

Community-Driven Low-Power Wide Area Networking

<http://www.openchirp.io>

Low-Power Wide Area Networking (LP-WAN)

- IoT is ready to leave the building...
- Wide area low data-rate and low-power IoT City Networks
- Transmitters can send a few bytes per second over kilometers
- Sub 1GHz support deeper building penetration

Existing Technologies

- NarrowBand IoT (3G cellular IoT channel)
- SIGFOX
- LoRaWAN (open standard)

Challenges

- User / Service / Device Management
- Network Management
- Data Representation and Sharing
- Plugging in Analytics
- Security & Privacy

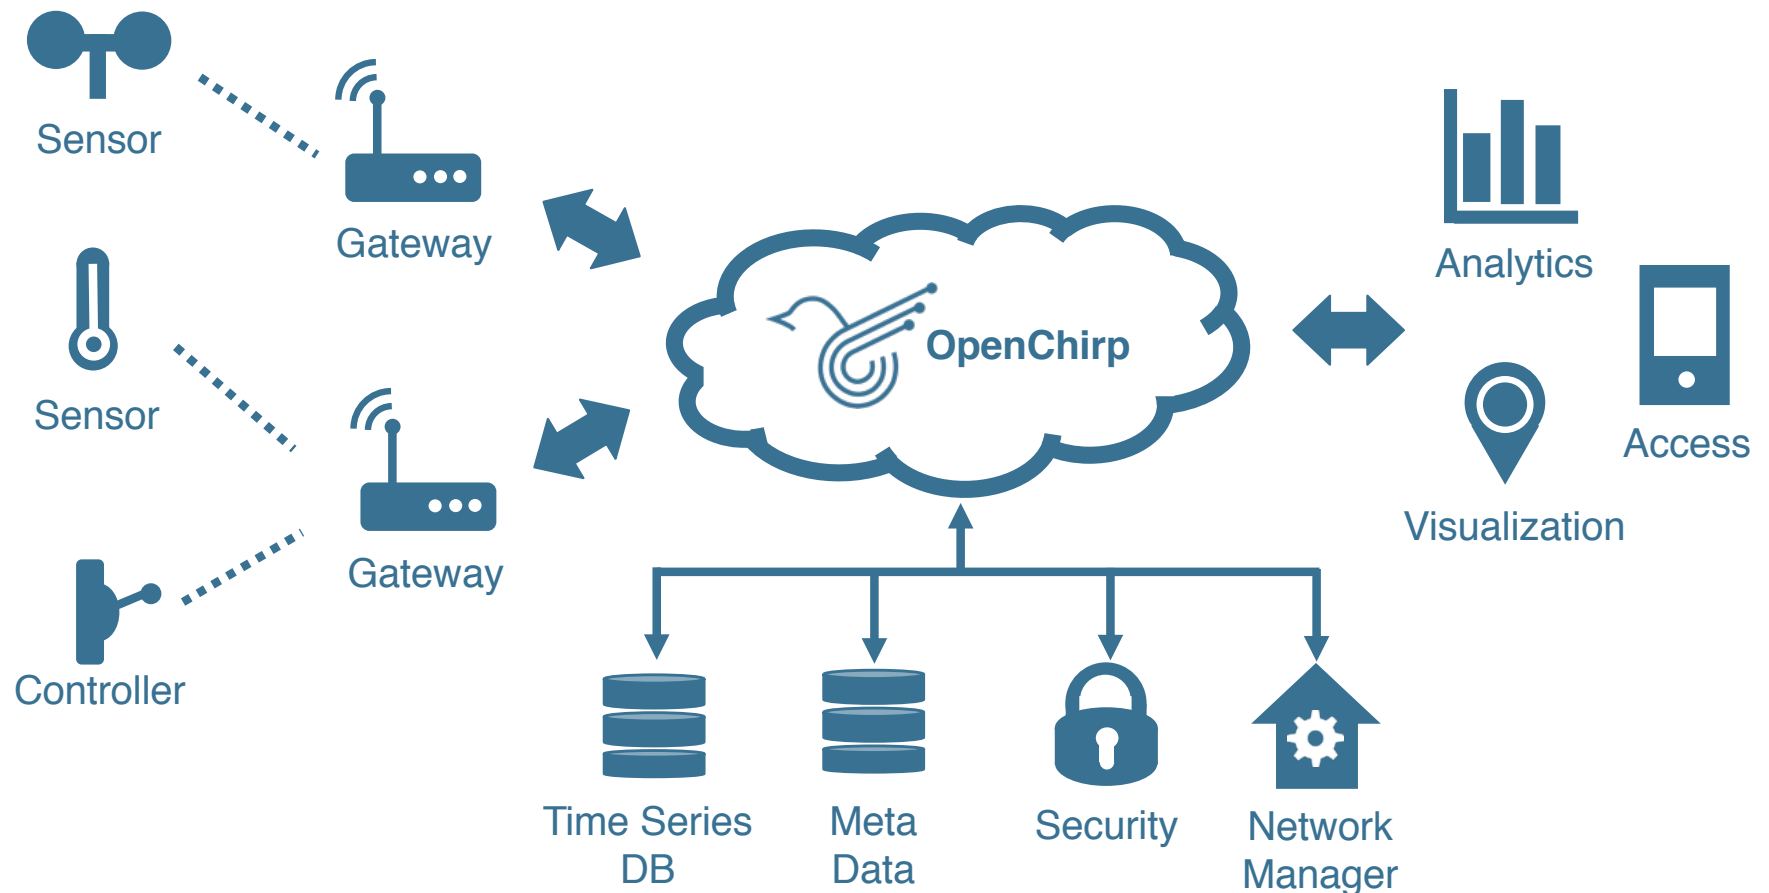

NB-IoT

What is OpenChirp?

- Management Platform for LP-WAN Networks
- Web Portal for sharing and managing data sources
- Provides Data context, storage, visualization
