PROTEIN KINASE C INHIBITORS AND METHODS OF THEIR USE

FIELD OF THE INVENTION

[0001] The present invention relates to new compounds and their tautomers and stereoisomers, and pharmaceutically acceptable salts, esters, metabolites or prodrugs thereof, compositions of the new compounds together with pharmaceutically acceptable carriers, and uses of the new compounds, either alone or in combination with at least one additional therapeutic agent, in the prophylaxis or treatment of cancer.

BACKGROUND

[0002] Uveal melanoma is the most common primary intraocular malignant tumor in adults. Certain protein kinase inhibitors are described in International Publ. Nos. WO 02/38561 and WO 2008/106692. One protein kinase C (PKC) inhibitor, sotrastaurin, has been shown to have activity against certain PKC isotypes and has only recently been shown to selectively inhibit the growth of uveal melanoma cells harboring GNAQ mutations by targeting PKC/ERK1/2 and PKC/NF- κ B pathways (see X. Wu, et al in Mol. Cancer Ther., Vol. 11, pages 1905-1914, 2012). A clinical trial studying the use of sotrastaurin to treat patients having uveal melanoma is in progress. However, there still remains a unmet need to provide next generation PKC inhibitors for treating uveal melanoma that have improved efficacy at lower dosage amounts to achieve tumor regression, improved potency, hERG activity, absorption, gastrointestinal tolerance and kinase selectivity.

[0003] Diffuse large B-cell lymphoma (DLBCL) represents the most common subtype of malignant lymphoma and is heterogeneous with respect to morphology, biology and clinical presentation. The PKC inhibitor, sotrastaurin (AEB071), has been shown to selectively inhibit growth of CD79-mutant DLBCL cells (see T. Naylor, et al in Cancer Res., Vol. 71(7), 2643-2653, 2011). In addition the study suggested that sotrastaurin showed significant synergy when combined with the mTor inhibitor everolimus (AfinitorTM). A clinical trial studying the use of sotrastaurin to treat patients having DLBCL harboring the CD79 mutation is in progress. However, there still remains a unmet need to provide next generation PKC inhibitors for treating DLBCL that have improved efficacy at lower dosage amounts to achieve tumor regression, improved potency, PK profile, absorption, gastrointestinal tolerance and kinase selectivity.

When used in connection with cycloalkyl substituents, the term "polycyclic" refers herein to fused and non-fused alkyl cyclic structures. The term "carbocyclic or carbocyclyl" refers to a saturated, or partially unsaturated carbocyclic ring fused to another carbocyclic ring, aryl ring, heterocyclic ring or heteroaryl ring. The cycloalkyl group is unsubstituted or substituted.

[0029] The term "substituted heterocycle" or "heterocyclic group" or "heterocyclyl", as used herein, refers to any 3- or 4-membered ring containing a heteroatom selected from nitrogen, oxygen, and sulfur or a 5-, 6- or 7-membered ring containing from one to three heteroatoms selected from the group consisting of nitrogen, oxygen, or sulfur; wherein the 5-membered ring has 0-1 double bonds and the 6- and 7-membered rings have 0-1 double bonds or fused rings having 0-2 double bonds; wherein the nitrogen and sulfur atom maybe optionally oxidized; wherein the nitrogen and sulfur heteroatoms may be optionally quarternized; and including any bicyclic group in which any of the above heterocyclic rings is fused to a benzene ring or another 5- or 6-membered heterocyclic ring independently defined above and is referred to as a heterobicyclic ring or a heterobicyclyl group. The heterocyclyl group is unsubstituted or substituted with 1 to 3 substituents each independently selected from the group consisting of: H, ²H, halo, CN, C₁₋₃ alkyl, C₁₋₃ alkoxy, C₁₋₃ haloalkyl, and C₁₋₃ haloalkoxy.

[0030] The term "heterocycle" thus includes rings in which nitrogen is the heteroatom as well as partially and fully-saturated rings. Exemplary heterocycles include but are not limited to, for example: piperidinyl, piperazinyl, 1,2-oxazinane, 2-oxopiperazinyl, 2-oxopiperidinyl, N-methyl piperazinyl, and morpholinyl, each optionally substituted.

[0031] Heterocyclic moieties can be unsubstituted or monosubstituted or disubstituted with various substituents independently selected from hydroxy, halo, oxo (C=O), alkylimino (RN=, wherein R is a C₁₋₃ alkyl or C₁₋₃ alkoxy group), amino, C₁₋₃ alkylamino, C₁₋₃ dialkylamino, acylaminoalkyl, C₁₋₃ alkoxy, C₁₋₃ alkyl, cycloalkyl or C₁₋₃ haloalkyl.

[0032] The heterocyclic groups (heterocyclyl) may be attached at various positions as will be apparent to those having skill in the organic and medicinal chemistry arts in conjunction with the disclosure herein. Representative examples of heterocyclyl, heterobicyclyl and substituted heterocyclyl groups used in accordance with the invention are listed below:

[0033] The term "C₆₋₁₀ aryl" refers to optionally substituted monocyclic and polycyclic aromatic groups having from 6 to 10 or 3 to 14 backbone carbon or hetero atoms, and includes both carbocyclic aryl groups and heterocyclic aryl groups. Carbocyclic aryl groups are C₆₋₁₀ aryl groups in which all ring atoms in the aromatic ring are carbon. Exemplary C₆₋₁₀ aryl moieties employed as substituents in compounds of the present invention include phenyl, naphthyl, isonaphthyl and the like.

[0034] "Aralkyl" refers to a C₁₋₃ alkyl or C₁₋₆ alkyl group substituted with an C₆₋₁₀ aryl group. Typically, aralkyl groups employed in compounds of the present invention have from 1 to 6 carbon atoms incorporated within the alkyl portion of the aralkyl group. Suitable aralkyl groups employed in compounds of the present invention include, for example, benzyl, picolyl, and the like.

