**TITLE OF THE INVENTION**

LONG-ACTING INJECTABLE FORMULATIONS COMPRISING AN ISOXAZOLINE ACTIVE AGENT, METHODS AND USES THEROF

**CROSS REFERENCE TO RELATED APPLICATIONS**

This application claims the benefit of U.S. Provisional Application No. 62/121,350, filed February 26, 2015, which is incorporated herein by reference.

**FIELD OF THE INVENTION**

The present invention provides long-acting injectable formulations comprising at least one isoxazoline active agent, a block co-polymer of ethylene oxide and propylene oxide (poloxamer) and, optionally, a co-solvent; the use of these formulations against parasites (including ectoparasites (e.g., fleas or ticks) and/or endoparasites), and methods for preventing or treating parasitic infections and infestations in animals.

**BACKGROUND OF THE INVENTION**

Animals such as mammals and birds are often susceptible to parasite infestations/infections. These parasites may be ectoparasites, such as fleas, ticks and parasitic flies, and endoparasites such as nematodes and other worms. Domesticated animals, such as cats and dogs, are often infested with one or more of the following ectoparasites:

- fleas (e.g. *Ctenocephalides* spp., such as *Ctenocephalides felis* and the like);
- ticks (e.g. *Rhipicephalus* spp., *Ixodes* spp., *Dermacentor* spp., *Amblyomma* spp., and the like);
- mites (e.g. *Demodex* spp., *Sarcoptes* spp., *Otodectes* spp., and the like);
- lice (e.g. *Trichodectes* spp., *Cheyletiella* spp., *Linognathus* spp. and the like);
- mosquitoes (*Aedes* spp., *Culex* spp., *Anopheles* spp. and the like); and
- flies (*Haematobia* spp., *Musca* spp., *Stomoxys* spp., *Dermatobia* spp., *Cochliomyia* spp. and the like).

Fleas are a particular problem because not only do they adversely affect the health of the animal or human, but they also cause a great deal of psychological stress. Moreover, fleas may also transmit pathogenic agents to animals and humans, such as tapeworm (*Dipylidium*

*caninum*).

Similarly, ticks are also harmful to the physical and psychological health of the animal or human. However, the most serious problem associated with ticks is that they are vectors of pathogenic agents in both humans and animals. Major diseases which may be transmitted by ticks include borrelioses (Lyme disease caused by *Borrelia burgdorferi*), babesiosis (or piroplasmoses caused by *Babesia* spp.) and rickettsioses (e.g. Rocky Mountain spotted fever). Ticks also release toxins which cause inflammation or paralysis in the host. Occasionally, these toxins are fatal to the host.

Likewise, farm animals are also susceptible to parasite infestations. For example, cattle are affected by a large number of parasites. A parasite which is prevalent among cattle in some regions are ticks of the genus *Rhipicephalus*, especially those of the species *microplus* (cattle tick), *decoloratus* and *annulatus*. Ticks such as *Rhipicephalus microplus* (formerly *Boophilus microplus*) are difficult to control because they lay eggs in the pasture where farm animals graze. This species of ticks is considered a one-host tick and spends immature and adult stages on one animal before the female engorges and falls off the host to lay eggs in the environment. The life cycle of the tick is approximately three to four weeks. In addition to cattle, *Rhipicephalus microplus* may infest buffalo, horses, donkeys, goats, sheep, deer, pigs, and dogs. A heavy tick burden on animals can decrease production and damage hides as well as transmit diseases such as babesiosis (“cattle fever”) and anaplasmosis.

Animals and humans also suffer from endoparasitic infections including, for example, helminthiasis which is caused by of parasitic worms categorized as cestodes (tapeworm), nematodes (roundworm) and trematodes (flatworm or flukes). These parasites adversely affect the nutrition of the animal and cause severe economic losses in pigs, sheep, horses, and cattle as well as affecting companion animals and poultry. Other parasites which occur in the gastrointestinal tract of animals and humans include *Ancylostoma*, *Necator*, *Ascaris*, *Strongyloides*, *Trichinella*, *Capillaria*, *Toxocara*, *Toxascaris*, *Trichuris*, *Enterobius* and parasites which are found in the blood or other tissues and organs such as filarial worms and the extra intestinal stages of *Strongyloides*, *Toxocara* and *Trichinella*.

