(54) Titre : COMPOSES DE MONOMETHYLVALINE CAPABLES DE CONJUGAISON AUX LIGANDS

(54) Title: MONOMETHYLVALINE COMPOUNDS CAPABLE OF CONJUGATION TO LIGANDS

(57) Abrégé/Abstract:

Auristatin peptides, including MeVal-Val-Dil-Dap-Norephedrine (MMAE) and MeVal-Val-Dil-Dap-Phe (MMAF), were prepared and attached to Ligands through various linkers, including maleimidocaproyl-val-cit-PAB. The resulting ligand drug conjugates were active in vitro and in vivo.

(72) Inventeurs(suite)/Inventors(continued): SLIWKOWSKI, MARK X., US; SPENCER, SUSAN D., US

## ABSTRACT

Auristatin peptides, including MeVal-Val-Dil-Dap-Norephedrine (MMAE) and MeVal-Val-Dil-Dap-Phe (MMAF), were prepared and attached to Ligands through various linkers, including maleimidocaproyl-val-cit-PAB. The resulting ligand drug conjugates were active *in vitro and in vivo*.

# MONOMETHYLVALINE COMPOUNDS CAPABLE OF CONJUGATION TO LIGANDS

## CONTINUITY

5

10

### 1. FIELD OF THE INVENTION

The present invention is directed to a Drug Compound and more particularly to Drug-Linker-Ligand Conjugates, Drug-Linker Compounds, and Drug-Ligand Conjugates, to compositions including the same, and to methods for using the same to treat cancer, an autoimmune disease or an infectious disease. The present invention is also directed to antibody-drug conjugates, to compositions including the same, and to methods for using the same to treat cancer, an autoimmune disease or an infectious disease. The invention also relates to methods of using antibody-drug conjugate compounds for *in vitro*, *in situ*, and *in vivo* diagnosis or treatment of mammalian cells, or associated pathological conditions.

20

### 2. BACKGROUND OF THE INVENTION

Improving the delivery of drugs and other agents to target cells, tissues and tumors to achieve maximal efficacy and minimal toxicity has been the focus of considerable research for many years. Though many attempts have been made to develop effective methods for importing biologically active molecules into cells, both *in vivo* and *in vitro*, none has proved to be entirely satisfactory. Optimizing the association of the drug with its intracellular target, while minimizing intercellular redistribution of the drug, *e.g.*, to neighboring cells, is often difficult or inefficient.

25

30

Most agents currently administered to a patient parenterally are not targeted, resulting in systemic delivery of the agent to cells and tissues of the body where it is unnecessary, and often undesirable. This may result in adverse drug side effects, and

often limits the dose of a drug (*e.g.*, chemotherapeutic (anti-cancer), cytotoxic, enzyme inhibitor agents and antiviral or antimicrobial drugs) that can be administered. By comparison, although oral administration of drugs is considered to be a convenient and economical mode of administration, it shares the same concerns of non-specific toxicity to unaffected cells once the drug has been absorbed into the systemic circulation. Further complications involve problems with oral bioavailability and residence of drug in the gut leading to additional exposure of gut to the drug and hence risk of gut toxicities. Accordingly, a major goal has been to develop methods for specifically targeting agents to cells and tissues. The benefits of such treatment include avoiding the general physiological effects of inappropriate delivery of such agents to other cells and tissues, such as uninfected cells. Intracellular targeting may be achieved by methods, compounds and formulations which allow accumulation or retention of biologically active agents, *i.e.* active metabolites, inside cells.

Monoclonal antibody therapy has been established for the targeted treatment of patients with cancer, immunological and angiogenic disorders.

The use of antibody-drug conjugates for the local delivery of cytotoxic or cytostatic agents, *e.g.*, drugs to kill or inhibit tumor cells in the treatment of cancer (Syrigos and Epenetos (1999) *Anticancer Research* 19:605-614; Niculescu-Duvaz and Springer (1997) *Adv. Drg. Del. Rev.* 26:151-172; U.S. Patent No. 4975278) theoretically allows targeted delivery of the drug moiety to tumors, and intracellular accumulation therein, while systemic administration of these unconjugated drug agents may result in unacceptable levels of toxicity to normal cells as well as the tumor cells sought to be eliminated (Baldwin *et al.*, 1986, *Lancet* pp. (Mar. 15, 1986):603-05; Thorpe, 1985, "Antibody Carriers Of Cytotoxic Agents In Cancer Therapy: A Review," in *Monoclonal Antibodies '84: Biological And Clinical Applications*, A. Pinchera *et al.* (ed.s), pp. 475-506). Maximal efficacy with minimal toxicity is sought thereby. Both polyclonal antibodies and monoclonal antibodies have been reported as useful in these strategies (Rowland *et al.*, 1986, *Cancer Immunol. Immunother.* 21:183-87). Drugs used in these methods include daunomycin, doxorubicin, methotrexate, and vindesine (Rowland *et al.*, 1986, *supra*). Toxins used in antibody-toxin conjugates include bacterial toxins such as diphtheria toxin, plant toxins such as ricin, small molecule toxins such as geldanamycin (Kerr *et al.*, 1997, *Bioconjugate Chem.* 8(6):781-784; Mandler *et al.* (2000) *Jour. of the Nat. Cancer Inst.* 92(19):1573-1581; Mandler *et al.* (2000) *Bioorganic & Med. Chem.*

Letters 10:1025-1028; Mandler *et al.* (2002) *Bioconjugate Chem.* 13:786-791), maytansinoids (EP 1391213; Liu *et al.*, (1996) *Proc. Natl. Acad. Sci. USA* 93:8618-8623), and calicheamicin (Lode *et al.* (1998) *Cancer Res.* 58:2928; Hinman *et al.* (1993) *Cancer Res.* 53:3336-3342). The toxins may affect their cytotoxic and cytostatic effects  
5 by mechanisms including tubulin binding, DNA binding, or topoisomerase inhibition (Meyer, D.L. and Senter, P.D. "Recent Advances in Antibody Drug Conjugates for Cancer Therapy" in *Annual Reports in Medicinal Chemistry*, Vol 38 (2003) Chapter 23, 229-237). Some cytotoxic drugs tend to be inactive or less active when conjugated to large antibodies or protein receptor ligands.

10                   ZEVALIN® (ibritumomab tiuxetan, Biogen/Idex) is an antibody-radioisotope conjugate composed of a murine IgG1 kappa monoclonal antibody directed against the CD20 antigen found on the surface of normal and malignant B lymphocytes and <sup>111</sup>In or <sup>90</sup>Y radioisotope bound by a thiourea linker-chelator (Wiseman *et al.* (2000) *Eur. Jour. Nucl. Med.* 27(7):766-77; Wiseman *et al.* (2002) *Blood* 99(12):4336-42;  
15 Witzig *et al.* (2002) *J. Clin. Oncol.* 20(10):2453-63; Witzig *et al.* (2002) *J. Clin. Oncol.* 20(15):3262-69). Although ZEVALIN has activity against B-cell non-Hodgkin's Lymphoma (NHL), administration results in severe and prolonged cytopenias in most patients. MYLOTARG™ (gemtuzumab ozogamicin, Wyeth Pharmaceuticals), an antibody drug conjugate composed of a hu CD33 antibody linked to calicheamicin, was  
20 approved in 2000 for the treatment of acute myeloid leukemia by injection (Drugs of the Future (2000) 25(7):686; U.S. Patent Nos. 4970198; 5079233; 5585089; 5606040; 5693762; 5739116; 5767285; 5773001). Cantuzumab mertansine (Immunogen, Inc.), an antibody drug conjugate composed of the huC242 antibody linked via the disulfide linker SPP to the maytansinoid drug moiety, DM1, is advancing into Phase II trials for the  
25 treatment of cancers that express CanAg, such as colon, pancreatic, gastric, and others. MLN-2704 (Millennium Pharm., BZL Biologics, Immunogen Inc.), an antibody drug conjugate composed of the anti-prostate specific membrane antigen (PSMA) monoclonal antibody linked to the maytansinoid drug moiety, DM1, is under development for the potential treatment of prostate tumors. The same maytansinoid drug moiety, DM1, was  
30 linked through a non-disulfide linker, SMCC, to a mouse murine monoclonal antibody, TA.1 (Chari *et al.* (1992) *Cancer Research* 52:127-131). This conjugate was reported to be 200-fold less potent than the corresponding disulfide linker conjugate. The SMCC linker was considered therein to be "noncleavable."

Several short peptidic compounds have been isolated from the marine mollusc *Dolabella auricularia* and found to have biological activity (Pettit *et al.* (1993) Tetrahedron 49:9151; Nakamura *et al.* (1995) Tetrahedron Letters 36:5059-5062; Sone *et al.* (1995) Jour. Org Chem. 60:4474). Analogs of these compounds have also been prepared, and some were found to have biological activity (for a review, see Pettit *et al.* (1998) Anti-Cancer Drug Design 13:243-277). For example, auristatin E (U.S. Patent No. 5635483) is a synthetic analogue of the marine natural product Dolastatin 10, an agent that inhibits tubulin polymerization by binding to the same domain on tubulin as the anticancer drug vincristine (G. R. Pettit, (1997) Prog. Chem. Org. Nat. Prod. 70:1-79).  
5 Dolastatin 10, auristatin PE, and auristatin E are linear peptides having four amino acids, three of which are unique to the dolastatin class of compounds, and a C-terminal amide.

The auristatin peptides, auristatin E (AE) and monomethylauristatin (MMAE), synthetic analogs of dolastatin, were conjugated to: (i) chimeric monoclonal antibodies cBR96 (specific to Lewis Y on carcinomas); (ii) cAC10 which is specific to  
15 CD30 on hematological malignancies (Klussman, *et al.* (2004), Bioconjugate Chemistry 15(4):765-773; Doronina *et al.* (2003) Nature Biotechnology 21(7):778-784; "Monomethylvaline Compounds Capable of Conjugation to Ligands"; Francisco *et al.* (2003) Blood 102(4):1458-1465; U.S. Publication 2004/0018194; (iii) anti-CD20 antibodies such as RITUXAN® (WO 04/032828) for the treatment of CD20-expressing  
20 cancers and immune disorders; (iv) anti-EphB2 antibodies 2H9 and anti-IL-8 for treatment of colorectal cancer (Mao, *et al.* (2004) Cancer Research 64(3):781-788); (v) E-selectin antibody (Bhaskar *et al.* (2003) Cancer Res. 63:6387-6394); and (vi) other anti-CD30 antibodies (WO 03/043583).

Auristatin E conjugated to monoclonal antibodies are disclosed in Senter *et al.*, Proceedings of the American Association for Cancer Research, Volume 45, Abstract  
25 Number 623, presented March 28, 2004.

Despite *in vitro* data for compounds of the dolastatin class and its analogs, significant general toxicities at doses required for achieving a therapeutic effect compromise their efficacy in clinical studies. Accordingly, there is a clear need in the art  
30 for dolastatin/auristatin derivatives having significantly lower toxicity, yet useful therapeutic efficiency. These and other limitations and problems of the past are addressed by the present invention.

The ErbB family of receptor tyrosine kinases are important mediators of cell growth, differentiation and survival. The receptor family includes four distinct members including epidermal growth factor receptor (EGFR, ErbB1, HER1), HER2 (ErbB2 or p185<sup>neu</sup>), HER3 (ErbB3) and HER4 (ErbB4 or tyro2). A panel of anti-ErbB2 antibodies has been characterized using the human breast tumor cell line SKBR3 (Hudziak *et al.*, (1989) *Mol. Cell. Biol.* 9(3):1165-1172. Maximum inhibition was obtained with the antibody called 4D5 which inhibited cellular proliferation by 56%. Other antibodies in the panel reduced cellular proliferation to a lesser extent in this assay. The antibody 4D5 was further found to sensitize ErbB2-overexpressing breast tumor cell lines to the cytotoxic effects of TNF- $\alpha$  (U.S. Patent No. 5677171). The anti-ErbB2 antibodies discussed in Hudziak *et al.* are further characterized in Fendly *et al.* (1990) *Cancer Research* 50:1550-1558; Kotts *et al.* (1990) *In vitro* 26(3):59A; Sarup *et al.* (1991) *Growth Regulation* 1:72-82; Shepard *et al.* J. (1991) *Clin. Immunol.* 11(3):117-127; Kumar *et al.* (1991) *Mol. Cell. Biol.* 11(2):979-986; Lewis *et al.* (1993) *Cancer Immunol. Immunother.* 37:255-263; Pietras *et al.* (1994) *Oncogene* 9:1829-1838; Vitetta *et al.* (1994) *Cancer Research* 54:5301-5309; Sliwkowski *et al.* (1994) *J. Biol. Chem.* 269(20):14661-14665; Scott *et al.* (1991) *J. Biol. Chem.* 266:14300-5; D'souza *et al.* *Proc. Natl. Acad. Sci.* (1994) 91:7202-7206; Lewis *et al.* (1996) *Cancer Research* 56:1457-1465; and Schaefer *et al.* (1997) *Oncogene* 15:1385-1394.

Other anti-ErbB2 antibodies with various properties have been described in Tagliabue *et al.* *Int. J. Cancer* 47:933-937 (1991); McKenzie *et al.* *Oncogene* 4:543-548 (1989); Maier *et al.* *Cancer Res.* 51:5361-5369 (1991); Bacus *et al.* *Molecular Carcinogenesis* 3:350-362 (1990); Stancovski *et al.* *Proc. Natl. Acad. Sci. USA* 88:8691-8695 (1991); Bacus *et al.* *Cancer Research* 52:2580-2589 (1992); Xu *et al.* *Int. J. Cancer* 53:401-408 (1993); WO94/00136; Kasprzyk *et al.* *Cancer Research* 52:2771-2776 (1992); Hancock *et al.* (1991) *Cancer Res.* 51:4575-4580; Shawver *et al.* (1994) *Cancer Res.* 54:1367-1373; Arteaga *et al.* (1994) *Cancer Res.* 54:3758-3765; Harwerth *et al.* (1992) *J. Biol. Chem.* 267:15160-15167; U.S. Patent No. 5783186; and Klapper *et al.* (1997) *Oncogene* 14:2099-2109.

Homology screening has resulted in the identification of two other ErbB receptor family members; ErbB3 (U.S. Patent No. 5,183,884; U.S. Patent No. 5,480,968; KraU.S. *et al.* (1989) *Proc. Natl. Acad. Sci. USA* 86:9193-9197) and ErbB4 (EP 599274; Plowman *et al.* (1993) *Proc. Natl. Acad. Sci. USA* 90:1746-1750; and Plowman *et al.*

(1993) Nature 366:473-475). Both of these receptors display increased expression on at least some breast cancer cell lines.

HERCEPTIN® (Trastuzumab) is a recombinant DNA-derived humanized monoclonal antibody that selectively binds with high affinity in a cell-based assay (K<sub>d</sub> = 5 nM) to the extracellular domain of the human epidermal growth factor receptor2 protein, HER2 (ErbB2) (U.S. Patent No. 5821337; U.S. Patent No. 6054297; U.S. Patent No. 6407213; U.S. Patent No. 6639055; Coussens L, *et al.* (1985) Science 230:1132-9; Slamon DJ, *et al.* (1989) Science 244:707-12). Trastuzumab is an IgG1 kappa antibody that contains human framework regions with the complementarity-determining regions of a murine antibody (4D5) that binds to HER2. Trastuzumab binds to the HER2 antigen and thus inhibits the growth of cancerous cells. Because Trastuzumab is a humanized antibody, it minimizes any HAMA response in patients. The humanized antibody against HER2 is produced by a mammalian cell (Chinese Hamster Ovary, CHO) suspension culture. The HER2 (or c-erbB2) proto-oncogene encodes a transmembrane receptor protein of 185kDa, which is structurally related to the epidermal growth factor receptor. HER2 protein overexpression is observed in 25%–30% of primary breast cancers and can be determined using an immunohistochemistry based assessment of fixed tumor blocks (Press MF, *et al.* (1993) Cancer Res 53:4960-70. Trastuzumab has been shown, in both *in vitro* assays and in animals, to inhibit the proliferation of human tumor cells that overexpress HER2 (Hudziak RM, *et al.* (1989) Mol Cell Biol 9:1165-72; Lewis GD, *et al.* (1993) Cancer Immunol Immunother; 37:255-63; Baselga J, *et al.* (1998) Cancer Res. 58:2825-2831). Trastuzumab is a mediator of antibody-dependent cellular cytotoxicity, ADCC (Hotelling TE, *et al.* (1996) [abstract]. Proc. Annual Meeting Am Assoc Cancer Res; 37:471; Pegram MD, *et al.* (1997) [abstract]. Proc Am Assoc Cancer Res; 38:602). *In vitro*, Trastuzumab mediated ADCC has been shown to be preferentially exerted on HER2 overexpressing cancer cells compared with cancer cells that do not overexpress HER2. HERCEPTIN® as a single agent is indicated for the treatment of patients with metastatic breast cancer whose tumors overexpress the HER2 protein and who have received one or more chemotherapy regimens for their metastatic disease. HERCEPTIN® in combination with paclitaxel is indicated for treatment of patients with metastatic breast cancer whose tumors overexpress the HER2 protein and who have not received chemotherapy for their metastatic disease. HERCEPTIN® is clinically active in

patients with ErbB2-overexpressing metastatic breast cancers that have received extensive prior anti-cancer therapy (Baselga et al, (1996) J. Clin. Oncol. 14:737-744).

The murine monoclonal anti-HER2 antibody inhibits the growth of breast cancer cell lines that overexpress HER2 at the 2+ and 3+ ( $1-2 \times 10^6$  HER2 receptors per cell) level, but has no activity on cells that express lower levels of HER2 (Lewis *et al.*, (1993) Cancer Immunol. Immunother. 37:255-263). Based on this observation, antibody 4D5 was humanized (huMAb4D5-8, rhuMAb HER2, U.S. Patent No. 5821337; Carter *et al.*, (1992) Proc. Natl. Acad. Sci. USA 89: 4285-4289) and tested in breast cancer patients whose tumors overexpress HER2 but who had progressed after conventional chemotherapy (Cobleigh *et al.*, (1999) J. Clin. Oncol. 17: 2639-2648).

Although HERCEPTIN is a breakthrough in treating patients with ErbB2-overexpressing breast cancers that have received extensive prior anti-cancer therapy, some patients in this population fail to respond or respond only poorly to HERCEPTIN treatment.

Therefore, there is a significant clinical need for developing further HER2-directed cancer therapies for those patients with HER2-overexpressing tumors or other diseases associated with HER2 expression that do not respond, or respond poorly, to HERCEPTIN treatment.

The recitation of any reference in this application is not an admission that the reference is prior art to this application.

### 3. SUMMARY OF THE INVENTION

In one aspect, the present invention provides Drug-Linker-Ligand compounds having the Formula Ia:

or a pharmaceutically acceptable salt or solvate thereof

wherein,

L- is a Ligand unit;

-A<sub>a</sub>-W<sub>w</sub>-Y<sub>y</sub>- is a Linker unit (LU), wherein the Linker unit includes:

-A- is a Stretcher unit,

a is 0 or 1,

each -W- is independently an Amino Acid unit,

w is an integer ranging from 0 to 12,

-Y- is a Spacer unit, and

y is 0, 1 or 2;

5

p ranges from 1 to about 20; and

-D is a Drug unit having the Formulas D<sub>E</sub> and D<sub>F</sub>:

10

wherein, independently at each location:

R<sup>2</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>3</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

15

R<sup>4</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

R<sup>5</sup> is selected from H and methyl;

20

or R<sup>4</sup> and R<sup>5</sup> jointly form a carbocyclic ring and have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl and C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected from 2, 3, 4, 5 and 6;

R<sup>6</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

WO 2005/081711

PCT/US2004/038392

$R^7$  is selected from H,  $C_1-C_8$  alkyl,  $C_3-C_8$  carbocycle, aryl,  $C_1-C_8$  alkyl-aryl,  $C_1-C_8$  alkyl- $(C_3-C_8$  carbocycle),  $C_3-C_8$  heterocycle and  $C_1-C_8$  alkyl- $(C_3-C_8$  heterocycle);

each  $R^8$  is independently selected from H, OH,  $C_1-C_8$  alkyl,  $C_3-C_8$  carbocycle and O- $(C_1-C_8$  alkyl);

$R^9$  is selected from H and  $C_1-C_8$  alkyl;

$R^{10}$  is selected from aryl or  $C_3-C_8$  heterocycle;

Z is O, S, NH, or  $NR^{12}$ , wherein  $R^{12}$  is  $C_1-C_8$  alkyl;

$R^{11}$  is selected from H,  $C_1-C_{20}$  alkyl, aryl,  $C_3-C_8$  heterocycle,  $-(R^{13}O)_m-R^{14}$ , or  $-(R^{13}O)_m-CH(R^{15})_2$ ;

m is an integer ranging from 1-1000;

$R^{13}$  is  $C_2-C_8$  alkyl;

$R^{14}$  is H or  $C_1-C_8$  alkyl;

each occurrence of  $R^{15}$  is independently H, COOH,  $-(CH_2)_n-N(R^{16})_2$ ,  $-(CH_2)_n-SO_3H$ , or  $-(CH_2)_n-SO_3-C_1-C_8$  alkyl;

each occurrence of  $R^{16}$  is independently H,  $C_1-C_8$  alkyl, or  $-(CH_2)_n-COOH$ ; where; n is an integer ranging from 0 to 6; and

$R^{18}$  is selected from  $-C(R^8)_2-C(R^8)_2$ -aryl,  $-C(R^8)_2-C(R^8)_2$ - $(C_3-C_8$  heterocycle), and  $-C(R^8)_2-C(R^8)_2$ - $(C_3-C_8$  carbocycle).

20

In another aspect, Drug Compounds having the Formula **Ib** are provided:

or pharmaceutically acceptable salts or solvates thereof,

25

wherein:

$R^2$  is selected from hydrogen and  $-C_1-C_8$  alkyl;

$R^3$  is selected from hydrogen,  $-C_1-C_8$  alkyl,  $-C_3-C_8$  carbocycle, aryl,  $-C_1-C_8$  alkyl-aryl,  $-C_1-C_8$  alkyl- $(C_3-C_8$  carbocycle),  $-C_3-C_8$  heterocycle and  $-C_1-C_8$  alkyl- $(C_3-C_8$  heterocycle);

5  $R^4$  is selected from hydrogen,  $-C_1-C_8$  alkyl,  $-C_3-C_8$  carbocycle, -aryl,  $-C_1-C_8$  alkyl-aryl,  $-C_1-C_8$  alkyl- $(C_3-C_8)$  carbocycle),  $-C_3-C_8$  heterocycle and  $-C_1-C_8$  alkyl- $(C_3-C_8)$  heterocycle) wherein  $R^5$  is selected from -H and -methyl; or  $R^4$  and  $R^5$  jointly, have the formula  $-(CR^aR^b)_n-$  wherein  $R^a$  and  $R^b$  are independently selected from -H,  $-C_1-C_8$  alkyl and  $-C_3-C_8$  carbocycle and n is selected from 2, 3, 4, 5 and 6, and form a ring with the carbon atom to which they are attached;

$R^6$  is selected from H and  $-C_1-C_8$  alkyl;

10  $R^7$  is selected from H,  $-C_1-C_8$  alkyl,  $-C_3-C_8$  carbocycle, aryl,  $-C_1-C_8$  alkyl-aryl,  $-C_1-C_8$  alkyl- $(C_3-C_8)$  carbocycle),  $-C_3-C_8$  heterocycle and  $-C_1-C_8$  alkyl- $(C_3-C_8)$  heterocycle);

each  $R^8$  is independently selected from H, -OH,  $-C_1-C_8$  alkyl,  $-C_3-C_8$  carbocycle and  $-O-(C_1-C_8)$  alkyl);

$R^9$  is selected from H and  $-C_1-C_8$  alkyl;

$R^{10}$  is selected from aryl group or  $-C_3-C_8$  heterocycle;

15 Z is -O-, -S-, -NH-, or  $-NR^{12}-$ , wherein  $R^{12}$  is  $C_1-C_8$  alkyl;

$R^{11}$  is selected from H,  $C_1-C_{20}$  alkyl, aryl,  $-C_3-C_8$  heterocycle,  $-(R^{13}O)_m-$ ,  $R^{14}$ , or  $-(R^{13}O)_m-CH(R^{15})_2$ ;

m is an integer ranging from 1-1000;

$R^{13}$  is  $-C_2-C_8$  alkyl;

20  $R^{14}$  is H or  $-C_1-C_8$  alkyl;

each occurrence of  $R^{15}$  is independently H, -COOH,  $-(CH_2)_n-N(R^{16})_2$ ,  $-(CH_2)_n-SO_3H$ , or  $-(CH_2)_n-SO_3-C_1-C_8$  alkyl;

each occurrence of  $R^{16}$  is independently H,  $-C_1-C_8$  alkyl, or  $-(CH_2)_n-COOH$ ; and

25 n is an integer ranging from 0 to 6.

The compounds of Formula (Ib) are useful for treating cancer, an autoimmune disease or an infectious disease in a patient or useful as an intermediate for the synthesis of a Drug-Linker, Drug-Linker-Ligand Conjugate, and Drug-Ligand Conjugate having a cleavable Drug unit.

30 In another aspect, compositions are provided including an effective amount of a Drug-Linker-Ligand Conjugate and a pharmaceutically acceptable carrier or vehicle.

WO 2005/081711

PCT/US2004/038392

In still another aspect, the invention provides pharmaceutical compositions comprising an effective amount of a Drug-Linker Compound and a pharmaceutically acceptable carrier or vehicle.

5 In still another aspect, the invention provides compositions comprising an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate and a pharmaceutically acceptable carrier or vehicle.

In yet another aspect, the invention provides methods for killing or inhibiting the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

10 In another aspect, the invention provides methods for killing or inhibiting the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Linker-Ligand Conjugate.

In another aspect, the invention provides methods for killing or inhibiting the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

15 In still another aspect, the invention provides methods for treating cancer including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

20 In yet another aspect, the invention provides methods for treating cancer including administering to a patient in need thereof an effective amount of a Drug-Linker-Ligand Conjugate.

In yet another aspect, the invention provides methods for treating cancer including administering to a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

25 In still another aspect, the invention provides methods for killing or inhibiting the replication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

30 In another aspect, the invention provides methods for killing or inhibiting the replication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Linker-Ligand Conjugate.

WO 2005/081711

PCT/US2004/038392

In another aspect, the invention provides methods for killing or inhibiting the replication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

5 In yet another aspect, the invention provides methods for treating an autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

In yet another aspect, the invention provides methods for treating an autoimmune disease including administering to a patient in need thereof an effective  
10 amount of a Drug-Linker-Ligand Conjugate.

In yet another aspect, the invention provides methods for treating an autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

15 In still another aspect, the invention provides methods for treating an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

In still another aspect, the invention provides methods for treating an infectious disease including administering to a patient in need thereof an effective amount  
20 of a Drug-Linker-Ligand Conjugate.

In still another aspect, the invention provides methods for treating an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

25 In yet another aspect, the invention provides methods for preventing the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

In another aspect, the invention provides methods for preventing the multiplication of a tumor cell or cancer cell including administering to a patient in need  
30 thereof an effective amount of a Drug-Linker-Ligand Conjugate.

In another aspect, the invention provides methods for preventing the multiplication of a tumor cell or cancer cell including administering to a patient in need

WO 2005/081711

PCT/US2004/038392

thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

In still another aspect, the invention provides methods for preventing cancer including administering to a patient in need thereof an effective amount of a Drug-  
5 Linker Compound.

In yet another aspect, the invention provides methods for preventing cancer including administering to a patient in need thereof an effective amount of a Drug-Linker-Ligand Conjugate.

In yet another aspect, the invention provides methods for preventing  
10 cancer including administering to a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

In still another aspect, the invention provides methods for preventing the multiplication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

In another aspect, the invention provides methods for preventing the  
15 multiplication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Linker-Ligand Conjugate.

In another aspect, the invention provides methods for preventing the multiplication of a cell that expresses an autoimmune antibody including administering to  
20 a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

In yet another aspect, the invention provides methods for preventing an autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

In yet another aspect, the invention provides methods for preventing an  
25 autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Linker-Ligand Conjugate.

In yet another aspect, the invention provides methods for preventing an autoimmune disease including administering to a patient in need thereof an effective  
30 amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

WO 2005/081711

PCT/US2004/038392

In still another aspect, the invention provides methods for preventing an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Linker Compound.

5 In still another aspect, the invention provides methods for preventing an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Linker-Ligand Conjugate.

10 In still another aspect, the invention provides methods for preventing an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate.

In another aspect, a Drug Compound is provided which can be used as an intermediate for the synthesis of a Drug-Linker Compound having a cleavable Drug unit from the Drug-Ligand Conjugate.

15 In another aspect, a Drug-Linker Compound is provided which can be used as an intermediate for the synthesis of a Drug-Linker-Ligand Conjugate.

In another aspect, compounds having having Formula Ia' are provided:

or a pharmaceutically acceptable salt or solvate thereof, wherein:

20 Ab includes an antibody including one which binds to to CD30, CD40, CD70, and Lewis Y antigen,

A is a Stretcher unit,

a is 0 or 1,

each W is independently an Amino Acid unit,

w is an integer ranging from 0 to 12,

25 Y is a Spacer unit, and

y is 0, 1 or 2,

p ranges from 1 to about 20, and

D is a Drug unit selected from Formulas D<sub>E</sub> and D<sub>F</sub>:

- 5                    wherein, independently at each location:  
                      $R^2$  is selected from H and  $C_1-C_8$  alkyl;  
                      $R^3$  is selected from H,  $C_1-C_8$  alkyl,  $C_3-C_8$  carbocycle, aryl,  $C_1-C_8$  alkyl-  
 10                    aryl,  $C_1-C_8$  alkyl- $(C_3-C_8$  carbocycle),  $C_3-C_8$  heterocycle and  $C_1-C_8$  alkyl- $(C_3-C_8$   
                     heterocycle);  
                      $R^4$  is selected from H,  $C_1-C_8$  alkyl,  $C_3-C_8$  carbocycle, aryl,  $C_1-C_8$  alkyl-  
 15                    aryl,  $C_1-C_8$  alkyl- $(C_3-C_8$  carbocycle),  $C_3-C_8$  heterocycle and  $C_1-C_8$  alkyl- $(C_3-C_8$   
                     heterocycle);  
                      $R^5$  is selected from H and methyl;  
                     or  $R^4$  and  $R^5$  jointly form a carbocyclic ring and have the formula  
 20                     $-(CR^aR^b)_n$  wherein  $R^a$  and  $R^b$  are independently selected from H,  $C_1-C_8$  alkyl and  $C_3-C_8$   
                     carbocycle and n is selected from 2, 3, 4, 5 and 6;  
                      $R^6$  is selected from H and  $C_1-C_8$  alkyl;  
                      $R^7$  is selected from H,  $C_1-C_8$  alkyl,  $C_3-C_8$  carbocycle, aryl,  $C_1-C_8$  alkyl-  
 25                    aryl,  $C_1-C_8$  alkyl- $(C_3-C_8$  carbocycle),  $C_3-C_8$  heterocycle and  $C_1-C_8$  alkyl- $(C_3-C_8$   
                     heterocycle);  
                     each  $R^8$  is independently selected from H, OH,  $C_1-C_8$  alkyl,  $C_3-C_8$   
                     carbocycle and O- $(C_1-C_8$  alkyl);  
                      $R^9$  is selected from H and  $C_1-C_8$  alkyl;  
                      $R^{10}$  is selected from aryl or  $C_3-C_8$  heterocycle;  
                     Z is O, S, NH, or  $NR^{12}$ , wherein  $R^{12}$  is  $C_1-C_8$  alkyl;

WO 2005/081711

PCT/US2004/038392

$R^{11}$  is selected from H,  $C_1$ - $C_{20}$  alkyl, aryl,  $C_3$ - $C_8$  heterocycle,  $-(R^{13}O)_m-R^{14}$ , or  $-(R^{13}O)_m-CH(R^{15})_2$ ;

$m$  is an integer ranging from 1-1000;

$R^{13}$  is  $C_2$ - $C_8$  alkyl;

5  $R^{14}$  is H or  $C_1$ - $C_8$  alkyl;

each occurrence of  $R^{15}$  is independently H, COOH,  $-(CH_2)_n-N(R^{16})_2$ ,  $-(CH_2)_n-SO_3H$ , or  $-(CH_2)_n-SO_3-C_1-C_8$  alkyl;

each occurrence of  $R^{16}$  is independently H,  $C_1$ - $C_8$  alkyl, or  $-(CH_2)_n$ -COOH;

10  $R^{18}$  is selected from  $-C(R^8)_2-C(R^8)_2$ -aryl,  $-C(R^8)_2-C(R^8)_2$ -( $C_3$ - $C_8$  heterocycle), and  $-C(R^8)_2-C(R^8)_2$ -( $C_3$ - $C_8$  carbocycle); and

$n$  is an integer ranging from 0 to 6.

In one embodiment, Ab is not an antibody which binds to an ErbB receptor or which binds to one or more of receptors (1)-(35):

15 (1) BMPR1B (bone morphogenetic protein receptor-type IB, Genbank accession no. NM\_001203);

(2) E16 (LAT1, SLC7A5, Genbank accession no. NM\_003486);

(3) STEAP1 (six transmembrane epithelial antigen of prostate, Genbank accession no. NM\_012449);

20 (4) 0772P (CA125, MUC16, Genbank accession no. AF361486);

(5) MPF (MPF, MSLN, SMR, megakaryocyte potentiating factor, mesothelin, Genbank accession no. NM\_005823);

(6) Napi3b (NAPI-3B, NPTIib, SLC34A2, solute carrier family 34 (sodium phosphate), member 2, type II sodium-dependent phosphate transporter 3b, 25 Genbank accession no. NM\_006424);

(7) Sema 5b (FLJ10372, KIAA1445, Mm.42015, SEMA5B, SEMAG, Semaphorin 5b Hlog, sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 5B, Genbank accession no. AB040878);

WO 2005/081711

PCT/US2004/038392

- (8) PSCA hlg (2700050C12Rik, C530008O16Rik, RIKEN cDNA 2700050C12, RIKEN cDNA 2700050C12 gene, Genbank accession no. AY358628);
- (9) ETBR (Endothelin type B receptor, Genbank accession no. AY275463);
- 5 (10) MSG783 (RNF124, hypothetical protein FLJ20315, Genbank accession no. NM\_017763);
- (11) STEAP2 (HGNC\_8639, IPCA-1, PCANAP1, STAMP1, STEAP2, STMP, prostate cancer associated gene 1, prostate cancer associated protein 1, six transmembrane epithelial antigen of prostate 2, six transmembrane prostate protein, 10 Genbank accession no. AF455138);
- (12) TrpM4 (BR22450, FLJ20041, TRPM4, TRPM4B, transient receptor potential cation channel, subfamily M, member 4, Genbank accession no. NM\_017636);
- (13) CRIPTO (CR, CR1, CRGF, CRIPTO, TDGF1, teratocarcinoma-derived growth factor, Genbank accession no. NP\_003203 or NM\_003212);
- 15 (14) CD21 (CR2 (Complement receptor 2) or C3DR (C3d/Epstein Barr virus receptor) or Hs.73792, Genbank accession no. M26004);
- (15) CD79b (IGb (immunoglobulin-associated beta), B29, Genbank accession no. NM\_000626);
- (16) FcRH2 (IFGP4, IRTA4, SPAP1A (SH2 domain containing 20 phosphatase anchor protein 1a), SPAP1B, SPAP1C, Genbank accession no. NM\_030764);
- (17) HER2 (Genbank accession no. M11730);
- (18) NCA (Genbank accession no. M18728);
- (19) MDP (Genbank accession no. BC017023);
- 25 (20) IL20R $\alpha$  (Genbank accession no. AF184971);
- (21) Brevican (Genbank accession no. AF229053);
- (22) Ephb2R (Genbank accession no. NM\_004442);

- (23) ASLG659 (Genbank accession no. AX092328);
- (24) PSCA (Genbank accession no. AJ297436);
- (25) GEDA (Genbank accession no. AY260763);
- (26) BAFF-R (Genbank accession no. NP\_443177.1);
- 5 (27) CD22 (Genbank accession no. NP-001762.1);
- (28) CD79a (CD79A, CD79 $\alpha$ , immunoglobulin-associated alpha, a B cell-specific protein that covalently interacts with Ig beta (CD79B) and forms a complex on the surface with Ig M molecules, transduces a signal involved in B-cell differentiation, Genbank accession No. NP\_001774.1);
- 10 (29) CXCR5 (Burkitt's lymphoma receptor 1, a G protein-coupled receptor that is activated by the CXCL13 chemokine, functions in lymphocyte migration and humoral defense, plays a role in HIV-2 infection and perhaps development of AIDS, lymphoma, myeloma, and leukemia, Genbank accession No. NP\_001707.1);
- (30) HLA-DOB (Beta subunit of MHC class II molecule (Ia antigen) that  
15 binds peptides and presents them to CD4+ T lymphocytes, Genbank accession No. NP\_002111.1);
- (31) P2X5 (Purinergic receptor P2X ligand-gated ion channel 5, an ion channel gated by extracellular ATP, may be involved in synaptic transmission and neurogenesis, deficiency may contribute to the pathophysiology of idiopathic detrusor  
20 instability, Genbank accession No. NP\_002552.2);
- (32) CD72 (B-cell differentiation antigen CD72, Lyb-2, Genbank accession No. NP\_001773.1);
- (33) LY64 (Lymphocyte antigen 64 (RP105), type I membrane protein of the leucine rich repeat (LRR) family, regulates B-cell activation and apoptosis, loss of  
25 function is associated with increased disease activity in patients with systemic lupus erythematosus, Genbank accession No. NP\_005573.1);
- (34) FCRH1 (Fc receptor-like protein 1, a putative receptor for the immunoglobulin Fc domain that contains C2 type Ig-like and ITAM domains, may have a role in B-lymphocyte differentiation, Genbank accession No. NP\_443170.1); or

(35) IRTA2 (Immunoglobulin superfamily receptor translocation associated 2, a putative immunoreceptor with possible roles in B cell development and lymphomagenesis; deregulation of the gene by translocation occurs in some B cell malignancies, Genbank accession No. NP\_112571.1).

5                   In still another aspect, the invention provides pharmaceutical compositions comprising an effective amount of a Drug-Linker-Antibody Conjugate and a pharmaceutically acceptable carrier or vehicle.

                  In still another aspect, the invention provides compositions comprising an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit (moiety)  
10                   from the Drug-Antibody Conjugate and a pharmaceutically acceptable carrier or vehicle.

                  In another aspect, the invention provides methods for killing or inhibiting the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

                  In another aspect, the invention provides methods for killing or inhibiting  
15                   the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

                  In yet another aspect, the invention provides methods for treating cancer including administering to a patient in need thereof an effective amount of a Drug-Linker-  
20                   Antibody Conjugate.

                  In yet another aspect, the invention provides methods for treating cancer including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

                  In another aspect, the invention provides methods for killing or inhibiting  
25                   the replication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

                  In another aspect, the invention provides methods for killing or inhibiting the replication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a  
30                   cleavable Drug unit from the Drug-Antibody Conjugate.

In yet another aspect, the invention provides methods for treating an autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

5 In yet another aspect, the invention provides methods for treating an autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

10 In still another aspect, the invention provides methods for treating an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

In still another aspect, the invention provides methods for treating an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

15 In another aspect, the invention provides methods for preventing the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

20 In another aspect, the invention provides methods for preventing the multiplication of a tumor cell or cancer cell including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

In yet another aspect, the invention provides methods for preventing cancer including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

25 In yet another aspect, the invention provides methods for preventing cancer including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

30 In another aspect, the invention provides methods for preventing the multiplication of a cell that expresses an autoimmune antibody including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

In another aspect, the invention provides methods for preventing the multiplication of a cell that expresses an autoimmune antibody including administering to

WO 2005/081711

PCT/US2004/038392

a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

In yet another aspect, the invention provides methods for preventing an autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

In yet another aspect, the invention provides methods for preventing an autoimmune disease including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

In still another aspect, the invention provides methods for preventing an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Linker-Antibody Conjugate.

In still another aspect, the invention provides methods for preventing an infectious disease including administering to a patient in need thereof an effective amount of a Drug-Antibody Conjugate having a cleavable Drug unit from the Drug-Antibody Conjugate.

In another aspect, a Drug Compound is provided which can be used as an intermediate for the synthesis of a Drug-Linker Compound having a cleavable Drug unit from the Drug-Antibody Conjugate.

In another aspect, a Drug-Linker Compound is provided which can be used as an intermediate for the synthesis of a Drug-Linker-Antibody Conjugate.

In one aspect, the present invention provides Drug-Linker-Antibody Conjugates (also referred to as antibody-drug conjugates) having Formula Ic:

or a pharmaceutically acceptable salt or solvate thereof, wherein:

Ab is an antibody which binds to one or more of the antigens (1)-(35):

(1) BMPR1B (bone morphogenetic protein receptor-type IB, Genbank accession no. NM\_001203);

(2) E16 (LAT1, SLC7A5, Genbank accession no. NM\_003486);

(3) STEAP1 (six transmembrane epithelial antigen of prostate, Genbank accession no. NM\_012449);

WO 2005/081711

PCT/US2004/038392

- (4) 0772P (CA125, MUC16, Genbank accession no. AF361486);
- (5) MPF (MPF, MSLN, SMR, megakaryocyte potentiating factor, mesothelin, Genbank accession no. NM\_005823);
- (6) Napi3b (NAPI-3B, NPTIib, SLC34A2, solute carrier family 34 (sodium phosphate), member 2, type II sodium-dependent phosphate transporter 3b, Genbank accession no. NM\_006424);
- (7) Sema 5b (FLJ10372, KIAA1445, Mm.42015, SEMA5B, SEMAG, Semaphorin 5b Hlog, sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 5B, Genbank accession no. AB040878);
- (8) PSCA hlg (2700050C12Rik, C530008O16Rik, RIKEN cDNA 2700050C12, RIKEN cDNA 2700050C12 gene, Genbank accession no. AY358628);
- (9) ETBR (Endothelin type B receptor, Genbank accession no. AY275463);
- (10) MSG783 (RNF124, hypothetical protein FLJ20315, Genbank accession no. NM\_017763);
- (11) STEAP2 (HGNC\_8639, IPCA-1, PCANAP1, STAMP1, STEAP2, STMP, prostate cancer associated gene 1, prostate cancer associated protein 1, six transmembrane epithelial antigen of prostate 2, six transmembrane prostate protein, Genbank accession no. AF455138);
- (12) TrpM4 (BR22450, FLJ20041, TRPM4, TRPM4B, transient receptor potential cation channel, subfamily M, member 4, Genbank accession no. NM\_017636);
- (13) CRIPTO (CR, CR1, CRGF, CRIPTO, TDGF1, teratocarcinoma-derived growth factor, Genbank accession no. NP\_003203 or NM\_003212);
- (14) CD21 (CR2 (Complement receptor 2) or C3DR (C3d/Epstein Barr virus receptor) or Hs.73792, Genbank accession no. M26004);
- (15) CD79b (IGb (immunoglobulin-associated beta), B29, Genbank accession no. NM\_000626);

(35) IRTA2 (Immunoglobulin superfamily receptor translocation associated 2, a putative immunoreceptor with possible roles in B cell development and lymphomagenesis; deregulation of the gene by translocation occurs in some B cell malignancies, Genbank accession No. NP\_112571.1);

- 5           A is a Stretcher unit,  
               a is 0 or 1,  
               each W is independently an Amino Acid unit,  
               w is an integer ranging from 0 to 12,  
               Y is a Spacer unit, and  
 10           y is 0, 1 or 2,  
               p ranges from 1 to about 20, and  
               D is a Drug moiety selected from Formulas D<sub>E</sub> and D<sub>F</sub>:

wherein the wavy line of D<sub>E</sub> and D<sub>F</sub> indicates the covalent attachment site to A, W, or Y, and independently at each location:

- 20           R<sup>2</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;  
               R<sup>3</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);  
               R<sup>4</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);
- 25

$R^5$  is selected from H and methyl;

or  $R^4$  and  $R^5$  jointly form a carbocyclic ring and have the formula  $-(CR^aR^b)_n$  wherein  $R^a$  and  $R^b$  are independently selected from H,  $C_1$ - $C_8$  alkyl and  $C_3$ - $C_8$  carbocycle and  $n$  is selected from 2, 3, 4, 5 and 6;

5  $R^6$  is selected from H and  $C_1$ - $C_8$  alkyl;

$R^7$  is selected from H,  $C_1$ - $C_8$  alkyl,  $C_3$ - $C_8$  carbocycle, aryl,  $C_1$ - $C_8$  alkyl-aryl,  $C_1$ - $C_8$  alkyl- $(C_3$ - $C_8$  carbocycle),  $C_3$ - $C_8$  heterocycle and  $C_1$ - $C_8$  alkyl- $(C_3$ - $C_8$  heterocycle);

10 each  $R^8$  is independently selected from H, OH,  $C_1$ - $C_8$  alkyl,  $C_3$ - $C_8$  carbocycle and O- $(C_1$ - $C_8$  alkyl);

$R^9$  is selected from H and  $C_1$ - $C_8$  alkyl;

$R_{10}$  is selected from aryl or  $C_3$ - $C_8$  heterocycle;

Z is O, S, NH, or  $NR^{12}$ , wherein  $R^{12}$  is  $C_1$ - $C_8$  alkyl;

15  $R^{11}$  is selected from H,  $C_1$ - $C_{20}$  alkyl, aryl,  $C_3$ - $C_8$  heterocycle,  $-(R^{13}O)_m$ ,  $R^{14}$ , or  $-(R^{13}O)_m-CH(R^{15})_2$ ;

$m$  is an integer ranging from 1-1000;

$R^{13}$  is  $C_2$ - $C_8$  alkyl;

$R^{14}$  is H or  $C^1$ - $C^8$  alkyl;

20 each occurrence of  $R^{15}$  is independently H, COOH,  $-(CH_2)_n-N(R^{16})_2$ ,  $-(CH_2)_n-SO_3H$ , or  $-(CH_2)_n-SO_3-C_1-C_8$  alkyl;

each occurrence of  $R^{16}$  is independently H,  $C_1$ - $C_8$  alkyl, or  $-(CH_2)_n$ -COOH;

$R^{18}$  is selected from  $-C(R^8)_2-C(R^8)_2$ -aryl,  $-C(R^8)_2-C(R^8)_2-(C^3-C_8$  heterocycle), and  $-C(R^8)_2-C(R^8)_2-(C_3-C_8$  carbocycle); and

25  $n$  is an integer ranging from 0 to 6.

In another aspect, the antibody of the antibody-drug conjugate (ADC) of the invention specifically binds to a receptor encoded by an ErbB2 gene.

In another aspect, the antibody of the antibody-drug conjugate is a humanized antibody selected from huMAb4D5-1, huMAb4D5-2, huMAb4D5-3, huMAb4D5-4, huMAb4D5-5, huMAb4D5-6, huMAb4D5-7 and huMAb4D5-8 (Trastuzumab).

In another aspect, the invention includes an article of manufacture comprising an antibody-drug conjugate compound of the invention; a container; and a

package insert or label indicating that the compound can be used to treat cancer characterized by the overexpression of an ErbB2 receptor.

In another aspect, the invention includes a method for the treatment of cancer in a mammal, wherein the cancer is characterized by the overexpression of an ErbB2 receptor and does not respond, or responds poorly, to treatment with an anti-ErbB2 antibody, comprising administering to the mammal a therapeutically effective amount of an antibody-drug conjugate compound of the invention.

In another aspect, a substantial amount of the drug moiety is not cleaved from the antibody until the antibody-drug conjugate compound enters a cell with a cell-surface receptor specific for the antibody of the antibody-drug conjugate, and the drug moiety is cleaved from the antibody when the antibody-drug conjugate does enter the cell.

In another aspect, the bioavailability of the antibody-drug conjugate compound or an intracellular metabolite of the compound in a mammal is improved when compared to a drug compound comprising the drug moiety of the antibody-drug conjugate compound, or when compared to an analog of the compound not having the drug moiety.

In another aspect, the drug moiety is intracellularly cleaved in a mammal from the antibody of the compound, or an intracellular metabolite of the compound.

In another aspect, the invention includes a pharmaceutical composition comprising an effective amount of the antibody-drug conjugate compound of the invention, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable diluent, carrier or excipient. The composition may further comprise a therapeutically effective amount of chemotherapeutic agent such as a tubulin-forming inhibitor, a topoisomerase inhibitor, and a DNA binder.

In another aspect, the invention includes a method for killing or inhibiting the proliferation of tumor cells or cancer cells comprising treating tumor cells or cancer cells with an amount of the antibody-drug conjugate compound of the invention, or a pharmaceutically acceptable salt or solvate thereof, being effective to kill or inhibit the proliferation of the tumor cells or cancer cells.

In another aspect, the invention includes a method of inhibiting cellular proliferation comprising exposing mammalian cells in a cell culture medium to an antibody drug conjugate compound of the invention, wherein the antibody drug conjugate

compound enters the cells and the drug is cleaved from the remainder of the antibody drug conjugate compound; whereby proliferation of the cells is inhibited.

In another aspect, the invention includes a method of treating cancer comprising administering to a patient a formulation of an antibody-drug conjugate compound of the invention and a pharmaceutically acceptable diluent, carrier or excipient.

In another aspect, the invention includes an assay for detecting cancer cells comprising:

- (a) exposing cells to an antibody-drug conjugate compound of the invention; and
- (b) determining the extent of binding of the antibody-drug conjugate compound to the cells.

Various embodiments of this invention relate to an antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof, wherein the conjugate comprises an antibody covalently attached to one or more drug moieties, the antibody-drug conjugate having Formula Ic:

wherein:

Ab is an antibody which binds to CD79b (IGb (immunoglobulin-associated beta), B29);

A is a Stretcher unit;

a is 0 or 1;

each W is independently an Amino Acid unit;

w is an integer ranging from 0 to 12;

Y is a Spacer unit;

y is 0, 1 or 2;

p ranges from 1 to 20;

D has Formula D<sub>E</sub> :

25

wherein the wavy line of D<sub>E</sub> indicates the covalent attachment site to A, W, Y or Ab, and independently at each location;

$R^2$  is H or C<sub>1</sub>-C<sub>8</sub> alkyl;

$R^3$  is H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle, or C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

5  $R^4$  is H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle, or C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

$R^5$  is H or methyl;

or  $R^4$  and  $R^5$  jointly form a carbocyclic ring and have the formula  $-(CR^aR^b)_n-$  wherein  $R^a$  and  $R^b$  are independently H, C<sub>1</sub>-C<sub>8</sub> alkyl or C<sub>3</sub>-C<sub>8</sub> carbocycle and n is 2, 3, 4, 5, or 6;

$R^6$  is H or C<sub>1</sub>-C<sub>8</sub> alkyl;

10  $R^7$  is H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle, or C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

each  $R^8$  is independently H, OH, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, or O-(C<sub>1</sub>-C<sub>8</sub> alkyl);

$R^9$  is H or C<sub>1</sub>-C<sub>8</sub> alkyl; and

15  $R^{18}$  is  $-C(R^8)_2-C(R^8)_2$ -aryl,  $-C(R^8)_2-C(R^8)_2$ -(C<sub>3</sub>-C<sub>8</sub> heterocycle), or  $-C(R^8)_2-C(R^8)_2$ -(C<sub>3</sub>-C<sub>8</sub> carbocycle).