[0035] The term "heteroaryl" refers to 5-10 membered carbocyclic ring system, including fused ring systems, having 1 to 4 heteroatoms each independently selected from the group consisting of: O, N and S. Said heteroaryl may be optionally substituted with one or two substituents. The term "heteroaryl" also refers herein to C₆₋₁₀ aryl groups having from 1 to 4 heteroatoms as ring atoms in an aromatic ring with the remainder of the ring atoms being carbon atoms. Exemplary substituents include, but are not limited to: halo, CN, C₁₋₃ alkyl, C₁₋₃ alkoxy, C₁₋₃ haloalkyl, C₁₋₃ haloalkoxy, C₃₋₇ cycloalkyl, and 4-7 membered heterocyclyl having 1 or 2 heteroatoms selected from N, O and S, said heterocyclyl optionally substituted with 1 to 3 substituents each independently selected from the group consisting of: halo, CN, C₁₋₃ alkyl, C₁₋₃ alkoxy, C₁₋₃ haloalkyl, and C₁₋₃ haloalkoxy. Representative heteroaryl groups include, for example, those shown below. Representative heteroaryls include, for example, imidazolyl, pyridinyl (also referred to as pyridyl), pyrazinyl, azetidyl, thiazolyl, triazolyl, benzimidazolyl, benzothiazolyl, thiazolyl, thiazolidinyl, isothiazolyl, isothiazolidinyl, indolyl, quinolinyl, isoquinolinyl, azetidyl, N-methylazetidyl, pyrimidinyl, pyridazinyl, oxazolyl, oxazolidinyl, isoxazolyl, isoxazolidinyl, benzimidazolyl, benzothiazolyl, benzoxazolyl, furyl, thienyl, triazolyl, benzothienyl diazapinyl, pyrrol, pyrrolinyl, pyrrolidinyl, pyrazolyl, pyrazolinyl, pyrazolidinyl, imidazolyl, imidazolyl, imidazolidinyl and benzoxazolyl. The heteroaryl is unsubstituted or substituted with 1 to 3 substituents each independently selected from the group consisting of: H, ²H, halo, C₂₋₃ alkynyl, C₂₋₃ alkenyl, CN, C₁₋₃ alkyl, C₁₋₃ alkoxy, C₁₋₃ haloalkyl, C₁₋₃ haloalkoxy, C₃₋₇ cycloalkyl, CONH₂, CONHC₁₋₃ alkyl, CONHC₆₋₁₀ aryl, SO₂NH₂, SO₂NHC₁₋₃ alkyl, SO₂NHC₆₋₁₀ aryl and 4-7 membered heterocyclyl having 1 to 3 heteroatoms selected from N, O and S, said heterocyclyl optionally substituted one or two substituents each independently selected from the group consisting of: H, ²H, halo, CN, C₁₋₃ alkyl, C₁₋₃ alkoxy, C₁₋₃ haloalkyl, and C₁₋₃ haloalkoxy.

[0036] The heteroaryl groups can be further substituted and may be attached at various positions as will be apparent to those having skill in the organic and medicinal chemistry arts in conjunction with the disclosure herein. Representative examples of heteroaryl and substituted heteroaryl groups used in accordance with the invention are listed below:

[0037] "Optionally substituted" or "substituted" refers to the replacement of one or more hydrogen atoms with a monovalent or divalent radical. Suitable substitution groups include, for example, H, ²H, halo, C₂₋₃ alkynyl, C₂₋₃ alkenyl, CN, C₁₋₃ alkyl, C₁₋₃ alkoxy, C₁₋₃ haloalkyl, C₁₋₃ haloalkoxy, C₃₋₇ cycloalkyl, CONH₂, CONHC₁₋₃ alkyl, CONHC₆₋₁₀ aryl, SO₂NH₂, SO₂NHC₁₋₃ alkyl, SO₂NHC₆₋₁₀ aryl and 4-7 membered heterocyclyl having 1 to 3 heteroatoms selected from N, O and S, said heterocyclyl optionally substituted one or two substituents each independently selected from the group consisting of: H, ²H, halo, CN, C₁₋₃ alkyl, C₁₋₃ alkoxy, C₁₋₃ haloalkyl, and C₁₋₃ haloalkoxy; and the like.

[0038] The substitution group can itself be substituted. The group substituted onto the substitution group can be carboxyl, halo; nitro, amino, cyano, hydroxy, C₁₋₃ alkyl, C₁₋₃ alkoxy, aminocarbonyl, -SR, thioamido, -SO₃H, -SO₂R or C₃₋₈ cycloalkyl, where R is typically hydrogen, hydroxyl or C₁₋₃ alkyl.

[0039] When the substituted substituent includes a straight chain group, the substitution can occur either within the chain (e.g., 2-hydroxypropyl, 2-aminobutyl, and the like) or at the chain terminus (e.g., 2-hydroxyethyl, 3-cyanopropyl, and the like). Substituted substituents can be straight chain, branched or cyclic arrangements of covalently bonded carbon or heteroatoms.

[0040] The term “²H” refers to a heavy isotope of hydrogen that is also referred to as deuterium (D). It is understood that the above definitions are not intended to include impermissible substitution patterns (e.g., methyl substituted with five fluoro groups or a halogen atom substituted with another halogen atom). Such impermissible substitution patterns are well known to the skilled artisan.

[0041] The compounds of the invention, including the compounds of formulas (I), (Ia), (II) or (III) or their tautomers, as well as the pharmaceutically acceptable salts, esters, metabolites and prodrugs of any of them, may comprise asymmetrically substituted carbon atoms. Such asymmetrically substituted carbon atoms can result in the compounds of the invention existing in enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, such as in (R)- or (S)- forms. As a result, all such possible isomers, individual stereoisomers in their optically pure forms, mixtures thereof, racemic mixtures (or "racemates"), mixtures of diastereomers, as well as single diastereomers of the compounds of the invention are included in the present invention. The terms "S" and "R" configuration, as used herein, are as defined by the IUPAC 1974 RECOMMENDATIONS FOR SECTION E, FUNDAMENTAL STEREOCHEMISTRY, *Pure Appl. Chem.* 45:13-30 (1976). The terms α and β are employed for ring positions of cyclic compounds. The α -side of the reference plane is that side on which the preferred substituent lies at the lower numbered position. Those substituents lying on the opposite side of the reference plane are assigned β descriptor. It should be noted that this usage differs from that for cyclic stereoparents, in which " α " means "below the plane" and denotes absolute configuration. The terms α and β configuration, as used herein, are as defined by the CHEMICAL ABSTRACTS INDEX GUIDE-APPENDIX IV (1987) paragraph 203.

[0060] As used herein, the term "pharmaceutically acceptable salts" refers to the nontoxic acid or alkaline earth metal salts of the compounds of Formulas (I), (Ia), (II) or (III). These salts can be prepared *in situ* during the final isolation and purification of the compounds of Formulas (I), (Ia), (II) or (III), or by separately reacting the base or acid functions with a suitable organic or inorganic acid or base, respectively. Representative salts include but are not limited to the following: acetate, adipate, alginate, citrate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, cyclopentanepropionate, dodecylsulfate, ethanesulfonate, glucoheptanoate, glycerophosphate, hemisulfate, heptanoate, hexanoate, fumarate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, methanesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylproionate, picrate, pivalate, propionate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate and undecanoate. Also, the basic nitrogen-containing groups can be quaternized with such agents as loweralkyl halides, such as methyl, ethyl, propyl, and butyl chloride, bromides, and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl, and diamyl sulfates, long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides, aralkyl halides like benzyl and phenethyl bromides, and others. Water or oil-soluble or dispersible products are thereby obtained.

[0061] Examples of acids which may be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid, sulfuric acid and phosphoric acid and such organic acids as oxalic acid, maleic acid, methanesulfonic acid, succinic acid and citric acid. Basic addition salts can be prepared *in situ* during the final

isolation and purification of the compounds of formula (I), or separately by reacting carboxylic acid moieties with a suitable base such as the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or with ammonia, or an organic primary, secondary or tertiary amine. Pharmaceutically acceptable salts include, but are not limited to, cations based on the alkali and alkaline earth metals, such as sodium, lithium, potassium, calcium, magnesium, aluminum salts and the like, as well as nontoxic ammonium, quaternary ammonium, and amine cations, including, but not limited to ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, ethylamine, and the like. Other representative organic amines useful for the formation of base addition salts include diethylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine and the like.

