

# Tribler-lab

14 years of “ledger” experience

Dr. Johan Pouwelse  
associate professor  
Founder blockchain-lab.org  
j.a.pouwelse@tudelft.nl

# Tribler-lab

*Why:* monopolisation of the digital economy

*How:* craft public critical digital infrastructure

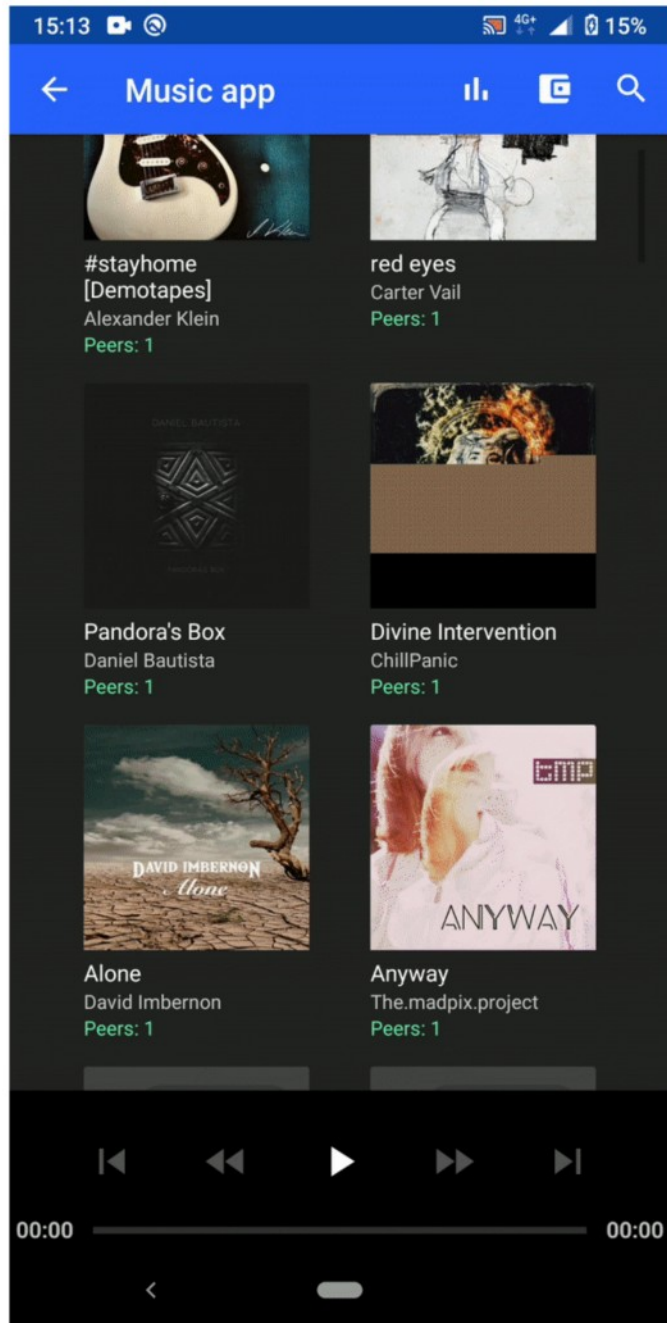

*What:* blockchain-based self re-enforcing trust

**Lesson for today:**

**Blockchain Engineering is being 95% less productive  
(or cheat with central servers)**

# Outline

- Centralisation of economy and Big Tech
- Blockchain 1.0 (Cryptocurrency)  **bitcoin**
- Blockchain 2.0 (Smart contracts)  **ethereum**
- *Blockchain 3.0 (TrustChain) ? ? ?*  **Tribler**
  - *TU Delft 2007 distributed ledger*
  - *Trustchain*

# Key example for today

# What is the 2<sup>nd</sup> music platform?

## Music streaming subscribers 2020

App	Subscribers
Spotify	165 million
Apple Music	88 million
Amazon Music	70 million
YouTube Premium	50 million
Deezer	7 million
Pandora	6 million
Tidal	3 million

# Concentration in manufacturing

Number and Percentage of U.S. Manufacturing Industries in which Largest Four Companies Accounted for at Least 50 Percent of Shipment Value in Their Industries, 1947-2007

