"FLAVOR DELIVERY SYSTEM FOR FAT FREE FOODS"

10

BACKGROUND OF THE INVENTION

15 The present invention relates generally to
methods for delivery of flavors to food products and
specifically to methods for delivery of fat soluble
flavor compounds to nonfat and low-fat food products in
which fat components have been replaced by non-lipid fat
20 substitutes. With the development of novel nonfat and
low-fat food products such as those described by Singer,
et al. U.S. Patent No. 4,734,287 wherein fats or oils in
food products are replaced by proteinaceous materials,
there has developed a need for the development of
25 compounds or flavor enhancers which can create a natural
flavor impression reproducing that found in conventional
high-fat foods. Full fat products possess a temporal
flavor profile that is characteristically absent in food
products wherein much of the fat is removed in an effort
30 to reduce calories.

 Differences in the efficacy of flavor
components depend to a large degree upon their relative
distributions between the fat and aqueous phases present
in most food products. Patton, S., Flavor Thresholds of
35 Volatile Fatty Acids, J. Food Science, 29, 679-680
(1964) discloses that long-chain volatile fatty acids

- 2 -

have low flavor thresholds in water (i.e., can be detected at low concentrations) and higher flavor thresholds in oil. Aliphatic aldehydes have been shown to demonstrate the same flavor phenomena. See, Lea, C.,
5 and Swoboda, P., The Flavor of Aliphatic Aldehydes, Chem. and Indust., 1958, 1289 (1958). The reverse principle, however, has been known to hold true with respect to short-chain fatty acids. McDaniel, M., et al., Influence of Free Fatty Acids on Sweet Cream Butter
10 Flavor, J. Food Science, 34, 251-253 (1969).

In food products wherein the fat components which are normally present have been replaced by non-lipid substitutes for fat, the retention and natural presentation of flavors associated with fat soluble
15 flavor compounds is difficult due to the absence of fat within which such flavor compounds can be incorporated. Non-lipid fat substitutes which reproduce the organoleptic character of fats and oils tend to retain and present fat soluble flavor compounds in a
20 manner different from fats. Thus, while blends of flavor ingredients have been mixed with various non-caloric and low-caloric carriers in an attempt to flavor low-fat foods, the resulting mixtures provide only a short, intense and fleeting flavor profile wherein
25 flavor components are perceived for only very short periods of time in an unfamiliar or unnatural pattern. Accordingly, the goal of preparing flavoring ingredients which provide to nonfat and low-fat food products the full temporal characteristics of full fat foods has been
30 elusive.

SUMMARY OF THE INVENTION

The present invention provides a system for delivery of fat soluble flavor compounds into nonfat and
35 low-fat food products in which fat components have been replaced by non-lipid fat substitutes so as to reproduce

- 3 -

the natural taste impression of conventional full fat food products. Specifically, the invention provides a system for the delivery of fat soluble flavor compounds through the loading of elevated levels of the flavor compounds into carrier fat globules so that the natural flavor of these compounds can be incorporated into food products while at the same time adding minimal amounts of fat. The invention provides methods for the manufacture and use of the flavor delivery system as well as improved nonfat and low-fat food products comprising the flavor delivery system.

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides a system for the delivery of fat soluble flavor components into nonfat and low-fat food products. The invention relates to the partitioning of flavor components with respect to their solubility in fat and water. Flavor compounds with high solubility in fat can be loaded at elevated levels many times greater than their ordinary concentration into a fat globule. This flavor loaded fat globule acts as a carrier for incorporation into the low-fat food system. The flavor is then released in a more natural and familiar sequence and rate as the fat globules are warmed by the mouth, thereby generating a more natural temporal flavor profile which is characteristic of the flavor profile of conventional high-fat foods. Water soluble flavor components, on the other hand, are readily released in low or nonfat foods for sensory perception resulting in the usual pattern of perception for such components since this process doesn't impede or perturb their pattern of release. Therefore, by increasing the flavor load of these fat soluble compounds into fat globules, the flavor sensation of full fat foods is achieved through the incorporation of only a deminimus amount of fat.

- 4 -

Specifically, the flavor compounds to be incorporated into the nonfat food product are mixed with a fat, such as butterfat, which may be presented as a dairy cream at a temperature above the melting point of the fat. This promotes loading (partitioning) of the fat soluble flavor components into the fat globule. The fat soluble components may be in admixture with water soluble components as is found in many natural flavor extracts with no adverse effects upon the process. High speed mixing of this blend prevents separation of the components and the fat and provides maximum exposure and therefore maximum opportunity for partition. Subsequent homogenization results in an emulsion comprising stabilized fat globules containing the fat soluble flavor compounds. The emulsion is then cooled and may be added to nonfat and low-fat food products for flavor enhancement. The process of loading the fat soluble flavor compounds into the fat globule may be carried out at atmospheric pressure. Alternatively, it may be carried out at elevated pressures such as would be produced in HTST pasteurization equipment. A continuous process could be carried out in which fat soluble flavor compounds and the fat globules could be mixed, homogenized and later cooled under elevated pressure in an HTST pasteurization device.

The fat soluble flavor compounds are loaded into the fat globules at elevated concentrations up to their saturation point. In order to minimize the amount of fat incorporated into a nonfat or low-fat food product in the form of the flavor system, it is generally desired that the level of fat soluble flavor compounds be maximized in the fat globule. Nevertheless, the precise amounts of fat soluble flavor compounds incorporated into the fat globules and the concentrations of fat globules incorporated into food products may be varied according to the circumstances of a particular application.

- 5 -

Fat globules that may serve as a suitable carrier system may be any naturally occurring food grade fat such as, but not limited to, butterfat, beef fat, tallow, vegetable oils and emulsifiers. Preferred fats include butterfat and cholesterol free fats. In addition to comprising food grade fats, the fat globules of the present invention may also be comprised of lipophilic non-caloric fat substitutes. Suitable materials are contemplated to include synthetic fat substitutes such as sucrose polyester materials, natural materials such as jojoba oil and blends thereof together and with food grade fats and oils.

The present invention may be used to deliver virtually any natural or artificial food grade fat soluble flavor component. The invention is particularly useful with vanilla extract, vanillin, starter distillates, lipolyzed oils and botanical extracts.

The invention provides improved nonfat and low-fat food products in which fat components have been replaced by non-lipid fat substitutes. The fat globules comprising the fat soluble flavor compounds may be introduced to the food products at concentrations of less than about 1.0% by weight of the food product. In cases where it is desired to maintain a very low-fat level in the food product, the fat globules may be added at concentrations less than about 0.2% by weight of the food product. Preferred nonfat and low-fat food products include those in which fat components have been replaced by a proteinaceous macrocolloid such as described in U.S. Patent No. 4,734,287. Food products in which the flavoring system is particularly useful include those products which are nonfat or low-fat analogs of ice cream and other frozen dessert products; high acid products such as salad dressings and mayonnaise; solid dairy products such as cheeses and cream cheese; fermented dairy products such as sour

- 6 -

cream and yogurt; dairy products such as milk and cream; semi-solid products such as icings and spreads; whipped toppings and spreads.

5 EXAMPLE 1: FLAVORING OF HIGH-FAT AND LOW-FAT FOODS

According to this example, 50 ml each of skim milk and heavy cream were flavored with 0.5 ml vanilla extract. Taste testing indicated that the mixture of skim milk and vanilla extract had a taste which was
 10 characterized as harsh, intense and fleeting with woody and alcoholic characteristics. The mixture of cream and vanilla extract was characterized as having a much milder, natural and lingering vanilla character, which blended more tightly into the dairy flavor complex of
 15 the cream. This demonstrates the important role played by fat in presenting a flavor impression that is perceived as natural.

20 EXAMPLE 2: VANILLA FLAVOR DELIVERY SYSTEM

According to this example, a vanilla flavor delivery system was formed using heavy cream (% Fat = 43), vanilla extract and a cream flavor was used to make an ice cream-like frozen dessert.

25	<u>Ingredients</u>	<u>Flavor System (%)</u>	<u>Frozen Dessert (%)</u>
	Heavy Cream	55.76	0.58
	Vanilla Extract	28.85	0.30
30	Cream Flavor	<u>15.39</u>	<u>0.16</u>
		100.00	1.04

The ingredients listed above were combined in a jacketed kettle and warmed to 104°F while mixing at a
 35 medium speed in a Dispermat mixer equipped with a 70-90 mm diameter Cowles-type impeller (UMA-Getzmann

- 7 -

GMBH). This mixture was homogenized at 3000 psi and then cooled to 60°F while being mixed by the Dispermat to yield the vanilla flavor delivery system comprising globules of milk fat into which the fat soluble flavor compounds of the vanilla extract and cream flavor were loaded. The flavor delivery system was then added to a fat-free frozen dessert mixture at a concentration of 1.04% (thus adding 0.25% fat to the dessert mixture) and the mixture was frozen and whipped as in the preparation of conventional ice cream. The product so made had a full, rich and lingering vanilla flavor with a natural vanilla character.

EXAMPLE 3: CREAM CHEESE-TYPE PRODUCT

According to this example, a cream cheese-type product in which natural dairy fat had been replaced with a proteinaceous fat substitute was provided with butter and cream flavor by means of a flavor delivery system according to the invention. The flavor delivery system was formed by blending 5 parts (by weight) butter flavor (OTANI) and 5 parts cream flavor (Grindsted) into 500 parts Half and Half (11.7% butterfat, Deans Foods) using a Dispermat mixer at 500 rpm. The cream/flavor mixture was heated to 145°F and was then homogenized at 145°F at 2500 psi using a Rannie High Pressure Homogenizer (Rannie a/s, Albertslund, Denmark) to form the flavor delivery system.

	<u>Ingredients</u>	<u>Source</u>	<u>Parts</u>
30	Farmers Cheese	Michigan Farms	3490
	Pressed Dry Curd Cottage Cheese	Deans	2459
	Proteinaceous Fat Substitute		3300
35	Meyprogat 150 (2%)	Hi-Tek Polymer	60
	Locust Bean Gum 175 (2%)	Hi-Tek Polymer	120

- 8 -

	<u>Ingredients</u>	<u>Source</u>	<u>Parts</u>
	Carageenan CSMI (2%)	Hercules	30
	Salt	Diamond Crystal	30
5	Cream Flavor	Grindsted	5
	Butter Flavor	OTANI	5
	Half and Half (11.7% fat)	Deans	500
	Potassium Sorbate	Tri-K Industries	<u>1</u>
10			10,000

The flavor delivery system was incorporated into a low-fat cream cheese-type product produced according to the following method. Farmers Cheese (3490 parts, Michigan Farms) and Pressed Dry Curd Cottage Cheese (2459 parts, Deans Foods) were ground in a chopper for 15 minutes and transferred to a Dispermat mixer. Proteinaceous fat substitute prepared according to Singer, et al., U.S. Patent No. 4,734,287 was added (3300 parts) to the cheeses in the mixer which were then heated to 165°F. A mixture of prehydrated gums including Meyprogat 150 (2%) (60 parts, Hi-Tek Polymer), locust bean gum 175 (2%) (120 parts, Hi-Tek Polymer) and carageenan CSMI (2%) (30 parts, Hercules) were added to the mixer and blended for one minute. At this time, 30 parts salt (Alberger Fine Flake, Diamond Crystal), the flavor delivery system described above and potassium sorbate (1 part, Tri-K Industries) were added to the mixer. The ingredients were then homogenized at 11,000 psi at 165°F and were packed off at 160°F. The product so produced had the flavor of a conventional cream cheese product.

35 EXAMPLE 4: RANCH DRESSING PRODUCT

According to this example, a ranch dressing product in which natural fat had been replaced with a

- 9 -

proteinaceous fat substitute was provided with a flavor delivery system to improve the lingering aftertaste characteristic which is desired of salad dressings.

	Salt	Diamond Crystal	<u>2050</u>
			100,000

15 The flavor delivery system was formed by
blending fat soluble flavor ingredients with soybean oil
in a Dispermat high speed mixer. To 2000 parts soybean
oil was mixed Liponate GC, a caprylic capric
triglyceride (2 parts, Lipo Chem), mouthfeel flavor
20 (300 parts, IFF 13561188), garlic flavor (10 parts,
Takasago TAK-7516), onion flavor (500 parts, F&C 80841),
celery flavor 0.01% in oil (100 parts, McCormick), mixed
tocopherols (6 parts, Henkel) and dairy flavor
(50 parts, IFF 73568691). The blended ingredients were
25 warmed to 145°F and then homogenized at 2500 psi prior
to being cooled to room temperature.

The flavor delivery system was incorporated
into a low-fat ranch dressing product produced according
to the following method. Cultured low-fat buttermilk
30 and skim milk were added to a batch kettle according to
the proportions presented in the table above. The gums,
starch, maltodextrin, sugar, corn syrup solids, spices,
nonfat milk, monosodium glutamate and potassium sorbate
preservatives were dry-blended in the proportions
35 presented above and were then added to the kettle under
shearing conditions. Proteinaceous fat substitute

- 11 -

prepared according to Singer, et al. U.S. Patent No. 4,734,287 and whole egg were added under shear conditions to blend them into the mixture and the flavor delivery system was then also added.

5 Vinegar, sodium acetate and Givaudan TPS 6551 flavor were then added slowly to acidify the mixture and salt was added. The mixture was homogenized at 2500 psi and was then heated to 180°F and held at that
10 temperature for 30 seconds before being cooled to 165°F and packed off. The product so produced had the flavor of a conventional high-fat ranch dressing product.

 From the foregoing description, one of skill in the art will recognize numerous variations and modifications of the invention to adapt it to particular
15 usages. Consequently, only such limitations should be placed on the invention as appear in the following claims.

20

25

30

35

- 12 -

WHAT IS CLAIMED IS:

1. A method for the delivery of fat soluble flavor compounds into nonfat and low-fat food products in which fat components have been replaced by non-lipid fat substitutes comprising the step of introducing into said food products fat globules comprising elevated levels of fat soluble flavor compounds.
2. The method of claim 1 wherein said fat globules are introduced into said food products at a concentration of less than 1.0% by weight.
3. The method of claim 2 wherein said fat globules are introduced into said food products at a concentration of less than 0.2% by weight.
4. The method of claim 1 wherein said flavor compounds are selected from the group consisting of vanilla extract, vanillin, starter distillates, lipolyzed oils, botanical extracts, natural and artificial fatty flavors.
5. The method of claim 1 wherein said fat globule comprises material selected from the group consisting of butterfat, beef fat, tallow, vegetable oils and emulsifiers.
6. The method of claim 1 wherein said fat globules comprise material selected from the group consisting of sucrose polyesters and jojoba oil.
7. The method of claim 1 wherein said fat globules comprising fat soluble flavor compounds are incorporated in the form of an emulsion.

- 13 -

8. In a nonfat or low-fat food product in which fat components have been replaced by non-lipid fat substitutes, the improvement comprising delivering fat soluble flavor compounds into the food product by
5 introducing into said food product, fat globules comprising elevated levels of fat soluble flavor compounds.

9. The product of claim 8 wherein said fat
10 globules are introduced at a concentration of less than 1.0% by weight.

10. The product of claim 9 wherein said fat
15 globules are introduced at a concentration of less than 0.2% by weight.

11. The product of claim 8 wherein said
flavor compounds are selected from the group consisting
of vanilla extract, starter distillates, lipolyzed oils,
20 botanical extracts, natural and artificial fatty
flavors.

12. The product of claim 8 wherein said fat
globules comprise material selected from the group
25 consisting of butterfat, beef fat, tallow, vegetable
oils and emulsifiers.

13. The product of claim 8 wherein said fat
globules comprise material selected from the group
30 consisting of sucrose polyesters and jojoba oil.

14. The product of claim 8 wherein said fat
globules comprising fat soluble flavor compounds are
incorporated in the form of an emulsion.
35

- 14 -

15. The product of claim 8 wherein said fat substitute is a proteinaceous material.

5 16. The product of claim 8 wherein said product is a frozen desert product.

10 17. The product of claim 8 wherein said product is an analog of a high acid product selected from the group consisting of salad dressings and mayonnaise.

15 18. The product of claim 8 wherein said product is an analog of a solid dairy product selected from the group consisting of cheeses and cream cheese.

20 19. The product of claim 8 wherein said product is an analog of a fermented dairy product selected from the group consisting of sour cream and yogurt.

25 20. The product of claim 8 wherein said product is an analog of a dairy product selected from the group consisting of milk and cream.

30 21. The product of claim 8 wherein said product is an analog of a semi-solid product selected from the group consisting of icings and spreads.

35 22. The product of claim 8 wherein said product is an analog of a whipped topping.

23. The product of claim 8 wherein said product is an analog of a sauce.

24. A system for the delivery of fat soluble flavor compounds into nonfat and low-fat food products

in which fat components have been replaced by non-lipid fat substitutes the system comprising fat globules comprising elevated levels of fat soluble flavor compounds.

5

25. The flavor delivery system of claim 24 wherein said fat soluble flavor compounds are selected from the group consisting of vanilla extract, starter distillates, lipolyzed oils, botanical extracts, natural and artificial fatty flavors.

10

26. The flavor delivery system of claim 24 wherein said fat globule comprises a member selected from the group consisting of butterfat, beef fat, tallow, vegetable oils and emulsifiers.

V. OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE ¹

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. Claim numbers _____, because they relate to subject matter ¹² not required to be searched by this Authority, namely:

2. Claim numbers _____, because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out ¹³, specifically:

3. Claim numbers _____, because they are dependent claims not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ²

This International Searching Authority found multiple inventions in this international application as follows:

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.

2. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:

3. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:

4. As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

The additional search fees were accompanied by applicant's protest.

No protest accompanied the payment of additional search fees.