[0062] As used herein, the term "pharmaceutically acceptable ester" refers to esters, which hydrolyze *in vivo* and include those that break down readily in the human body to leave the parent compound or a salt thereof. Suitable ester groups include, for example, those derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alkanolic, alkenolic, cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety advantageously has not more than 6 carbon atoms. Examples of particular esters include formates, acetates, propionates, butyrates, acrylates and ethylsuccinates.

[0063] The term "pharmaceutically acceptable prodrugs" as used herein refers to those prodrugs of the compounds of the present invention which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the invention. The term "prodrug" refers to compounds that are rapidly transformed *in vivo* to yield the parent compound of the above formula, for example by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

[0064] It will be apparent to those skilled in the art that the compounds of the invention, including the compounds of formulas (I), (Ia), (II) or (III) or their tautomers, prodrugs and stereoisomers, as well as the pharmaceutically acceptable salts, esters and prodrugs of any of

them, may be processed *in vivo* through metabolism in a human or animal body or cell to produce metabolites. The term "metabolite" as used herein refers to the formula of any derivative produced in a subject after administration of a parent compound. The derivatives may be produced from the parent compound by various biochemical transformations in the subject such as, for example, oxidation, reduction, hydrolysis, or conjugation and include, for example, oxides and demethylated derivatives. The metabolites of a compound of the invention may be identified using routine techniques known in the art. See, e.g., Bertolini, G. et al., *J. Med. Chem.* 40:2011-2016 (1997); Shan, D. et al., *J. Pharm. Sci.* 86(7):765-767; Bagshawe K., *Drug Dev. Res.* 34:220-230 (1995); Bodor, N., *Advances in Drug Res.* 13:224-331 (1984); Bundgaard, H., *Design of Prodrugs* (Elsevier Press 1985); and Larsen, I. K., *Design and Application of Prodrugs, Drug Design and Development* (Krogsgaard-Larsen et al., eds., Harwood Academic Publishers, 1991). It should be understood that individual chemical compounds that are metabolites of the compounds of formulas (I), (II) or (III) or their tautomers, prodrugs and stereoisomers, as well as the pharmaceutically acceptable salts, esters and prodrugs of any of them, are included within the invention.

Nos. 5,545,636; 5,668,152; 5,672,681; 5,698,578; 5,710,145; 6,645,970; 7,220,774; 7,235,555; US Publication No. 2008/0318975; European Patent Nos. 0776895 B1; 0817627 B1; 1449529 B1; 1337527 B1; and PCT Publication Nos. Biol. Chem., Vol. 288, pp 3918-3928 (2013).

[0082] In other aspects, the present invention relates to the processes for preparing the compounds of Formulas (I), (Ia), (II) or (III), and to the synthetic intermediates useful in such processes, as described in detail below.

Synthetic Methods

[0083] Compounds of the invention (Formulas (I), (Ia), (II) or (III)) can be obtained through procedures known to the skilled in the art (Methods 1-6). For example, as shown in Scheme 1 (Method 1), 3-Amino-6-substituted-pyrazine-2-carboxylic acid can be prepared from its corresponding methyl 3-Amino-6-substituted-pyrazine-2-carboxylate starting from methyl 3-amino-6-bromopyrazine-2-carboxylate. A protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound (e.g. tert-butyl (1-(2-aminopyridin-3-yl)piperidin-4-yl)carbamate), is then prepared starting from 3-fluoro-2-nitropyridine. The methyl 3-Amino-6-substituted-pyrazine-2-carboxylate is then reacted with a protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound, then de-protected to yield a 3-amino-N-(3-(4-aminopiperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II) or (III).

Scheme 1

[0084] Alternatively, 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II), or (III), can be prepared in one less synthetic step, as depicted in Method 2 (Scheme 2). For example, as shown in Scheme 2, 3-Amino-6-substituted-pyrazine-2-carboxylic acid can be prepared from its corresponding methyl 3-Amino-6-substituted-pyrazine-2-carboxylate starting from methyl 3-amino-6-bromopyrazine-2-carboxylate. A protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound (e.g. tert-butyl (1-(2-aminopyridin-3-yl)piperidin-4-yl)carbamate), is then prepared starting from 3-fluoro-2-nitropyridine. The methyl 3-Amino-6-substituted-pyrazine-2-carboxylate is then reacted with a protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound, then de-protected to yield a 3-amino-N-(3-(4-aminopiperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II) or (III).

Scheme 2

[0085] In an alternative manner, 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II), or (III) can be obtained as depicted in Method 3 (Scheme 3). For example, starting from 3-fluoro-2-nitropyridine, a protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound is prepared. The protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound is then reacted with 3-amino-6-bromopyrazine-2-carboxylic acid or a protected acid (e.g. methyl 3-amino-6-bromopyrazine-2-carboxylate) to produce a 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-bromo-pyrazine-2-carboxamide. The 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-bromo-pyrazine-2-carboxamide is converted in two steps to the 3-amino-N-(3-(4-aminopiperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II) or (III).

Scheme 3

[0086] In an alternative manner, 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II), or (III) can be obtained as depicted in Method 4 (Scheme 4). For example, starting from 3-fluoro-2-nitropyridine, a protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound is prepared. The protected (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound is then reacted with 3-amino-6-bromopyrazine-2-carboxylic acid or a protected acid (e.g. methyl 3-amino-6-bromopyrazine-2-carboxylate) to produce a 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-bromo-pyrazine-2-carboxamide. The 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-bromo-pyrazine-2-carboxamide is converted in fewer steps to the 3-amino-N-(3-(4-aminopiperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II) or (III).

Scheme 4

[0087] In an alternative manner, 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II), or (III) can be obtained as depicted in Method 5 (Scheme 5). For example, 3-Amino-6-substituted-pyrazine-2-carboxylic acid can be prepared from its corresponding methyl 3-Amino-6-substituted-pyrazine-2-carboxylate starting from methyl 3-amino-6-bromopyrazine-2-carboxylate. The 3-Amino-6-substituted-pyrazine-2-carboxylic acid is then reacted with 2-amino-3-iodo-pyridine to produce Intermediate 12, which is then converted to (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound, then de-protected to yield a 3-amino-N-(3-(4-aminopiperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II) or (III).