"Monopoly and Competition in Twenty-First Century Capitalism",

# 2007: TUDelft & Harvard: bandwidth-as-a-currency

The screenshot shows the BBC News website in a Mozilla Firefox browser window. The browser's address bar displays the URL `http://news.bbc.co.uk/2/hi/technology/`. The page features a navigation menu with links for Home, News, Sport, Radio, TV, Weather, and Languages. A search bar is located in the top right corner. The main content area is titled "Technology" and includes a sub-header "Last Updated: Saturday, 1 September 2007, 09:48 GMT 10:48 UK". The primary article is "File-sharers forced to play fair", which discusses researchers' efforts to make file-sharing fairer by treating bandwidth as a currency. Other articles mentioned include "NBC ends iTunes deal in price row" and "German spyware plans trigger row". A sidebar on the left lists various news front pages, and a right sidebar contains "OTHER TOP STORIES" and "FROM THE BLOGOSPHERE".

# Three generations ?

- Blockchain 1.0 (Cryptocurrency)
- Blockchain 2.0 (Smart contracts)
- *Blockchain 3.0 (TrustChain) ? ? ?*

# Blockchain 1.0: Bitcoin

- Proposed in 2007 by Satoshi Nakamoto (pseudonym)
- Your public key is your wallet address
- With the private key, you can sign transactions

# Blockchain 2.0: Ethereum

- Founded in 2014
- Nodes in the network execute **smart contracts**
  - Executed within the Ethereum Virtual Machine
  - Written in the Solidity scripting language
- Ether, the “fuel” of the network
  - Every computing step that transforms the state consumes some ether

ethereum

# Example of a smart contract

```
contract MyToken {
    /* This creates an array with all balances */
    mapping (address => uint256) public balanceOf;

    /* Initializes contract with initial supply tokens to the creator of the contract */
    function MyToken(
        uint256 initialSupply
    ) {
        balanceOf[msg.sender] = initialSupply;           // Give the creator all initial tokens
    }

    /* Send coins */
    function transfer(address _to, uint256 _value) {
        if (balanceOf[msg.sender] < _value) throw;       // Check if the sender has enough
        if (balanceOf[_to] + _value < balanceOf[_to]) throw; // Check for overflows
        balanceOf[msg.sender] -= _value;                 // Subtract from the sender
        balanceOf[_to] += _value;                         // Add the same to the recipient
    }
}
```

OPINION | [TECH](#)

# Smart Contracts Are Still Way Too Dumb

They've proven good mainly at helping people lose money.

By [Elaine Ou](#)

# Bartercast: early distributed ledger (2007)

- ledger for bandwidth exchanges
  - Uploaded and downloaded bytes
  - Unbounded scalability
  - Incentive compatible
  - Has no global consensus
  - Insecure: free to lie
- Solve freeriding, superior to T4T
- 2007: initial Bartercast deployment

