BACKGROUND OF THE INVENTION

Cancer is the leading cause of death in developed countries and the second leading cause of death in developing countries. Deaths from cancer worldwide are
15 projected to continue rising, with an estimated 12 million deaths in 2030. While substantial progress has been made in developing effective therapies, there is a need for additional therapeutic modalities that target cancer and related diseases.

The complexity of cancer disease arises after a selection process for cells with acquired functional capabilities to enhance survival and/or resistance towards
20 apoptosis and a limitless proliferative potential. In addition, bi-direction interaction of cancer cells and stromal cells provides further advantage of cancer cell survival and distant metastasis to the secondary organs and tissues [*Liotta LA, Kohn EC. The microenvironment of the tumour-host interface. Nature 411:375, 2001*]. Furthermore, cancer stem cells (CSCs) represent the apex in the hierarchical
25 model of tumor genesis, heterogeneity and metastasis. CSCs possess the capacity for unlimited selfrenewal, the ability to give rise to progeny cells, and also an innate resistance to cytotoxic therapeutics [*Corbin E. Meacham and Sean J. Morrison. Tumour heterogeneity and cancer cell plasticity. [Nature 501:328, 2013]*]. Thus, there is need to develop drugs for cancer therapy addressing distinct
30 features of established tumors.

The discovery that *Drosophila* segment polarity gene *Wingless* had a common origin with the murine oncogene *Int-1* led to intensive studies on Wnt signalling pathway and identification of 19 mammalian Wnts and 10 Wnt receptors [Rijsewijk F, Schuermann M, Wagenaar E, Parren P, Weigel D, Nusse R. *The Drosophila homolog of the mouse mammary oncogene int-1 is identical to the segment polarity gene wingless. Cell. 1987; 50: 649-57.*]. Wnts are secreted glycoproteins which bind to cell surface receptors to initiate signaling cascades. Wnt signaling cascades have classified into two categories: canonical and non-canonical, differentiated by their dependence on β -catenin. Non-canonical Wnt pathways, such as the planar cell polarity (PCP) and Ca^{2+} pathway, function through β -catenin independent mechanisms. Canonical Wnt signalling is initiated when a Wnt ligand engages co-receptors of the Frizzled (Fzd) and low-density lipoprotein receptor related protein (LRP) families, ultimately leading to β -catenin stabilization, nuclear translocation and activation of target genes [Angers S, Moon RT. *Proximal events in Wnt signal transduction. Nat Rev Mol Cell Biol. 2009; 10: 468-77.* 68. Cadigan KM, Liu YI. *Wnt signaling: complexity at the surface. J Cell Sci. 2006; 119: 395-402.* 69. Gordon MD, Nusse R. *Wnt signaling: multiple pathways, multiple receptors, and multiple transcription factors. J Biol Chem. 2006; 281: 22429-33.* 70. Huang H, He X. *Wnt/beta-catenin signaling: new (and old) players and new insights. Curr Opin Cell Biol. 2008; 20: 119-25.* 71. Polakis P. *The many ways of Wnt in cancer. Curr Opin Genet Dev. 2007; 17: 45-51.* 72. Rao TP, Kuhl M. *An updated overview on Wnt signaling pathways: a prelude for more. Circ Res. 2010; 106: 1798- 806.*].

In the absence of Wnt stimulus, β -catenin is held in an inactive state by a multimeric “destruction” complex comprised of adenomatous polyposis coli (APC), Axin, glycogen synthase kinase 3 β (GSK3 β) and casein kinase 1 α (CK1 α). APC and Axin function as a scaffold, permitting GSK3 β - and CK1 α -mediated phosphorylation of critical residues within β -catenin. These phosphorylation events mark β -catenin for ubiquitination recognition by the E3 ubiquitin ligase β -transducin-repeat-containing protein and lead to subsequent proteasomal degradation [He X, Semenov M, Tamai K, Zeng X. *LDL receptor-related proteins 5 and 6 in Wnt/beta-*

catenin signaling: arrows point the way. Development.131:1663, 2004. Kimelman D, Xu W. beta-catenin destruction complex: insights and questions from a structural perspective. Oncogene25: 7482, 2006.].

5 In the presence of Wnt stimulus, Axin, GSK3B and Dvl are recruited to the co-receptor complex Fzd and LRP5/6 and lead to disruption of the β -catenin destruction complex. Therefore, β -catenin is stabilized and translocated to nucleus. Once in the nucleus, β -catenin forms a complex with members of the T-cell factor/lymphoid enhancer factor (TCF/LEF) family of transcription factors,
10 recruiting co-factors such as CBP, p300, TNIK, Bcl9 and Pygopus, and ultimately driving transcription of target genes including c-myc, Oct4, cyclin D, survivin.[*Joshua C. Curtin and Matthew V. Lorenzi. Drug Discovery Approaches to Target Wnt Signaling in Cancer Stem Cells. Oncotarget 1: 552, 2010].*

15 Tankyrases play a key role in the destruction complex by regulating the stability of the rate-limiting AXIN proteins, RNF146 and tankyrase itself. The E3 ubiquitin ligase RNF146 recognizes tankyrase-mediated PARsylation and eartags AXIN, tankyrase and itself for proteasome-mediated degradation. Thus, tankyrases control the protein stability and turnover of key components of the destruction complex, and
20 consequently the cellular levels of β -catenin [*Shih-Min A. Huang, Yuji M. Mishina, Shanming Liu, Atwood Cheung, Frank Stegmeier, et al. Tankyrase inhibition stabilizes axin and antagonizes Wnt signalling. Nature 461:614, 2009, Yue Zhang, Shanming Liu, Craig Mickanin, Yan Feng, Olga Charlat, et al. RNF146 is a poly(ADP-ribose)-directed E3 ligase that regulates axin degradation and Wnt signalling. Nature Cell Biology 13:623-629, 2011].*