- Developer API and tools

OpenChirp Concept

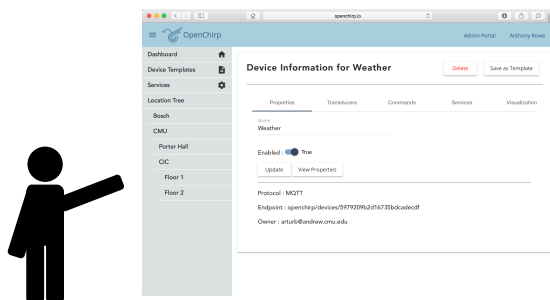

Step 1: Login using Google ID

Step 2: Grab a LoRa Device

Step 3: Configure Devices

Step 4: Register on Web Portal

Step 5: Manage Devices

Sounds easy, but there is a lot that needs to be done under the hood...

OpenChirp Features

ProtoBuf serialization
from end-device to cloud

MQTT for scalable real-
time publish subscribe

Bring your own gateway
to crowd-source coverage

REST interface for
configuration and
management

Open-Source Technologies

- Scalable PubSub Architecture (MQTT)
- Time Series Datastore (InfluxDB)
- Data Visualization and Analytics (Grafana)
- REST Interface (node.js)
- Authentication (OAuth2 integrated with Google)
- Meta Data storage and search (MongoDB)