Scheme 5

[0088] In yet another alternative manner, 3-amino-N-(3-(4-amino-4-(methoxymethyl)piperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II), or (III), can be prepared in one less synthetic step as depicted in Method 6 (Scheme 6). For example, a 3-Amino-6-halo-substituted-pyrazine-2-carboxylic acid can be prepared from its corresponding methyl 3-Amino-6-substituted-pyrazine-2-carboxylate starting from methyl 3-amino-6-bromopyrazine-2-carboxylate in one less step. The 3-Amino-6-substituted-pyrazine-2-carboxylic acid is then reacted with 2-amino-3-iodo-pyridine to produce Intermediate 12, which is then converted to (1-(2-aminopyridin-3-yl)piperidin-4-yl) compound, then de-protected to yield a 3-amino-N-(3-(4-aminopiperidin-1-yl)pyridin-2-yl)-6-substituted-pyrazine-2-carboxamide of Formulas (I), (Ia), (II) or (III).

dextrose, hydroxypropyl- β -cyclodextrin, polyvinylpyrrolidinone, low melting waxes, ion exchange resins, and the like, as well as combinations of any two or more thereof. Other suitable pharmaceutically acceptable excipients are described in "Remington's Pharmaceutical Sciences," Mack Pub. Co., New Jersey (1991), incorporated herein by reference.

[0090] Effective amounts of the compounds of the invention generally include any amount sufficient to detectably inhibit the disclosed PKC isoform activity by any of the assays described herein, by other PKC activity assays known to those having ordinary skill in the art or by detecting an inhibition or alleviation of symptoms of cancer.

[0091] The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination, and the severity of the particular disease undergoing therapy. The therapeutically effective amount for a given situation can be readily determined by routine experimentation and is within the skill and judgment of the ordinary clinician.

[0092] For purposes of the present invention, a therapeutically effective dose will generally be a total daily dose administered to a host in single or divided doses may be in amounts, for example, of from 0.001 to 1000 mg/kg body weight daily and more preferred from 1.0 to 30 mg/kg body weight daily. Dosage unit compositions may contain such amounts of submultiples thereof to make up the daily dose.

[0093] The compounds of the present invention may be administered orally, parenterally, sublingually, by aerosolization or inhalation spray, rectally, or topically in dosage unit formulations containing conventional nontoxic pharmaceutically acceptable carriers, adjuvants, and vehicles as desired. Topical administration may also involve the use of transdermal administration such as transdermal patches or ionophoresis devices. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection, or infusion techniques.

[0094] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting

agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-propanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or di-glycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

[0095] Suppositories for rectal administration of the drug can be prepared by mixing the drug with a suitable nonirritating excipient such as cocoa butter and polyethylene glycols, which are solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum and release the drug.

[0096] Solid dosage forms for oral administration may include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound may be admixed with at least one inert diluent such as sucrose lactose or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, e.g., lubricating agents such as magnesium stearate. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents. Tablets and pills can additionally be prepared with enteric coatings.

[0097] Liquid dosage forms for oral administration may include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs containing inert diluents commonly used in the art, such as water. Such compositions may also comprise adjuvants, such as wetting agents, emulsifying and suspending agents, cyclodextrins, and sweetening, flavoring, and perfuming agents.

[0098] The compounds of the present invention can also be administered in the form of liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals that are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes can be used. The present compositions in liposome form can contain, in addition to a compound of the present invention, stabilizers, preservatives, excipients, and the like. The preferred lipids are the phospholipids and phosphatidyl cholines (lecithins), both natural and synthetic. Methods to form liposomes are

known in the art. See, for example, Prescott, Ed., *Methods in Cell Biology*, Volume XIV, Academic Press, New York, N.W., p. 33 *et seq.* (1976).

[0107] Agents that interfere with cell cycle checkpoints are compounds that inhibit protein kinases that transduce cell cycle checkpoint signals, thereby sensitizing the cancer cell to DNA damaging agents. Such agents include inhibitors of ATR, ATM, the Chk1 and Chk2 kinases and cdk and cdc kinase inhibitors and are specifically exemplified by 7-hydroxystaurosporin, flavopiridol, CYC202 (Cyclacel) and BMS-387032.

[0108] Inhibitors of cell proliferation and survival signaling pathway are pharmaceutical agents that inhibit cell surface receptors and signal transduction cascades downstream of those surface receptors. Such agents include inhibitors of inhibitors of EGFR (for example gefitinib and erlotinib), inhibitors of ERB-2 (for example trastuzumab), inhibitors of IGFR, inhibitors of cytokine receptors, inhibitors of MET, inhibitors of PI3K (for example LY294002), serine/threonine kinases (including but not limited to inhibitors of Akt such as described in WO 02/083064, WO 02/083139, WO 02/083140 and WO 02/083138), inhibitors of Raf kinase (for example BAY-43-9006), inhibitors of MEK (for example CI-1040 and PD-098059) and inhibitors of mTOR (for example, rapamycin, everolimus and Wyeth CCI-779). Such agents include small molecule inhibitor compounds and antibody antagonists.

[0109] Apoptosis inducing agents include activators of TNF receptor family members (including the TRAIL receptors).

[0110] In certain presently preferred embodiments of the invention, representative agents useful in combination with the compounds of the invention for the treatment of cancer include, for example, irinotecan, topotecan, gemcitabine, 5-fluorouracil, leucovorin carboplatin, cisplatin, taxanes, tezacitabine, cyclophosphamide, vinca alkaloids, imatinib (GleevecTM), nilotinib (TasignaTM), everolimus (AfinitorTM), anthracyclines, rituximab, trastuzumab, as well as other cancer chemotherapeutic agents.

[0111] The above compounds to be employed in combination with the compounds of the invention will be used in therapeutic amounts as indicated in the *Physicians' Desk Reference* (PDR) 47th Edition (1993), which is incorporated herein by reference, or such therapeutically useful amounts as would be known to one of ordinary skill in the art.

[0112] The compounds of the invention and the other anticancer agents can be administered at the recommended maximum clinical dosage or at lower doses. Dosage levels of the active compounds in the compositions of the invention may be varied so as to obtain a desired therapeutic response depending on the route of administration, severity of the disease and the response of the patient. The combination can be administered as separate compositions or as a single dosage form containing both agents. When administered as a combination, the therapeutic agents can be formulated as separate compositions, which are given at the same time or different times, or the therapeutic agents, can be given as a single composition.

[0113] Antiestrogens, such as tamoxifen, inhibit breast cancer growth through induction of cell cycle arrest, effecting the action of the cell cycle inhibitor p27Kip. Recently, it has been shown that activation of the Ras-Raf-MAP Kinase pathway alters the phosphorylation status of p27Kip such that its inhibitory activity in arresting the cell cycle is attenuated, thereby contributing to antiestrogen resistance (Donovan et al., *J. Biol. Chem.* 276:40888, 2001). As reported by Donovan et al., inhibition of MAPK signaling through treatment with MEK inhibitor changed the phosphorylation status of p27 in hormone refractory breast cancer cell lines and in so doing restored hormone sensitivity. Accordingly, in one aspect, the compounds of formulas (I), (Ia), (II), (III) and (IV) may be used in the treatment of hormone dependent cancers, such as breast and prostate cancers, to reverse hormone resistance commonly seen in these cancers with conventional anticancer agents.