The invention will best be understood by reference to the following detailed description of the exemplary embodiments, taken in conjunction with the accompanying

drawings, figures, and schemes. The discussion below is descriptive, illustrative and exemplary and is not to be taken as limiting the scope defined by any appended claims.

#### BRIEF DESCRIPTION OF THE DRAWINGS

5                   Figure 1 shows an *in vivo*, single dose, efficacy assay of cAC10-mcMMAF in subcutaneous Karpas-299 ALCL xenografts.

                  Figure 2 shows an *in vivo*, single dose, efficacy assay of cAC10-mcMMAF in subcutaneous L540cy. For this study there were 4 mice in the untreated group and 10 in each of the treatment groups.

10                   Figures 3a and 3b show *in vivo* efficacy of cBR96-mcMMAF in subcutaneous L2987. The filled triangles in Figure 3a and arrows in Figure 3b indicate the days of therapy.

                  Figures 4a and 4b show *in vitro* activity of cAC10-antibody-drug conjugates against CD30<sup>+</sup> cell lines.

15                   Figures 5a and 5b show *in vitro* activity of cBR96-antibody-drug conjugates against Le<sup>y+</sup> cell lines.

                  Figures 6a and 6b show *in vitro* activity of C1F6-antibody-drug conjugates against CD70<sup>+</sup> renal cell carcinoma cell lines.

Figure 7 shows an *in vitro*, cell proliferation assay with SK-BR-3 cells treated with antibody drug conjugates (ADC): —●— Trastuzumab-MC-vc-PAB-MMAF, 3.8 MMAF/Ab, —○— Trastuzumab-MC-MMAF, 4.1 MMAF/Ab, and —△— Trastuzumab-MC-MMAF, 4.8 MMAF/Ab, measured in Relative Fluorescence Units (RLU) versus  
 5  $\mu\text{g/ml}$  concentration of ADC. H = Trastuzumab where H is linked via a cysteine [cys].

Figure 8 shows an *in vitro*, cell proliferation assay with BT-474 cells treated with ADC: —●— Trastuzumab-MC-vc-PAB-MMAF, 3.8 MMAF/Ab, —○— Trastuzumab-MC-MMAF, 4.1 MMAF/Ab, and —△— Trastuzumab-MC-MMAF, 4.8 MMAF/Ab.

10 Figure 9 shows an *in vitro*, cell proliferation assay with MCF-7 cells treated with ADC: —●— Trastuzumab-MC-vc-PAB-MMAF, 3.8 MMAF/Ab, —○— Trastuzumab-MC-(N-Me)vc-PAB-MMAF, 3.9 MMAF/Ab, and —△— Trastuzumab-MC-MMAF, 4.1 MMAF/Ab.

Figure 10 shows an *in vitro*, cell proliferation assay with MDA-MB-468  
 15 cells treated with ADC: —●— Trastuzumab-MC-vc-PAB-MMAE, 4.1 MMAE/Ab, —○— Trastuzumab-MC-vc-PAB-MMAE, 3.3 MMAE/Ab, and —△— Trastuzumab-MC-vc-PAB-MMAF, 3.7 MMAF/Ab.

Figure 11 shows a plasma concentration clearance study after administration of H-MC-vc-PAB-MMAF-TEG and H-MC-vc-PAB-MMAF to Sprague-Dawley rats: The administered dose was 2 mg of ADC per kg of rat. Concentrations of  
 20 total antibody and ADC were measured over time. (H = Trastuzumab).

Figure 12 shows a plasma concentration clearance study after administration of H-MC-vc-MMAE to Cynomolgus monkeys at different doses: 0.5, 1.5, 2.5, and 3.0 mg/kg administered at day 1 and day 21. Concentrations of total antibody  
 25 and ADC were measured over time. (H = Trastuzumab).

Figure 13 shows the mean tumor volume change over time in athymic nude mice with MMTV-HER2 Fo5 Mammary tumor allografts dosed on Day 0 with: Vehicle, Trastuzumab-MC-vc-PAB-MMAE ( $1250 \mu\text{g/m}^2$ ) and Trastuzumab-MC-vc-PAB-MMAF ( $555 \mu\text{g/m}^2$ ). (H = Trastuzumab).

30 Figure 14 shows the mean tumor volume change over time in athymic nude mice with MMTV-HER2 Fo5 Mammary tumor allografts dosed on Day 0 with 10

WO 2005/081711

PCT/US2004/038392

mg/kg (660  $\mu\text{g}/\text{m}^2$ ) of Trastuzumab-MC-MMAE and 1250  $\mu\text{g}/\text{m}^2$  Trastuzumab-MC-vc-PAB-MMAE.

Figure 15 shows the mean tumor volume change over time in athymic nude mice with MMTV-HER2 Fo5 Mammary tumor allografts dosed on Day 0 with Vehicle and 650  $\mu\text{g}/\text{m}^2$  trastuzumab-MC-MMAF.

Figure 16 shows the mean tumor volume change over time in athymic nude mice with MMTV-HER2 Fo5 Mammary tumor allografts dosed on Day 0 with Vehicle and 350  $\mu\text{g}/\text{m}^2$  of four trastuzumab-MC-MMAF conjugates where the MMAF/trastuzumab (H) ratio is 2, 4, 5.9 and 6.

Figure 17 shows the Group mean change, with error bars, in animal (rat) body weights (Mean  $\pm$  SD) after administration of Vehicle, trastuzumab-MC-val-cit-MMAF, trastuzumab-MC(Me)-val-cit-PAB-MMAF, trastuzumab-MC-MMAF and trastuzumab-MC-val-cit-PAB-MMAF.

Figure 18 shows the Group mean change in animal (rat) body weights (Mean  $\pm$  SD) after administration of 9.94 mg/kg H-MC-vc-MMAF, 24.90 mg/kg H-MC-vc-MMAF, 10.69 mg/kg H-MC(Me)-vc-PAB-MMAF, 26.78 mg/kg H-MC(Me)-vc-PAB-MMAF, 10.17 mg/kg H-MC-MMAF, 25.50 mg/kg H-MC-MMAF, and 21.85 mg/kg H-MC-vc-PAB-MMAF. H = trastuzumab. The MC linker is attached via a cysteine of trastuzumab for each conjugate.

Figure 19 shows the Group mean change, with error bars, in Sprague Dawley rat body weights (Mean  $\pm$  SD) after administration of trastuzumab (H)-MC-MMAF at doses of 2105, 3158, and 4210  $\mu\text{g}/\text{m}^2$ . The MC linker is attached via a cysteine of trastuzumab for each conjugate.

## 4. DETAILED DESCRIPTION OF THE EXEMPLARY EMBODIMENTS

### 4.1 DEFINITIONS AND ABBREVIATIONS

Unless stated otherwise, the following terms and phrases as used herein are intended to have the following meanings:

When trade names are used herein, applicants intend to independently include the trade name product formulation, the generic drug, and the active pharmaceutical ingredient(s) of the trade name product.

The term "antibody" herein is used in the broadest sense and specifically covers intact monoclonal antibodies, polyclonal antibodies, multispecific antibodies (*e.g.*, bispecific antibodies) formed from at least two intact antibodies, and antibody fragments, so long as they exhibit the desired biological activity. An antibody is a protein generated by the immune system that is capable of recognizing and binding to a specific antigen. Described in terms of its structure, an antibody typically has a Y-shaped protein consisting of four amino acid chains, two heavy and two light. Each antibody has primarily two regions: a variable region and a constant region. The variable region, located on the ends of the arms of the Y, binds to and interacts with the target antigen. This variable region includes a complementary determining region (CDR) that recognizes and binds to a specific binding site on a particular antigen. The constant region, located on the tail of the Y, is recognized by and interacts with the immune system (Janeway, C., Travers, P., Walport, M., Shlomchik (2001) *Immuno Biology, 5th Ed.*, Garland Publishing, New York): A target antigen generally has numerous binding sites, also called epitopes, recognized by CDRs on multiple antibodies. Each antibody that specifically binds to a different epitope has a different structure. Thus, one antigen may have more than one corresponding antibody.

The term "antibody" as used herein, also refers to a full-length immunoglobulin molecule or an immunologically active portion of a full-length immunoglobulin molecule, *i.e.*, a molecule that contains an antigen binding site that immunospecifically binds an antigen of a target of interest or part thereof, such targets including but not limited to, cancer cell or cells that produce autoimmune antibodies associated with an autoimmune disease. The immunoglobulin disclosed herein can be of any type (*e.g.*, IgG, IgE, IgM, IgD, and IgA), class (*e.g.*, IgG1, IgG2, IgG3, IgG4, IgA1 and IgA2) or subclass of immunoglobulin molecule. The immunoglobulins can be derived from any species. In one aspect, however, the immunoglobulin is of human, murine, or rabbit origin. In another aspect, the antibodies are polyclonal, monoclonal, bispecific, human, humanized or chimeric antibodies, single chain antibodies, Fv, Fab fragments, F(ab') fragments, F(ab')<sub>2</sub> fragments, fragments produced by a Fab expression library, anti-idiotypic (anti-Id) antibodies, CDR's, and epitope-binding fragments of any of the above which immunospecifically bind to cancer cell antigens, viral antigens or microbial antigens.

The term “monoclonal antibody” as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, *i.e.*, the individual antibodies comprising the population are identical except for possible naturally-occurring mutations that may be present in minor amounts. Monoclonal antibodies are highly specific, being directed against a single antigenic site. Furthermore, in contrast to polyclonal antibody preparations which include different antibodies directed against different determinants (epitopes), each monoclonal antibody is directed against a single determinant on the antigen. In addition to their specificity, the monoclonal antibodies are advantageous in that they may be synthesized uncontaminated by other antibodies. The modifier “monoclonal” indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by the hybridoma method first described by Kohler *et al.* (1975) *Nature* 256:495, or may be made by recombinant DNA methods (see, U.S. Patent No. 4816567). The “monoclonal antibodies” may also be isolated from phage antibody libraries using the techniques described in Clackson *et al.* (1991) *Nature*, 352:624-628 and Marks *et al.* (1991) *J. Mol. Biol.*, 222:581-597, for example.

The monoclonal antibodies herein specifically include “chimeric” antibodies in which a portion of the heavy and/or light chain is identical with or homologous to corresponding sequences in antibodies derived from a particular species or belonging to a particular antibody class or subclass, while the remainder of the chain(s) is identical with or homologous to corresponding sequences in antibodies derived from another species or belonging to another antibody class or subclass, as well as fragments of such antibodies, so long as they exhibit the desired biological activity (U.S. Patent mp/ 4816567; and Morrison *et al.* (1984) *Proc. Natl. Acad. Sci. USA*, 81:6851-6855).

Various methods have been employed to produce monoclonal antibodies (MAbs). Hybridoma technology, which refers to a cloned cell line that produces a single type of antibody, uses the cells of various species, including mice (murine), hamsters, rats, and humans. Another method to prepare MAbs uses genetic engineering including recombinant DNA techniques. Monoclonal antibodies made from these techniques include, among others, chimeric antibodies and humanized antibodies. A chimeric antibody combines DNA encoding regions from more than one type of species. For

example, a chimeric antibody may derive the variable region from a mouse and the constant region from a human. A humanized antibody comes predominantly from a human, even though it contains nonhuman portions. Like a chimeric antibody, a humanized antibody may contain a completely human constant region. But unlike a  
5 chimeric antibody, the variable region may be partially derived from a human. The nonhuman, synthetic portions of a humanized antibody often come from CDRs in murine antibodies. In any event, these regions are crucial to allow the antibody to recognize and bind to a specific antigen.

As noted, murine antibodies can be used. While useful for diagnostics and  
10 short-term therapies, murine antibodies cannot be administered to people long-term without increasing the risk of a deleterious immunogenic response. This response, called Human Anti-Mouse Antibody (HAMA), occurs when a human immune system recognizes the murine antibody as foreign and attacks it. A HAMA response can cause toxic shock or even death.

15 Chimeric and humanized antibodies reduce the likelihood of a HAMA response by minimizing the nonhuman portions of administered antibodies. Furthermore, chimeric and humanized antibodies have the additional benefit of activating secondary human immune responses, such as antibody dependent cellular cytotoxicity.

“Antibody fragments” comprise a portion of an intact antibody, preferably  
20 comprising the antigen-binding or variable region thereof. Examples of antibody fragments include Fab, Fab', F(ab')<sub>2</sub>, and Fv fragments; diabodies; linear antibodies; single-chain antibody molecules; and multispecific antibodies formed from antibody fragment(s).

An “intact” antibody is one which comprises an antigen-binding variable  
25 region as well as a light chain constant domain (CL) and heavy chain constant domains, CH1, CH2 and CH3. The constant domains may be native sequence constant domains (*e.g.*, human native sequence constant domains) or amino acid sequence variant thereof.

The intact antibody may have one or more “effector functions” which refer  
30 to those biological activities attributable to the Fc region (a native sequence Fc region or amino acid sequence variant Fc region) of an antibody. Examples of antibody effector functions include C1q binding; complement dependent cytotoxicity; Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; down regulation of cell surface receptors (*e.g.*, B cell receptor; BCR), etc.

Depending on the amino acid sequence of the constant domain of their heavy chains, intact antibodies can be assigned to different "classes." There are five major classes of intact antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into "subclasses" (isotypes), *e.g.*, IgG1, IgG2, IgG3, IgG4, IgA, and  
 5 IgA2. The heavy-chain constant domains that correspond to the different classes of antibodies are called  $\alpha$ ,  $\delta$ ,  $\epsilon$ ,  $\gamma$ , and  $\mu$ , respectively. The subunit structures and three-dimensional configurations of different classes of immunoglobulins are well known.

The expressions "ErbB2" and "HER2" are used interchangeably herein and refer to human HER2 protein described, for example, in Semba *et al.*, *Proc. Natl. Acad. Sci. USA*, 82:6497-6501 (1985) and Yamamoto *et al.*, (1986) *Nature*, 319:230-234  
 10 (Genebank accession number X03363). The term "erbB2" refers to the gene encoding human ErbB2 and "neu" refers to the gene encoding rat p185neu. Preferred ErbB2 is native sequence human ErbB2.

Antibodies to ErbB receptors are available commercially from a number of  
 15 sources, including, for example, Santa Cruz Biotechnology, Inc., California, USA.

By "ErbB ligand" is meant a polypeptide which binds to and/or activates an ErbB receptor. The ErbB ligand may be a native sequence human ErbB ligand such as epidermal growth factor (EGF) (Savage *et al.* (1972) *J. Biol. Chem.*, 247:7612-7621); transforming growth factor alpha (TGF- $\alpha$ ) (Marquardt *et al.* (1984) *Science* 223:1079-  
 20 1082); amphiregulin also known as schwanoma or keratinocyte autocrine growth factor (Shoyab *et al.* (1989) *Science* 243:1074-1076; Kimura *et al.*, *Nature*, 348:257-260 (1990); and Cook *et al.*, *Mol. Cell. Biol.*, 11:2547-2557 (1991)); betacellulin (Shing *et al.*, *Science*, 259:1604-1607 (1993); and Sasada *et al.*, *Biochem. Biophys. Res. Commun.*, 190:1173 (1993)); heparin-binding epidermal growth factor (HB-EGF) (Higashiyama *et al.*, *Science*, 251:936-939 (1991)); epiregulin (Toyoda *et al.*, *J. Biol. Chem.*, 270:7495-  
 25 7500 (1995); and Komurasaki *et al.*, *Oncogene*, 15:2841-2848 (1997)); a heregulin (see below); neuregulin-2 (NRG-2) (Carraway *et al.*, *Nature*, 387:512-516 (1997)); neuregulin-3 (NRG-3) (Zhang *et al.*, *Proc. Natl. Acad. Sci.*, 94:9562-9567 (1997)); neuregulin-4 (NRG-4) (Harari *et al.*, *Oncogene*, 18:2681-89 (1999)) or cripto (CR-1)  
 30 (Kannan *et al.*, *J. Biol. Chem.*, 272(6):3330-3335 (1997)). ErbB ligands which bind EGFR include EGF, TGF- $\alpha$ , amphiregulin, betacellulin, HB-EGF and epiregulin. ErbB ligands which bind ErbB3 include heregulins. ErbB ligands capable of binding ErbB4 include betacellulin, epiregulin, HB-EGF, NRG-2, NRG-3, NRG-4 and heregulins. The

ErbB ligand may also be a synthetic ErbB ligand. The synthetic ligand may be specific for a particular ErbB receptor, or may recognize particular ErbB receptor complexes. An example of a synthetic ligand is the synthetic heregulin/BGF chimera biregulin (see, for example, Jones *et al.*, (1999) *FEBS Letters*, 447:227-231

5

“Heregulin” (HRG) refers to a polypeptide encoded by the heregulin gene product as disclosed in U.S. Patent No. 5641869 or Marchionni *et al.*, *Nature*, 362:312-318 (1993). Examples of heregulins include heregulin- $\alpha$ , heregulin- $\beta$ 1, heregulin- $\beta$ 2 and heregulin- $\beta$ 3 (Holmes *et al.*, *Science*, 256:1205-1210 (1992); and U.S. Patent Nno. 5641869); neu differentiation factor (NDF) (Peles *et al.*, *Cell* 69: 205-216 (1992)); acetylcholine receptor-inducing activity (ARIA) (Falls *et al.* (1993) *Cell* 72:801-815); glial growth factors (GGFs) (Marchionni *et al.*, *Nature*, 362:312-318 (1993)); sensory and motor neuron derived factor (SMDF) (Ho *et al.*, *J. Biol. Chem.*, 270:14523-14532 (1995));  $\gamma$ -heregulin (Schaefer *et al.*, *Oncogene*, 15:1385-1394 (1997)). The term includes biologically active fragments and/or amino acid sequence variants of a native sequence HRG polypeptide, such as an EGF-like domain fragment thereof (*e.g.*, HRG $\beta$ 1177-244).

“ErbB hetero-oligomer” is a noncovalently associated oligomer comprising at least two different ErbB receptors. An “ErbB dimer” is a noncovalently associated oligomer that comprises two different ErbB receptors. Such complexes may form when a cell expressing two or more ErbB receptors is exposed to an ErbB ligand. ErbB oligomers, such as ErbB dimers, can be isolated by immunoprecipitation and analyzed by SDS-PAGE as described in Sliwkowski *et al.*, *J. Biol. Chem.*, 269(20):14661-14665 (1994), for example. Examples of such ErbB hetero-oligomers include EGFR-ErbB2 (also referred to as HER1/HER2), ErbB2-ErbB3 (HER2/HER3) and ErbB3-ErbB4 (HER3/HER4) complexes. Moreover, the ErbB hetero-oligomer may comprise two or more ErbB2 receptors combined with a different ErbB receptor, such as ErbB3, ErbB4 or EGFR (ErbB1). Other proteins, such as a cytokine receptor subunit (*e.g.*, gp130) may be included in the hetero-oligomer.

A “native sequence” polypeptide is one which has the same amino acid sequence as a polypeptide, *e.g.*, tumor-associated antigen receptor, derived from nature. Such native sequence polypeptides can be isolated from nature or can be produced by recombinant or synthetic means. Thus, a native sequence polypeptide can have the amino

acid sequence of naturally-occurring human polypeptide, murine polypeptide, or polypeptide from any other mammalian species.

The term "amino acid sequence variant" refers to polypeptides having amino acid sequences that differ to some extent from a native sequence polypeptide.

5 Ordinarily, amino acid sequence variants will possess at least about 70% homology with at least one receptor binding domain of a native ligand, or with at least one ligand binding domain of a native receptor, such as a tumor-associated antigen, and preferably, they will be at least about 80%, more preferably, at least about 90% homologous with such receptor or ligand binding domains. The amino acid sequence variants possess  
10 substitutions, deletions, and/or insertions at certain positions within the amino acid sequence of the native amino acid sequence.

"Sequence identity" is defined as the percentage of residues in the amino acid sequence variant that are identical after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent sequence identity. Methods and computer  
15 programs for the alignment are well known in the art. One such computer program is "Align 2," authored by Genentech, Inc., which was filed with user documentation in the United States Copyright Office, Washington, DC 20559, on December 10, 1991.

"Antibody-dependent cell-mediated cytotoxicity" and "ADCC" refer to a cell-mediated reaction in which nonspecific cytotoxic cells that express Fc receptors  
20 (FcRs) (*e.g.*, Natural Killer (NK) cells, neutrophils, and macrophages) recognize bound antibody on a target cell and subsequently cause lysis of the target cell. The primary cells for mediating ADCC, NK cells, express Fc $\gamma$ RIII only, whereas monocytes express Fc $\gamma$ RI, Fc $\gamma$ RII and Fc $\gamma$ RIII. FcR expression on hematopoietic cells is summarized in Table 3 on page 464 of Ravetch and Kinet, (1991) *Annu. Rev. Immunol.*, 9:457-92. To assess ADCC  
25 activity of a molecule of interest, an *in vitro* ADCC assay, such as that described in U.S. Patent No. 5500362 or 5821337 may be performed. Useful effector cells for such assays include peripheral blood mononuclear cells (PBMC) and Natural Killer (NK) cells. Alternatively, or additionally, ADCC activity of the molecule of interest may be assessed  
*in vivo*, *e.g.*, in a animal model such as that disclosed in Clynes *et al.*, *Prco. Natl. Acad. Sci. USA*, 95:652-656 (1998).  
30

The terms "Fc receptor" or "FcR" are used to describe a receptor that binds to the Fc region of an antibody. The preferred FcR is a native sequence human FcR. Moreover, a preferred FcR is one which binds an IgG antibody (a gamma receptor)

and includes receptors of the Fc $\gamma$ RI, Fc $\gamma$ RII, and Fc $\gamma$ RIII subclasses, including allelic variants and alternatively spliced forms of these receptors. Fc $\gamma$ RII receptors include Fc $\gamma$ RIIA (an “activating receptor”) and Fc $\gamma$ RIIB (an “inhibiting receptor”), which have similar amino acid sequences that differ primarily in the cytoplasmic domains thereof.

5 Activating receptor Fc $\gamma$ RIIA contains an immunoreceptor tyrosine-based activation motif (ITAM) in its cytoplasmic domain. Inhibiting receptor Fc $\gamma$ RIIB contains an immunoreceptor tyrosine-based inhibition motif (ITIM) in its cytoplasmic domain. (See review M. in *Daëron, Annu. Rev. Immunol.*, 15:203-234 (1997)). FcRs are reviewed in Ravetch and Kinet, *Annu. Rev. Immunol.*, 9:457-92 (1991); Capel *et al.*, *Immunomethods*,  
10 4:25-34 (1994); and de Haas *et al.*, *J. Lab. Clin. Med.*, 126:330-41 (1995). Other FcRs, including those to be identified in the future, are encompassed by the term “FcR” herein. The term also includes the neonatal receptor, FcRn, which is responsible for the transfer of maternal IgGs to the fetus. (Guyer *et al.*, *J. Immunol.*, 117:587 (1976) and Kim *et al.*, *J. Immunol.*, 24:249 (1994)).

15 “Complement dependent cytotoxicity” or “CDC” refers to the ability of a molecule to lyse a target in the presence of complement. The complement activation pathway is initiated by the binding of the first component of the complement system (C1q) to a molecule (*e.g.*, an antibody) complexed with a cognate antigen. To assess complement activation, a CDC assay, *e.g.*, as described in Gazzano-Santoro *et al.*, *J.*  
20 *Immunol. Methods*, 202:163 (1996), may be performed.

The term “variable” refers to the fact that certain portions of the variable domains differ extensively in sequence among antibodies and are used in the binding and specificity of each particular antibody for its particular antigen. However, the variability is not evenly distributed throughout the variable domains of antibodies. It is concentrated  
25 in three segments called hypervariable regions both in the light chain and the heavy chain variable domains. The more highly conserved portions of variable domains are called the framework regions (FRs). The variable domains of native heavy and light chains each comprise four FRs, largely adopting a  $\beta$ -sheet configuration, connected by three hypervariable regions, which form loops connecting, and in some cases forming part of,  
30 the  $\beta$ -sheet structure. The hypervariable regions in each chain are held together in close proximity by the FRs and, with the hypervariable regions from the other chain, contribute to the formation of the antigen-binding site of antibodies (see Kabat *et al.* (1991) Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National

Institutes of Health, Bethesda, MD). The constant domains are not involved directly in binding an antibody to an antigen, but exhibit various effector functions, such as participation of the antibody in antibody dependent cellular cytotoxicity (ADCC).

The term "hypervariable region" when used herein refers to the amino acid residues of an antibody which are responsible for antigen-binding. The hypervariable region generally comprises amino acid residues from a "complementarity determining region" or "CDR" (*e.g.*, residues 24-34 (L1), 50-56 (L2) and 89-97 (L3) in the light chain variable domain and 31-35 (H1), 50-65 (H2) and 95-102 (H3) in the heavy chain variable domain; Kabat *et al. supra*) and/or those residues from a "hypervariable loop" (*e.g.*, residues 26-32 (L1), 50-52 (L2) and 91-96 (L3) in the light chain variable domain and 26-32 (H1), 53-55 (H2) and 96-101 (H3) in the heavy chain variable domain; Chothia and Lesk (1987) *J. Mol. Biol.*, 196:901-917). "Framework Region" or "FR" residues are those variable domain residues other than the hypervariable region residues as herein defined.

Papain digestion of antibodies produces two identical antigen-binding fragments, called "Fab" fragments, each with a single antigen-binding site, and a residual "Fc" fragment, whose name reflects its ability to crystallize readily. Pepsin treatment yields an F(ab')<sub>2</sub> fragment that has two antigen-binding sites and is still capable of cross-linking antigen.

Fv is the minimum antibody fragment which contains a complete antigen-recognition and antigen-binding site. This region consists of a dimer of one heavy chain and one light chain variable domain in tight, non-covalent association. It is in this configuration that the three hypervariable regions of each variable domain interact to define an antigen-binding site on the surface of the VH-VL dimer. Collectively, the six hypervariable regions confer antigen-binding specificity to the antibody. However, even a single variable domain (or half of an Fv comprising only three hypervariable regions specific for an antigen) has the ability to recognize and bind antigen, although at a lower affinity than the entire binding site.

The Fab fragment also contains the constant domain of the light chain and the first constant domain (CH1) of the heavy chain. Fab' fragments differ from Fab fragments by the addition of a few residues at the carboxy terminus of the heavy chain CH1 domain including one or more cysteines from the antibody hinge region. Fab'-SH is the designation herein for Fab' in which the cysteine residue(s) of the constant domains

bear at least one free thiol group. F(ab')<sub>2</sub> antibody fragments originally were produced as pairs of Fab' fragments which have hinge cysteines between them. Other chemical couplings of antibody fragments are also known.

The "light chains" of antibodies from any vertebrate species can be  
5 assigned to one of two clearly distinct types, called kappa ( $\kappa$ ) and lambda ( $\lambda$ ), based on the amino acid sequences of their constant domains.

"Single-chain Fv" or "scFv" antibody fragments comprise the VH and VL domains of antibody, wherein these domains are present in a single polypeptide chain. Preferably, the Fv polypeptide further comprises a polypeptide linker between the VH  
10 and VL domains which enables the scFv to form the desired structure for antigen binding. For a review of scFv, see Plückthun in *The Pharmacology of Monoclonal Antibodies*, vol. 113, Rosenberg and Moore eds., Springer-Verlag, New York, pp. 269-315 (1994).

The term "diabodies" refers to small antibody fragments with two antigen-binding sites, which fragments comprise a variable heavy domain (VH) connected to a  
15 variable light domain (VL) in the same polypeptide chain (VH - VL). By using a linker that is too short to allow pairing between the two domains on the same chain, the domains are forced to pair with the complementary domains of another chain and create two antigen-binding sites. Diabodies are described more fully in, for example, EP 404,097; WO 93/11161; and Hollinger *et al.* (1993) *Proc. Natl. Acad. Sci. USA* 90:6444-6448.

"Humanized" forms of non-human (*e.g.*, rodent) antibodies are chimeric  
20 antibodies that contain minimal sequence derived from non-human immunoglobulin. For the most part, humanized antibodies are human immunoglobulins (recipient antibody) in which residues from a hypervariable region of the recipient are replaced by residues from a hypervariable region of a non-human species (donor antibody) such as mouse, rat,  
25 rabbit or nonhuman primate having the desired specificity, affinity, and capacity. In some instances, framework region (FR) residues of the human immunoglobulin are replaced by corresponding non-human residues. Furthermore, humanized antibodies may comprise residues that are not found in the recipient antibody or in the donor antibody. These modifications are made to further refine antibody performance. In general, the  
30 humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the hypervariable loops correspond to those of a non-human immunoglobulin and all or substantially all of the FRs are those of a human immunoglobulin sequence. The humanized antibody optionally also will

comprise at least a portion of an immunoglobulin constant region (Fc), typically that of a human immunoglobulin. For further details, see Jones *et al.* (1986) *Nature*, 321:522-525; Riechmann *et al.* (1988) *Nature* 332:323-329; and Presta, (1992) *Curr. Op. Struct. Biol.*, 2:593-596.

5 Humanized anti-ErbB2 antibodies include huMAb4D5-1, huMAb4D5-2, huMAb4D5-3, huMAb4D5-4, huMAb4D5-5, huMAb4D5-6, huMAb4D5-7 and huMAb4D5-8 (HERCEPTIN®) as described in Table 3 of U.S. Patent No. 5821337; humanized 520C9 (WO 93/21319) and humanized 2C4 antibodies as described herein below.

10 An "isolated" antibody is one which has been identified and separated and/or recovered from a component of its natural environment. Contaminant components of its natural environment are materials which would interfere with diagnostic or therapeutic uses for the antibody, and may include enzymes, hormones, and other proteinaceous or nonproteinaceous solutes. In preferred embodiments, the antibody will  
15 be purified (1) to greater than 95% by weight of antibody as determined by the Lowry method, and most preferably more than 99% by weight, (2) to a degree sufficient to obtain at least 15 residues of N-terminal or internal amino acid sequence by use of a spinning cup sequenator, or (3) to homogeneity by SDS-PAGE under reducing or nonreducing conditions using Coomassie blue or, preferably, silver stain. Isolated  
20 antibody includes the antibody *in situ* within recombinant cells since at least one component of the antibody's natural environment will not be present. Ordinarily, however, isolated antibody will be prepared by at least one purification step.

An antibody "which binds" an antigen of interest is one capable of binding that antigen with sufficient affinity such that the antibody is useful in targeting a cell  
25 expressing the antigen.

An antibody which "induces apoptosis" is one which induces programmed cell death as determined by binding of annexin V, fragmentation of DNA, cell shrinkage, dilation of endoplasmic reticulum, cell fragmentation, and/or formation of membrane vesicles (called apoptotic bodies). The cell is a tumor cell, *e.g.*, a breast, ovarian,  
30 stomach, endometrial, salivary gland, lung, kidney, colon, thyroid, pancreatic or bladder cell. Various methods are available for evaluating the cellular events associated with apoptosis. For example, phosphatidyl serine (PS) translocation can be measured by annexin binding; DNA fragmentation can be evaluated through DNA laddering; and

WO 2005/081711

PCT/US2004/038392

nuclear/chromatin condensation along with DNA fragmentation can be evaluated by any increase in hypodiploid cells.

A “disorder” is any condition that would benefit from treatment of the present invention. This includes chronic and acute disorders or diseases including those pathological conditions which predispose the mammal to the disorder in question. Non-limiting examples of disorders to be treated herein include benign and malignant tumors; leukemia and lymphoid malignancies, in particular breast, ovarian, stomach, endometrial, salivary gland, lung, kidney, colon, thyroid, pancreatic, prostate or bladder cancer; neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal and blastocoelic disorders; and inflammatory, angiogenic and immunologic disorders.

The term “therapeutically effective amount” refers to an amount of a drug effective to treat a disease or disorder in a mammal. In the case of cancer, the therapeutically effective amount of the drug may reduce the number of cancer cells; reduce the tumor size; inhibit (*i.e.*, slow to some extent and preferably stop) cancer cell infiltration into peripheral organs; inhibit (*i.e.*, slow to some extent and preferably stop) tumor metastasis; inhibit, to some extent, tumor growth; and/or relieve to some extent one or more of the symptoms associated with the cancer. To the extent the drug may prevent growth and/or kill existing cancer cells, it may be cytostatic and/or cytotoxic. For cancer therapy, efficacy can, for example, be measured by assessing the time to disease progression (TTP) and/or determining the response rate (RR).

The term “substantial amount” refers to a majority, *i.e.* >50% of a population, of a collection or a sample.

The term “intracellular metabolite” refers to a compound resulting from a metabolic process or reaction inside a cell on an antibody drug conjugate (ADC). The metabolic process or reaction may be an enzymatic process such as proteolytic cleavage of a peptide linker of the ADC, or hydrolysis of a functional group such as a hydrazone, ester, or amide. Intracellular metabolites include, but are not limited to, antibodies and free drug which have undergone intracellular cleavage after entry, diffusion, uptake or transport into a cell.

The terms “intracellularly cleaved” and “intracellular cleavage” refer to a metabolic process or reaction inside a cell on an Drug-Ligand Conjugate, a Drug-Linker-Ligand Conjugate, an antibody drug conjugate (ADC) or the like whereby the covalent

attachment, *e.g.*, the linker, between the drug moiety (D) and the antibody (Ab) is broken, resulting in the free drug dissociated from the antibody inside the cell. The cleaved moieties of the Drug-Ligand Conjugate, a Drug-Linker-Ligand Conjugate or ADC are thus intracellular metabolites.

5                   The term "bioavailability" refers to the systemic availability (*i.e.*, blood/plasma levels) of a given amount of drug administered to a patient. Bioavailability is an absolute term that indicates measurement of both the time (rate) and total amount (extent) of drug that reaches the general circulation from an administered dosage form.

10                   The term "cytotoxic activity" refers to a cell-killing, cytostatic or anti-proliferation effect of an antibody drug conjugate compound or an intracellular metabolite of an antibody drug conjugate compound. Cytotoxic activity may be expressed as the  $IC_{50}$  value which is the concentration (molar or mass) per unit volume at which half the cells survive.

15                   The terms "cancer" and "cancerous" refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth. A "tumor" comprises one or more cancerous cells. Examples of cancer include, but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukemia or lymphoid malignancies. More particular examples of such cancers include squamous cell cancer (*e.g.*, epithelial squamous cell cancer), lung cancer including small-cell lung cancer, non-20 small cell lung cancer ("NSCLC"), adenocarcinoma of the lung and squamous carcinoma of the lung, cancer of the peritoneum, hepatocellular cancer, gastric or stomach cancer including gastrointestinal cancer, pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, hepatoma, breast cancer, colon cancer, rectal cancer, colorectal cancer, endometrial or uterine carcinoma, salivary gland carcinoma, 25 kidney or renal cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma, anal carcinoma, penile carcinoma, as well as head and neck cancer.

                  An "ErbB2-expressing cancer" is one which produces sufficient levels of ErbB2 at the surface of cells thereof, such that an anti-ErbB2 antibody can bind thereto and have a therapeutic effect with respect to the cancer.

30                   A cancer "characterized by excessive activation" of an ErbB2 receptor is one in which the extent of ErbB2 receptor activation in cancer cells significantly exceeds the level of activation of that receptor in non-cancerous cells of the same tissue type. Such excessive activation may result from overexpression of the ErbB2 receptor and/or

greater than normal levels of an ErbB2 ligand available for activating the ErbB2 receptor in the cancer cells. Such excessive activation may cause and/or be caused by the malignant state of a cancer cell. In some embodiments, the cancer will be subjected to a diagnostic or prognostic assay to determine whether amplification and/or overexpression of an ErbB2 receptor is occurring which results in such excessive activation of the ErbB2 receptor. Alternatively, or additionally, the cancer may be subjected to a diagnostic or prognostic assay to determine whether amplification and/or overexpression an ErbB2 ligand is occurring in the cancer which attributes to excessive activation of the receptor. In a subset of such cancers, excessive activation of the receptor may result from an autocrine stimulatory pathway.

A cancer which "overexpresses" an ErbB2 receptor is one which has significantly higher levels of an ErbB2 receptor at the cell surface thereof, compared to a noncancerous cell of the same tissue type. Such overexpression may be caused by gene amplification or by increased transcription or translation. ErbB2 receptor overexpression may be determined in a diagnostic or prognostic assay by evaluating increased levels of the ErbB2 protein present on the surface of a cell (*e.g.*, via an immunohistochemistry assay; IHC). Alternatively, or additionally, one may measure levels of ErbB2-encoding nucleic acid in the cell, *e.g.*, via fluorescent *in situ* hybridization (FISH; see WO 98/45479), southern blotting, or polymerase chain reaction (PCR) techniques, such as real time quantitative PCR (RT-PCR). Overexpression of the ErbB2 ligand, may be determined diagnostically by evaluating levels of the ligand (or nucleic acid encoding it) in the patient, *e.g.*, in a tumor biopsy or by various diagnostic assays such as the IHC, FISH, southern blotting, PCR or *in vivo* assays described above. One may also study ErbB2 receptor overexpression by measuring shed antigen (*e.g.*, ErbB2 extracellular domain) in a biological fluid such as serum (see, *e.g.*, U.S. Patent No. 4933294; WO 91/05264; U.S. Patent No. 5401638; and Sias *et al.*, (1990) *J. Immunol. Methods*, 132: 73-80). Aside from the above assays, various other *in vivo* assays are available to the skilled practitioner. For example, one may expose cells within the body of the patient to an antibody which is optionally labeled with a detectable label, *e.g.*, a radioactive isotope, and binding of the antibody to cells in the patient can be evaluated, *e.g.*, by external scanning for radioactivity or by analyzing a biopsy taken from a patient previously exposed to the antibody.

The tumors overexpressing HER2 are rated by immunohistochemical scores corresponding to the number of copies of HER2 molecules expressed per cell, and can be determined biochemically: 0 = 0-10,000 copies/cell, 1+ = at least about 200,000 copies/cell, 2+ = at least about 500,000 copies/cell, 3+ = about  $1-2 \times 10^6$  copies/cell.

5 Overexpression of HER2 at the 3+ level, which leads to ligand-independent activation of the tyrosine kinase (Hudziak *et al.*, (1987) *Proc. Natl. Acad. Sci. USA*, 84:7159-7163), occurs in approximately 30% of breast cancers, and in these patients, relapse-free survival and overall survival are diminished (Slamon *et al.*, (1989) *Science*, 244:707-712; Slamon *et al.*, (1987) *Science*, 235:177-182).

10 Conversely, a cancer which is "not characterized by overexpression of the ErbB2 receptor" is one which, in a diagnostic assay, does not express higher than normal levels of ErbB2 receptor compared to a noncancerous cell of the same tissue type.

The term "cytotoxic agent" as used herein refers to a substance that inhibits or prevents the function of cells and/or causes destruction of cells. The term is intended to include radioactive isotopes (*e.g.*,  $^{211}\text{At}$ ,  $^{131}\text{I}$ ,  $^{125}\text{I}$ ,  $^{90}\text{Y}$ ,  $^{186}\text{Re}$ ,  $^{188}\text{Re}$ ,  $^{153}\text{Sm}$ ,  $^{212}\text{Bi}$ ,  $^{32}\text{P}$ ,  $^{60}\text{C}$ , and radioactive isotopes of Lu), chemotherapeutic agents, and toxins such as small molecule toxins or enzymatically active toxins of bacterial, fungal, plant or animal origin, including synthetic analogs and derivatives thereof. In one aspect, the term is not intended to include radioactive isotopes.

20 A "chemotherapeutic agent" is a chemical compound useful in the treatment of cancer. Examples of chemotherapeutic agents include alkylating agents such as thiotepa and CYTOXAN® cyclophosphamide; alkyl sulfonates such as busulfan, improsulfan and piposulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines and methylamelamines including altretamine,

25 triethylenemelamine, trietylenephosphoramide, triethylenethiophosphoramide and trimethylolomelamine; TLK 286 (TELCYTA™); acetogenins (especially bullatacin and bullatacinone); delta-9-tetrahydrocannabinol (dronabinol, MARINOL®); beta-lapachone; lapachol; colchicines; betulinic acid; a camptothecin (including the synthetic analogue topotecan (HYCAMTIN®), CPT-11 (irinotecan, CAMPTOSAR®),

30 acetylcamptothecin, scoplectin, and 9-aminocamptothecin); bryostatins; callistatin; CC-1065 (including its adozelesin, carzelesin and bizelesin synthetic analogues); podophyllotoxin; podophyllinic acid; teniposide; cryptophycins (particularly cryptophycin 1 and cryptophycin 8); dolastatin; duocarmycin (including the synthetic

analogues, KW-2189 and CB1-TM1); eleutherobin; pancratistatin; a sarcodictyin;  
 spongistatin; nitrogen mustards such as chlorambucil, chlornaphazine,  
 cholophosphamide, estramustine, ifosfamide, mechlorethamine, mechlorethamine oxide  
 hydrochloride, melphalan, novembichin, phenesterine, prednimustine, trofosfamide,  
 5 uracil mustard; nitrosureas such as carmustine, chlorozotocin, fotemustine, lomustine,  
 nimustine, and ranimustine; bisphosphonates, such as clodronate; antibiotics such as the  
 enediyne antibiotics (*e. g.*, calicheamicin, especially calicheamicin gammaII and  
 calicheamicin omegaII (see, *e.g.*, *Angew. Chem. Int. Ed. Engl.* 33: 183-186 (1994)) and  
 anthracyclines such as annamycin, AD 32, acarubicin, daunorubicin, dexrazoxane, DX-  
 10 52-1, epirubicin, GPX-100, idarubicin, KRN5500, menogaril, dynemicin, including  
 dynemicin A, an esperamicin, neocarzinostatin chromophore and related chromoprotein  
 enediyne antibiotic chromophores, aclacinomysins, actinomycin, anthramycin,  
 azaserine, bleomycins, cactinomycin, carabycin, carminomycin, carzinophilin,  
 chromomycinis, dactinomycin, detorubicin, 6-diazo-5-oxo-L-norleucine,  
 15 ADRIAMYCIN® doxorubicin (including morpholino-doxorubicin; cyanomorpholino-  
 doxorubicin, 2-pyrrolino-doxorubicin, liposomal doxorubicin, and deoxydoxorubicin),  
 esorubicin, marcellomycin, mitomycins such as mitomycin C, mycophenolic acid,  
 nogalamycin, olivomycins, peplomycin, potfiromycin, puromycin, quelamycin,  
 rodorubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, and zorubicin;  
 20 folic acid analogues such as denopterin, pteropterin, and trimetrexate; purine analogs such  
 as fludarabine, 6-mercaptopurine, thiamiprine, and thioguanine; pyrimidine analogs such  
 as ancitabine, azacitidine, 6-azauridine, carmofur, cytarabine, dideoxyuridine,  
 doxifluridine, encitabine, and floxuridine; androgens such as calusterone,  
 dromostanolone propionate, epitio stanol, mepitio stanol, and testolactone; anti-adrenals  
 25 such as aminoglutethimide, mitotane, and trilostane; folic acid replenisher such as folinic  
 acid (leucovorin); aceglatone; anti-folate anti-neoplastic agents such as ALIMTA®,  
 LY231514 pemetrexed, dihydrofolate reductase inhibitors such as methotrexate, anti-  
 metabolites such as 5-fluorouracil (5-FU) and its prodrugs such as UFT, S-1 and  
 capecitabine, and thymidylate synthase inhibitors and glycinamide ribonucleotide  
 30 formyltransferase inhibitors such as raltitrexed (TOMUDEX<sup>RM</sup>, TDX); inhibitors of  
 dihydropyrimidine dehydrogenase such as eniluracil; aldophosphamide glycoside;  
 aminolevulinic acid; amsacrine; bestrabucil; bisantrene; edatraxate; defofamine;  
 demecolcine; diaziqunone; elfornithine; elliptinium acetate; an eptothilone; etoglucid;

WO 2005/081711

PCT/US2004/038392

gallium nitrate; hydroxyurea; lentinan; lonidainine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; mopidanmol; nitraerine; pentostatin; phenamet; pirarubicin; losoxantrone; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex (JHS Natural Products, Eugene, OR); razoxane; rhizoxin;

5 sizofiran; spirogermanium; tenuazonic acid; triaziquone; 2,2',2"-trichlorotriethylamine; trichothecenes (especially T-2 toxin, verracurin A, roridin A and anguidine); urethan; vindesine (ELDISINE®, FILDESIN®); dacarbazine; mannomustine; mitobronitol; mitolactol; pipobroman; gacytosine; arabinoside ("Ara-C"); cyclophosphamide; thiotepa; taxoids and taxanes, *e.g.*, TAXOL® paclitaxel (Bristol-Myers Squibb Oncology,

10 Princeton, N.J.), ABRAXANE™ Cremophor-free, albumin-engineered nanoparticle formulation of paclitaxel (American Pharmaceutical Partners, Schaumburg, Illinois), and TAXOTERE® doxorubicin (Rhône-Poulenc Rorer, Antony, France); chloranbucil; gemcitabine (GEMZAR®); 6-thioguanine; mercaptopurine; platinum; platinum analogs or platinum-based analogs such as cisplatin, oxaliplatin and carboplatin; vinblastine

15 (VELBAN®); etoposide (VP-16); ifosfamide; mitoxantrone; vincristine (ONCOVIN®); vinca alkaloid; vinorelbine (NAVELBINE®); novantrone; edatrexate; daunomycin; aminopterin; xeloda; ibandronate; topoisomerase inhibitor RFS 2000; difluoromethylornithine (DMFO); retinoids such as retinoic acid; pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two

20 or more of the above such as CHOP, an abbreviation for a combined therapy of cyclophosphamide, doxorubicin, vincristine, and prednisolone, and FOLFOX, an abbreviation for a treatment regimen with oxaliplatin (ELOXATIN™) combined with 5-FU and leucovorin.

Also included in this definition are anti-hormonal agents that act to

25 regulate or inhibit hormone action on tumors such as anti-estrogens and selective estrogen receptor modulators (SERMs), including, for example, tamoxifen (including NOLVADEX® tamoxifen), raloxifene, droloxifene, 4-hydroxytamoxifen, trioxifene, keoxifene, LY117018, onapristone, and FARESTON® toremifene; aromatase inhibitors that inhibit the enzyme aromatase, which regulates estrogen production in the adrenal

30 glands, such as, for example, 4(5)-imidazoles, aminoglutethimide, MEGASE® megestrol acetate, AROMASIN® exemestane, formestane, fadrozole, RIVISOR® vorozole, FEMARA® letrozole, and ARIMIDEX® anastrozole; and anti-androgens such as flutamide, nilutamide, bicalutamide, leuprolide, and goserelin; as well as troxacitabine (a

WO 2005/081711

PCT/US2004/038392

1,3-dioxolane nucleoside cytosine analog); antisense oligonucleotides, particularly those that inhibit expression of genes in signaling pathways implicated in aberrant cell proliferation, such as, for example, PKC-alpha, Raf, H-Ras, and epidermal growth factor receptor (EGF-R); vaccines such as gene therapy vaccines, for example,

5 ALLOVECTIN® vaccine, LEUVECTIN® vaccine, and VAXID® vaccine;  
PROLEUKIN® rIL-2; LURTOTECAN® topoisomerase 1 inhibitor; ABARELIX®  
mmRH; and pharmaceutically acceptable salts, acids or derivatives of any of the above.

As used herein, the term "EGFR-targeted drug" refers to a therapeutic agent that binds to EGFR and, optionally, inhibits EGFR activation. Examples of such agents include antibodies and small molecules that bind to EGFR. Examples of antibodies which bind to EGFR include MAb 579 (ATCC CRL HB 8506), MAb 455 (ATCC CRL HB8507), MAb 225 (ATCC CRL 8508), MAb 528 (ATCC CRL 8509) (see, U.S. Patent No. 4943533, Mendelsohn *et al.*) and variants thereof, such as chimerized 225 (C225 or Cetuximab; ERBITUX®) and reshaped human 225 (H225) (see, WO 96/40210, Imclone Systems Inc.); antibodies that bind type II mutant EGFR (U.S. Patent No. 5,212,290); humanized and chimeric antibodies that bind EGFR as described in U.S. Patent No. 5891996; and human antibodies that bind EGFR, such as ABX-EGF (see WO 98/50433, Abgenix). The anti-EGFR antibody may be conjugated with a cytotoxic agent, thus generating an immunoconjugate (see, *e.g.*, EP 659,439A2, Merck Patent GmbH).

20 Examples of small molecules that bind to EGFR include ZD1839 or Gefitinib (IRESSA™; Astra Zeneca), Erlotinib HCl (CP-358774, TARCEVA™; Genentech/OSI) and AG1478, AG1571 (SU 5271; Sugen).

A "tyrosine kinase inhibitor" is a molecule which inhibits to some extent tyrosine kinase activity of a tyrosine kinase such as an ErbB receptor. Examples of such inhibitors include the EGFR-targeted drugs noted in the preceding paragraph as well as quinazolines such as PD 153035, 4-(3-chloroanilino)quinazoline, pyridopyrimidines, pyrimidopyrimidines, pyrrolopyrimidines, such as CGP 59326, CGP 60261 and CGP 62706, and pyrazolopyrimidines, 4-(phenylamino)-7H-pyrrolo[2,3-d]pyrimidines, curcumin (diferuloyl methane, 4,5-bis (4-fluoroanilino)phthalimide), tyrphostines containing nitrothiophene moieties; PD-0183805 (Warner-Lambert); antisense molecules (*e.g.*, those that bind to ErbB-encoding nucleic acid); quinoxalines (U.S. Patent No. 5,804,396); tryphostins (U.S. Patent No. 5804396); ZD6474 (Astra Zeneca); PTK-787 (Novartis/Schering AG); pan-ErbB inhibitors such as CI-1033 (Pfizer); Affinitac

(ISIS 3521; Isis/Lilly); Imatinib mesylate (Gleevac; Novartis); PKI 166 (Novartis); GW2016 (Glaxo SmithKline); CI-1033 (Pfizer); EKB-569 (Wyeth); Semaxanib (Sugen); ZD6474 (AstraZeneca); PTK-787 (Novartis/Schering AG); INC-1C11 (Imclone); or as described in any of the following patent publications: U.S. Patent No. 5804396; WO  
5 99/09016 (American Cyanamid); WO 98/43960 (American Cyanamid); WO 97/38983 (Warner Lambert); WO 99/06378 (Warner Lambert); WO 99/06396 (Warner Lambert); WO 96/30347 (Pfizer, Inc); WO 96/33978 (Zeneca); WO 96/3397 (Zeneca); and WO 96/33980 (Zeneca).

An "anti-angiogenic agent" refers to a compound which blocks, or  
10 interferes with to some degree, the development of blood vessels. The anti-angiogenic factor may, for instance, be a small molecule or antibody that binds to a growth factor or growth factor receptor involved in promoting angiogenesis. In one embodiment, the anti-angiogenic factor is an antibody that binds to Vascular Endothelial Growth Factor (VEGF).