Energy-Efficient
Reference Firmware

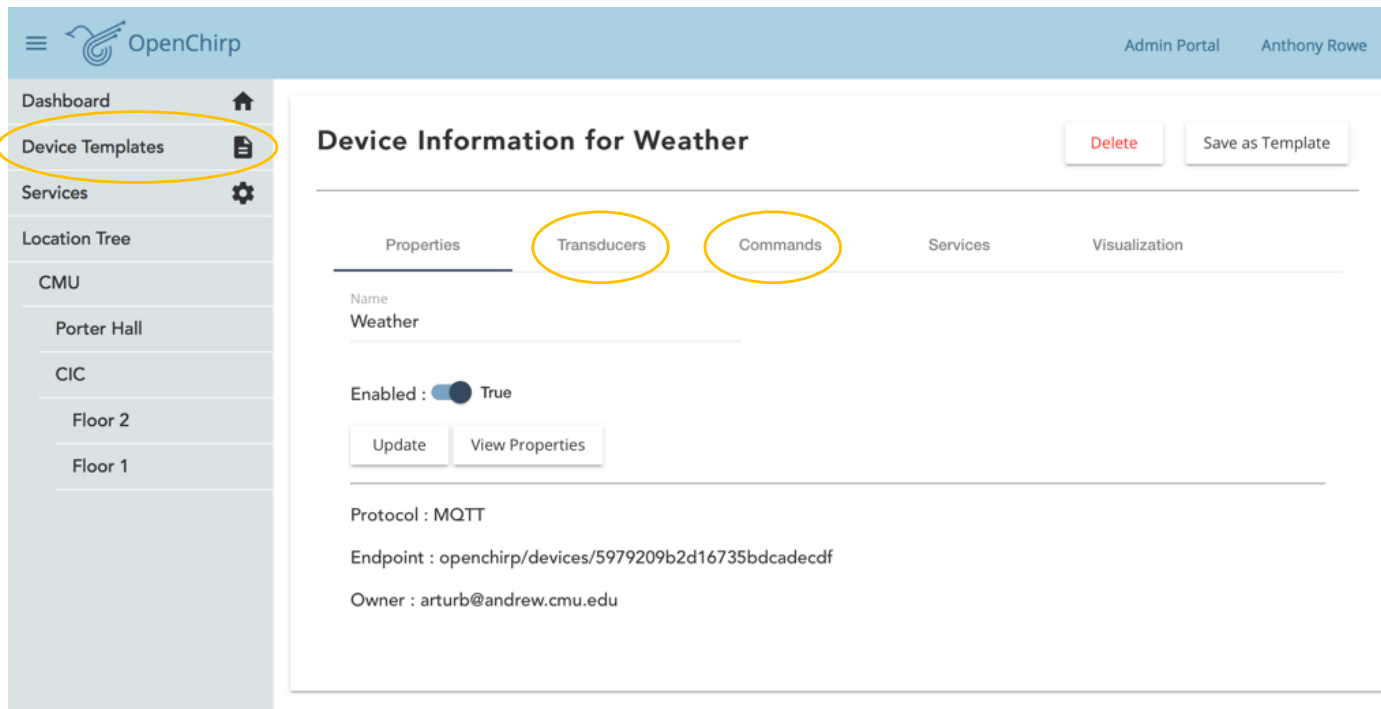

Intelligent Network
Management

Devices

- **Transducers**
 - Sensor / Actuator Name, Unit, Value, Timestamp
- **Commands**
 - Shortcut for writing a value to a transducer
 - Captures typical "actuate" requests
 - Shareable links
- **Device Templates**
 - Package of common transducers / commands with services