[0114] In hematological cancers, such as chronic myelogenous leukemia (CML), chromosomal translocation is responsible for the constitutively activated BCR-AB1 tyrosine kinase. The afflicted patients are responsive to Gleevec, a small molecule tyrosine kinase inhibitor, as a result of inhibition of Ab1 kinase activity. However, many patients with advanced stage disease respond to Gleevec initially, but then relapse later due to resistance-conferring mutations in the Ab1 kinase domain. *In vitro* studies have demonstrated that BCR-Av1 employs the Raf kinase pathway to elicit its effects. In addition, inhibiting more than one kinase in the same pathway provides additional protection against resistance-conferring mutations.

Accordingly, in another aspect of the invention, the compounds of formulas (I), (Ia), (II), (III) and (IV) are used in combination with at least one additional agent, such as Gleevec™ or Tasigna™ in the treatment of hematological cancers, such as chronic myelogenous leukemia (CML), to reverse or prevent resistance to the at least one additional agent.

[0115] In another aspect, the present invention relates to methods of inhibiting at least one serine/threonine kinase in the Jak/Stat signaling pathway in a subject, or treating a biological condition mediated by a PKC signaling pathway in a subject, comprising administering a therapeutic composition comprising at least one compound of formula (I), (Ia), (II) or (III) effective to inhibit the activity of the at least one serine/threonine kinase in the PKC signaling pathway in the subject.

[0116] The therapeutic compositions in accordance with this aspect of the invention are useful for treating patients with a need for such inhibitors (e.g., those suffering from cancer mediated by abnormal PKC signaling). Cancer types mediated by abnormal PKC signaling include, for example, melanoma, uveal melanoma, lymphoma, diffuse large B-cell lymphoma (DLBCL) and ibrutinib resistant cancers, papillary cancer, thyroid cancer, ovarian cancer, colon cancer, pancreatic cancer, non-small cell lung cancer (NSCLC), hematological cancers, chronic myelogenous leukemia (CML), acute lymphoblastic leukemia (ALL), and acute myeloid leukemia.

[0117] In one embodiment, the invention provides a method of inhibiting PKC α , PKC θ and GSK β in a human or animal subject. The method includes administering an effective amount of a compound, or a pharmaceutically acceptable salt thereof, of any of the embodiments of compounds of formula (I), (Ia), (II) or (III) to a subject in need thereof.

[0118] The present invention will be understood more readily by reference to the following examples, which are provided by way of illustration and are not intended to be limiting of the present invention.

[0119] Representative side chains for use in the compounds of the following examples may generally be prepared in accordance with the following procedures:

EXAMPLES

[0120] Referring to the examples that follow, compounds of the preferred embodiments were synthesized using the methods described herein, or other methods, which are known in the art.

[0121] The compounds and/or intermediates were characterized by high performance liquid chromatography (HPLC) using a Waters Millennium chromatography system with a 2695 Separation Module (Milford, MA). The analytical columns were reversed phase Phenomenex Luna C18 -5 μ , 4.6 x 50 mm, from Alltech (Deerfield, IL). A gradient elution was used (flow 2.5 mL/min), typically starting with 5% acetonitrile/95% water and progressing to 100% acetonitrile over a period of 10 minutes. All solvents contained 0.1% trifluoroacetic acid (TFA). Compounds were detected by ultraviolet light (UV) absorption at either 220 or 254 nm. HPLC solvents were from Burdick and Jackson (Muskegan, MI), or Fisher Scientific (Pittsburgh, PA).

[0122] In some instances, purity was assessed by thin layer chromatography (TLC) using glass or plastic backed silica gel plates, such as, for example, Baker-Flex Silica Gel 1B2-F flexible sheets. TLC results were readily detected visually under ultraviolet light, or by employing well-known iodine vapor and other various staining techniques.

[0123] The compounds and/or intermediates were characterized by LCMS. General conditions are as follows.

Low and High resolution Mass spectra were acquired on LC/MS systems using electrospray ionization methods from a range of instruments of the following configurations: Low resolution - Agilent 1100 HPLC-UV system equipped with Waters ZQ Mass Spectrometer and Shimadzu ELSD detectors; Low resolution - Waters AcQuity UPLC-UV system equipped with Waters SQ Mass Spectrometer and Thermo CAD detectors; High resolution - Waters AcQuity UPLC-UV system equipped with a Waters LCT Premier Mass Spectrometer. $[M+H]^+$ refers to the protonated molecular ion of the chemical species.

Step 1. Synthesis of methyl 3-amino-6-(trimethylstannyl)pyrazine-2-carboxylate

To a 500 mL two neck round-bottom flask equipped with a magnetic stirrer and a reflux condenser, methyl 3-amino-6-bromopyrazine-2-carboxylate (25 g, 108 mmol) and Pd(PPh₃)₄ (6.23 g, 5.39 mmol) were suspended in 1,2-dimethoxyethane (200 ml) at rt (room temperature) under an argon atmosphere. The mixture was degassed and flushed with Argon (two times) and hexamethylditin (29.0 mL, 140 mmol) was added via syringe through a rubber septum, the mixture was degassed and flushed with argon again, and heated to 90 °C for 2 h. The mixture was cooled to rt and concentrated *in vacuo*. Water (400 mL) and ethyl acetate (200 mL) were added, stirred for 20 minutes and filtered through celite. The filtrate was transferred to a separation funnel, the phases were separated and the organic phase was washed with brine, dried

over sodium sulfate and the solvent was removed under reduced pressure. The residue was filtered over silica gel with heptane, then a solvent mixture of (ethyl acetate 1:9 heptane) and finally a solvent mixture (ethyl acetate 2:8 heptane) which gave methyl 3-amino-6-(trimethylstannyl)pyrazine-2-carboxylate (20.92 g) of a yellow solid.

LC-MS (Basic Method): ret.time= 1.07 min, M+H = 317.8.

Step 2. Synthesis of methyl 3-amino-6-(3-(trifluoromethyl)pyridin-2-yl)pyrazine-2-carboxylate

Step 3: Synthesis of tert-butyl ((1R,5S,8s)-3-(2-(3-amino-6-(6-morpholino-3-(trifluoromethyl)pyridin-2-yl)pyrazine-2-carboxamido)pyridin-3-yl)-3-azabicyclo[3.2.1]octan-8-yl)carbamate

To a 10 mL screw cap vial was added 3-amino-6-(6-morpholino-3-(trifluoromethyl)pyridin-2-yl)pyrazine-2-carboxylic acid (0.257 g, 0.696 mmol) which was prepared in analogy as in Example 1 (Method 1), DMF (2.5 mL), N-ethyl-N-isopropylpropan-2-

amine (0.334 g, 0.258 mmol) and 2-(3H-[1,2,3]triazolo[4,5-b]pyridin-3-yl)-1,1,3,3-tetramethylisouronium hexafluorophosphate(V) (0.421 g, 1.107 mmol). The mixture was allowed to stir for 15 minutes. To the resultant mixture was added tert-butyl ((1R,5S,8s)-3-(2-aminopyridin-3-yl)-3-azabicyclo[3.2.1]octan-8-yl)carbamate (0.235 g, 0.738 mmol) and allowed to stir for 18 hours. The reaction was concentrated and was purified by silica gel chromatography using ethyl acetate and heptane which gave tert-butyl ((1R,5S,8s)-3-(2-(3-amino-6-(6-morpholino-3-(trifluoromethyl)pyridin-2-yl)pyrazine-2-carboxamido)pyridin-3-yl)-3-azabicyclo[3.2.1]octan-8-yl)carbamate (0.494 g, 0.556 mmol) in 80% yield. LC-MS (Basic method): ret.time= 1.28 min, M+H = 670.8.