Recently, isoxazole and isoxazoline-containing compounds have been demonstrated to be effective against parasites that harm animals. For example, US 7,964,204 (to DuPont,

incorporated by reference herein in its entirety) discloses isoxazoline compounds according to Formula (I) below, which are active against ectoparasites and/or endoparasites.

In addition, published patent application nos. Other published patent applications that describe various other parasitocidal isoxazoline compounds and formulations comprising the same include WO 2007/079162 A1, WO 2008/154528 A1, WO 2009/002809 A2, WO 2011/149749 A1, WO 2013/078070, WO 2014/439475 A1, US 8,466,115, WO 2012/120399, WO 2014/039484, WO 2014/189837, (Zoetis) and WO2012 120135A1 (Novartis). WO 2012/089623 describes topical localized isoxazoline formulations comprising glycofurol. WO 2013/039948 A1 provides for topical veterinary compositions comprising at least one isoxazoline active agent and WO 2013/119442 A1 provides for oral veterinary compositions such as a soft chew which comprising at least one isoxazoline active agent. All of the publications above are incorporated herein by reference in their entirety.

In additional to topical and oral dosage forms, it is sometimes possible to formulate active agents as long-acting formulations, depending upon, for example, the physiochemical properties of the individual active agent; these properties include, for example, solubility, bioavailability, etc. For example, US 6,733,767 and US 8,362,086 (both incorporated herein by reference in their entirety) provide for long acting injectable formulations comprising a bioactive substance, such as, for example, an avermectin or a milbemycin and a biological acceptable polymer.

Notwithstanding the compositions comprising isoxazoline active agents alone or in combination with other active agents described in the documents above, there is a need for veterinary compositions and methods with improved efficacy, bioavailability, and spectrum of coverage to protect animals against endoparasites and/or ectoparasites. More specifically, there is a need to develop a long-acting injectable formulation comprising an isoxazoline compound, which has good bioavailability and exhibits a reduced irritation at the injection site while still being effective against parasites (e.g., fleas and ticks) for a long duration (e.g., from three (3) to six (6) months or longer).

### **SUMMARY OF THE INVENTION**

The present invention for novel and inventive long-acting injectable formulations for the treatment or prevention of parasite infections or infestations in an animal comprising an antiparasitic effective amount of at least one isoxazoline compound, a poloxamer and, optionally, a co-solvent in which the formulation does not contain a pharmaceutically acceptable polymer, as defined herein, other than a poloxamer. As used herein, the term “poloxamer” means a block copolymer of ethylene oxide and propylene oxide. Different grades, sources, and brands of block copolymers of ethylene oxide and propylene oxide may be used in the long-acting injectable formulations of the invention. Likewise, for the purposes of this application, liquid polyethylene glycols (PEGs) are considered to be a co-solvent and are not considered to be a pharmaceutically acceptable polymer

In accordance with this invention, it has been discovered that the inventive formulations generally show desirable bioavailability and duration of efficacy, while causing minimal irritation at the injection site. The compositions also provide desirable safety profiles toward the warm-blooded and bird animal recipients. In addition, it has been discovered that a single administration of such formulations generally provides potent activity against one or more parasites (e.g., ectoparasites), while also tending to provide fast onset of activity, long duration of activity, and/or desirable safety profiles.

The invention encompasses uses or veterinary uses of the isoxazoline compositions for the treatment or prevention or prophylaxis of parasitic infections and infestations of animals (either wild or domesticated), including livestock and companion animals such as cats, dogs, horses, chickens, sheep, goats, pigs, turkeys and cattle, with the aim of ridding these hosts of parasites commonly encountered by such animals.