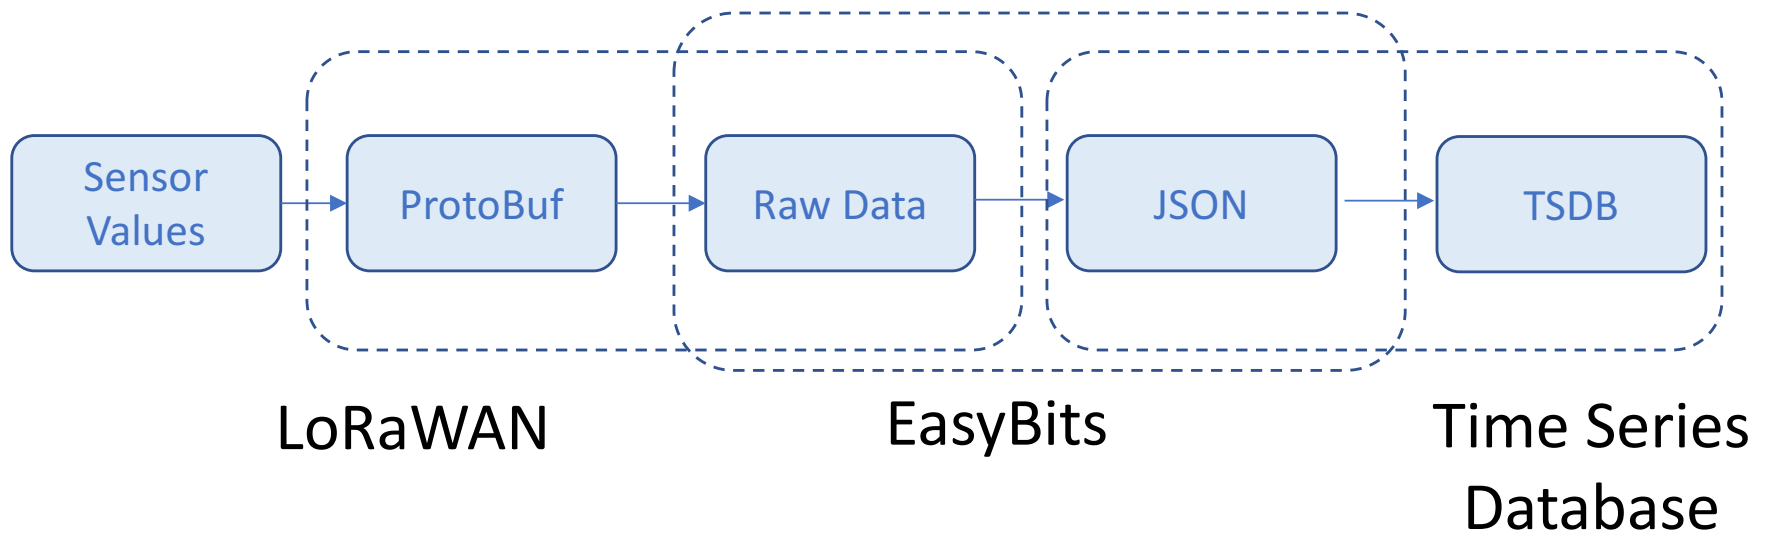

The screenshot displays the OpenChirp Admin Portal interface. The top navigation bar includes the OpenChirp logo, a hamburger menu, and the user's name 'Anthony Rowe' in the 'Admin Portal' section. The left sidebar contains a navigation menu with items: Dashboard, Device Templates (highlighted with a yellow circle), Services, Location Tree, CMU, Porter Hall, CIC, Floor 2, and Floor 1. The main content area is titled 'Device Information for Weather' and features a 'Delete' button and a 'Save as Template' button. Below the title is a tabbed interface with five tabs: Properties, Transducers (highlighted with a yellow circle), Commands (highlighted with a yellow circle), Services, and Visualization. The 'Transducers' tab is active, showing the following details for the 'Weather' device: Name: Weather, Enabled: True, and buttons for 'Update' and 'View Properties'. Below the tabs, the device configuration is shown: Protocol: MQTT, Endpoint: openchirp/devices/5979209b2d16735bdcadecdf, and Owner: arturb@andrew.cmu.edu.

Services

- Plug-ins for processing data
 - “Stackable” setup a processing pipeline

Example Services

- **Time series data store**
 - Store data in a TSDB like influx
- **LoRaWAN device**
 - Link a device with a LoRaWAN end-point
- **LoRaWAN gateway**
 - Link a gateway with a LoRaWAN server
- **EasyBits**
 - Link a binary stream to Transducers
- **Trigger**
 - Push a URL on a data event

Security

- **Authentication**

- Login with google ID for Authentication (OAuth2)

