# UNITED STATES PATENT OFFICE.

#### JAMES HOWARD YOUNG, OF PITTSBURGH, PENNSYLVANIA, ASSIGNOR TO H. H. ROBERTSON CO., OF PITTSBURGH, PENNSYLVANIA, A CORPORATION OF PENN-SYLVANIA.

#### LIGHT-COLORED ASPHALTIC SURFACE.

Application filed March 27, 1920, Serial No. 369,294. Renewed October 8, 1924.

#### To all whom it may concern:

Be it known that I, JAMES HOWARD YOUNG, a citizen of the United States, residing in Pittsburgh, in the county of Alle-gheny and State of Pennsylvania, have in-vented an Improvement in Light-Colored Asphaltic Surfaces, of which the following

description, in connection with the accompanying drawings, is a specification, like 10 characters on the drawings representing like parts.

This invention relates to an article having an asphaltic or like hydrocarbonaceous sur-

face provided with a colored and particu-15 larly a light colored film or layer affixed thereto and free or substantially free from discoloration by the hydrocarbonaceous material of said surface.

20colored film or layer, by applying thereto an ordinary oil paint, but such attempts have not to my knowledge been successful 25 owing to the fact that the vehicle of the paint, such as linseed or other oil, has a solvent action on the asphalt or like black hydrocarbonaceous material, which dis-colors the light colored paint and defeats the object sought. 30

The present invention has for its object to provide an article having an asphaltic, bituminous, tar, pitch or like hydrocarbonaceous black surface, with a light colored layer or film, such as a white, French gray, 35 light green or the like, which is free or substantially free from discoloration by the black of the underlying surface, and which also possesses certain properties, as will be 40 described, which render the light colored surface layer or film particularly advan-tageous as a coating for asphaltic and like hydrocarbonaceous surfaces.

To this end, the light colored surface film or layer is composed of cellulose derivatives as a base, a solvent therefor, a pigment or color, and a diluent or thinner for the cellulose solution, which diluent is of such a nature that it has very little if any solvent action on the asphaltic or like black surface, and which is present in sufficient quantity to render the solvent for the cellulose derivatives non-active or substantially so on the asphalt or like material without ma-

terially affecting the solution of the cellu- 55 lose derivative used.

It is preferred to employ as the cellulose derivatives cellulose nitrate or cellulose acetate, and as the solvent therefor acetone, but instead of the latter any other of the 60 well known solvents for cellulose nitrates and acetates, such as amyl acetate, ethyl and methyl acetates, ethyl and methyl ketones, and the like may be used. As a diluent which is non-active or substantially so upon 65 the asphalt or like material, it is preferred to use an alcohol, preferably ethyl or methyl alcohol.

In order that the invention may be clearly comprehended, one set of ingredients and 70 proportions with which excellent results have been obtained will be enumerated, but Prior to this invention, attempts have it is to be understood that it is not desired been made to provide asphaltic or like to limit the invention to the particular in-hydrocarbonaceous surfaces with a light gredients and proportions recited.

Cellulose nitrate or products containing essentially cellulose nitrate, such as some photographic films, celluloid, etc., is dissolved in acetone in a manner well known, and to this solution is then added enough 80 ethyl alcohol to produce a solution of the following proportions, to wit: 10 parts by weight cellulose nitrate, 25 parts by weight acetone, 70 parts by weight ethyl alcohol, parts by weight castor oil. 5

To this is then added 10 parts by weight of aluminum resinate and the whole is stirred until the resinate is dissolved. To this solution is then added 10 parts by weight of powdered aluminum and 5 parts 90 by weight of green pigment, finely ground in alcohol. The whole is then thoroughly stirred together. By thinning this composition with a mixture of alcohol 70 parts and acetone 30 parts, it is possible to get a 95 liquid of a consistency which may be brushed onto the asphaltic surface either mechanically or by hand, or it may be sprayed onto the surface or the asphaltic article may be dipped into it, the idea being 100 to uniformly coat the asphaltic surface with the liquid described. Upon standing the volatile part of the solution evaporates leaving a tough uniform film over the asphaltic surface which is light green in 105 color and which has not been darkened or streaked by the constituents of the asphalt upon which the film was produced.

of the cellulose nitrate and pigments, but has in addition a filler (aluminum resinate) which gives body to the film and which aids 5 in preventing the so-called "blushing" of the film during the evaporation of the solvents.

In the above formula it will be seen that the alcohol which is a non-solvent for the 10 asphalt, is present in the composition or paint materially in excess of the solvent for the cellulose base, so as to render the said solvent inactive or passive on the asphalt, yet is not in such excess as to precipitate the 15 cellulose from its solution.