The invention also provides methods for the treatment or prevention of parasitic infections and infestations in animals, comprising administering an effective amount of long-acting injectable formulations comprising an antiparasitic effective amount of at least one isoxazoline compound together with a poloxamer and a co-solvent, wherein the formulation does not contain a pharmaceutically acceptable biodegradable polymer as defined herein. Surprisingly, it has been found that the inventive isoxazoline-containing formulations described herein exhibit superior broad spectrum efficacy against harmful parasites (e.g. ectoparasites such as fleas and ticks) more rapidly, and over a long duration compared to other injectable formulations containing isoxazoline active agents known in the art while exhibiting minimal irritation at the injection site.

This invention also provides for the use of an isoxazoline in the preparation of a long-acting injectable formulation for the treatment or prevention of an animal against parasites.

In one embodiment, the invention provides for long-acting injectable formulations comprising antiparasitic effective amounts of at least one isoxazoline of formula (I) below, in combination and a pharmaceutically or veterinary acceptable liquid carrier, where variables  $A^1$ ,  $A^2$ ,  $A^3$ ,  $A^4$ ,  $A^5$ ,  $A^6$ ,  $B^1$ ,  $B^2$ ,  $B^3$ ,  $R^1$ ,  $R^2$ ,  $R^4$ ,  $R^5$ ,  $W$  and  $n$  are defined herein.

In some embodiments, the long-acting injectable formulations and methods comprise 4-[5-[3-chloro-5-(trifluoromethyl)phenyl]-4,5-dihydro-5-(trifluoromethyl)-3-isoxazolyl]-N-[2-oxo-2-[(2,2,2-trifluoroethyl)amino]ethyl]-1-naphthalenecarboxamide as the active agent.

In other embodiments, the long-acting injectable formulations may further comprise one or more additional active agents that are systemically active. Systemically-acting active agents may include, but are not limited to, isoxazoline active agents of different structure, a systemically-acting neonicotinoid active agent, a systemically-acting 1-N-arylpyrazole active agent, macrocyclic lactones such as avermectin and milbemycin compounds, a cyclic depsipeptide such as emodepside or PF1022A or analogs thereof, benzimidazoles, imidazothiazoles, a tetrahydropyrimidine active agent, an organophosphate active agent, levamisole, a paraherquamide active agent and/or a marcfortine active agent, praziquantel, closantel, clorsulon, a spinosyn or spinosoid active agent, an amino acetonitrile active agent, an aryloazol-2-yl cyanoethyl active agent, a systemically-acting insect growth regulator. In one embodiment, the long-acting injectable formulations comprise at least one macrocyclic lactone active agent, including, but not limited to, avermectins or milbemycins. In some embodiments, the avermectin or milbemycin active agent is eprinomectin, ivermectin, selamectin, milbemectin, milbemycin D, milbemycin oxime, or moxidectin.

In other embodiments, the compositions and methods comprise at least one of thiabendazole, oxibendazole, mebendazole, fenbendazole, oxfendazole, albendazole, triclabendazole, febantel, levamisole, pyrantel, morantel, praziquantel, closantel, clorsulon, an amino acetonitrile active agent, or an aryloazol-2-yl cyanoethylamino active agent.

The compounds of formula (I) through formula (VIa) can exist as stereoisomers where there is a chiral center and these individual stereoisomers are encompassed by the structural formulas depicted herein. Hence, in an another embodiment, the long-acting injectable formulations of present invention comprise an antiparasitic effective amount of at least one isoxazoline of Formula (I), Formula (Ia), Formula (II), Formula (II-1.1001) to Formula (II-1.025), Formula (II-2.001) to Formula (II-018), Formula (III), Formula (IV), Formula (V), Formula (Va), Formula (VI) or Formula (VIa) which is enriched in one enantiomer, or a pharmaceutically acceptable salt thereof. In an embodiment, the compounds of formula (I) to formula (VIa) present in the compositions of the invention are enriched in one enantiomer (either (S)- or (R)-configuration) in a weight:weight ratio of at least 1.5, at least 2, at least 5 or at least 10. In another embodiment, the compounds of formula (I) to formula (VIa) present in the compositions of the invention are essentially pure enantiomers.