15 The term "cytokine" is a generic term for proteins released by one cell population which act on another cell as intercellular mediators. Examples of such cytokines are lymphokines, monokines, and traditional polypeptide hormones. Included among the cytokines are growth hormone such as human growth hormone, N-methionyl human growth hormone, and bovine growth hormone; parathyroid hormone; thyroxine;  
20 insulin; proinsulin; relaxin; prorelaxin; glycoprotein hormones such as follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), and luteinizing hormone (LH); hepatic growth factor; fibroblast growth factor; prolactin; placental lactogen; tumor necrosis factor- $\alpha$  and - $\beta$ ; mullerian-inhibiting substance; mouse gonadotropin-associated peptide; inhibin; activin; vascular endothelial growth factor; integrin; thrombopoietin  
25 (TPO); nerve growth factors such as NGF- $\beta$ ; platelet-growth factor; transforming growth factors (TGFs) such as TGF- $\alpha$  and TGF- $\beta$ ; insulin-like growth factor-I and -II; erythropoietin (EPO); osteoinductive factors; interferons such as interferon- $\alpha$ , - $\beta$ , and - $\gamma$ ; colony stimulating factors (CSFs) such as macrophage-CSF (M-CSF); granulocyte-macrophage-CSF (GM-CSF); and granulocyte-CSF (G-CSF); interleukins (ILs) such as  
30 IL-1, IL-1 $\alpha$ , IL-2, IL-3, IL-4, IL-5, IL-6, IL-7, IL-8, IL-9, IL-10, IL-11, IL-12; a tumor necrosis factor such as TNF- $\alpha$  or TNF- $\beta$ ; and other polypeptide factors including LIF and kit ligand (KL). As used herein, the term cytokine includes proteins from natural sources

WO 2005/081711

PCT/US2004/038392

or from recombinant cell culture and biologically active equivalents of the native sequence cytokines.

The term "prodrug" as used in this application refers to a precursor or derivative form of a pharmaceutically active substance that is less cytotoxic to tumor cells compared to the parent drug and is capable of being enzymatically or hydrolytically activated or converted into the more active parent form. See, *e.g.*, Wilman, "Prodrugs in Cancer Chemotherapy" *Biochemical Society Transactions*, 14, pp. 375-382, 615th Meeting Belfast (1986) and Stella *et al.*, "Prodrugs: A Chemical Approach to Targeted Drug Delivery," *Directed Drug Delivery*, Borchardt *et al.*, (ed.), pp. 247-267, Humana Press (1985). The prodrugs of this invention include, but are not limited to, phosphate-containing prodrugs, thiophosphate-containing prodrugs, sulfate-containing prodrugs, peptide-containing prodrugs, D-amino acid-modified prodrugs, glycosylated prodrugs,  $\beta$ -lactam-containing prodrugs, optionally substituted phenoxyacetamide-containing prodrugs or optionally substituted phenylacetamide-containing prodrugs, 5-fluorocytosine and other 5-fluorouridine prodrugs which can be converted into the more active cytotoxic free drug. Examples of cytotoxic drugs that can be derivatized into a prodrug form for use in this invention include, but are not limited to, those chemotherapeutic agents described above.

A "liposome" is a small vesicle composed of various types of lipids, phospholipids and/or surfactant which is useful for delivery of a drug (such as including the anti-CD30, CD40, CD70 or Lewis Y antibodies and, optionally, a chemotherapeutic agent) to a mammal. The components of the liposome are commonly arranged in a bilayer formation, similar to the lipid arrangement of biological membranes. The term "package insert" is used to refer to instructions customarily included in commercial packages of therapeutic products, that contain information about the indications, usage, dosage, administration, contraindications and/or warnings concerning the use of such therapeutic products.

An "isolated" nucleic acid molecule is a nucleic acid molecule that is identified and separated from at least one contaminant nucleic acid molecule with which it is ordinarily associated in the natural source of the antibody nucleic acid. An isolated nucleic acid molecule is other than in the form or setting in which it is found in nature. Isolated nucleic acid molecules therefore are distinguished from the nucleic acid molecule as it exists in natural cells. However, an isolated nucleic acid molecule includes a nucleic

WO 2005/081711

PCT/US2004/038392

acid molecule contained in cells that ordinarily express the antibody where, for example, the nucleic acid molecule is in a chromosomal location different from that of natural cells.

The expression "control sequences" refers to DNA sequences necessary for the expression of an operably linked coding sequence in a particular host organism.

5 The control sequences that are suitable for prokaryotes, for example, include a promoter, optionally an operator sequence, and a ribosome binding site. Eukaryotic cells are known to utilize promoters, polyadenylation signals, and enhancers.

A nucleic acid is "operably linked" when it is placed into a functional relationship with another nucleic acid sequence. For example, DNA for a presequence or  
10 secretory leader is operably linked to DNA for a polypeptide if it is expressed as a preprotein that participates in the secretion of the polypeptide; a promoter or enhancer is operably linked to a coding sequence if it affects the transcription of the sequence; or a ribosome binding site is operably linked to a coding sequence if it is positioned so as to facilitate translation. Generally, "operably linked" means that the DNA sequences being  
15 linked are contiguous, and, in the case of a secretory leader, contiguous and in reading phase. However, enhancers do not have to be contiguous. Linking can be accomplished by ligation at convenient restriction sites. If such sites do not exist, the synthetic oligonucleotide adaptors or linkers can be used in accordance with conventional practice.

As used herein, the expressions "cell," "cell line," and "cell culture" are  
20 used interchangeably and all such designations include progeny. Thus, the words "transformants" and "transformed cells" include the primary subject cell and cultures derived therefrom without regard for the number of transfers. It is also understood that all progeny may not be precisely identical in DNA content, due to deliberate or inadvertent mutations. Mutant progeny that have the same function or biological activity as screened  
25 for in the originally transformed cell are included. Where distinct designations are intended, it will be clear from the context.

An "autoimmune disease" herein is a disease or disorder arising from and directed against an individual's own tissues or a co-segregate or manifestation thereof or resulting condition therefrom. Examples of autoimmune diseases or disorders include,  
30 but are not limited to arthritis (rheumatoid arthritis, juvenile rheumatoid arthritis, osteoarthritis, psoriatic arthritis, and ankylosing spondylitis), psoriasis, dermatitis including atopic dermatitis; chronic idiopathic urticaria, including chronic autoimmune urticaria, polymyositis/dermatomyositis, toxic epidermal necrolysis, systemic

scleroderma and sclerosis, responses associated with inflammatory bowel disease (IBD) (Crohn's disease, ulcerative colitis), and IBD with co-segregate of pyoderma gangrenosum, erythema nodosum, primary sclerosing cholangitis, and/or episcleritis), respiratory distress syndrome, including adult respiratory distress syndrome (ARDS),

5 meningitis, IgE-mediated diseases such as anaphylaxis and allergic rhinitis, encephalitis such as Rasmussen's encephalitis, uveitis, colitis such as microscopic colitis and collagenous colitis, glomerulonephritis (GN) such as membranous GN, idiopathic membranous GN, membranous proliferative GN (MPGN), including Type I and Type II, and rapidly progressive GN, allergic conditions, eczema, asthma, conditions involving

10 infiltration of T cells and chronic inflammatory responses, atherosclerosis, autoimmune myocarditis, leukocyte adhesion deficiency, systemic lupus erythematosus (SLE) such as cutaneous SLE, lupus (including nephritis, cerebritis, pediatric, non-renal, discoid, alopecia), juvenile onset diabetes, multiple sclerosis (MS) such as spino-optical MS, allergic encephalomyelitis, immune responses associated with acute and delayed

15 hypersensitivity mediated by cytokines and T-lymphocytes, tuberculosis, sarcoidosis, granulomatosis including Wegener's granulomatosis, agranulocytosis, vasculitis (including Large Vessel vasculitis (including Polymyalgia Rheumatica and Giant Cell (Takayasu's) Arteritis), Medium Vessel vasculitis (including Kawasaki's Disease and Polyarteritis Nodosa), CNS vasculitis, and ANCA-associated vasculitis, such as Churg-

20 Strauss vasculitis or syndrome (CSS)), aplastic anemia, Coombs positive anemia, Diamond Blackfan anemia, immune hemolytic anemia including autoimmune hemolytic anemia (AIHA), pernicious anemia, pure red cell aplasia (PRCA), Factor VIII deficiency, hemophilia A, autoimmune neutropenia, pancytopenia, leukopenia, diseases involving leukocyte diapedesis, CNS inflammatory disorders, multiple organ injury syndrome,

25 myasthenia gravis, antigen-antibody complex mediated diseases, anti-glomerular basement membrane disease, anti-phospholipid antibody syndrome, allergic neuritis, Bechet disease, Castleman's syndrome, Goodpasture's Syndrome, Lambert-Eaton Myasthenic Syndrome, Reynaud's syndrome, Sjorgen's syndrome, Stevens-Johnson syndrome, solid organ transplant rejection (including pretreatment for high panel reactive

30 antibody titers, IgA deposit in tissues, and rejection arising from renal transplantation, liver transplantation, intestinal transplantation, cardiac transplantation, etc.), graft versus host disease (GVHD), pemphigoid bullous, pemphigus (including vulgaris, foliaceus, and pemphigus mucus-membrane pemphigoid), autoimmune polyendocrinopathies, Reiter's

disease, stiff-man syndrome, immune complex nephritis, IgM polyneuropathies or IgM mediated neuropathy, idiopathic thrombocytopenic purpura (ITP), thrombotic thrombocytopenic purpura (TTP), thrombocytopenia (as developed by myocardial infarction patients, for example), including autoimmune thrombocytopenia, autoimmune disease of the testis and ovary including autoimmune orchitis and oophoritis, primary hypothyroidism; autoimmune endocrine diseases including autoimmune thyroiditis, chronic thyroiditis (Hashimoto's Thyroiditis), subacute thyroiditis, idiopathic hypothyroidism, Addison's disease, Grave's disease, autoimmune polyglandular syndromes (or polyglandular endocrinopathy syndromes), Type I diabetes also referred to as insulin-dependent diabetes mellitus (IDDM), including pediatric IDDM, and Sheehan's syndrome; autoimmune hepatitis, Lymphoid interstitial pneumonitis (HIV), bronchiolitis obliterans (non-transplant) vs NSIP, Guillain-Barré Syndrome, Berger's Disease (IgA nephropathy), primary biliary cirrhosis, celiac sprue (gluten enteropathy), refractory sprue with co-segregate dermatitis herpetiformis, cryoglobulinemia, amyotrophic lateral sclerosis (ALS; Lou Gehrig's disease), coronary artery disease, autoimmune inner ear disease (AIED), autoimmune hearing loss, opsoclonus myoclonus syndrome (OMS), polychondritis such as refractory polychondritis, pulmonary alveolar proteinosis, amyloidosis, giant cell hepatitis, scleritis, monoclonal gammopathy of uncertain/unknown significance (MGUS), peripheral neuropathy, paraneoplastic syndrome, channelopathies such as epilepsy, migraine, arrhythmia, muscular disorders, deafness, blindness, periodic paralysis, and channelopathies of the CNS; autism, inflammatory myopathy, and focal segmental glomerulosclerosis (FSGS).

"Alkyl" is C<sub>1</sub>-C<sub>18</sub> hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms. Examples are methyl (Me, -CH<sub>3</sub>), ethyl (Et, -CH<sub>2</sub>CH<sub>3</sub>), 1-propyl (n-Pr, n-propyl, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-propyl (i-Pr, i-propyl, -CH(CH<sub>3</sub>)<sub>2</sub>), 1-butyl (n-Bu, n-butyl, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-methyl-1-propyl (i-Bu, i-butyl, -CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 2-butyl (s-Bu, s-butyl, -CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>3</sub>), 2-methyl-2-propyl (t-Bu, t-butyl, -C(CH<sub>3</sub>)<sub>3</sub>), 1-pentyl (n-pentyl, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-pentyl (-CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-pentyl (-CH(CH<sub>2</sub>CH<sub>3</sub>)<sub>2</sub>), 2-methyl-2-butyl (-C(CH<sub>3</sub>)<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-methyl-2-butyl (-CH(CH<sub>3</sub>)CH(CH<sub>3</sub>)<sub>2</sub>), 3-methyl-1-butyl (-CH<sub>2</sub>CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 2-methyl-1-butyl (-CH<sub>2</sub>CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>3</sub>), 1-hexyl (-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-hexyl (-CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-hexyl (-CH(CH<sub>2</sub>CH<sub>3</sub>)(CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>)), 2-methyl-2-

pentyl (-C(CH<sub>3</sub>)<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-methyl-2-pentyl (-CH(CH<sub>3</sub>)CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>3</sub>), 4-methyl-2-pentyl (-CH(CH<sub>3</sub>)CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 3-methyl-3-pentyl (-C(CH<sub>3</sub>)(CH<sub>2</sub>CH<sub>3</sub>)<sub>2</sub>), 2-methyl-3-pentyl (-CH(CH<sub>2</sub>CH<sub>3</sub>)CH(CH<sub>3</sub>)<sub>2</sub>), 2,3-dimethyl-2-butyl (-C(CH<sub>3</sub>)<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 3,3-dimethyl-2-butyl (-CH(CH<sub>3</sub>)C(CH<sub>3</sub>)<sub>3</sub>).

- 5                   “Alkenyl” is C<sub>2</sub>-C<sub>18</sub> hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, *i.e.* a carbon-carbon, *sp*<sup>2</sup> double bond. Examples include, but are not limited to: ethylene or vinyl (-CH=CH<sub>2</sub>), allyl (-CH<sub>2</sub>CH=CH<sub>2</sub>), cyclopentenyl (-C<sub>5</sub>H<sub>7</sub>), and 5-hexenyl (-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH=CH<sub>2</sub>).
- 10                   “Alkynyl” is C<sub>2</sub>-C<sub>18</sub> hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, *i.e.* a carbon-carbon, *sp* triple bond. Examples include, but are not limited to: acetylenic (-C≡CH) and propargyl (-CH<sub>2</sub>C≡CH).
- “Alkylene” refers to a saturated, branched or straight chain or cyclic hydrocarbon radical of 1-18 carbon atoms, and having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkane. Typical alkylene radicals include, but are not limited to: methylene (-CH<sub>2</sub>-), 1,2-ethyl (-CH<sub>2</sub>CH<sub>2</sub>-), 1,3-propyl (-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-), 1,4-butyl (-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-), and the like.
- 15                   “Alkenylene” refers to an unsaturated, branched or straight chain or cyclic hydrocarbon radical of 2-18 carbon atoms, and having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkene. Typical alkenylene radicals include, but are not limited to: 1,2-ethylene (-CH=CH-).
- 20                   “Alkynylene” refers to an unsaturated, branched or straight chain or cyclic hydrocarbon radical of 2-18 carbon atoms, and having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkyne. Typical alkynylene radicals include, but are not limited to: acetylene (-C≡C-), propargyl (-CH<sub>2</sub>C≡C-), and 4-pentynyl (-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>C≡CH-).
- 25                   “Aryl” means a monovalent aromatic hydrocarbon radical of 6-20 carbon atoms derived by the removal of one hydrogen atom from a single carbon atom of a parent aromatic ring system. Some aryl groups are represented in the exemplary
- 30

structures as "Ar". Typical aryl groups include, but are not limited to, radicals derived from benzene, substituted benzene, naphthalene, anthracene, biphenyl, and the like.

"Arylalkyl" refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or  $sp^3$  carbon atom, is replaced with an aryl radical. Typical arylalkyl groups include, but are not limited to, benzyl, 2-phenylethan-1-yl, 2-phenylethen-1-yl, naphthylmethyl, 2-naphthylethan-1-yl, 2-naphthylethen-1-yl, naphthobenzyl, 2-naphthophenylethan-1-yl and the like. The arylalkyl group comprises 6 to 20 carbon atoms, *e.g.*, the alkyl moiety, including alkanyl, alkenyl or alkynyl groups, of the arylalkyl group is 1 to 6 carbon atoms and the aryl moiety is 5 to 14 carbon atoms.

"Heteroarylalkyl" refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or  $sp^3$  carbon atom, is replaced with a heteroaryl radical. Typical heteroarylalkyl groups include, but are not limited to, 2-benzimidazolylmethyl, 2-furylethyl, and the like. The heteroarylalkyl group comprises 6 to 20 carbon atoms, *e.g.*, the alkyl moiety, including alkanyl, alkenyl or alkynyl groups, of the heteroarylalkyl group is 1 to 6 carbon atoms and the heteroaryl moiety is 5 to 14 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S. The heteroaryl moiety of the heteroarylalkyl group may be a monocycle having 3 to 7 ring members (2 to 6 carbon atoms or a bicycle having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S), for example: a bicyclo [4,5], [5,5], [5,6], or [6,6] system.

"Substituted alkyl", "substituted aryl", and "substituted arylalkyl" mean alkyl, aryl, and arylalkyl respectively, in which one or more hydrogen atoms are each independently replaced with a substituent. Typical substituents include, but are not limited to, -X, -R, -O<sup>-</sup>, -OR, -SR, -S<sup>-</sup>, -NR<sub>2</sub>, -NR<sub>3</sub>, =NR, -CX<sub>3</sub>, -CN, -OCN, -SCN, -N=C=O, -NCS, -NO, -NO<sub>2</sub>, =N<sub>2</sub>, -N<sub>3</sub>, NC(=O)R, -C(=O)R, -C(=O)NR<sub>2</sub>, -SO<sub>3</sub><sup>-</sup>, -SO<sub>3</sub>H, -S(=O)<sub>2</sub>R, -OS(=O)<sub>2</sub>OR, -S(=O)<sub>2</sub>NR, -S(=O)R, -OP(=O)(OR)<sub>2</sub>, -P(=O)(OR)<sub>2</sub>, -PO<sub>3</sub><sup>-</sup>, -PO<sub>3</sub>H<sub>2</sub>, -C(=O)R, -C(=O)X, -C(=S)R, -CO<sub>2</sub>R, -CO<sub>2</sub><sup>-</sup>, -C(=S)OR, -C(=O)SR, -C(=S)SR, -C(=O)NR<sub>2</sub>, -C(=S)NR<sub>2</sub>, -C(=NR)NR<sub>2</sub>, where each X is independently a halogen: F, Cl, Br, or I; and each R is independently -H, C<sub>2</sub>-C<sub>18</sub> alkyl, C<sub>6</sub>-C<sub>20</sub> aryl, C<sub>3</sub>-C<sub>14</sub> heterocycle, protecting group or prodrug moiety. Alkylene, alkenylene, and alkynylene groups as described above may also be similarly substituted.

"Heteroaryl" and "Heterocycle" refer to a ring system in which one or more ring atoms is a heteroatom, *e.g.*, nitrogen, oxygen, and sulfur. The heterocycle radical comprises 1 to 20 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S. A heterocycle may be a monocycle having 3 to 7 ring members (2 to 6 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S) or a bicycle having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S), for example: a bicyclo [4,5], [5,5], [5,6], or [6,6] system.

Heterocycles are described in Paquette, Leo A.; "Principles of Modern Heterocyclic Chemistry" (W.A. Benjamin, New York, 1968), particularly Chapters 1, 3, 4, 6, 7, and 9; "The Chemistry of Heterocyclic Compounds, A series of Monographs" (John Wiley & Sons, New York, 1950 to present), in particular Volumes 13, 14, 16, 19, and 28; and *J. Am. Chem. Soc.* (1960) 82:5566.

Examples of heterocycles include by way of example and not limitation pyridyl, dihydropyridyl, tetrahydropyridyl (piperidyl), thiazolyl, tetrahydrothiophenyl, sulfur oxidized tetrahydrothiophenyl, pyrimidinyl, furanyl, thienyl, pyrrolyl, pyrazolyl, imidazolyl, tetrazolyl, benzofuranyl, thianaphthalenyl, indolyl, indolenyl, quinolinyl, isoquinolinyl, benzimidazolyl, piperidinyl, 4-piperidonyl, pyrrolidinyl, 2-pyrrolidonyl, pyrrolinyl, tetrahydrofuranyl, bis-tetrahydrofuranyl, tetrahydropyranyl, bis-tetrahydropyranyl, tetrahydroquinolinyl, tetrahydroisoquinolinyl, decahydroquinolinyl, octahydroisoquinolinyl, azocinyl, triazinyl, 6H-1,2,5-thiadiazinyl, 2H,6H-1,5,2-dithiazinyl, thienyl, thianthrenyl, pyranyl, isobenzofuranyl, chromenyl, xanthenyl, phenoxathinyl, 2H-pyrrolyl, isothiazolyl, isoxazolyl, pyrazinyl, pyridazinyl, indoliziny, isoindolyl, 3H-indolyl, 1H-indazolyl, purinyl, 4H-quinoliziny, phthalazinyl, naphthyridinyl, quinoxalinyl, quinazolinyl, cinnolinyl, pteridinyl, 4aH-carbazolyl, carbazolyl,  $\beta$ -carbolinyl, phenanthridinyl, acridinyl, pyrimidinyl, phenanthrolinyl, phenazinyl, phenothiazinyl, furazanyl, phenoxazinyl, isochromanyl, chromanyl, imidazolidinyl, imidazoliny, pyrazolidinyl, pyrazoliny, piperazinyl, indoliny, isoindoliny, quinuclidiny, morpholiny, oxazolidinyl, benzotriazolyl, benzisoxazolyl, oxindolyl, benzoxazoliny, and isatinoyl.

By way of example and not limitation, carbon bonded heterocycles are bonded at position 2, 3, 4, 5, or 6 of a pyridine, position 3, 4, 5, or 6 of a pyridazine, position 2, 4, 5, or 6 of a pyrimidine, position 2, 3, 5, or 6 of a pyrazine, position 2, 3, 4, or 5 of a furan, tetrahydrofuran, thiofuran, thiophene, pyrrole or tetrahydropyrrole,

position 2, 4, or 5 of an oxazole, imidazole or thiazole, position 3, 4, or 5 of an isoxazole, pyrazole, or isothiazole, position 2 or 3 of an aziridine, position 2, 3, or 4 of an azetidine, position 2, 3, 4, 5, 6, 7, or 8 of a quinoline or position 1, 3, 4, 5, 6, 7, or 8 of an isoquinoline. Still more typically, carbon bonded heterocycles include 2-pyridyl, 3-pyridyl, 4-pyridyl, 5-pyridyl, 6-pyridyl, 3-pyridazinyl, 4-pyridazinyl, 5-pyridazinyl, 6-pyridazinyl, 2-pyrimidinyl, 4-pyrimidinyl, 5-pyrimidinyl, 6-pyrimidinyl, 2-pyrazinyl, 3-pyrazinyl, 5-pyrazinyl, 6-pyrazinyl, 2-thiazolyl, 4-thiazolyl, or 5-thiazolyl.

By way of example and not limitation, nitrogen bonded heterocycles are bonded at position 1 of an aziridine, azetidine, pyrrole, pyrrolidine, 2-pyrroline, 3-pyrroline, imidazole, imidazolidine, 2-imidazoline, 3-imidazoline, pyrazole, pyrazoline, 2-pyrazoline, 3-pyrazoline, piperidine, piperazine, indole, indoline, 1H-indazole, position 2 of a isoindole, or isoindoline, position 4 of a morpholine, and position 9 of a carbazole, or  $\beta$ -carboline. Still more typically, nitrogen bonded heterocycles include 1-aziridyl, 1-azetidedyl, 1-pyrrolyl, 1-imidazolyl, 1-pyrazolyl, and 1-piperidinyl.

"Carbocycle" means a saturated or unsaturated ring having 3 to 7 carbon atoms as a monocycle or 7 to 12 carbon atoms as a bicycle. Monocyclic carbocycles have 3 to 6 ring atoms, still more typically 5 or 6 ring atoms. Bicyclic carbocycles have 7 to 12 ring atoms, e.g., arranged as a bicyclo [4,5], [5,5], [5,6] or [6,6] system, or 9 or 10 ring atoms arranged as a bicyclo [5,6] or [6,6] system. Examples of monocyclic carbocycles include cyclopropyl, cyclobutyl, cyclopentyl, 1-cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-2-enyl, 1-cyclohex-3-enyl, cycloheptyl, and cyclooctyl.

"Linker", "Linker Unit", or "link" means a chemical moiety comprising a covalent bond or a chain of atoms that covalently attaches an antibody to a drug moiety. In various embodiments, a linker is specified as LU. Linkers include a divalent radical such as an alkylidyl, an arylidyl, a heteroarylidyl, moieties such as:  $-(CR_2)_nO(CR_2)_n-$ , repeating units of alkyloxy (e.g., polyethylenoxy, PEG, polymethyleneoxy) and alkylamino (e.g., polyethyleneamino, Jeffamine<sup>TM</sup>); and diacid ester and amides including succinate, succinamide, diglycolate, malonate, and caproamide.

The term "chiral" refers to molecules which have the property of non-superimposability of the mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner.

The term "stereoisomers" refers to compounds which have identical chemical constitution, but differ with regard to the arrangement of the atoms or groups in space.

"Diastereomer" refers to a stereoisomer with two or more centers of  
5 chirality and whose molecules are not mirror images of one another. Diastereomers have different physical properties, *e.g.*, melting points, boiling points, spectral properties, and reactivities. Mixtures of diastereomers may separate under high resolution analytical procedures such as electrophoresis and chromatography.

"Enantiomers" refer to two stereoisomers of a compound which are non-  
10 superimposable mirror images of one another.

Stereochemical definitions and conventions used herein generally follow S. P. Parker, Ed., *McGraw-Hill Dictionary of Chemical Terms* (1984) McGraw-Hill Book Company, New York; and Eliel, E. and Wilen, S., *Stereochemistry of Organic Compounds* (1994) John Wiley & Sons, Inc., New York. Many organic compounds exist  
15 in optically active forms, *i.e.*, they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L, or R and S, are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or l meaning that the compound is levorotatory.  
20 A compound prefixed with (+) or d is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture or a racemate, which may occur where there has been no  
25 stereoselection or stereospecificity in a chemical reaction or process. The terms "racemic mixture" and "racemate" refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

Examples of a "patient" include, but are not limited to, a human, rat,  
30 mouse, guinea pig, monkey, pig, goat, cow, horse, dog, cat, bird and fowl. In an exemplary embodiment, the patient is a human.

"Aryl" refers to a carbocyclic aromatic group. Examples of aryl groups include, but are not limited to, phenyl, naphthyl and anthracenyl. A carbocyclic aromatic group or a heterocyclic aromatic group can be unsubstituted or substituted with one or

more groups including, but not limited to,  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8$  alkyl), -aryl,  $-C(O)R'$ ,  $-OC(O)R'$ ,  $-C(O)OR'$ ,  $-C(O)NH_2$ ,  $-C(O)NHR'$ ,  $-C(O)N(R')_2$   $-NHC(O)R'$ ,  $-S(O)_2R'$ ,  $-S(O)R'$ ,  $-OH$ , -halogen,  $-N_3$ ,  $-NH_2$ ,  $-NH(R')$ ,  $-N(R')_2$  and  $-CN$ ; wherein each  $R'$  is independently selected from H,  $-C_1-C_8$  alkyl and aryl.

5                   The term " $C_1-C_8$  alkyl," as used herein refers to a straight chain or branched, saturated or unsaturated hydrocarbon having from 1 to 8 carbon atoms. Representative " $C_1-C_8$  alkyl" groups include, but are not limited to, -methyl, -ethyl, -*n*-propyl, -*n*-butyl, -*n*-pentyl, -*n*-hexyl, -*n*-heptyl, -*n*-octyl, -*n*-nonyl and -*n*-decyl; while branched  $C_1-C_8$  alkyls include, but are not limited to, -isopropyl, -*sec*-butyl, -isobutyl, -  
10 *tert*-butyl, -isopentyl, 2-methylbutyl, unsaturated  $C_1-C_8$  alkyls include, but are not limited to, -vinyl, -allyl, -1-butenyl, -2-butenyl, -isobutylenyl, -1-pentenyl, -2-pentenyl, -3-methyl-1-butenyl, -2-methyl-2-butenyl, -2,3-dimethyl-2-butenyl, 1-hexyl, 2-hexyl, 3-hexyl, -acetylenyl, -propynyl, -1-butyne, -2-butyne, -1-pentyne, -2-pentyne, -3-methyl-1 butyne. methyl, ethyl, propyl, isopropyl, *n*-butyl, isobutyl, *sec*-butyl, *tert*-  
15 butyl, *n*-pentyl, isopentyl, neopentyl, *n*-hexyl, isohexyl, 2-methylpentyl, 3-methylpentyl, 2,2-dimethylbutyl, 2,3-dimethylbutyl, 2,2-dimethylpentyl, 2,3-dimethylpentyl, 3,3-dimethylpentyl, 2,3,4-trimethylpentyl, 3-methylhexyl, 2,2-dimethylhexyl, 2,4-dimethylhexyl, 2,5-dimethylhexyl, 3,5-dimethylhexyl, 2,4-dimethylpentyl, 2-methylheptyl, 3-methylheptyl, *n*-heptyl, isoheptyl, *n*-octyl, and isooctyl. A  $C_1-C_8$  alkyl  
20 group can be unsubstituted or substituted with one or more groups including, but not limited to,  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8$  alkyl), -aryl,  $-C(O)R'$ ,  $-OC(O)R'$ ,  $-C(O)OR'$ ,  $-C(O)NH_2$ ,  $-C(O)NHR'$ ,  $-C(O)N(R')_2$   $-NHC(O)R'$ ,  $-SO_3R'$ ,  $-S(O)_2R'$ ,  $-S(O)R'$ ,  $-OH$ , -halogen,  $-N_3$ ,  $-NH_2$ ,  $-NH(R')$ ,  $-N(R')_2$  and  $-CN$ ; where each  $R'$  is independently selected from H,  $-C_1-C_8$  alkyl and aryl.

25                   A " $C_3-C_8$  carbocycle" is a 3-, 4-, 5-, 6-, 7- or 8-membered saturated or unsaturated non-aromatic carbocyclic ring. Representative  $C_3-C_8$  carbocycles include, but are not limited to, -cyclopropyl, -cyclobutyl, -cyclopentyl, -cyclopentadienyl, -cyclohexyl, -cyclohexenyl, -1,3-cyclohexadienyl, -1,4-cyclohexadienyl, -cycloheptyl, -1,3-cycloheptadienyl, -1,3,5-cycloheptatrienyl, -cyclooctyl, and -cyclooctadienyl. A  $C_3-C_8$  carbocycle group can be unsubstituted or substituted with one or more groups  
30 including, but not limited to,  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8$  alkyl), -aryl,  $-C(O)R'$ ,  $-OC(O)R'$ ,  $-C(O)OR'$ ,  $-C(O)NH_2$ ,  $-C(O)NHR'$ ,  $-C(O)N(R')_2$   $-NHC(O)R'$ ,  $-S(O)_2R'$ ,  $-S(O)R'$ ,  $-OH$ , -

halogen,  $-N_3$ ,  $-NH_2$ ,  $-NH(R')$ ,  $-N(R')_2$  and  $-CN$ ; where each  $R'$  is independently selected from H,  $-C_1-C_8$  alkyl and aryl.

A " $C_3-C_8$  carbocyclo" refers to a  $C_3-C_8$  carbocycle group defined above wherein one of the carbocycle groups' hydrogen atoms is replaced with a bond.

5 A " $C_1-C_{10}$  alkylene" is a straight chain, saturated hydrocarbon group of the formula  $-(CH_2)_{1-10}-$ . Examples of a  $C_1-C_{10}$  alkylene include methylene, ethylene, propylene, butylene, pentylene, hexylene, heptylene, octylene, nonylene and decalene.

An "arylene" is an aryl group which has two covalent bonds and can be in the ortho, meta, or para configurations as shown in the following structures:

in which the phenyl group can be unsubstituted or substituted with up to four groups including, but not limited to,  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8$  alkyl),  $-aryl$ ,  $-C(O)R'$ ,  $-OC(O)R'$ ,  $-C(O)OR'$ ,  $-C(O)NH_2$ ,  $-C(O)NHR'$ ,  $-C(O)N(R')_2$ ,  $-NHC(O)R'$ ,  $-S(O)_2R'$ ,  $-S(O)R'$ ,  $-OH$ ,  $-halogen$ ,  $-N_3$ ,  $-NH_2$ ,  $-NH(R')$ ,  $-N(R')_2$  and  $-CN$ ; wherein each  $R'$  is independently  
15 selected from H,  $-C_1-C_8$  alkyl and aryl.

A " $C_3-C_8$  heterocycle" refers to an aromatic or non-aromatic  $C_3-C_8$  carbocycle in which one to four of the ring carbon atoms are independently replaced with a heteroatom from the group consisting of O, S and N. Representative examples of a  $C_3-C_8$  heterocycle include, but are not limited to, benzofuranyl, benzothiophene, indolyl,  
20 benzopyrazolyl, coumarinyl, isoquinolinyl, pyrrolyl, thiophenyl, furanyl, thiazolyl, imidazolyl, pyrazolyl, triazolyl, quinolinyl, pyrimidinyl, pyridinyl, pyridonyl, pyrazinyl, pyridazinyl, isothiazolyl, isoxazolyl and tetrazolyl. A  $C_3-C_8$  heterocycle can be unsubstituted or substituted with up to seven groups including, but not limited to,  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8$  alkyl),  $-aryl$ ,  $-C(O)R'$ ,  $-OC(O)R'$ ,  $-C(O)OR'$ ,  $-C(O)NH_2$ ,  $-C(O)NHR'$ ,  $-C(O)N(R')_2$ ,  $-NHC(O)R'$ ,  $-S(O)_2R'$ ,  $-S(O)R'$ ,  $-OH$ ,  $-halogen$ ,  $-N_3$ ,  $-NH_2$ ,  $-NH(R')$ ,  $-N(R')_2$  and  $-CN$ ; wherein each  $R'$  is independently selected from H,  $-C_1-C_8$  alkyl and  
25 aryl.

" $C_3-C_8$  heterocyclo" refers to a  $C_3-C_8$  heterocycle group defined above wherein one of the heterocycle group's hydrogen atoms is replaced with a bond. A  $C_3-C_8$

heterocyclo can be unsubstituted or substituted with up to six groups including, but not limited to, -C<sub>1</sub>-C<sub>8</sub> alkyl, -O-(C<sub>1</sub>-C<sub>8</sub> alkyl), -aryl, -C(O)R', -OC(O)R', -C(O)OR', -C(O)NH<sub>2</sub>, -C(O)NHR', -C(O)N(R')<sub>2</sub>, -NHC(O)R', -S(O)<sub>2</sub>R', -S(O)R', -OH, -halogen, -N<sub>3</sub>, -NH<sub>2</sub>, -NH(R'), -N(R')<sub>2</sub> and -CN; wherein each R' is independently selected from  
 5 H, -C<sub>1</sub>-C<sub>8</sub> alkyl and aryl.

An "Exemplary Compound" is a Drug Compound or a Drug-Linker Compound.

An "Exemplary Conjugate" is a Drug-Ligand Conjugate having a cleavable Drug unit from the Drug-Ligand Conjugate or a Drug-Linker-Ligand  
 10 Conjugate.

In some embodiments, the Exemplary Compounds and Exemplary Conjugates are in isolated or purified form. As used herein, "isolated" means separated from other components of (a) a natural source, such as a plant or animal cell or cell culture, or (b) a synthetic organic chemical reaction mixture. As used herein, "purified"  
 15 means that when isolated, the isolate contains at least 95 %, and in another aspect at least 98%, of Exemplary Compound or Exemplary Conjugate by weight of the isolate.

Examples of a "hydroxyl protecting group" include, but are not limited to, methoxymethyl ether, 2-methoxyethoxymethyl ether, tetrahydropyranyl ether, benzyl ether, p-methoxybenzyl ether, trimethylsilyl ether, triethylsilyl ether, triisopropyl silyl  
 20 ether, t-butyl dimethyl silyl ether, triphenylmethyl silyl ether, acetate ester, substituted acetate esters, pivaloate, benzoate, methanesulfonate and p-toluenesulfonate.

"Leaving group" refers to a functional group that can be substituted by another functional group. Such leaving groups are well known in the art, and examples include, but are not limited to, a halide (*e.g.*, chloride, bromide, iodide), methanesulfonyl  
 25 (mesyl), p-toluenesulfonyl (tosyl), trifluoromethylsulfonyl (triflate), and trifluoromethylsulfonate.

The phrase "pharmaceutically acceptable salt," as used herein, refers to pharmaceutically acceptable organic or inorganic salts of an Exemplary Compound or Exemplary Conjugate. The Exemplary Compounds and Exemplary Conjugates contain at  
 30 least one amino group, and accordingly acid addition salts can be formed with this amino group. Exemplary salts include, but are not limited, to sulfate, citrate, acetate, oxalate, chloride, bromide, iodide, nitrate, bisulfate, phosphate, acid phosphate, isonicotinate, lactate, salicylate, acid citrate, tartrate, oleate, tannate, pantothenate, bitartrate, ascorbate,

succinate, maleate, gentisinate, fumarate, gluconate, glucuronate, saccharate, formate, benzoate, glutamate, methanesulfonate, ethanesulfonate, benzenesulfonate, *p*-toluenesulfonate, and pamoate (*i.e.*, 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)) salts. A pharmaceutically acceptable salt may involve the inclusion of another molecule  
 5 such as an acetate ion, a succinate ion or other counterion. The counterion may be any organic or inorganic moiety that stabilizes the charge on the parent compound. Furthermore, a pharmaceutically acceptable salt may have more than one charged atom in its structure. Instances where multiple charged atoms are part of the pharmaceutically acceptable salt can have multiple counter ions. Hence, a pharmaceutically acceptable salt  
 10 can have one or more charged atoms and/or one or more counterion.

“Pharmaceutically acceptable solvate” or “solvate” refer to an association of one or more solvent molecules and a compound of the invention, *e.g.*, an Exemplary Compound or Exemplary Conjugate. Examples of solvents that form pharmaceutically acceptable solvates include, but are not limited to, water, isopropanol, ethanol, methanol,  
 15 DMSO, ethyl acetate, acetic acid, and ethanolamine.

The following abbreviations are used herein and have the indicated definitions: AE is auristatin E, Boc is *N*-(*t*-butoxycarbonyl), cit is citrulline, dap is dolaproine, DCC is 1,3-dicyclohexylcarbodiimide, DCM is dichloromethane, DEA is diethylamine, DEAD is diethylazodicarboxylate, DEPC is diethylphosphoryl cyanidate,  
 20 DIAD is diisopropylazodicarboxylate, DIEA is *N,N*-diisopropylethylamine, dil is dolaisoleuine, DMAP is 4-dimethylaminopyridine, DME is ethyleneglycol dimethyl ether (or 1,2-dimethoxyethane), DMF is *N,N*-dimethylformamide, DMSO is dimethylsulfoxide, doe is dolaphenine, dov is *N,N*-dimethylvaline, DTNB is 5,5'-dithiobis(2-nitrobenzoic acid), DTPA is diethylenetriaminepentaacetic acid, DTT is dithiothreitol, EDCI is 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride, EEDQ is  
 25 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline, ES-MS is electrospray mass spectrometry, EtOAc is ethyl acetate, Fmoc is *N*-(9-fluorenylmethoxycarbonyl), gly is glycine, HATU is *O*-(7-azabenzotriazol-1-yl)-*N,N,N',N'*-tetramethyluronium hexafluorophosphate, HOBt is 1-hydroxybenzotriazole, HPLC is high pressure liquid  
 30 chromatography, ile is isoleucine, lys is lysine, MeCN (CH<sub>3</sub>CN) is acetonitrile, MeOH is methanol, Mtr is 4-anisyl diphenylmethyl (or 4-methoxytrityl), nor is (*1S*, *2R*)-(+)-norephedrine, PAB is *p*-aminobenzyl, PBS is phosphate-buffered saline (pH 7.4), PEG is polyethylene glycol, Ph is phenyl, Pnp is *p*-nitrophenyl, MC is 6-maleimidocaproyl, phe

is L-phenylalanine, PyBrop is bromo *tris*-pyrrolidino phosphonium hexafluorophosphate, SEC is size-exclusion chromatography, Su is succinimide, TBTU is *O*-benzotriazol-1-yl-*N,N,N,N*-tetramethyluronium tetrafluoroborate, TFA is trifluoroacetic acid, TLC is thin layer chromatography, UV is ultraviolet, and val is valine.

5                   The following linker abbreviations are used herein and have the indicated definitions: Val Cit is a valine-citrulline, dipeptide site in protease cleavable linker; PAB is *p*-aminobenzylcarbamoyl; (Me)vc is *N*-methyl-valine citrulline, where the linker peptide bond has been modified to prevent its cleavage by cathepsin B; MC(PEG)6-OH is maleimidocaproyl- polyethylene glycol; SPP is *N*-Succinimidyl 4-(2-pyridylthio) pentanoate; and SMCC is *N*-Succinimidyl 4-(*N*-maleimidomethyl) cyclohexane-1  
10                   carboxylate.

                  The terms “treat” or “treatment,” unless otherwise indicated by context, refer to both therapeutic treatment and prophylactic or preventative measures, wherein the object is to prevent or slow down (lessen) an undesired physiological change or disorder,  
15                   such as the development or spread of cancer. For purposes of this invention, beneficial or desired clinical results include, but are not limited to, alleviation of symptoms, diminishment of extent of disease, stabilized (*i.e.*, not worsening) state of disease, delay or slowing of disease progression, amelioration or palliation of the disease state, and remission (whether partial or total), whether detectable or undetectable. “Treatment” can  
20                   also mean prolonging survival as compared to expected survival if not receiving treatment. Those in need of treatment include those already with the condition or disorder as well as those prone to have the condition or disorder or those in which the condition or disorder is to be prevented.

                  In the context of cancer, the term “treating” includes any or all of:  
25                   preventing growth of tumor cells, cancer cells, or of a tumor; preventing replication of tumor cells or cancer cells, lessening of overall tumor burden or decreasing the number of cancerous cells, and ameliorating one or more symptoms associated with the disease.

                  In the context of an autoimmune disease, the term “treating” includes any or all of: preventing replication of cells associated with an autoimmune disease state  
30                   including, but not limited to, cells that produce an autoimmune antibody, lessening the autoimmune-antibody burden and ameliorating one or more symptoms of an autoimmune disease.

In the context of an infectious disease, the term "treating" includes any or all of: preventing the growth, multiplication or replication of the pathogen that causes the infectious disease and ameliorating one or more symptoms of an infectious disease.

The following cytotoxic drug abbreviations are used herein and have the indicated definitions: MMAE is mono-methyl auristatin E (MW 718); MMAF is N-methylvaline-valine-dolaisoleuine-dolaproine-phenylalanine (MW 731.5); MMAF-DMAEA is MMAF with DMAEA (dimethylaminoethylamine) in an amide linkage to the C-terminal phenylalanine (MW 801.5); MMAF-TEG is MMAF with tetraethylene glycol esterified to the phenylalanine; MMAF-NtBu is N-t-butyl, attached as an amide to C-terminus of MMAF; AEVB is auristatin E valeryl benzylhydrazone, acid labile linker through the C-terminus of AE (MW 732); and AFP is Monoamide of p-phenylene diamine with C-terminal Phenylalanine of Auristatin F (MW 732).

## 4.2 THE COMPOUNDS OF THE INVENTION

15

### 4.2.1 THE COMPOUNDS OF FORMULA (Ia)

In one aspect, the invention provides Drug-Linker-Ligand Conjugates having Formula Ia:

20

or a pharmaceutically acceptable salt or solvate thereof

wherein,

L- is a Ligand unit;

-A<sub>a</sub>-W<sub>w</sub>-Y<sub>y</sub>- is a Linker unit (LU), wherein the Linker unit includes:

-A- is a Stretcher unit,

25

a is 0 or 1,

each -W- is independently an Amino Acid unit,

w is an integer ranging from 0 to 12,

-Y- is a Spacer unit, and

y is 0, 1 or 2;

30

p ranges from 1 to about 20; and

-D is a Drug unit having the Formulas D<sub>E</sub> and D<sub>F</sub>:

wherein, independently at each location:

R<sup>2</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>3</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

10

R<sup>4</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

R<sup>5</sup> is selected from H and methyl;

15 or R<sup>4</sup> and R<sup>5</sup> jointly form a carbocyclic ring and have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl and C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected from 2, 3, 4, 5 and 6;

R<sup>6</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>7</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

20

each R<sup>8</sup> is independently selected from H, OH, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle and O-(C<sub>1</sub>-C<sub>8</sub> alkyl);

R<sup>9</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

25 R<sup>10</sup> is selected from aryl or C<sub>3</sub>-C<sub>8</sub> heterocycle;

WO 2005/081711

PCT/US2004/038392

Z is O, S, NH, or NR<sup>12</sup>, wherein R<sup>12</sup> is C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>11</sup> is selected from H, C<sub>1</sub>-C<sub>20</sub> alkyl, aryl, C<sub>3</sub>-C<sub>8</sub> heterocycle, -(R<sup>13</sup>O)<sub>m</sub>-R<sup>14</sup>, or -(R<sup>13</sup>O)<sub>m</sub>-CH(R<sup>15</sup>)<sub>2</sub>;

m is an integer ranging from 1-1000;

5 R<sup>13</sup> is C<sub>2</sub>-C<sub>8</sub> alkyl;

R<sup>14</sup> is H or C<sub>1</sub>-C<sub>8</sub> alkyl;

each occurrence of R<sup>15</sup> is independently H, COOH, -(CH<sub>2</sub>)<sub>n</sub>-N(R<sup>16</sup>)<sub>2</sub>, -(CH<sub>2</sub>)<sub>n</sub>-SO<sub>3</sub>H, or -(CH<sub>2</sub>)<sub>n</sub>-SO<sub>3</sub>-C<sub>1</sub>-C<sub>8</sub> alkyl;

10 each occurrence of R<sup>16</sup> is independently H, C<sub>1</sub>-C<sub>8</sub> alkyl, or -(CH<sub>2</sub>)<sub>n</sub>-COOH;

R<sup>18</sup> is selected from -C(R<sup>8</sup>)<sub>2</sub>-C(R<sup>8</sup>)<sub>2</sub>-aryl, -C(R<sup>8</sup>)<sub>2</sub>-C(R<sup>8</sup>)<sub>2</sub>-(C<sub>3</sub>-C<sub>8</sub> heterocycle), and -C(R<sup>8</sup>)<sub>2</sub>-C(R<sup>8</sup>)<sub>2</sub>-(C<sub>3</sub>-C<sub>8</sub> carbocycle); and

n is an integer ranging from 0 to 6.

15 In another embodiment, the present invention provides Drug Compounds having the Formula Ib:

or pharmaceutically acceptable salts or solvates thereof,

wherein:

20 R<sup>2</sup> is selected from hydrogen and -C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>3</sup> is selected from hydrogen, -C<sub>1</sub>-C<sub>8</sub> alkyl, -C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), -C<sub>3</sub>-C<sub>8</sub> heterocycle and -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

25 R<sup>4</sup> is selected from hydrogen, -C<sub>1</sub>-C<sub>8</sub> alkyl, -C<sub>3</sub>-C<sub>8</sub> carbocycle, -aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), -C<sub>3</sub>-C<sub>8</sub> heterocycle and -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle) wherein R<sup>5</sup> is selected from -H and -methyl; or R<sup>4</sup> and R<sup>5</sup> jointly, have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently selected from -H, -C<sub>1</sub>-C<sub>8</sub> alkyl and -C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected from 2, 3, 4, 5 and 6, and form a ring with the carbon atom to which they are attached;

WO 2005/081711

PCT/US2004/038392

- $R^6$  is selected from H and  $-C_1-C_8$  alkyl;
- $R^7$  is selected from H,  $-C_1-C_8$  alkyl,  $-C_3-C_8$  carbocycle, aryl,  $-C_1-C_8$  alkyl-aryl,  $-C_1-C_8$  alkyl- $(C_3-C_8$  carbocycle),  $-C_3-C_8$  heterocycle and  $-C_1-C_8$  alkyl- $(C_3-C_8$  heterocycle);
- 5 each  $R^8$  is independently selected from H,  $-OH$ ,  $-C_1-C_8$  alkyl,  $-C_3-C_8$  carbocycle and  $-O-(C_1-C_8$  alkyl);
- $R^9$  is selected from H and  $-C_1-C_8$  alkyl;
- $R^{10}$  is selected from aryl group or  $-C_3-C_8$  heterocycle;
- Z is  $-O-$ ,  $-S-$ ,  $-NH-$ , or  $-NR^{12}-$ , wherein  $R^{12}$  is  $C_1-C_8$  alkyl;
- 10  $R^{11}$  is selected from H,  $C_1-C_{20}$  alkyl, aryl,  $-C_3-C_8$  heterocycle,  $-(R^{13}O)_m-$ ,  $R^{14}$ , or  $-(R^{13}O)_m-CH(R^{15})_2$ ;
- m is an integer ranging from 1-1000;
- $R^{13}$  is  $-C_2-C_8$  alkyl;
- $R^{14}$  is H or  $-C_1-C_8$  alkyl;
- 15 each occurrence of  $R^{15}$  is independently H,  $-COOH$ ,  $-(CH_2)_n-N(R^{16})_2$ ,  $-(CH_2)_n-SO_3H$ , or  $-(CH_2)_n-SO_3-C_1-C_8$  alkyl;
- each occurrence of  $R^{16}$  is independently H,  $-C_1-C_8$  alkyl, or  $-(CH_2)_n-COOH$ ; and
- n is an integer ranging from 0 to 6.
- 20 In yet another embodiment, the invention provides Drug-Linker-Ligand Conjugates having the Formula Ia':

Formula Ia'

or pharmaceutically acceptable salts or solvates thereof.

