
 int & W,
 int & H) [protected]

```

Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.

##### Returns

- 0 – on success, XYWH returns the region of the specified cell.
- -1 – if R or C are out of range, and X/Y/W/H will be set to zero.

#### 33.139.4.20 get\_selection()

```

void Fl_Table::get_selection (
 int & row_top,
 int & col_left,
 int & row_bot,
 int & col_right)

```

Gets the region of cells selected (highlighted).

##### Parameters

in	<i>row_top</i>	Returns the top row of selection area
in	<i>col_left</i>	Returns the left column of selection area
in	<i>row_bot</i>	Returns the bottom row of selection area
in	<i>col_right</i>	Returns the right column of selection area

#### 33.139.4.21 handle()

```

int Fl_Table::handle (

```

```
int e) [protected], [virtual]
```

Handle FLTK events.

Reimplemented from [Fl\\_Group](#).

Reimplemented in [Fl\\_Table\\_Row](#).

### 33.139.4.22 `init_sizes()`

```
void Fl_Table::init_sizes () [inline]
```

Resets the internal array of widget sizes and positions.

See also

[Fl\\_Group::init\\_sizes\(\)](#)

### 33.139.4.23 `insert()`

```
void Fl_Table::insert (
 Fl_Widget & wgt,
 Fl_Widget * w2) [inline]
```

The specified widget is removed from its current group (if any) and inserted into [Fl\\_Table](#)'s group before widget 'w2'. This will append if 'w2' is not in [Fl\\_Table](#)'s group.

### 33.139.4.24 `is_interactive_resize()`

```
int Fl_Table::is_interactive_resize () [inline]
```

Returns 1 if someone is interactively resizing a row or column.

You can currently call this only from within your [callback\(\)](#).

### 33.139.4.25 `is_selected()`

```
int Fl_Table::is_selected (
 int r,
 int c)
```

See if the cell at row *r* and column *c* is selected.

Returns

1 if the cell is selected, 0 if not.

### 33.139.4.26 `move_cursor()`

```
int Fl_Table::move_cursor (
 int R,
 int C,
 int shiftselect)
```

Moves the selection cursor a relative number of rows/columns specified by R/C.

R/C can be positive or negative, depending on the direction to move. A value of 0 for R or C prevents cursor movement on that axis.

If shiftselect is set, the selection range is extended to the new cursor position. If clear, the cursor is simply moved, and any previous selection is cancelled.

Used mainly by keyboard events (e.g. [Fl\\_Right](#), [FL\\_Home](#), [FL\\_End](#)..) to let the user keyboard navigate the selection cursor around.

The scroll positions may be modified if the selection cursor traverses into cells off the screen's edge.

Internal variables `select_row/select_col` and `current_row/current_col` are modified, among others.

Examples:

```
R=1, C=0 -- moves the selection cursor one row downward.
R=5, C=0 -- moves the selection cursor 5 rows downward.
R=-5, C=0 -- moves the cursor 5 rows upward.
R=2, C=2 -- moves the cursor 2 rows down and 2 columns to the right.
```

### 33.139.4.27 recalc\_dimensions()

```
void Fl_Table::recalc_dimensions () [protected]
```

Recalculate the dimensions of the table, and affect any children. Internally, [Fl\\_Group::resize\(\)](#) and [init\\_sizes\(\)](#) are called.

### 33.139.4.28 redraw\_range()

```
void Fl_Table::redraw_range (
 int topRow,
 int botRow,
 int leftCol,
 int rightCol) [inline], [protected]
```

Define region of cells to be redrawn by specified range of rows/cols, and then sets `damage(DAMAGE_CHILD)`. Extends any previously defined range to redraw.

### 33.139.4.29 resize()

```
void Fl_Table::resize (
 int X,
 int Y,
 int W,
 int H) [virtual]
```

Handle resize events if user resizes parent window. This changes the size of [Fl\\_Table](#), causing it to redraw. Reimplemented from [Fl\\_Group](#).

### 33.139.4.30 row\_col\_clamp()

```
int Fl_Table::row_col_clamp (
 TableContext context,
 int & R,
 int & C) [protected]
```

Return specified row/col values R and C to within the table's current row/col limits.

#### Returns

0 if no changes were made, or 1 if they were.

### 33.139.4.31 row\_header()

```
void Fl_Table::row_header (
 int flag) [inline]
```

Enables/disables showing the row headers. 1=enabled, 0=disabled. If changed, the table is redrawn.

### 33.139.4.32 row\_height()