Step 4: Synthesis of 3-amino-N-(3-((1R,5S,8s)-8-amino-3-azabicyclo[3.2.1]octan-3-yl)pyridin-2-yl)-6-(6-morpholino-3-(trifluoromethyl)pyridin-2-yl)pyrazine-2-carboxamide

To a 100 mL flask was added a magnetic stirrer, tert-butyl ((1R,5S,8s)-3-(2-(3-amino-6-(6-morpholino-3-(trifluoromethyl)pyridin-2-yl)pyrazine-2-carboxamido)pyridin-3-yl)-3-azabicyclo[3.2.1]octan-8-yl)carbamate (0.61 g, 0.923 mmol) and dichloromethane (10 mL). The mixture was stirred until all solids dissolved and then cooled in an ice water bath under nitrogen. To this mixture was added trifluoroacetic acid (25 mL). The ice bath was removed and the mixture was stirred for 2.5 hours at room temperature. The mixture was then concentrated and the residue was then co-evaporated with toluene (30 mL) 3 times to a thick residue. The residue was purified by a reverse phase HPLC method which gave 3-amino-N-(3-((1R,5S,8s)-8-amino-3-azabicyclo[3.2.1]octan-3-yl)pyridin-2-yl)-6-(6-morpholino-3-(trifluoromethyl)pyridin-2-

Example 110: Synthesis of tert-butyl (3-fluoro-4-methyl-1-(2-nitropyridin-3-yl)piperidin-4-yl)carbamate (Intermediate)

Step 1. Synthesis of 3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-one

To a 100 mL round-bottom flask equipped with a magnetic stirrer and a nitrogen inlet, was added dioxane (10 mL), DMF (6 mL), 3-fluoropiperidin-4-one (550mg, 3.58mmol), 3-fluoro-2-nitropyridine (509 mg, 3.58 mmol) and diisopropylethylamine (1.876 ml, 10.74 mmol). The homogenous solution was stirred at 70°C in an oil bath for 4 hours. The mixture was then

partitioned between ethyl acetate (20 mL) and water (20 mL), and the organic extracts were washed with water (10 mL) twice and brine (10 mL), and then dried over Na_2SO_4 . After evaporation of solvent, an amber oil was collected as crude product, 3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-one. Carried this crude product to the next step directly without further purification.

LC-MS (Acidic Method): ret.time= 0.63 min, M+H = 240.1

Step 2. Synthesis of (Z)-ethyl 2-(3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-ylidene)acetate

To a 100 mL round-bottom flask equipped with a magnetic stirrer and a nitrogen inlet, was added NaH (169 mg, 4.21 mmol) and THF (10 mL). The mixture was cooled to 0 °C and added ethyl 2-(dimethoxyphosphoryl)acetate (827 mg, 4.21 mmol) dropwise. The reaction was stirred at room temperature for 20 minutes then a solution of 3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-one (840 mg, 3.51 mmol) in THF (5 mL) was added. The mixture was stirred at room temperature for 3 hours and was quenched by addition of water (25 mL) at 0 °C. The aqueous mixture was extracted with ethyl acetate (2 x 50 mL). The organic layer was washed with brine, dried over Na_2SO_4 , filtered and concentrated. The crude material was purified by silica gel chromatography using ethyl acetate-heptane ($R_f \sim 0.5$ at 50% of ethyl acetate in heptane). (Z)-ethyl 2-(3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-ylidene)acetate was obtained as light yellow solid.

LC-MS (Acidic Method): ret.time= 1.44 min, M+H = 310.2

Step 3. Synthesis of ethyl 2-(4-amino-3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-yl)acetate

(Z)-ethyl 2-(3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-ylidene)acetate (4.02 g, 13 mmol) was dissolved in 10mL of 7N NH₃ in MeOH in a pressure vessel. The vessel was sealed and heated at 80°C for 12 hours. Evaporated the solvents and then applied to silica gel chromatography (R_f ~ 0.4 at 5% MeOH (0.5% of NH₄OH) in DCM) to collect ethyl 2-(4-amino-3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-yl)acetate with >80% purity.

LC-MS (Acidic Method): ret.time= 0.68 min, M+H = 327.3

To a 100 mL flask was added a magnetic stirrer and ethyl 2-(4-amino-3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-yl)acetate (3 g, 9.19 mmol) and BOC Anhydride (2.006 g, 9.19 mmol) in THF (Volume: 33 mL, Ratio: 1.000), Water (Volume: 33.0 mL, Ratio: 1.000) and THF (Volume: 8.0 mL, Ratio: 1.000). Added DIPEA (1.606 mL, 9.19 mmol). The mixture was heated at 85 °C for 4 hours. The mixture cooled down to room temperature and yellow

precipitate was observed. The mixture was filtered and the solid was rinsed with water. The solid was purified by silica gel chromatography ($R_f \sim 0.7$ at 70% of ethyl acetate in heptane) to collect ethyl 2-(4-((tert-butoxycarbonyl)amino)-3-fluoro-1-(2-nitropyridin-3-yl)piperidin-4-yl)acetate.

Biological Activity

PIM kinase inhibition activity

[0161] For comparison between certain PKC inhibitors of the present application and structurally comparable PIM kinase inhibitors, the activity of PIM2 was measured using an in vitro Caliper kinase assay. Liquid handling and incubation steps were done on an Innovadyne Nanodrop Express equipped with a robotic arm (Thermo CatX, Caliper Twister II) and an incubator (Liconic STX40, Thermo Cytomat 2C450). The 384 well microtiter assay plates were prepared by addition of 50nl per well of compound solution in 90% DMSO. The kinase reactions were started by stepwise addition of 4.5µl per well of peptide/ATP-solution (50mM HEPES, pH

7.5, 1mM DTT, 0.02% Tween20, 0.02% BSA, 0.6% DMSO, 10mM beta-glycerophosphate, and 10 μ M sodium orthovanadate, 1mM MgCl₂, 25 μ M ATP, and 2 μ M S6 peptide) and 4.5 μ l per well of enzyme solution (50mM HEPES, pH 7.5, 1mM DTT, 0.02% Tween20, 0.02% BSA, 0.6% DMSO, 10mM beta-glycerophosphate, and 10 μ M sodium orthovanadate, 1mM MgCl₂, and 0.6nM PIM2 enzyme).