- **“Thing” Credentials**

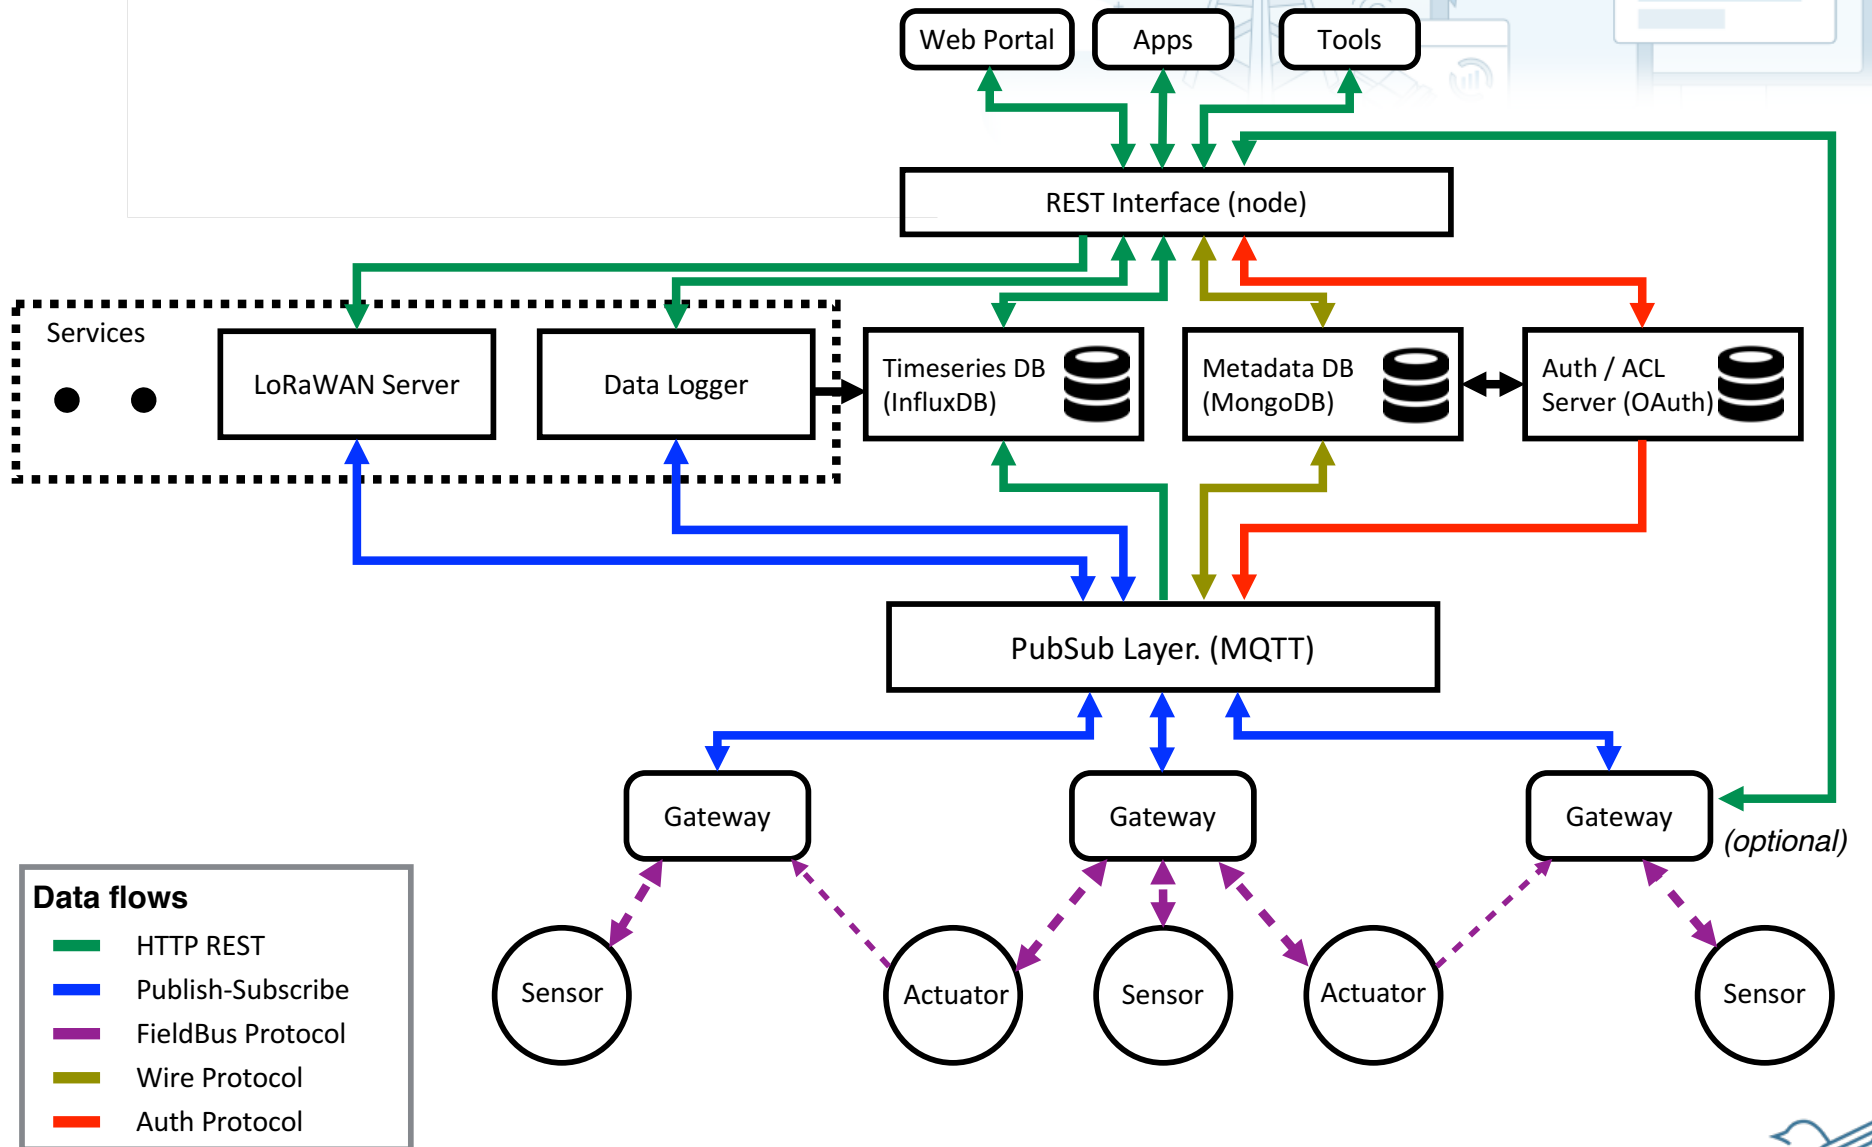

- Tokens for users, devices and services
- Limited domains