Processes to prepare individual stereoisomers of the compounds of formula (I) through formula (VIa) (e.g., the stereoisomers for formula I-1a and formula I-1b below) from a racemic mixture comprising the same are well with the skill level of one of ordinary skill in this art. Processes include, for example, recrystallization or chiral chromatography using, for example a Chiralpak<sup>®</sup> AD column, and processes to prepare individual stereoisomers of an isoxazoline compound are found in the prior art (*see, e.g.*, WO 2014/090918 A1, WO 2011/104089 A1 or US 2010/0254959 A1).

The various stereoisomers include enantiomers, diastereomers and atropisomers. One of skill in the art will understand that one stereoisomer may be more active and/or may exhibit beneficial properties in when enriched relative to the other enantiomer. In addition, the skilled person in the art knows how to separate, enrich, and/or selectively prepare a stereoisomer of the isoxazoline compounds described herein. The isoxazoline compounds of formula (I) to formula

(VIa) described herein contain a chiral quaternary carbon atom in the five-membered isoxazoline ring (shown by the asterisk (\*)); therefore, the compounds will contain at least two possible stereoisomers (e.g. enantiomers). As an example for the compounds of formula (Ia), the two possible stereoisomers resulting from the quaternary carbon are shown as formula (*S*)-Ia and (*R*)-Ia:

(*S*)-Ia(*R*)-Ia

The compound of formula (*S*)-Ia above has the (*S*) configuration at the chiral carbon atom in the isoxazoline ring and the compound of formula (*R*)-Ia has the (*R*) configuration at the chiral carbon in the ring.

By the term substantially enriched is meant wherein the weight:weight ratio is at least about 1.5 to 1 or higher in favor of the desired enantiomer. In another embodiment, the long-acting injectable compositions of the invention comprise a compound of formula (I), (Ia) or (Ib) that is substantially enriched in the (*S*)-enantiomer. In still another embodiment, the compositions of the invention comprise a compound of formula (I), (Ia) or (Ib) that is enriched in the (*S*)-enantiomer in a weight:weight ratio of at least approximately 10 to 1, (*S*)-enantiomer to (*R*)-enantiomer, or greater. In still another embodiment, the compositions of the invention comprise a compound of formula (I), (Ia) or (Ib) that is essentially the pure (*S*)-enantiomer.

In another embodiment of the invention, the compositions comprise a compound of formula (I), (Ia) or (Ib) that is enriched in the (*R*)-enantiomer in a weight:weight ratio is at least approximately 2 to 1, (*R*)-enantiomer to (*S*)-enantiomer, or greater. In yet another embodiment, the compositions of the invention comprise a compound of formula (I), (Ia) or (Ib) that is enriched in the (*R*)-enantiomer in a weight:weight ratio of at least about 5 to 1, (*R*)-enantiomer to (*S*)-enantiomer, or greater. In still another embodiment, the compositions of the invention comprise a compound of formula (I), (Ia) or (Ib) that is enriched in the (*R*)-enantiomer in a weight:weight ratio of at least about 10 to 1, (*R*)-enantiomer to (*S*)-enantiomer, or greater. In still another embodiment, the compositions of the invention comprise a compound of formula (I), (Ia) or (Ib) that is essentially the pure (*R*)-enantiomer.

Molecular depictions drawn herein follow standard conventions for depicting stereochemistry. To indicate stereo configuration, bonds rising from the plane of the drawing and towards the viewer are denoted by solid wedges wherein the broad end of the wedge is attached to the atom rising from the plane of the drawing towards the viewer. Bonds going below the plane of the drawing and away from the viewer are denoted by dashed wedges wherein the narrow end of the wedge is attached to the atom further away from the viewer. Constant width lines indicate bonds with a direction opposite or neutral relative to bonds shown with solid or dashed wedges; constant width lines also depict bonds in molecules or parts of molecules in which no particular stereo configuration is intended to be specified.