- 25 wherein:
- Ab is an antibody,
- A is a Stretcher unit,
- a is 0 or 1,
- each W is independently an Amino Acid unit,
- 30 w is an integer ranging from 0 to 12,

Y is a Spacer unit, and

y is 0, 1 or 2,

p ranges from 1 to about 20, and

D is a Drug moiety selected from Formulas D<sub>E</sub> and D<sub>F</sub>:

wherein, independently at each location:

R<sup>2</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

10 R<sup>3</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

15 R<sup>4</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

R<sup>5</sup> is selected from H and methyl;

or R<sup>4</sup> and R<sup>5</sup> jointly form a carbocyclic ring and have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl and C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected from 2, 3, 4, 5 and 6;

20 R<sup>6</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>7</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

25 each R<sup>8</sup> is independently selected from H, OH, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle and O-(C<sub>1</sub>-C<sub>8</sub> alkyl);

WO 2005/081711

PCT/US2004/038392

- $R^9$  is selected from H and  $C_1-C_8$  alkyl;  
 $R^{10}$  is selected from aryl or  $C_3-C_8$  heterocycle;  
Z is O, S, NH, or  $NR^{12}$ , wherein  $R^{12}$  is  $C_1-C_8$  alkyl;  
 $R^{11}$  is selected from H,  $C_1-C_{20}$  alkyl, aryl,  $C_3-C_8$  heterocycle,  $-(R^{13}O)_m-R^{14}$ ,  
5 or  $-(R^{13}O)_m-CH(R^{15})_2$ ;  
m is an integer ranging from 1-1000;  
 $R^{13}$  is  $C_2-C_8$  alkyl;  
 $R^{14}$  is H or  $C_1-C_8$  alkyl;

(21) Brevican (Genbank accession no. AF229053);

(22) Ephb2R (Genbank accession no. NM\_004442);

30 (23) ASLG659 (Genbank accession no. AX092328);

(24) PSCA (Genbank accession no. AJ297436);

(25) GEDA (Genbank accession no. AY260763);

(26) BAFF-R (Genbank accession no. NP\_443177.1);

WO 2005/081711

PCT/US2004/038392

(27) CD22 (Genbank accession no. NP-001762.1);

(28) CD79a (CD79A, CD79 $\alpha$ , immunoglobulin-associated alpha, a B cell-specific protein that covalently interacts with Ig beta (CD79B) and forms a complex on the surface with Ig M molecules, transduces a signal involved in B-cell differentiation, Genbank accession No. NP\_001774.1);

(29) CXCR5 (Burkitt's lymphoma receptor 1, a G protein-coupled receptor that is activated by the CXCL13 chemokine, functions in lymphocyte migration and humoral defense, plays a role in HIV-2 infection and perhaps development of AIDS, lymphoma, myeloma, and leukemia, Genbank accession No. NP\_001707.1);

(30) HLA-DOB (Beta subunit of MHC class II molecule (Ia antigen) that binds peptides and presents them to CD4+ T lymphocytes, Genbank accession No. NP\_002111.1);

(31) P2X5 (Purinergic receptor P2X ligand-gated ion channel 5, an ion channel gated by extracellular ATP, may be involved in synaptic transmission and neurogenesis, deficiency may contribute to the pathophysiology of idiopathic detrusor instability, Genbank accession No. NP\_002552.2);

(32) CD72 (B-cell differentiation antigen CD72, Lyb-2, Genbank accession No. NP\_001773.1);

(33) LY64 (Lymphocyte antigen 64 (RP105), type I membrane protein of the leucine rich repeat (LRR) family, regulates B-cell activation and apoptosis, loss of function is associated with increased disease activity in patients with systemic lupus erythematosus, Genbank accession No. NP\_005573.1);

(34) FCRH1 (Fc receptor-like protein 1, a putative receptor for the immunoglobulin Fc domain that contains C2 type Ig-like and ITAM domains, may have a role in B-lymphocyte differentiation, Genbank accession No. NP\_443170.1); and/or

(35) IRTA2 (Immunoglobulin superfamily receptor translocation associated 2, a putative immunoreceptor with possible roles in B cell development and lymphomagenesis; deregulation of the gene by translocation occurs in some B cell malignancies, Genbank accession No. NP\_112571.1).

In one embodiment -Ww- is -Val-Cit-.

In another embodiment, R<sup>3</sup>, R<sup>4</sup> and R<sup>7</sup> are independently isopropyl or sec-butyl and R<sup>5</sup> is -H. In an exemplary embodiment, R<sup>3</sup> and R<sup>4</sup> are each isopropyl, R<sup>5</sup> is -H, and R<sup>7</sup> is sec-butyl. In yet another embodiment, R<sup>2</sup> and R<sup>6</sup> are each methyl, and R<sup>9</sup> is -H.

WO 2005/081711

PCT/US2004/038392

In still another embodiment, each occurrence of  $R^8$  is  $-OCH_3$ .

In an exemplary embodiment,  $R^3$  and  $R^4$  are each isopropyl,  $R^2$  and  $R^6$  are each methyl,  $R^5$  is  $-H$ ,  $R^7$  is sec-butyl, each occurrence of  $R^8$  is  $-OCH_3$ , and  $R^9$  is  $-H$ .

In one embodiment,  $Z$  is  $-O-$  or  $-NH-$ .

5

In one embodiment,  $R^{10}$  is aryl

In an exemplary embodiment,  $R^{10}$  is  $-phenyl$ .

In an exemplary embodiment, when  $Z$  is  $-O-$ ,  $R^{11}$  is  $-H$ , methyl or  $t$ -butyl.

In one embodiment, when  $Z$  is  $-NH$ ,  $R^{11}$  is  $-CH(R^{15})_2$ , wherein  $R^{15}$  is  $-(CH_2)_n-N(R^{16})_2$ , and  $R^{16}$  is  $-C_1-C_8$  alkyl or  $-(CH_2)_n-COOH$ .

10

In another embodiment, when  $Z$  is  $-NH$ ,  $R^{11}$  is  $-CH(R^{15})_2$ , wherein  $R^{15}$  is  $-(CH_2)_n-SO_3H$ .

In one aspect,  $Ab$  is  $cAC10$ ,  $cBR96$ ,  $cS2C6$ ,  $c1F6$ ,  $c2F2$ ,  $hAC10$ ,  $hBR96$ ,  $hS2C6$ ,  $h1F6$ , and  $h2F2$ .

Exemplary embodiments of Formula **Ia** have the following structures:

or

WO 2005/081711

PCT/US2004/038392

L-MC-MMAF

wherein L is an antibody, Val is valine, and Cit is citrulline.

The drug loading is represented by p, the average number of drug molecules per antibody in a molecule (e.g., of Formula Ia, Ia' and Ic). Drug loading may range from 1 to 20 drugs (D) per Ligand (eg. Ab or mAb). Compositions of Formula Ia and Formula Ia' include collections of antibodies conjugated with a range of drugs, from 1 to 20. The average number of drugs per antibody in preparation of conjugation reactions may be characterized by conventional means such as mass spectroscopy, ELISA assay, and HPLC. The quantitative distribution of Ligand-Drug-Conjugates in terms of p may also be determined. In some instances, separation, purification, and characterization of homogeneous Ligand-Drug-conjugates where p is a certain value from Ligand-Drug-Conjugates with other drug loadings may be achieved by means such as reverse phase HPLC or electrophoresis.

#### 4.2.2 THE DRUG COMPOUNDS OF FORMULA (Ib)

In another aspect, the present invention provides Drug Compounds having the Formula (Ib):

Ib

or a pharmaceutically acceptable salt or solvate thereof,

20

wherein:

R<sup>2</sup> is selected from -hydrogen and -C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>3</sup> is selected from -hydrogen, -C<sub>1</sub>-C<sub>8</sub> alkyl, -C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), -C<sub>3</sub>-C<sub>8</sub> heterocycle and -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

25

R<sup>4</sup> is selected from -hydrogen, -C<sub>1</sub>-C<sub>8</sub> alkyl, -C<sub>3</sub>-C<sub>8</sub> carbocycle, -aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), -C<sub>3</sub>-C<sub>8</sub> heterocycle and -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-

C<sub>8</sub> heterocycle) wherein R<sup>5</sup> is selected from -H and -methyl; or R<sup>4</sup> and R<sup>5</sup> jointly, have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently selected from -H, -C<sub>1</sub>-C<sub>8</sub> alkyl and -C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected from 2, 3, 4, 5 and 6, and form a ring with the carbon atom to which they are attached;

- 5 R<sup>6</sup> is selected from -H and -C<sub>1</sub>-C<sub>8</sub> alkyl;  
 R<sup>7</sup> is selected from -H, -C<sub>1</sub>-C<sub>8</sub> alkyl, -C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), -C<sub>3</sub>-C<sub>8</sub> heterocycle and -C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);  
 each R<sup>8</sup> is independently selected from -H, -OH, -C<sub>1</sub>-C<sub>8</sub> alkyl, -C<sub>3</sub>-C<sub>8</sub> carbocycle and -O-(C<sub>1</sub>-C<sub>8</sub> alkyl);  
 10 R<sup>9</sup> is selected from -H and -C<sub>1</sub>-C<sub>8</sub> alkyl;  
 R<sup>10</sup> is selected from aryl group or -C<sub>3</sub>-C<sub>8</sub> heterocycle;  
 Z is -O-, -S-, -NH-, or -NR<sup>12</sup>-, wherein R<sup>12</sup> is C<sub>1</sub>-C<sub>8</sub> alkyl;  
 R<sup>11</sup> is selected from -H, C<sub>1</sub>-C<sub>20</sub> alkyl, aryl, -C<sub>3</sub>-C<sub>8</sub> heterocycle, -(R<sup>13</sup>O)<sub>m</sub>-  
 15 R<sup>14</sup>, or -(R<sup>13</sup>O)<sub>m</sub>-CH(R<sup>15</sup>)<sub>2</sub>;  
 m is an integer ranging from 1-1000;  
 R<sup>13</sup> is -C<sub>2</sub>-C<sub>8</sub> alkyl;  
 R<sup>14</sup> is -H or -C<sub>1</sub>-C<sub>8</sub> alkyl;  
 each occurrence of R<sup>15</sup> is independently -H, -COOH, -(CH<sub>2</sub>)<sub>n</sub>-N(R<sup>16</sup>)<sub>2</sub>, -  
 20 (CH<sub>2</sub>)<sub>n</sub>-SO<sub>3</sub>H, or -(CH<sub>2</sub>)<sub>n</sub>-SO<sub>3</sub>-C<sub>1</sub>-C<sub>8</sub> alkyl;  
 each occurrence of R<sup>16</sup> is independently -H, -C<sub>1</sub>-C<sub>8</sub> alkyl, or -(CH<sub>2</sub>)<sub>n</sub>-COOH; and  
 n is an integer ranging from 0 to 6.  
 In one embodiment, R<sup>3</sup>, R<sup>4</sup> and R<sup>7</sup> are independently isopropyl or sec-butyl and R<sup>5</sup> is -H. In an exemplary embodiment, R<sup>3</sup> and R<sup>4</sup> are each isopropyl, R<sup>5</sup> is -H, and R<sup>7</sup> is sec-butyl.  
 In another embodiment, R<sup>2</sup> and R<sup>6</sup> are each methyl, and R<sup>9</sup> is -H.  
 In still another embodiment, each occurrence of R<sup>8</sup> is -OCH<sub>3</sub>.  
 In an exemplary embodiment, R<sup>3</sup> and R<sup>4</sup> are each isopropyl, R<sup>2</sup> and R<sup>6</sup> are  
 30 each methyl, R<sup>5</sup> is -H, R<sup>7</sup> is sec-butyl, each occurrence of R<sup>8</sup> is -OCH<sub>3</sub>, and R<sup>9</sup> is -H.  
 In one embodiment, Z is -O- or -NH-.  
 In one embodiment, R<sup>10</sup> is aryl  
 In an exemplary embodiment, R<sup>10</sup> is -phenyl.

WO 2005/081711

PCT/US2004/038392

In an exemplary embodiment, when Z is -O-, R<sup>11</sup> is -H, methyl or t-butyl.

In one embodiment, when Z is -NH, R<sup>11</sup> is -CH(R<sup>15</sup>)<sub>2</sub>, wherein R<sup>15</sup> is -  
(CH<sub>2</sub>)<sub>n</sub>-N(R<sup>16</sup>)<sub>2</sub>, and R<sup>16</sup> is -C<sub>1</sub>-C<sub>8</sub> alkyl or -(CH<sub>2</sub>)<sub>n</sub>-COOH.

In another embodiment, when Z is -NH, R<sup>11</sup> is -CH(R<sup>15</sup>)<sub>2</sub>, wherein R<sup>15</sup> is -  
5 (CH<sub>2</sub>)<sub>n</sub>-SO<sub>3</sub>H.

Illustrative Compounds of Formula (Ib), each of which may be used as  
drug moieties (D) in ADC, include compounds having the following structures:

WO 2005/081711

PCT/US2004/038392

5

and pharmaceutically acceptable salts or solvates thereof.

## 5 THE COMPOUNDS OF FORMULA (Ic)

In another aspect, the invention provides antibody-drug conjugate compounds (ADC) having Formula Ic:

10 comprising an antibody covalently attached to one or more drug units (moieties). The antibody-drug conjugate compounds include pharmaceutically acceptable salts or solvates thereof.

Formula Ic compounds are defined wherein:

Ab is an antibody which binds to one or more tumor-associated antigen receptors (1)-(35):

- 15 (1) BMPR1B (bone morphogenetic protein receptor-type IB, Genbank accession no. NM\_001203);
- (2) E16 (LAT1, SLC7A5, Genbank accession no. NM\_003486);
- (3) STEAP1 (six transmembrane epithelial antigen of prostate, Genbank accession no. NM\_012449);

- (27) CD22 (B-cell receptor CD22-B isoform, NP-001762.1);
- 5 (28) CD79a (CD79A, CD79 $\alpha$ , immunoglobulin-associated alpha, a B cell-specific protein that covalently interacts with Ig beta (CD79B) and forms a complex on the surface with Ig M molecules, transduces a signal involved in B-cell differentiation, Genbank accession No. NP\_001774.1);
- (29) CXCR5 (Burkitt's lymphoma receptor 1, a G protein-coupled receptor
- 10 that is activated by the CXCL13 chemokine, functions in lymphocyte migration and humoral defense, plays a role in HIV-2 infection and perhaps development of AIDS, lymphoma, myeloma, and leukemia, Genbank accession No. NP\_001707.1);
- (30) HLA-DOB (Beta subunit of MHC class II molecule (Ia antigen) that binds peptides and presents them to CD4+ T lymphocytes, Genbank accession No.
- 15 NP\_002111.1);
- (31) P2X5 (Purinergic receptor P2X ligand-gated ion channel 5, an ion channel gated by extracellular ATP, may be involved in synaptic transmission and neurogenesis, deficiency may contribute to the pathophysiology of idiopathic detrusor instability, Genbank accession No. NP\_002552.2);
- 20 (32) CD72 (B-cell differentiation antigen CD72, Lyb-2, Genbank accession No. NP\_001773.1);
- (33) LY64 (Lymphocyte antigen 64 (RP105), type I membrane protein of the leucine rich repeat (LRR) family, regulates B-cell activation and apoptosis, loss of function is associated with increased disease activity in patients with systemic lupus
- 25 erythematosus, Genbank accession No. NP\_005573.1);
- (34) FCRH1 (Fc receptor-like protein 1, a putative receptor for the immunoglobulin Fc domain that contains C2 type Ig-like and ITAM domains, may have a role in B-lymphocyte differentiation, Genbank accession No. NP\_443170.1); and
- (35) IRTA2 (Immunoglobulin superfamily receptor translocation
- 30 associated 2, a putative immunoreceptor with possible roles in B cell development and lymphomagenesis; deregulation of the gene by translocation occurs in some B cell malignancies, Genbank accession No. NP\_112571.1).

A is a Stretcher unit,

WO 2005/081711

PCT/US2004/038392

a is 0 or 1,

each W is independently an Amino Acid unit,

w is an integer ranging from 0 to 12,

Y is a Spacer unit, and

5

y is 0, 1 or 2,

p ranges from 1 to about 8, and

D is a Drug moiety selected from Formulas D<sub>E</sub> and D<sub>F</sub>:

10

wherein the wavy line of D<sub>E</sub> and D<sub>F</sub> indicates the covalent attachment site to A, W, or Y, and independently at each location:

R<sup>2</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

15 R<sup>3</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

R<sup>4</sup> is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

20

R<sup>5</sup> is selected from H and methyl;

or R<sup>4</sup> and R<sup>5</sup> jointly form a carbocyclic ring and have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl and C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected from 2, 3, 4, 5 and 6;

R<sup>6</sup> is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

WO 2005/081711

PCT/US2004/038392

$R^7$  is selected from H,  $C_1-C_8$  alkyl,  $C_3-C_8$  carbocycle, aryl,  $C_1-C_8$  alkyl-aryl,  $C_1-C_8$  alkyl- $(C_3-C_8$  carbocycle),  $C_3-C_8$  heterocycle and  $C_1-C_8$  alkyl- $(C_3-C_8$  heterocycle);

5 each  $R^8$  is independently selected from H, OH,  $C_1-C_8$  alkyl,  $C_3-C_8$  carbocycle and O- $(C_1-C_8$  alkyl);

$R^9$  is selected from H and  $C_1-C_8$  alkyl;

$R^{10}$  is selected from aryl or  $C_3-C_8$  heterocycle;

Z is O, S, NH, or  $NR^{12}$ , wherein  $R^{12}$  is  $C_1-C_8$  alkyl;

10  $R^{11}$  is selected from H,  $C_1-C_{20}$  alkyl, aryl,  $C_3-C_8$  heterocycle,  $-(R^{13}O)_m-R^{14}$ , or  $-(R^{13}O)_m-CH(R^{15})_2$ ;

m is an integer ranging from 1-1000;

$R^{13}$  is  $C_2-C_8$  alkyl;

$R^{14}$  is H or  $C_1-C_8$  alkyl;

15 each occurrence of  $R^{15}$  is independently H, COOH,  $-(CH_2)_n-N(R^{16})_2$ ,  $-(CH_2)_n-SO_3H$ , or  $-(CH_2)_n-SO_3-C_1-C_8$  alkyl;

each occurrence of  $R^{16}$  is independently H,  $C_1-C_8$  alkyl, or  $-(CH_2)_n-COOH$ ;

$R^{18}$  is selected from  $-C(R^8)_2-C(R^8)_2$ -aryl,  $-C(R^8)_2-C(R^8)_2-(C_3-C_8$  heterocycle), and  $-C(R^8)_2-C(R^8)_2-(C_3-C_8$  carbocycle); and

20 n is an integer ranging from 0 to 6.

In one embodiment -Ww- is -Val-Cit-.

In another embodiment,  $R^3$ ,  $R^4$  and  $R^7$  are independently isopropyl or sec-butyl and  $R^5$  is -H. In an exemplary embodiment,  $R^3$  and  $R^4$  are each isopropyl,  $R^5$  is -H, and  $R^7$  is sec-butyl.

25 In yet another embodiment,  $R^2$  and  $R^6$  are each methyl, and  $R^9$  is -H.

In still another embodiment, each occurrence of  $R^8$  is  $-OCH_3$ .

In an exemplary embodiment,  $R^3$  and  $R^4$  are each isopropyl,  $R^2$  and  $R^6$  are each methyl,  $R^5$  is -H,  $R^7$  is sec-butyl, each occurrence of  $R^8$  is  $-OCH_3$ , and  $R^9$  is -H.

In one embodiment, Z is -O- or -NH-.

30 In one embodiment,  $R^{10}$  is aryl.

In an exemplary embodiment,  $R^{10}$  is -phenyl.

In an exemplary embodiment, when Z is -O-,  $R^{11}$  is -H, methyl or t-butyl.

WO 2005/081711

PCT/US2004/038392

In one embodiment, when Z is -NH, R<sup>11</sup> is -CH(R<sup>15</sup>)<sub>2</sub>, wherein R<sup>15</sup> is -  
(CH<sub>2</sub>)<sub>n</sub>-N(R<sup>16</sup>)<sub>2</sub>, and R<sup>16</sup> is -C<sub>1</sub>-C<sub>8</sub> alkyl or -(CH<sub>2</sub>)<sub>n</sub>-COOH.

In another embodiment, when Z is -NH, R<sup>11</sup> is -CH(R<sup>15</sup>)<sub>2</sub>, wherein R<sup>15</sup> is -  
(CH<sub>2</sub>)<sub>n</sub>-SO<sub>3</sub>H.

5 Exemplary embodiments of Formula Ic ADC have the following  
structures:

Ab-MC-vc-PAB-MMAF

10

Ab-MC-vc-PAB-MMAE

Ab-MC-MMAE

15

Ab-MC-MMAF

wherein Ab is an antibody which binds to one or more tumor-associated antigen receptors  
20 (1)-(35); Val is valine; and Cit is citrulline.

The drug loading is represented by p, the average number of drugs per  
antibody in a molecule of Formula I. Drug loading may range from 1 to 20 drugs (D) per

antibody (Ab or mAb). Compositions of ADC of Formula I include collections of antibodies conjugated with a range of drugs, from 1 to 20. The average number of drugs per antibody in preparations of ADC from conjugation reactions may be characterized by conventional means such as UV/visible spectroscopy, mass spectrometry, ELISA assay, and HPLC. The quantitative distribution of ADC in terms of p may also be determined. In some instances, separation, purification, and characterization of homogeneous ADC where p is a certain value from ADC with other drug loadings may be achieved by means such as reverse phase HPLC or electrophoresis.

For some antibody drug conjugates, p may be limited by the number of attachment sites on the antibody. For example, where the attachment is a cysteine thiol, as in the exemplary embodiments above, an antibody may have only one or several cysteine thiol groups, or may have only one or several sufficiently reactive thiol groups through which a linker may be attached.

Typically, fewer than the theoretical maximum of drug moieties are conjugated to an antibody during a conjugation reaction. An antibody may contain, for example, many lysine residues that do not react with the drug-linker intermediate or linker reagent. Only the most reactive lysine groups may react with an amine-reactive linker reagent. Generally, antibodies do not contain many, if any, free and reactive cysteine thiol groups which may be linked to a drug moiety. Most cysteine thiol residues in the antibodies of the compounds of the invention exist as disulfide bridges and must be reduced with a reducing agent such as dithiothreitol (DTT). Additionally, the antibody must be subjected to denaturing conditions to reveal reactive nucleophilic groups such as lysine or cysteine. The loading (drug/antibody ratio) of an ADC may be controlled in several different manners, including: (i) limiting the molar excess of drug-linker intermediate or linker reagent relative to antibody, (ii) limiting the conjugation reaction time or temperature, and (iii) partial or limiting reductive conditions for cysteine thiol modification.

It is to be understood that where more than one nucleophilic group reacts with a drug-linker intermediate, or linker reagent followed by drug moiety reagent, then the resulting product is a mixture of ADC compounds with a distribution of one or more drug moieties attached to an antibody. The average number of drugs per antibody may be calculated from the mixture by dual ELISA antibody assay, specific for antibody and specific for the drug. Individual ADC molecules may be identified in the mixture by mass

WO 2005/081711

PCT/US2004/038392

spectroscopy, and separated by HPLC, *e.g.*, hydrophobic interaction chromatography (“Effect of drug loading on the pharmacology, pharmacokinetics, and toxicity of an anti-CD30 antibody-drug conjugate”, Hamblett, K.J., et al, Abstract No. 624, American Association for Cancer Research; 2004 Annual Meeting, March 27-31, 2004, Proceedings of the AACR, Volume 45, March 2004; “Controlling the Location of Drug Attachment in Antibody-Drug Conjugates”, Alley, S.C., et al, Abstract No. 627, American Association for Cancer Research; 2004 Annual Meeting, March 27-31, 2004, Proceedings of the AACR, Volume 45, March 2004). Thus, a homogeneous ADC with a single loading value may be isolated from the conjugation mixture by electrophoresis or chromatography.

#### 4.3 THE LINKER UNIT

A “Linker unit” (LU) is a bifunctional compound which can be used to link a Drug unit and an Ligand unit to form Drug-Linker-Ligand Conjugates, or which are useful in the formation of immunoconjugates directed against tumor associated antigens. Such immunoconjugates allow the selective delivery of toxic drugs to tumor cells. In one embodiment, the Linker unit of the Drug-Linker Compound and Drug-Linker-Ligand Conjugate has the formula:

wherein:

-A- is a Stretcher unit;

a is 0 or 1;

each -W- is independently an Amino Acid unit;

w is independently an integer ranging from 0 to 12;

-Y- is a Spacer unit; and

y is 0, 1 or 2.

In the Drug-Linker-Ligand Conjugate, the Linker is capable of linking the Drug moiety and the Ligand unit.

### 4.3.1 THE STRETCHER UNIT

The Stretcher unit (-A-), when present, is capable of linking a Ligand unit to an amino acid unit (-W-). In this regard a Ligand (L) has a functional group that can form a bond with a functional group of a Stretcher. Useful functional groups that can be present on a ligand, either naturally or via chemical manipulation include, but are not limited to, sulfhydryl (-SH), amino, hydroxyl, carboxy, the anomeric hydroxyl group of a carbohydrate, and carboxyl. In one aspect, the Ligand functional groups are sulfhydryl and amino. Sulfhydryl groups can be generated by reduction of an intramolecular disulfide bond of a Ligand. Alternatively, sulfhydryl groups can be generated by reaction of an amino group of a lysine moiety of a Ligand using 2-iminothiolane (Traut's reagent) or another sulfhydryl generating reagent.

In one embodiment, the Stretcher unit forms a bond with a sulfur atom of the Ligand unit. The sulfur atom can be derived from a sulfhydryl group of a Ligand. Representative Stretcher units of this embodiment are depicted within the square brackets of Formulas IIIa and IIIb, wherein L-, -W-, -Y-, -D, w and y are as defined above, and R<sup>17</sup> is selected from -C<sub>1</sub>-C<sub>10</sub> alkylene-, -C<sub>3</sub>-C<sub>8</sub> carbocyclo-, -O-(C<sub>1</sub>-C<sub>8</sub> alkyl)-, -arylene-, -C<sub>1</sub>-C<sub>10</sub> alkylene-arylene-, -arylene-C<sub>1</sub>-C<sub>10</sub> alkylene-, -C<sub>1</sub>-C<sub>10</sub> alkylene-(C<sub>3</sub>-C<sub>8</sub> carbocyclo)-, -(C<sub>3</sub>-C<sub>8</sub> carbocyclo)-C<sub>1</sub>-C<sub>10</sub> alkylene-, -C<sub>3</sub>-C<sub>8</sub> heterocyclo-, -C<sub>1</sub>-C<sub>10</sub> alkylene-(C<sub>3</sub>-C<sub>8</sub> heterocyclo)-, -(C<sub>3</sub>-C<sub>8</sub> heterocyclo)-C<sub>1</sub>-C<sub>10</sub> alkylene-, -(CH<sub>2</sub>CH<sub>2</sub>O)<sub>r</sub>-, and -(CH<sub>2</sub>CH<sub>2</sub>O)<sub>r</sub>-CH<sub>2</sub>-; and r is an integer ranging from 1-10. It is to be understood from all the exemplary embodiments of Formula Ia, such as III-VI, that even where not denoted expressly, from 1 to 20 drug moieties are linked to a Ligand ( p = 1-20).

IIIa

IIIb

WO 2005/081711

PCT/US2004/038392

An illustrative Stretcher unit is that of Formula IIIa wherein R<sup>17</sup> is -(CH<sub>2</sub>)<sub>5</sub>:

Another illustrative Stretcher unit is that of Formula IIIa wherein R<sup>17</sup> is -(CH<sub>2</sub>CH<sub>2</sub>O)<sub>r</sub>-CH<sub>2</sub>-; and r is 2:

Still another illustrative Stretcher unit is that of Formula IIIb wherein R<sup>17</sup> is -(CH<sub>2</sub>)<sub>5</sub>:

10 In another embodiment, the Stretcher unit is linked to the Ligand unit via a disulfide bond between a sulfur atom of the Ligand unit and a sulfur atom of the Stretcher unit. A representative Stretcher unit of this embodiment is depicted within the square brackets of Formula IV, wherein R<sup>17</sup>, L-, -W-, -Y-, -D, w and y are as defined above.

IV

15 In yet another embodiment, the reactive group of the Stretcher contains a reactive site that can form a bond with a primary or secondary amino group of a Ligand. Example of these reactive sites include, but are not limited to, activated esters such as succinimide esters, 4-nitrophenyl esters, pentafluorophenyl esters, tetrafluorophenyl esters, anhydrides, acid chlorides, sulfonyl chlorides, isocyanates and isothiocyanates.

WO 2005/081711

PCT/US2004/038392

Representative Stretcher units of this embodiment are depicted within the square brackets of Formulas Va and Vb, wherein  $-R^{17}$ -, L-, -W-, -Y-, -D, w and y are as defined above;

Va

Vb

5 In yet another aspect, the reactive group of the Stretcher contains a reactive site that is reactive to a modified carbohydrate's (-CHO) group that can be present on a Ligand. For example, a carbohydrate can be mildly oxidized using a reagent such as sodium periodate and the resulting (-CHO) unit of the oxidized carbohydrate can be condensed with a Stretcher that contains a functionality such as a hydrazide, an oxime,  
 10 a primary or secondary amine, a hydrazine, a thiosemicarbazone, a hydrazine carboxylate, and an arylhydrazide such as those described by Kaneko, T. *et al.* (1991) Bioconjugate Chem 2:133-41. Representative Stretcher units of this embodiment are depicted within the square brackets of Formulas VIa, VIb, and VIc, wherein  $-R^{17}$ -, L-, -W-, -Y-, -D, w and y are as defined above.

15

VIa

VIb

VIc

### 4.3.2 THE AMINO ACID UNIT

The Amino Acid unit (-W-), when present, links the Stretcher unit to the Spacer unit if the Spacer unit is present, links the Stretcher unit to the Drug moiety if the Spacer unit is absent, and links the Ligand unit to the Drug unit if the Stretcher unit and Spacer unit are absent.

W<sub>w</sub>- is a dipeptide, tripeptide, tetrapeptide, pentapeptide, hexapeptide, heptapeptide, octapeptide, nonapeptide, decapeptide, undecapeptide or dodecapeptide unit. Each -W- unit independently has the formula denoted below in the square brackets, and w is an integer ranging from 0 to 12:

wherein R<sup>19</sup> is hydrogen, methyl, isopropyl, isobutyl, *sec*-butyl, benzyl, *p*-hydroxybenzyl, -CH<sub>2</sub>OH, -CH(OH)CH<sub>3</sub>, -CH<sub>2</sub>CH<sub>2</sub>SCH<sub>3</sub>, -CH<sub>2</sub>CONH<sub>2</sub>, -CH<sub>2</sub>COOH, -CH<sub>2</sub>CH<sub>2</sub>CONH<sub>2</sub>, -CH<sub>2</sub>CH<sub>2</sub>COOH, -(CH<sub>2</sub>)<sub>3</sub>NHC(=NH)NH<sub>2</sub>, -(CH<sub>2</sub>)<sub>3</sub>NH<sub>2</sub>, -(CH<sub>2</sub>)<sub>3</sub>NHCOCH<sub>3</sub>, -(CH<sub>2</sub>)<sub>3</sub>NHCHO, -(CH<sub>2</sub>)<sub>4</sub>NHC(=NH)NH<sub>2</sub>, -(CH<sub>2</sub>)<sub>4</sub>NH<sub>2</sub>, -(CH<sub>2</sub>)<sub>4</sub>NHCOCH<sub>3</sub>, -(CH<sub>2</sub>)<sub>4</sub>NHCHO, -(CH<sub>2</sub>)<sub>3</sub>NHCONH<sub>2</sub>, -(CH<sub>2</sub>)<sub>4</sub>NHCONH<sub>2</sub>, -CH<sub>2</sub>CH<sub>2</sub>CH(OH)CH<sub>2</sub>NH<sub>2</sub>, 2-pyridylmethyl-, 3-pyridylmethyl-, 4-pyridylmethyl-, phenyl, cyclohexyl,

WO 2005/081711

PCT/US2004/038392

The Amino Acid unit can be enzymatically cleaved by one or more enzymes, including a tumor-associated protease, to liberate the Drug unit (-D), which in one embodiment is protonated *in vivo* upon release to provide a Drug (D).

5 Illustrative  $W_w$  units are represented by formulas (VII)-(IX):

wherein  $R^{20}$  and  $R^{21}$  are as follows:

$R^{20}$	$R^{21}$
benzyl	$(CH_2)_4NH_2$ ;
methyl	$(CH_2)_4NH_2$ ;
isopropyl	$(CH_2)_4NH_2$ ;
isopropyl	$(CH_2)_3NHCONH_2$ ;
benzyl	$(CH_2)_3NHCONH_2$ ;
isobutyl	$(CH_2)_3NHCONH_2$ ;
<i>sec</i> -butyl	$(CH_2)_3NHCONH_2$ ;

WO 2005/081711

PCT/US2004/038392

benzyl

benzyl

 $(\text{CH}_2)_3\text{NHCONH}_2$ ;

methyl; and

 $(\text{CH}_2)_3\text{NHC(=NH)NH}_2$ ;

(VIII)

wherein  $\text{R}^{20}$ ,  $\text{R}^{21}$  and  $\text{R}^{22}$  are as follows:

$\text{R}^{20}$	$\text{R}^{21}$	$\text{R}^{22}$
benzyl	benzyl	$(\text{CH}_2)_4\text{NH}_2$ ;
isopropyl	benzyl	$(\text{CH}_2)_4\text{NH}_2$ ; and
H	benzyl	$(\text{CH}_2)_4\text{NH}_2$ ;

(IX)

wherein  $\text{R}^{20}$ ,  $\text{R}^{21}$ ,  $\text{R}^{22}$  and  $\text{R}^{23}$  are as follows:

$\text{R}^{20}$	$\text{R}^{21}$	$\text{R}^{22}$	$\text{R}^{23}$
H	benzyl	isobutyl	H; and
methyl	isobutyl	methyl	isobutyl.

Exemplary Amino Acid units include, but are not limited to, units of formula (VII) where:  $\text{R}^{20}$  is benzyl and  $\text{R}^{21}$  is  $-(\text{CH}_2)_4\text{NH}_2$ ;  $\text{R}^{20}$  isopropyl and  $\text{R}^{21}$  is  $-(\text{CH}_2)_4\text{NH}_2$ ;  $\text{R}^{20}$  isopropyl and  $\text{R}^{21}$  is  $-(\text{CH}_2)_3\text{NHCONH}_2$ . Another exemplary Amino Acid unit is a unit of formula (VIII) wherein  $\text{R}^{20}$  is benzyl,  $\text{R}^{21}$  is benzyl, and  $\text{R}^{22}$  is  $-(\text{CH}_2)_4\text{NH}_2$ .

Useful  $-\text{W}_w-$  units can be designed and optimized in their selectivity for enzymatic cleavage by a particular enzymes, for example, a tumor-associated protease.

WO 2005/081711

PCT/US2004/038392

In one embodiment, a  $-W_w-$  unit is that whose cleavage is catalyzed by cathepsin B, C and D, or a plasmin protease.

In one embodiment,  $-W_w-$  is a dipeptide, tripeptide, tetrapeptide or pentapeptide.

5                   When  $R^{19}$ ,  $R^{20}$ ,  $R^{21}$ ,  $R^{22}$  or  $R^{23}$  is other than hydrogen, the carbon atom to which  $R^{19}$ ,  $R^{20}$ ,  $R^{21}$ ,  $R^{22}$  or  $R^{23}$  is attached is chiral.

Each carbon atom to which  $R^{19}$ ,  $R^{20}$ ,  $R^{21}$ ,  $R^{22}$  or  $R^{23}$  is attached is independently in the (S) or (R) configuration.

In one aspect of the Amino Acid unit, the Amino Acid unit is valine-citrulline. In another aspect, the Amino Acid unit is phenylalanine-lysine (*i.e.* fk). In yet another aspect of the Amino Acid unit, the Amino Acid unit is N-methylvaline-citrulline. In yet another aspect, the Amino Acid unit is 5-aminovaleric acid, homo phenylalanine lysine, tetraisoquinolinecarboxylate lysine, cyclohexylalanine lysine, isonepeçotic acid lysine, beta-alanine lysine, glycine serine valine glutamine and isonepeçotic acid.

15                   In certain embodiments, the Amino Acid unit can comprise natural amino acids. In other embodiments, the Amino Acid unit can comprise non-natural amino acids.

#### 4.3.3 THE SPACER UNIT

The Spacer unit ( $-Y-$ ), when present, links an Amino Acid unit to the Drug moiety when an Amino Acid unit is present. Alternately, the Spacer unit links the Stretcher unit to the Drug moiety when the Amino Acid unit is absent. The Spacer unit also links the Drug moiety to the Ligand unit when both the Amino Acid unit and Stretcher unit are absent.

Spacer units are of two general types: self-immolative and non self-immolative. A non self-immolative Spacer unit is one in which part or all of the Spacer unit remains bound to the Drug moiety after cleavage, particularly enzymatic, of an Amino Acid unit from the Drug-Linker-Ligand Conjugate or the Drug-Linker Compound. Examples of a non self-immolative Spacer unit include, but are not limited to a (glycine-glycine) Spacer unit and a glycine Spacer unit (both depicted in Scheme 1) (*infra*). When an Exemplary Compound containing a glycine-glycine Spacer unit or a glycine Spacer unit undergoes enzymatic cleavage via a tumor-cell associated-protease, a cancer-cell-associated protease or a lymphocyte-associated protease, a glycine-glycine-Drug moiety or a glycine-Drug moiety is cleaved from  $L-A_a-W_w-$ . In one embodiment, an

WO 2005/081711

PCT/US2004/038392

independent hydrolysis reaction takes place within the target cell, cleaving the glycine-Drug moiety bond and liberating the Drug.

In another embodiment,  $-Y_1$  is a p-aminobenzyl alcohol (PAB) unit (see Schemes 2 and 3) whose phenylene portion is substituted with  $Q_m$  wherein Q is  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8$  alkyl), -halogen, -nitro or -cyano; and m is an integer ranging from 0-4.

Scheme 1

In one embodiment, a non self-immolative Spacer unit ( $-Y-$ ) is  $-\text{Gly-Gly}-$ . In another embodiment, a non self-immolative the Spacer unit ( $-Y-$ ) is  $-\text{Gly}-$ .

10 In one embodiment, a Drug-Linker Compound or a Drug-Linker Ligand Conjugate is provided in which the Spacer unit is absent ( $y=0$ ), or a pharmaceutically acceptable salt or solvate thereof.

Alternatively, an Exemplary Compound containing a self-immolative Spacer unit can release  $-D$  without the need for a separate hydrolysis step. In this  
 15 embodiment,  $-Y-$  is a PAB group that is linked to  $-\text{W}_w-$  via the amino nitrogen atom of the PAB group, and connected directly to  $-D$  via a carbonate, carbamate or ether group. Without being bound by any particular theory or mechanism, Scheme 2 depicts a possible mechanism of Drug release of a PAB group which is attached directly to  $-D$  via a carbamate or carbonate group espoused by Toki *et al.* (2002) J Org. Chem. 67:1866-1872.

Scheme 2

wherein Q is  $-\text{C}_1-\text{C}_8$  alkyl,  $-\text{O}-(\text{C}_1-\text{C}_8$  alkyl), -halogen, -nitro or -cyano; m is an integer ranging from 0-4; and p ranges from 1 to about 20.

- 5 Without being bound by any particular theory or mechanism, Scheme 3 depicts a possible mechanism of Drug release of a PAB group which is attached directly to -D via an ether or amine linkage.

Scheme 3

wherein Q is  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8)$  alkyl, -halogen, -nitro or -cyano; m is an integer ranging from 0-4; and p ranges from 1 to about 20.

- 5 Other examples of self-immolative spacers include, but are not limited to, aromatic compounds that are electronically similar to the PAB group such as 2-aminoimidazol-5-methanol derivatives (Hay *et al.* (1999) *Bioorg. Med. Chem. Lett.* 9:2237) and ortho or para-aminobenzylacetals. Spacers can be used that undergo cyclization upon amide bond hydrolysis, such as substituted and unsubstituted 4-
- 10 aminobutyric acid amides (Rodrigues *et al.*, *Chemistry Biology*, 1995, 2, 223), appropriately substituted bicyclo[2.2.1] and bicyclo[2.2.2] ring systems (Storm, *et al.*, *J. Amer. Chem. Soc.*, 1972, 94, 5815) and 2-aminophenylpropionic acid amides (Amsberry, *et al.*, *J. Org. Chem.*, 1990, 55, 5867). Elimination of amine-containing drugs that are substituted at the  $\alpha$ -position of glycine (Kingsbury, *et al.*, *J. Med. Chem.*, 1984, 27, 1447)
- 15 are also examples of self-immolative spacer useful in Exemplary Compounds.

In one embodiment, the Spacer unit is a branched bis(hydroxymethyl)styrene (BHMS) unit as depicted in Scheme 4, which can be used to incorporate and release multiple drugs.

Scheme 4

#### 4.4 THE DRUG UNIT (MOIETY)

The drug moiety (D) of the antibody drug conjugates (ADC) are of the  
 5 dolastatin/auristatin type (U.S. Patent Nos. 5635483; 5780588) which have been shown to  
 interfere with microtubule dynamics, GTP hydrolysis, and nuclear and cellular division  
 (Woyke *et al.* (2001) *Antimicrob. Agents and Chemother.* 45(12):3580-3584) and have  
 anticancer (U.S. Patent No. 5663149) and antifungal activity (Pettit *et al.* (1998)  
*Antimicrob. Agents Chemother.* 42:2961-2965)

10 D is a Drug unit (moiety) having a nitrogen atom that can form a bond  
 with the Spacer unit when  $y=1$  or 2, with the C-terminal carboxyl group of an Amino  
 Acid unit when  $y=0$ , with the carboxyl group of a Stretcher unit when  $w$  and  $y=0$ , and  
 with the carboxyl group of a Drug unit when  $a$ ,  $w$ , and  $y=0$ . It is to be understood that  
 the terms "drug unit" and "drug moiety" are synonymous and used interchangeably  
 15 herein.

In one embodiment, -D is either formula  $D_E$  or  $D_F$ :

$D_E$

$D_F$

wherein, independently at each location:

$R^2$  is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

$R^3$  is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

$R^4$  is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

$R^5$  is selected from H and methyl;

or  $R^4$  and  $R^5$  jointly form a carbocyclic ring and have the formula  $-(CR^aR^b)_n-$  wherein  $R^a$  and  $R^b$  are independently selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl and C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected from 2, 3, 4, 5 and 6;

$R^6$  is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

$R^7$  is selected from H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

each  $R^8$  is independently selected from H, OH, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle and O-(C<sub>1</sub>-C<sub>8</sub> alkyl);

$R^9$  is selected from H and C<sub>1</sub>-C<sub>8</sub> alkyl;

$R^{10}$  is selected from aryl or C<sub>3</sub>-C<sub>8</sub> heterocycle;

Z is O, S, NH, or NR<sup>12</sup>, wherein R<sup>12</sup> is C<sub>1</sub>-C<sub>8</sub> alkyl;

$R^{11}$  is selected from H, C<sub>1</sub>-C<sub>20</sub> alkyl, aryl, C<sub>3</sub>-C<sub>8</sub> heterocycle,  $-(R^{13}O)_m-R^{14}$ , or  $-(R^{13}O)_m-CH(R^{15})_2$ ;

m is an integer ranging from 1-1000;

$R^{13}$  is C<sub>2</sub>-C<sub>8</sub> alkyl;

$R^{14}$  is H or C<sub>1</sub>-C<sub>8</sub> alkyl;

each occurrence of  $R^{15}$  is independently H, COOH,  $-(CH_2)_n-N(R^{16})_2$ ,  $-(CH_2)_n-SO_3H$ , or  $-(CH_2)_n-SO_3-C_1-C_8$  alkyl;

each occurrence of  $R^{16}$  is independently H, C<sub>1</sub>-C<sub>8</sub> alkyl, or COOH;

$R^{18}$  is selected from  $-C(R^8)_2-C(R^8)_2$ -aryl,  $-C(R^8)_2-C(R^8)_2$ -(C<sub>3</sub>-C<sub>8</sub> heterocycle), and  $-C(R^8)_2-C(R^8)_2$ -(C<sub>3</sub>-C<sub>8</sub> carbocycle); and

n is an integer ranging from 0 to 6.

In one embodiment,  $R^3$ ,  $R^4$  and  $R^7$  are independently isopropyl or sec-butyl and  $R^5$  is -H. In an exemplary embodiment,  $R^3$  and  $R^4$  are each isopropyl,  $R^5$  is H, and  $R^7$  is sec-butyl.

In another embodiment,  $R^2$  and  $R^6$  are each methyl, and  $R^9$  is H.

5 In still another embodiment, each occurrence of  $R^8$  is -OCH<sub>3</sub>.

In an exemplary embodiment,  $R^3$  and  $R^4$  are each isopropyl,  $R^2$  and  $R^6$  are each methyl,  $R^5$  is H,  $R^7$  is sec-butyl, each occurrence of  $R^8$  is -OCH<sub>3</sub>, and  $R^9$  is H.

In one embodiment, Z is -O- or -NH-.

In one embodiment,  $R^{10}$  is aryl

10 In an exemplary embodiment,  $R^{10}$  is -phenyl.

In an exemplary embodiment, when Z is -O-,  $R^{11}$  is H, methyl or t-butyl.

In one embodiment, when Z is -NH,  $R^{11}$  is -CH( $R^{15}$ )<sub>2</sub>, wherein  $R^{15}$  is -  
(CH<sub>2</sub>)<sub>n</sub>-N( $R^{16}$ )<sub>2</sub>, and  $R^{16}$  is -C<sub>1</sub>-C<sub>8</sub> alkyl or -(CH<sub>2</sub>)<sub>n</sub>-COOH.

15 In another embodiment, when Z is -NH,  $R^{11}$  is -CH( $R^{15}$ )<sub>2</sub>, wherein  $R^{15}$  is -  
(CH<sub>2</sub>)<sub>n</sub>-SO<sub>3</sub>H.

Illustrative Drug units (-D) include the drug units having the following structures:

5

10

5

and pharmaceutically acceptable salts or solvates thereof.

In one aspect, hydrophilic groups, such as but not limited to triethylene glycol esters (TEG), as shown above, can be attached to the Drug Unit at  $\text{R}^{11}$ . Without being bound by theory, the hydrophilic groups assist in the internalization and non-agglomeration of the Drug Unit.

#### 4.5 THE LIGAND UNIT

The Ligand unit (L-) includes within its scope any unit of a Ligand (L) that binds or reactively associates or complexes with a receptor, antigen or other receptive moiety associated with a given target-cell population. A Ligand is a molecule that binds to, complexes with, or reacts with a moiety of a cell population sought to be therapeutically or otherwise biologically modified. In one aspect, the Ligand unit acts to deliver the Drug unit to the particular target cell population with which the Ligand unit

reacts. Such Ligands include, but are not limited to, large molecular weight proteins such as, for example, full-length antibodies, antibody fragments, smaller molecular weight proteins, polypeptide or peptides, lectins, glycoproteins, non-peptides, vitamins, nutrient-transport molecules (such as, but not limited to, transferrin), or any other cell binding molecule or substance.

A Ligand unit can form a bond to a Stretcher unit, an Amino Acid unit, a Spacer Unit, or a Drug Unit. A Ligand unit can form a bond to a Linker unit via a heteroatom of the Ligand. Heteroatoms that may be present on a Ligand unit include sulfur (in one embodiment, from a sulfhydryl group of a Ligand), oxygen (in one embodiment, from a carbonyl, carboxyl or hydroxyl group of a Ligand) and nitrogen (in one embodiment, from a primary or secondary amino group of a Ligand). These heteroatoms can be present on the Ligand in the Ligand's natural state, for example a naturally-occurring antibody, or can be introduced into the Ligand via chemical modification.

In one embodiment, a Ligand has a sulfhydryl group and the Ligand bonds to the Linker unit via the sulfhydryl group's sulfur atom.

In yet another aspect, the Ligand has one or more lysine residues that can be chemically modified to introduce one or more sulfhydryl groups. The Ligand unit bonds to the Linker unit via the sulfhydryl group's sulfur atom. The reagents that can be used to modify lysines include, but are not limited to, N-succinimidyl S-acetylthioacetate (SATA) and 2-Iminothiolane hydrochloride (Traut's Reagent).

In another embodiment, the Ligand can have one or more carbohydrate groups that can be chemically modified to have one or more sulfhydryl groups. The Ligand unit bonds to the Linker Unit, such as the Stretcher Unit, via the sulfhydryl group's sulfur atom.

In yet another embodiment, the Ligand can have one or more carbohydrate groups that can be oxidized to provide an aldehyde (-CHO) group (see, for *e.g.*, Laguzza, *et al.*, *J. Med. Chem.* 1989, 32(3), 548-55). The corresponding aldehyde can form a bond with a Reactive Site on a Stretcher. Reactive sites on a Stretcher that can react with a carbonyl group on a Ligand include, but are not limited to, hydrazine and hydroxylamine. Other protocols for the modification of proteins for the attachment or association of Drug Units are described in Coligan *et al.*, *Current Protocols in Protein Science*, vol. 2, John Wiley & Sons (2002).

Useful non-immunoreactive protein, polypeptide, or peptide Ligands include, but are not limited to, transferrin, epidermal growth factors ("EGF"), bombesin, gastrin, gastrin-releasing peptide, platelet-derived growth factor, IL-2, IL-6, transforming growth factors ("TGF"), such as TGF- $\alpha$  and TGF- $\beta$ , vaccinia growth factor ("VGF"),  
5 insulin and insulin-like growth factors I and II, lectins and apoprotein from low density lipoprotein.

Useful polyclonal antibodies are heterogeneous populations of antibody molecules derived from the sera of immunized animals. Various procedures well known in the art may be used for the production of polyclonal antibodies to an antigen-of-  
10 interest. For example, for the production of polyclonal antibodies, various host animals can be immunized by injection with an antigen of interest or derivative thereof, including but not limited to rabbits, mice, rats, and guinea pigs. Various adjuvants may be used to increase the immunological response, depending on the host species, and including but not limited to Freund's (complete and incomplete) adjuvant, mineral gels such as  
15 aluminum hydroxide, surface active substances such as lysolecithin, pluronic polyols, polyanions, peptides, oil emulsions, keyhole limpet hemocyanins, dinitrophenol, and potentially useful human adjuvants such as BCG (bacille Calmette-Guerin) and corynebacterium parvum. Such adjuvants are also well known in the art.

Useful monoclonal antibodies are homogeneous populations of antibodies  
20 to a particular antigenic determinant (*e.g.*, a cancer cell antigen, a viral antigen, a microbial antigen, a protein, a peptide, a carbohydrate, a chemical, nucleic acid, or fragments thereof). A monoclonal antibody (mAb) to an antigen-of-interest can be prepared by using any technique known in the art which provides for the production of antibody molecules by continuous cell lines in culture. These include, but are not limited  
25 to, the hybridoma technique originally described by Köhler and Milstein (1975, *Nature* 256, 495-497), the human B cell hybridoma technique (Kozbor *et al.*, 1983, *Immunology Today* 4: 72), and the EBV-hybridoma technique (Cole *et al.*, 1985, *Monoclonal Antibodies and Cancer Therapy*, Alan R. Liss, Inc., pp. 77-96). Such antibodies may be of any immunoglobulin class including IgG, IgM, IgE, IgA, and IgD and any subclass  
30 thereof. The hybridoma producing the mAbs of use in this invention may be cultivated *in vitro* or *in vivo*.

Useful monoclonal antibodies include, but are not limited to, human monoclonal antibodies, humanized monoclonal antibodies, antibody fragments, or

chimeric human-mouse (or other species) monoclonal antibodies. Human monoclonal antibodies may be made by any of numerous techniques known in the art (e.g., Teng *et al.*, 1983, *Proc. Natl. Acad. Sci. USA.* 80, 7308-7312; Kozbor *et al.*, 1983, *Immunology Today* 4, 72-79; and Olsson *et al.*, 1982, *Meth. Enzymol.* 92, 3-16).

5           The antibody can also be a bispecific antibody. Methods for making bispecific antibodies are known in the art. Traditional production of full-length bispecific antibodies is based on the coexpression of two immunoglobulin heavy chain-light chain pairs, where the two chains have different specificities (Milstein *et al.*, 1983, *Nature* 305:537-539). Because of the random assortment of immunoglobulin heavy and light  
10 chains, these hybridomas (quadromas) produce a potential mixture of 10 different antibody molecules, of which only one has the correct bispecific structure. Similar procedures are disclosed in International Publication No. WO 93/08829, and in Traunecker *et al.*, *EMBO J.* 10:3655-3659 (1991).

          According to a different approach, antibody variable domains with the  
15 desired binding specificities (antibody-antigen combining sites) are fused to immunoglobulin constant domain sequences. The fusion preferably is with an immunoglobulin heavy chain constant domain, comprising at least part of the hinge, C<sub>H</sub>2, and C<sub>H</sub>3 regions. It is preferred to have the first heavy-chain constant region (C<sub>H</sub>1) containing the site necessary for light chain binding, present in at least one of the fusions.  
20 Nucleic acids with sequences encoding the immunoglobulin heavy chain fusions and, if desired, the immunoglobulin light chain, are inserted into separate expression vectors, and are co-transfected into a suitable host organism. This provides for great flexibility in adjusting the mutual proportions of the three polypeptide fragments in embodiments when unequal ratios of the three polypeptide chains used in the construction provide the  
25 optimum yields. It is, however, possible to insert the coding sequences for two or all three polypeptide chains in one expression vector when the expression of at least two polypeptide chains in equal ratios results in high yields or when the ratios are of no particular significance.

          In an embodiment of this approach, the bispecific antibodies have a hybrid  
30 immunoglobulin heavy chain with a first binding specificity in one arm, and a hybrid immunoglobulin heavy chain-light chain pair (providing a second binding specificity) in the other arm. This asymmetric structure facilitates the separation of the desired bispecific compound from unwanted immunoglobulin chain combinations, as the

presence of an immunoglobulin light chain in only one half of the bispecific molecule provides for a facile way of separation (International Publication No. WO 94/04690).

For further details for generating bispecific antibodies see, for example,  
5 Suresh *et al.*, *Methods in Enzymology*, 1986, 121:210; Rodrigues *et al.*, 1993, *J. of Immunology* 151:6954-6961; Carter *et al.*, 1992, *Bio/Technology* 10:163-167; Carter *et al.*, 1995, *J. of Hematotherapy* 4:463-470; Merchant *et al.*, 1998, *Nature Biotechnology* 16:677-681. Using such techniques, bispecific antibodies can be prepared for use in the treatment or prevention of disease as defined herein.

10 Bifunctional antibodies are also described, in European Patent Publication No. EPA 0 105 360. As disclosed in this reference, hybrid or bifunctional antibodies can be derived either biologically, *i.e.*, by cell fusion techniques, or chemically, especially with cross-linking agents or disulfide-bridge forming reagents, and may comprise whole antibodies or fragments thereof. Methods for obtaining such hybrid antibodies are  
15 disclosed for example, in International Publication WO 83/03679, and European Patent Publication No. EPA 0 217 577.

The antibody can be a functionally active fragment, derivative or analog of an antibody that immunospecifically binds to cancer cell antigens, viral antigens, or microbial antigens or other antibodies bound to tumor cells or matrix. In this regard,  
20 "functionally active" means that the fragment, derivative or analog is able to elicit anti-anti-idiotypic antibodies that recognize the same antigen that the antibody from which the fragment, derivative or analog is derived recognized. Specifically, in an exemplary embodiment the antigenicity of the idiotype of the immunoglobulin molecule can be enhanced by deletion of framework and CDR sequences that are C-terminal to the CDR  
25 sequence that specifically recognizes the antigen. To determine which CDR sequences bind the antigen, synthetic peptides containing the CDR sequences can be used in binding assays with the antigen by any binding assay method known in the art (*e.g.*, the BIA core assay) (See, for *e.g.*, Kabat *et al.*, 1991, *Sequences of Proteins of Immunological Interest*, Fifth Edition, National Institute of Health, Bethesda, Md; Kabat E *et al.*, 1980, *J. of  
30 Immunology* 125(3):961-969).

Other useful antibodies include fragments of antibodies such as, but not limited to, F(ab')<sub>2</sub> fragments, which contain the variable region, the light chain constant region and the CH1 domain of the heavy chain can be produced by pepsin digestion of the

antibody molecule, and Fab fragments, which can be generated by reducing the disulfide bridges of the F(ab')<sub>2</sub> fragments. Other useful antibodies are heavy chain and light chain dimers of antibodies, or any minimal fragment thereof such as Fvs or single chain antibodies (SCAs) (e.g., as described in U.S. Patent No. 4946778; Bird, 1988, *Science* 5 242:423-42; Huston *et al.*, 1988, *Proc. Natl. Acad. Sci. USA* 85:5879-5883; and Ward *et al.*, 1989, *Nature* 334:544-54), or any other molecule with the same specificity as the antibody.

Additionally, recombinant antibodies, such as chimeric and humanized monoclonal antibodies, comprising both human and non-human portions, which can be 10 made using standard recombinant DNA techniques, are useful antibodies. A chimeric antibody is a molecule in which different portions are derived from different animal species, such as those having a variable region derived from a murine monoclonal and human immunoglobulin constant regions. (See, e.g., Cabilly *et al.*, U.S. Patent No. 4816567; and Boss *et al.*, U.S. Patent No. 4,816397.

15 Humanized antibodies are antibody molecules from non-human species having one or more complementarity determining regions (CDRs) from the non-human species and a framework region from a human immunoglobulin molecule. (See, e.g., Queen, U.S. Patent No. 5,585,089).

Such chimeric and humanized monoclonal antibodies can be produced by 20 recombinant DNA techniques known in the art, for example using methods described in International Publication No. WO 87/02671; European Patent Publication No. 184,187; European Patent Publication No. 171496; European Patent Publication No. 173494; International Publication No. WO 86/01533; U.S. Patent No. 4816567; European Patent Publication No. 12,023; Berter *et al.*, 1988, *Science* 240:1041-1043; Liu *et al.*, 1987, *Proc.* 25 *Natl. Acad. Sci. USA* 84:3439-3443; Liu *et al.*, 1987, *J. Immunol.* 139:3521-3526; Sun *et al.*, 1987, *Proc. Natl. Acad. Sci. USA* 84:214-218; Nishimura *et al.*, 1987, *Cancer Res.* 47:999-1005; Wood *et al.*, 1985, *Nature* 314:446-449; and Shaw *et al.*, 1988, *J. Natl. Cancer Inst.* 80:1553-1559; Morrison, 1985, *Science* 229:1202-1207; Oi *et al.*, 1986, *BioTechniques* 4:214; U.S. Patent No. 5225539; Jones *et al.*, 1986, *Nature* 321:552-525; 30 Verhoeyan *et al.* (1988) *Science* 239:1534; and Beidler *et al.*, 1988, *J. Immunol.* 141:4053-4060.

Completely human antibodies are particularly desirable and can be produced using transgenic mice that are incapable of expressing endogenous

immunoglobulin heavy and light chains genes, but which can express human heavy and light chain genes. The transgenic mice are immunized in the normal fashion with a selected antigen, *e.g.*, all or a portion of a polypeptide of the invention. Monoclonal antibodies directed against the antigen can be obtained using conventional hybridoma technology. The human immunoglobulin transgenes harbored by the transgenic mice rearrange during B cell differentiation, and subsequently undergo class switching and somatic mutation. Thus, using such a technique, it is possible to produce therapeutically useful IgG, IgA, IgM and IgE antibodies. For an overview of this technology for producing human antibodies, see Lonberg and Huszar (1995, *Int. Rev. Immunol.* 13:65-93). For a detailed discussion of this technology for producing human antibodies and human monoclonal antibodies and protocols for producing such antibodies. See, *e.g.*, U.S. Patent Nos. 5625126; 5633425; 5569825; 5661016; 5545806.

Other human antibodies can be obtained commercially from, for example, Abgenix, Inc. (Freemont, CA) and Genpharm (San Jose, CA).

Completely human antibodies that recognize a selected epitope can be generated using a technique referred to as "guided selection." In this approach a selected non-human monoclonal antibody, *e.g.*, a mouse antibody, is used to guide the selection of a completely human antibody recognizing the same epitope. (Jespers *et al.* (1994) *Biotechnology* 12:899-903). Human antibodies can also be produced using various techniques known in the art, including phage display libraries (Hoogenboom and Winter, *J. Mol. Biol.*, 227:381 (1991); Marks *et al.*, *J. Mol. Biol.*, 222:581 (1991); Quan, M. P. and Carter, P. 2002. *The rise of monoclonal antibodies as therapeutics*. In *Anti-IgE and Allergic Disease*, Jardieu, P. M. and Fick Jr., R. B, eds., Marcel Dekker, New York, NY, Chapter 20, pp. 427-469).

In other embodiments, the antibody is a fusion protein of an antibody, or a functionally active fragment thereof, for example in which the antibody is fused via a covalent bond (*e.g.*, a peptide bond), at either the N-terminus or the C-terminus to an amino acid sequence of another protein (or portion thereof, preferably at least 10, 20 or 50 amino acid portion of the protein) that is not the antibody. Preferably, the antibody or fragment thereof is covalently linked to the other protein at the N-terminus of the constant domain.

Antibodies include analogs and derivatives that are either modified, *i.e.*, by the covalent attachment of any type of molecule as long as such covalent attachment permits the antibody to retain its antigen binding immunospecificity. For example, but not by way of limitation, the derivatives and analogs of the antibodies include those that  
5 have been further modified, *e.g.*, by glycosylation, acetylation, pegylation, phosphorylation, amidation, derivatization by known protecting/blocking groups, proteolytic cleavage, linkage to a cellular antibody unit or other protein, etc. Any of numerous chemical modifications can be carried out by known techniques, including, but not limited to specific chemical cleavage, acetylation, formylation, metabolic synthesis in  
10 the presence of tunicamycin, etc. Additionally, the analog or derivative can contain one or more unnatural amino acids.

The antibodies include antibodies having modifications (*e.g.*, substitutions, deletions or additions) in amino acid residues that interact with Fc receptors. In particular, antibodies include antibodies having modifications in amino acid residues identified as  
15 involved in the interaction between the anti-Fc domain and the FcRn receptor (see, *e.g.*, International Publication No. WO 97/34631

). Antibodies immunospecific for a cancer cell antigen can be obtained commercially, for example, from Genentech (San Francisco, CA) or produced by any method known to one of skill in the art such as, *e.g.*, chemical synthesis or recombinant  
20 expression techniques. The nucleotide sequence encoding antibodies immunospecific for a cancer cell antigen can be obtained, *e.g.*, from the GenBank database or a database like it, the literature publications, or by routine cloning and sequencing.

In a specific embodiment, known antibodies for the treatment or prevention of cancer can be used. Antibodies immunospecific for a cancer cell antigen  
25 can be obtained commercially or produced by any method known to one of skill in the art such as, *e.g.*, recombinant expression techniques. The nucleotide sequence encoding antibodies immunospecific for a cancer cell antigen can be obtained, *e.g.*, from the GenBank database or a database like it, the literature publications, or by routine cloning and sequencing. Examples of antibodies available for the treatment of cancer include, but  
30 are not limited to, humanized anti-HER2 monoclonal antibody, HERCEPTIN® (trastuzumab; Genentech) for the treatment of patients with metastatic breast cancer; RITUXAN® (rituximab; Genentech) which is a chimeric anti-CD20 monoclonal antibody for the treatment of patients with non-Hodgkin's lymphoma; OvaRex (AltaRex

Corporation, MA) which is a murine antibody for the treatment of ovarian cancer; Panorex (Glaxo Wellcome, NC) which is a murine IgG<sub>2a</sub> antibody for the treatment of colorectal cancer; Cetuximab Erbitux (Imclone Systems Inc., NY) which is an anti-EGFR IgG chimeric antibody for the treatment of epidermal growth factor positive cancers, such as head and neck cancer; Vitaxin (MedImmune, Inc., MD) which is a humanized antibody for the treatment of sarcoma; Campath 1H (Leukosite, MA) which is a humanized IgG<sub>1</sub> antibody for the treatment of chronic lymphocytic leukemia (CLL); Smart MI95 (Protein Design Labs, Inc., CA) which is a humanized anti-CD33 IgG antibody for the treatment of acute myeloid leukemia (AML); LymphoCide (Immunomedics, Inc., NJ) which is a humanized anti-CD22 IgG antibody for the treatment of non-Hodgkin's lymphoma; Smart ID10 (Protein Design Labs, Inc., CA) which is a humanized anti-HLA-DR antibody for the treatment of non-Hodgkin's lymphoma; Oncolym (Techniclone, Inc., CA) which is a radiolabeled murine anti-HLA-Dr10 antibody for the treatment of non-Hodgkin's lymphoma; Allomune (BioTransplant, CA) which is a humanized anti-CD2 mAb for the treatment of Hodgkin's Disease or non-Hodgkin's lymphoma; Avastin (Genentech, Inc., CA) which is an anti-VEGF humanized antibody for the treatment of lung and colorectal cancers; Epratuzamab (Immunomedics, Inc., NJ and Amgen, CA) which is an anti-CD22 antibody for the treatment of non-Hodgkin's lymphoma; and CEAcide (Immunomedics, NJ) which is a humanized anti-CEA antibody for the treatment of colorectal cancer.

Other antibodies useful in the treatment of cancer include, but are not limited to, antibodies against the following antigens: CA125 (ovarian), CA15-3 (carcinomas), CA19-9 (carcinomas), L6 (carcinomas), Lewis Y (carcinomas), Lewis X (carcinomas), alpha fetoprotein (carcinomas), CA 242 (colorectal), placental alkaline phosphatase (carcinomas), prostate specific antigen (prostate), prostatic acid phosphatase (prostate), epidermal growth factor (carcinomas), MAGE-1 (carcinomas), MAGE-2 (carcinomas), MAGE-3 (carcinomas), MAGE -4 (carcinomas), anti-transferrin receptor (carcinomas), p97 (melanoma), MUC1-KLH (breast cancer), CEA (colorectal), gp100 (melanoma), MART1 (melanoma), PSA (prostate), IL-2 receptor (T-cell leukemia and lymphomas), CD20 (non-Hodgkin's lymphoma), CD52 (leukemia), CD33 (leukemia), CD22 (lymphoma), human chorionic gonadotropin (carcinoma), CD38 (multiple myeloma), CD40 (lymphoma), mucin (carcinomas), P21 (carcinomas), MPG (melanoma), and Neu oncogene product (carcinomas). Some specific, useful antibodies

include, but are not limited to, BR96 mAb (Trail, P. A., Willner, D., Lasch, S. J., Henderson, A. J., Hofstead, S. J., Casazza, A. M., Firestone, R. A., Hellström, I., Hellström, K. E., "Cure of Xenografted Human Carcinomas by BR96-Doxorubicin Immunoconjugates" *Science* 1993, 261, 212-215), BR64 (Trail, PA, Willner, D, Knipe, J., Henderson, A. J., Lasch, S. J., Zoeckler, M. E., Trailsmith, M. D., Doyle, T. W., King, H. D., Casazza, A. M., Braslawsky, G. R., Brown, J. P., Hofstead, S. J., (Greenfield, R. S., Firestone, R. A., Mosure, K., Kadow, D. F., Yang, M. B., Hellstrom, K. E., and Hellstrom, I. "Effect of Linker Variation on the Stability, Potency, and Efficacy of Carcinoma-reactive BR64-Doxorubicin Immunoconjugates" *Cancer Research* 1997, 57, 100-105, mAbs against the CD40 antigen, such as S2C6 mAb (Francisco, J. A., Donaldson, K. L., Chace, D., Siegall, C. B., and Wahl, A. F. "Agonistic properties and *in vivo* antitumor activity of the anti-CD-40 antibody, SGN-14" *Cancer Res.* 2000, 60, 3225-3231), mAbs against the CD70 antigen, such as 1F6 mAb and 2F2 mAb, and mAbs against the CD30 antigen, such as AC10.(Bowen, M. A., Olsen, K. J., Cheng, L., Avila, D., and Podack, E. R. "Functional effects of CD30 on a large granular lymphoma cell line YT" *J. Immunol.*, 151, 5896-5906, 1993; Wahl *et al.*, 2002 *Cancer Res.* 62(13):3736-42 ). Many other internalizing antibodies that bind to tumor associated antigens can be used and have been reviewed (Franke, A. E., Sievers, E. L., and Scheinberg, D. A., "Cell surface receptor-targeted therapy of acute myeloid leukemia: a review" *Cancer Biother Radiopharm.* 2000,15, 459-76; Murray, J. L., "Monoclonal antibody treatment of solid tumors: a coming of age" *Semin Oncol.* 2000, 27, 64-70; Breitling, F., and Dubel, S., *Recombinant Antibodies*, John Wiley, and Sons, New York, 1998).

In certain embodiments, the antibody is not Trastuzumab (full length, humanized anti-HER2 (MW 145167)), HerceptinF(ab')<sub>2</sub> (derived from anti-HER2 enzymatically (MW 100000)), 4D5 (full-length, murine antiHER2, from hybridoma), rhu4D5 (transiently expressed, full-length humanized antibody), rhuFab4D5 (recombinant humanized Fab (MW 47738)), 4D5Fc8 (full-length, murine antiHER2, with mutated FcRn binding domain), or Hg ("Hingeless" full-length humanized 4D5, with heavy chain hinge cysteines mutated to serines. Expressed in *E. coli* (therefore non-glycosylated)).

In another specific embodiment, known antibodies for the treatment or prevention of an autoimmune disease are used in accordance with the compositions and methods of the invention. Antibodies immunospecific for an antigen of a cell that is

responsible for producing autoimmune antibodies can be obtained from any organization (e.g., a university scientist or a company) or produced by any method known to one of skill in the art such as, e.g., chemical synthesis or recombinant expression techniques. In another embodiment, useful antibodies are immunospecific for the treatment of

5 autoimmune diseases include, but are not limited to, Anti-Nuclear Antibody; Anti-ds DNA; Anti-ss DNA, Anti-Cardiolipin Antibody IgM, IgG; Anti-Phospholipid Antibody IgM, IgG; Anti-SM Antibody; Anti-Mitochondrial Antibody; Thyroid Antibody; Microsomal Antibody; Thyroglobulin Antibody; Anti-SCL-70; Anti-Jo; Anti-U<sub>1</sub>RNP; Anti-La/SSB; Anti SSA; Anti-SSB; Anti-Perital Cells Antibody; Anti-Histones; Anti-

10 RNP; C-ANCA; P-ANCA; Anti centromere; Anti-Fibrillar, and Anti-GBM Antibody.

In certain embodiments, useful antibodies can bind to both a receptor or a receptor complex expressed on an activated lymphocyte. The receptor or receptor complex can comprise an immunoglobulin gene superfamily member, a TNF receptor superfamily member, an integrin, a cytokine receptor, a chemokine receptor, a major

15 histocompatibility protein, a lectin, or a complement control protein. Non-limiting examples of suitable immunoglobulin superfamily members are CD2, CD3, CD4, CD8, CD19, CD22, CD28, CD79, CD90, CD152/CTLA-4, PD-1, and ICOS. Non-limiting examples of suitable TNF receptor superfamily members are CD27, CD40, CD95/Fas, CD134/OX40, CD137/4-1BB, TNF-R1, TNFR-2, RANK, TACI, BCMA,

20 osteoprotegerin, Apo2/TRAIL-R1, TRAIL-R2, TRAIL-R3, TRAIL-R4, and APO-3. Non-limiting examples of suitable integrins are CD11a, CD11b, CD11c, CD18, CD29, CD41, CD49a, CD49b, CD49c, CD49d, CD49e, CD49f, CD103, and CD104. Non-limiting examples of suitable lectins are C-type, S-type, and I-type lectin.

In one embodiment, the Ligand binds to an activated lymphocyte that is

25 associated with an autoimmune disease.

In another specific embodiment, useful Ligands immunospecific for a viral or a microbial antigen are monoclonal antibodies. The antibodies may be chimeric, humanized or human monoclonal antibodies. As used herein, the term "viral antigen" includes, but is not limited to, any viral peptide, polypeptide protein (e.g., HIV gp120,

30 HIV nef, RSV F glycoprotein, influenza virus neuraminidase, influenza virus hemagglutinin, HTLV tax, herpes simplex virus glycoprotein (e.g., gB, gC, gD, and gE) and hepatitis B surface antigen) that is capable of eliciting an immune response. As used herein, the term "microbial antigen" includes, but is not limited to, any microbial peptide,

polypeptide, protein, saccharide, polysaccharide, or lipid molecule (*e.g.*, a bacterial, fungi, pathogenic protozoa, or yeast polypeptide including, *e.g.*, LPS and capsular polysaccharide 5/8) that is capable of eliciting an immune response.

Antibodies immunospecific for a viral or microbial antigen can be  
 5 obtained commercially, for example, from BD Biosciences (San Francisco, CA),  
 Chemicon International, Inc. (Temecula, CA), or Vector Laboratories, Inc. (Burlingame,  
 CA) or produced by any method known to one of skill in the art such as, *e.g.*, chemical  
 synthesis or recombinant expression techniques. The nucleotide sequence encoding  
 antibodies that are immunospecific for a viral or microbial antigen can be obtained, *e.g.*,  
 10 from the GenBank database or a database like it, literature publications, or by routine  
 cloning and sequencing.

In a specific embodiment, useful Ligands are those that are useful for the  
 treatment or prevention of viral or microbial infection in accordance with the methods  
 disclosed herein. Examples of antibodies available useful for the treatment of viral  
 15 infection or microbial infection include, but are not limited to, SYNAGIS (MedImmune,  
 Inc., MD) which is a humanized anti-respiratory syncytial virus (RSV) monoclonal  
 antibody useful for the treatment of patients with RSV infection; PRO542 (Progenics)  
 which is a CD4 fusion antibody useful for the treatment of HIV infection; OSTAVIR  
 (Protein Design Labs, Inc., CA) which is a human antibody useful for the treatment of  
 20 hepatitis B virus; PROTOVIR (Protein Design Labs, Inc., CA) which is a humanized IgG<sub>1</sub>  
 antibody useful for the treatment of cytomegalovirus (CMV); and anti-LPS antibodies.

Other antibodies useful in the treatment of infectious diseases include, but  
 are not limited to, antibodies against the antigens from pathogenic strains of bacteria  
 (Streptococcus pyogenes, Streptococcus pneumoniae, Neisseria gonorrhoeae, Neisseria  
 25 meningitidis, Corynebacterium diphtheriae, Clostridium botulinum, Clostridium  
 perfringens, Clostridium tetani, Hemophilus influenzae, Klebsiella pneumoniae,  
 Klebsiella ozaenas, Klebsiella rhinoscleromatis, Staphylococcus aureus, Vibrio cholerae,  
 Escherichia coli, Pseudomonas aeruginosa, Campylobacter (Vibrio) fetus, Aeromonas  
 hydrophila, Bacillus cereus, Edwardsiella tarda, Yersinia enterocolitica, Yersinia pestis,  
 30 Yersinia pseudotuberculosis, Shigella dysenteriae, Shigella flexneri, Shigella sonnei,  
 Salmonella typhimurium, Treponema pallidum, Treponema pertenue, Treponema  
 carateneum, Borrelia vincentii, Borrelia burgdorferi, Leptospira icterohemorrhagiae,  
 Mycobacterium tuberculosis, Pneumocystis carinii, Francisella tularensis, Brucella

WO 2005/081711

PCT/US2004/038392

abortus, *Brucella suis*, *Brucella melitensis*, *Mycoplasma* spp., *Rickettsia prowazeki*, *Rickettsia tsutsugumushi*, *Chlamydia* spp.); pathogenic fungi (*Coccidioides immitis*, *Aspergillus fumigatus*, *Candida albicans*, *Blastomyces dermatitidis*, *Cryptococcus neoformans*, *Histoplasma capsulatum*); protozoa (*Entamoeba histolytica*, *Toxoplasma gondii*, *Trichomonas tenax*, *Trichomonas hominis*, *Trichomonas vaginalis*, *Trypanosoma gambiense*, *Trypanosoma rhodesiense*, *Trypanosoma cruzi*, *Leishmania donovani*, *Leishmania tropica*, *Leishmania braziliensis*, *Pneumocystis pneumonia*, *Plasmodium vivax*, *Plasmodium falciparum*, *Plasmodium malariae*); or Helminths (*Enterobius vermicularis*, *Trichuris trichiura*, *Ascaris lumbricoides*, *Trichinella spiralis*, *Strongyloides stercoralis*, *Schistosoma japonicum*, *Schistosoma mansoni*, *Schistosoma haematobium*, and hookworms).

Other antibodies useful in this invention for treatment of viral disease include, but are not limited to, antibodies against antigens of pathogenic viruses, including as examples and not by limitation: Poxviridae, Herpesviridae, Herpes Simplex virus 1, Herpes Simplex virus 2, Adenoviridae, Papovaviridae, Enteroviridae, Picornaviridae, Parvoviridae, Reoviridae, Retroviridae, influenza viruses, parainfluenza viruses, mumps, measles, respiratory syncytial virus, rubella, Arboviridae, Rhabdoviridae, Arenaviridae, Hepatitis A virus, Hepatitis B virus, Hepatitis C virus, Hepatitis E virus, Non-A/Non-B Hepatitis virus, Rhinoviridae, Coronaviridae, Rotoviridae, and Human Immunodeficiency Virus.

In attempts to discover effective cellular targets for cancer diagnosis and therapy, researchers have sought to identify transmembrane or otherwise tumor-associated polypeptides that are specifically expressed on the surface of one or more particular type(s) of cancer cell as compared to on one or more normal non-cancerous cell(s). Often, such tumor-associated polypeptides are more abundantly expressed on the surface of the cancer cells as compared to on the surface of the non-cancerous cells. The identification of such tumor-associated cell surface antigen polypeptides has given rise to the ability to specifically target cancer cells for destruction via antibody-based therapies.

Antibodies which comprise Ab in Formula Ic antibody drug conjugates (ADC) and which may be useful in the treatment of cancer include, but are not limited to, antibodies against tumor-associated antigens (TAA). Such tumor-associated antigens are known in the art, and can be prepared for use in generating antibodies using methods and information which are well known in the art. Examples of TAA include (1)-(35), but are

WO 2005/081711

PCT/US2004/038392

not limited to TAA (1)-(35) listed below. For convenience, information relating to these antigens, all of which are known in the art, is listed below and includes names, alternative names, Genbank accession numbers and primary reference(s). Tumor-associated antigens targetted by antibodies include all amino acid sequence variants and isoforms possessing at least about 70%, 80%, 85%, 90%, or 95% sequence identity relative to the sequences identified in the corresponding sequences listed (SEQ ID NOS: 1-35) or the sequences identified in the cited references. In some embodiments, TAA having amino acid sequence variants exhibit substantially the same biological properties or characteristics as a TAA having the sequence found in the corresponding sequences listed (SEQ ID NOS: 1-35). For example, a TAA having a variant sequence generally is able to bind specifically to an antibody that binds specifically to the TAA with the corresponding sequence listed. The sequences and disclosure specifically recited herein are expressly incorporated by reference.

15 TUMOR-ASSOCIATED ANTIGENS (1)-(35):

In an embodiment, the Ligand-Linker-Drug Conjugate has Formula IIIa, where the Ligand is an antibody Ab including one that binds at least one of CD30, CD40, CD70, Lewis Y antigen,  $w=0$ ,  $y=0$ , and D has Formula Ib. Exemplary Conjugates of Formula IIIa include where  $R^{17}$  is  $-(CH_2)_5-$ . Also included are such Conjugates of Formula IIIa in which D has the structure of Compound 2 in Example 3 and esters thereof. Also included are such Conjugates of Formula IIIa containing about 3 to about 8, in one aspect, about 3 to about 5 Drug moieties D, that is, Conjugates of Formula Ia wherein  $p$  is a value in the range about 3-8, for example about 3-5. Conjugates containing combinations of the structural features noted in this paragraph are also contemplated as within the scope of the compounds of the invention.

In another embodiment, the Ligand-Linker-Drug Conjugate has Formula IIIa, where Ligand is an Antibody Ab that binds one of CD30, CD40, CD70, Lewis Y antigen,  $w=1$ ,  $y=0$ , and D has Formula Ib. Included are such Conjugates of Formula IIIa in which  $R^{17}$  is  $-(CH_2)_5-$ . Also included are such Conjugates of Formula IIIa in which W is  $-Val-Cit-$ , and/or where D has the structure of Compound 2 in Example 3 and esters thereof. Also included are such Conjugates of Formula IIIa containing about 3 to about 8, preferably about 3 to about 5 Drug moieties D, that is, Conjugates of Formula Ia wherein  $p$  is a value in the range of about 3-8, preferably about 3-5. Conjugates containing combinations of the structural features noted in this paragraph are also exemplary.

In an embodiment, the Ligand-Linker-Drug Conjugate has Formula IIIa, where the Ligand is an Antibody Ab that binds one of CD30, CD40, CD70, Lewis Y antigen,  $w=1$ ,  $y=1$ , and D has Formula Ib. Included are Conjugates of Formula IIIa in which  $R^{17}$  is  $-(CH_2)_5-$ . Also included are such Conjugates of Formula IIIa where: W is  $-Val-Cit-$ ; Y has Formula X; D has the structure of Compound 2 in Example 3 and esters thereof;  $p$  is about 3 to about 8, preferably about 3 to about 5 Drug moieties D. Conjugates containing combinations of the structural features noted in this paragraph are also contemplated within the scope of the compounds of the invention.

A further embodiment is an antibody drug conjugate (ADC), or a pharmaceutically acceptable salt or solvate thereof, wherein Ab is an antibody that binds one of the tumor-associated antigens (1)-(35) noted above (the "TAA Compound").

Another embodiment is the TAA Compound or pharmaceutically acceptable salt or solvate thereof that is in isolated and purified form.

Another embodiment is a method for killing or inhibiting the multiplication of a tumor cell or cancer cell comprising administering to a patient, for example a human with a hyperproliferative disorder, an amount of the TAA Compound or a pharmaceutically acceptable salt or solvate thereof, said amount being effective to kill or inhibit the multiplication of a tumor cell or cancer cell.

Another embodiment is a method for treating cancer comprising administering to a patient, for example a human with a hyperproliferative disorder, an amount of the TAA Compound or a pharmaceutically acceptable salt or solvate thereof, said amount being effective to treat cancer, alone or together with an effective amount of an additional anticancer agent.

Another embodiment is a method for treating an autoimmune disease, comprising administering to a patient, for example a human with a hyperproliferative disorder, an amount of the TAA Compound or a pharmaceutically acceptable salt or solvate thereof, said amount being effective to treat an autoimmune disease.

The antibodies suitable for use in the invention can be produced by any method known in the art for the synthesis of antibodies, in particular, by chemical synthesis or by recombinant expression, and are preferably produced by recombinant expression techniques.

#### **4.5.1 PRODUCTION OF RECOMBINANT ANTIBODIES**

Antibodies of the invention can be produced using any method known in the art to be useful for the synthesis of antibodies, in particular, by chemical synthesis or by recombinant expression.

Recombinant expression of antibodies, or fragment, derivative or analog thereof, requires construction of a nucleic acid that encodes the antibody. If the nucleotide sequence of the antibody is known, a nucleic acid encoding the antibody may be assembled from chemically synthesized oligonucleotides (*e.g.*, as described in Kutmeier *et al.*, 1994, *BioTechniques* 17:242), which involves the synthesis of overlapping oligonucleotides containing portions of the sequence encoding the antibody, annealing and ligation of those oligonucleotides, and then amplification of the ligated oligonucleotides, *e.g.*, by PCR.

Alternatively, a nucleic acid molecule encoding an antibody can be generated from a suitable source. If a clone containing the nucleic acid encoding the particular antibody is not available, but the sequence of the antibody is known, a nucleic acid encoding the antibody can be obtained from a suitable source (*e.g.*, an antibody  
5 cDNA library, or cDNA library generated from any tissue or cells expressing the immunoglobulin) by, *e.g.*, PCR amplification using synthetic primers hybridizable to the 3' and 5' ends of the sequence or by cloning using an oligonucleotide probe specific for the particular gene sequence.

If an antibody that specifically recognizes a particular antigen is not  
10 commercially available (or a source for a cDNA library for cloning a nucleic acid encoding such an immunoglobulin), antibodies specific for a particular antigen can be generated by any method known in the art, for example, by immunizing a patient, or suitable animal model such as a rabbit or mouse, to generate polyclonal antibodies or, more preferably, by generating monoclonal antibodies, *e.g.*, as described by Kohler and  
15 Milstein (1975, *Nature* 256:495-497) or, as described by Kozbor *et al.* (1983, *Immunology Today* 4:72) or Cole *et al.* (1985 in *Monoclonal Antibodies and Cancer Therapy*, Alan R. Liss, Inc., pp. 77-96). Alternatively, a clone encoding at least the Fab portion of the antibody can be obtained by screening Fab expression libraries (*e.g.*, as described in Huse *et al.*, 1989, *Science* 246:1275-1281) for clones of Fab fragments that  
20 bind the specific antigen or by screening antibody libraries (See, *e.g.*, Clackson *et al.*, 1991, *Nature* 352:624; Hane *et al.*, 1997 *Proc. Natl. Acad. Sci. USA* 94:4937).

Once a nucleic acid sequence encoding at least the variable domain of the antibody is obtained, it can be introduced into a vector containing the nucleotide sequence encoding the constant regions of the antibody (see, *e.g.*, International Publication No.  
25 WO 86/05807; WO 89/01036; and U.S. Patent No. 5122464). Vectors containing the complete light or heavy chain that allow for the expression of a complete antibody molecule are available. Then, the nucleic acid encoding the antibody can be used to introduce the nucleotide substitutions or deletion necessary to substitute (or delete) the one or more variable region cysteine residues participating in an intrachain disulfide bond  
30 with an amino acid residue that does not contain a sulfhydryl group. Such modifications can be carried out by any method known in the art for the introduction of specific mutations or deletions in a nucleotide sequence, for example, but not limited to, chemical

mutagenesis and *in vitro* site directed mutagenesis (Hutchinson *et al.*, 1978, *J. Biol. Chem.* 253:6551).

In addition, techniques developed for the production of "chimeric antibodies" (Morrison *et al.*, 1984, *Proc. Natl. Acad. Sci.* 81:851-855; Neuberger *et al.*, 1984, *Nature* 312:604-608; Takeda *et al.*, 1985, *Nature* 314:452-454) by splicing genes from a mouse antibody molecule of appropriate antigen specificity together with genes from a human antibody molecule of appropriate biological activity can be used. A chimeric antibody is a molecule in which different portions are derived from different animal species, such as those having a variable region derived from a murine monoclonal antibody and a human immunoglobulin constant region, *e.g.*, humanized antibodies.

Alternatively, techniques described for the production of single chain antibodies (U.S. Patent 4,694,778; Bird, 1988, *Science* 242:423-42; Huston *et al.*, 1988, *Proc. Natl. Acad. Sci. USA* 85:5879-5883; and Ward *et al.*, 1989, *Nature* 334:544-54) can be adapted to produce single chain antibodies. Single chain antibodies are formed by linking the heavy and light chain fragments of the Fv region via an amino acid bridge, resulting in a single chain polypeptide. Techniques for the assembly of functional Fv fragments in *E. coli* may also be used (Skerra *et al.*, 1988, *Science* 242:1038-1041).

Antibody fragments that recognize specific epitopes can be generated by known techniques. For example, such fragments include, but are not limited to the F(ab')<sub>2</sub> fragments that can be produced by pepsin digestion of the antibody molecule and the Fab fragments that can be generated by reducing the disulfide bridges of the F(ab')<sub>2</sub> fragments.

Once a nucleic acid sequence encoding an antibody has been obtained, the vector for the production of the antibody can be produced by recombinant DNA technology using techniques well known in the art. Methods that are well known to those skilled in the art can be used to construct expression vectors containing the antibody coding sequences and appropriate transcriptional and translational control signals. These methods include, for example, *in vitro* recombinant DNA techniques, synthetic techniques, and *in vivo* genetic recombination. See, for example, the techniques described in Sambrook *et al.* (1990, *Molecular Cloning, A Laboratory Manual*, 2<sup>nd</sup> Ed., Cold Spring Harbor Laboratory, Cold Spring Harbor, NY) and Ausubel *et al.* (eds., 1998, *Current Protocols in Molecular Biology*, John Wiley & Sons, NY).

An expression vector comprising the nucleotide sequence of an antibody or the nucleotide sequence of an antibody can be transferred to a host cell by conventional techniques (e.g., electroporation, liposomal transfection, and calcium phosphate precipitation), and the transfected cells are then cultured by conventional techniques to produce the antibody. In specific embodiments, the expression of the antibody is regulated by a constitutive, an inducible or a tissue, specific promoter.

The host cells used to express the recombinant antibody can be either bacterial cells such as *Escherichia coli*, or, preferably, eukaryotic cells, especially for the expression of whole recombinant immunoglobulin molecule. In particular, mammalian cells such as Chinese hamster ovary cells (CHO), in conjunction with a vector such as the major intermediate early gene promoter element from human cytomegalovirus is an effective expression system for immunoglobulins (Foecking *et al.*, 198, *Gene* 45:101; Cockett *et al.*, 1990, *BioTechnology* 8:2).

A variety of host-expression vector systems can be utilized to express the immunoglobulin antibodies. Such host-expression systems represent vehicles by which the coding sequences of the antibody can be produced and subsequently purified, but also represent cells that can, when transformed or transfected with the appropriate nucleotide coding sequences, express an antibody immunoglobulin molecule *in situ*. These include, but are not limited to, microorganisms such as bacteria (e.g., *E. coli* and *B. subtilis*) transformed with recombinant bacteriophage DNA, plasmid DNA or cosmid DNA expression vectors containing immunoglobulin coding sequences; yeast (e.g., *Saccharomyces Pichia*) transformed with recombinant yeast expression vectors containing immunoglobulin coding sequences; insect cell systems infected with recombinant virus expression vectors (e.g., baculovirus) containing the immunoglobulin coding sequences; plant cell systems infected with recombinant virus expression vectors (e.g., cauliflower mosaic virus (CaMV) and tobacco mosaic virus (TMV)) or transformed with recombinant plasmid expression vectors (e.g., Ti plasmid) containing immunoglobulin coding sequences; or mammalian cell systems (e.g., COS, CHO, BH, 293, 293T, 3T3 cells) harboring recombinant expression constructs containing promoters derived from the genome of mammalian cells (e.g., metallothionein promoter) or from mammalian viruses (e.g., the adenovirus late promoter; the vaccinia virus 7.5K promoter).

In bacterial systems, a number of expression vectors can be advantageously selected depending upon the use intended for the antibody being

expressed. For example, when a large quantity of such a protein is to be produced, vectors that direct the expression of high levels of fusion protein products that are readily purified might be desirable. Such vectors include, but are not limited, to the *E. coli* expression vector pUR278 (Ruther *et al.*, 1983, *EMBO J.* 2:1791), in which the antibody coding sequence may be ligated individually into the vector in frame with the *lac Z* coding region so that a fusion protein is produced; pIN vectors (Inouye & Inouye, 1985, *Nucleic Acids Res.* 13:3101-3109; Van Heeke & Schuster, 1989, *J. Biol. Chem.* 24:5503-5509); and the like. pGEX Vectors can also be used to express foreign polypeptides as fusion proteins with glutathione S-transferase (GST). In general, such fusion proteins are soluble and can easily be purified from lysed cells by adsorption and binding to a matrix glutathione-agarose beads followed by elution in the presence of free glutathione. The pGEX vectors are designed to include thrombin or factor Xa protease cleavage sites so that the cloned target gene product can be released from the GST moiety.

In an insect system, *Autographa californica* nuclear polyhedrosis virus (AcNPV) or the analogous virus from *Drosophila Melanogaster* is used as a vector to express foreign genes. The virus grows in *Spodoptera frugiperda* cells. The antibody coding sequence can be cloned individually into non-essential regions (for example the polyhedrin gene) of the virus and placed under control of an AcNPV promoter (for example the polyhedrin promoter).

In mammalian host cells, a number of viral-based expression systems can be utilized. In cases where an adenovirus is used as an expression vector, the antibody coding sequence of interest can be ligated to an adenovirus transcription/translation control complex, *e.g.*, the late promoter and tripartite leader sequence. This chimeric gene can then be inserted in the adenovirus genome by *in vitro* or *in vivo* recombination. Insertion in a non-essential region of the viral genome (*e.g.*, region E1 or E3) results in a recombinant virus that is viable and capable of expressing the immunoglobulin molecule in infected hosts. (*e.g.*, see Logan & Shenk, 1984, *Proc. Natl. Acad. Sci. USA* 81:355-359). Specific initiation signals can also be required for efficient translation of inserted antibody coding sequences. These signals include the ATG initiation codon and adjacent sequences. Furthermore, the initiation codon must be in phase with the reading frame of the desired coding sequence to ensure translation of the entire insert. These exogenous translational control signals and initiation codons can be of a variety of origins, both natural and synthetic. The efficiency of expression can be enhanced by the inclusion of

appropriate transcription enhancer elements, transcription terminators, etc. (*see Bittner et al., 1987, Methods in Enzymol.* 153:51-544).

In addition, a host cell strain can be chosen to modulate the expression of the inserted sequences, or modifies and processes the gene product in the specific fashion desired. Such modifications (*e.g.*, glycosylation) and processing (*e.g.*, cleavage) of protein products can be important for the function of the protein. Different host cells have characteristic and specific mechanisms for the post-translational processing and modification of proteins and gene products. Appropriate cell lines or host systems can be chosen to ensure the correct modification and processing of the foreign protein expressed.

10 To this end, eukaryotic host cells that possess the cellular machinery for proper processing of the primary transcript, glycosylation, and phosphorylation of the gene product can be used. Such mammalian host cells include, but are not limited to, CHO, VERY, BH, Hela, COS, MDCK, 293, 293T, 3T3, WI38, BT483, Hs578T, HTB2, BT20 and T47D, CRL7030 and Hs578Bst.

15 For long-term, high-yield production of recombinant proteins, stable expression is preferred. For example, cell lines that stably express an antibody can be engineered. Rather than using expression vectors that contain viral origins of replication, host cells can be transformed with DNA controlled by appropriate expression control elements (*e.g.*, promoter, enhancer, sequences, transcription terminators, polyadenylation sites, etc.), and a selectable marker. Following the introduction of the foreign DNA, engineered cells can be allowed to grow for 1-2 days in an enriched media, and then are switched to a selective media. The selectable marker in the recombinant plasmid confers resistance to the selection and allows cells to stably integrate the plasmid into their chromosomes and grow to form foci that in turn can be cloned and expanded into cell

20 lines. This method can advantageously be used to engineer cell lines which express the antibody. Such engineered cell lines can be particularly useful in screening and evaluation of tumor antigens that interact directly or indirectly with the antibody.

A number of selection systems can be used, including but not limited to the herpes simplex virus thymidine kinase (Wigler *et al.*, 1977, *Cell* 11:223), hypoxanthine-guanine phosphoribosyltransferase (Szybalska & Szybalski, 192, *Proc. Natl. Acad. Sci. USA* 48:202), and adenine phosphoribosyltransferase (Lowy *et al.*, 1980, *Cell* 22:817) genes can be employed in tk-, hgppt- or apt- cells, respectively. Also, antimetabolite resistance can be used as the basis of selection for the following genes:

25

DHFR, which confers resistance to methotrexate (Wigler *et al.*, 1980, *Proc. Natl. Acad. Sci. USA* 77:357; O'Hare *et al.*, 1981, *Proc. Natl. Acad. Sci. USA* 78:1527); gpt, which confers resistance to mycophenolic acid (Mulligan & Berg, 1981, *Proc. Natl. Acad. Sci. USA* 78:2072); neo, which confers resistance to the aminoglycoside G-418 (*Clinical*  
5 *Pharmacy* 12:488-505; Wu and Wu, 1991, *Biotherapy* 3:87-95; Tolstoshev, 1993, *Ann. Rev. Pharmacol. Toxicol.* 32:573-596; Mulligan, 1993, *Science* 260:926-932; and Morgan and Anderson, 1993, *Ann. Rev. Biochem.* 62:191-217; May, 1993, *TIB TECH* 11(5):155-215) and hygromycin (Santerre *et al.*, 1984, *Gene* 30:147). Methods commonly known in the art of recombinant DNA technology which  
10 can be used are described in Ausubel *et al.* (eds., 1993, *Current Protocols in Molecular Biology*, John Wiley & Sons, NY; Kriegler, 1990, *Gene Transfer and Expression, A Laboratory Manual*, Stockton Press, NY; and in Chapters 12 and 13, Dracopoli *et al.* (eds), 1994, *Current Protocols in Human Genetics*, John Wiley & Sons, NY.; Colberre-Garapin *et al.*, 1981, *J. Mol. Biol.* 150:1).

15 The expression levels of an antibody can be increased by vector amplification (for a review, see Bebbington and Hentschel, *The use of vectors based on gene amplification for the expression of cloned genes in mammalian cells in DNA cloning*, Vol.3. (Academic Press, New York, 1987)). When a marker in the vector system expressing an antibody is amplifiable, an increase in the level of inhibitor present in  
20 culture of host cell will increase the number of copies of the marker gene. Since the amplified region is associated with the nucleotide sequence of the antibody, production of the antibody will also increase (Crouse *et al.*, 1983, *Mol. Cell. Biol.* 3:257).

The host cell can be co-transfected with two expression vectors, the first vector encoding a heavy chain derived polypeptide and the second vector encoding a light  
25 chain derived polypeptide. The two vectors can contain identical selectable markers that enable equal expression of heavy and light chain polypeptides. Alternatively, a single vector can be used to encode both heavy and light chain polypeptides. In such situations, the light chain should be placed before the heavy chain to avoid an excess of toxic free heavy chain (Proudfoot, 1986, *Nature* 322:52; Kohler, 1980, *Proc. Natl. Acad. Sci. USA*  
30 77:2197). The coding sequences for the heavy and light chains can comprise cDNA or genomic DNA.

Once the antibody has been recombinantly expressed, it can be purified using any method known in the art for purification of an antibody, for example, by

chromatography (*e.g.*, ion exchange, affinity, particularly by affinity for the specific antigen after Protein A, and sizing column chromatography), centrifugation, differential solubility, or by any other standard technique for the purification of proteins.

In yet another exemplary embodiment, the antibody is a monoclonal  
5 antibody.

In any case, the hybrid antibodies have a dual specificity, preferably with one or more binding sites specific for the hapten of choice or one or more binding sites specific for a target antigen, for example, an antigen associated with a tumor, an autoimmune disease, an infectious organism, or other disease state.

10

#### **4.5.2 PRODUCTION OF ANTIBODIES**

The production of antibodies will be illustrated with reference to anti-CD30 antibodies but it will be apparent for those skilled in the art that antibodies to other members of the TNF receptor family can be produced and modified in a similar manner.  
15 The use of CD30 for the production of antibodies is exemplary only and not intended to be limiting.

The CD30 antigen to be used for production of antibodies may be, *e.g.*, a soluble form of the extracellular domain of CD30 or a portion thereof, containing the desired epitope. Alternatively, cells expressing CD30 at their cell surface (*e.g.*, L540  
20 (Hodgkin's lymphoma derived cell line with a T cell phenotype) and L428 (Hodgkin's lymphoma derived cell line with a B cell phenotype)) can be used to generate antibodies. Other forms of CD30 useful for generating antibodies will be apparent to those skilled in the art.

In another exemplary embodiment, the ErbB2 antigen to be used for  
25 production of antibodies may be, *e.g.*, a soluble form of the extracellular domain of ErbB2 or a portion thereof, containing the desired epitope. Alternatively, cells expressing ErbB2 at their cell surface (*e.g.*, NIH-3T3 cells transformed to overexpress ErbB2; or a carcinoma cell line such as SK-BR-3 cells, see Stancovski *et al. Proc. Natl. Acad. Sci. USA* 88:8691-8695 (1991)) can be used to generate antibodies. Other forms of ErbB2  
30 useful for generating antibodies will be apparent to those skilled in the art.

##### **(i) Polyclonal antibodies**

Polyclonal antibodies are preferably raised in animals by multiple subcutaneous (sc) or intraperitoneal (ip) injections of the relevant antigen and an adjuvant. It may be useful to conjugate the relevant antigen to a protein that is immunogenic in the species to be immunized, *e.g.*, keyhole limpet hemocyanin, serum albumin, bovine thyroglobulin, or soybean trypsin inhibitor using a bifunctional or derivatizing agent, for example, maleimidobenzoyl sulfosuccinimide ester (conjugation through cysteine residues), N-hydroxysuccinimide (through lysine residues), glutaraldehyde, succinic anhydride,  $\text{SOCl}_2$ , or  $\text{R}^1\text{N}=\text{C}=\text{NR}^1$ , where R and  $\text{R}^1$  are different alkyl groups.

Animals are immunized against the antigen, immunogenic conjugates, or derivatives by combining, *e.g.*, 100  $\mu\text{g}$  or 5  $\mu\text{g}$  of the protein or conjugate (for rabbits or mice, respectively) with 3 volumes of Freund's complete adjuvant and injecting the solution intradermally at multiple sites. One month later the animals are boosted with 1/5 to 1/10 the original amount of peptide or conjugate in Freund's complete adjuvant by subcutaneous injection at multiple sites. Seven to 14 days later the animals are bled and the serum is assayed for antibody titer. Animals are boosted until the titer plateaus. Preferably, the animal is boosted with the conjugate of the same antigen, but conjugated to a different protein and/or through a different cross-linking reagent. Conjugates also can be made in recombinant cell culture as protein fusions. Also, aggregating agents such as alum are suitably used to enhance the immune response.

**(ii) Monoclonal antibodies**

Monoclonal antibodies are obtained from a population of substantially homogeneous antibodies, *i.e.*, the individual antibodies comprising the population are identical except for possible naturally-occurring mutations that may be present in minor amounts. Thus, the modifier "monoclonal" indicates the character of the antibody as not being a mixture of discrete antibodies.

For example, the monoclonal antibodies may be made using the hybridoma method first described by Kohler *et al.*, *Nature*, 256:495 (1975), or may be made by recombinant DNA methods (U.S. Patent No. 4816567).

In the hybridoma method, a mouse or other appropriate host animal, such as a hamster, is immunized as hereinabove described to elicit lymphocytes that produce or are capable of producing antibodies that will specifically bind to the protein used for

immunization. Alternatively, lymphocytes may be immunized *in vitro*. Lymphocytes then are fused with myeloma cells using a suitable fusing agent, such as polyethylene glycol, to form a hybridoma cell (Goding, *Monoclonal Antibodies: Principles and Practice*, pp.59-103 (Academic Press, 1986)).

5                   The hybridoma cells thus prepared are seeded and grown in a suitable culture medium that preferably contains one or more substances that inhibit the growth or survival of the unfused, parental myeloma cells. For example, if the parental myeloma cells lack the enzyme hypoxanthine guanine phosphoribosyl transferase (HGPRT or HPRT), the culture medium for the hybridomas typically will include hypoxanthine, aminopterin, and thymidine (HAT medium), which substances prevent the growth of  
10 HGPRT-deficient cells.

                  Preferred myeloma cells are those that fuse efficiently, support stable high-level production of antibody by the selected antibody-producing cells, and are sensitive to a medium such as HAT medium. Among these, preferred myeloma cell lines are murine  
15 myeloma lines, such as those derived from MOPC-21 and MPC-11 mouse tumors available from the Salk Institute Cell Distribution Center, San Diego, California USA, and SP-2 or X63-Ag8-653 cells available from the American Type Culture Collection, Rockville, Maryland USA. Human myeloma and mouse-human heteromyeloma cell lines also have been described for the production of human monoclonal antibodies (Kozbor, *J. Immunol.*, 133:3001 (1984); and Brodeur *et al.*, *Monoclonal Antibody Production Techniques and Applications*, pp. 51-63 (Marcel Dekker, Inc., New York, 1987)).  
20

                  Culture medium in which hybridoma cells are growing is assayed for production of monoclonal antibodies directed against the antigen. Preferably, the binding specificity of monoclonal antibodies produced by hybridoma cells is determined by  
25 immunoprecipitation or by an *in vitro* binding assay, such as radioimmunoassay (RIA) or enzyme-linked immunoabsorbent assay (ELISA). The binding affinity of the monoclonal antibody can, for example, be determined by the Scatchard analysis of Munson *et al.*, *Anal. Biochem.*, 107:220 (1980).

                  After hybridoma cells are identified that produce antibodies of the desired  
30 specificity, affinity, and/or activity, the clones may be subcloned by limiting dilution procedures and grown by standard methods (Goding, *Monoclonal Antibodies: Principles and Practice*, pp.59-103 (Academic Press, 1986)). Suitable culture media for this

purpose include, for example, D-MEM or RPMI-1640 medium. In addition, the hybridoma cells may be grown *in vivo* as ascites tumors in an animal.

The monoclonal antibodies secreted by the subclones are suitably separated from the culture medium, ascites fluid, or serum by conventional antibody  
5 purification procedures such as, for example, protein A-Sepharose™, hydroxylapatite chromatography, gel electrophoresis, dialysis, or affinity chromatography.

DNA encoding the monoclonal antibodies is readily isolated and sequenced using conventional procedures (*e.g.*, by using oligonucleotide probes that are capable of binding specifically to genes encoding the heavy and light chains of murine  
10 antibodies). The hybridoma cells serve as a preferred source of such DNA. Once isolated, the DNA may be placed into expression vectors, which are then transfected into host cells such as *E. coli* cells, simian COS cells, Chinese Hamster Ovary (CHO) cells, or myeloma cells that do not otherwise produce antibody protein, to obtain the synthesis of monoclonal antibodies in the recombinant host cells. Review articles on recombinant  
15 expression in bacteria of DNA encoding the antibody include Skerra *et al.*, *Curr. Opinion in Immunol.*, 5:256-262 (1993) and Plückerthun, *Immunol. Revs.*, 130:151-188 (1992).

In a further embodiment, monoclonal antibodies or antibody fragments can be isolated from antibody phage libraries generated using the techniques described in McCafferty *et al.*, *Nature*, 348:552-554 (1990). Clackson *et al.*, *Nature*, 352:624-628  
20 (1991) and Marks *et al.*, *J. Mol. Biol.*, 222:581-597 (1991) describe the isolation of murine and human antibodies, respectively, using phage libraries. Subsequent publications describe the production of high affinity (nM range) human antibodies by chain shuffling (Marks *et al.*, *BioTechnology*, 10:779-783 (1992)), as well as combinatorial infection and *in vivo* recombination as a strategy for constructing very large  
25 phage libraries (Waterhouse *et al.*, *Nuc. Acids. Res.*, 21:2265-2266 (1993)). Thus, these techniques are viable alternatives to traditional monoclonal antibody hybridoma techniques for isolation of monoclonal antibodies.

The DNA also may be modified, for example, by substituting the coding sequence for human heavy chain and light chain constant domains in place of the  
30 homologous murine sequences (U.S. Patent No. 4816567; and Morrison, *et al.* (1984) Proc. Natl Acad. Sci. USA 81:6851), or by covalently joining to the immunoglobulin coding sequence all or part of the coding sequence for a non-immunoglobulin polypeptide.

Typically such non-immunoglobulin polypeptides are substituted for the constant domains of an antibody, or they are substituted for the variable domains of one antigen-combining site of an antibody to create a chimeric bivalent antibody comprising one antigen-combining site having specificity for an antigen and another antigen-combining site having specificity for a different antigen.

**(iii) Humanized antibodies**

A humanized antibody may have one or more amino acid residues introduced into it from a source which is non-human. These non-human amino acid residues are often referred to as "import" residues, which are typically taken from an "import" variable domain. Humanization can be essentially performed following the method of Winter and co-workers (Jones *et al.*, Nature 321:522-525 (1986); Riechmann *et al.*, Nature, 332:323-327 (1988); Verhoeven *et al.*, Science 239:1534-1536 (1988)), by substituting hypervariable region sequences for the corresponding sequences of a human antibody. Accordingly, such "humanized" antibodies are chimeric antibodies (U.S. Patent No. 4,816,567) wherein substantially less than an intact human variable domain has been substituted by the corresponding sequence from a non-human species. In practice, humanized antibodies are typically human antibodies in which some hypervariable region residues and possibly some FR residues are substituted by residues from analogous sites in rodent antibodies.

The choice of human variable domains, both light and heavy, to be used in making the humanized antibodies is very important to reduce antigenicity. According to the so-called "best-fit" method, the sequence of the variable domain of a rodent antibody is screened against the entire library of known human variable-domain sequences. The human sequence which is closest to that of the rodent is then accepted as the human framework region (FR) for the humanized antibody (Sims *et al.*, *J. Immunol.*, 151:2296 (1993); Chothia *et al.*, *J. Mol. Biol.*, 196:901 (1987)). Another method uses a particular framework region derived from the consensus sequence of all human antibodies of a particular subgroup of light or heavy chains. The same framework may be used for several different humanized antibodies (Carter *et al.*, *Proc. Natl. Acad. Sci. USA*, 89:4285 (1992); Presta *et al.*, *J. Immunol.*, 151:2623 (1993)).

In another embodiment, the antibodies may be humanized with retention of high affinity for the antigen and other favorable biological properties. Humanized

WO 2005/081711

PCT/US2004/038392

antibodies may be prepared by a process of analysis of the parental sequences and various conceptual humanized products using three-dimensional models of the parental and humanized sequences. Three-dimensional immunoglobulin models are commonly available and are familiar to those skilled in the art. Computer programs are available which illustrate and display probable three-dimensional conformational structures of selected candidate immunoglobulin sequences. Inspection of these displays permits analysis of the likely role of the residues in the functioning of the candidate immunoglobulin sequence, *i.e.*, the analysis of residues that influence the ability of the candidate immunoglobulin to bind its antigen. In this way, FR residues can be selected and combined from the recipient and import sequences so that the desired antibody characteristic, such as increased affinity for the target antigen(s), is achieved. In general, the hypervariable region residues are directly and most substantially involved in influencing antigen binding.

Various forms of the humanized antibody are contemplated. For example, the humanized antibody may be an antibody fragment, such as a Fab. Alternatively, the humanized antibody may be an intact antibody, such as an intact IgG1 antibody.

The Examples describe production of an exemplary humanized anti-ErbB2 antibody. The humanized antibody may, for example, comprise nonhuman hypervariable region residues incorporated into a human variable heavy domain and may further comprise a framework region (FR) substitution at a position selected from the group consisting of 69H, 71H and 73H utilizing the variable domain numbering system set forth in Kabat *et al.*, *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD (1991). In one embodiment, the humanized antibody comprises FR substitutions at two or all of positions 69H, 71H and 73H. Another Example describes preparation of purified trastuzumab antibody from the HERCEPTIN® formulation.

**(iv) Human antibodies**

As an alternative to humanization, human antibodies can be generated. For example, it is now possible to produce transgenic animals (*e.g.*, mice) that are capable, upon immunization, of producing a full repertoire of human antibodies in the absence of endogenous immunoglobulin production. For example, it has been described that the homozygous deletion of the antibody heavy-chain joining region ( $J_H$ ) gene in

chimeric and germ-line mutant mice results in complete inhibition of endogenous antibody production. Transfer of the human germ-line immunoglobulin gene array in such germ-line mutant mice will result in the production of human antibodies upon antigen challenge. See, e.g., Jakobovits *et al.*, *Proc. Natl. Acad. Sci. USA*, 90:2551 (1993);  
5 Jakobovits *et al.*, *Nature*, 362:255-258 (1993); Bruggermann *et al.*, *Year in Immuno.*, 7:33 (1993); and U.S. Patent Nos. 5,591,669, 5,589,369 and 5,545,807.

Alternatively, phage display technology (McCafferty *et al.*, *Nature* 348:552-553 (1990)) can be used to produce human antibodies and antibody fragments *in vitro*, from immunoglobulin variable (V) domain gene repertoires from unimmunized  
10 donors. According to this technique, antibody V domain genes are cloned in-frame into either a major or minor coat protein gene of a filamentous bacteriophage, such as M13 or fd, and displayed as functional antibody fragments on the surface of the phage particle. Because the filamentous particle contains a single-stranded DNA copy of the phage genome, selections based on the functional properties of the antibody also result in  
15 selection of the gene encoding the antibody exhibiting those properties. Thus, the phage mimics some of the properties of the B-cell. Phage display can be performed in a variety of formats; for their review see, e.g., Johnson, Kevin S. and Chiswell, David J., *Current Opinion in Structural Biology* 3:564-571 (1993). Several sources of V-gene segments can be used for phage display. Clackson *et al.*, *Nature*, 352:624-628 (1991) isolated a  
20 diverse array of anti-oxazolone antibodies from a small random combinatorial library of V genes derived from the spleens of immunized mice. A repertoire of V genes from unimmunized human donors can be constructed and antibodies to a diverse array of antigens (including self-antigens) can be isolated essentially following the techniques described by Marks *et al.*, *J. Mol. Biol.* 222:581-597 (1991), or Griffith *et al.*, *EMBO J.*  
25 12:725-734 (1993). See, also, U.S. Patent Nos. 5565332 and 5573905. As discussed above, human antibodies may also be generated by *in vitro* activated B cells (see U.S. Patents Nos. 5567610 and 5229275). Human anti-CD30 antibodies are described in U.S. Patent No. 7,387,776.

#### (v) Antibody fragments

30 Various techniques have been developed for the production of antibody fragments. Traditionally, these fragments were derived via proteolytic digestion of intact antibodies (see, e.g., Morimoto *et al.*, *Journal of Biochemical and Biophysical Methods*

24:107-117 (1992); and Brennan *et al.*, *Science*, 229:81 (1985)). However, these fragments can now be produced directly by recombinant host cells. For example, the antibody fragments can be isolated from the antibody phage libraries discussed above. Alternatively, Fab'-SH fragments can be directly recovered from *E. coli* and chemically coupled to form F(ab')<sub>2</sub> fragments (Carter *et al.*, *Bio/Technology* 10:163-167 (1992)).  
5 According to another approach, F(ab')<sub>2</sub> fragments can be isolated directly from recombinant host cell culture. Other techniques for the production of antibody fragments will be apparent to the skilled practitioner. In other embodiments, the antibody of choice is a single chain Fv fragment (scFv). See WO 93/16185; U.S. Patent No. 5,571,894; and  
10 U.S. Patent No. 5,587,458. The antibody fragment may also be a "linear antibody", *e.g.*, as described in U.S. Patent No. 5,641,870 for example. Such linear antibody fragments may be monospecific or bispecific.

(vi) **Bispecific antibodies**

Bispecific antibodies are antibodies that have binding specificities for at least two different epitopes. Exemplary bispecific antibodies may bind to two different epitopes of the CD30 protein. Alternatively, an anti-CD30 arm may be combined with an arm which binds to a Fc receptors for IgG (FcγR), such as FcγRI (CD64), FcγRII (CD32) and FcγRIII (CD16) so as to focus cellular defense mechanisms to the CD30-expressing cell. Bispecific antibodies may also be used to localize cytotoxic agents to cells which  
15  
20 express CD30.

Traditional production of full length bispecific antibodies is based on the coexpression of two immunoglobulin heavy chain-light chain pairs, where the two chains have different specificities (Millstein *et al.*, *Nature*, 305:537-539 (1983)). Because of the random assortment of immunoglobulin heavy and light chains, these hybridomas  
25 (quadromas) produce a potential mixture of 10 different antibody molecules, of which only one has the correct bispecific structure. Purification of the correct molecule, which is usually done by affinity chromatography steps, is rather cumbersome, and the product yields are low. Similar procedures are disclosed in WO 93/08829, and in Traunecker *et al.*, *EMBO J.*, 10:3655-3659 (1991). According to a different approach, antibody variable  
30 domains with the desired binding specificities (antibody-antigen combining sites) are fused to immunoglobulin constant domain sequences. The fusion preferably is with an immunoglobulin heavy chain constant domain, comprising at least part of the hinge, CH2,

and CH3 regions. It is preferred to have the first heavy-chain constant region (CH1) containing the site necessary for light chain binding, present in at least one of the fusions. DNAs encoding the immunoglobulin heavy chain fusions and, if desired, the immunoglobulin light chain, are inserted into separate expression vectors, and are co-  
5 transfected into a suitable host organism. This provides for great flexibility in adjusting the mutual proportions of the three polypeptide fragments in embodiments when unequal ratios of the three polypeptide chains used in the construction provide the optimum yields. It is, however, possible to insert the coding sequences for two or all three polypeptide chains in one expression vector when the expression of at least two polypeptide chains in  
10 equal ratios results in high yields or when the ratios are of no particular significance.

In one embodiment of this approach, the bispecific antibodies are composed of a hybrid immunoglobulin heavy chain with a first binding specificity in one arm, and a hybrid immunoglobulin heavy chain-light chain pair (providing a second binding specificity) in the other arm. It was found that this asymmetric structure  
15 facilitates the separation of the desired bispecific compound from unwanted immunoglobulin chain combinations, as the presence of an immunoglobulin light chain in only one half of the bispecific molecule provides for a facile way of separation. This approach is disclosed in WO 94/04690. For further details of generating bispecific antibodies see, for example, Suresh *et al.*, *Methods in Enzymology*, 121:210 (1986).

20 According to another approach described in U.S. Patent No. 5,731,168, the interface between a pair of antibody molecules can be engineered to maximize the percentage of heterodimers which are recovered from recombinant cell culture. The preferred interface comprises at least a part of the CH3 domain of an antibody constant domain. In this method, one or more small amino acid side chains from the interface of  
25 the first antibody molecule are replaced with larger side chains (*e.g.*, tyrosine or tryptophan). Compensatory "cavities" of identical or similar size to the large side chain(s) are created on the interface of the second antibody molecule by replacing large amino acid side chains with smaller ones (*e.g.*, alanine or threonine). This provides a mechanism for increasing the yield of the heterodimer over other unwanted end-products  
30 such as homodimers.

Techniques for generating bispecific antibodies from antibody fragments have also been described in the literature. For example, bispecific antibodies can be prepared using chemical linkage. Brennan *et al.*, *Science*, 229: 81 (1985) describe a

procedure wherein intact antibodies are proteolytically cleaved to generate F(ab')<sub>2</sub> fragments. These fragments are reduced in the presence of the dithiol complexing agent sodium arsenite to stabilize vicinal dithiols and prevent intermolecular disulfide formation. The Fab' fragments generated are then converted to thionitrobenzoate (TNB) derivatives. One of the Fab'-TNB derivatives is then reconverted to the Fab'-thiol by reduction with mercaptoethylamine and is mixed with an equimolar amount of the other Fab'-TNB derivative to form the bispecific antibody. The bispecific antibodies produced can be used as agents for the selective immobilization of enzymes.

Recent progress has facilitated the direct recovery of Fab'-SH fragments from *E. coli*, which can be chemically coupled to form bispecific antibodies. Shalaby *et al.*, *J. Exp. Med.*, 175: 217-225 (1992) describe the production of a fully humanized bispecific antibody F(ab')<sub>2</sub> molecule. Each Fab' fragment was separately secreted from *E. coli* and subjected to directed chemical coupling *in vitro* to form the bispecific antibody.

Various techniques for making and isolating bispecific antibody fragments directly from recombinant cell culture have also been described. For example, bispecific antibodies have been produced using leucine zippers. Kostelny *et al.*, *J. Immunol.*, 148(5):1547-1553 (1992). The leucine zipper peptides from the Fos and Jun proteins were linked to the Fab' portions of two different antibodies by gene fusion. The antibody homodimers were reduced at the hinge region to form monomers and then re-oxidized to form the antibody heterodimers. This method can also be utilized for the production of antibody homodimers. The "diabody" technology described by Hollinger *et al.*, *Proc. Natl. Acad. Sci. USA*, 90:6444-6448 (1993) has provided an alternative mechanism for making bispecific antibody fragments. The fragments comprise a heavy-chain variable domain (V<sub>H</sub>) connected to a light-chain variable domain (V<sub>L</sub>) by a linker which is too short to allow pairing between the two domains on the same chain. Accordingly, the V<sub>H</sub> and V<sub>L</sub> domains of one fragment are forced to pair with the complementary V<sub>L</sub> and V<sub>H</sub> domains of another fragment, thereby forming two antigen-binding sites. Another strategy for making bispecific antibody fragments by the use of single-chain Fv (sFv) dimers has also been reported. See Gruber *et al.*, *J. Immunol.*, 152:5368 (1994).

Antibodies with more than two valencies are contemplated. For example, trispecific antibodies can be prepared. Tutt *et al.* *J. Immunol.* 147: 60 (1991).

**(vii) Other amino acid sequence modifications**

Amino acid sequence modification(s) of the antibodies described herein are contemplated. For example, it may be desirable to improve the binding affinity and/or other biological properties of the antibody. Amino acid sequence variants of the antibodies are prepared by introducing appropriate nucleotide changes into the antibody nucleic acid, or by peptide synthesis. Such modifications include, for example, deletions from, and/or insertions into and/or substitutions of, residues within the amino acid sequences of the antibody. Any combination of deletion, insertion, and substitution is made to arrive at the final construct, provided that the final construct possesses the desired characteristics. The amino acid changes also may alter post-translational processes of the antibody, such as changing the number or position of glycosylation sites.

A useful method for identification of certain residues or regions of the antibody that are favored locations for mutagenesis is called "alanine scanning mutagenesis" as described by Cunningham and Wells *Science*, 244:1081-1085 (1989). Here, a residue or group of target residues are identified (*e.g.*, charged residues such as arg, asp, his, lys, and glu) and replaced by a neutral or negatively charged amino acid (most preferably alanine or polyalanine) to affect the interaction of the amino acids with antigen. Those amino acid locations demonstrating functional sensitivity to the substitutions then are refined by introducing further or other variants at, or for, the sites of substitution. Thus, while the site for introducing an amino acid sequence variation is predetermined, the nature of the mutation *per se* need not be predetermined. For example, to analyze the performance of a mutation at a given site, ala scanning or random mutagenesis is conducted at the target codon or region and the expressed antibody variants are screened for the desired activity.

Amino acid sequence insertions include amino- and/or carboxyl-terminal fusions ranging in length from one residue to polypeptides containing a hundred or more residues, as well as intrasequence insertions of single or multiple amino acid residues. Examples of terminal insertions include an antibody with an N-terminal methionyl residue or the antibody fused to a cytotoxic polypeptide. Other insertional variants of the antibody molecule include the fusion to the N- or C-terminus of the antibody to an enzyme (*e.g.*, for ADEPT) or a polypeptide which increases the serum half-life of the antibody.

Another type of variant is an amino acid substitution variant. These variants have at least one amino acid residue in the antibody molecule replaced by a

different residue. The sites of greatest interest for substitutional mutagenesis include the hypervariable regions, but FR alterations are also contemplated.

Substantial modifications in the biological properties of the antibody are accomplished by selecting substitutions that differ significantly in their effect on  
5 maintaining (a) the structure of the polypeptide backbone in the area of the substitution, for example, as a sheet or helical conformation, (b) the charge or hydrophobicity of the molecule at the target site, or (c) the bulk of the side chain. Naturally-occurring residues are divided into groups based on common side-chain properties:

- 10 (1) hydrophobic: norleucine, met, ala, val, leu, ile;
- (2) neutral hydrophilic: cys, ser, thr;
- (3) acidic: asp, glu;
- (4) basic: asn, gln, his, lys, arg;
- (5) residues that influence chain orientation: gly, pro; and
- (6) aromatic: trp, tyr, phe.

15 Non-conservative substitutions will entail exchanging a member of one of these classes for another class.

A particularly preferred type of substitutional variant involves substituting one or more hypervariable region residues of a parent antibody (*e.g.*, a humanized or human antibody). Generally, the resulting variant(s) selected for further development  
20 will have improved biological properties relative to the parent antibody from which they are generated. A convenient way for generating such substitutional variants involves affinity maturation using phage display. Briefly, several hypervariable region sites (*e.g.*, 6-7 sites) are mutated to generate all possible amino substitutions at each site. The antibody variants thus generated are displayed in a monovalent fashion from filamentous  
25 phage particles as fusions to the gene III product of M13 packaged within each particle. The phage-displayed variants are then screened for their biological activity (*e.g.*, binding affinity) as herein disclosed. In order to identify candidate hypervariable region sites for modification, alanine scanning mutagenesis can be performed to identify hypervariable region residues contributing significantly to antigen binding. Alternatively, or  
30 additionally, it may be beneficial to analyze a crystal structure of the antigen-antibody complex to identify contact points between the antibody and the antigen. Such contact residues and neighboring residues are candidates for substitution according to the techniques elaborated herein. Once such variants are generated, the panel of variants is

WO 2005/081711

PCT/US2004/038392

subjected to screening as described herein and antibodies with superior properties in one or more relevant assays may be selected for further development.

It may be desirable to modify the antibody of the invention with respect to effector function, *e.g.*, so as to enhance antigen-dependent cell-mediated cytotoxicity (ADCC) and/or complement dependent cytotoxicity (CDC) of the antibody. This may be achieved by introducing one or more amino acid substitutions in an Fc region of the antibody. Alternatively or additionally, cysteine residue(s) may be introduced in the Fc region, thereby allowing interchain disulfide bond formation in this region. The homodimeric antibody thus generated may have improved internalization capability and/or increased complement-mediated cell killing and antibody-dependent cellular cytotoxicity (ADCC). See Caron *et al.* *J. Exp Med.* 176:1191-1195 (1992) and Shopes, B. J. *Immunol.* 148:2918-2922 (1992). Homodimeric antibodies with enhanced anti-tumor activity may also be prepared using heterobifunctional cross-linkers as described in Wolff *et al.* *Cancer Research* 53:2560-2565 (1993). Alternatively, an antibody can be engineered which has dual Fc regions and may thereby have enhanced complement lysis and ADCC capabilities. See Stevenson *et al.* *Anti-Cancer Drug Design* 3:219-230 (1989).

To increase the serum half life of the antibody, one may incorporate a salvage receptor binding epitope into the antibody (especially an antibody fragment) as described in U.S. Patent No. 5739277, for example. As used herein, the term "salvage receptor binding epitope" refers to an epitope of the Fc region of an IgG molecule (*e.g.*, IgG<sub>1</sub>, IgG<sub>2</sub>, IgG<sub>3</sub>, or IgG<sub>4</sub>) that is responsible for increasing the *in vivo* serum half-life of the IgG molecule.

#### (viii) Glycosylation Variants

Antibodies in the ADC of the invention may be glycosylated at conserved positions in their constant regions (Jefferis and Lund, (1997) *Chem. Immunol.* 65:111-128; Wright and Morrison, (1997) *TibTECH* 15:26-32). The oligosaccharide side chains of the immunoglobulins affect the protein's function (Boyd *et al.*, (1996) *Mol. Immunol.* 32:1311-1318; Wittwe and Howard, (1990) *Biochem.* 29:4175-4180), and the intramolecular interaction between portions of the glycoprotein which can affect the conformation and presented three-dimensional surface of the glycoprotein (Hefferis and Lund, *supra*; Wyss and Wagner, (1996) *Current Opin. Biotech.* 7:409-416). Oligosaccharides may also serve to target a given glycoprotein to certain molecules based

upon specific recognition structures. For example, it has been reported that in agalactosylated IgG, the oligosaccharide moiety 'flips' out of the inter-CH2 space and terminal N-acetylglucosamine residues become available to bind mannose binding protein (Malhotra *et al.*, (1995) *Nature Med.* 1:237-243). Removal by glycopeptidase of the oligosaccharides from CAMPATH-1H (a recombinant humanized murine monoclonal IgG1 antibody which recognizes the CDw52 antigen of human lymphocytes) produced in Chinese Hamster Ovary (CHO) cells resulted in a complete reduction in complement mediated lysis (CMCL) (Boyd *et al.*, (1996) *Mol. Immunol.* 32:1311-1318), while selective removal of sialic acid residues using neuraminidase resulted in no loss of DMCL. Glycosylation of antibodies has also been reported to affect antibody-dependent cellular cytotoxicity (ADCC). In particular, CHO cells with tetracycline-regulated expression of  $\beta(1,4)$ -N-acetylglucosaminyltransferase III (GnTIII), a glycosyltransferase catalyzing formation of bisecting GlcNAc, was reported to have improved ADCC activity (Umana *et al.* (1999) *Mature Biotech.* 17:176-180).

Glycosylation of antibodies is typically either N-linked or O-linked. N-linked refers to the attachment of the carbohydrate moiety to the side chain of an asparagine residue. The tripeptide sequences asparagine-X-serine and asparagine-X-threonine, where X is any amino acid except proline, are the recognition sequences for enzymatic attachment of the carbohydrate moiety to the asparagine side chain. Thus, the presence of either of these tripeptide sequences in a polypeptide creates a potential glycosylation site. O-linked glycosylation refers to the attachment of one of the sugars N-acetylgalactosamine, galactose, or xylose to a hydroxyamino acid, most commonly serine or threonine, although 5-hydroxyproline or 5-hydroxylysine may also be used.

Glycosylation variants of antibodies are variants in which the glycosylation pattern of an antibody is altered. By altering is meant deleting one or more carbohydrate moieties found in the antibody, adding one or more carbohydrate moieties to the antibody, changing the composition of glycosylation (glycosylation pattern), the extent of glycosylation, etc.

Addition of glycosylation sites to the antibody is conveniently accomplished by altering the amino acid sequence such that it contains one or more of the above-described tripeptide sequences (for N-linked glycosylation sites). The alteration may also be made by the addition of, or substitution by, one or more serine or threonine residues to the sequence of the original antibody (for O-linked glycosylation sites).

Similarly, removal of glycosylation sites can be accomplished by amino acid alteration within the native glycosylation sites of the antibody.

The amino acid sequence is usually altered by altering the underlying nucleic acid sequence. These methods include, but are not limited to, isolation from a natural source (in the case of naturally-occurring amino acid sequence variants) or  
5 preparation by oligonucleotide-mediated (or site-directed) mutagenesis, PCR mutagenesis, and cassette mutagenesis of an earlier prepared variant or a non-variant version of the antibody.

The glycosylation (including glycosylation pattern) of antibodies may also  
10 be altered without altering the amino acid sequence or the underlying nucleotide sequence. Glycosylation largely depends on the host cell used to express the antibody. Since the cell type used for expression of recombinant glycoproteins, *e.g.*, antibodies, as potential therapeutics is rarely the native cell, significant variations in the glycosylation pattern of the antibodies can be expected. See, *e.g.*, Hse *et al.*, (1997) *J. Biol. Chem.*  
15 272:9062-9070. In addition to the choice of host cells, factors which affect glycosylation during recombinant production of antibodies include growth mode, media formulation, culture density, oxygenation, pH, purification schemes and the like. Various methods have been proposed to alter the glycosylation pattern achieved in a particular host organism including introducing or overexpressing certain enzymes involved in  
20 oligosaccharide production (U.S. Patent Nos. 5047335; 5510261; 5278299). Glycosylation, or certain types of glycosylation, can be enzymatically removed from the glycoprotein, for example using endoglycosidase H (Endo H). In addition, the recombinant host cell can be genetically engineered, *e.g.*, make defective in processing certain types of polysaccharides. These and similar techniques are well known in the art.

The glycosylation structure of antibodies can be readily analyzed by  
25 conventional techniques of carbohydrate analysis, including lectin chromatography, NMR, Mass spectrometry, HPLC, GPC, monosaccharide compositional analysis, sequential enzymatic digestion, and HPAEC-PAD, which uses high pH anion exchange chromatography to separate oligosaccharides based on charge. Methods for releasing  
30 oligosaccharides for analytical purposes are also known, and include, without limitation, enzymatic treatment (commonly performed using peptide-N-glycosidase F/endo- $\beta$ -galactosidase), elimination using harsh alkaline environment to release mainly O-linked

structures, and chemical methods using anhydrous hydrazine to release both N- and O-linked oligosaccharides.

#### **4.5.2a SCREENING FOR ANTIBODY-DRUG CONJUGATES (ADC)**

5 Transgenic animals and cell lines are particularly useful in screening antibody drug conjugates (ADC) that have potential as prophylactic or therapeutic treatments of diseases or disorders involving overexpression of proteins including Lewis Y, CD30, CD40, and CD70. Transgenic animals and cell lines are particularly useful in screening antibody drug conjugates (ADC) that have potential as prophylactic or  
10 therapeutic treatments of diseases or disorders involving overexpression of HER2 (US6632979). Screening for a useful ADC may involve administering candidate ADC over a range of doses to the transgenic animal, and assaying at various time points for the effect(s) of the ADC on the disease or disorder being evaluated. Alternatively, or additionally, the drug can be administered prior to or simultaneously with exposure to an  
15 inducer of the disease, if applicable. Candidate ADC may be screened serially and individually, or in parallel under medium or high-throughput screening format. The rate at which ADC may be screened for utility for prophylactic or therapeutic treatments of diseases or disorders is limited only by the rate of synthesis or screening methodology, including detecting/measuring/analysis of data.

20 One embodiment is a screening method comprising (a) transplanting cells from a stable renal cell cancer cell line into a non-human animal, (b) administering an ADC drug candidate to the non-human animal and (c) determining the ability of the candidate to inhibit the formation of tumors from the transplanted cell line.

Another embodiment is a screening method comprising (a) contacting cells  
25 from a stable Hodgkin's disease cell line with an ADC drug candidate and (b) evaluating the ability of the ADC candidate to block ligand activation of CD40.

Another embodiment is a screening method comprising (a) contacting cells from a stable Hodgkin's disease cell line with an ADC drug candidate and (b) evaluating the ability of the ADC candidate to induce cell death. In one embodiment the ability of  
30 the ADC candidate to induce apoptosis is evaluated.

One embodiment is a screening method comprising (a) transplanting cells from a stable cancer cell line into a non-human animal, (b) administering an ADC drug candidate to the non-human animal and (c) determining the ability of the candidate to

WO 2005/081711

PCT/US2004/038392

inhibit the formation of tumors from the transplanted cell line. The invention also concerns a method of screening ADC candidates for the treatment of a disease or disorder characterized by the overexpression of HER2 comprising (a) contacting cells from a stable breast cancer cell line with a drug candidate and (b) evaluating the ability of the  
5 ADC candidate to inhibit the growth of the stable cell line.

Another embodiment is a screening method comprising (a) contacting cells from a stable cancer cell line with an ADC drug candidate and (b) evaluating the ability of the ADC candidate to block ligand activation of HER2. In one embodiment the ability of the ADC candidate to block heregulin binding is evaluated. In another embodiment the  
10 ability of the ADC candidate to block ligand-stimulated tyrosine phosphorylation is evaluated.

Another embodiment is a screening method comprising (a) contacting cells from a stable cancer cell line with an ADC drug candidate and (b) evaluating the ability of the ADC candidate to induce cell death. In one embodiment the ability of the ADC  
15 candidate to induce apoptosis is evaluated.

Another embodiment is a screening method comprising (a) administering an ADC drug candidate to a transgenic non-human mammal that overexpresses in its mammary gland cells a native human HER2 protein or a fragment thereof, wherein such transgenic mammal has stably integrated into its genome a nucleic acid sequence  
20 encoding a native human HER2 protein or a fragment thereof having the biological activity of native human HER2, operably linked to transcriptional regulatory sequences directing its expression to the mammary gland, and develops a mammary tumor not responding or poorly responding to anti-HER2 antibody treatment, or to a non-human mammal bearing a tumor transplanted from said transgenic non-human mammal; and (b)  
25 evaluating the effect of the ADC candidate on the target disease or disorder. Without limitations, the disease or disorder may be a HER2-overexpressing cancer, such as breast, ovarian, stomach, endometrial, salivary gland, lung, kidney, colon, thyroid, pancreatic and bladder cancer. The cancer preferably is breast cancer which expressed HER2 in at least about 500,000 copies per cell, more preferably at least about 2,000,000 copies per  
30 cell. ADC drug candidates may, for example, be evaluated for their ability to induce cell death and/or apoptosis, using assay methods well known in the art and described hereinafter.

In one embodiment, candidate ADC are screened by being administered to the transgenic animal over a range of doses, and evaluating the animal's physiological response to the compounds over time. Administration may be oral, or by suitable injection, depending on the chemical nature of the compound being evaluated. In some cases, it may be appropriate to administer the compound in conjunction with co-factors that would enhance the efficacy of the compound. If cell lines derived from the subject transgenic animals are used to screen for compounds useful in treating various disorders, the test compounds are added to the cell culture medium at an appropriate time, and the cellular response to the compound is evaluated over time using the appropriate biochemical and/or histological assays. In some cases, it may be appropriate to apply the compound of interest to the culture medium in conjunction with co-factors that would enhance the efficacy of the compound.

Thus, provided herein are assays for identifying ADC which specifically target and bind a target protein, the presence of which is correlated with abnormal cellular function, and in the pathogenesis of cellular proliferation and/or differentiation that is causally related to the development of tumors.

To identify an ADC which blocks ligand activation of an ErbB (*e.g.*, ErbB2) receptor, the ability of the compound to block ErbB ligand binding to cells expressing the ErbB (ErbB2) receptor (*e.g.*, in conjugation with another ErbB receptor with which the ErbB receptor of interest forms an ErbB hetero-oligomer) may be determined. For example, cells isolated from the transgenic animal overexpressing HER2 and transfected to express another ErbB receptor (with which HER2 forms hetero-oligomer) may be incubated, *i.e.* culturing, with the ADC and then exposed to labeled ErbB ligand. The ability of the compound to block ligand binding to the ErbB receptor in the ErbB hetero-oligomer may then be evaluated.

For example, inhibition of heregulin (HRG) binding to breast tumor cell lines, overexpressing HER2 and established from the transgenic non-human mammals (*e.g.*, mice) herein, by the candidate ADC may be performed using monolayer cultures on ice in a 24-well-plate format. Anti-ErbB2 monoclonal antibodies may be added to each well and incubated for 30 minutes. <sup>125</sup>I-labeled rHRGβ<sub>1177-224</sub> (25,000 cpm) may then be added, and the incubation may be continued for 4 to 16 hours. Dose response curves may be prepared and an IC<sub>50</sub> value (cytotoxic activity) may be calculated for the compound of interest.

Alternatively, or additionally, the ability of an ADC to block ErbB ligand-stimulated tyrosine phosphorylation of an ErbB receptor present in an ErbB hetero-oligomer may be assessed. For example, cell lines established from the transgenic animals herein may be incubated with a test ADC and then assayed for ErbB ligand-dependent  
5 tyrosine phosphorylation activity using an anti-phosphotyrosine monoclonal antibody (which is optionally conjugated with a detectable label). The kinase receptor activation assay described in U.S. Patent No. 5766863 is also available for determining ErbB receptor activation and blocking of that activity by the compound.

In one embodiment, one may screen for ADC which inhibit HRG  
10 stimulation of p180 tyrosine phosphorylation in MCF7 cells essentially as described below. For example, a cell line established from a HER2-transgenic animal may be plated in 24-well plates and the compound may be added to each well and incubated for 30 minutes at room temperature; then rHRG $\beta_{1177-244}$  may be added to each well to a final concentration of 0.2 nM, and the incubation may be continued for about 8 minutes. Media  
15 may be aspirated from each well, and reactions may be stopped by the addition of 100  $\mu$ l of SDS sample buffer (5% SDS, 25 mM DTT, and 25 mM Tris-HCl, pH 6.8). Each sample (25  $\mu$ l) may be electrophoresed on a 4-12% gradient gel (Novex) and then electrophoretically transferred to polyvinylidene difluoride membrane. Antiphosphotyrosine (at 1  $\mu$ g/ml) immunoblots may be developed, and the intensity of  
20 the predominant reactive band at  $M_r$  -180,000 may be quantified by reflectance densitometry. An alternate method to evaluate inhibition of receptor phosphorylation is the KIRA (kinase receptor activation) assay of Sadick *et al.* (1998) Jour. of Pharm. and Biomed. Anal. Some of the well established monoclonal antibodies against HER2 that are known to inhibit HRG stimulation of p180 tyrosine phosphorylation can be used as  
25 positive control in this assay. A dose-response curve for inhibition of HRG stimulation of p180 tyrosine phosphorylation as determined by reflectance densitometry may be prepared and an  $IC_{50}$  for the compound of interest may be calculated.

One may also assess the growth inhibitory effects of a test ADC on cell lines derived from a HER2-transgenic animal, *e.g.*, essentially as described in Schaefer *et al.* (1997) Oncogene 15:1385-1394. According to this assay, the cells may be treated  
30 with a test compound at various concentrations for 4 days and stained with crystal violet or the redox dye Alamar Blue. Incubation with the compound may show a growth inhibitory effect on this cell line similar to that displayed by monoclonal antibody 2C4 on

MDA-MB-175 cells (Schaefer *et al.*, supra). In a further embodiment, exogenous HRG will not significantly reverse this inhibition.

To identify growth inhibitory compounds that specifically target an antigen of interest, one may screen for compounds which inhibit the growth of cancer cells overexpressing antigen of interest derived from transgenic animals, the assay described in U.S. Patent No. 5677171 can be performed. According to this assay, cancer cells overexpressing the antigen of interest are grown in a 1:1 mixture of F12 and DMEM medium supplemented with 10% fetal bovine serum, glutamine and penicillin streptomycin. The cells are plated at 20,000 cells in a 35 mm cell culture dish (2 mls/35mm dish) and the test compound is added at various concentrations. After six days, the number of cells, compared to untreated cells is counted using an electronic COULTER™ cell counter. Those compounds which inhibit cell growth by about 20-100% or about 50-100% may be selected as growth inhibitory compounds.

To select for compounds which induce cell death, loss of membrane integrity as indicated by, *e.g.*, PI, trypan blue or 7AAD uptake may be assessed relative to control. The PI uptake assay uses cells isolated from the tumor tissue of interest of a transgenic animal. According to this assay, the cells are cultured in Dulbecco's Modified Eagle Medium (D-MEM):Ham's F-12 (50:50) supplemented with 10% heat-inactivated FBS (Hyclone) and 2 mM L-glutamine. Thus, the assay is performed in the absence of complement and immune effector cells. The cells are seeded at a density of  $3 \times 10^6$  per dish in 100 x 20 mm dishes and allowed to attach overnight. The medium is then removed and replaced with fresh medium alone or medium containing various concentrations of the compound. The cells are incubated for a 3-day time period. Following each treatment, monolayers are washed with PBS and detached by trypsinization. Cells are then centrifuged at 1200 rpm for 5 minutes at 4 °C, the pellet resuspended in 3 ml cold  $\text{Ca}^{2+}$  binding buffer (10 mM HEPES, pH 7.4, 140 mM NaCl, 2.5 mM  $\text{CaCl}_2$ ) and aliquoted into 35 mm strainer-capped 12 x 75 mm tubes (1 ml per tube, 3 tubes per treatment group) for removal of cell clumps. Tubes then receive PI (10  $\mu\text{g}/\text{ml}$ ). Samples may be analyzed using a FACSCAN™ flow cytometer and FACSCONVERT™ CellQuest software (Becton Dickinson). Those compounds which induce statistically significant levels of cell death as determined by PI uptake may be selected as cell death-inducing compounds.

In order to select for compounds which induce apoptosis, an annexin binding assay using cells established from the tumor tissue of interest of the transgenic

animal is performed. The cells are cultured and seeded in dishes as discussed in the preceding paragraph. The medium is then removed and replaced with fresh medium alone or medium containing 10 µg/ml of the antibody drug conjugate (ADC). Following a three-day incubation period, monolayers are washed with PBS and detached by  
5 trypsinization. Cells are then centrifuged, resuspended in Ca<sup>2+</sup> binding buffer and aliquoted into tubes as discussed above for the cell death assay. Tubes then receive labeled annexin (e.g., annexin V-FITC) (1 µg/ml). Samples may be analyzed using a FACSCAN™ flow cytometer and FACSCONVERT™ CellQuest software (Becton Dickinson). Those compounds which induce statistically significant levels of annexin  
10 binding relative to control are selected as apoptosis-inducing compounds.

#### 4.5.3 IN VITRO CELL PROLIFERATION ASSAYS

Generally, the cytotoxic or cytostatic activity of an antibody drug conjugate (ADC) is measured by: exposing mammalian cells having receptor proteins to  
15 the antibody of the ADC in a cell culture medium; culturing the cells for a period from about 6 hours to about 5 days; and measuring cell viability. Cell-based *in vitro* assays were used to measure viability (proliferation), cytotoxicity, and induction of apoptosis (caspase activation) of the ADC of the invention.

The *in vitro* potency of antibody drug conjugates was measured by a cell  
20 proliferation assay (Example 18, Figures 7-10). The CellTiter-Glo® Luminescent Cell Viability Assay is a commercially available (Promega Corp., Madison, WI), homogeneous assay method based on the recombinant expression of *Coleoptera* luciferase (U.S. Patent Nos. 5583024; 5674713 and 5700670). This cell proliferation assay determines the number of viable cells in culture based on quantitation of the ATP  
25 present, an indicator of metabolically active cells (Crouch *et al.* (1993) *J. Immunol. Meth.* 160:81-88, U.S. Patent No. 6602677). The CellTiter-Glo® Assay was conducted in 96 well format, making it amenable to automated high-throughput screening (HTS) (Cree *et al.* (1995) *AntiCancer Drugs* 6:398-404). The homogeneous assay procedure involves adding the single reagent (CellTiter-Glo® Reagent) directly to cells cultured in serum-  
30 supplemented medium. Cell washing, removal of medium and multiple pipetting steps are not required. The system detects as few as 15 cells/well in a 384-well format in 10 minutes after adding reagent and mixing. The cells may be treated continuously with

ADC, or they may be treated and separated from ADC. Generally, cells treated briefly, *i.e.* 3 hours, showed the same potency effects as continuously treated cells.

The homogeneous "add-mix-measure" format results in cell lysis and generation of a luminescent signal proportional to the amount of ATP present. The amount of ATP is directly proportional to the number of cells present in culture. The CellTiter-Glo<sup>®</sup> Assay generates a "glow-type" luminescent signal, produced by the luciferase reaction, which has a half-life generally greater than five hours, depending on cell type and medium used. Viable cells are reflected in relative luminescence units (RLU). The substrate, Beetle Luciferin, is oxidatively decarboxylated by recombinant firefly luciferase with concomitant conversion of ATP to AMP and generation of photons. The extended half-life eliminates the need to use reagent injectors and provides flexibility for continuous or batch mode processing of multiple plates. This cell proliferation assay can be used with various multiwell formats, *e.g.*, 96 or 384 well format. Data can be recorded by luminometer or CCD camera imaging device. The luminescence output is presented as relative light units (RLU), measured over time.

The anti-proliferative effects of antibody drug conjugates were measured by the cell proliferation, *in vitro* cell killing assay above against four different breast tumor cell lines (Figures 7-10). IC<sub>50</sub> values were established for SK-BR-3 and BT-474 which are known to over express HER2 receptor protein. Table 2a shows the potency (IC<sub>50</sub>) measurements of exemplary antibody drug conjugates in the cell proliferation assay against SK-BR-3 cells. Table 2b shows the potency (IC<sub>50</sub>) measurements of exemplary antibody drug conjugates in the cell proliferation assay against BT-474 cells.

Antibody drug conjugates: Trastuzumab-MC-vc-PAB-MMAF, 3.8 MMAF/Ab; Trastuzumab-MC-(N-Me)vc-PAB-MMAF, 3.9 MMAF/Ab; Trastuzumab-MC-MMAF, 4.1 MMAF/Ab; Trastuzumab-MC-vc-PAB-MMAE, 4.1 MMAE/Ab; Trastuzumab-MC-vc-PAB-MMAE, 3.3 MMAE/Ab; and Trastuzumab-MC-vc-PAB-MMAF, 3.7 MMAF/Ab did not inhibit the proliferation of MCF-7 cells (Figure 9).

Antibody drug conjugates: Trastuzumab-MC-vc-PAB-MMAE, 4.1 MMAE/Ab; Trastuzumab-MC-vc-PAB-MMAE, 3.3 MMAE/Ab; Trastuzumab-MC-vc-PAB-MMAF, 3.7 MMAF/Ab; Trastuzumab-MC-vc-PAB-MMAF, 3.8 MMAF/Ab; Trastuzumab-MC-(N-Me)vc-PAB-MMAF, 3.9 MMAF/Ab; and Trastuzumab-MC-MMAF, 4.1 MMAF/Ab did not inhibit the proliferation of MDA-MB-468 cells (Figure 10).

MCF-7 and MDA-MB-468 cells do not overexpress HER2 receptor protein. The anti-HER2 antibody drug conjugates of the invention therefore show selectivity for inhibition of cells which express HER2.

WO 2005/081711

PCT/US2004/038392

In a surprising and unexpected discovery, the *in vitro* cell proliferation activity results of the ADC in Tables 2a and 2b show generally that ADC with a low average number of drug moieties per antibody showed efficacy, e.g.,  $IC_{50} < 0.1 \mu\text{g ADC/ml}$ . The results suggest that at least for trastuzumab ADC, the optimal ratio of drug moieties per antibody may be less than 8, and may be about 2 to about 5.

#### 4.5.4 IN VIVO PLASMA CLEARANCE AND STABILITY

Pharmacokinetic plasma clearance and stability of ADC were investigated in rats and cynomolgus monkeys. Plasma concentration was measured over time. Table 2c shows pharmacokinetic data of antibody drug conjugates and other dosed samples in rats. Rats are a non-specific model for ErbB receptor antibodies, since the rat is not known to express HER2 receptor proteins.

AUC inf is the area under the plasma concentration-time curve from time of dosing to infinity and is a measure of the total exposure to the measured entity (drug, ADC). CL is defined as the volume of plasma cleared of the measured entity in unit time and is expressed by normalizing to body weight. T<sub>1/2</sub> term is the half-life of the drug in the body measured during its elimination phase. The % Conj. term is the relative amount of ADC compared to total antibody detected, by separate ELISA immunoaffinity tests ("Analytical Methods for Biotechnology Products", Ferraiolo et al, p85-98 in Pharmacokinetics of Drugs (1994) P.G. Welling and L.P. Balant, Eds., Handbook of Experimental Pharmacology, Vol. 110, Springer-Verlag. The % Conj. calculation is simply AUC<sub>inf</sub> of ADC + AUC<sub>inf</sub> total Ab, and is a general indicator of linker stability, although other factors and mechanisms may be in effect.

Figure 11 shows a graph of a plasma concentration clearance study after administration of the antibody drug conjugates: H-MC-vc-PAB-MMAF-TEG and H-MC-vc-PAB-MMAF to Sprague-Dawley rats. Concentrations of total antibody and ADC were measured over time.

Figure 12 shows a graph of a two stage plasma concentration clearance study where ADC was administered at different dosages and concentrations of total antibody and ADC were measured over time.

*IN VIVO* EFFICACY

The *in vivo* efficacy of the ADC of the invention was measured by a high expressing HER2 transgenic explant mouse model. An allograft was propagated from the Fo5 mmtv transgenic mouse which does not respond to, or responds poorly to,  
5 HERCEPTIN® therapy. Subjects were treated once with ADC and monitored over 3-6 weeks to measure the time to tumor doubling, log cell kill, and tumor shrinkage. Follow up dose-response and multi-dose experiments were conducted.

Tumors arise readily in transgenic mice that express a mutationally activated form of *neu*, the rat homolog of HER2, but the HER2 that is overexpressed in  
10 breast cancers is not mutated and tumor formation is much less robust in transgenic mice that overexpress nonmutated HER2 (Webster *et al.* (1994) *Semin. Cancer Biol.* 5:69-76).

To improve tumor formation with nonmutated HER2, transgenic mice were produced using a HER2 cDNA plasmid in which an upstream ATG was deleted in order to prevent initiation of translation at such upstream ATG codons, which would  
15 otherwise reduce the frequency of translation initiation from the downstream authentic initiation codon of HER2 (for example, see Child *et al.* (1999) *J. Biol. Chem.* 274: 24335-24341). Additionally, a chimeric intron was added to the 5' end, which should also enhance the level of expression as reported earlier (Neuberger and Williams (1988) *Nucleic Acids Res.* 16: 6713; Buchman and Berg (1988) *Mol. Cell. Biol.* 8:4395; Brinster  
20 *et al.* (1988) *Proc. Natl. Acad. Sci. USA* 85:836). The chimeric intron was derived from a Promega vector, pCI-neo mammalian expression vector (bp 890-1022). The cDNA 3'-end is flanked by human growth hormone exons 4 and 5, and polyadenylation sequences. Moreover, FVB mice were used because this strain is more susceptible to tumor development. The promoter from MMTV-LTR was used to ensure tissue-specific HER2  
25 expression in the mammary gland. Animals were fed the AIN 76A diet in order to increase susceptibility to tumor formation (Rao *et al.* (1997) *Breast Cancer Res. and Treatment* 45:149-158).

7C2 = anti-HER2 murine antibody which binds a different epitope than trastuzumab.

Fc8 = mutant that does not bind to FcRn

WO 2005/081711

PCT/US2004/038392

Hg = "Hingeless" full-length humanized 4D5, with heavy chain hinge cysteines mutated to serines. Expressed in *E. coli* (therefore non-glycosylated.)

2H9 = Anti-EphB2R

11D10 = Anti-0772P

5

The term  $T_i$  is the number of animals in the study group with tumor at  $T = 0$  ÷ total animals in group. The term PR is the number of animals attaining partial remission of tumor ÷ animals with tumor at  $T = 0$  in group. The term CR is the number of animals attaining complete remission of tumor ÷ animals with tumor at  $T = 0$  in group.

10 The term Log cell kill is the time in days for the tumor volume to double - the time in days for the control tumor volume to double divided by 3.32 X time for tumor volume to double in control animals (dosed with Vehicle). The log-cell-kill calculation takes into account tumor growth delay resulting from treatment and tumor volume doubling time of the control group. Anti-tumor activity of ADC is classified with log-cell-kill values of:

15	++++	≥ 3.4	(highly active)
	+++	= 2.5-3.4	
	++	= 1.7-2.4	
	+	= 1.0-1.6	
	inactive	= 0	

20

Figure 13 shows the mean tumor volume change over time in athymic nude mice with MMTV-HER2 Fo5 Mammary tumor allografts dosed on Day 0 with: Vehicle, Trastuzumab-MC-vc-PAB-MMAE ( $1250 \mu\text{g}/\text{m}^2$ ) and Trastuzumab-MC-vc-PAB-MMAF ( $555 \mu\text{g}/\text{m}^2$ ). (H = Trastuzumab). The growth of tumors was retarded by

25 treatment with ADC as compared to control (Vehicle) level of growth. Figure 14 shows the mean tumor volume change over time in athymic nude mice with MMTV-HER2 Fo5 Mammary tumor allografts dosed on Day 0 with 10 mg/kg ( $660 \mu\text{g}/\text{m}^2$ ) of Trastuzumab-MC-MMAE and  $1250 \mu\text{g}/\text{m}^2$  Trastuzumab-MC-vc-PAB-MMAE. Figure 15 shows the mean tumor volume change over time in athymic nude mice with MMTV-HER2 Fo5

30 Mammary tumor allografts dosed with  $650 \mu\text{g}/\text{m}^2$  Trastuzumab-MC-MMAF. Table 2d and Figures 13-15 show that the ADC have strong anti-tumor activity in the allograft of a HER2 positive tumor (Fo5) that originally arose in an MMTV-HER2 transgenic mouse. The antibody alone (*e.g.*, Trastuzumab) does not have significant anti-tumor activity in this model (Erickson *et al.* U.S. Patent No. 6632979). As illustrated in Figures 13-15, the

growth of the tumors was retarded by treatment with ADC as compared to control (Vehicle) level of growth.

In a surprising and unexpected discovery, the *in vivo* anti-tumor activity results of the ADC in Table 2d show generally that ADC with a low average number of drug moieties per antibody showed efficacy, *e.g.*, tumor doubling time > 15 days and mean log cell kill > 1.0. Figure 16 shows that for the antibody drug conjugate, trastuzumab-MC-vc-PAB-MMAF, the mean tumor volume diminished and did not progress where the MMAF:trastuzumab ratio was 2 and 4, whereas tumor progressed at a ratio of 5.9 and 6, but at a rate lower than Vehicle (buffer). The rate of tumor progression in this mouse xenograft model was about the same, *i.e.* 3 days, for Vehicle and trastuzumab. The results suggest that at least for trastuzumab ADC, the optimal ratio of drug moieties per antibody may be less than about 8, and may be about 2 to about 4.

#### 4.5.5 RODENT TOXICITY

Antibody drug conjugates and an ADC-minus control, "Vehicle", were evaluated in an acute toxicity rat model. Toxicity of ADC was investigated by treatment of male and female Sprague-Dawley rats with the ADC and subsequent inspection and analysis of the effects on various organs. Gross observations included changes in body weights and signs of lesions and bleeding. Clinical pathology parameters (serum chemistry and hematology), histopathology, and necropsy were conducted on dosed animals.

It is considered that weight loss, or weight change relative to animals dosed only with Vehicle, in animals after dosing with ADC is a gross and general indicator of systemic or localized toxicity. Figures 17-19 show the effects of various ADC and control (Vehicle) after dosing on rat body weight.

Hepatotoxicity was measured by elevated liver enzymes, increased numbers of mitotic and apoptotic figures and hepatocyte necrosis. Hematolymphoid toxicity was observed by depletion of leukocytes, primarily granulocytes (neutrophils), and/or platelets, and lymphoid organ involvement, *i.e.* atrophy or apoptotic activity. Toxicity was also noted by gastrointestinal tract lesions such as increased numbers of mitotic and apoptotic figures and degenerative enterocolitis.

Enzymes indicative of liver injury that were studied include:  
AST (aspartate aminotransferase)

WO 2005/081711

PCT/US2004/038392

-Localization: cytoplasmic; liver, heart, skeletal muscle, kidney

-Liver:Plasma ratio of 7000:1

-T1/2: 17 hrs

ALT (alanine aminotransferase)

5 -Localization: cytoplasmic; liver, kidney, heart, skeletal muscle

-Liver:Plasma ratio of 3000:1

-T1/2: 42 hrs; diurnal variation

GGT (g-glutamyl transferase)

10 -Localization: plasma membrane of cells with high secretory or  
absorptive capacity; liver, kidney, intestine

-Poor predictor of liver injury; commonly elevated in bile duct disorders

The toxicity profiles of trastuzumab-MC-val-cit-MMAF, trastuzumab-MC(Me)-val-cit-PAB-MMAF, trastuzumab-MC-MMAF and trastuzumab-MC-val-cit-PAB-MMAF were studied in female Sprague-Dawley rats (Example 19). The humanized  
15 trastuzumab antibody does not bind appreciably to rat tissue, and any toxicity would be considered non-specific. Variants at dose levels of 840 and 2105  $\mu\text{g}/\text{m}^2$  MMAF were compared to trastuzumab-MC-val-cit-PAB-MMAF at 2105  $\mu\text{g}/\text{m}^2$ .

Animals in groups 1, 2, 3, 4, 6, and 7 (Vehicle, 9.94 & 24.90 mg/kg trastuzumab-MC-val-cit-MMAF, 10.69 mg/kg trastuzumab-MC(Me)-val-cit-PAB-MMAF, and 10.17 & 25.50 mg/kg trastuzumab-MC-MMAF, respectively) gained weight  
20 during the study. Animals in groups 5 and 8 (26.78 mg/kg trastuzumab-MC(Me)-val-cit-PAB-MMAF and 21.85 mg/kg trastuzumab-MC-val-cit-PAB-MMAF, respectively) lost weight during the study. On Study Day 5, the change in body weights of animals in groups 2, 6 and 7 were not significantly different from group 1 animals. The change in  
25 body weights of animals in groups 3, 4, 5 and 8 were statistically different from group 1 animals (Example 19).

Rats treated with trastuzumab-MC-MMAF (groups 6 and 7) were indistinguishable from vehicle-treated control animals at both dose levels; *i.e.* this conjugate showed a superior safety profile in this model. Rats treated with trastuzumab-MC-val-cit-MMAF (without the self-immolative PAB moiety; groups 2 and 3) showed  
30 dose-dependent changes typical for MMAF conjugates; the extent of the changes was less compared with a full length MC-val-cit-PAB-MMAF conjugate (group 8). The platelet counts on day 5 were at approximately 30% of baseline values in animals of group 3

(high dose trastuzumab-MC-val-cit-MMAF) compared with 15% in animals of group 8 (high dose trastuzumab-MC-val-cit-PAB-MMAF). Elevation of liver enzymes AST and ALT, of bilirubin and the extent of thrombocytopenia was most evident in animals treated with trastuzumab-MC(Me)-val-cit-PAB-MMAF (groups 4 and 5) in a dose-dependent fashion; animals of group 5 (high dose group) showed on day 5 levels of ALT of approximately 10x the baseline value and platelets were reduced by approximately 90% at the time of necropsy.

Female Sprague Dawley Rats were also dosed at high levels (Example 19, High Dose study: Groups 2, 3, 4) with trastuzumab-MC-MMAF, and Vehicle control (Group 1). Mild toxicity signals were observed, including a dose-dependent elevation of liver enzymes ALT, AST and GGT. On day 5 animals in the highest dose group showed a 2-fold elevation of ALT and a 5-fold elevation of AST; GGT is also elevated (6U/L). Enzyme levels show a trend towards normalization on day 12. There was a mild granulocytosis in all three dose groups on day 5, the platelet count remained essentially unchanged in all animals. Morphological changes were mild; animals treated at the 4210 $\mu\text{g}/\text{m}^2$  dose level (Group 2) showed unremarkable histology of liver, spleen, thymus, intestines and bone marrow. Mildly increased apoptotic and mitotic activity was observed in thymus and liver, respectively in animals treated at the 5500 $\mu\text{g}/\text{m}^2$  dose level (Group 3). The bone marrow was normocellular, but showed evidence of granulocytic hyperplasia, which is consistent with the absolute granulocytosis observed in the peripheral blood counts in these animals. Animals at the highest dose in group 4 showed qualitatively the same features; the mitotic activity in the liver appears somewhat increased compared to animals in Group 3. Also, extramedullary hematopoiesis was seen in spleen and liver.

EphB2R is a type 1 TM tyrosine kinase receptor with close homology between mouse and human, and is over-expressed in colorectal cancer cells. 2H9 is an antibody against EphB2R. The naked antibody has no effect on tumor growth, but 2H9-val-cit-MMAE killed EphB2R expressing cells and showed efficacy in a mouse xenograft model using CXF1103 human colon tumors (Mao et al (2004) Cancer Res. 64:781-788). 2H9 and 7C2 are both mouse IgG1 anti-HER2 antibodies. The toxicity profiles of 2H9-MC-val-cit-PAB-MMAF (3.7 MMAF/Ab), 7C2-MC-val-cit-PAB-MMAF (4 MMAF/Ab), and trastuzumab-MC-val-cit-PAB-MMAF (5.9 MMAF/Ab) were compared. The differences in the structure of each immunoconjugate or the drug portion of the

immunoconjugate may affect the pharmacokinetics and ultimately the safety profile. The humanized trastuzumab antibody does not bind appreciably to rat tissue, and any toxicity would be considered non-specific.

#### CYNOMOLGUS MONKEY TOXICITY/SAFETY

5                    Similar to the rat toxicity/safety study, cynomolgus monkeys were treated with ADC followed by liver enzyme measurements, and inspection and analysis of the effects on various organs. Gross observations included changes in body weights and signs of lesions and bleeding. Clinical pathology parameters (serum chemistry and hematology), histopathology, and necropsy were conducted on dosed animals (Example  
10 19).

                    The antibody drug conjugate, H-MC-vc-PAB-MMAE (H = trastuzumab linked through cysteine) showed no evidence of liver toxicity at any of the dose levels tested. Peripheral blood granulocytes showed depletion after a single dose of 1100mg/m<sup>2</sup> with complete recovery 14 days post-dose. The antibody drug conjugate H-MC-vc-PAB-  
15 MMAF showed elevation of liver enzymes at 550 (transient) and 880 mg/m<sup>2</sup> dose level, no evidence of granulocytopenia, and a dose-dependent, transient (groups 2 & 3) decline of platelets.

#### 4.6 SYNTHESIS OF THE COMPOUNDS OF THE INVENTION

                    The Exemplary Compounds and Exemplary Conjugates can be made using  
20 the synthetic procedures outlined below in Schemes 5-16. As described in more detail below, the Exemplary Compounds or Exemplary Conjugates can be conveniently prepared using a Linker having a reactive site for binding to the Drug and Ligand. In one aspect, a Linker has a reactive site which has an electrophilic group that is reactive to a nucleophilic group present on a Ligand, such as but not limited to an antibody. Useful  
25 nucleophilic groups on an antibody include but are not limited to, sulfhydryl, hydroxyl and amino groups. The heteroatom of the nucleophilic group of an antibody is reactive to an electrophilic group on a Linker and forms a covalent bond to a Linker unit. Useful electrophilic groups include, but are not limited to, maleimide and haloacetamide groups. The electrophilic group provides a convenient site for antibody attachment.

30                    In another embodiment, a Linker has a reactive site which has a nucleophilic group that is reactive to an electrophilic group present on an antibody.

WO 2005/081711

PCT/US2004/038392

Useful electrophilic groups on an antibody include, but are not limited to, aldehyde and ketone carbonyl groups. The heteroatom of a nucleophilic group of a Linker can react with an electrophilic group on an antibody and form a covalent bond to an antibody unit. Useful nucleophilic groups on a Linker include, but are not limited to, hydrazide, oxime, amino, hydrazine, thiosemicarbazone, hydrazine carboxylate, and arylhydrazide. The electrophilic group on an antibody provides a convenient site for attachment to a Linker.

Carboxylic acid functional groups and chloroformate functional groups are also useful reactive sites for a Linker because they can react with secondary amino groups of a Drug to form an amide linkage. Also useful as a reactive site is a carbonate functional group on a Linker, such as but not limited to p-nitrophenyl carbonate, which can react with an amino group of a Drug, such as but not limited to N-methyl valine, to form a carbamate linkage. Typically, peptide-based Drugs can be prepared by forming a peptide bond between two or more amino acids and/or peptide fragments. Such peptide bonds can be prepared, for example, according to the liquid phase synthesis method (see E. Schröder and K. Lübke, "The Peptides", volume 1, pp 76-136, 1965, Academic Press) that is well known in the field of peptide chemistry.

The synthesis of an illustrative Stretcher having an electrophilic maleimide group is illustrated below in Schemes 8-9. General synthetic methods useful for the synthesis of a Linker are described in Scheme 10. Scheme 11 shows the construction of a Linker unit having a val-cit group, an electrophilic maleimide group and a PAB self-immolative Spacer group. Scheme 12 depicts the synthesis of a Linker having a phe-lys group, an electrophilic maleimide group, with and without the PAB self-immolative Spacer group. Scheme 13 presents a general outline for the synthesis of a Drug-Linker Compound, while Scheme 14 presents an alternate route for preparing a Drug-Linker Compound. Scheme 15 depicts the synthesis of a branched linker containing a BHMS group. Scheme 16 outlines the attachment of an antibody to a Drug-Linker Compound to form a Drug-Linker-Antibody Conjugate, and Scheme 14 illustrates the synthesis of Drug-Linker-Antibody Conjugates having, for example but not limited to, 2 or 4 drugs per Antibody.

As described in more detail below, the Exemplary Conjugates are conveniently prepared using a Linker having two or more Reactive Sites for binding to the Drug and a Ligand. In one aspect, a Linker has a Reactive site which has an electrophilic group that is reactive to a nucleophilic group present on a Ligand, such as an

antibody. Useful nucleophilic groups on an antibody include but are not limited to, sulfhydryl, hydroxyl and amino groups. The heteroatom of the nucleophilic group of an antibody is reactive to an electrophilic group on a Linker and forms a covalent bond to a Linker unit. Useful electrophilic groups include, but are not limited to, maleimide and  
5 haloacetamide groups. The electrophilic group provides a convenient site for antibody attachment.

In another embodiment, a Linker has a Reactive site which has a nucleophilic group that is reactive to an electrophilic group present on a Ligand, such as an antibody. Useful electrophilic groups on an antibody include, but are not limited to,  
10 aldehyde and ketone carbonyl groups. The heteroatom of a nucleophilic group of a Linker can react with an electrophilic group on an antibody and form a covalent bond to an antibody unit. Useful nucleophilic groups on a Linker include, but are not limited to, hydrazide, oxime, amino, hydrazine, thiosemicarbazone, hydrazine carboxylate, and arylhydrazide. The electrophilic group on an antibody provides a convenient site for  
15 attachment to a Linker.

#### 4.6.1 DRUG MOIETY SYNTHESIS

Typically, peptide-based Drugs can be prepared by forming a peptide bond between two or more amino acids and/or peptide fragments. Such peptide bonds can be prepared, for example, according to the liquid phase synthesis method (*see* E. Schröder  
20 and K. Lübke, "The Peptides", volume 1, pp 76-136, 1965, Academic Press) that is well known in the field of peptide chemistry.

The auristatin/dolastatin drug moieties may be prepared according to the general methods of: U.S. Patent No. 5635483; U.S. Patent No. 5780588; Pettit *et al.* (1989) *J. Am. Chem. Soc.* 111:5463-5465; Pettit *et al.* (1998) *Anti-Cancer Drug Design*  
25 13:243-277; and Pettit *et al.* (1996) *J. Chem. Soc. Perkin Trans. 1* 5:859-863.

In one embodiment, a Drug is prepared by combining about a stoichiometric equivalent of a dipeptide and a tripeptide, preferably in a one-pot reaction under suitable condensation conditions. This approach is illustrated in Schemes 5-7,  
below.

30 Scheme 5 illustrates the synthesis of an N-terminal tripeptide unit F which is a useful intermediate for the synthesis of the drug compounds of Formula Ib.

Scheme 5

- 5 As illustrated in Scheme 5, a protected amino acid **A** (where PG represents an amine protecting group,  $R^4$  is selected from hydrogen,  $C_1$ - $C_8$  alkyl,  $C_3$ - $C_8$  carbocycle, - $O$ -( $C_1$ - $C_8$  alkyl), -aryl, alkyl-aryl, alkyl-( $C_3$ - $C_8$  carbocycle),  $C_3$ - $C_8$  heterocycle, alkyl-( $C_3$ - $C_8$  heterocycle) wherein  $R^5$  is selected from H and methyl; or  $R^4$  and  $R^5$  join, have the formula  $-(CR^aR^b)_n$ - wherein  $R^a$  and  $R^b$  are independently selected from hydrogen,  $C_1$ - $C_8$  alkyl and  $C_3$ - $C_8$  carbocycle and  $n$  is selected from 2, 3, 4, 5 and 6, and form a ring with the carbon atom to which they are attached) is coupled to *t*-butyl ester **B** (where  $R^6$  is selected from -H and - $C_1$ - $C_8$  alkyl; and  $R^7$  is selected from hydrogen,  $C_1$ - $C_8$  alkyl,  $C_3$ - $C_8$  carbocycle, - $O$ -( $C_1$ - $C_8$  alkyl), -aryl, alkyl-aryl, alkyl-( $C_3$ - $C_8$  carbocycle),  $C_3$ - $C_8$  heterocycle and alkyl-( $C_3$ - $C_8$  heterocycle)) under suitable coupling conditions, *e.g.*, in the presence of PyBrop and diisopropylethylamine, or using DCC (see, for example, Miyazaki, K. *et al. Chem. Pharm. Bull.* 1995, 43(10), 1706-1718).

Suitable protecting groups PG, and suitable synthetic methods to protect an amino group with a protecting group are well known in the art. *See, e.g.*, Greene, T.W. and Wuts, P.G.M., *Protective Groups in Organic Synthesis*, 2nd Edition, 1991, John Wiley & Sons. Exemplary protected amino acids **A** are PG-Ile and, particularly, PG-Val, while other suitable protected amino acids include, without limitation: PG-cyclohexylglycine, PG-cyclohexylalanine, PG-aminocyclopropane-1-carboxylic acid, PG-aminoisobutyric acid, PG-phenylalanine, PG-phenylglycine, and PG-*tert*-

butylglycine. Z is an exemplary protecting group. Fmoc is another exemplary protecting group. An exemplary *t*-butyl ester B is dolaisoleuine *t*-butyl ester.

The dipeptide C can be purified, *e.g.*, using chromatography, and subsequently deprotected, *e.g.*, using H<sub>2</sub> and 10% Pd-C in ethanol when PG is

5 benzyloxycarbonyl, or using diethylamine for removal of an Fmoc protecting group. The resulting amine D readily forms a peptide bond with an amino acid BB (wherein R<sup>1</sup> is selected from -H, -C<sub>1</sub>-C<sub>8</sub> alkyl and -C<sub>3</sub>-C<sub>8</sub> carbocycle; and R<sup>2</sup> is selected from -H and -C<sub>1</sub>-C<sub>8</sub> alkyl; or R<sup>1</sup> and R<sup>2</sup> join, have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently selected from -H, -C<sub>1</sub>-C<sub>8</sub> alkyl and -C<sub>3</sub>-C<sub>8</sub> carbocycle and n is selected

10 from 2, 3, 4, 5 and 6, and form a ring with the nitrogen atom to which they are attached; and R<sup>3</sup> is selected from hydrogen, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, -O-(C<sub>1</sub>-C<sub>8</sub> alkyl), -aryl, alkyl-aryl, alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle and alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle)). *N,N*-Dialkyl amino acids are exemplary amino acids for BB, such as commercially available *N,N*-dimethyl valine. Other *N,N*-dialkyl amino acids can be prepared by

15 reductive bis -alkylation using known procedures (*see, e.g.*, Bowman, R.E, Stroud, H.H J. *Chem. Soc.*, 1950, 1342-1340). Fmoc-Me-L-Val and Fmoc-Me-L-glycine are two exemplary amino acids BB useful for the synthesis of *N*-monoalkyl derivatives. The amine D and the amino acid BB react to provide the tripeptide E using coupling reagent DEPC with triethylamine as the base. The C-terminus protecting group of E is

20 subsequently deprotected using HCl to provide the tripeptide compound of formula F.

Illustrative DEPC coupling methodology and the PyBrop coupling methodology shown in Scheme 5 are outlined below in General Procedure A and General Procedure B, respectively. Illustrative methodology for the deprotection of a Z-protected amine via catalytic hydrogenation is outlined below in General Procedure C.

25 **General Procedure A: Peptide synthesis using DEPC.** The *N*-protected or *N,N*-disubstituted amino acid or peptide D (1.0 eq.) and an amine BB (1.1 eq.) are diluted with an aprotic organic solvent, such as dichloromethane (0.1 to 0.5 M). An organic base such as triethylamine or diisopropylethylamine (1.5 eq.) is then added, followed by DEPC (1.1 eq.). The resulting solution is stirred, preferably under argon, for

30 up to 12 hours while being monitored by HPLC or TLC. The solvent is removed *in vacuo* at room temperature, and the crude product is purified using, for example, HPLC or flash column chromatography (silica gel column). Relevant fractions are combined and concentrated *in vacuo* to afford tripeptide E which is dried under vacuum overnight.

**General procedure B: Peptide synthesis using PyBrop.** The amino acid **B** (1.0 eq.), optionally having a carboxyl protecting group, is diluted with an aprotic organic solvent such as dichloromethane or DME to provide a solution of a concentration between 0.5 and 1.0 mM, then diisopropylethylamine (1.5 eq.) is added. Fmoc-, or Z-  
5 protected amino acid **A** (1.1 eq.) is added as a solid in one portion, then PyBrop (1.2 eq.) is added to the resulting mixture. The reaction is monitored by TLC or HPLC, followed by a workup procedure similar to that described in General Procedure A.

**General procedure C: Z-removal via catalytic hydrogenation.** Z-protected amino acid or peptide **C** is diluted with ethanol to provide a solution of a  
10 concentration between 0.5 and 1.0 mM in a suitable vessel, such as a thick-walled round bottom flask. 10% palladium on carbon is added (5-10% w/w) and the reaction mixture is placed under a hydrogen atmosphere. Reaction progress is monitored using HPLC and is generally complete within 1-2 h. The reaction mixture is filtered through a pre-washed  
15 pad of celite and the celite is again washed with a polar organic solvent, such as methanol after filtration. The eluent solution is concentrated *in vacuo* to afford a residue which is diluted with an organic solvent, preferably toluene. The organic solvent is then removed  
20 in vacuo to afford the deprotected amine **C**.

Scheme 6 shows a method useful for making a C-terminal dipeptide of formula **K** and a method for coupling the dipeptide of formula **K** with the tripeptide of  
20 formula **F** to make drug compounds of Formula **Ib**.

Scheme 6

The dipeptide **K** can be readily prepared by condensation of the modified amino acid Boc-Dolaprine **G** (see, for example, Pettit, G.R., *et al. Synthesis*, 1996, 719-725), with an amine of formula **H** using condensing agents well known for peptide chemistry, such as, for example, DEPC in the presence of triethylamine, as shown in Scheme 5.

The dipeptide of formula **K** can then be coupled with a tripeptide of formula **F** using General Procedure D to make the Fmoc-protected drug compounds of formula **L** which can be subsequently deprotected using General Procedure E in order to provide the drug compounds of formula **(Ib)**.

**General procedure D: Drug synthesis.** A mixture of dipeptide **K** (1.0 eq.) and tripeptide **F** (1 eq.) is diluted with an aprotic organic solvent, such as dichloromethane, to form a 0.1M solution, then a strong acid, such as trifluoroacetic acid (1/2 v/v) is added and the resulting mixture is stirred under a nitrogen atmosphere for two

hours at 0°C. The reaction can be monitored using TLC or, preferably, HPLC. The solvent is removed *in vacuo* and the resulting residue is azeotropically dried twice, preferably using toluene. The resulting residue is dried under high vacuum for 12 h and then diluted with an aprotic organic solvent, such as dichloromethane. An organic base  
5 such as triethylamine or diisopropylethylamine (1.5 eq.) is then added, followed by either PyBrop (1.2 eq.) or DEPC (1.2 eq.) depending on the chemical functionality on the residue. The reaction mixture is monitored by either TLC or HPLC and upon completion, the reaction is subjected to a workup procedure similar or identical to that described in General Procedure A.

10                   **General procedure E: Fmoc-removal using diethylamine.** An Fmoc-protected Drug L is diluted with an aprotic organic solvent such as dichloromethane and to the resulting solution is added diethylamine (½ v/v). Reaction progress is monitored by TLC or HPLC and is typically complete within 2 h. The reaction mixture is concentrated *in vacuo* and the resulting residue is azeotropically dried, preferably using  
15 toluene, then dried under high vacuum to afford Drug Ib having a deprotected amino group.

Scheme 7 shows a method useful for making MMAF derivatives of Formula (Ib).

WO 2005/081711

PCT/US2004/038392

## Scheme 7

The dipeptide **O** can be readily prepared by condensation of the modified amino acid Boc-Dolaproine **G** (*see*, for example, Pettit, G.R., *et al. Synthesis*, 1996, 719-725), with a protected amino acid of formula **M** using condensing agents well known for peptide chemistry, such as, for example, DEPC in the presence of triethylamine, as shown in Schemes 5 and 6.

The dipeptide of formula **O** can then be coupled with a tripeptide of formula **F** using General Procedure D to make the Fmoc-protected MMAF compounds of formula **P** which can be subsequently deprotected using General Procedure E in order to provide the MMAF drug compounds of formula **(Ib)**.

Thus, the above methods are useful for making Drugs that can be used in the present invention.

#### 4.6.2 DRUG LINKER SYNTHESIS

5 To prepare a Drug-Linker Compound of the present invention, the Drug is reacted with a reactive site on the Linker. In general, the Linker can have the structure:

when both a Spacer unit (-Y-) and a Stretcher unit (-A-) are present. Alternately, the Linker can have the structure:

when the Spacer unit (-Y-) is absent.

The Linker can also have the structure:

when both the Stretcher unit (-A-) and the Spacer unit (-Y-) are absent.

15 The Linker can also have the structure:

when both the Amino Acid unit (W) and the Spacer Unit (Y) are absent.

20 In general, a suitable Linker has an Amino Acid unit linked to an optional Stretcher Unit and an optional Spacer Unit. Reactive Site 1 is present at the terminus of the Spacer and Reactive site 2 is present at the terminus of the Stretcher. If a Spacer unit is not present, then Reactive site 1 is present at the C-terminus of the Amino Acid unit.

In an exemplary embodiment of the invention, Reactive Site No. 1 is  
25 reactive to a nitrogen atom of the Drug, and Reactive Site No. 2 is reactive to a sulfhydryl group on the Ligand. Reactive Sites 1 and 2 can be reactive to different functional groups.

In one aspect of the invention, Reactive Site No. 1 is  $\zeta - \text{COOH}$ .

In another aspect of the invention, Reactive Site No. 1 is

In still another aspect of the invention, Reactive Site No. 1 is a p-nitrophenyl carbonate having the formula

In one aspect of the invention, Reactive Site No. 2 is a thiol-accepting group. Suitable thiol-accepting groups include haloacetamide groups having the formula

wherein X represents a leaving group, preferably O-mesyl, O-tosyl, -Cl, -Br, or -I; or a maleimide group having the formula

Useful Linkers can be obtained via commercial sources, such as Molecular Biosciences Inc.(Boulder, CO), or prepared as summarized in Schemes 8-10 below.

Scheme 8

wherein X is  $-\text{CH}_2-$  or  $-\text{CH}_2\text{OCH}_2-$ ; and n is an integer ranging either from 0-10 when X is  $-\text{CH}_2-$ ; or 1-10 when X is  $-\text{CH}_2\text{OCH}_2-$ .

- 5 The method shown in Scheme 9 combines maleimide with a glycol under Mitsunobu conditions to make a polyethylene glycol maleimide Stretcher (see for example, Walker, M.A. *J. Org. Chem.* 1995, 60, 5352-5), followed by installation of a p-nitrophenyl carbonate Reactive Site group.

WO 2005/081711

PCT/US2004/038392

Scheme 9

wherein E is  $-\text{CH}_2-$  or  $-\text{CH}_2\text{OCH}_2-$ ; and e is an integer ranging from 0-8;

Alternatively, PEG-maleimide and PEG-haloacetamide stretchers can be prepared as described by Frisch, *et al.*, *Bioconjugate Chem.* 1996, 7, 180-186.

Scheme 10 illustrates a general synthesis of an illustrative Linker unit containing a maleimide Stretcher group and optionally a p-aminobenzyl ether self-immolative Spacer.

Scheme 10

PCT/US2004/038392

wherein Q is  $-C_1-C_8$  alkyl,  $-O-(C_1-C_8$  alkyl), -halogen, -nitro or -cyano; m is an integer ranging from 0-4; and n is an integer ranging from 0-10.

- Useful Stretchers may be incorporated into a Linker using the commercially available intermediates from Molecular Biosciences (Boulder, CO) described below by utilizing known techniques of organic synthesis.
- 5 Stretchers of formula (IIIa) can be introduced into a Linker by reacting the following intermediates with the N-terminus of an Amino Acid unit as depicted in Schemes 11 and 12:

10

where n is an integer ranging from 1-10 and T is -H or  $-SO_3Na$ ;

where n is an integer ranging from 0-3;

15

Stretcher units of formula (IIIb) can be introduced into a Linker by reacting the following intermediates with the N-terminus of an Amino Acid unit:

where X is -Br or -I; and

5

Stretcher units of formula (IV) can be introduced into a Linker by reacting the following intermediates with the N-terminus of an Amino Acid unit:

Stretcher units of formula (Va) can be introduced into a Linker by reacting the following intermediates with the N-terminus of an Amino Acid unit:

5

Other useful Stretchers may be synthesized according to known procedures. Aminoxy Stretchers of the formula shown below can be prepared by treating alkyl halides with N-Boc-hydroxylamine according to procedures described in Jones, D.S. *et al.*, *Tetrahedron Letters*, 2000, 41(10), 1531-1533; and Gilon, C. *et al.*, *Tetrahedron*, 1967, 23(11), 4441-4447.

wherein  $\text{-R}^{17}$  is selected from  $\text{-C}_1\text{-C}_{10}$  alkylene-,  $\text{-C}_3\text{-C}_8$  carbocyclo-,  $\text{-O-(C}_1\text{-C}_8\text{ alkyl)-}$ ,  $\text{-arylene-}$ ,  $\text{-C}_1\text{-C}_{10}$  alkylene-arylene-,  $\text{-arylene-C}_1\text{-C}_{10}$  alkylene-,  $\text{-C}_1\text{-C}_{10}$  alkylene-( $\text{C}_3\text{-C}_8$  carbocyclo)-,  $\text{-(C}_3\text{-C}_8\text{ carbocyclo)-C}_1\text{-C}_{10}$  alkylene-,  $\text{-C}_3\text{-C}_8$  heterocyclo-,  $\text{-C}_1\text{-C}_{10}$  alkylene-( $\text{C}_3\text{-C}_8$  heterocyclo)-,  $\text{-(C}_3\text{-C}_8\text{ heterocyclo)-C}_1\text{-C}_{10}$  alkylene-,  $\text{-(CH}_2\text{CH}_2\text{O)}_r\text{-}$ ,  $\text{(CH}_2\text{CH}_2\text{O)}_r\text{-CH}_2\text{-}$ ; and  $r$  is an integer ranging from 1-10;

15

Isothiocyanate Stretchers of the formula shown below may be prepared from isothiocyanatocarboxylic acid chlorides as described in *Angew. Chem.*, 1975, 87(14):517.

wherein  $-\text{R}^{17}-$  is as described herein.

5

Scheme 11 shows a method for obtaining of a val-cit dipeptide Linker having a maleimide Stretcher and optionally a p-aminobenzyl self-immolative Spacer.

Scheme 11

wherein Q is  $-\text{C}_1-\text{C}_8$  alkyl,  $-\text{O}-(\text{C}_1-\text{C}_8$  alkyl), -halogen, -nitro or -cyano;

10 and m is an integer ranging from 0-4.

Scheme 12 illustrates the synthesis of a phe-lys(Mtr) dipeptide Linker unit having a maleimide Stretcher unit and a p-aminobenzyl self-immolative Spacer unit. Starting material AD (lys(Mtr)) is commercially available (Bachem, Torrance, CA) or can be prepared according to Dubowchik, *et al. Tetrahedron Letters* (1997) 38:5257-60.

Scheme 12

wherein Q is  $-\text{C}_1-\text{C}_8$  alkyl,  $-\text{O}-(\text{C}_1-\text{C}_8$  alkyl), -halogen, -nitro or -cyano; and m is an integer ranging from 0-4.

- 5 As shown in Scheme 13, a Linker can be reacted with an amino group of a Drug Compound of Formula (Ib) to form a Drug-Linker Compound that contains an amide or carbamate group, linking the Drug unit to the Linker unit. When Reactive Site No. 1 is a carboxylic acid group, as in Linker AJ, the coupling reaction can be performed using HATU or PyBrop and an appropriate amine base, resulting in a Drug-Linker
- 10 Compound AK, containing an amide bond between the Drug unit and the Linker unit. When Reactive Site No. 1 is a carbonate, as in Linker AL, the Linker can be coupled to

the Drug using HOBt in a mixture of DMF/pyridine to provide a Drug-Linker Compound **AM**, containing a carbamate bond between the Drug unit and the Linker unit

Alternately, when Reactive Site No. 1 is a good leaving group, such as in Linker **AN**, the Linker can be coupled with an amine group of a Drug via a nucleophilic substitution process to provide a Drug-Linker Compound having an amine linkage (**AO**) between the Drug unit and the Linker unit.

Illustrative methods useful for linking a Drug to a Ligand to form a Drug-Linker Compound are depicted in Scheme 13 and are outlined in General Procedures G-H.

10

**General Procedure G: Amide formation using HATU.** A Drug (**Ib**) (1.0 eq.) and an N-protected Linker containing a carboxylic acid Reactive site (1.0 eq.) are diluted with a suitable organic solvent, such as dichloromethane, and the resulting solution is treated with HATU (1.5 eq.) and an organic base, preferably pyridine (1.5 eq.). The reaction mixture is allowed to stir under an inert atmosphere, preferably argon, for 6h, during which time the reaction mixture is monitored using HPLC. The reaction mixture is concentrated and the resulting residue is purified using HPLC to yield the amide of formula **AK**.

20

**Procedure H: Carbamate formation using HOBt.** A mixture of a Linker **AL** having a p-nitrophenyl carbonate Reactive site (1.1 eq.) and Drug (**Ib**) (1.0 eq.) are diluted with an aprotic organic solvent, such as DMF, to provide a solution having a concentration of 50-100 mM, and the resulting solution is treated with HOBt

WO 2005/081711

PCT/US2004/038392

(2.0 eq.) and placed under an inert atmosphere, preferably argon. The reaction mixture is allowed to stir for 15 min, then an organic base, such as pyridine (1/4 v/v), is added and the reaction progress is monitored using HPLC. The Linker is typically consumed within 16 h. The reaction mixture is then concentrated *in vacuo* and the resulting residue is

5 purified using, for example, HPLC to yield the carbamate AM.

An alternate method of preparing Drug-Linker Compounds is outlined in Scheme 14. Using the method of Scheme 14, the Drug is attached to a partial Linker unit (ZA, for example), which does not have a Stretcher unit attached. This provides intermediate AP, which has an Amino Acid unit having an Fmoc-protected N-terminus.

10 The Fmoc group is then removed and the resulting amine intermediate AQ is then attached to a Stretcher unit via a coupling reaction catalyzed using PyBrop or DEPC. The construction of Drug-Linker Compounds containing either a bromoacetamide Stretcher AR or a PEG maleimide Stretcher AS is illustrated in Scheme 14.

Scheme 14

wherein Q is  $-\text{C}_1-\text{C}_8$  alkyl,  $-\text{O}(\text{C}_1-\text{C}_8 \text{ alkyl})$ ,  $-\text{halogen}$ ,  $-\text{nitro}$  or  $-\text{cyano}$ ; and m is an integer ranging from 0-4.

- 5 Methodology useful for the preparation of a Linker unit containing a branched spacer is shown in Scheme 15.

## Scheme 15

Scheme 15 illustrates the synthesis of a val-cit dipeptide linker having a maleimide Stretcher unit and a bis(4-hydroxymethyl)styrene (BHMS) unit. The synthesis of the BHMS intermediate (AW) has been improved from previous literature procedures (see International Publication No, WO 9813059 to Firestone *et al.*, and Crozet, M.P.; Archaimbault, G.; Vanelle, P.; Nougier, R. *Tetrahedron Lett.* (1985) 26:5133-5134) and utilizes as starting materials, commercially available diethyl (4-nitrobenzyl)phosphonate (AT) and commercially available 2,2-dimethyl-1,3-dioxan-5-one (AU). Linkers AY and BA can be prepared from intermediate AW using the methodology described in Scheme 9.

## 4.6.3 DENDRITIC LINKERS

The linker may be a dendritic type linker for covalent attachment of more than one drug moiety through a branching, multifunctional linker moiety to a Ligand, such as but not limited to an antibody (Sun *et al.* (2002) *Bioorganic & Medicinal Chemistry Letters* 12:2213-2215; Sun *et al.* (2003) *Bioorganic & Medicinal Chemistry* 11:1761-1768). Dendritic linkers can increase the molar ratio of drug to antibody, *i.e.* loading, which is related to the potency of the Drug-Linker-Ligand Conjugate. Thus, where a cysteine engineered antibody bears only one reactive cysteine thiol group, a multitude of drug moieties may be attached through a dendritic linker.

10 The following exemplary embodiments of dendritic linker reagents allow up to nine nucleophilic drug moiety reagents to be conjugated by reaction with the chloroethyl nitrogen mustard functional groups:

15

or

#### 4.6.4 CONJUGATION OF DRUG MOIETIES TO ANTIBODIES

Scheme 16 illustrates methodology useful for making Drug-Linker-Ligand conjugates having about 2 to about 4 drugs per antibody. An antibody is treated with a reducing agent, such as dithiothreitol (DTT) to reduce some or all of the cysteine disulfide residues to form highly nucleophilic cysteine thiol groups (-CH<sub>2</sub>SH). The partially reduced antibody thus reacts with drug-linker compounds, or linker reagents, with electrophilic functional groups such as maleimide or  $\alpha$ -halo carbonyl, according to the conjugation method at page 766 of Klussman, *et al.* (2004), *Bioconjugate Chemistry* 15(4):765-773.

Scheme 16

For example, an antibody, *e.g.*, AC10, dissolved in 500 mM sodium borate and 500 mM sodium chloride at pH 8.0 is treated with an excess of 100 mM dithiothreitol (DTT). After incubation at 37 °C for about 30 minutes, the buffer is exchanged by elution over Sephadex G25 resin and eluted with PBS with 1mM DTPA. The thiol/Ab value is checked by determining the reduced antibody concentration from the absorbance at 280 nm of the solution and the thiol concentration by reaction with DTNB (Aldrich, Milwaukee, WI) and determination of the absorbance at 412 nm. The reduced antibody dissolved in PBS is chilled on ice. The drug linker, *e.g.*, MC-val-cit-PAB-MMAE in DMSO, dissolved in acetonitrile and water at known concentration, is added to the chilled reduced antibody in PBS. After about one hour, an excess of maleimide is added to quench the reaction and cap any unreacted antibody thiol groups. The reaction mixture is concentrated by centrifugal ultrafiltration and the ADC, *e.g.*, AC10-MC-vc-PAB-MMAE, is purified and desalted by elution through G25 resin in PBS, filtered through 0.2  $\mu$ m filters under sterile conditions, and frozen for storage.

A variety of antibody drug conjugates (ADC) were prepared, with a variety of linkers, and the drug moieties, MMAE and MMAF. The following table is an exemplary group of ADC which were prepared following the protocol of Example 27, and characterized by HPLC and drug loading assay.

#### 4.7 COMPOSITIONS AND METHODS OF ADMINISTRATION

In other embodiments, described is a composition including an effective amount of an Exemplary Compound and/or Exemplary Conjugate and a pharmaceutically acceptable carrier or vehicle. For convenience, the Drug units and Drug-Linker  
5 Compounds can be referred to as Exemplary Compounds, while Drug-Ligand Conjugates and Drug-Linker-Ligand Conjugates can be referred to as Exemplary Conjugates. The compositions are suitable for veterinary or human administration.

The present compositions can be in any form that allows for the composition to be administered to a patient. For example, the composition can be in the  
10 form of a solid, liquid or gas (aerosol). Typical routes of administration include, without limitation, oral, topical, parenteral, sublingual, rectal, vaginal, ocular, intra-tumor, and intranasal. Parenteral administration includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques. In one aspect, the compositions are administered parenterally. In yet another aspect, the Exemplary  
15 Compounds and/or the Exemplary Conjugates or compositions are administered intravenously.

Pharmaceutical compositions can be formulated so as to allow an Exemplary Compound and/or Exemplary Conjugate to be bioavailable upon administration of the composition to a patient. Compositions can take the form of one or  
20 more dosage units, where for example, a tablet can be a single dosage unit, and a container of an Exemplary Compound and/or Exemplary Conjugate in aerosol form can hold a plurality of dosage units.

Materials used in preparing the pharmaceutical compositions can be non-toxic in the amounts used. It will be evident to those of ordinary skill in the art that the  
25 optimal dosage of the active ingredient(s) in the pharmaceutical composition will depend on a variety of factors. Relevant factors include, without limitation, the type of animal (*e.g.*, human), the particular form of the Exemplary Compound or Exemplary Conjugate, the manner of administration, and the composition employed.

The pharmaceutically acceptable carrier or vehicle can be particulate, so that the compositions are, for example, in tablet or powder form. The carrier(s) can be  
30 liquid, with the compositions being, for example, an oral syrup or injectable liquid. In addition, the carrier(s) can be gaseous or particulate, so as to provide an aerosol composition useful in, *e.g.*, inhalatory administration.

When intended for oral administration, the composition is preferably in solid or liquid form, where semi-solid, semi-liquid, suspension and gel forms are included within the forms considered herein as either solid or liquid.

As a solid composition for oral administration, the composition can be formulated into a powder, granule, compressed tablet, pill, capsule, chewing gum, wafer or the like form. Such a solid composition typically contains one or more inert diluents. In addition, one or more of the following can be present: binders such as carboxymethylcellulose, ethyl cellulose, microcrystalline cellulose, or gelatin; excipients such as starch, lactose or dextrans, disintegrating agents such as alginic acid, sodium alginate, Primogel, corn starch and the like; lubricants such as magnesium stearate or Sterotex; glidants such as colloidal silicon dioxide; sweetening agents such as sucrose or saccharin, a flavoring agent such as peppermint, methyl salicylate or orange flavoring, and a coloring agent.

When the composition is in the form of a capsule, *e.g.*, a gelatin capsule, it can contain, in addition to materials of the above type, a liquid carrier such as polyethylene glycol, cyclodextrin or a fatty oil.

The composition can be in the form of a liquid, *e.g.*, an elixir, syrup, solution, emulsion or suspension. The liquid can be useful for oral administration or for delivery by injection. When intended for oral administration, a composition can comprise one or more of a sweetening agent, preservatives, dye/colorant and flavor enhancer. In a composition for administration by injection, one or more of a surfactant, preservative, wetting agent, dispersing agent, suspending agent, buffer, stabilizer and isotonic agent can also be included.

The liquid compositions, whether they are solutions, suspensions or other like form, can also include one or more of the following: sterile diluents such as water for injection, saline solution, preferably physiological saline, Ringer's solution, isotonic sodium chloride, fixed oils such as synthetic mono or diglycerides which can serve as the solvent or suspending medium, polyethylene glycols, glycerin, cyclodextrin, propylene glycol or other solvents; antibacterial agents such as benzyl alcohol or methyl paraben; antioxidants such as ascorbic acid or sodium bisulfite; chelating agents such as ethylenediaminetetraacetic acid; buffers such as acetates, citrates or phosphates and agents for the adjustment of tonicity such as sodium chloride or dextrose. A parenteral composition can be enclosed in ampoule, a disposable syringe or a multiple-dose vial

WO 2005/081711

PCT/US2004/038392

made of glass, plastic or other material. Physiological saline is an exemplary adjuvant. An injectable composition is preferably sterile.

The amount of the Exemplary Compound and/or Exemplary Conjugate that is effective in the treatment of a particular disorder or condition will depend on the nature of the disorder or condition, and can be determined by standard clinical techniques. In addition, *in vitro* or *in vivo* assays can optionally be employed to help identify optimal dosage ranges. The precise dose to be employed in the compositions will also depend on the route of administration, and the seriousness of the disease or disorder, and should be decided according to the judgment of the practitioner and each patient's circumstances.

The compositions comprise an effective amount of an Exemplary Compound and/or Exemplary Conjugate such that a suitable dosage will be obtained. Typically, this amount is at least about 0.01% of an Exemplary Compound and/or Exemplary Conjugate by weight of the composition. When intended for oral administration, this amount can be varied to range from about 0.1% to about 80% by weight of the composition. In one aspect, oral compositions can comprise from about 4% to about 50% of the Exemplary Compound and/or Exemplary Conjugate by weight of the composition. In yet another aspect, present compositions are prepared so that a parenteral dosage unit contains from about 0.01% to about 2% by weight of the Exemplary Compound and/or Exemplary Conjugate.

For intravenous administration, the composition can comprise from about 0.01 to about 100 mg of an Exemplary Compound and/or Exemplary Conjugate per kg of the animal's body weight. In one aspect, the composition can include from about 1 to about 100 mg of an Exemplary Compound and/or Exemplary Conjugate per kg of the animal's body weight. In another aspect, the amount administered will be in the range from about 0.1 to about 25 mg/kg of body weight of the Exemplary Compound and/or Exemplary Conjugate.

Generally, the dosage of an Exemplary Compound and/or Exemplary Conjugate administered to a patient is typically about 0.01 mg/kg to about 2000 mg/kg of the animal's body weight. In one aspect, the dosage administered to a patient is between about 0.01 mg/kg to about 10 mg/kg of the animal's body weight, in another aspect, the dosage administered to a patient is between about 0.1 mg/kg and about 250 mg/kg of the animal's body weight, in yet another aspect, the dosage administered to a patient is between about 0.1 mg/kg and about 20 mg/kg of the animal's body weight, in yet another

WO 2005/081711

PCT/US2004/038392

aspect the dosage administered is between about 0.1 mg/kg to about 10 mg/kg of the animal's body weight, and in yet another aspect, the dosage administered is between about 1 mg/kg to about 10 mg/kg of the animal's body weight.

The Exemplary Compounds and/or Exemplary Conjugate or compositions  
5 can be administered by any convenient route, for example by infusion or bolus injection, by absorption through epithelial or mucocutaneous linings (*e.g.*, oral mucosa, rectal and intestinal mucosa, etc.). Administration can be systemic or local. Various delivery systems are known, *e.g.*, encapsulation in liposomes, microparticles, microcapsules, capsules, etc., and can be used to administer an Exemplary Compound and/or Exemplary  
10 Conjugate or composition. In certain embodiments, more than one Exemplary Compound and/or Exemplary Conjugate or composition is administered to a patient.

In specific embodiments, it can be desirable to administer one or more Exemplary Compounds and/or Exemplary Conjugate or compositions locally to the area in need of treatment. This can be achieved, for example, and not by way of limitation, by  
15 local infusion during surgery; topical application, *e.g.*, in conjunction with a wound dressing after surgery; by injection; by means of a catheter; by means of a suppository; or by means of an implant, the implant being of a porous, non-porous, or gelatinous material, including membranes, such as sialastic membranes, or fibers. In one embodiment, administration can be by direct injection at the site (or former site) of a  
20 cancer, tumor or neoplastic or pre-neoplastic tissue. In another embodiment, administration can be by direct injection at the site (or former site) of a manifestation of an autoimmune disease.

In certain embodiments, it can be desirable to introduce one or more Exemplary Compounds and/or Exemplary Conjugate or compositions into the central  
25 nervous system by any suitable route, including intraventricular and intrathecal injection. Intraventricular injection can be facilitated by an intraventricular catheter, for example, attached to a reservoir, such as an Ommaya reservoir.

Pulmonary administration can also be employed, *e.g.*, by use of an inhaler or nebulizer, and formulation with an aerosolizing agent, or via perfusion in a  
30 fluorocarbon or synthetic pulmonary surfactant.

In yet another embodiment, the Exemplary Compounds and/or Exemplary Conjugate or compositions can be delivered in a controlled release system, such as but not limited to, a pump or various polymeric materials can be used. In yet another

WO 2005/081711

PCT/US2004/038392

embodiment, a controlled-release system can be placed in proximity of the target of the Exemplary Compounds and/or Exemplary Conjugate or compositions, *e.g.*, the brain, thus requiring only a fraction of the systemic dose (*see, e.g.*, Goodson, in *Medical Applications of Controlled Release, supra*, vol. 2, pp. 115-138 (1984)). Other controlled-  
5 release systems discussed in the review by Langer (*Science* 249:1527-1533 (1990)) can be used.

The term "carrier" refers to a diluent, adjuvant or excipient, with which an Exemplary Compound and/or Exemplary Conjugate is administered. Such pharmaceutical carriers can be liquids, such as water and oils, including those of  
10 petroleum, animal, vegetable or synthetic origin, such as peanut oil, soybean oil, mineral oil, sesame oil and the like. The carriers can be saline, gum acacia, gelatin, starch paste, talc, keratin, colloidal silica, urea, and the like. In addition, auxiliary, stabilizing, thickening, lubricating and coloring agents can be used. In one embodiment, when administered to a patient, the Exemplary Compound and/or Exemplary Conjugate or  
15 compositions and pharmaceutically acceptable carriers are sterile. Water is an exemplary carrier when the Exemplary Compounds and/or Exemplary Conjugates are administered intravenously. Saline solutions and aqueous dextrose and glycerol solutions can also be employed as liquid carriers, particularly for injectable solutions. Suitable pharmaceutical carriers also include excipients such as starch, glucose, lactose, sucrose, gelatin, malt,  
20 rice, flour, chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim milk, glycerol, propylene, glycol, water, ethanol and the like. The present compositions, if desired, can also contain minor amounts of wetting or emulsifying agents, or pH buffering agents.

The present compositions can take the form of solutions, suspensions,  
25 emulsion, tablets, pills, pellets, capsules, capsules containing liquids, powders, sustained-release formulations, suppositories, emulsions, aerosols, sprays, suspensions, or any other form suitable for use. Other examples of suitable pharmaceutical carriers are described in "Remington's Pharmaceutical Sciences" by E.W. Martin.

In an embodiment, the Exemplary Compounds and/or Exemplary  
30 Conjugates are formulated in accordance with routine procedures as a pharmaceutical composition adapted for intravenous administration to animals, particularly human beings. Typically, the carriers or vehicles for intravenous administration are sterile isotonic aqueous buffer solutions. Where necessary, the compositions can also include a

WO 2005/081711

PCT/US2004/038392

solubilizing agent. Compositions for intravenous administration can optionally comprise a local anesthetic such as lignocaine to ease pain at the site of the injection. Generally, the ingredients are supplied either separately or mixed together in unit dosage form, for example, as a dry lyophilized powder or water free concentrate in a hermetically sealed  
5 container such as an ampoule or sachette indicating the quantity of active agent. Where an Exemplary Compound and/or Exemplary Conjugate is to be administered by infusion, it can be dispensed, for example, with an infusion bottle containing sterile pharmaceutical grade water or saline. Where the Exemplary Compound and/or Exemplary Conjugate is administered by injection, an ampoule of sterile water for injection or saline can be  
10 provided so that the ingredients can be mixed prior to administration.