Aberrant regulation of the Wnt/ β -catenin signaling pathway is a common feature across a broad spectrum of human cancers and evolves as a central mechanism in cancer biology. First of all, Wnt overexpression could lead to malignant
30 transformation of mouse mammary tissue [*Klaus A, BirchmeierW. Wnt signalling and its impact on development and cancer. Nat Rev Cancer 8: 387-398, 2008].*

Second, tumor genome sequencing discovered the mutations in Wnt/ β -catenin pathway components as well as epigenetic mechanisms that altered the expression of genes relevant to Wnt/ β -catenin pathway [Ying, Y. *et al. Epigenetic disruption of the WNT/beta-catenin signaling pathway in human cancers. Epigenetics* 4:307, 2009]. Third, Wnt/ β -catenin pathway also cooperates with other oncogenic signaling pathways in cancer and regulates tumorigenesis, growth, and metastasis [Klaus A, Birchmeier W. *Wnt signalling and its impact on development and cancer. Nat Rev Cancer* 8: 387-398, 2008]. In addition, there is an additional role of WNT signaling between tumor and stromal cell interaction leading to tumorigenesis and metastasis [Shahi P, Park D, Pond AC, Seethammagari M, Chiou S-H, Cho K, *et al. Activation of Wnt signaling by chemically induced dimerization of LRP5 disrupts cellular homeostasis. PLoS ONE* 7: e30814, 2012]. Furthermore, growing body of evidence indicates a critical role of β -catenin in CSCs [Eaves CJ, Humphries RK. *Acute myeloid leukemia and the Wnt pathway. N Engl J Med.* 362: 2326-7, 2010; Nusse R, Fuerer C, Ching W, Harnish K, Logan C, Zeng A, ten Berge D, Kalani Y. *Wnt signaling and stem cell control. Cold Spring Harb Symp Quant Biol.* 73: 59-66, 2008; Reya T, Clevers H. *Wnt signalling in stem cells and cancer. Nature* 434: 843-50, 2005]. For example, stem-like colon cells with a high level of β -catenin signaling have a much greater tumorigenic potential than counterpart cells with low β -catenin signaling [Vermeulen L, De Sousa EMF, van der Heijden M, Cameron K, de Jong JH, Borovski T, Tuynman JB, Todaro M, Merz C, Rodermond H, Sprick MR, Kemper K, Richel DJ, Stassi G, Medema JP. *Wnt activity defines colon cancer stem cells and is regulated by the microenvironment. Nat Cell Biol.* 12: 468-76, 2010]. Finally, activation of Wnt/ β -catenin signalling pathway is also one of the major mechanism causing tumor recurrence and drug resistance. All these provide clear rationale to develop therapeutics targeting Wnt/ β -catenin signaling pathway for the treatment of cancer.

One of the approaches to inhibit Wnt/ β -catenin signaling pathway is to target druggable tankyrases. Tankyrase 1 (TNKS1) and tankyrase 2 (TNKS2) are poly(ADP-ribose)ases that are distinguishable from other members of the enzyme family by the structural features of the catalytic domain, and the presence of a sterile motif multimerization domain and an ankyrin repeat protein-interaction domain.

Inhibition of TNKS blocks PARsylation of AXIN1 and AXIN2 and prevents their proteasomal degradation. As the consequence, TNKS inhibition enhances the activity of the β -catenin destruction complex and suppresses β -catenin nuclear translocation and the expression of β -catenin target genes.

5

In addition to its function in Wnt signaling through modulation of β -catenin destruction, tankyrases are also implicated in other cellular functions, including telomere homeostasis, mitotic spindle formation, vesicle transport linked to glucose metabolism, and viral replication. In these processes, tankyrases interact with target proteins, catalyze poly (ADP-ribosyl)ation, and regulate protein interactions and stability. For example, TNKS1 controls telomere homeostasis, which promotes telomeric extension by PARsylating TRF1. TRF1 is then targeted for proteasomal degradation by the E3 ubiquitin ligases F-box only protein 4 and/or RING finger LIM domain-binding protein (RLIM/RNF12), which facilitates telomere maintenance [Donigian JR and de Lange T. *The role of the poly(ADP-ribose) polymerase tankyrase1 in telomere length control by the TRF1 component of the shelterin complex. J Biol Chem 282:22662, 2007*]. In addition, telomeric end-capping also requires canonical DNA repair proteins such as DNA-dependent protein kinase (DNAPK) TNKS1 stabilizes the catalytic subunit of DNAPK (DNAPKcs) by PARsylation [Dregalla RC, Zhou J, Idate RR, Battaglia CL, Liber HL, Bailey SM. *Regulatory roles of tankyrase 1 at telomeres and in DNA repair: suppression of T-SCE and stabilization of DNA-PKcs. Aging 2(10):691, 2010*]. Altered expression of TNKS1 and/or TNKS2, as well as genetic alterations in the tankyrase locus, have been detected in multiple tumors, e.g. fibrosarcoma, ovarian cancer, glioblastoma, pancreatic adenocarcinoma, breast cancer, astrocytoma, lung cancer, gastric cancer, and colon cancer [Lari Lehti, Nai-Wen Chi and Stefan Krauss. *Tankyrases as drug targets. FEBS Journal 280 : 3576, 2013*]. In addition, tankyrases appear to have impact on viral infections. For example, HSV infection, it was shown that the virus cannot replicate efficiently in cells that with depletion of both TNKS1 and TNKS2.