```
void Fl_Table::row_height (
 int row,
 int height)
```

Sets the height of the specified row in pixels, and the table is redrawn. [callback\(\)](#) will be invoked with `CONTEXT_RC_RESIZE` if the row's height was actually changed, and [when\(\)](#) is `FL_WHEN_CHANGED`.

### 33.139.4.33 row\_height\_all()

```
void Fl_Table::row_height_all (
 int height) [inline]
```

Convenience method to set the height of all rows to the same value, in pixels. The screen is redrawn.

### 33.139.4.34 row\_resize()

```
void Fl_Table::row_resize (
 int flag) [inline]
```

Allows/disallows row resizing by the user.

1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the row headers, [row\\_header\(\)](#) must also be enabled to allow resizing.

### 33.139.4.35 row\_resize\_min()

```
void Fl_Table::row_resize_min (
 int val) [inline]
```

Sets the current row minimum resize value.

This is used to prevent the user from interactively resizing any row to be smaller than 'pixels'. Must be a value  $\geq 1$ .

### 33.139.4.36 rows()

```
void Fl_Table::rows (
 int val) [virtual]
```

Sets the number of rows in the table, and the table is redrawn.

Reimplemented in [Fl\\_Table\\_Row](#).

### 33.139.4.37 scrollbar\_size() [1/2]

```
int Fl_Table::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

#### Returns

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

#### See also

[Fl::scrollbar\\_size\(int\)](#)

### 33.139.4.38 scrollbar\_size() [2/2]

```
void Fl_Table::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

## Parameters

in	<i>newSize</i>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
----	----------------	-----------------------------------------------------------------------------------------------------------------------------

## See also

[Fl::scrollbar\\_size\(\)](#)

**33.139.4.39 set\_selection()**

```
void Fl_Table::set_selection (
 int row_top,
 int col_left,
 int row_bot,
 int col_right)
```

Sets the region of cells to be selected (highlighted).

So for instance, `set_selection(0,0,0,0)` selects the top/left cell in the table. And `set_selection(0,0,1,1)` selects the four cells in rows 0 and 1, column 0 and 1.

To deselect all cells, use `set_selection(-1,-1,-1,-1)`;

## Parameters

in	<i>row_top</i>	Top row of selection area
in	<i>col_left</i>	Left column of selection area
in	<i>row_bot</i>	Bottom row of selection area
in	<i>col_right</i>	Right column of selection area

**33.139.4.40 tab\_cell\_nav()** [1/2]

```
int Fl_Table::tab_cell_nav () const [inline]
```

Get state of table's 'Tab' key cell navigation flag.

## Returns

1 if Tab configured to navigate cells in table  
0 to navigate widget focus (default)

## See also

[tab\\_cell\\_nav\(int\)](#)

**33.139.4.41 tab\_cell\_nav()** [2/2]

```
void Fl_Table::tab_cell_nav (
 int val) [inline]
```

Flag to control if Tab navigates table cells or not.

If on, Tab key navigates table cells. If off, Tab key navigates fltk widget focus. (default)

As of fltk 1.3, the default behavior of the Tab key is to navigate focus off of the current widget, and on to the next one. But in some applications, it's useful for Tab to be used to navigate cells in the [Fl\\_Table](#).

## Parameters

in	val	If val is 1, Tab key navigates cells in table, not fltk widgets. If val is 0, Tab key will advance focus to the next fltk widget (default), and does not navigate cells in table.
----	-----	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**33.139.4.42 table\_box()**

```
void Fl_Table::table_box (
 Fl_Boxtype val) [inline]
```

Sets the kind of box drawn around the data table, the default being FL\_NO\_BOX. Changing this value will cause the table to redraw.

**33.139.4.43 table\_resized()**

```
void Fl_Table::table_resized () [protected]
```

Call this if table was resized, to recalculate internal data. Calls `recall_dimensions()`, and recalculates scrollbar sizes.

**33.139.4.44 table\_scrolled()**

```
void Fl_Table::table_scrolled () [protected]
```

Recalculate internals after a scroll.

Call this if table has been scrolled or resized. Does not handle `redraw()`. TODO: Assumes `ti[xywh]` has already been recalculated.

**33.139.4.45 top\_row() [1/2]**

```
int Fl_Table::top_row () [inline]
```

Returns the current top row shown in the table. This row may be partially obscured.

**33.139.4.46 top\_row() [2/2]**

```
void Fl_Table::top_row (
 int row) [inline]
```

Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn. If the table cannot be scrolled that far, it is scrolled as far as possible.

**33.139.4.47 visible\_cells()**

```
void Fl_Table::visible_cells (
 int & r1,
 int & r2,
 int & c1,
 int & c2) [inline]
```

Returns the range of row and column numbers for all visible and partially visible cells in the table.

These values can be used e.g. by your `draw_cell()` routine during `CONTEXT_STARTPAGE` to figure out what cells are about to be redrawn for the purposes of locking the data from a database before it's drawn.

```

leftcol rightcol
:
toprow .. :-----:
| |
| V I S I B L E |
| |
| T A B L E |
| |
botrow .. :-----:
```

e.g. in a table where the visible rows are 5-20, and the visible columns are 100-120, then those variables would be:

- `toprow = 5`

- botrow = 20
- leftcol = 100
- rightcol = 120

#### 33.139.4.48 when()

```
void Fl_Table::when (
 Fl_When flags)
```

The `Fl_Widget::when()` function is used to set a group of flags, determining when the widget callback is called:

FL_WHEN_CHANGED	<code>callback()</code> will be called when rows or columns are resized (interactively or via <code>col_width()</code> or <code>row_height()</code> ), passing <code>CONTEXT_RC_RESIZE</code> via <code>callback_context()</code> .
FL_WHEN_RELEASE	<code>callback()</code> will be called during <code>FL_RELEASE</code> events, such as when someone releases a mouse button somewhere on the table.

The `callback()` routine is sent a `TableContext` that indicates the context the event occurred in, such as in a cell, in a header, or elsewhere on the table. When an event occurs in a cell or header, `callback_row()` and `callback_col()` can be used to determine the row and column. The callback can also look at the regular fltk event values (ie. `Fl::event()` and `Fl::event_button()`) to determine what kind of event is occurring.

The documentation for this class was generated from the following files:

- `Fl_Table.H`
- `Fl_Table.cxx`

## 33.140 Fl\_Table\_Row Class Reference

A table with row selection capabilities.

```
#include <Fl_Table_Row.H>
```

## Additional Inherited Members

### 33.140.1 Detailed Description

A table with row selection capabilities.

This class implements a simple table with the ability to select rows. This widget is similar to an [Fl\\_Browser](#) with columns. Most methods of importance will be found in the [Fl\\_Table](#) widget, such as [Fl\\_Table::rows\(\)](#) and [Fl\\_Table::cols\(\)](#).

To be useful it must be subclassed and at minimum the [draw\\_cell\(\)](#) method must be overridden to provide the content of the cells. This widget does *not* manage the cell's data content; it is up to the parent class's [draw\\_cell\(\)](#) method override to provide this.

Events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the values you supply for [Fl\\_Table::when\(\)](#).

### 33.140.2 Constructor & Destructor Documentation

#### 33.140.2.1 Fl\_Table\_Row()

```
Fl_Table_Row::Fl_Table_Row (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0) [inline]
```

The constructor for the [Fl\\_Table\\_Row](#).

This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

#### 33.140.2.2 ~Fl\_Table\_Row()

```
Fl_Table_Row::~Fl_Table_Row () [inline]
```

The destructor for the [Fl\\_Table\\_Row](#).

Destroys the table and its associated widgets.

### 33.140.3 Member Function Documentation

### 33.140.3.1 clear()

```
void Fl_Table_Row::clear (
 void) [inline], [virtual]
```

Clears the table to zero rows (`rows(0)`), zero columns (`cols(0)`), and clears any widgets (`table->clear()`) that were added with `begin()/end()` or `add()/insert()/etc.`

See also

[rows\(int\)](#), [cols\(int\)](#)

Reimplemented from [Fl\\_Table](#).

### 33.140.3.2 handle()

```
int Fl_Table_Row::handle (
 int e) [protected], [virtual]
```

Handle FLTK events.

Reimplemented from [Fl\\_Table](#).

### 33.140.3.3 row\_selected()

```
int Fl_Table_Row::row_selected (
 int row)
```

Checks to see if 'row' is selected.

Returns 1 if selected, 0 if not. You can change the selection of a row by clicking on it, or by using `select_row(row, flag)`

### 33.140.3.4 rows()

```
void Fl_Table_Row::rows (
 int val) [virtual]
```

Sets the number of rows in the table, and the table is redrawn.

Reimplemented from [Fl\\_Table](#).

### 33.140.3.5 select\_all\_rows()

```
void Fl_Table_Row::select_all_rows (
 int flag = 1)
```

This convenience function changes the selection state for *all* rows based on 'flag'.  
0=deselect, 1=select, 2=toggle existing state.

### 33.140.3.6 select\_row()

```
int Fl_Table_Row::select_row (
 int row,
 int flag = 1)
```

Changes the selection state for 'row', depending on the value of 'flag'.  
0=deselected, 1=select, 2=toggle existing state.

### 33.140.3.7 type()

```
void Fl_Table_Row::type (
 TableRowSelectMode val)
```

Sets the table selection mode.

- `Fl_Table_Row::SELECT_NONE` - No selection allowed
- `Fl_Table_Row::SELECT_SINGLE` - Only single rows can be selected

- `Fl_Table_Row::SELECT_MULTI` - Multiple rows can be selected

The documentation for this class was generated from the following files:

- `Fl_Table_Row.H`
- `Fl_Table_Row.cxx`

### 33.141 Fl\_Tabs Class Reference

The `Fl_Tabs` widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

```
#include <Fl_Tabs.H>
```

Inheritance diagram for `Fl_Tabs`:

#### Public Types

- enum { `OVERFLOW_COMPRESS` = 0, `OVERFLOW_CLIP`, `OVERFLOW_PULLDOWN`, `OVERFLOW_DRAG` }

#### Public Member Functions

- void `client_area` (int &rx, int &ry, int &rw, int &rh, int tabh=0)  
*Returns the position and size available to be used by its children.*
- `Fl_Tabs` (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new `Fl_Tabs` widget using the given position, size, and label string.*
- int `handle` (int) `FL_OVERRIDE`  
*Handle all events in the tabs area and forward the rest to the selected child.*
- void `handle_overflow` (int ov)  
*Set a method to handle an overflowing tab bar.*
- `Fl_Widget *` `push` () const  
*Returns the tab group for the tab the user has currently down-clicked on and remains over until `FL_RELEASE`.*
- int `push` (`Fl_Widget *`)  
*This is called by the tab widget's `handle()` method to set the tab group widget the user last `FL_PUSH`'ed on.*
- void `resize` (int, int, int, int) `FL_OVERRIDE`  
*Make sure that we redraw all tabs when the widget size changes.*
- void `show` () `FL_OVERRIDE`  
*Ensure proper placement of selected tab.*
- `Fl_Align` `tab_align` () const  
*Gets the tab label alignment.*
- void `tab_align` (`Fl_Align` a)  
*Sets the tab label alignment.*
- `Fl_Widget *` `value` ()  
*Gets the currently visible widget/tab.*
- int `value` (`Fl_Widget *`)  
*Sets the widget to become the current visible widget/tab.*

- virtual [Fl\\_Widget](#) \* [which](#) (int event\_x, int event\_y)  
*Return a pointer to the child widget with a tab at the given coordinates.*
- ~[Fl\\_Tabs](#) () [FL\\_OVERRIDE](#)  
*Delete allocated resources and destroy all children.*

## Protected Member Functions

- void [check\\_overflow\\_menu](#) ()  
*Check if the tabs overflow and sets the `has_overflow_menu` flag accordingly.*
- virtual void [clear\\_tab\\_positions](#) ()  
*Clear internal array of tab positions and widths.*
- void [draw](#) () [FL\\_OVERRIDE](#)  
*Draw the tabs area, the optional pulldown button, and all children.*
- void [draw\\_overflow\\_menu\\_button](#) ()  
*Draw square button-like graphics with a down arrow in the top or bottom right corner.*
- virtual void [draw\\_tab](#) (int x1, int x2, int W, int H, [Fl\\_Widget](#) \*o, int flags, int sel)  
*Draw a tab in the top or bottom tabs area.*
- void [handle\\_overflow\\_menu](#) ()  
*This is called when the user clicks the overflow pulldown menu button.*
- virtual int [hit\\_close](#) ([Fl\\_Widget](#) \*o, int event\_x, int event\_y)  
*Check whether the coordinates fall within the "close" button area of the tab.*
- virtual int [hit\\_overflow\\_menu](#) (int event\_x, int event\_y)  
*Determine if the coordinates are in the area of the overflow menu button.*
- virtual int [hit\\_tabs\\_area](#) (int event\_x, int event\_y)  
*Determine if the coordinates are within the tabs area.*
- int [maybe\\_do\\_callback](#) ([Fl\\_Widget](#) \*o)  
*Set tab o as selected and call callbacks if needed.*
- int [on\\_insert](#) ([Fl\\_Widget](#) \*, int) [FL\\_OVERRIDE](#)  
*Make sure that we redraw all tabs when new children are added.*
- int [on\\_move](#) (int, int) [FL\\_OVERRIDE](#)  
*Make sure that we redraw all tabs when children are moved.*
- void [on\\_remove](#) (int) [FL\\_OVERRIDE](#)  
*Make sure that we redraw all tabs when new children are removed.*
- virtual void [redraw\\_tabs](#) ()  
*Redraw all tabs (and only the tabs).*
- virtual int [tab\\_height](#) ()  
*Return space (height) in pixels usable for tabs.*
- virtual int [tab\\_positions](#) ()  
*Calculate tab positions and widths.*
- void [take\\_focus](#) ([Fl\\_Widget](#) \*o)  
*Take keyboard focus if o is not NULL.*

## Protected Attributes

- int [has\\_overflow\\_menu](#)  
*set in `OVERFLOW_PULLDOWN` mode if tabs overflow. The actual menu array is created only on demand*
- int [overflow\\_type](#)
- [Fl\\_Align](#) [tab\\_align\\_](#)  
*tab label alignment*
- int [tab\\_count](#)  
*Array size of tab positions etc.*
- int \* [tab\\_flags](#)

- `int tab_offset`  
*Array of tab flag of tabs per child.*  
*for pulldown and drag overflow, this is the horizontal offset when the tabs bar is dragged by the user*
- `int * tab_pos`  
*Array of x-offsets of tabs per child + 1.*
- `int * tab_width`  
*Array of widths of tabs per child.*

## Additional Inherited Members

### 33.141.1 Detailed Description

The `Fl_Tabs` widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

The user can select a tab by clicking on it, and the corresponding child widget will be displayed. The `Fl_Tabs` widget is useful for organizing a large number of controls or other widgets into a compact space, allowing the user to switch between different sets of controls as needed.

Figure 33.50 `Fl_Tabs`

Clicking the tab makes a child `visible()` by calling `show()` on it, and all other children are made invisible by calling `hide()` on them. Usually the children are `Fl_Group` widgets containing several widgets themselves.

Each child makes a card, and its `label()` is printed on the card tab, including the label font and style. The selection color of that child is used to color the tab, while the color of the child determines the background color of the pane. '&' in labels are used to prefix a shortcut that is drawn underlined and that activates the corresponding tab; repeated '&&' avoids that.

The size of the tabs is controlled by the bounding box of the children (there should be some space between the children and the edge of the `Fl_Tabs`), and the tabs may be placed "inverted" on the bottom - this is determined by which gap is larger. It is easiest to lay this out in FLUID, using the FLUID browser to select each child group and resize them until the tabs look the way you want them to.

The background area behind and to the right of the tabs is "transparent", exposing the background detail of the parent. The value of `Fl_Tabs::box()` does not affect this area. So if `Fl_Tabs` is resized by itself without the parent, force the appropriate parent (visible behind the tabs) to `redraw()` to prevent artifacts.

See "Resizing Caveats" below on how to keep tab heights constant. See "Callback's Use Of `when()`" on how to control the details of how clicks invoke the `callback()`.

A typical use of the `Fl_Tabs` widget:

```
// Typical use of Fl_Tabs
Fl_Tabs *tabs = new Fl_Tabs(10,10,300,200);
{
 Fl_Group *grp1 = new Fl_Group(20,30,280,170,"Tab1");
 {
 ..widgets that go in tab#1..
 }
 grp1->end();
 Fl_Group *grp2 = new Fl_Group(20,30,280,170,"Tab2");
 {
```

```

 ..widgets that go in tab#2..
 }
 grp2->end();
}
tabs->end();

```

### Default Appearance

The appearance of each "tab" is taken from the [label\(\)](#) and [color\(\)](#) of the child group corresponding to that "tab" and panel. Where the "tabs" appear depends on the position and size of the child groups that make up the panels within the [Fl\\_Tabs](#) widget, i.e. whether there is more space above or below them. The height of the "tabs" depends on how much free space is available.

Figure 33.51 Fl\_Tabs Default Appearance
