Population Projection of Cambodia 2013-2023
Based on
Cambodia Inter-Censal Population Survey 2013
and
Cambodia Demographic and Health Survey 2014

Foreword

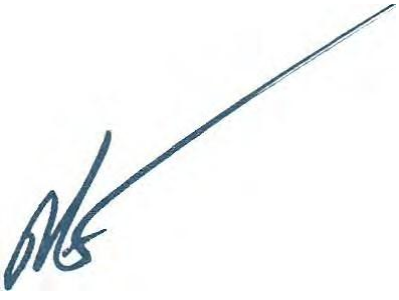
This report presents the "**Population Projections for Cambodia 2013 to 2023**" using results of Cambodia Inter-Censal Population Survey (CIPS) 2013 as well as its Cambodia Demographic and Health Survey (CDHS) 2014 data. The projection exercise was undertaken by the National Institute of Statistics (NIS) in collaboration with World Health Organization (WHO) country office in Cambodia.

The results include population projections of national level and its provincial aggregated by sex five-year age groups and summary of some demographic indicators. The year boundaries for projections is set from 2013 to 2023.

On behalf of the Ministry of Planning, we would like to place on record our gratitude to WHO for their technical and financial support to produce this population projections report. It is appreciated the effort from the principle writer, Mr Sok Kosal, and the technical officials of the National Institute of Statistics, Ministry of Planning was made possible by joint efforts of organizations and individuals, whose participation we would like to acknowledge with gratitude.

Valuable inputs in the form of technical contributions, reviews, suggestions and feedback were received from Dineke Venekamp; and Bophea Suon from Palladium; Momoe Takeuchi; Sheryl Keller; and Mo Mai from WHO/Cambodia.

It is anticipated that the findings from this Population Projections will enhance the understanding and used by the line-ministries, international agencies, non-government organization, policy makers, program implementers, development planners, and researchers a publication with a plethora of useful information. We hope to receive feedback and comments to improve our subsequent publication.



Hang Lina
Delegation of the Royal Government of Cambodia
In-Charge of Director General
National Institute of Statistics

1. Introduction

Population projection is a scientific attempt to peep into the future population conditioned by making certain assumptions, using data relating to the past available at that point of time. Assumptions used and their probability of adhering in future, forms a critical input in this mathematical effort. Predicting the future course of human fertility and mortality is not easy, especially when looking beyond in time as medical and health intervention strategies, food production and its equitable availability, climatic variability, socio-cultural setting, politico economic conditions and a host of other factors influence population dynamics, making it difficult to predict the growth with certainty. Therefore, caution must be exercised while making or using the population projections in the context of various conditions imposed.

The appropriate method to do this is to prepare estimates and projections of population size and structure by age and sex. The starting point for any projections is a reliable age-sex distribution of a population. Furthermore information on recent levels and patterns of fertility, mortality, and migration is needed. The cohort-component method is the most scientific and reliable method of population projections. This procedure simulates population changes as a result of changes in the components of growth: fertility, mortality, and migration. Based on past information, assumptions are made about future trends in these components of change. The assumed rates are applied to the age and sex structure of the population, in a simulation that takes into account that people die according to their sex and age that women have children, and some people change their residence. The cohort-component method of projecting a population follows each cohort of people of the same age and sex throughout their lifetime according to their exposure to fertility, mortality, and migration. This projection carried out for 10-year period; 2013-2023. The key to making meaningful projections lies in the choice of assumptions about future population developments. These assumptions concern possible future birth, death, and migration rates. In general, when preparing multiple assumptions about future levels of fertility, mortality and/or migration, it is advisable to arrive at outcomes that are symmetric.

2. Objective

The purpose of this population projection to fulfill the APW in order to prepare an updated, officially endorsed set of population projections, at national and provincial levels, for the period

2013 – 2023 with age and sex breakdown consistent with the subpopulations of interest to the Ministry of Health (MoH).

3. Methodology

The population projection software used for this projection is the Spectrum System which is a computer package that analyses existing information to determine the future consequences of today's development programs and policies. Spectrum is a Windows-based system of integrated policy models. The integration is based on Demographic Projection (DemProj). The DemProj, is a computer program for making population projections for countries or regions. The program requires information on the number of people by age and sex in the base year, as well as current year data and future assumptions about the Total Fertility Rate (TFR), the age distribution of fertility, life expectancy at birth by sex detail as follows:

♦ **Age and Sex Structure**: The results age and sex structure information from Cambodia Inter Censal Population Survey (CIPS) 2013 have been used to project the size of the future population by age and sex for many years into the future. The results include population projections of national level and its provincial aggregated by sex five-year age groups and summary of some demographic indicators. The projections been predicted from 2013 to 2023.

Table 1: Distribution of Population by Five-Years Age Group and Sex, CIPS 2013

Age Group	SEX		Total
	Male	Female	
0-4	674,274	629,314	1,303,588
5-9	748,334	726,316	1,474,650
0-14	797,569	745,592	1,543,161

80+	47,415	73,657	121,072
Total	**7,121,509**	**7,555,084**	**14,676,593**

Source: CIPS 2013

♦ **Predict Fertility and Mortality**

Mortality change (and fertility change) are processes where new behavior is gradually being adopted by people. It is similar to the processes of a new product penetrating a market. In other words: A **diffusion process**. Diffusion processes are often modeled by a **logistic function**.