In one embodiment of the invention, the more biologically active enantiomer is believed to be Formula I-1a. Formula I-1a has the (S) configuration at the chiral carbon of the isoxazoline ring and Formula I-1b has the (R) configuration at the chiral carbon. Similarly, the more biologically active enantiomers of isoxazoline compounds of formula (II) to (VIa) are believed to have the (S)-configuration at the chiral carbon of the isoxazoline ring. In certain embodiments, an isoxazoline compound of the invention or compositions comprising the compound which are enriched in an enantiomer that displays significant in vitro and in vivo activity (the eutomer) with a favorable toxicity profile whereas a compound or composition enriched with the other corresponding enantiomer displays significantly far less in vitro and in vivo activity (the distomer).

This invention comprises racemic mixtures, for example, equal amounts of the enantiomers of isoxazoline compounds of Formulae (I) to (VIa). The invention includes compounds of Formula (I), Formula (Ia), Formula (Ib), Formula (II), Formula (II-1.1001) to Formula (II-1.025), Formula (II-2.001) to Formula (II-018), Formula (III), Formula (IV), Formula (V), Formula (Va), Formula (VI) or Formula (VIa) that are enriched in one enantiomer compared to the racemic mixture. Also included are the essentially pure enantiomers of the compounds of Formula (I), Formula (Ia), Formula (Ib), Formula (II), Formula (II-1.1001) to Formula (II-1.025), Formula (II-2.001) to Formula (II-018), Formula (III), Formula (IV), Formula (V), Formula (Va), Formula (VI) or Formula (VIa).

When enantiomerically enriched, one enantiomer is present in greater amounts than the other, and the extent of enrichment may be defined by an expression of enantiomeric excess ("ee"), which is defined as  $(2x-1) \cdot 100\%$ , where  $x$  is the mole fraction of the dominant enantiomer in the mixture (e.g., an ee of 20 % corresponds to a 60:40 ratio of enantiomers). In some embodiments, the compositions of the invention comprise compounds that have at least a 50 % enantiomeric excess. In other embodiments, the compositions of the invention comprise compounds that have at least a 75 % enantiomeric excess, at least a 90 % enantiomeric excess, or at least a 94 % enantiomeric excess of the more active isomer. Of particular note are enantiomerically pure embodiments of the more active isomer (the eutomer).

conformational isomers. In addition, this invention includes compounds that are enriched in one conformer relative to others.

#### Stereoisomers and polymorphic forms

As noted above, it will be appreciated by those of skill in the art that certain compounds within the compositions of the invention may exist and be isolated as optically active and

racemic forms. Compounds having one or more chiral centers as those of formula (I) to formula (VIa) above, including at a sulfur atom, may be present as single enantiomers or diastereomers or as mixtures of enantiomers and/or diastereomers. For example, it is well known in the art that sulfoxide compounds may be optically active and may exist as single enantiomers or racemic mixtures. In addition, compounds within the compositions of the invention may include one or more chiral centers, which results in a theoretical number of optically active isomers. Where compounds within the compositions of the invention include  $n$  chiral centers, the compounds may comprise up to  $2^n$  optical isomers. The present invention encompasses compositions comprising the specific enantiomers or diastereomers of each compound as well as mixtures of different enantiomers and/or diastereomers of the compounds of the invention that possess the useful properties described herein. In addition, the invention encompasses compositions comprising one or more conformational isomers (e.g. rotamers) as well as mixtures of conformational isomers. Conformational isomers of the isoxazoline compounds may be produced by a restriction of rotation about the amide bond bonded to the aryl or heteroaryl ring (e.g. the amide bonded to the naphthyl group in Formula (I)). The optically active forms can be prepared by, for example, resolution of the racemic forms by selective crystallization techniques, by synthesis from optically active precursors, by chiral synthesis, by chromatographic separation using a chiral stationary phase or by enzymatic resolution.