Compositions for oral delivery can be in the form of tablets, lozenges, aqueous or oily suspensions, granules, powders, emulsions, capsules, syrups, or elixirs, for example. Orally administered compositions can contain one or more optionally agents, for example, sweetening agents such as fructose, aspartame or saccharin;  
15 flavoring agents such as peppermint, oil of wintergreen, or cherry; coloring agents; and preserving agents, to provide a pharmaceutically palatable preparation. Moreover, where in tablet or pill form, the compositions can be coated to delay disintegration and absorption in the gastrointestinal tract thereby providing a sustained action over an extended period of time. Selectively permeable membranes surrounding an osmotically  
20 active driving compound are also suitable for orally administered compounds. In these later platforms, fluid from the environment surrounding the capsule is imbibed by the driving compound, which swells to displace the agent or agent composition through an aperture. These delivery platforms can provide an essentially zero order delivery profile as opposed to the spiked profiles of immediate release formulations. A time-delay  
25 material such as glycerol monostearate or glycerol stearate can also be used.

The compositions can be intended for topical administration, in which case the carrier may be in the form of a solution, emulsion, ointment or gel base. If intended for transdermal administration, the composition can be in the form of a transdermal patch or an iontophoresis device. Topical formulations can comprise a concentration of an  
30 Exemplary Compound and/or Exemplary Conjugate of from about 0.05% to about 50% w/v (weight per unit volume of composition), in another aspect, from 0.1% to 10% w/v.

WO 2005/081711

PCT/US2004/038392

The composition can be intended for rectal administration, in the form, *e.g.*, of a suppository which will melt in the rectum and release the Exemplary Compound and/or Exemplary Conjugate.

5 The composition can include various materials that modify the physical form of a solid or liquid dosage unit. For example, the composition can include materials that form a coating shell around the active ingredients. The materials that form the coating shell are typically inert, and can be selected from, for example, sugar, shellac, and other enteric coating agents. Alternatively, the active ingredients can be encased in a gelatin capsule.

10 The compositions can consist of gaseous dosage units, *e.g.*, it can be in the form of an aerosol. The term aerosol is used to denote a variety of systems ranging from those of colloidal nature to systems consisting of pressurized packages. Delivery can be by a liquefied or compressed gas or by a suitable pump system that dispenses the active ingredients.

15 Whether in solid, liquid or gaseous form, the present compositions can include a pharmacological agent used in the treatment of cancer, an autoimmune disease or an infectious disease.

#### 4.8 THERAPEUTIC USES OF THE EXEMPLARY CONJUGATES

20 The Exemplary Compounds and/or Exemplary Conjugates are useful for treating cancer, an autoimmune disease or an infectious disease in a patient.

##### 4.8.1 TREATMENT OF CANCER

25 The Exemplary Compounds and/or Exemplary Conjugates are useful for inhibiting the multiplication of a tumor cell or cancer cell, causing apoptosis in a tumor or cancer cell, or for treating cancer in a patient. The Exemplary Compounds and/or Exemplary Conjugates can be used accordingly in a variety of settings for the treatment of animal cancers. The Drug-Linker-Ligand Conjugates can be used to deliver a Drug or Drug unit to a tumor cell or cancer cell. Without being bound by theory, in one  
30 embodiment, the Ligand unit of an Exemplary Conjugate binds to or associates with a cancer-cell or a tumor-cell-associated antigen, and the Exemplary Conjugate can be taken up inside a tumor cell or cancer cell through receptor-mediated endocytosis. The antigen

can be attached to a tumor cell or cancer cell or can be an extracellular matrix protein associated with the tumor cell or cancer cell. Once inside the cell, one or more specific peptide sequences within the Linker unit are hydrolytically cleaved by one or more tumor-cell or cancer-cell-associated proteases, resulting in release of a Drug or a Drug-  
 5 Linker Compound. The released Drug or Drug-Linker Compound is then free to migrate within the cell and induce cytotoxic or cytostatic activities. In an alternative embodiment, the Drug or Drug unit is cleaved from the Exemplary Conjugate outside the tumor cell or cancer cell, and the Drug or Drug-Linker Compound subsequently penetrates the cell.

In one embodiment, the Ligand unit binds to the tumor cell or cancer cell.

10 In another embodiment, the Ligand unit binds to a tumor cell or cancer cell antigen which is on the surface of the tumor cell or cancer cell.

In another embodiment, the Ligand unit binds to a tumor cell or cancer cell antigen which is an extracellular matrix protein associated with the tumor cell or cancer cell.

15 The specificity of the Ligand unit for a particular tumor cell or cancer cell can be important for determining those tumors or cancers that are most effectively treated. For example, Exemplary Conjugates having a BR96 Ligand unit can be useful for treating antigen positive carcinomas including those of the lung, breast, colon, ovaries, and pancreas. Exemplary Conjugates having an Anti-CD30 or an anti-CD40 Ligand unit can  
 20 be useful for treating hematologic malignancies.

Other particular types of cancers that can be treated with Exemplary Conjugates include, but are not limited to, those disclosed in Table 3.

meningioma  
skin cancer  
melanoma  
neuroblastoma  
retinoblastoma
- blood-borne cancers, including but not limited to:
- 10 acute lymphoblastic leukemia "ALL"  
acute lymphoblastic B-cell leukemia  
acute lymphoblastic T-cell leukemia  
acute myeloblastic leukemia "AML"  
acute promyelocytic leukemia "APL"  
acute monoblastic leukemia  
15 acute erythroleukemic leukemia  
acute megakaryoblastic leukemia  
acute myelomonocytic leukemia  
acute nonlymphocytic leukemia  
acute undifferentiated leukemia  
20 chronic myelocytic leukemia "CML"  
chronic lymphocytic leukemia "CLL"  
hairy cell leukemia  
multiple myeloma
- acute and chronic leukemias:
- 25 lymphoblastic  
myelogenous  
lymphocytic  
myelocytic leukemias
- Lymphomas:
- 30 Hodgkin's disease  
non-Hodgkin's Lymphoma
- Multiple myeloma  
Waldenström's macroglobulinemia  
Heavy chain disease  
Polycythemia vera
- 35 The Exemplary Conjugates provide conjugation-specific tumor or cancer targeting, thus reducing general toxicity of these compounds. The Linker units stabilize the Exemplary Conjugates in blood, yet are cleavable by tumor-specific proteases within the cell, liberating a Drug.

#### 4.8.2 MULTI-MODALITY THERAPY FOR CANCER

Cancers, including, but not limited to, a tumor, metastasis, or other disease or disorder characterized by uncontrolled cell growth, can be treated or prevented by administration of an Exemplary Conjugate and/or an Exemplary Compound.

5 In other embodiments, methods for treating or preventing cancer are provided, including administering to a patient in need thereof an effective amount of an Exemplary Conjugate and a chemotherapeutic agent. In one embodiment the chemotherapeutic agent is that with which treatment of the cancer has not been found to be refractory. In another embodiment, the chemotherapeutic agent is that with which the  
10 treatment of cancer has been found to be refractory. The Exemplary Conjugates can be administered to a patient that has also undergone surgery as treatment for the cancer.

In one embodiment, the additional method of treatment is radiation therapy.

In a specific embodiment, the Exemplary Conjugate is administered  
15 concurrently with the chemotherapeutic agent or with radiation therapy. In another specific embodiment, the chemotherapeutic agent or radiation therapy is administered prior or subsequent to administration of an Exemplary Conjugates, in one aspect at least an hour, five hours, 12 hours, a day, a week, a month, in further aspects several months (*e.g.*, up to three months), prior or subsequent to administration of an Exemplary  
20 Conjugate.

A chemotherapeutic agent can be administered over a series of sessions. Any one or a combination of the chemotherapeutic agents listed in Table 4 can be administered. With respect to radiation, any radiation therapy protocol can be used depending upon the type of cancer to be treated. For example, but not by way of  
25 limitation, x-ray radiation can be administered; in particular, high-energy megavoltage (radiation of greater than 1 MeV energy) can be used for deep tumors, and electron beam and orthovoltage x-ray radiation can be used for skin cancers. Gamma-ray emitting radioisotopes, such as radioactive isotopes of radium, cobalt and other elements, can also be administered.

30 Additionally, methods of treatment of cancer with an Exemplary Compound and/or Exemplary Conjugate are provided as an alternative to chemotherapy or radiation therapy where the chemotherapy or the radiation therapy has proven or can prove too toxic, *e.g.*, results in unacceptable or unbearable side effects, for the subject

WO 2005/081711

PCT/US2004/038392

being treated. The animal being treated can, optionally, be treated with another cancer treatment such as surgery, radiation therapy or chemotherapy, depending on which treatment is found to be acceptable or bearable.

The Exemplary Compounds and/or Exemplary Conjugates can also be  
 5 used in an *in vitro* or *ex vivo* fashion, such as for the treatment of certain cancers, including, but not limited to leukemias and lymphomas, such treatment involving autologous stem cell transplants. This can involve a multi-step process in which the animal's autologous hematopoietic stem cells are harvested and purged of all cancer cells, the animal's remaining bone-marrow cell population is then eradicated via the  
 10 administration of a high dose of an Exemplary Compound and/or Exemplary Conjugate with or without accompanying high dose radiation therapy, and the stem cell graft is infused back into the animal. Supportive care is then provided while bone marrow function is restored and the animal recovers.

#### 15 4.8.3 MULTI-DRUG THERAPY FOR CANCER

Methods for treating cancer including administering to a patient in need thereof an effective amount of an Exemplary Conjugate and another therapeutic agent that is an anti-cancer agent are disclosed. Suitable anticancer agents include, but are not limited to, methotrexate, taxol, L-asparaginase, mercaptopurine, thioguanine,  
 20 hydroxyurea, cytarabine, cyclophosphamide, ifosfamide, nitrosoureas, cisplatin, carboplatin, mitomycin, dacarbazine, procarbazine, topotecan, nitrogen mustards, cytoxan, etoposide, 5-fluorouracil, BCNU, irinotecan, camptothecins, bleomycin, doxorubicin, idarubicin, daunorubicin, dactinomycin, plicamycin, mitoxantrone, asparaginase, vinblastine, vincristine, vinorelbine, paclitaxel, and docetaxel. In one aspect, the anti-  
 25 cancer agent includes, but is not limited to, a drug listed in Table 4.

TABLE 4

Epipodophyllins:	etoposide teniposide topotecan 9-aminocamptothecin camptothecin crisnatol
mitomycins:	mitomycin C
Anti-metabolites	
Anti-folates:	
DHFR inhibitors:	methotrexate trimetrexate
IMP dehydrogenase Inhibitors:	mycophenolic acid tiazofurin ribavirin EICAR
Ribonucleotide reductase Inhibitors:	hydroxyurea deferoxamine
Pyrimidine analogs:	
Uracil analogs	5-Fluorouracil
	floxuridine doxifluridine ratitrexed
Cytosine analogs	cytarabine (ara C) cytosine arabinoside fludarabine
Purine analogs:	mercaptopurine thioguanine
Hormonal therapies:	
Receptor antagonists:	
Anti-estrogen	tamoxifen raloxifene megestrol
LHRH agonists:	goserelin leuprolide acetate
Anti-androgens:	flutamide bicalutamide

Retinoids/Deltoids	
Vitamin D3 analogs:	EB 1089 CB 1093 KH 1060
Photodynamic therapies:	vertoporphin (BPD-MA) phthalocyanine photosensitizer Pc4 demethoxy-hypocrellin A (2BA-2-DMHA)
Cytokines:	Interferon- $\alpha$ Interferon- $\gamma$ tumor necrosis factor
Others:	Gemcitabine Velcade Revamid Thalamid
Isoprenylation inhibitors:	Lovastatin
Dopaminergic neurotoxins:	1-methyl-4-phenylpyridinium ion
Cell cycle inhibitors:	staurosporine
Actinomycins:	Actinomycin D dactinomycin
Bleomycins:	bleomycin A2 bleomycin B2 peplomycin
Anthracyclines:	daunorubicin Doxorubicin (adriamycin) idarubicin epirubicin pirarubicin zorubicin mtoxantrone
MDR inhibitors:	verapamil
Ca <sup>2+</sup> ATPase inhibitors:	thapsigargin

#### 4.8.4 TREATMENT OF AUTOIMMUNE DISEASES

The Exemplary Conjugates are useful for killing or inhibiting the replication of a cell that produces an autoimmune disease or for treating an autoimmune disease. The Exemplary Conjugates can be used accordingly in a variety of settings for the treatment of an autoimmune disease in a patient. The Drug-Linker-Ligand Conjugates can be used to deliver a Drug to a target cell. Without being bound by theory, in one embodiment, the Drug-Linker-Ligand Conjugate associates with an antigen on the surface of a target cell, and the Exemplary Conjugate is then taken up inside a target-cell through receptor-mediated endocytosis. Once inside the cell, one or more specific

peptide sequences within the Linker unit are enzymatically or hydrolytically cleaved, resulting in release of a Drug. The released Drug is then free to migrate in the cytosol and induce cytotoxic or cytostatic activities. In an alternative embodiment, the Drug is cleaved from the Exemplary Conjugate outside the target cell, and the Drug subsequently  
 5 penetrates the cell.

In one embodiment, the Ligand unit binds to an autoimmune antigen. In one aspect, the antigen is on the surface of a cell involved in an autoimmune condition.

In another embodiment, the Ligand unit binds to an autoimmune antigen which is on the surface of a cell.

10 In one embodiment, the Ligand binds to activated lymphocytes that are associated with the autoimmune disease state.

In a further embodiment, the Exemplary Conjugates kill or inhibit the multiplication of cells that produce an autoimmune antibody associated with a particular autoimmune disease.

15 Particular types of autoimmune diseases that can be treated with the Exemplary Conjugates include, but are not limited to, Th2 lymphocyte related disorders (*e.g.*, atopic dermatitis, atopic asthma, rhinoconjunctivitis, allergic rhinitis, Omenn's syndrome, systemic sclerosis, and graft versus host disease); Th1 lymphocyte-related disorders (*e.g.*, rheumatoid arthritis, multiple sclerosis, psoriasis, Sjorgren's syndrome,  
 20 Hashimoto's thyroiditis, Grave's disease, primary biliary cirrhosis, Wegener's granulomatosis, and tuberculosis); activated B lymphocyte-related disorders (*e.g.*, systemic lupus erythematosus, Goodpasture's syndrome, rheumatoid arthritis, and type I diabetes); and those disclosed in Table 5.

5. EXAMPLES

Example 1 - Preparation of compound AB

AB

Fmoc-val-cit-PAB-OH (14.61 g, 24.3 mmol, 1.0 eq., U.S. Patent No. 6214345 to Firestone *et al.*) was diluted with DMF (120 mL, 0.2 M) and to this solution was added a diethylamine (60 mL). The reaction was monitored by HPLC and found to be complete in 2 h. The reaction mixture was concentrated and the resulting residue was precipitated using ethyl acetate (ca. 100 mL) under sonication over for 10 min. Ether (200 mL) was added and the precipitate was further sonicated for 5 min. The solution was allowed to stand for 30 min. without stirring and was then filtered and dried under high vacuum to provide Val-cit-PAB-OH, which was used in the next step without further purification. Yield: 8.84 g (96%). Val-cit-PAB-OH (8.0 g, 21 mmol) was diluted with DMF (110 mL) and the resulting solution was treated with MC-OSu (Willner *et al.*, (1993) Bioconjugate Chem. 4:521; 6.5 g, 21 mmol, 1.0 eq.). Reaction was complete according to HPLC after 2 h. The reaction mixture was concentrated and the resulting oil was precipitated using ethyl acetate (50 mL). After sonicating for 15 min, ether (400 mL) was added and the mixture was sonicated further until all large particles were broken up. The solution was then filtered and the solid dried to provide an off-white solid intermediate. Yield: 11.63 g (96%); ES-MS  $m/z$  757.9 [M-H]

Fmoc-val-cit-PAB-OH (14.61 g, 24.3 mmol, 1.0 eq., U.S. Patent No. 6214345 to Firestone *et al.*) was diluted with DMF (120 mL, 0.2 M) and to this solution was added a diethylamine (60 mL). The reaction was monitored by HPLC and found to be complete in 2 h. The solution was then filtered and the solid dried to provide an off-white solid intermediate. Yield: 11.63 g (96%); ES-MS  $m/z$  757.9 [M-H].

WO 2005/081711

PCT/US2004/038392

The off-white solid intermediate (8.0 g, 14.0 mmol) was diluted with DMF (120 mL, 0.12 M) and to the resulting solution was added bis(4-nitrophenyl)carbonate (8.5 g, 28.0 mmol, 2.0 eq.) and DIEA (3.66 mL, 21.0 mmol, 1.5 eq.). The reaction was complete in 1 h according to HPLC. The reaction mixture was concentrated to provide an oil that was precipitated with EtOAc, and then triturated with EtOAc (ca. 25 mL). The solute was further precipitated with ether (ca. 200 mL) and triturated for 15 min. The solid was filtered and dried under high vacuum to provide Compound AB which was 93% pure according to HPLC and used in the next step without further purification. Yield: 9.7 g (94%).

10

Example 2 - Preparation of compound 1

15

Phenylalanine *t*-butyl ester HCl salt (868 mg, 3 mmol), *N*-Boc-Dolaproine (668 mg, 1 eq.), DEPC (820  $\mu$ L, 1.5 eq.), and DIEA (1.2 mL) were diluted with dichloromethane (3 mL). After 2 hours (h) at room temperature (about 28 degrees Celsius), the reaction mixture was diluted with dichloromethane (20 mL), washed successively with saturated aqueous (aq.) NaHCO<sub>3</sub> (2 x 10 mL), saturated aq. NaCl (2 x 10 mL). The organic layer was separated and concentrated. The resulting residue was re-suspended in ethyl acetate and was purified via flash chromatography in ethyl acetate. The relevant fractions were combined and concentrated to provide the dipeptide as a white solid: 684 mg (46 %). ES-MS *m/z* 491.3 [M+H]<sup>+</sup>.

25

For selective Boc cleavage in the presence of *t*-butyl ester, the above dipeptide (500 mg, 1.28 mmol) was diluted with dioxane (2 mL). 4M HCl/dioxane (960  $\mu$ L, 3 eq.) was added, and the reaction mixture was stirred overnight at room temperature. Almost complete Boc deprotection was observed by RP-HPLC with minimal amount of *t*-butyl ester cleavage. The mixture was cooled down on an ice bath, and triethylamine (500  $\mu$ L) was added. After 10 min., the mixture was removed from the cooling bath, diluted

30

WO 2005/081711

PCT/US2004/038392

with dichloromethane (20 mL), washed successively with saturated aq.  $\text{NaHCO}_3$  (2 x 10 mL), saturated aq.  $\text{NaCl}$  (2 x 10 mL). The organic layer was concentrated to give a yellow foam: 287 mg (57 %). The intermediate was used without further purification.

The tripeptide Fmoc-Meval-val-dil-*O-t*-Bu (prepared as described in WO 02/088172, entitled "Pentapeptide Compounds and Uses Related Thereto"; 0.73 mmol) was treated with TFA (3 mL), dichloromethane (3 mL) for 2 h at room temperature. The mixture was concentrated to dryness, the residue was co-evaporated with toluene (3 x 20 mL), and dried in vacuum overnight. The residue was diluted with dichloromethane (5 mL) and added to the deprotected dipeptide (287 mg, 0.73 mmol), followed by DIEA (550  $\mu\text{L}$ , 4 eq.), DEPC (201  $\mu\text{L}$ , 1.1 eq.). After 2 h at room temperature the reaction mixture was diluted with ethyl acetate (50 mL), washed successively with 10% aq. citric acid (2 x 20 mL), saturated aq.  $\text{NaHCO}_3$  (2 x 10 mL), saturated aq.  $\text{NaCl}$  (10 mL). The organic layer was separated and concentrated. The resulting residue was re-suspended in ethyl acetate and was purified via flash chromatography in ethyl acetate. The relevant fractions were combined and concentrated to provide Fmoc-Meval-val-dil-dap-phe-*O-t*-Bu as a white solid: 533 mg (71 %).  $R_f$  0.4 (EtOAc). ES-MS  $m/z$  1010.6  $[\text{M}+\text{H}]^+$ .

The product (200 mg, 0.2 mmol) was diluted with dichloromethane (3 mL), diethylamine (1 mL). The reaction mixture was stirred overnight at room temperature. Solvents were removed to provide an oil that was purified by flash silica gel chromatography in a step gradient 0-10 % MeOH in dichloromethane to provide Compound 1 as a white solid: 137 mg (87 %).  $R_f$  0.3 (10 % MeOH/ $\text{CH}_2\text{Cl}_2$ ). ES-MS  $m/z$  788.6  $[\text{M}+\text{H}]^+$ .

25 Example 3 - Preparation of compound 2

30 Compound 2 was prepared from compound 1 (30 mg, 0.038 mmol) by treatment with 4M HCl/dioxane (4 ml) for 7 h at room temperature. The solvent was removed, and the residue was dried in a vacuum overnight to give provide Compound 2

WO 2005/081711

PCT/US2004/038392

as a hygroscopic white solid: 35 mg (120 % calculated for HCl salt). ES-MS  $m/z$  732.56  $[M+H]^+$ .

Example 4 - Preparation of compound 3

5

3

10 Fmoc-Meal-val-dil-dap-phe-*O-t*-Bu (Example 2, 50 mg) was treated with 4M HCl/dioxane (4 ml) for 16 h at room temperature. The solvent was removed, and the residue was dried in vacuum overnight to give 50 mg of a hygroscopic white solid intermediate

The white solid intermediate (20 mg, 0.02 mmol) was diluted with  
 15 dichloromethane (1 mL); DEPC (5  $\mu$ L, 0.03 mmol, 1.5 eq.) was added followed by DIEA (11  $\mu$ L, 0.06 mmol, 3 eq.), and *t*-butylamine (3.2  $\mu$ L, 0.03 mmol, 1.5 eq.). After 2 h at room temperature, the reaction was found to be uncompleted by RP-HPLC. More DEPC (10  $\mu$ L) and *t*-butylamine (5  $\mu$ L) were added and the reaction was stirred for additional 4 h. Reaction mixture was diluted with dichloromethane (15 mL), washed successively with  
 20 water (5 mL), 0.1 M aq. HCl (10 mL), saturated aq. NaCl (10 mL). The organic layer was separated and concentrated. The resulting residue was diluted with dichloromethane and purified via flash chromatography in a step gradient 0–5 % MeOH in dichloromethane. The relevant fractions were combined and concentrated to provide the Fmoc protected intermediate as a white solid: 7.3 mg (36 %).  $R_f$  0.75 (10 % MeOH/ $CH_2Cl_2$ ).

25 Fmoc protected intermediate was diluted with dichloromethane (0.5 mL) and treated with diethylamine (0.5 mL) for 3 h at room temperature. The reaction mixture was concentrated to dryness. The product was isolated by flash silica gel chromatography in a step gradient 0–10 % MeOH in dichloromethane to provide Compound 3 as a white solid: 4 mg (70 %).  $R_f$  0.2 (10 % MeOH/ $CH_2Cl_2$ ). ES-MS  $m/z$  787  $[M+H]^+$ , 809  
 30  $[M+Na]^+$ .

Example 5 - Preparation of compound 4

5                   Boc-L-Phenylalanine (265 mg, 1 mmol, 1 eq.) and triethyleneglycol monomethyl ether (164  $\mu$ L, 1 mmol, 1 eq.) were diluted with dichloromethane (5 mL). Then, DCC (412 mg, 2 mmol, 2 eq.) was added, followed by DMAP (10 mg). The reaction mixture was stirred overnight at room temperature. The precipitate was filtered off. The solvent was removed in a vacuum, the residue was diluted with ethyl acetate, and purified by silica gel flash chromatography in ethyl acetate. The product containing fractions were pulled, concentrated, and dried in vacuum to give a white solid: 377 mg (91 %).  $R_f$  0.5 (EtOAc). ES-MS  $m/z$  434  $[M+Na]^+$ .

10                   Removal of Boc protecting group was performed by treatment of the above material in dioxane (10 mL) with 4M HCl/dioxane (6 mL) for 6 h at room temperature. The solvent was removed in a vacuum, the residue was dried in a vacuum to give a white solid.

15                   The HCl salt of Phenylalanine-triethyleneglycol monomethyl ether ester (236 mg, 0.458 mmol, 1eq.) and *N*-Boc-Dolaproine (158 mg, 0.55 mmol, 1.2 eq.) were diluted with dichloromethane (3 mL). DEPC (125  $\mu$ L, 1.5 eq.) and added to the mixture followed by DIEA (250  $\mu$ L, 3 eq.). After 2 h at room temperature the reaction mixture was diluted with ethyl acetate (30 mL), washed successively with saturated aq.  $NaHCO_3$  (2 x 10 mL), 10% aq. citric acid (2 x 10 mL), saturated aq. NaCl (10 mL). The organic layer was separated and concentrated. The resulting residue was re-suspended in ethyl acetate and was purified via flash chromatography on silica gel in ethyl acetate. The relevant fractions were combined and concentrated to provide a white foam intermediate: 131 mg (50 %).  $R_f$  0.25 (EtOAc). ES-MS  $m/z$  581.3  $[M+H]^+$ .

20                   Boc deprotection was done in dichloromethane (2 mL), TFA (0.5 mL) at room temperature for 2 h. Solvent was removed in vacuum, and the residue was co-evaporated with toluene (3 x 25 mL), then dried in vacuum to give 138 mg of dipeptide TFA salt.

WO 2005/081711

PCT/US2004/038392

Fmoc-Meval-val-dil-OH (Example 2, 147 mg, 0.23 mmol, 1 eq.), and dipeptide TFA salt (138 mg) were diluted with dichloromethane (2 mL). To the mixture DEPC (63  $\mu$ L, 1.5 eq.) was added, followed by DIEA (160  $\mu$ L, 4 eq.). After 2 h at room temperature the reaction mixture was diluted with dichloromethane (30 mL), washed successively with 10% aq. citric acid (2 x 20 mL), saturated aq. NaCl (20 mL). The organic layer was separated and concentrated. The resulting residue was re-suspended in dichloromethane and was purified via flash chromatography on silica gel in a step gradient 0-5 % MeOH in dichloromethane. The relevant fractions were combined and concentrated to provide white foam: 205 mg (81 %).  $R_f$  0.4 (10 % MeOH/ $\text{CH}_2\text{Cl}_2$ ). ES-MS  $m/z$  1100.6  $[\text{M}+\text{H}]^+$ , 1122.4  $[\text{M}+\text{Na}]^+$ .

Fmoc protecting group was removed by treatment with diethylamine (2 mL) in dichloromethane (6 mL). After 6 h at room temperature solvent was removed in vacuum, product was isolated by flash chromatography on silica gel in a step gradient 0-10 % MeOH in dichloromethane. The relevant fractions were combined and concentrated. After evaporation from dichloromethane/hexane, 1:1, Compound 4 was obtained as a white foam: 133 mg (80 %).  $R_f$  0.15 (10% MeOH/ $\text{CH}_2\text{Cl}_2$ ). ES-MS  $m/z$  878.6  $[\text{M}+\text{H}]^+$ .

#### Example 6 - Preparation of compound 5

20

5

Fmoc-Meval-val-dil-OH (Example 2, 0.50 g, 0.78 mmol) and dap-phe-OMe-HCl (0.3 g, 0.78 mmol, prepared according to Pettit, G.R., *et al. Anti-Cancer Drug Design* 1998, 13, 243-277) were dissolved in  $\text{CH}_2\text{Cl}_2$  (10 mL) followed by the addition of diisopropylethylamine (0.30 mL, 1.71 mmol, 2.2 eq.). DEPC (0.20 mL, 1.17, 1.5 eq.) was added and the contents stood over Ar. Reaction was complete according to HPLC in 1 h. The mixture was concentrated to an oil and purified by  $\text{SiO}_2$  chromatography (300 x 25 mm column) and eluting with 100 % EtOAc. The product was isolated as a white foamy solid. Yield: 0.65 g (87 %). ES-MS  $m/z$  968.35  $[\text{M}+\text{H}]^+$ , 991.34  $[\text{M}+\text{Na}]^+$ ; UV  $\lambda_{\text{max}}$  215, 265 nm.

25

WO 2005/081711

PCT/US2004/038392

The Fmoc-protected peptide (0.14 g, 0.14 mmol) in methylene chloride (5 mL) was treated with diethylamine (2 mL) and the contents stood at room temperature for 2 h. The reaction, complete by HPLC, was concentrated to an oil, taken up in 2 mL of DMSO and injected into a preparative-HPLC (C<sub>12</sub>-RP column, 5  $\mu$ , 100  $\text{\AA}$ , linear gradient of MeCN in water (containing 0.1% TFA) 10 to 100 % in 40 min followed by 20 min at 100 %, at a flow rate of 25 mL/min). Fractions containing the product were evaporated to afford a white powder for the trifluoroacetate salt. Yield: 0.126 g (98 %). R<sub>f</sub> 0.28 (100 % EtOAc); ES-MS *m/z* 746.59 [M+H]<sup>+</sup>, 768.51 [M+Na]<sup>+</sup>; UV  $\lambda_{\text{max}}$  215 nm.

#### Example 7 - Preparation of compound 6

10

6

The trifluoroacetate salt of Compound 5 (0.11 g, 0.13 mmol), Compound AB (0.103 g, 0.14 mmol, 1.1 eq.) and HOBT (3.4 mg, 26  $\mu$ mol, 0.2 eq.) were suspended in DMF/pyridine (2 mL/0.5 mL, respectively). Diisopropylethylamine (22.5  $\mu$ L, 0.13 mmol, 1.0 eq.) was added and the yellow solution stirred while under argon. After 3 h, an additional 1.0 eq. of DIEA was added. 24 hours later, 0.5 eq. of the activated linker was included in the reaction mixture. After 40 h total, the reaction was complete. The contents were evaporated, taken up in DMSO and injected into a prep-HPLC (C<sub>12</sub>-RP column, 5  $\mu$ , 100  $\text{\AA}$ , linear gradient of MeCN in water (containing 0.1 % TFA) 10 to 100 % in 40 min followed by 20 min at 100 %, at a flow rate of 50 mL/min). The desired fractions were evaporated to give the product as a yellow oil. Methylene chloride (ca. 2 mL) and excess ether were added to provide Compound 6 as a white precipitate that was filtered and dried. Yield: 90 mg (52 %). ES-MS *m/z* 1344.32 [M+H]<sup>+</sup>, 1366.29 [M+Na]<sup>+</sup>; UV  $\lambda_{\text{max}}$  215, 248 nm.

**Example 8 - Preparation of compound 7**

7

5

Compound 4 (133 mg, 0.15 mmol, 1 eq.), Compound AB, (123 mg, 0.167 mmol, 1.1 eq.), and HOBT (4 mg, 0.2 eq.) were diluted with DMF (1.5 mL). After 2 min, pyridine (5 mL) was added and the reaction was monitored using RP-HPLC. The reaction was shown to be complete within 18 h. The reaction mixture was diluted with dichloromethane (20 mL), washed successively with 10 % aq. citric acid (2 x 10 mL), water (10 mL), saturated aq. NaCl (10 mL). The organic layer was separated and concentrated. The resulting residue was re-suspended in dichloromethane and was purified via flash chromatography on silica gel in a step gradient 0-10% MeOH in dichloromethane. The relevant fractions were combined and concentrated to provide Compound 7 as a white foam: 46 mg (21 %).  $R_f$  0.15 (10 % MeOH/ $\text{CH}_2\text{Cl}_2$ ). ES-MS  $m/z$  1476.94  $[\text{M}+\text{H}]^+$ .

15

**Example 9 - Preparation of MC-Val-Cit-PAB-MMAF t-butyl ester 8**

8

20

Compound 1 (83 mg, 0.11 mmol), Compound AB (85 mg, 0.12 mmol, 1.1 eq.), and HOBT (2.8 mg, 21  $\mu\text{mol}$ , 0.2 eq.) were taken up in dry DMF (1.5 mL) and pyridine (0.3 mL) while under argon. After 30 h, the reaction was found to be essentially complete by HPLC. The mixture was evaporated, taken up in a minimal amount of

25

WO 2005/081711

PCT/US2004/038392

DMSO and purified by prep-HPLC ( $C_{12}$ -RP column, 5  $\mu$ , 100  $\text{\AA}$ , linear gradient of MeCN in water (containing 0.1% TFA) 10 to 100 % in 40 min followed by 20 min at 100 %, at a flow rate of 25 mL/min) to provide Compound 8 as a white solid. Yield: 103 mg (71%). ES-MS  $m/z$  1387.06  $[M+H]^+$ , 1409.04  $[M+Na]^+$ ; UV  $\lambda_{\max}$  205, 248 nm.

5

**Example 10 - Preparation of MC-val-cit-PAB-MMAF 9**

9

10 Compound 8 (45 mg, 32  $\mu$ mol) was suspended in methylene chloride (6 mL) followed by the addition of TFA (3 mL). The resulting solution stood for 2 h. The reaction mixture was concentrated *in vacuo* and purified by prep-HPLC ( $C_{12}$ -RP column, 5  $\mu$ , 100  $\text{\AA}$ , linear gradient of MeCN in water (containing 0.1% TFA) 10 to 100 % in 40 min followed by 20 min at 100 %, at a flow rate of 25 mL/min). The desired fractions  
 15 were concentrated to provide maleimidocaproyl-valine-citrulline-p-hydroxymethylaminobenzene-MMAF (MC-val-cit-PAB-MMAF) 9 as an off-white solid. Yield: 11 mg (25%). ES-MS  $m/z$  1330.29  $[M+H]^+$ , 1352.24  $[M+Na]^+$ ; UV  $\lambda_{\max}$  205, 248 nm.

**Example 11 - Preparation of MC-val-cit-PAB-MMAF tert-butyl amide 10**

20

10

240

WO 2005/081711

PCT/US2004/038392

Compound 3 (217 mg, 0.276 mmol, 1.0 eq.), Compound AB (204 mg, 0.276 mmol, 1.0 eq.), and HOBt (11 mg, 0.0828 mmol, 0.3 eq.) were diluted with pyridine/DMF (6 mL). To this mixture was added DIEA (0.048 mL), and the mixture was stirred ca. 16 hr. Volatile organics were evaporated *in vacuo*. The crude residue was purified by Chromatotron® (radial thin-layer chromatography) with a step gradient (0-5-10% methanol in DCM) to provide MC-val-cit-PAB-MMAF tert-butyl amide 10. Yield: 172 mg (45 %); ES-MS  $m/z$  1386.33  $[M+H]^+$ , 1408.36  $[M+Na]^+$ ; UV  $\lambda_{max}$  215, 248 nm.

Example 12 - Preparation of AC10-MC-MMAE by conjugation of AC10 and MC-MMAE

AC10, dissolved in 500 mM sodium borate and 500 mM sodium chloride at pH 8.0 is treated with an excess of 100 mM dithiothreitol (DTT). After incubation at 37 °C for about 30 minutes, the buffer is exchanged by elution over Sephadex G25 resin and eluted with PBS with 1mM DTPA. The thiol/Ab value is checked by determining the reduced antibody concentration from the absorbance at 280 nm of the solution and the thiol concentration by reaction with DTNB (Aldrich, Milwaukee, WI) and determination of the absorbance at 412 nm. The reduced antibody dissolved in PBS is chilled on ice.

The drug linker reagent, maleimidocaproyl-monomethyl auristatin E, *i.e.* MC-MMAE, dissolved in DMSO, is diluted in acetonitrile and water at known concentration, and added to the chilled reduced antibody AC10 in PBS. After about one hour, an excess of maleimide is added to quench the reaction and cap any unreacted antibody thiol groups. The reaction mixture is concentrated by centrifugal ultrafiltration and AC10-MC-MMAE is purified and desalted by elution through G25 resin in PBS, filtered through 0.2  $\mu$ m filters under sterile conditions, and frozen for storage.

Example 13 - Preparation of AC10-MC-MMAF by conjugation of AC10 and MC-MMAF

AC10-MC-MMAF was prepared by conjugation of AC10 and MC-MMAF following the procedure of Example 12.

Example 14 - Preparation of AC10-MC-val-cit-PAB-MMAE by conjugation of AC10 and MC-val-cit-PAB-MMAE

AC10-MC-val-cit-PAB-MMAE was prepared by conjugation of AC10 and MC-val-cit-PAB-MMAE following the procedure of Example 12.

**Example 15 - Preparation of AC10-MC- val-cit-PAB-MMAF by conjugation of AC10 and MC-val-cit-PAB-MMAF (9)**

AC10-MC-val-cit-PAB-MMAF was prepared by conjugation of AC10 and MC-val-cit-PAB-MMAF (9) following the procedure of Example 12.

5

**Example 16 - Determination of cytotoxicity of selected compounds**

Cytotoxic activity of MMAF and Compounds 1-5 was evaluated on the Lewis Y positive cell lines OVCAR-3, H3396 breast carcinoma, L2987 lung carcinoma and LS174t colon carcinoma Lewis Y positive cell lines can be assayed for cytotoxicity.

10 To evaluate the cytotoxicity of Compounds 1-5, cells can be seeded at approximately 5 - 10,000 per well in 150  $\mu$ l of culture medium then treated with graded doses of Compounds 1-5 in quadruplicates at the initiation of assay. Cytotoxicity assays are usually carried out for 96 hours after addition of test compounds. Fifty  $\mu$ l of resazurin dye may be added to each well during the last 4 to 6 hours of the incubation to assess viable  
15 cells at the end of culture. Dye reduction can be determined by fluorescence spectrometry using the excitation and emission wavelengths of 535nm and 590nm, respectively. For analysis, the extent of resazurin reduction by the treated cells can be compared to that of the untreated control cells.

For 1 h exposure assays cells can be pulsed with the drug for 1 h and then  
20 washed; the cytotoxic effect can be determined after 96 h of incubation.

**EXAMPLE 17 - *in vitro* cytotoxicity data for selected compounds**

Table 10 shows cytotoxic effect of cAC10 Conjugates of Compounds 7-10, assayed as described in General Procedure I on a CD30+ cell line Karpas 299. Data of two separate experiments are presented. The cAC10 conjugates of Compounds 7 and 9  
25 were found to be slightly more active than cAC10-val-cit-MMAE.

TABLE 10

Conjugate	IC <sub>50</sub> (ng/mL)
cAC10-val-cit-MMAE	6
cAC10-7	1.0
cAC10-8	15
cAC10-9	0.5
cAC10-10	20

WO 2005/081711

PCT/US2004/038392

In other experiments, BR96-val-cit-MMAF was at least 250 fold more potent than the free MMAF.

**General Procedure I - Cytotoxicity determination.** To evaluate the cytotoxicity of Exemplary Conjugates 7-10, cells were seeded at approximately 5 -  
5 10,000 per well in 150  $\mu$ l of culture medium then treated with graded doses of Exemplary Conjugates 7-10 in quadruplicates at the initiation of assay. Cytotoxicity assays were carried out for 96 hours after addition of test compounds. Fifty  $\mu$ l of the resazurin dye was added to each well during the last 4 to 6 hours of the incubation to assess viable cells at  
10 the end of culture. Dye reduction was determined by fluorescence spectrometry using the excitation and emission wavelengths of 535nm and 590nm, respectively. For analysis, the extent of resazurin reduction by the treated cells was compared to that of the untreated control cells.

**Example 18 - In vitro cell proliferation assay**

Efficacy of ADC can be measured by a cell proliferation assay employing  
15 the following protocol (Promega Corp. Technical Bulletin TB288; Mendoza *et al.* (2002) Cancer Res. 62:5485-5488):

1. An aliquot of 100  $\mu$ l of cell culture containing about  $10^4$  cells (SKBR-3, BT474, MCF7 or MDA-MB-468) in medium was deposited in each well of a 96-well, opaque-walled plate.
- 20 2. Control wells were prepared containing medium and without cells.
3. ADC was added to the experimental wells and incubated for 3-5 days.
4. The plates were equilibrated to room temperature for approximately 30 minutes.
5. A volume of CellTiter-Glo Reagent equal to the volume of cell culture medium present in each well was added.
- 25 6. The contents were mixed for 2 minutes on an orbital shaker to induce cell lysis.
7. The plate was incubated at room temperature for 10 minutes to stabilize the luminescence signal.
8. Luminescence was recorded and reported in graphs as RLU = relative luminescence units.

30 **Example 19 - Plasma clearance in rat**

Plasma clearance pharmacokinetics of antibody drug conjugates and total antibody was studied in Sprague-Dawley rats (Charles River Laboratories, 250-275 gms

WO 2005/081711

PCT/US2004/038392

each). Animals were dosed by bolus tail vein injection (IV Push). Approximately 300  $\mu$ l whole blood was collected through jugular cannula, or by tail stick, into lithium/heparin anticoagulant vessels at each timepoint: 0 (predose), 10, and 30 minutes; 1, 2, 4, 8, 24 and 36 hours; and 2, 3, 4, 7, 14, 21, 28 days post dose. Total antibody was measured by  
 5 ELISA - ECD/GxhuFc-HRP. Antibody drug conjugate was measured by ELISA - MMAE/MMAF/ECD-Bio/SA-HRP.

Example 20 - Plasma clearance in monkey

Plasma clearance pharmacokinetics of antibody drug conjugates and total antibody can be studied in cynomolgus monkeys. Figure 12 shows a two-stage plasma  
 10 concentration clearance study after administration of H-MC-vc-MMAE to Cynomolgus monkeys at different doses: 0.5, 1.5, 2.5, and 3.0 mg/kg, administered at day 1 and day 21. Concentrations of total antibody and ADC were measured over time. (H = Trastuzumab).

Example 21 - Tumor volume *in vivo* efficacy in transgenic explant mice

15 Animals suitable for transgenic experiments can be obtained from standard commercial sources such as Taconic (Germantown, N.Y.). Many strains are suitable, but FVB female mice are preferred because of their higher susceptibility to tumor formation. FVB males can be used for mating and vasectomized CD.1 studs can be used to stimulate pseudopregnancy. Vasectomized mice can be obtained from any commercial supplier.  
 20 Founders can be bred with either FVB mice or with 129/BL6 x FVB p53 heterozygous mice. The mice with heterozygosity at p53 allele can be used to potentially increase tumor formation. Some F1 tumors are of mixed strain. Founder tumors can be FVB only.

Animals having tumors (allograft propagated from Fo5 mmtv transgenic  
 25 mice) can be treated with a single or multiple dose by IV injection of ADC. Tumor volume can be assessed at various time points after injection.

Example 22 - Synthesis of MC-MMAF via t-butyl ester

Synthesis 1:

30

MeVal-Val-Dil-Dap-Phe-OtBu, 1001

MC-MeVal-Val-Dil-Dap-Phe-OtBu

MC-MMAF

MeVal-Val-Dil-Dap-Phe-OtBu (compound 1, 128.6 mg, 0.163 mmol) was suspended in  $\text{CH}_2\text{Cl}_2$  (0.500 mL). 6-Maleimidocaproic acid (68.9 mg, 0.326 mmol) and 1,3-diisopropylcarbodiimide (0.0505 mL, 0.326 mmol) were added followed by pyridine (0.500 mL). Reaction mixture was allowed to stir for 1.0 hr. HPLC analysis indicated complete consumption of starting compound 1. Volatile organics were evaporated under reduced pressure. Product was isolated via flash column chromatography, using a step gradient from 0 to 5% Methanol in  $\text{CH}_2\text{Cl}_2$ . A total of 96 mg of pure MC-MeVal-Val-Dil-Dap-Phe-OtBu (12) (60% yield) was recovered. ES-MS  $m/z$  981.26  $[\text{M}+\text{H}]^+$ ; 1003.47  $[\text{M}+\text{Na}]^+$ ; 979.65  $[\text{M}-\text{H}]^-$ .

MC-MeVal-Val-Dil-Dap-Phe-OtBu (Compound 12, 74 mg, 0.0754 mmol) was suspended in  $\text{CH}_2\text{Cl}_2$  (2.0 mL) and TFA (1 mL) at room temperature. After 2.5 hr, HPLC analysis indicated complete consumption of starting material. Volatile organics were evaporated under reduced pressure, and the product was isolated via preparatory RP-HPLC, using a Phenomenex<sup>TM</sup> C<sub>12</sub> Synergi Max-RP 80Å Column (250 x 21.20 mm). Eluent: linear gradient 10% to 90% MeCN/0.05% TFA (aq) over 30 minutes, then isocratic 90% MeCN/0.05% TFA (aq) for an additional 20 minutes. ES-MS  $m/z$  925.33  $[\text{M}+\text{H}]^+$ ; 947.30  $[\text{M}+\text{Na}]^+$ ; 923.45  $[\text{M}-\text{H}]^-$ .

## CLAIMS:

1. An antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof, wherein the conjugate comprises an antibody covalently attached to one or more drug moieties, the antibody-drug conjugate having Formula Ic:

wherein:

Ab is an antibody which binds to CD79b (IGb (immunoglobulin-associated beta), B29);

A is a Stretcher unit;

a is 0 or 1;

each W is independently an Amino Acid unit;

w is an integer ranging from 0 to 12;

Y is a Spacer unit;

y is 0, 1 or 2;

p ranges from 1 to 20;

D has Formula D<sub>E</sub> :

wherein the wavy line of D<sub>E</sub> indicates the covalent attachment site to A, W, Y or Ab, and independently at each location;

R<sup>2</sup> is H or C<sub>1</sub>-C<sub>8</sub> alkyl;

R<sup>3</sup> is H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle, or C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

R<sup>4</sup> is H, C<sub>1</sub>-C<sub>8</sub> alkyl, C<sub>3</sub>-C<sub>8</sub> carbocycle, aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-aryl, C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> carbocycle), C<sub>3</sub>-C<sub>8</sub> heterocycle, or C<sub>1</sub>-C<sub>8</sub> alkyl-(C<sub>3</sub>-C<sub>8</sub> heterocycle);

R<sup>5</sup> is H or methyl;

or R<sup>4</sup> and R<sup>5</sup> jointly form a carbocyclic ring and have the formula -(CR<sup>a</sup>R<sup>b</sup>)<sub>n</sub>- wherein R<sup>a</sup> and R<sup>b</sup> are independently H, C<sub>1</sub>-C<sub>8</sub> alkyl or C<sub>3</sub>-C<sub>8</sub> carbocycle and n is 2, 3, 4, 5, or 6;

$R^6$  is H or  $C_1$ - $C_8$  alkyl;

$R^7$  is H,  $C_1$ - $C_8$  alkyl,  $C_3$ - $C_8$  carbocycle, aryl,  $C_1$ - $C_8$  alkyl-aryl,  $C_1$ - $C_8$  alkyl-( $C_3$ - $C_8$  carbocycle),  $C_3$ - $C_8$  heterocycle, or  $C_1$ - $C_8$  alkyl-( $C_3$ - $C_8$  heterocycle);

each  $R^8$  is independently H, OH,  $C_1$ - $C_8$  alkyl,  $C_3$ - $C_8$  carbocycle, or O-( $C_1$ - $C_8$  alkyl);

$R^9$  is H or  $C_1$ - $C_8$  alkyl; and

$R^{18}$  is  $-C(R^8)_2-C(R^8)_2$ -aryl,  $-C(R^8)_2-C(R^8)_2$ -( $C_3$ - $C_8$  heterocycle), or  $-C(R^8)_2-C(R^8)_2$ -( $C_3$ - $C_8$  carbocycle).

2. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 1, wherein the antibody is a monoclonal antibody, a bispecific antibody, a chimeric antibody, a humanized antibody, or an antibody fragment.

3. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 2, wherein the antibody fragment is a Fab fragment.

4. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 1, 2, or 3, wherein the conjugate has the formula:

wherein  $R^{17}$  is selected from the group consisting of  $C_1$ - $C_{10}$  alkylene-,  $C_3$ - $C_8$  carbocyclo-,  $-O$ -( $C_1$ - $C_8$  alkyl)-,  $-$ arylene-,  $C_1$ - $C_{10}$  alkylene-arylene-,  $-$ arylene- $C_1$ - $C_{10}$  alkylene-,  $C_1$ - $C_{10}$  alkylene-( $C_3$ - $C_8$  carbocyclo)-, ( $C_3$ - $C_8$  carbocyclo)- $C_1$ - $C_{10}$  alkylene-,  $C_3$ - $C_8$  heterocyclo-,  $C_1$ - $C_{10}$  alkylene-( $C_3$ - $C_8$  heterocyclo)-, ( $C_3$ - $C_8$  heterocyclo)- $C_1$ - $C_{10}$  alkylene-,  $-(CH_2CH_2O)_r$ -, and  $-(CH_2CH_2O)_r-CH_2$ -; and  $r$  is an integer ranging from 1 to 11.

5. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 1, 2, or 3, wherein the conjugate has the formula:

6. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of any one of claims 1 to 5, wherein  $w$  is an integer ranging from 2 to 12.

7. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of any one of claims 1 to 5, wherein  $w$  is 2.

8. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of any one of claims 1 to 7, wherein  $W_w$  is -valine-citrulline-.

9. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 1, 2, or 3, wherein  $w$  and  $y$  are each 0 and the conjugate has the formula:

10. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 1, 2, or 3, having the formula:

11. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 1, 2, or 3, having the formula:

12. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 1, 2, or 3, having the formula:

13. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of any one of claims 1 to 12, wherein the antibody is attached to the drug moiety through a cysteine residue of the antibody.

14. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of any one of claims 1 to 12, wherein  $p$  is 2 to 8.

15. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of any one of claims 1 to 14, wherein  $D$  is:

16. An antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof as defined in claim 1, 2, or 3, having the formula:

or

wherein Val is valine and Cit is citrulline.

17. The antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof of claim 16, wherein p is 2 to 8.

18. A pharmaceutical composition for use in treating cancer, an autoimmune disease or an infectious disease comprising an antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof as defined in any one of claims 1 to 17, and a pharmaceutically acceptable diluent, carrier or excipient.

19. The pharmaceutical composition of claim 18, further comprising an additional agent that is an anticancer agent, an immunosuppressant agent or an anti-infectious agent.

20. The pharmaceutical composition of claim 18, further comprising a chemotherapeutic agent that is a tubulin-forming inhibitor, a topoisomerase inhibitor or a DNA binder.

21. The pharmaceutical composition of claim 18, 19, or 20, wherein the cancer is breast, ovarian, stomach, endometrial, salivary gland, lung, kidney, colon, colorectal, thyroid, pancreatic, prostate, bladder, a blood-borne cancer, an acute or chronic leukemia, or a lymphoma.

22. The pharmaceutical composition of any one of claims 18 to 21, formulated to provide an amount of the antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof in the range of 0.1 to 10 mg/kg of patient weight.

23. The pharmaceutical composition of any one of claims 18 to 22, for administration at three week intervals.

24. The pharmaceutical composition of any one of claims 18 to 23, wherein said antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof is formulated with a pharmaceutically acceptable parenteral vehicle for administration parenterally.

25. The pharmaceutical composition of any one of claims 18 to 24, for intravenous administration.

26. A unit dosage injectable form of a pharmaceutical composition as defined in any one of claims 18 to 25.

27. A pharmaceutical preparation comprising (a) an antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof as defined in any one of claims 1 to 17, which binds specifically CD79b and (b) a chemotherapeutic agent for inhibiting growth of tumor cells that overexpress CD79b, which composition is formulated for separate, sequential or simultaneous administration of (a) and (b).

28. An article of manufacture comprising:  
an antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof as defined in any one of claims 1 to 17;  
a container; and  
a package insert or label indicating that the antibody-drug conjugate or pharmaceutically acceptable salt or solvate thereof can be used to treat cancer.