The general form of a logistic function can be expressed as

$$P(t)=\frac{k}{1+\exp[-\alpha(t-\beta)]}.$$

k	Saturation level or asymptote of the diffusion process
α	Growth rate of the s-curve
β	Length of time the curve takes to reach the midpoint of the growth trajectory.

For modelling purposes, the logistic function is often simplified, with easier to interpret parameters:

$$P(t)=\frac{k}{1+\exp[-\frac{Ln(81)}{\Delta t}(t-t_m)]}$$

t_m	Midpoint of the growth/diffusion process { $\beta=t_m$ }
Δt	Duration for the growth process to proceed from 10 per cent to 90 per cent of the asymptote (k) { $\Delta t=\frac{\ln(81)}{\alpha}$ }

- **Fertility level**: The TFR of Cambodia have rapid declines in fertility and mortality, as well as substantial internal migration, have occurred since 2008, as demonstrated by the results of the Cambodian Demographic and Health Surveys (CDHS) 2010 and 2014 and the results of the NIS's Cambodian Inter-Censal Population Survey (CIPS) 2013.

  Using the spreadsheet interpolates and extrapolates total fertility rates (TFRLGST) developed by U.S. bureau of the census international programs center population analysis spreadsheets (PAS). The program fits a logistic function using 2 to 17 total fertility rates, given the values of upper and lower asymptotes. The fertility rates, given the values of upper and lower asymptotes. The beginning date for displaying the results is also entered.

Table 2: Interpolation and Extrapolation of the TFR Using a Logistic Function

Year		Value	Year	TFR
Asymptotes:			2008	3.1
			2009	3.0
Lower		2	2010	3.0
Upper		7	2011	2.9
			2012	2.8
Initial TFR's			2013	2.8
			2014	2.7
	2008	3.1	2015	2.6
	2014	2.7	2016	2.6

2017	2.6
2018	2.5
2019	2.5
2020	2.4
2021	2.4
2022	2.4
2023	2.3

- **Mortality level**: assume that mortality, illustrated by the life expectancy at birth (E0), increases following the models for mortality improvement suggested by the United Nations. Mortality model: assume that mortality models, described by the Age Specific Death Rate (ASDR), based on the west model life tables of Coale Demeny West. The Logistic function developed by

  Using the spreadsheet interpolates and extrapolates Life Expectancy at Birth (E0LGST) developed by U.S. bureau of the census international programs center population analysis spreadsheets (PAS). The program fits a logistic function given the values of upper and lower asymptotes

Table 3 : Interpolation and Extrapolation of the Life Expectancy at Birth Using a Logistic Function

Year	Male	Female	Year	Male	Female	Both sexes
Asymptotes:			2008	60.5	64.3	62.4
			2009	61.4	65.2	63.3
Lower	25	25	2010	62.3	66.1	64.2
Upper	82.56	88.4	2011	63.1	67.0	65.0
			2012	64.0	67.9	65.9
Life expectancy at birth:			2013	64.8	68.8	66.7
			2014	65.6	69.6	67.6
2008	60.5	64.3	2015	66.4	70.4	68.3
2014	65.6	69.6	2016	67.1	71.2	69.1
			2017	67.9	72.0	69.9
			2018	68.6	72.7	70.6
			2019	69.3	73.5	71.3
			2020	69.9	74.2	72.0
			2021	70.6	74.8	72.7
			2022	71.2	75.5	73.3
			2023	71.8	76.1	73.9

♦ **Migration**: Making meaningful assumptions about future migration developments provides the single greatest difficulty for undertaking population projections, as many of the social and economic parameters shaping migration patterns depend largely on countries' overall social, economic and political developments, which can fluctuate widely and are hard to predict. It,

furthermore, depends on economic and political developments overseas, in particular on decisions whether or not to provide working or residency visas, and/or establish immigration quotas for potential (labour) migrants.

Based on the migration data of Cambodia Inter-Censal Population Survey (CIPS) 2013, inter-provinces net migrants during decade 2008-2013 has been assumed to remain constant throughout the projection periods. The component of international migration has been assumed to be negligible then assumed as 0.

4. Results

4.1 Population projection at national level

The Spectrum program converted all data set to single years of age before executing the projection. This flexibility has the advantage of allowing a demographer to develop a projection model that accurately captures the demographic situation of a country and makes maximum use of available data in a way that is as close as possible to its original form. The program provides outputs on diverse demographic measures for any given year within the projection period such as population by age and sex.

Data for special age groups of five-year age groups to be projected using the components method of Spectrum Software to provide in either single years or five-year age groups. It also makes it possible to follow population cohorts that may be smaller or larger than adjacent cohorts due to past demographic events.

APPENDIX A

4.2 Population projection at provincial level

Conducting population projections by sub-national, such as provinces, is important because the different sub-national of a country usually have dissimilar densities, unequal levels of development, diverse forms of insertion in the national economy, different natural resources and assorted problems that may range from those related to the environment to natural disasters. Regional planning is directed, precisely, to the design of plans and programs that consider the specific characteristics of a region, zone, area or its administrative equivalent. Ideally, regional planning should harmonize national with local development, that is, generate national development through the progress in the different parts of the country. The magnitude of the population in different geographic or administrative units, its structure and demographic dynamic are essential inputs to regional planning exercises. The infant mortality rates estimated from General Population Census of Cambodia (GPCC) 2008 and Cambodia Demographic and Health Survey (CDHS) 2014 for each province and have been used in conjunction with the Coale and Demeny Model Life Tables (Model West) in MORTPAK Software to derive the estimates of life expectancy at birth for each province. They show the expected differentials according to province.

APPENDIX B