Kinase reactions were incubated at 30°C for 60 minutes and subsequently terminated by addition of 16 μ l per well of stop solution (100mM HEPES pH 7.5, 5%DMSO, 0.1% Caliper coating reagent, 10mM EDTA, and 0.015% Brij35). Plates with terminated kinase reactions were transferred to the Caliper LC3000 workstations for reading. Phosphorylated and unphosphorylated peptides were separated using the Caliper microfluidic mobility shift technology. Briefly, samples from terminated kinase reactions were applied to the chip. Analytes are transported through the chip by constant buffer flow and the migration of the substrate peptide is monitored by the fluorescence signal of its label. Phosphorylated S6 peptide (product) and unphosphorylated S6 peptide (substrate) are separated in an electric field by their charge/mass ratio. Kinase activities were calculated from the amounts of formed phosphopeptide. IC₅₀ values were determined from percent inhibition values at different compound concentrations by non-linear regression analysis.

Compounds of the foregoing examples were tested by the Pim2 kinase assay and found to exhibit an IC₅₀ values as shown in Table 4. IC₅₀, the half maximal inhibitory concentration, represents the concentration of a test compound of the invention that is required for 50% inhibition of its target in vitro.

GSKbeta Assay

[0162] Types of GSK-3 assay used to test the selectivity/off target potential compounds of the invention with respect to PKC α/θ inhibition activity includes the following: Type 1 : The GSK-3 specific peptide used in this assay was derived from the phosphorylation site of glycogen synthase and its sequence is: YRRAAVPPSPSLSRHSSPHQ(S)EDEEE. (S) is pre-phosphorylated as is glycogen synthase in vivo and the three consensus sites for GSK-3 specific phosphorylation are underlined. The buffer used to make up the glycogen synthase peptide and [γ -³³P] ATP consisted of MOPS 25mM, EDTA 0.2 mM, magnesium acetate 10 mM, Tween-20

0.01% and mercaptoethanol 7.5m M at pH 7.00. The compounds were dissolved in dimethyl sulphoxide (DMSO) to a final concentration of 100 mM. Various concentrations were made up in DMSO and mixed with the substrate (GSK-3 peptide) solution (to a final concentration 20 μ M) described in the above section along with rabbit or human GSK-3 α and GSK-3 β (final concentration 0.5 μ M/mL enzyme). The reactions were initiated with the addition of [γ - 33 P] ATP (500cpm/pmole) spiked into a mixture of ATP (final concentration of 10 μ M). After 30 minutes at room temperature the reaction was terminated by the addition of 10 μ L of H₃PO₄/O.OP/0 Tween-20 (2.5%). A volume (10 μ L) of the mixture was spotted onto P-30 phosphocellulose paper (Wallac & Berthold, EG&G Instruments Ltd, Milton Keynes). The paper was washed four times in H₃PO₄ (0.5%), 2 minutes for each wash, air dried and the radioactive phosphate incorporated into the synthetic glycogen synthase peptide, which binds to the P-30 phosphocellulose paper, was counted in a Wallac microbeta scintillation counter. Analysis of Data: Values for IC₅₀ for each inhibitor were calculated by fitting a four-parameter logistic curve to the model: $\text{cpm} = \text{lower} + (\text{upper} - \text{lower}) / (1 + (\text{concentration} / \text{IC}_{50})^{\text{slope}})$.

Type 2: This protocol is based on the ability of the kinase to phosphorylate a biotinylated peptide, sequence of which derived from the phosphorylation site of glycogen synthase and its sequence is: Biot-KYRRAAVPPSPSLSRHSSPHQ(S)EDEEEE. (S) is a pre-phosphorylated serine as is glycogen synthase in vivo and the three consensus sites for GSK-3 specific phosphorylation are underlined. The phosphorylated biotinylated peptide is then captured onto streptavidin coated SPA beads (Amersham Technology), where the signal from the 33 P is amplified via the scintillant contained in the beads. The kinase was assayed at a concentration of 10 nM final in 25 mM MOPS buffer, pH 7.0 containing 0.01% Tween-20, 7.5 mM 2-mercaptoethanol, 10 mM magnesium acetate, and 10 μ M [γ - 33 P]-ATP. After 60 minutes incubation at room temperature, the reaction was stopped by addition of 50 mM EDTA solution containing the Streptavidin coated SPA beads to give a final 0.5 mg of beads per assay well in a 384 microtiter plate format. 10 mM stock solutions of the compounds of the invention in 100% DMSO are generated as a first step in the screening process. The second step involves the creation of dose response plates where these compounds are diluted across the plate where the final low and high concentrations are to be 0.008 and 10 μ M final in the kinase assay. The third step involves the creation of the assay plates. This is achieved by transferring the compounds from four 96 dose response plates

to one 384 assay plate on the Robocon Robolab system. The fourth step is to perform the assay as described and count the resulting plates in the Trilux (Wallac 1450 microbeta liquid scintillation and luminescence counter). The final step is data acquisition and analysis where IC₅₀ values are generated for each compound in duplicate by fitting a four parameter logistic curve to the model: $\text{cpm} = \text{lower} + (\text{upper} - \text{lower}) / (1 + (\text{concentration} / \text{IC}_{50})^{5*P^c})$ in a batch manner. The most potent PKC compounds of the present invention show GSKbetaIC₅₀ values in the range of from between 100 to 100,000 nM.

In Vitro PKC α/θ inhibition activity

[0163] The compounds of formula I were tested for their activity on different PKC isoforms according to a published method (D. Geiges et al. Biochem. Pharmacol. 1997;53:865-875) The assay is performed in a 96-well polypropylene microtiterplate (Costar 3794) that has been previously siliconized with Sigmacote (Sigma SL-2). The reaction mixture (50 μ L) contains 10 μ L of the relevant PKC isozyme together with 25 μ L of the PKC inhibitor compound and 15 μ L of a mix solution that contains 200 μ g/mL protamine sulfate, 10 mM Mg(NO₃)₂, 10 μ M ATP (Boehringer 519987) and 3750 Bq of ³³P-ATP (Hartmann Analytic SFC301, 110TBq/mmol) in 20 mM Tris-buffer pH 7.4 + 0.1% BSA. Incubation was performed for 15 minutes at 32° C in a microtiterplate shaking incubator (Biolabo Scientific Instruments). Reaction was stopped by adding 10 μ l of 0.5 M Na₂EDTA, pH 7.4. 50 μ l of mixture are pipetted onto a pre-wetted phosphocellulose paper (Whatmann 3698-915) under gentle pressure. Non-incorporated ATP is washed away with 100 μ L bi-dist H₂O. The paper is washed twice in 0.5% H₃PO₄ for 15 minutes followed by 5 minutes in EtOH. Thereafter the paper is dried and placed in an omnifilter (Packard 6005219), and overlaid with 10 μ L/well of Microscint-O (Packard 6013611) before counting in a Topcount radioactivity counter (Packard). IC₅₀ measurement is performed on a routine basis by incubating a serial dilution of inhibitor at concentrations ranging between 1-1000 μ M according to the procedures described above. IC₅₀ values are calculated from the graph by sigmoidal curve fitting.

2. Protein Kinase C α Assay

Human recombinant PKC α is used under the assay conditions as described above. In this assay, compounds of formula I inhibit PKC α with an $IC_{50} \leq 1 \mu M$. Compound of Examples 2, 9, 75 and 76 inhibits PKC α in this assay with an $IC_{50} < 10 \text{ nM}$.

3. Protein Kinase C θ Assay

Human recombinant PKC θ was obtained from Oxford Biomedical Research and is used under the assay conditions as described under Section A.1 above: compounds of formula I inhibit PKC α with an $IC_{50} \leq 1 \mu M$. Compound of Examples 2, 9, 75 and 76 inhibits PKC θ in this assay with an $IC_{50} < 10 \text{ nM}$.

Cellular Assays

[0164] To assess the ability of compounds of the invention to inhibit PKC activity in cellular assays, compounds were evaluated for their ability to selectively inhibit the proliferation of 92.1 uveal melanoma cells and TMD8 B cell lymphoma cells, relative to SK-MEL-28 cells. 92.1 uveal melanoma cells are dependent on the expression of a mutant form of the G protein alpha subunit, GNAQ, which signals via PKC to enable growth and proliferation. TMD8 cells are dependent on the expression of a mutant form of CD79 which signals via PKC to enable growth and proliferation. SK-MEL-28 cells are dependent on the expression of a mutant form of B-Raf which does not signal via PKC to enable growth and proliferation. Therefore PKC inhibitors are expected to have anti-proliferative activity against 92.1 and/or TMD8 cells but not SK-MEL-28 cells. 92.1 cells (GNAQ mutant) were obtained from Martine Jager (Leiden University Medical Center, 2300 RC Leiden, The Netherlands). SK-MEL-28 cells can be obtained from the American Type Culture Collection (ATCC). Cells were maintained in RPMI 1640 media (Lonza) and 10% FBS (Lonza).

Proliferation assay

[0165] For each cell line, the cell density may be adjusted to 40 000 cells/ml and 50ul (2000 cells) added per well of a 384 well assay plate. Test compounds are re-suspended in

DMSO at a concentration of 10 mM. A serial three-fold dilution of each compound with DMSO was performed in 384-well plates using the Janus Liquid Dispenser (PerkinElmer). 50nL of each compound dilution was transferred to the assay plate containing cells for final assay concentrations of 10 μ M, 3.33 μ M, 1.11 μ M, 0.37 μ M, 0.12 μ M, 0.041 μ M, 0.014 μ M, 0.0046 μ M, 0.0015 μ M, 0.00051 μ M.

[0166] Cells may be incubated at 37 degrees celsius in a humidified environment with 5% carbon dioxide for 72 hours. ATPlite (Perkin Elmer) was prepared according to the manufacturer's instructions and 25 μ L added to each well of the assay plate. Plates are incubated for 10 minutes and the luminescence detected on an EnVision Multimode plate reader (Perkin Elmer). The degree of luminescence correlates with the number of viable cells in each well. The effect of each inhibitor concentration was calculated and IC₅₀ values can be generated.

[0167] The PKC isoform alpha and theta IC₅₀ values for PKC inhibitors (Examples 1-29) are summarized in Table 2. The data presented herein represents the average of at least two replicates.

Table 4 presents a direct comparison of the kinase assay data for various PIM kinase inhibitors disclosed in WO2008/160692 and Example 1, an exemplary PKC inhibitor disclosed in this application. These data reveal that Example 1 is unexpectedly selective with regards to off target GSK3 β and unexpectedly potent in suppressing 92.1 (uveal melanoma) cell proliferation, as compared to the exemplary PIM inhibitors. This increased selectivity is likely the result of the pyridin-3-yl hinge portion attached to the piperidin-4-yl moiety which is present in Example 1. The pyridine-3-yl hinge portion is found in all of the PKC inhibitor compounds of this application. None of the exemplary PIM kinase inhibitors in Table 4 possess the pyridin-3-yl hinge portion and as shown in Table 4 the PIM kinase inhibitors are relatively non-selective. Accordingly, structurally similar PIM kinase inhibitors disclosed in WO2008/160692 do not or would not be expected to have the selectivity of the PKC inhibitors disclosed herein. In addition, the data in Table 4 shows that Example 1 has little to no PIM2 activity, which further

differentiates the PKC inhibitor compounds of this application from known PIM kinase inhibitors.

[0170] Representative on target and off target kinase IC₅₀ data for additional exemplary PKC inhibitors of the invention are summarized in Table 5.

In vivo Efficacy models – 92.1 uveal melanoma xenograft studies of selected PKC inhibitors

[0171] Mice were implanted with 92.1 GNAQ mutant uveal melanoma cells to test the *in vivo* efficacy of PKC inhibitors. Each mouse was injected subcutaneously (axillary region) with 5×10^6 cells mixed in 50Ll Matrigel and 50uL PBS. Tumor growth was monitored until tumors reached a volume of 150-250mm³. Tumor size, in mm³, was calculated from: Tumor Volume = $(w^2 \times l)/2$ where w = width and l = length, in mm, of the tumor. When tumors reached the required size, test compounds were administered with the required doses and schedules at a dosing volume of 10ml/kg. Animals were weighed twice per week and dosing volumes adjusted accordingly. Tumor volume was measured twice a week using caliper measurements and tumor volumes calculated as Length x width²/2. The *in-vivo* data was generated for certain potent and selective PKC inhibitors (Examples 2, 9) and compared with AEB071. The invented PKC inhibitors achieved tumor regression as compared to tumor stasis for AEB071 at doses lower than those for AEB071 that only achieved stasis in the model.

[0172] Example 2 decreases tumor proliferation in a 92.1 uveal melanoma xenografts in a dose dependent manner, as compared to sotrastaurin (Figure 1). Further, Example 2 shows a significant reduction in dose to achieve improved efficacy (regression) vs. sotrastaurin (stasis). Based on the data presented herein the compounds disclosed in this application either do or would be expected to selectively induce tumor regression in a uveal melanoma model harboring GNAQ mutations, as well as achieve improved efficacy (regression) vs. sotrastaurin (stasis), as shown in Figure 1. For example, as seen in Figure 3, Example 9 and Example 10 also show improved efficacy (regression) in a 92.1 uveal melanoma xenograft model as compared to vehicle. Accordingly it is expected that the compounds disclosed herein do or would be expected to selectively induce tumor regression *in vivo*.

A comparison of *in-vivo* mouse and rat pharmacokinetic data for Example 2 and sotrastaurin (Tables 6 and 7) shows that Example 2 has improved PK versus sotrastaurin.

The compounds of this application represent an improved class of selective, small molecule PKC inhibitors with proven in-vivo anti-tumor activity and selectivity as compared to sotrastaurin. Moreover the PKC inhibitors of the this application generally exhibit improved potency, PK profile, absorption, gastrointestinal tolerance and kinase selectivity as compared to known PKC inhibitors.