**rely on voluntary reports**

# Bartercast: Information Exchange

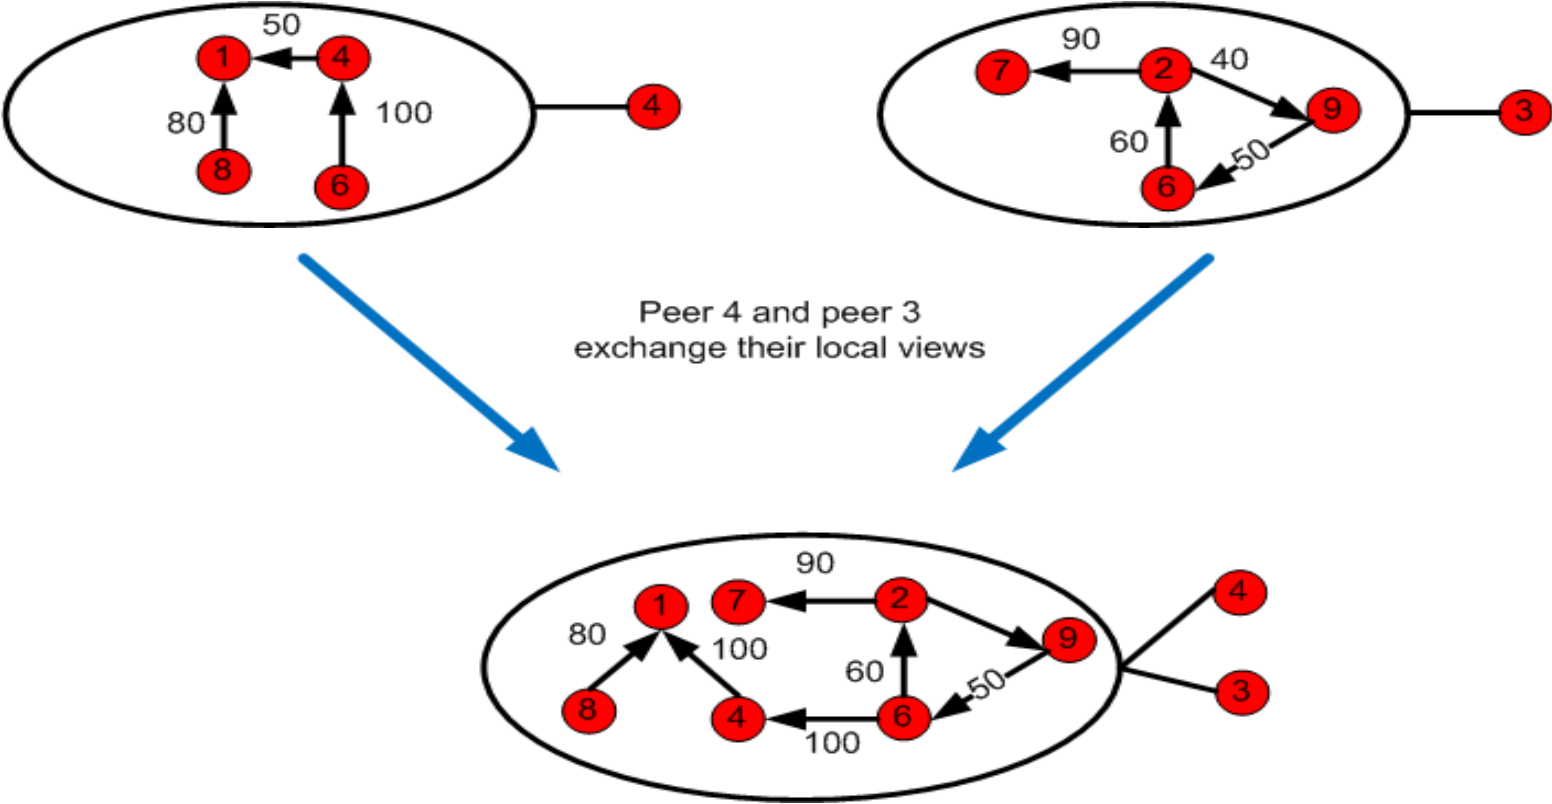

# Bartercast: Information Exchange

# Bartercast: Information Exchange

# Bartercast: Internet-deployment

# Trustchain (2012)

# Transaction

- Consider a transaction between two users
- Both users sign the transaction
  - Using any secure signing algorithm

# Transaction Chaining

- We can chain these transactions together
- Each user keeps track of his own transaction history

# Improving Security

- We add an additional pointer to each block
  - Points towards a block in the chain of the transaction counterparty

# Chaining transactions

Tx units:

- TorCoin (Lira, GoldStar, Par..)
- BittorrentSeeding
- Bandwidth credits

Tx = A gives 10 units

Tx = A takes 35 units

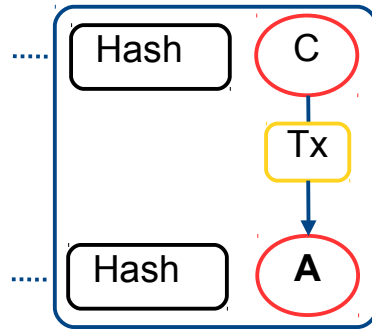

Tx = A gives 25 units

# Ledger counting

**Tx** = A gives 10 units

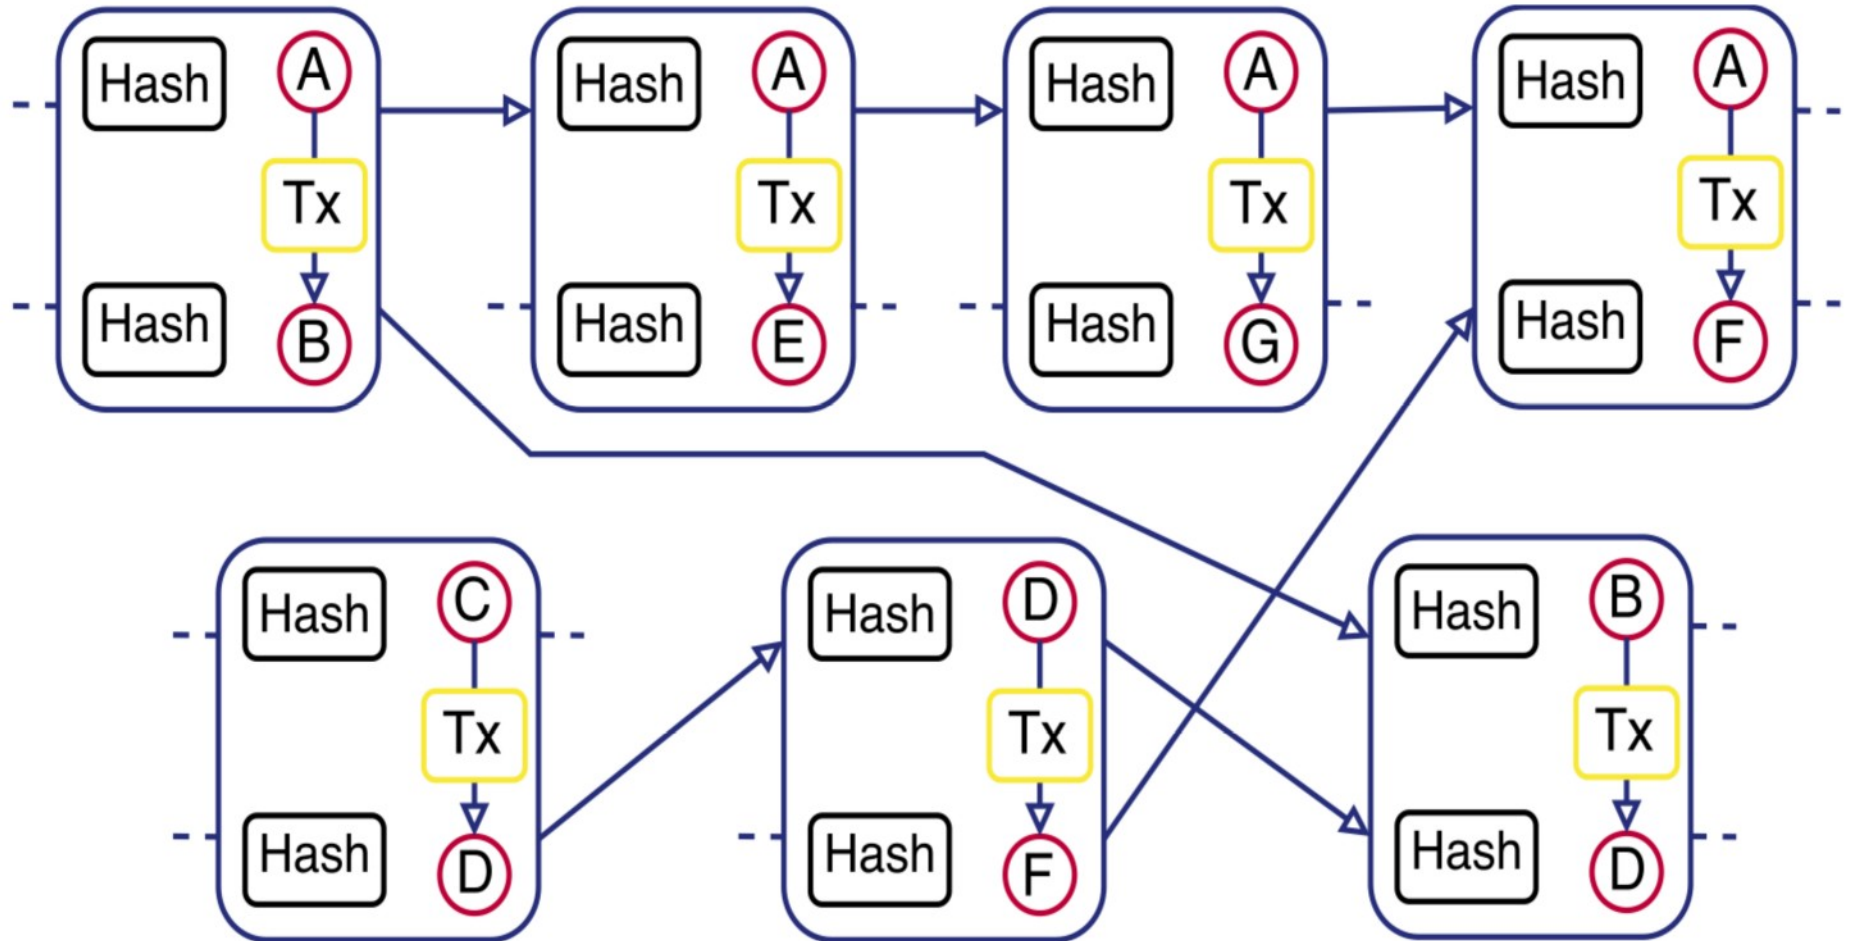

**Tx** = A takes 35 units

**Tx** = A gives 25 units

$$\text{Tx} + \text{Tx} + \text{Tx} = 10 + -35 + 25 = 0 \text{ units}$$

# Critical infrastructure with self-governance

## scientific challenge: foundations of trust

**Outcome:** fully autonomous economic entities,  
independent of creator, only temporary leaders,  
no dependence on any single machine

*New class of distributed systems: nobody owns them*

## Load TrustChain overlay

First, we initialize IPv8 in a similar way as described in the [overlay tutorial](#).

`TrustChainCommunity.Factory` requires two compulsory arguments: `TrustChainSettings` defining protocol parameters, and the persistence storage implementing `TrustChainStore` interface. The following snippet can be used to configure the overlay with the default settings and the SQLite store implementation:

```
val settings = TrustChainSettings()
val driver = AndroidSqliteDriver(Database.Schema, this, "trustchain.db")
val store = TrustChainSQLiteStore(Database(driver))
val randomWalk = RandomWalk.Factory()
val trustChainCommunity = OverlayConfiguration(
    TrustChainCommunity.Factory(settings, store),
    listOf(randomWalk)
)
```

As previously, the `OverlayConfiguration` should be passed to `TrustChainSettings` which is subsequently used to

## Thesis: replace music industry with open source code, including the investment part.

Wealth has accumulated with a select few: the investing class. The rest of the world belongs to the worker class. Digital technology is breaking the monopoly on investing. We prove the viability of our ideas with an Internet-deployment focused on an industry that operates purely digitally and has deep rooted monopolistic culture: the music industry.

Prior work: [Tribler/trustchain-superapp#45](#)

Focus: multi-signature transactions [using FROST algorithm](#)

Re-use the existing source code, as inside [this WIP PR](#). See [work by Martijn](#). How functional is this Kotlin code? Missing parts? Could Trustchain+IPv8 help with overlay topology for 1+ million users scalability?

We have Taproot somewhat integrated in Superapp. Taproot.tribler.org documentation `const val REG_TEST_FAUCET_IP = "131.180.27.224"`, the call [itself](#) and [documentation here](#)

Application: the Internet-deployed MusicDAO by Delft students enables music streaming and Bitcoin donations. Future step is to integrate [FROST for enabling collective music investment decisions](#)

Grading and outcome: a *merged* pull request on the Superapp, readme addition to the repo, and some operational code. We do not ask you to solve hard scientific problems within this course, but that you spend 5 x 5 ECTS wisely.

# 2022: decentralised Google

i3		Search
<i>html</i>	<a href="#">Findwise i3 Version 1.2</a> The below list illustrates the components that combined makes up version 1.2 of Findwise i3.	Original score: 3,44 Total nb of clicks: 20 Nb of clicks by dev: 15 Nb of clicks by sales: 5