The film or layer above described, not only provides the black asphalt or like material with a light colored attractive surface, which is not streaked or otherwise dis-20 colored by the black color of the asphalt, but also forms when the solvent has evaporated a tough and durable weather resisting surface which is not tacky and which pre-

vents sticking. 25Instead of the light green pigment or

color, any other pigment or color suitable for giving a light color, such as white, French gray or the like can be used. So also any suitable pigment or color for giv-<sup>50</sup> ing a dark color, such as red, brown, etc., may be used when a dark color is desired

and a clearer and better dark colored surface obtained.

The advantages of the invention are par- $^{35}$  ticularly noticeable when a light colored film or layer is desired.

When cellulose acetate is used in producing the film or layer, the same principle of maintaining an adequate percentage of non-

40 solvent for asphalt in the solution of the cellulose acetate during the evaporation of the solvents to produce a satisfactory film on asphalt or the like is observed.

The light colored film is especially adapted 45among other uses to be formed on asphaltic or like surfaces of metal articles and particularly metal sheets.

Fig. 1 represents a plan view of a protected metal sheet provided with a light 50 colored exterior surface layer or film, and

Fig. 2, a section of Fig. 1 on the line 2-

Referring to the drawing, a represents a metal sheet provided with a protective layer 55b of asphalt, bitumen or the like, and c represents the light colored film or layer affixed to the asphalt surface. A light green film cis represented in the drawing. A metal 60 65 presents a highly attractive appearance, be- surface.

The film so produced consists essentially sides being durable, weather-resisting and capable of being shipped without sticking together or softening under summer temperatures. So also, the light colored film is tough, firm and does not crack or "alligator" 70 and serves as a protective layer for the asphalt, and can be painted with the ordinary drying oil paint, as the latter is prevented from being discolored by the asphalt.

> Inasmuch as the film or layer c may be ap- 75 plied to the asphalt surface in any suitable manner as above pointed out, it is particularly serviceable as a paint to be applied by hand to roofs or other articles or structures of any material, which is covered with a 80 layer of asphalt or the like.

While it may and will be preferred to make the light colored composition as a paint in which the non-solvent for the asphalt and the like is present in the paint, it 85 is not desired to limit the present invention in this respect, as it is possible to apply the non-solvent to the asphalt surface and then apply the cellulose colored solution to the article thus treated and obtain the light 90 colored film or layer desired.

It is to be understood that the physical properties of the cellulose base may be modified as desired by the addition to the cellulose solution of other materials, such as  $^{95}$ triphenylphosphate, to reduce the inflammability, and camphor, castor oil, etc. to increase the flexibility or otherwise modify the physical characteristics of the cellulose, so long as they are not used in sufficient quan- 100 tity to cause the film to appreciably dissolve the underlying asphalt or become discolored by it.

So also, resins, such as soft copals, sandarac, shellac or the resinates such as alumi- 105 nium or zinc, may be added to the cellulose solution if desired.

In the foregoing specification, I disclose a form of building material comprising a base, an asphaltic or like hydrocarbonaceous 110 surface on the base, and a continuous insoluble layer comprising a metallic substance in the metallic state and formed as a part of said building material which is impervious 115 to asphaltic oils.

The particular use of a metallic substance in the metallic state as a part of the continuous layer is not, however, specifically claimed in the present application, but is claimed in my co-pending application, Se-rial No. 523,359, filed December 19, 1921. Claims.

1. The combination with an article having sheet protected by asphalt and having a an asphaltic or like hydrocarbonaceous sur-light green, white, French gray, or other face, of a light-colored, flexible, thin layer light colored exterior surface, which is free or film affixed directly to said asphaltic sur-125 or substantially free from discoloration, is face to contact therewith and having a base highly useful in the building arts, especially and a light-colored pigment whose color is for roofs, sidings, shingles and the like and substantially unaffected by said asphaltic

an asphaltic or like hydrocarbonaceous sur-face, of a colored, flexible, thin layer or film affixed directly to said asphaltic surface to contact therewith and having a cellulose base and a colored pigment, whose color is substantially unaffected by said asphaltic surface.

• ing an asphaltic or like hydrocarbonaceous surface, of a light-colored, flexible, thin layer or film affixed directly to said asphaltic sur-face to contact therewith and having a cellulose derivative as a base and a light-colored 15

surface. 4. The combination with a metal article name to this specification.

provided with a coating of asphalt or like

2. The combination with an article having hydrocarbonaceous material, of a light-col- 20 ored flexible, thin layer or film affixed directly to said asphaltic or like coating to contact therewith and having a base and a light colored pigment carried by said base and whose color is substantially unaffected 25 by said asphaltic coating.

5. The combination with an article having 3. The combination with an article hav- an asphaltic or like hydrocarbonaceous surface, of a flexible, thin film or layer of cellulose derivative affixed directly to said as- 30 phaltic surface to contact therewith and form thereon a protective coating which is insoluble in water, weather-resisting, firm, pigment carried by said base and substan- durable, non-tacky and substantially unaf-tially unaffected in color by said asphaltic fected by said asphaltic surface. 35

In testimony whereof I have signed my JAMES HOWARD YOUNG.