In addition, the compounds within the compositions of the invention may exist as hydrates or solvates, in which a certain stoichiometric amount of water or a solvent is associated with the molecule in the crystalline form. The compositions of the invention may include hydrates and solvates of the active agents. In some embodiments, the compositions of the invention may include up to 15% (w/w), up to 20% (w/w), or up to 30% (w/w) of a particular solid form.

Efficacy Examples

The following examples demonstrate the efficacy of the long-acting injectable compositions of the invention against ectoparasites in companion and farm animals.

**Example 20**

An efficacy study was run to determine the efficacy of the formula in Example 1 dosed at 20mg/kg in beagles against *Rhipicephalus sanguineus* (tick) and *Ctenocephalides felis* (flea). Compared with a non-treated control, the efficacy against ticks on Day 184 48 hours after infestation was 74%. On day 185, 72 hours after infestation, efficacy against ticks was 90.4%. Efficacy against fleas on Day 193, 24 hours after infestation, was 85.6%.

**Example 21**

The efficacy of a long-acting injectable composition of the invention against *Rhipicephalus* (*Boophilus*) *microplus* in cattle was tested. Two groups of cattle were studied, a non-treated control group and a test group treated with a long-acting injectable of the invention comprising 15% (w/v) of Formula Ia in a carrier comprising a mixture of poloxomer 124 (QS) and 20% (w/v) ethanol to deliver a dose of 5 mg/kg of body weight. Cattle in the treatment group were treated on Day 0 with the long-acting injectable composition. Each animal was infested with 5000 tick larvae on days 7, 21, and every 14 days thereafter. Adult ticks dropping from each animal are collected daily from Day 1 until the end of the study. The efficacy of the treatment is determined by collecting and counting the number of ticks dropping from each animal and comparing with the number of ticks collected from the control group. The efficacy of the long-acting composition was found to be about almost 100% for infestations conducted on day 7, 21, 35, and 49; 95% at for infestations conducted at Day 63; and greater than 70% at for infestations conducted at Day 91.

Injection Site Irritation**Example 22**

The following example assessed the irritation of the long-acting injectable compositions of the invention (compositions of Treatment Groups Nos. 2-6) in beagle dogs against a placebo (Treatment Group No. 1).

The compositions of the following Treatment Groups in Table 1 were prepared:

**Table 1**

Group	Compound of Formula (Ia)	Compound of Formula (S)-(Ia)	Poloxomer 124	PEG 400	Ethanol	Dose (mg/kg)	Dose volume (ml/kg)
1	--	--	46	46	8	N/A	0.08
2	13	--	39.5	39.5	8	12.5	0.08

3	--	13	39.5	39.5	8	12.5	0.08
4	26	--	33	33	8	12.5	0.04
5	26	--	52	14	8	12.5	0.04
6	13	--	52	27	8	12.5	0.08

All concentrations are in % w/w.

A composition from each of the Treatment Groups was subcutaneously injected into a dog at two sites and the irritation at the two injection sites was monitored for 1 or two weeks respectively and assessed according to the following criteria:

- 0 no detectable reaction
- 1 thickening of injection site, no distinct nodule (non-fluctuant).
- 2 small (pea size nodule)  $\leq$  approximately 0.5 – 2 cm in diameter
- 3 medium (grape size) nodule  $>$  approximately 2-3 cm in diameter
- 4 large (walnut size) nodule  $>$  3 cm in diameter
- 5 abscess formation

Criteria # a lower score is deemed a better result (e.g. 0-2 vs. 3-5).

Table 2 provides the assessment of the above-identified groups at the first injection site on the indicated day post injection.

**Table 2**

Group	Day 1	Day 3	Day 7	Day 10	Day 14
1	0	0	0	0	0
2	0	0	0	0	0
3	0	0	0	0	2
4	0	0	0	2	0
5	0	0	0	0	0
6	0	0	0	0	0

Table 3 provides the assessment for the above-identified Treatment Groups at the second injection site at the indicated day post injection.

