

Data visualization course

Laboratory work 6

Gephi for Graphs Visualization

To download Gephi, go to <https://gephi.org>, and then download and install the program by following the instructions for your operating system.

After that, download one of the datasets from the link: <https://github.com/gephi/gephi/wiki/Datasets>.

The dataset number depends on the number of the student in the list. Check it out below. The example in this document will be on the "Les Miserables" dataset.

Unzip the downloaded archive and open your dataset in Gephi using File → Open.

A window will appear on the screen containing a report on the results of the import (Figure 1). In this window, it is important to specify the graph type (in our case – unoriented). Then click "OK".

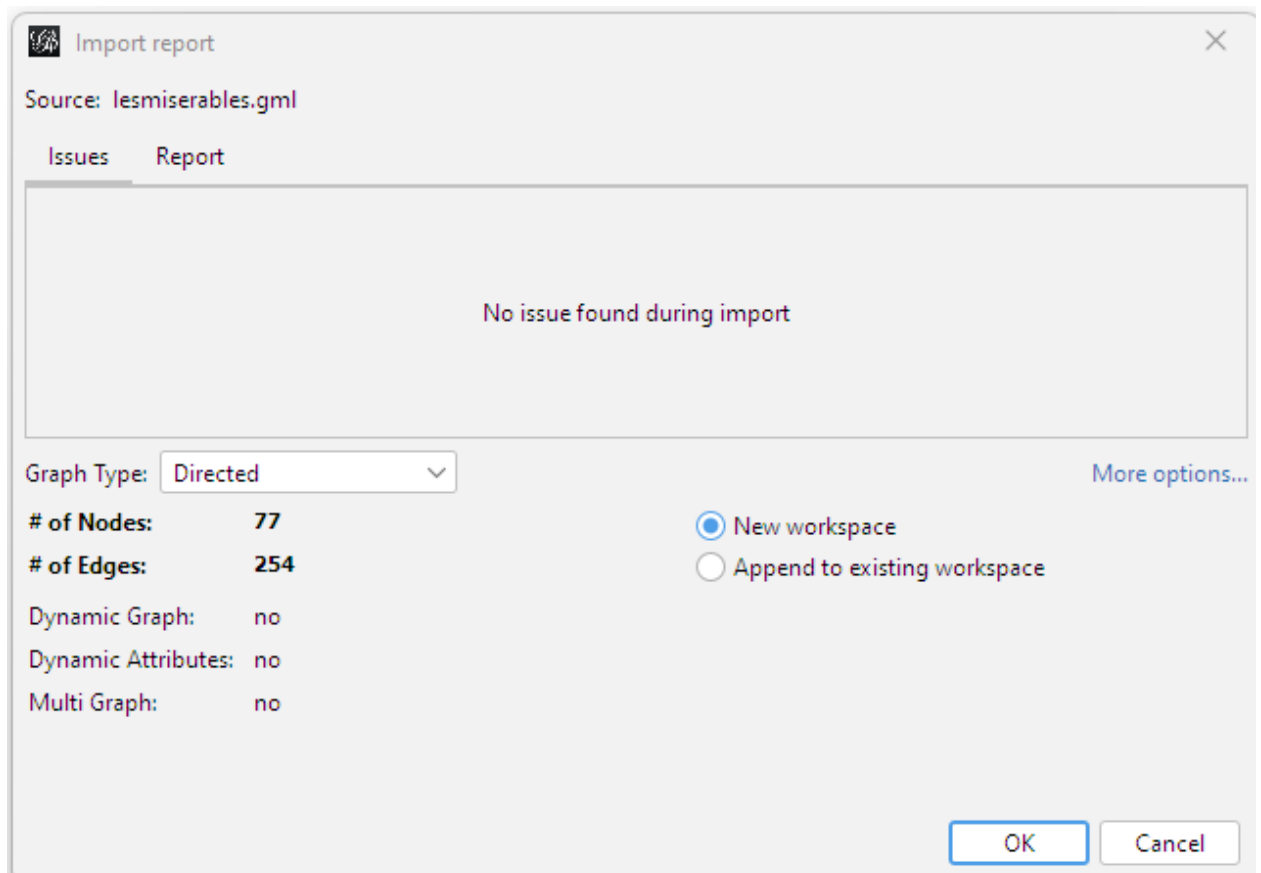

Figure 1 – Import Results Report

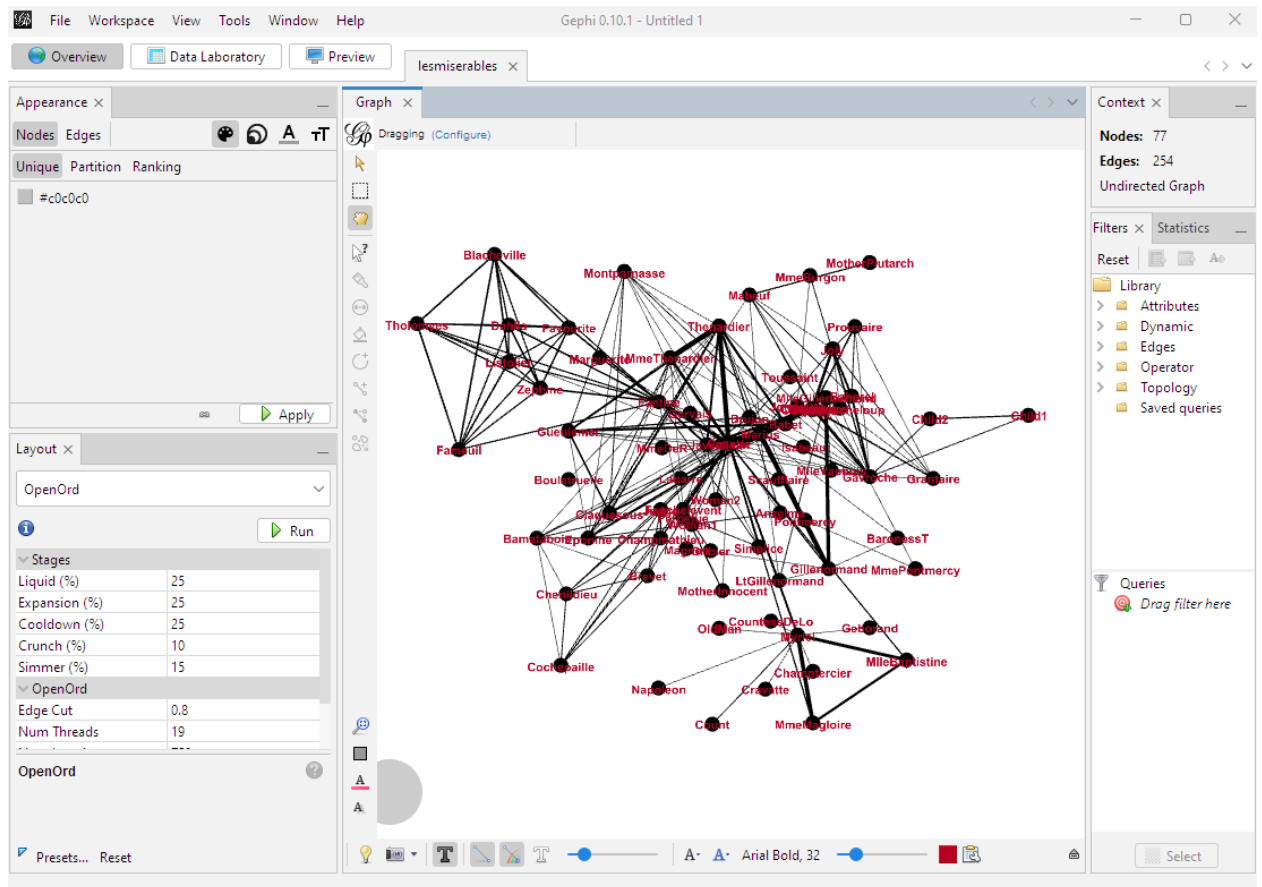

Figure 3 – Results of plotting the graph using the OpenOrd method (node labels are colored red)

To understand the state of the graph's average path length, click the Network Diameter button on the right in the statistics tab. Clicking will bring up a pop-up window like the one shown in Fig. 4, where the average path length of the graph is 2.6411.

Close the pop-up window and activate nodes ranking: Move to Appearance tab on the left, select Nodes distribution, and select node's size option by clicking on an icon next to "Nodes" and "Edges" buttons (3 circles). Then move to the Ranking section, and select "Degree" from the drop-out menu. Your options should look like on the Figure 5. Then click "Apply".

In the same section, when you click on the palette instead of size icon, you can set the coloring of the nodes. In this example, coloring is chosen depending on the degree (Degree) of the node (Fig. 5).

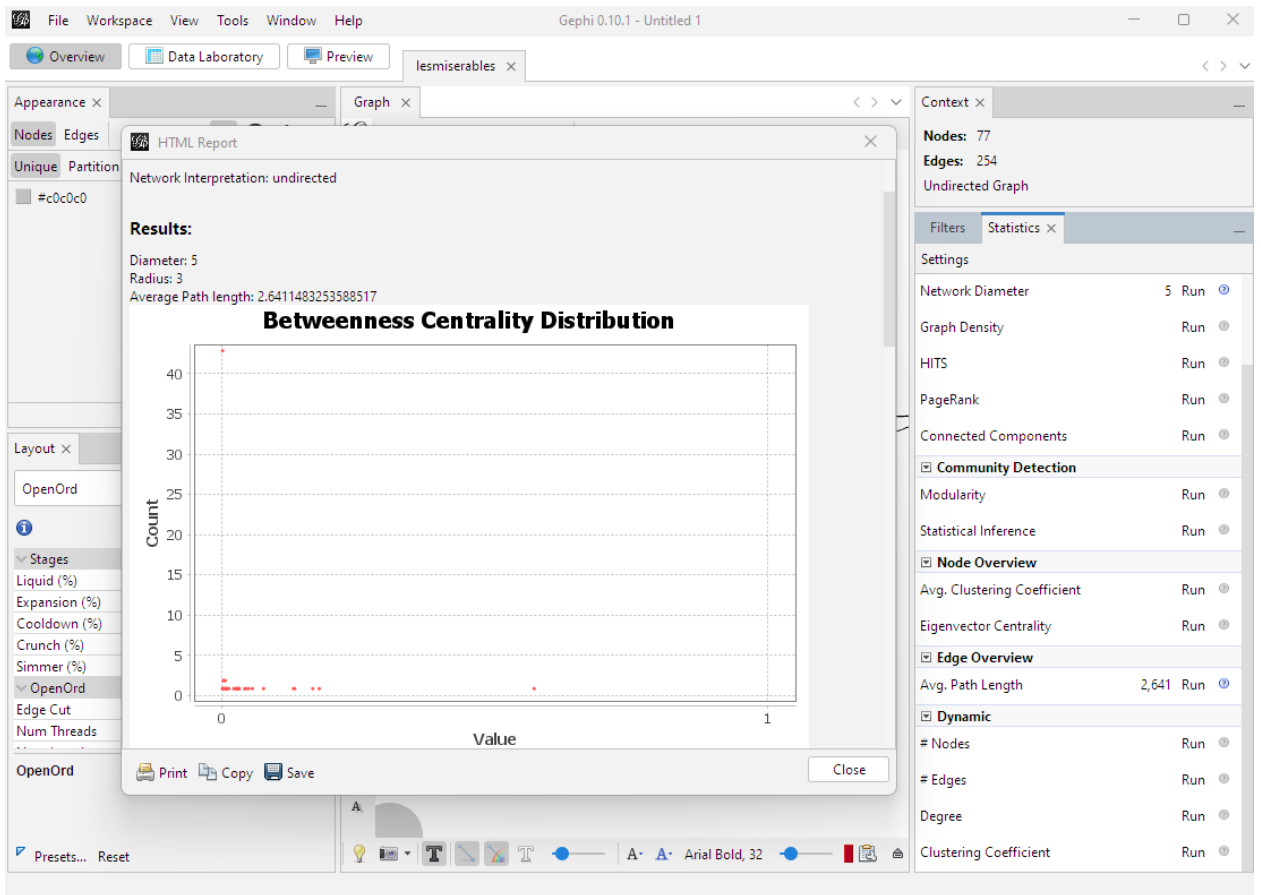

Figure 4 – Graph path length statistics

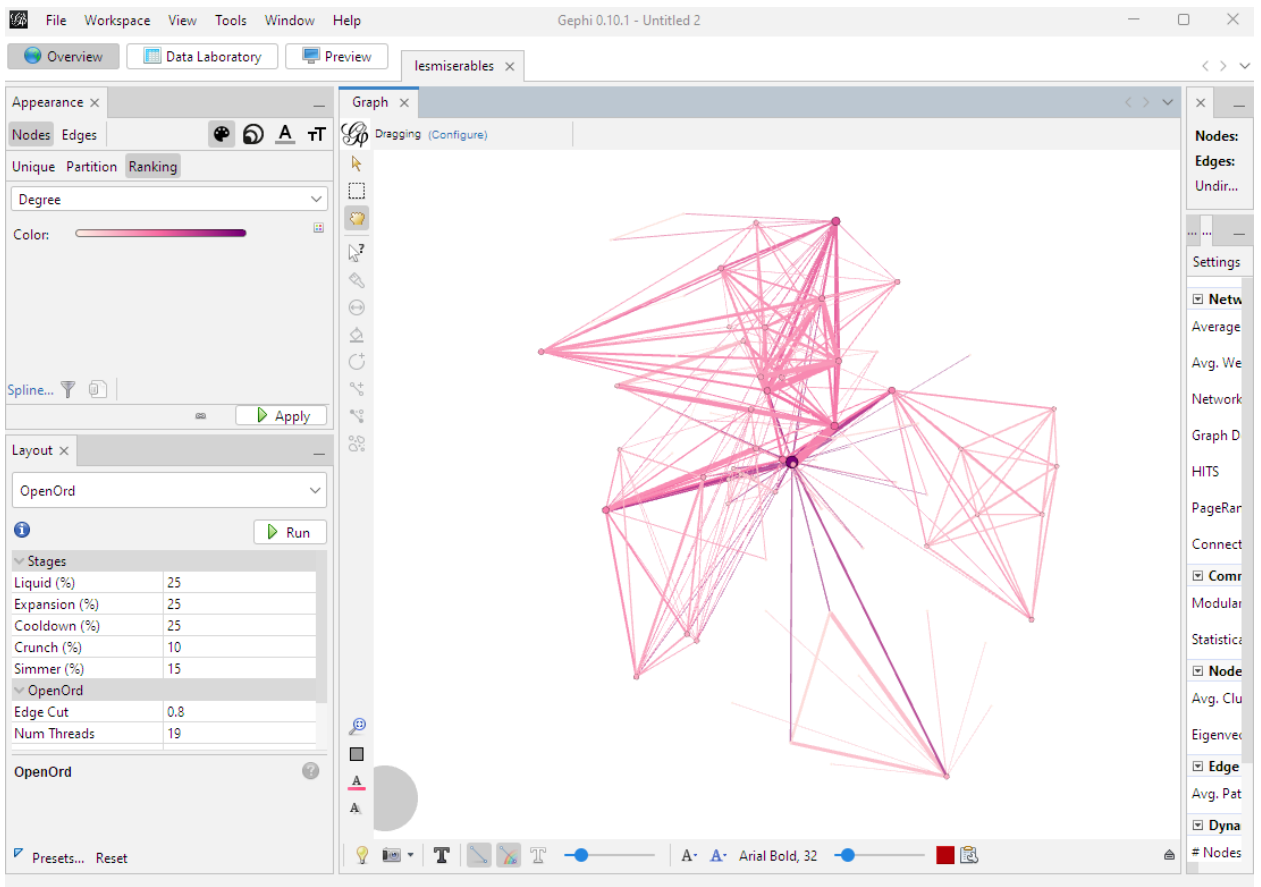

Figure 5 – The result of setting the size and color of the nodes

To prepare the graph for printing, go to the preview panel at the top of the screen. Under the Preview Setting tab, select the Black Background preset from the drop-down menu of presets and click the Refresh button in the lower left corner of the window. To save the rendering result, click on "export svg/pdf/png" in the lower left corner.

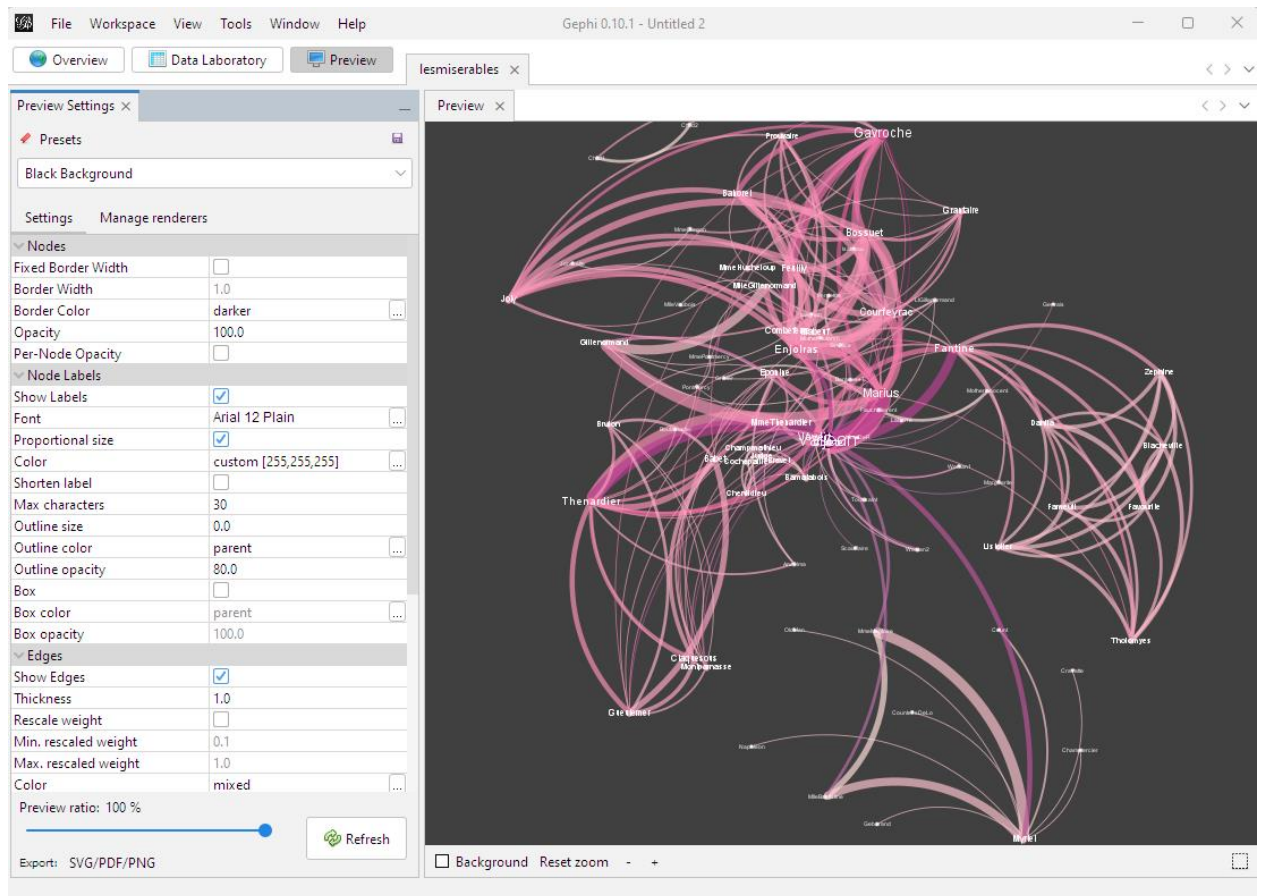

Figure 6 – The graph visualization result

Task

According to the option, visualize the dataset (student number – dataset number) at the link in two ways:

1. Using gephi
2. Using networkx

To open dataset in networkx, you can use:

```
G = nx.read_gml("test.gml")
```

Datasets:

1. Web and Internet: Internet
2. Social networks: Zachary's karate club
3. Social networks: Coauthorships in network science
4. Infrastructure networks: Power grid
5. Word adjacencies