- **Access Control**

- Users / Groups
- Public Links

OpenChirp Architecture

Pilot Deployments

1- λ separated 5.5dBi 902MHz ~ 928MHz

Rooftop Gateway

CMU LoRa Gateway

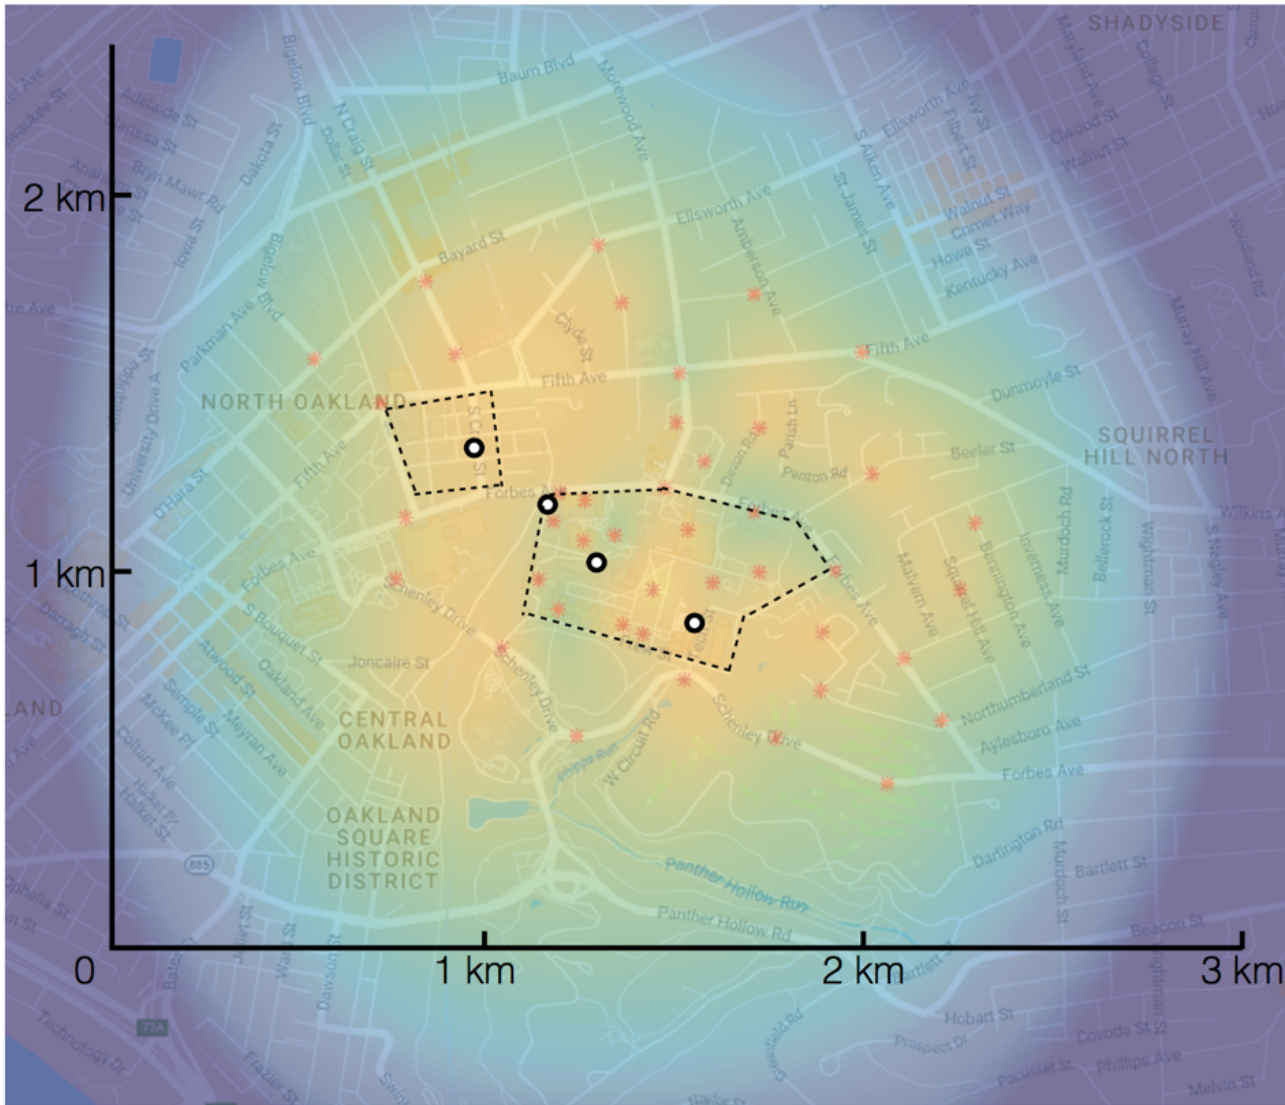

PoE GPS RPi 3 SDR MultiTech AP2 (x8) 32-Chan Concentrator (x2)

stackable

Campus Coverage

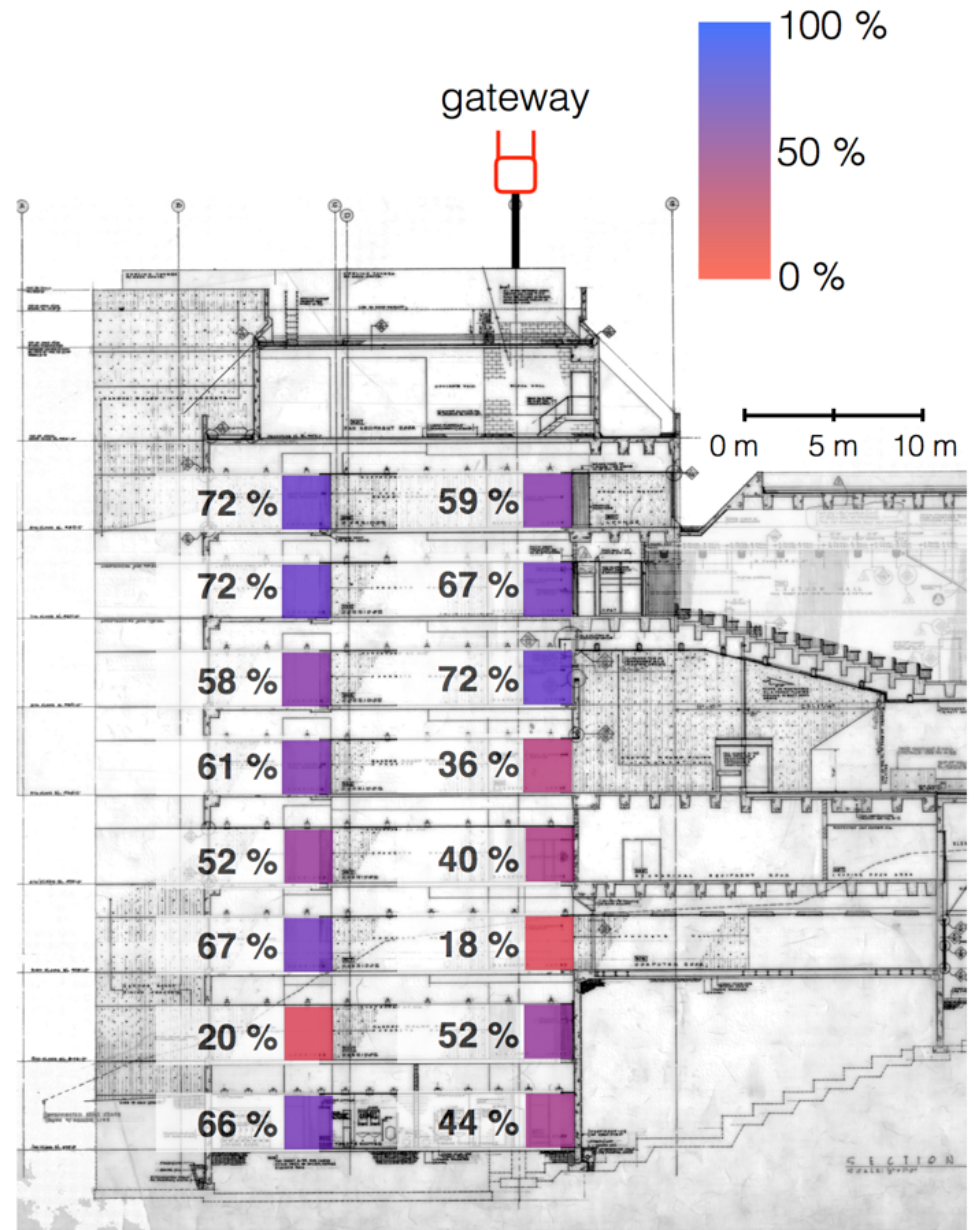

Gateway RSSI

- Gateway
- ★ Sampling point
- ⋯ Campus regions

Building Penetration

9 Floor poured concrete building

LoRa Devices on Campus

- LoRaBug
 - Open environmental sensor
 - Monitors environment in remote indoor areas

- Laser Ranger
 - Time-of-flight laser ranger
 - Monitors structural deflection over time

- Occupancy Sensing
 - Measure people traffic across spaces

- Water Heater Controller
 - Demand-Response peak shifting

LoRaBug – Sensing Platform

**TI CC2650 ARM M3
BLE + 802.15.4**

**General Purpose
Sensor Header**

Sensor Board: Light, Temperature, Accelerometer, Magnetometer, Rate Gyro, Humidity, LEL, Water Contact, Pressure, Audio, PIR motion, 8x8 FLIR imager

5 years @ 15 min

**SX1276
LoRa Radio**

USB

Laser Monitoring

Range: 150m
Resolution: 1mm
Accuracy: 2mm
Lifetime: 5 years @ 15min

Bridge Monitoring Example

Campus Occupancy Sensing

Door Frame Sensor

GridBallast – Water Heaters

Electric Water Heater Controller

- Learns Grid load profile (Voltage Frequency / ADR)
- Learns User Patterns
- Platform for Demand Response Algorithms

Research Thrusts

- Network Management
 - Automatic configuration with Bring Your Own Gateway model
 - Mix of Towers (Macro-cell) and Home APs (Micro-cell)
 - Decoupling Data / Control Plan to create “OpenFlow” of LP-WAN
 - Security
- Whitespace Offloading
 - Integrate our framework with FCC database for WS registration
 - Dual-mode MAC layer
- Localization
 - Collaborative localization with APs and Peers
 - Improved performance based on RF-modeling and geometry constraints
- Application Drivers
 - Campus sensing
 - Energy-efficient client support

Thanks, Questions?