**Table 3**

Group	Day 3	Day 7
1	0	0
2	0	0
3	0	0
4	0	0
5	0	0
6	0	0

The data in Table 1 and 2 indicate that the inventive formulations exhibited either no or very minor irritation at the injection site and the injection site irritation was comparable to the placebo, which did not contain an isoxazoline active agent.

#### Efficacy and Injection Site Irritation Site Evaluation.

#### **Example 23**

The efficacy and the injection site irritation of a long-acting injectable composition according to the invention (Treatment Group 5) was compared against placebo compositions (Treatment Groups 1 and 2) and an injectable composition comprising a PEG 400/ethanol (80:20 (v/v)) co-solvent mixture (Treatment Group 3). Eight dogs were evaluated in each of the treatment groups. The long-acting injectable compositions were administered on day 0.

The compositions of the following Treatment Groups in Table 4 were prepared

**Table 4**

Group	Compound of Formula (Ia) (%w/v)	Poloxamer 124 (%v/v)	PEG 400 (%v/v)	Ethanol (%v/v)	Dose (mg/kg)	Dose volume (ml/kg)
1	--	--	80	20	N/A	0.067
2	--	80	--	20	N/A	0.067
3	30	--	QS (80:20 PEG400/EtOH)	QS (80:20 PEG400/EtOH)	15	0.05
4	30	--	QS (80:20 PEG400/EtOH)	QS (80:20 PEG400/EtOH)	20	0.067
5	30	QS	--	20	20	0.067

#### Site Irritation

The compositions from Treatment Groups 1-5 were subcutaneously injected to beagle dogs at Day 0 to assess the injection site irritation for the compositions described in Table 5 -

**Table 5**

Group	Days 0-3	Day 7	Day 14	Day 28
1	0 (4 dogs)	0 (4 dogs)	0 (4 dogs)	0 (4 dogs)
2	0 (4 dogs)	0 (4 dogs)	0 (4 dogs)	0 (4 dogs)
3	0 (8 dogs)	1 (8 dogs)	2 (2 dogs) 3 (3 dogs) 3 (3 dogs)	0 (8 dogs)
4	0 (8 dogs)	1 (8 dogs)	1 (6 dogs) 3 (2 dogs)	0 (8 dogs)
5	0 (8 dogs)	0 (8 dogs)	0 (5 dogs) 2 (2 dogs) 2 (1 dogs)	0 (8 dogs)

The following criteria were used to evaluate the injection site irritation:

- 0 no detectable reaction
- 1 thickening of injection site, no distinct nodule (non-fluctuant).
- 2 small (pea size nodule)  $\leq$  approximately 0.5 – 2 cm in diameter
- 3 medium (grape size) nodule  $>$  approximately 2-3 cm in diameter
- 4 large (walnut size) nodule  $>$  3 cm in diameter
- 5 abscess formation

Criteria A lower score is deemed a better result (e.g. 0-2 vs. 3-5). The number of dogs assigned a given score is listed parentheses.

Efficacy vs. *Rhipicephalus sanguineus* (ticks) and *Ctenocephalides felis* (fleas).

Dogs from Treatment Groups 3, 4 and 5 were infested with 50 *Rhipicephalus sanguineus* on Day 182. Thumb counts were performed on Day 184 and tick removal and counting on Day 185. Dogs were infested with 100 *Ctenocephalides felis* on Day 192. Fleas were removed and counted on Day 193. The percent reduction in tick attachment (comb count) Days 184 and 185 for each of the Treatment Groups is shown in **Fig. 1**. The efficacy against fleas for each of the Treatment Groups on Day 193 is shown in **Fig. 2**. Overall the data demonstrates that the inventive compositions showed good bioavailability, close to 6 month flea and tick efficacy, and

minimal injection site reactions. The invention is further described in the following numbered paragraphs:
