## NICOTINIC ALPHA-7 RECEPTOR LIGANDS AND PREPARATION AND USES THEREOF

This application claims the benefit of U. S. Provisional Application Serial No. 60/637,771, filed December 22, 2004, the entire disclosure of which is hereby  
5 incorporated by reference.

### FIELD OF THE INVENTION

The present invention relates generally to the field of ligands for nicotinic acetylcholine receptors (nAChR), activation of nAChRs, and the treatment of disease conditions associated with defective or malfunctioning nicotinic acetylcholine receptors,  
10 especially of the brain. Further, this invention relates to novel compounds, which act as ligands for the  $\alpha 7$  nAChR subtype, methods of preparing such compounds, compositions comprising such compounds, and methods of use thereof.

### BACKGROUND OF THE INVENTION

There are two types of receptors for the neurotransmitter, acetylcholine: muscarinic  
15 receptors and nicotinic receptors, based on the selectivity of action of muscarine and nicotine, respectively. Muscarinic receptors are G-protein coupled receptors. Nicotinic receptors are members of the ligand-gated ion channel family. When activated, the conductance of ions across the nicotinic ion channels increases.

Nicotinic alpha-7 receptor protein forms a homo-pentameric channel in vitro that is  
20 highly permeable to a variety of cations (e.g.,  $\text{Ca}^{++}$ ). Each nicotinic alpha-7 receptor has four transmembrane domains, named M1, M2, M3, and M4. The M2 domain has been suggested to form the wall lining the channel. Sequence alignment shows that nicotinic alpha-7 is highly conserved during evolution. The M2 domain that lines the channel is identical in protein sequence from chicken to human. For discussions of the alpha-7  
25 receptor, see, e.g., Revah et al. (1991), *Nature*, 353, 846-849; Galzi et al. (1992), *Nature* 359, 500-505; Fucile et al. (2000), *PNAS* 97(7), 3643-3648; Briggs et al. (1999), *Eur. J.*

*Pharmacol.* 366 (2-3), 301-308; and Gopalakrishnan et al. (1995), *Eur. J. Pharmacol.* 290(3), 237-246.

The nicotinic alpha-7 receptor channel is expressed in various brain regions and is believed to be involved in many important biological processes in the central nervous system (CNS), including learning and memory. Nicotinic alpha-7 receptors are localized on both presynaptic and postsynaptic terminals and have been suggested to be involved in modulating synaptic transmission. It is therefore of interest to develop novel compounds, which act as ligands for the  $\alpha 7$  nAChR subtype, for the treatment of disease conditions associated with defective or malfunctioning nicotinic acetylcholine receptors.

### SUMMARY OF THE INVENTION

Preferred aspects include pharmaceutical compositions comprising a compound of this invention and a pharmaceutically acceptable carrier and, optionally, another active agent as discussed below; a method of stimulating or activating inhibiting alpha-7 nicotinic receptors, e.g., as determined by a conventional assay or one described herein, either *in vitro* or *in vivo* (in an animal, e.g., in an animal model, or in a mammal or in a human); a method of treating a neurological syndrome, e.g., loss of memory, especially long-term memory, cognitive impairment or decline, memory impairment, etc. method of treating a disease state modulated by nicotinic alpha-7 activity, in a mammal, e.g., a human, e.g., those mentioned herein.

The compounds of the present invention may be prepared conventionally. Some of the known processes that can be used are described below. All starting materials are known or can be conventionally prepared from known starting materials.

The synthesis of similar compounds is disclosed in copending U.S. applications Serial No. 10/669,645, filed September 25, 2003, and Serial No. 11/089,544, filed March 25, 2005, the entire disclosures of which are hereby incorporated by reference.

Acids that can be used in the preparation of the bicyclobase esters are commercially available, can be prepared by known procedures described in the literature, or as described below. For example, 7-trifluoromethoxyindazole-3-carboxylic acid is commercially available. 5-Nitroindazole-3-acid can be prepared by nitration of indazole-3-acid (Kamm, O.; Segur, J.B. *Org. Syn. Coll. Vol 1*. 1941, 372). Bromoindazole acids and 5-trifluoromethoxyindazole-3-acid can be prepared from the corresponding isatins by basic hydrolysis, diazotization, and reduction (Snyder, H.R.; et al. *J. Am. Chem. Soc.* 1952, 74, 2009). 3-Substituted benzisothiazolecarboxylic acids can be prepared from the corresponding thiophenols by reaction with oxalyl chloride and aluminum chloride followed by treatment with hydroxylamine, hydrogen peroxide, and sodium hydroxide. The thiazole substituted indazole acids can be prepared from the bromoindazole acids by

esterification, palladium mediated cross-coupling with the requisite thiazole zinc reagent (Reeder, M.R.; et. al. *Org. Proc. Res. Devel.* **2003**, 7, 696), and saponification. The oxazole substituted indazole acids were prepared in a similar manner. The dihydropyran and tetrahydropyran substituted indazole acids can be prepared from the bromo acids by esterification, metal-halogen exchange and trapping with tetrahydropyran-4-one, followed by acid-mediated dehydration or reduction under acidic conditions. Some substituted indazole-3-acids were prepared from simple benzene derivatives. For example, 5-difluoromethoxyindazole-3-acid was prepared from 3-bromo-4-nitrophenol by reaction with ethyl difluoroacetate, reaction with diethyl malonate, decarboxylative saponification, esterification, reduction of the nitro group, and diazotization. 6-Difluoromethoxyindazole-3-acid was prepared in a similar manner from 2-bromo-5-difluoromethoxynitrobenzene. The 2-bromo-5-difluoromethoxynitrobenzene used in that preparation was prepared from 4-nitrophenol by ether formation, nitro reduction with concomitant protection as the amide, nitration, amide hydrolysis, and a Sandmeyer reaction with copper (I) bromide. The bicycloamine used to prepare the amide derivatives was readily prepared from quinuclidinone by reaction with tosylmethyloisocyanide followed by reduction.

The bicyclobase esters can be prepared by the coupling reaction of acids with the bicycloalcohol using triphenylphosphine and diisopropyl azodicarboxylate. (Ahn, C.; Correia, R.; DeShong, P. *J. Org. Chem.*, **2002**, 67, 1751). Alternatively, the bicyclobase esters can be prepared by the reaction of the acids with the bicycloalcohol in the presence of either *p*-toluenesulfonyl chloride or oxalyl chloride in pyridine. (Brewster, J. H.; Ciotti Jr., C. J. *J. Am. Chem. Soc.*, **1955**, 77, 6214). The bicyclobase amides can be prepared by the coupling reaction of acids with the bicycloamine and HBTU, HATU, or HOBt and EDCI in DMF, or by converting the acids to the corresponding acid chloride and then reaction with the bicycloamine (Macor, J.E.; Gurley, D.; Lanthorn, T.; Loch, J.; Mack, R.A.; Mullen, G.; Tran, O.; Wright, N.; Macor, J.E. *Bioorg. Med. Chem. Lett.* **2001**, 9, 319-321). The couplings are generally performed at 0 °C and maintained at room temperature for 18-24 hours. The resultant adducts can be isolated and purified by standard techniques, such as chromatography or recrystallization, practiced by those skilled in the art.

One of ordinary skill in the art will recognize that compounds of Formulas I, IA, and IB can exist in different tautomeric and geometrical isomeric forms. All of these compounds, including *cis* isomers, *trans* isomers, diastereomic mixtures, racemates, nonracemic mixtures of enantiomers, substantially pure, and pure enantiomers, are within the scope of the present invention. Substantially pure enantiomers contain no more than 5% w/w of the corresponding opposite enantiomer, preferably no more than 2%, most preferably no more than 1%.

The optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, for example, by the formation of diastereoisomeric salts using an optically active acid or base or formation of covalent diastereomers. Examples of appropriate acids are tartaric, diacetyltartaric, dibenzoyltartaric, ditoluoyltartaric and camphorsulfonic acid. Mixtures of diastereoisomers can be separated into their individual diastereomers on the basis of their physical and/or chemical differences by methods known to those skilled in the art, for example, by chromatography or fractional crystallization. The optically active bases or acids are then liberated from the separated diastereomeric salts. A different process for separation of optical isomers involves the use of chiral chromatography (e.g., chiral HPLC columns), with or without conventional derivatization, optimally chosen to maximize the separation of the enantiomers. Suitable chiral HPLC columns are manufactured by Diacel, e.g., Chiracel OD and Chiracel OJ among many others, all routinely selectable. Enzymatic separations, with or without derivitization, are also useful. The optically active compounds of Formulas I, IA, and IB can likewise be obtained by utilizing optically active starting materials in chiral synthesis processes under reaction conditions which do not cause racemization.

In addition, one of ordinary skill in the art will recognize that the compounds can be used in different enriched isotopic forms, e.g., enriched in the content of  $^2\text{H}$ ,  $^3\text{H}$ ,  $^{11}\text{C}$ ,  $^{13}\text{C}$  and/or  $^{14}\text{C}$ . In one particular embodiment, the compounds are deuterated. Such deuterated forms can be made the procedure described in U.S. Patent Nos. 5,846,514 and 6,334,997. As described in U.S. Patent Nos. 5,846,514 and 6,334,997, deuteration can improve the efficacy and increase the duration of action of drugs.

Deuterium substituted compounds can be synthesized using various methods such as described in: Dean, Dennis C.; Editor. Recent Advances in the Synthesis and Applications of Radiolabeled Compounds for Drug Discovery and Development. [In: Curr., Pharm. Des., 2000; 6(10)] (2000), 110 pp. CAN 133:68895 AN 2000:473538

Where applicable, the present invention also relates to useful forms of the compounds as disclosed herein, such as base free forms, and pharmaceutically acceptable salts or prodrugs of all the compounds of the present invention for which salts or prodrugs can be prepared. Pharmaceutically acceptable salts include those obtained by  
15 reacting the main compound, functioning as a base with an inorganic or organic acid to form a salt, for example, salts of hydrochloric acid, sulfuric acid, phosphoric acid, methane sulfonic acid, camphor sulfonic acid, oxalic acid, maleic acid, succinic acid, citric acid, formic acid, hydrobromic acid, benzoic acid, tartaric acid, fumaric acid, salicylic acid, mandelic acid, and carbonic acid. Pharmaceutically acceptable salts also  
20 include those in which the main compound functions as an acid and is reacted with an appropriate base to form, e.g., sodium, potassium, calcium, magnesium, ammonium, and choline salts. Those skilled in the art will further recognize that acid addition salts of the claimed compounds may be prepared by reaction of the compounds with the appropriate inorganic or organic acid via any of a number of known methods. Alternatively, alkali  
25 and alkaline earth metal salts can be prepared by reacting the compounds of the invention with the appropriate base via a variety of known methods.

The following are further examples of acid salts that can be obtained by reaction with inorganic or organic acids: acetates, adipates, alginates, citrates, aspartates, benzoates, benzenesulfonates, bisulfates, butyrates, camphorates, digluconates,  
30 cyclopentanepropionates, dodecylsulfates, ethanesulfonates, glucoheptanoates,

glycerophosphates, hemisulfates, heptanoates, hexanoates, fumarates, hydrobromides, hydroiodides, 2-hydroxy-ethanesulfonates, lactates, maleates, methanesulfonates, nicotines, 2-naphthalenesulfonates, oxalates, palmoates, pectinates, persulfates, 3-phenylpropionates, picrates, pivalates, propionates, succinates, tartrates, thiocyanates, 5 tosylates, mesylates and undecanoates.

For example, the pharmaceutically acceptable salt can be a hydrochloride, a hydrobromide, a hydroformate, a maleate, or an alkylbenzenesulfonate salt (e.g., a C<sub>1</sub>-4-alkylbenzenesulfonate salt such as 4-methylbenzenesulfonate salt).

Preferably, the salts formed are pharmaceutically acceptable for administration to 10 mammals. However, pharmaceutically unacceptable salts of the compounds are suitable as intermediates, for example, for isolating the compound as a salt and then converting the salt back to the free base compound by treatment with an alkaline reagent. The free base can then, if desired, be converted to a pharmaceutically acceptable acid addition salt.

One of ordinary skill in the art will also recognize that some of the compounds of 15 Formulas I, IA, and IB can exist in different polymorphic forms. As known in the art, polymorphism is an ability of a compound to crystallize as more than one distinct crystalline or "polymorphic" species. A polymorph is a solid crystalline phase of a compound with at least two different arrangements or polymorphic forms of that compound molecule in the solid state. Polymorphic forms of any given compound are 20 defined by the same chemical formula or composition and are as distinct in chemical structure as crystalline structures of two different chemical compounds.

One of ordinary skill in the art will further recognize that compounds of Formulas I, IA, and IB can exist in different solvate forms. Solvates of the compounds of the invention may also form when solvent molecules are incorporated into the crystalline 25 lattice structure of the compound molecule during the crystallization process.

The compounds of the invention can be administered alone or as an active ingredient of a formulation. Thus, the present invention also includes pharmaceutical

compositions of compounds of Formulas I, IA, or IB, containing, for example, one or more pharmaceutically acceptable carriers.

Numerous standard references are available that describe procedures for preparing various formulations suitable for administering the compounds according to the invention. Examples of potential formulations and preparations are contained, for example, in the Handbook of Pharmaceutical Excipients, American Pharmaceutical Association (current edition); Pharmaceutical Dosage Forms: Tablets (Lieberman, Lachman and Schwartz, editors) current edition, published by Marcel Dekker, Inc., as well as Remington's Pharmaceutical Sciences (Arthur Osol, editor), 1553-1593 (current edition).

In view of their alpha-7 stimulating activity and, preferably their high degree of selectivity, the compounds of the present invention can be administered to anyone needing stimulation of alpha-7 receptors. Administration may be accomplished according to patient needs, for example, orally, nasally, parenterally (subcutaneously, intravenously, intramuscularly, intrasternally and by infusion) by inhalation, rectally, vaginally, topically and by ocular administration.

Various solid oral dosage forms can be used for administering compounds of the invention including such solid forms as tablets, gelcaps, capsules, caplets, granules, lozenges and bulk powders. The compounds of the present invention can be administered alone or combined with various pharmaceutically acceptable carriers, diluents (such as sucrose, mannitol, lactose, starches) and excipients known in the art, including but not limited to suspending agents, solubilizers, buffering agents, binders, disintegrants, preservatives, colorants, flavorants, lubricants and the like. Time release capsules, tablets and gels are also advantageous in administering the compounds of the present invention.

Various liquid oral dosage forms can also be used for administering compounds of the inventions, including aqueous and non-aqueous solutions, emulsions, suspensions, syrups, and elixirs. Such dosage forms can also contain suitable inert diluents known in the art such as water and suitable excipients known in the art such as preservatives, wetting agents, sweeteners, flavorants, as well as agents for emulsifying and/or

suspending the compounds of the invention. The compounds of the present invention may be injected, for example, intravenously, in the form of an isotonic sterile solution. Other preparations are also possible.

Suppositories for rectal administration of the compounds of the present invention  
5 can be prepared by mixing the compound with a suitable excipient such as cocoa butter, salicylates and polyethylene glycols. Formulations for vaginal administration can be in the form of a pessary, tampon, cream, gel, past foam, or spray formula containing, in addition to the active ingredient, such suitable carriers as are known in the art.

For topical administration the pharmaceutical composition can be in the form of  
10 creams, ointments, liniments, lotions, emulsions, suspensions, gels, solutions, pastes, powders, sprays, and drops suitable for administration to the skin, eye, ear or nose. Topical administration may also involve transdermal administration via means such as transdermal patches.

Aerosol formulations suitable for administering via inhalation also can be made.  
15 For example, for treatment of disorders of the respiratory tract, the compounds according to the invention can be administered by inhalation in the form of a powder (e.g., micronized) or in the form of atomized solutions or suspensions. The aerosol formulation can be placed into a pressurized acceptable propellant.

The compounds can be administered as the sole active agent or in combination  
20 with other pharmaceutical agents such as other agents used in the treatment of cognitive impairment and/or memory loss, e.g., other  $\alpha$ -7 agonists, PDE4 inhibitors, calcium channel blockers, muscarinic m1 and m2 modulators, adenosine receptor modulators, ampakines NMDA-R modulators, mGluR modulators, dopamine modulators, serotonin modulators, cannabinoid modulators, and cholinesterase inhibitors (e.g., donepezil,  
25 rivastigimin and glanthanamine). In such combinations, each active ingredient can be administered either in accordance with their usual dosage range or a dose below their usual dosage range.

The compounds of the invention can be used in conjunction with “positive modulators” which enhance the efficacy of nicotinic receptor agonists. See, e.g., the positive modulators disclosed in WO 99/56745, WO 01/32619, and WO 01/32622. Such combinational therapy can be used in treating conditions/diseases associated with reduced  
5 nicotinic transmission.

Further the compounds may be used in conjunction with compounds that bind to A $\beta$  peptides and thereby inhibit the binding of the peptides to  $\alpha$ 7nAChR subtypes. See, e.g., WO 99/62505.

The compounds of the present invention are nicotinic alpha-7 ligands, preferably  
10 agonists, especially partial agonists, for the alpha-7 nicotinic acetylcholine receptor. Assays for determining nicotinic acetylcholine activity are known within the art. See, e.g., Davies, A.R., et al., Characterisation of the binding of [3H]methylycaconitine: a new radioligand for labelling alpha 7-type neuronal nicotinic acetylcholine receptors. *Neuropharmacology*, 1999. 38(5): p. 679-90. As agonists for  $\alpha$ -7 nAChRs, the  
15 compounds are useful in the prophylaxis and treatment of a variety of diseases and conditions associated with the central nervous system. Nicotinic acetylcholine receptors are ligand-gastrol ion-channel receptors that are composed of five subunit proteins which form a central ion-conducting pore. Presently, there are eleven known neuronal nAChR subunits ( $\alpha$ 2 -  $\alpha$ 9 and  $\beta$ 2 -  $\beta$ 4). There are also five further subunits expressed in the  
20 peripheral nervous system ( $\alpha$ 1,  $\beta$ 1,  $\gamma$ ,  $\delta$ ,  $\epsilon$ ).

The nAChR receptor subtypes can be homopentameric or heteropentameric. The subtype which has received considerable attention is the homopentameric  $\alpha$ 7 receptor subtype formed from five  $\alpha$ 7 subunits. The  $\alpha$ 7nAChRs exhibit a high affinity for nicotine (agonist) and for  $\alpha$ -bungarotoxin (antagonist). Studies have shown the  $\alpha$ 7-nAChR  
25 agonists can be useful in the treatment of psychotic diseases, neurodegenerative diseases, and cognitive impairments, among other things. While nicotine is a known agonist, there is a need for the development of other  $\alpha$ 7-nAChR agonists, especially selective agonists, that are less toxic or exhibit fewer side effects than nicotine.

The compound anabaseine, i.e., 2-(3-pyridyl)-3,4,5,6-tetrahydropyridine is a naturally occurring toxin in certain marine worms (nemertine worms) and ants. See, e.g., Kem et al., *Toxicon*, 9:23, 1971. Anabaseine is a potent activator of mammalian nicotinic receptors. See e.g., Kem, *Amer. Zoologist*, 25, 99, 1985. Certain anabaseine analogs such as anabasine and DMAB (3-[4-(dimethylamino)benzylidene]-3,4,5,6-tetrahydro-2',3'-bipyridine) are also known nicotinic receptor agonists. See, e.g., US 5,602,257 and WO 92/15306. One particular anabaseine analog, (E-3-[2,4-dimethoxybenzylidene]-anabaseine, also known as GTS-21 and DMXB (see e.g., US 5,741,802), is a selective partial  $\alpha 7$ -nAChR agonist that has been studied extensively. For example, abnormal sensory inhibition is a sensory processing deficit in schizophrenics and GTS-21 has been found to increase sensory inhibition through interaction with  $\alpha 7$ -nAChRs. See, e.g., Stevens et al., *Psychopharmacology*, 136: 320-27 (1998).

Another compound which is known to be a selective  $\alpha 7$ -nAChR agonist is Tropisetron, i.e., 1 $\alpha$ H, 5 $\alpha$ H-tropan-3 $\alpha$ -yl indole-3-carboxylate. See J. E. Macor et al., The 5-HT<sub>3</sub>-Antagonist Tropisetron (ICS 205-930) is a Potent and Selective A7 Nicotinic Receptor Partial Agonist. *Bioorg. Med. Chem. Lett.* 2001, 319-321).

The present invention further includes methods of treatment that involve activation of  $\alpha$ -7 nicotinic receptors. Thus, the present invention includes methods of selectively activating/stimulating  $\alpha$ -7 nicotinic receptors in animals, e.g., mammals, especially humans, wherein such activation/stimulation has a therapeutic effect, such as where such activation may relieve conditions involving neurological syndromes, such as the loss of memory, especially long-term memory. In accordance with a method aspect of the invention there is provided a method for the treatment or prophylaxis of a disease or condition resulting from dysfunction of  
5 nicotinic acetylcholine receptor transmission in a mammal, e.g. a human, comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

In accordance with a method aspect of the invention there is provided a method for the treatment or prophylaxis of a disease or condition resulting from defective or malfunctioning nicotinic acetylcholine receptors, particularly  $\alpha 7$ nACh receptors, in a

In accordance with a method aspect of the invention there is provided a method for the treatment or prophylaxis of a disease or condition resulting from suppressed nicotinic acetylcholine receptor transmission in a mammal, e.g., a human, comprising  
15 administering an amount of a compound according to Formulas I, IA, or IB effective to activate  $\alpha 7$ nACh receptors.

In accordance with another method aspect of the invention there is provided a method for the treatment or prophylaxis of a psychotic disorder, a cognition impairment (e.g., memory impairment), or neurodegenerative disease in a mammal, e.g., a human,  
20 comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

In accordance with another method aspect of the invention there is provided a method for the treatment or prophylaxis of a disease or condition resulting from loss of cholinergic synapses in a mammal, e.g., a human, comprising administering an effective  
25 amount of a compound according to Formulas I, IA, or IB.

In accordance with another method aspect of the invention there is provided a method for the treatment or prophylaxis of a neurodegenerative disorder by activation of

$\alpha 7$ nACh receptors in a mammal, e.g., a human, comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

In accordance with another method aspect of the invention there is provided a method for protecting neurons in a mammal, e.g., a human, from neurotoxicity induced  
5 by activation of  $\alpha 7$ nACh receptors comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

In accordance with another method aspect of the invention there is provided a method for the treatment or prophylaxis of a neurodegenerative disorder by inhibiting the  
10 binding of A $\beta$  peptides to  $\alpha 7$ nACh receptors in a mammal, e.g., a human, comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

In accordance with another method aspect of the invention there is provided a method for protecting neurons in a mammal, e.g., a human, from neurotoxicity induced  
by A $\beta$  peptides comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

15 In accordance with another method aspect of the invention there is provided a method for alleviating inhibition of cholinergic function induced by A $\beta$  peptides in a mammal, e.g., a human, comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

Agents that bind to nicotinic acetylcholine receptors have been indicated as useful  
20 in the treatment and/or prophylaxis of various diseases and conditions, particularly psychotic diseases, neurodegenerative diseases involving a dysfunction of the cholinergic system, and conditions of memory and/or cognition impairment, including, for example, schizophrenia, anxiety, mania, depression, manic depression [examples of psychotic disorders], Tourette's syndrome, Parkinson's disease, Huntington's disease [examples of  
25 neurodegenerative diseases], cognitive disorders (such as Alzheimer's disease, Lewy Body Dementia, Amyotrophic Lateral Sclerosis, memory impairment, memory loss, cognition deficit, attention deficit, Attention Deficit Hyperactivity Disorder), and other uses such as treatment of nicotine addiction, inducing smoking cessation, treating pain

(i.e., analgesic use), providing neuroprotection, treating jetlag, treating inflammation, and treating sepsis. See, e.g., WO 97/30998; WO 99/03850; WO 00/42044; WO 01/36417; Holladay et al., *J. Med. Chem.*, 40:26, 4169-94 (1997); Schmitt et al., *Annual Reports Med. Chem.*, Chapter 5, 41-51 (2000); Stevens et al., *Psychopharmacology*, (1998) 136: 320-27 (1998); and Shytle et al., *Molecular Psychiatry*, (2002), 7, pp. 525-535.

Thus, in accordance with the invention, there is provided a method of treating a patient, especially a human, suffering from psychotic diseases, neurodegenerative diseases involving a dysfunction of the cholinergic system, and conditions of memory and/or cognition impairment, including, for example, schizophrenia, anxiety, mania, depression, manic depression [examples of psychotic disorders], Tourette's syndrome, Parkinson's disease, Huntington's disease [examples of neurodegenerative diseases], and/or cognitive disorders (such as Alzheimer's disease, Lewy Body Dementia, Amyotrophic Lateral Sclerosis, memory impairment, memory loss, cognition deficit, attention deficit, Attention Deficit Hyperactivity Disorder) comprising administering to the patient an effective amount of a compound according to Formulas I, IA, or IB.

Neurodegenerative disorders included within the methods of the present invention include, but are not limited to, treatment and/or prophylaxis of Alzheimer's diseases, Pick's disease, diffuse Lewy Body disease, progressive supranuclear palsy (Steel-Richardson syndrome), multisystem degeneration (Shy-Drager syndrome), motor neuron diseases including amyotrophic lateral sclerosis, degenerative ataxias, cortical basal degeneration, ALS-Parkinson's-Dementia complex of Guam, subacute sclerosing panencephalitis, Huntington's disease, Parkinson's disease, synucleinopathies, primary progressive aphasia, striatonigral degeneration, Machado-Joseph disease/spinocerebellar ataxia type 3, olivopontocerebellar degenerations, Gilles De La Tourette's disease, bulbar, pseudobulbar palsy, spinal muscular atrophy, spinobulbar muscular atrophy (Kennedy's disease), primary lateral sclerosis, familial spastic paraplegia, Werdnig-Hoffmann disease, Kugelberg-Welander disease, Tay-Sach's disease, Sandhoff disease, familial spastic disease, Wohlfart-Kugelberg-Welander disease, spastic paraparesis, progressive multifocal leukoencephalopathy, prion diseases (such as Creutzfeldt-Jakob, Gerstmann-Sträussler-Scheinker disease, Kuru and fatal familial insomnia), and neurodegenerative

disorders resulting from cerebral ischemia or infarction including embolic occlusion and thrombotic occlusion as well as intracranial hemorrhage of any type (including, but not limited to, epidural, subdural, subarachnoid and intracerebral), and intracranial and intravertebral lesions (including, but not limited to, contusion, penetration, shear,  
5 compression and laceration).

In addition,  $\alpha$ -7nAChRs agonists, such as the compounds of the present invention can be used to treat age-related dementia and other dementias and conditions with memory loss including age-related memory loss, senility, vascular dementia, diffuse white matter disease (Binswanger's disease), dementia of endocrine or metabolic origin,  
10 dementia of head trauma and diffuse brain damage, dementia pugilistica and frontal lobe dementia. See, e.g., WO 99/62505. Thus, in accordance with the invention, there is provided a method of treating a patient, especially a human, suffering from age-related dementia and other dementias and conditions with memory loss comprising administering to the patient an effective amount of a compound according to Formulas I, IA, or IB.

Thus, in accordance with a further embodiment, the present invention includes  
15 methods of treating patients suffering from memory impairment due to, for example, mild cognitive impairment due to aging, Alzheimer's disease, schizophrenia, Parkinson's disease, Huntington's disease, Pick's disease, Creutzfeldt-Jakob disease, depression, aging, head trauma, stroke, CNS hypoxia, cerebral senility, multiinfarct dementia and  
20 other neurological conditions, as well as HIV and cardiovascular diseases, comprising administering an effective amount of a compound according to Formulas I, IA, or IB.

Amyloid precursor protein (APP) and A $\beta$  peptides derived therefrom, e.g., A $\beta$ <sub>1-40</sub>, A $\beta$ <sub>1-42</sub>, and other fragments, are known to be involved in the pathology of Alzheimer's disease. The A $\beta$ <sub>1-42</sub> peptides are not only implicated in neurotoxicity but also are known  
25 to inhibit cholinergic transmitter function. Further, it has been determined that A $\beta$  peptides bind to  $\alpha$ -7 nAChRs. Thus, agents which block the binding of the A $\beta$  peptides to  $\alpha$ -7 nAChRs are useful for treating neurodegenerative diseases. See, e.g., WO 99/62505. In addition, stimulation  $\alpha$ -7 nAChRs can protect neurons against cytotoxicity associated with A $\beta$  peptides. See, e.g., Kihara, T. et al., Ann. Neurol., 1997, 42, 159.

Thus, in accordance with an embodiment of the invention there is provided a method of treating and/or preventing dementia in an Alzheimer's patient which comprises administering to the subject a therapeutically effective amount of a compound according to Formulas I, IA, or IB to inhibit the binding of an amyloid beta peptide (preferably,  $A\beta_{1-42}$ ) with nAChRs, preferable  $\alpha$ -7 nAChRs, most preferably, human  $\alpha$ -7 nAChRs (as well as a method for treating and/or preventing other clinical manifestations of Alzheimer's disease that include, but are not limited to, cognitive and language deficits, apraxias, depression, delusions and other neuropsychiatric symptoms and signs, and movement and gait abnormalities).

10 The present invention also provides methods for treating other amyloidosis diseases, for example, hereditary cerebral angiopathy, nonneuropathic hereditary amyloid, Down's syndrome, macroglobulinemia, secondary familial Mediterranean fever, Muckle-Wells syndrome, multiple myeloma, pancreatic- and cardiac-related amyloidosis, chronic hemodialysis neuropathy, and Finnish and Iowa amyloidosis.

15 In addition, nicotinic receptors have been implicated as playing a role in the body's response to alcohol ingestion. Thus, agonists for  $\alpha$ -7nAChR's can be used in the treatment of alcohol withdrawal and in anti-intoxication therapy. Thus, in accordance with an embodiment of the invention there is provided a method of treating a patient for alcohol withdrawal or treating a patient with anti-intoxication therapy comprising  
20 administering to the patient an effective amount of a compound according to Formulas I, IA, or IB.

Agonists for the  $\alpha$ -7nAChR subtypes can also be used for neuroprotection against damage associated with strokes and ischemia and glutamate-induced excitotoxicity. Thus, in accordance with an embodiment of the invention there is provided a method of  
25 treating a patient to provide for neuroprotection against damage associated with strokes and ischemia and glutamate-induced excitotoxicity comprising administering to the patient an effective amount of a compound according to Formulas I, IA, or IB.

As noted above, agonists for the  $\alpha$ -7nAChR subtypes can also be used in the treatment of nicotine addiction, inducing smoking cessation, treating pain, and treating

jetlag, obesity, diabetes, inflammation, and sepsis. Thus, in accordance with an embodiment of the invention there is provided a method of treating a patient suffering from nicotine addiction, pain, jetlag, obesity and/or diabetes, or a method of inducing smoking cessation in a patient comprising administering to the patient an effective amount of a compound according to Formulas I, IA, or IB.

The inflammatory reflex is an autonomic nervous system response to an inflammatory signal. Upon sensing an inflammatory stimulus, the autonomic nervous system responds through the vagus nerve by releasing acetylcholine and activating nicotinic  $\alpha 7$  receptors on macrophages. These macrophages in turn release cytokines. Dysfunctions in this pathway have been linked to human inflammatory diseases including rheumatoid arthritis, diabetes and sepsis. Macrophages express the nicotinic  $\alpha 7$  receptor and it is likely this receptor that mediates the cholinergic anti-inflammatory response. Therefore, compounds with affinity for the  $\alpha 7$ nACh receptor on macrophages may be useful for human inflammatory diseases including rheumatoid arthritis, diabetes and sepsis. See, e.g., Czura, C J et al., J. Intern. Med., 2005, 257(2), 156-66.

Thus, in accordance with an embodiment of the invention there is provided a method of treating a patient (e.g., a mammal, such as a human) suffering from an inflammatory disease, such as, but not limited to, rheumatoid arthritis, diabetes or sepsis, comprising administering to the patient an effective amount of a compound according to Formulas I, IA, or IB.

In addition, due to their affinity to  $\alpha 7$ nAChR's, labeled derivatives of the compounds of Formulas I, IA, or IB (e.g.,  $C^{11}$  or  $F^{18}$  labelled derivatives), can be used in neuroimaging of the receptors within, e.g., the brain. Thus, using such labeled agents in vivo imaging of the receptors can be performed using, e.g., PET imaging.

The condition of memory impairment is manifested by impairment of the ability to learn new information and/or the inability to recall previously learned information. Memory impairment is a primary symptom of dementia and can also be a symptom associated with such diseases as Alzheimer's disease, schizophrenia, Parkinson's disease,

Huntington's disease, Pick's disease, Creutzfeldt-Jakob disease, HIV, cardiovascular disease, and head trauma as well as age-related cognitive decline.

Thus, in accordance with an embodiment of the invention there is provided a method of treating a patient suffering from, for example, mild cognitive impairment  
5 (MCI), vascular dementia (VaD), age-associated cognitive decline (AACD), amnesia associated w/open-heart-surgery, cardiac arrest, and/or general anesthesia, memory deficits from early exposure of anesthetic agents, sleep deprivation induced cognitive impairment, chronic fatigue syndrome, narcolepsy, AIDS-related dementia, epilepsy-related cognitive impairment, Down's syndrome, Alcoholism related dementia,  
10 drug/substance induced memory impairments, Dementia Puglistica (Boxer Syndrome), and animal dementia (e.g., dogs, cats, horses, etc.) patient comprising administering to the patient an effective amount of a compound according to Formulas I, IA, or IB.

The dosages of the compounds of the present invention depend upon a variety of factors including the particular syndrome to be treated, the severity of the symptoms, the  
15 route of administration, the frequency of the dosage interval, the particular compound utilized, the efficacy, toxicology profile, pharmacokinetic profile of the compound, and the presence of any deleterious side-effects, among other considerations.

The compounds of the invention can be administered to mammals, particularly humans, at typical dosage levels customary for  $\alpha$ -7 nicotinic receptor agonists such as the  
20 known  $\alpha$ -7 nicotinic receptor agonist compounds mentioned above. For example, the compounds can be administered, in single or multiple doses, by oral administration at a dosage level of, for example, 0.0001-10 mg/kg/day, e.g., 0.01-10 mg/kg/day. Unit dosage forms can contain, for example, 1-200 mg of active compound. For intravenous administration, the compounds can be administered, in single or multiple dosages.

### Representative Procedures.

## I. Acid Syntheses

### Procedure 1

Procedure 1 provides a method for the conversion of substituted isatins to the corresponding indazole-3-carboxylic acids.

5           The conversion of the substituted isatins to the corresponding indazole-3-carboxylic acids is essentially the same method as described for indazole-3-carboxylic acid: Snyder, H.R., et. al. *J. Am. Chem. Soc.* **1952**, *74*, 2009. The substituted isatin (22.1 mmol) was diluted with 1 N sodium hydroxide (24 mL) and was heated at 50 °C for 30 min. The burgundy solution was allowed to cool to rt and was maintained for 1h. The  
10 reaction mixture was cooled to 0 °C and was treated with a 0 °C solution of sodium nitrite (22.0 mmol) in water (5.5 mL). This solution was added through a pipet submerged below the surface of a vigorously stirred solution of sulfuric acid (2.3 mL) in water (45 mL) at 0 °C. The addition took 15 min and the reaction was maintained for an additional 30 min. A cold (0 °C) solution of tin (II) chloride dihydrate (52.7 mmol) in concentrated  
15 hydrochloric acid (20 mL) was added to the reaction mixture over 10 min and the slurry was maintained for 60 min. The precipitated solids were isolated by filtration, washed with water, and dried to give a quantitative mass balance. **Example 38:** [ $^3\text{H}$ ] MLA binding

Materials:

Rat Brain: Pel-Freez Biologicals, CAT No. 56004-2

10 Protease inhibitor cocktail tablet: Roche, CAT No. 1697498

Membrane preparation:

Rat brains in 20 vol (w/v) of ice-cold 0.32 M sucrose with protease inhibitors (one tablet per 50 ml,) were homogenized with a polytron for 10 sec at setting 11, then centrifuged 10 min at 1000 g, 4 °C. The supernatant was centrifuged again for 20 min at 15 20,000 g, 4 °C. The pellets were resuspended in binding buffer (200 mM TRIS-HCl, 20 mM HEPES, pH 7.5, 144 mM NaCl, 1.5 mM KCl, 1 mM MgSO<sub>4</sub>, 2 mM CaCl<sub>2</sub>, 0.1% (w/v) BSA) and stored membrane prep at -80 °C.

For saturation assay, the 200  $\mu$ l assay mixture in binding buffer contains 200  $\mu$ g of membrane protein, 0.2 to 44 nM of [ $^3\text{H}$ ] MLA. The nonspecific binding was defined 20 using 1  $\mu$ M MLA. Competition assay was carried out with 2 nM [ $^3\text{H}$ ] MLA and a

desirable range of compounds. The assay mixture was incubated at 22 °C for 2 hours, then harvested with GF/B filter presoaked with 0.3% PEI in binding buffer using Tomtec harvester. The filter was washed three time with binding buffer and the radioactivity was counted with Trilux.