Furthermore, a connection between tankyrases and glucose metabolism has been indicated. Thus, DNA polymorphism in a chromosomal region encoding

tankyrase/methionine sulfoxide reductase A is robustly associated with early-onset obesity. TNKS1 knockout mice appeared to have reduced fat pads, suggesting a potential connection of TNKS and obesity. TNKS may also play a role in tissue fibrosis.

5

In summary, tankyrases are promising drug targets in regulating WNT signalling, telomere length (e.g. telomere shortening and DNA damage induced cell death), lung fibrogenesis, myelination and viral infection. The invention presented here describes a novel class of tankyrase inhibitors and their potential clinical utility for
10 the treatment of various diseases, such as cancer, aging, metabolic diseases (e.g. diabetes and obesity), fibrosis (e.g. lung fibrogenesis) and viral infection.

10 Definitions

Constituents which are optionally substituted as stated herein, may be substituted, unless otherwise noted, one or more times, independently from one another at any possible position. When any variable occurs more than one time in any
15 constituent, each definition is independent.

20 R¹¹, R¹² and/or R¹³ occur more than one time in any compound of formula (I) each definition of R⁹, R¹⁰, R¹¹, R¹² and R¹³ is independent.

A hyphen at the beginning or at the end of the constituent marks the point of attachment to the rest of the molecule. Should a ring be substituted the
25 substituent could be at any suitable position of the ring, also on a ring nitrogen atom if suitable.

20

Similarly, as used herein, the term “C₂-C₆”, as used throughout this text, *e.g.* in the context of the definitions of “C₂-C₆-alkyl”, and “C₂-C₆-hydroxyalkyl” is to be understood as meaning an alkyl group or a hydroxyalkyl group having a finite number of carbon atoms of 2 to 6, *i.e.* 2, 3, 4, 5, or 6 carbon atoms. It is to be understood further that said term “C₂-C₆” is to be interpreted as any sub-range comprised therein, *e.g.* C₂-C₆, C₃-C₅, C₃-C₄, C₂-C₃, C₂-C₄, C₂-C₅; particularly C₂-C₃.

interpreted as any sub-range comprised therein, e.g. C₃-C₆, C₄-C₅, C₃-C₅, C₃-C₄, C₄-C₆, C₅-C₆; particularly C₃-C₆.

5 The term "substituted" means that one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency under the existing circumstances is not exceeded, and that the substitution results in a stable compound. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

10 The term "optionally substituted" means optional substitution with the specified groups, radicals or moieties.

15 Ring system substituent means a substituent attached to an aromatic or nonaromatic ring system which, for example, replaces an available hydrogen on the ring system.

As used herein, the term "one or more", e.g. in the definition of the substituents of the compounds of the general formulae of the present invention, is understood as meaning "one, two, three, four or five, particularly one, two, three or four, 20 more particularly one, two or three, even more particularly one or two".

The invention also includes all suitable isotopic variations of a compound of the invention. An isotopic variation of a compound of the invention is defined as one in which at least one atom is replaced by an atom having the same atomic number 25 but an atomic mass different from the atomic mass usually or predominantly found in nature. Examples of isotopes that can be incorporated into a compound of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, sulphur, fluorine, chlorine, bromine and iodine, such as ²H (deuterium), ³H (tritium), ¹¹C, ¹³C, ¹⁴C, ¹⁵N, ¹⁷O, ¹⁸O, ³²P, ³³P, ³³S, ³⁴S, ³⁵S, ³⁶S, ¹⁸F, ³⁶Cl, ⁸²Br, ¹²³I, 30 ¹²⁴I, ¹²⁵I, ¹²⁹I and ¹³¹I, respectively. Certain isotopic variations of a compound of the invention, for example, those in which one or more radioactive isotopes such as ³H

or ^{14}C are incorporated, are useful in drug and/or substrate tissue distribution studies. Tritiated and carbon-14, i.e., ^{14}C , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with isotopes such as deuterium may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increased in vivo half-life or reduced dosage requirements and hence is preferred in some circumstances. Isotopic variations of a compound of the invention can generally be prepared by conventional procedures known by a person skilled in the art such as by the illustrative methods or by the preparations described in the examples hereafter using appropriate isotopic variations of suitable reagents.

Where the plural form of the word compounds, salts, polymorphs, hydrates, solvates and the like, is used herein, this is taken to mean also a single compound, salt, polymorph, isomer, hydrate, solvate or the like.

By "stable compound" or "stable structure" is meant a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

The compounds of this invention optionally contain one or more asymmetric centre, depending upon the location and nature of the various substituents desired. Asymmetric carbon atoms is present in the (R) or (S) configuration, resulting in racemic mixtures in the case of a single asymmetric centre, and diastereomeric mixtures in the case of multiple asymmetric centres. In certain instances, asymmetry may also be present due to restricted rotation about a given bond, for example, the central bond adjoining two substituted aromatic rings of the specified compounds.

The compounds of the present invention optionally contain sulphur atoms which are asymmetric, such as an asymmetric sulfoxide, of structure:

, for example,

in which * indicates atoms to which the rest of the molecule can be bound.

Substituents on a ring may also be present in either cis or trans form. It is intended that all such configurations (including enantiomers and diastereomers), are
5 included within the scope of the present invention.

Preferred compounds are those which produce the more desirable biological activity. Separated, pure or partially purified isomers and stereoisomers or racemic or diastereomeric mixtures of the compounds of this invention are also included within the scope of the present invention. The purification and the separation of
10 such materials can be accomplished by standard techniques known in the art.

The optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, for example, by the formation of diastereoisomeric salts using an optically active acid or base or formation of covalent diastereomers. Examples of appropriate acids are tartaric,
15 diacetyltartaric, ditoluoyltartaric and camphorsulfonic acid. Mixtures of diastereoisomers can be separated into their individual diastereomers on the basis of their physical and/or chemical differences by methods known in the art, for example, by chromatography or fractional crystallisation. The optically active bases or acids are then liberated from the separated diastereomeric salts. A
20 different process for separation of optical isomers involves the use of chiral chromatography (*e.g.*, chiral HPLC columns), with or without conventional derivatisation, optimally chosen to maximise the separation of the enantiomers. Suitable chiral HPLC columns are manufactured by Daicel, *e.g.*, Chiracel OD and Chiracel OJ among many others, all routinely selectable. Enzymatic separations,
25 with or without derivatisation, are also useful. The optically active compounds of this invention can likewise be obtained by chiral syntheses utilizing optically active starting materials.

In order to limit different types of isomers from each other reference is made to IUPAC Rules Section E (Pure Appl Chem 45, 11-30, 1976).

The present invention includes all possible stereoisomers of the compounds of the present invention as single stereoisomers, or as any mixture of said stereoisomers, e.g. R- or S- isomers, or E- or Z-isomers, in any ratio. Isolation of a single stereoisomer, e.g. a single enantiomer or a single diastereomer, of a compound of the present invention is achieved by any suitable state of the art method, such as chromatography, especially chiral chromatography, for example.

The present invention includes all possible salts of the compounds of the present invention as single salts, or as any mixture of said salts, in any ratio.

In the present text, in particular in the Experimental Section, for the synthesis of intermediates and of examples of the present invention, when a compound is mentioned as a salt form with the corresponding base or acid, the exact stoichiometric composition of said salt form, as obtained by the respective preparation and/or purification process, is, in most cases, unknown.

10 Unless specified otherwise, suffixes to chemical names or structural formulae such as "hydrochloride", "trifluoroacetate", "sodium salt", or "x HCl", "x CF₃COOH", "x Na⁺", for example, are to be understood as not a stoichiometric specification, but solely as a salt form.

15 This applies analogously to cases in which synthesis intermediates or example compounds or salts thereof have been obtained, by the preparation and/or purification processes described, as solvates, such as hydrates with (if defined) unknown stoichiometric composition.

20 As used herein, the term "*in vivo* hydrolysable ester" is understood as meaning an *in vivo* hydrolysable ester of a compound of the present invention containing a carboxy or hydroxy group, for example, a pharmaceutically acceptable ester which is hydrolysed in the human or animal body to produce the parent acid or alcohol. Suitable pharmaceutically acceptable esters for carboxy include for example alkyl, cycloalkyl and optionally substituted phenylalkyl, in particular benzyl esters, C₁-C₆ alkoxyethyl esters, e.g. methoxyethyl, C₁-C₆ alkanoyloxyethyl esters, e.g. pivaloyloxyethyl, phthalidyl esters, C₃-C₈ cycloalkoxy-carbonyloxy-C₁-C₆ alkyl esters, e.g. 1-cyclohexylcarbonyloxyethyl ; 1,3-dioxolen-2-onylmethyl esters, e.g. 5-methyl-1,3-dioxolen-2-onylmethyl ; and C₁-C₆-alkoxycarbonyloxyethyl esters, e.g. 1-methoxycarbonyloxyethyl, and may be formed at any carboxy group in the compounds of this invention.

1. Syntheses of Compounds (Overview):

The compounds of the present invention can be prepared as described in the following section. Schemes 1 to 5 and the procedures described below illustrate general synthetic routes to the compounds of general formula (I) of the invention and are not intended to be limiting. It is clear to the person skilled in the art that the order of transformations as exemplified in Schemes 1 to 5 can be modified in various ways. The order of transformations as exemplified in the Schemes 1 to 5 are therefore not intended to be limiting. In addition, interconversion of any of the substituents, R¹, R², R⁵ and R⁸ can be achieved before and/or after the exemplified transformations. These modifications can be such as the introduction of protecting groups, cleavage of protecting groups, exchange, reduction or oxidation of functional groups, halogenation, metallation, substitution or other reactions known to the person skilled in the art. These transformations include those which introduce a functionality which allows for further interconversion of substituents. Appropriate protecting groups and their introduction and cleavage are well-known to the person skilled in the art (see for example T.W. Greene and P.G.M. Wuts in Protective Groups in Organic Synthesis, 3rd edition, Wiley 1999). Specific examples

are described in the subsequent paragraphs. Further, it is possible that two or more successive steps may be performed without work-up being performed between said steps, e.g. a “one-pot” reaction, as is well-known to the person skilled in the art.

All reagents used for the preparation of the compounds of the invention are either commercially available or can be prepared as described.

1.1 Synthesis of aromatic amines

10 Aromatic amines as intermediates for the synthesis of compounds of the invention are either commercially available or can be synthesized as depicted in scheme 1.

Scheme 1

15 Scheme 1: Synthesis of aromatic amines, wherein X_2 , R^5 and R^8 as defined for the compound of general formula (I) *supra*, and in which PG represents a protecting group, such as a BOC group, and W represents a hydroxy group or a chlorine atom.

Starting from an aromatic amine of type 1-1, where the para position of the amino function is a second protected amino function bearing a protecting group such as, for example, a BOC group or a nitro group as a precursor of a second amino function, upon a standard amide bond forming reaction, for example with a carboxylic acid of the type 1-4 in presence of a coupling agent such as, for example, HATU or the corresponding acid chloride of type 1-4, results in compounds of type 1-2.

Deprotection of the protected amine, in the case of a BOC-protecting group for example employing TFA or hydrochloric acid, or reduction of the nitro-moiety, for example using tin(II)chloride or a palladium on charcoal catalyst with hydrogen gas results in compounds of general formula (III), which can then be transformed
5 further as described, for example, in scheme 3.

1.2 Synthesis of imidazole derivatives

One possible synthesis route for the compounds of this invention is depicted in schemes 2 and 3.

10

Scheme 2

15

Scheme 2: Synthesis of 3,4 dicarboxylic acid substituted imidazoles, wherein X_1 represents NR^3 , and R^2 and R^3 are as defined for the compounds of general formula (I) *supra*.

Commercially available benzene-1,2-diamine **2-1** can be reacted with carboxylic acids at elevated temperatures to give compounds of type **2-2**.

Treatment of compound **2-2**, for example with hydrogenperoxide under acidic conditions and elevated temperature, yields compound **2-3**.

20

The synthesis of some of the compounds claimed in this invention employs the dicarboxylic acids of type **2-3** as depicted in scheme 3.

Scheme 3

Scheme 3: Synthesis of compounds starting from dicarboxylic acid precursors, wherein X_1 represents NR^3 , except for compounds 3-1 and (II) wherein X_1 represents N, and X_2 , and R^1 , R^2 , R^3 , R^5 , R^8 , R^9 , R^{10} and R^{11} are as defined for the compound of general formula (I) *supra*, and in which PG represents a protecting group, such as a BOC group, and in which YH represents an alcohol R^9OH or an amine $\text{R}^{11}(\text{R}^{10})\text{NH}_2$, wherein R^9 , R^{10} and R^{11} are as defined for the compound of general formula (I) *supra*, and W represents a hydroxy group or a chlorine atom.

Starting from the corresponding 1*H*-imidazole-4,5-dicarboxylic acid derivative 2-3, after treatment with thionylchloride at elevated temperature 5,10-dioxo-5*H*,10*H*-diimidazo[1,5-*a*:1',5'-*d*]pyrazine-1,6-dicarbonyl dichlorides of type 3-1 are obtained.

- 5 Compounds of type 3-1 can be reacted with suitable nucleophiles, such as, for example, amines or alcohols of general formula (V) in presence of a suitable base, for example N-ethyl-N-isopropylpropan-2-amine, to give a compound of general formula (II).

Compounds of type (II) may serve as starting materials for several transformations:

- 10 Compounds of general formula (I) can be obtained directly by reacting compounds of general formula (II) with a fully decorated aromatic amine of general formula (III) at elevated temperatures.

Alternatively, an intermediate of type 3-4 can be obtained by reacting a compound of general formula (II) with a suitably substituted aromatic diamine of type 3-5 at
15 elevated temperatures followed by standard amide bond forming reactions, for example with a carboxylic acid of the type 3-7 in presence of a coupling agent such as, for example, HATU or the corresponding acid chloride of type 3-7, to give compounds of type (I).

Another alternative synthesis route employs compounds of general formula (II) in
20 presence of an aromatic amines of the type 3-6 with a suitably protected second amine function, such as, for example a BOC-protecting group, or a nitro group as a precursor for the second amine function (N-PG) at elevated temperatures to give compounds of type 3-3.

Deprotection of the protected amine, in the case of a BOC-protecting group for
25 example employing TFA or hydrochloric acid, or reduction of the nitro-moiety, for example using tin(II)chloride or a palladium on charcoal catalyst with hydrogen gas results in compounds of type 3-4, which can then be transformed further as described above.

Esters of general formula (I) ($R^1 = OR^9$) can be transformed into amides of general
30 formula (I), ($R^1 = N(R^{10})R^{11}$), according to the invention, for example by treatment

with different amines, optionally in presence of a base, such as, for example, *N*-ethyl-*N*-isopropylpropan-2-amine, or alternatively in a two step procedure consisting of ester hydrolysis, for example using sodium hydroxide followed by standard amide bond formation in presence of amines and coupling agents such as HATU or alternatively in a three step procedure after hydrolysis of the ester, generation of corresponding acid chloride, for example using thionylchloride and reaction with amines under basic conditions in presence of, for example, *N*-ethyl-*N*-isopropylpropan-2-amine.

An alternative synthesis route of imidazole derivatives of the present invention is depicted in scheme 4.

Scheme 4

Scheme 4: Alternative Synthesis of imidazole derivatives, wherein X₁ represents NR³, except for compounds 3-1 and (IV) wherein X₁ represents N, and X₂, R¹, R², R³, R⁵ and R⁸ are as defined for the compound of general formula (I) *supra*, and in which YH represents an alcohol R⁹OH or an amine R¹¹(R¹⁰)NH₂, wherein R⁹, R¹⁰ and R¹¹ are as defined for the compound of general formula (I) *supra*.

Starting from compounds of type 3-1, upon reaction with aromatic amines of general formula (III) in the presence of a base such as, for example *N*-ethyl-*N*-isopropylpropan-2-amine, compounds of general formula (IV) can be obtained.

- 5 Compounds of general formula (IV) can be transformed to compounds of general formula (I) by reaction with nucleophiles of general formula (V), such as, for example, amines or alcohols, optionally in the presence of a base, such as, for example *N*-ethyl-*N*-isopropylpropan-2-amine.

10 1.3 Synthesis of oxazole derivatives

Yet another possible synthesis route for the compounds of this invention is depicted in scheme 5.

Scheme 5

Scheme 5: Synthesis of oxazole derivatives of the present invention, wherein X_1 represents O, and, X_2 , R^1 , R^2 , R^5 , R^8 , R^9 , R^{10} and R^{11} as defined for the compound of
 5 general formula (I) *supra*.

Compounds of type (III) can be transformed into compounds of type (VI) by reaction with oxalyl chloride.

Reaction of general formula (VI) with alkyl isocyanacetates of general formula (VII) in presence of, for example, imidazole and triethylamine yields esters of
 10 general formula as claimed in this invention.

Esters of general formula (I) ($R^1 = \text{OR}^9$) can be transformed into amides of general formula (I), ($R^1 = \text{N}(\text{R}^{10})\text{R}^{11}$), according to the invention, for example by treatment with different amines, optionally in presence of a base, such as, for example, *N*-ethyl-*N*-isopropylpropan-2-amine, or alternatively in a two step procedure

consisting of ester hydrolysis, for example using sodium hydroxide followed by standard amide bond formation in presence of amines and coupling agents such as HATU or alternatively in a three step procedure after hydrolysis of the ester, generation of corresponding acid chloride, for example using thionylchloride and reaction with amines under basic conditions in presence of, for example, *N*-ethyl-*N*-isopropylpropan-2-amine.

Scheme 6

10 Scheme 6: Synthesis of compounds starting from dicarboxylic acid precursors, wherein X_1 represents NR^3 , except for compounds 3-1 and (VIII) wherein X_1 represents N, R^{17} represents OR^{18} , wherein R^{18} represents hydrogen or phenyl and X_2 and R^2 , R^3 , R^5 , R^8 , R^{10} and R^{11} are as defined for the compound of general formula (I) *supra*, and in which ZH represents an alcohol R^{18}OH or a carbamate, such as *tert*-butyl carbamat.

15 Starting from the corresponding 1*H*-imidazole-4,5-dicarboxylic acid derivative 2-3, after treatment with thionylchloride at elevated

temperature 5,10-dioxo-5*H*,10*H*-diimidazo[1,5-*a*:1',5'-*d*]pyrazine-1,6-dicarbonyl dichlorides of type 3-1 are obtained.

NMR data :

The ¹H-NMR data of selected examples are listed in the form of ¹H-NMR peaklists.
 20 For each signal peak the δ value in ppm is given, followed by the signal intensity,
 reported in round brackets. The δ value-signal intensity pairs from different peaks
 are separated by commas. Therefore, a peaklist is described by the general form:
 δ₁ (intensity₁), δ₂ (intensity₂), ... , δ_i (intensity_i), ... , δ_n (intensity_n).

The intensity of a sharp signal correlates with the height (in cm) of the signal in a
 25 printed NMR spectrum. When compared with other signals, this data can be
 correlated to the real ratios of the signal intensities. In the case of broad signals,
 more than one peak, or the center of the signal along with their relative intensity,
 compared to the most intense signal displayed in the spectrum, are shown. A ¹H-
 NMR peaklist is similar to a classical ¹H-NMR readout, and thus usually contains all

the peaks listed in a classical NMR interpretation. Moreover, similar to classical ¹H-NMR printouts, peaklists can show solvent signals, signals derived from stereoisomers of target compounds (also the subject of the invention), and/or peaks of impurities. The peaks of stereoisomers, and/or peaks of impurities are typically displayed with a lower intensity compared to the peaks of the target compounds (e.g., with a purity of >90%). Such stereoisomers and/or impurities may be typical for the particular manufacturing process, and therefore their peaks may help to identify the reproduction of our manufacturing process on the basis of "by-product fingerprints". An expert who calculates the peaks of the target compounds by known methods (MestReC, ACD simulation, or by use of empirically evaluated expectation values), can isolate the peaks of target compounds as required, optionally using additional intensity filters. Such an operation would be similar to peak-picking in classical ¹H-NMR interpretation. A detailed description of the reporting of NMR data in the form of peaklists can be found in the publication "Citation of NMR Peaklist Data within Patent Applications" (cf. Research Disclosure Database Number 605005, 2014, 01 Aug 2014, or <http://www.researchdisclosure.com/searching-disclosures>). In the peak picking routine, as described in the Research Disclosure Database Number 605005, the parameter "MinimumHeight" can be adjusted between 1% and 4%. Depending on the chemical structure and/or depending on the concentration of the measured compound it may be reasonable to set the parameter "MinimumHeight" <1%.

Further, the compounds of formula (I) of the present invention can be converted to any salt as described herein, by any method which is known to the person skilled in the art. Similarly, any salt of a compound of formula (I) of the present invention can be converted into the free compound, by any method which is known to the person skilled in the art.

Pharmaceutical compositions of the compounds of the invention

This invention also relates to pharmaceutical compositions containing one or more compounds of the present invention. These compositions can be utilised to achieve the desired pharmacological effect by administration to a patient in need thereof. A patient, for the purpose of this invention, is a mammal, including a human, in need of treatment for the particular condition or disease. Therefore, the present invention includes pharmaceutical compositions that are comprised of a pharmaceutically acceptable carrier and a pharmaceutically effective amount of a compound, or salt thereof, of the present invention. A pharmaceutically acceptable carrier is preferably a carrier that is relatively non-toxic and innocuous to a patient at concentrations consistent with effective activity of the active ingredient so that any side effects ascribable to the carrier do not vitiate the beneficial effects of the active ingredient. A pharmaceutically effective amount of compound is preferably that amount which produces a result or exerts an influence on the particular condition being treated. The compounds of the present invention can be administered with pharmaceutically-acceptable carriers well known in the art using any effective conventional dosage unit forms, including immediate, slow and timed release preparations, orally, parenterally, topically, nasally, ophthalmically, optically, sublingually, rectally, vaginally, and the like.

For oral administration, the compounds can be formulated into solid or liquid preparations such as capsules, pills, tablets, troches, lozenges, melts, powders, solutions, suspensions, or emulsions, and may be prepared according to methods known to the art for the manufacture of pharmaceutical compositions. The solid unit dosage forms can be a capsule that can be of the ordinary hard- or soft-shelled gelatine type containing, for example, surfactants, lubricants, and inert fillers such as lactose, sucrose, calcium phosphate, and corn starch.

In another embodiment, the compounds of this invention may be tableted with conventional tablet bases such as lactose, sucrose and cornstarch in combination with binders such as acacia, corn starch or gelatine, disintegrating agents intended to assist the break-up and dissolution of the tablet following administration such as potato starch, alginic acid, corn starch, and guar gum, gum tragacanth, acacia, lubricants intended to improve the flow of tablet granulation and to prevent the adhesion of tablet material to the surfaces of the tablet dies and punches, for example talc, stearic acid, or magnesium, calcium or zinc stearate, dyes, colouring agents, and flavouring agents such as peppermint, oil of wintergreen, or cherry flavouring, intended to enhance the aesthetic qualities of the tablets and make them more acceptable to the patient. Suitable excipients for use in oral liquid dosage forms include dicalcium phosphate and diluents such as water and alcohols, for example, ethanol, benzyl alcohol, and polyethylene alcohols, either with or without the addition of a pharmaceutically acceptable surfactant, suspending agent or emulsifying agent. Various other materials may be present as coatings or to otherwise modify the physical form of the dosage unit. For instance tablets, pills or capsules may be coated with shellac, sugar or both.

Dispersible powders and granules are suitable for the preparation of an aqueous suspension. They provide the active ingredient in admixture with a dispersing or wetting agent, a suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example those sweetening, flavouring and colouring agents described above, may also be present.

The pharmaceutical compositions of this invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil such as liquid paraffin or a mixture of vegetable oils. Suitable emulsifying agents may be (1) naturally occurring gums such as gum acacia and gum tragacanth, (2) naturally occurring phosphatides such as soy bean and lecithin, (3) esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan monooleate, (4) condensation products of said partial esters with ethylene oxide, for example, polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil such as, for example, arachis oil, olive oil, sesame oil or coconut oil,

or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent such as, for example, beeswax, hard paraffin, or cetyl alcohol. The suspensions may also contain one or more preservatives, for example, ethyl or n-propyl p-hydroxybenzoate ; one or more colouring agents ; one or more
5 flavouring agents ; and one or more sweetening agents such as sucrose or saccharin.

Syrups and elixirs may be formulated with sweetening agents such as, for example, glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, and preservative, such as methyl and propyl parabens and flavouring
10 and colouring agents.

The compounds of this invention may also be administered parenterally, that is, subcutaneously, intravenously, intraocularly, intrasynovially, intramuscularly, or interperitoneally, as injectable dosages of the compound in preferably a physiologically acceptable diluent with a pharmaceutical carrier which can be a
15 sterile liquid or mixture of liquids such as water, saline, aqueous dextrose and related sugar solutions, an alcohol such as ethanol, isopropanol, or hexadecyl alcohol, glycols such as propylene glycol or polyethylene glycol, glycerol ketals such as 2,2-dimethyl-1,1-dioxolane-4-methanol, ethers such as poly(ethylene glycol) 400, an oil, a fatty acid, a fatty acid ester or, a fatty acid glyceride, or an
20 acetylated fatty acid glyceride, with or without the addition of a pharmaceutically acceptable surfactant such as a soap or a detergent, suspending agent such as pectin, carbomers, methylcellulose, hydroxypropylmethylcellulose, or carboxymethylcellulose, or emulsifying agent and other pharmaceutical adjuvants.

Illustrative of oils which can be used in the parenteral formulations of this
25 invention are those of petroleum, animal, vegetable, or synthetic origin, for example, peanut oil, soybean oil, sesame oil, cottonseed oil, corn oil, olive oil, petrolatum and mineral oil. Suitable fatty acids include oleic acid, stearic acid, isostearic acid and myristic acid. Suitable fatty acid esters are, for example, ethyl oleate and isopropyl myristate. Suitable soaps include fatty acid alkali metal, ammonium, and triethanolamine salts and suitable detergents include cationic
30 detergents, for example dimethyl dialkyl ammonium halides, alkyl pyridinium halides, and alkylamine acetates ; anionic detergents, for example, alkyl, aryl, and olefin sulfonates, alkyl, olefin, ether, and monoglyceride sulfates, and sulfosuccinates ; non-ionic detergents, for example, fatty amine oxides, fatty acid

alkanolamides, and poly(oxyethylene-oxypropylene)s or ethylene oxide or propylene oxide copolymers ; and amphoteric detergents, for example, alkyl-beta-aminopropionates, and 2-alkylimidazoline quarternary ammonium salts, as well as mixtures.

- 5 The parenteral compositions of this invention will typically contain from about 0.5% to about 25% by weight of the active ingredient in solution. Preservatives and buffers may also be used advantageously. In order to minimise or eliminate irritation at the site of injection, such compositions may contain a non-ionic surfactant having a hydrophile-lipophile balance (HLB) preferably of from about 12
10 to about 17. The quantity of surfactant in such formulation preferably ranges from about 5% to about 15% by weight. The surfactant can be a single component having the above HLB or can be a mixture of two or more components having the desired HLB.

Illustrative of surfactants used in parenteral formulations are the class of
15 polyethylene sorbitan fatty acid esters, for example, sorbitan monooleate and the high molecular weight adducts of ethylene oxide with a hydrophobic base, formed by the condensation of propylene oxide with propylene glycol.

The pharmaceutical compositions may be in the form of sterile injectable aqueous suspensions. Such suspensions may be formulated according to known methods
20 using suitable dispersing or wetting agents and suspending agents such as, for example, sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia ; dispersing or wetting agents which may be a naturally occurring phosphatide such as lecithin, a condensation product of an alkylene oxide with a fatty acid, for
25 example, polyoxyethylene stearate, a condensation product of ethylene oxide with a long chain aliphatic alcohol, for example, heptadeca-ethyleneoxycetanol, a condensation product of ethylene oxide with a partial ester derived from a fatty acid and a hexitol such as polyoxyethylene sorbitol monooleate, or a condensation product of an ethylene oxide with a partial ester derived from a fatty acid and a
30 hexitol anhydride, for example polyoxyethylene sorbitan monooleate.

The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent. Diluents and solvents that may be employed are, for example, water, Ringer's solution, isotonic sodium chloride solutions and isotonic glucose solutions. In addition, sterile fixed

oils are conventionally employed as solvents or suspending media. For this purpose, any bland, fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid can be used in the preparation of injectables.

5 A composition of the invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritation excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are, for example, cocoa
10 butter and polyethylene glycol.

Another formulation employed in the methods of the present invention employs transdermal delivery devices ("patches"). Such transdermal patches may be used to provide continuous or discontinuous infusion of the compounds of the present invention in controlled amounts. The construction and use of transdermal patches
15 for the delivery of pharmaceutical agents is well known in the art (see, e.g., US Patent No. 5,023,252, issued June 11, 1991, incorporated herein by reference). Such patches may be constructed for continuous, pulsatile, or on demand delivery of pharmaceutical agents.

Controlled release formulations for parenteral administration include liposomal,
20 polymeric microsphere and polymeric gel formulations that are known in the art.

It may be desirable or necessary to introduce the pharmaceutical composition to the patient via a mechanical delivery device. The construction and use of mechanical delivery devices for the delivery of pharmaceutical agents is well known in the art. Direct techniques for, for example, administering a drug directly
25 to the brain usually involve placement of a drug delivery catheter into the patient's ventricular system to bypass the blood-brain barrier. One such implantable delivery system, used for the transport of agents to specific anatomical regions of the body, is described in US Patent No. 5,011,472, issued April 30, 1991.

30 The compositions of the invention can also contain other conventional pharmaceutically acceptable compounding ingredients, generally referred to as carriers or diluents, as necessary or desired. The formulation is reconstituted with sterile, injectable saline or dextrose 5% to a concentration of 10 to 20 mg/mL, which is further diluted with saline or dextrose

5% to 0.2 - 0.4 mg/mL, and is administered either IV bolus or by IV infusion over 15 - 60 min.

5 50 mg/mL of the desired, water-insoluble compound of this invention

5 mg/mL sodium carboxymethylcellulose

4 mg/mL TWEEN 80

9 mg/mL sodium chloride

9 mg/mL benzyl alcohol

10 Hard Shell Capsules: A large number of unit capsules are prepared by filling standard two-piece hard galantine capsules each with 100 mg of powdered active ingredient, 150 mg of lactose, 50 mg of cellulose and 6 mg of magnesium stearate.

Soft Gelatin Capsules: A mixture of active ingredient in a digestible oil such as soybean oil, cottonseed oil or olive oil is prepared and injected by means of a positive displacement pump into molten gelatin to form soft gelatin capsules containing 100 mg of the active ingredient. The capsules are washed and dried. The active ingredient can be dissolved in a mixture of polyethylene glycol, glycerin and sorbitol to prepare a water miscible medicine mix.

20 Tablets: A large number of tablets are prepared by conventional procedures so that the dosage unit is 100 mg of active ingredient, 0.2 mg. of colloidal silicon dioxide, 5 mg of magnesium stearate, 275 mg of microcrystalline cellulose, 11 mg of starch, and 98.8 mg of lactose. Appropriate aqueous and non-aqueous coatings may be applied to increase palatability, improve elegance and stability or delay absorption.

25 Immediate Release Tablets/Capsules: These are solid oral dosage forms made by conventional and novel processes. These units are taken orally without water for immediate dissolution and delivery of the medication. The active ingredient is mixed in a liquid containing ingredient such as sugar, gelatin, pectin and

sweeteners. These liquids are solidified into solid tablets or caplets by freeze drying and solid state extraction techniques. The drug compounds may be compressed with viscoelastic and thermoelastic sugars and polymers or effervescent components to produce porous matrices intended for immediate

Combination therapies

10 The term “combination” in the present invention is used as known to persons skilled in the art and may be present as a fixed combination, a non-fixed combination or kit-of-parts.

A “fixed combination” in the present invention is used as known to persons skilled
15 in the art and is defined as a combination wherein the said first active ingredient and the said second active ingredient are present together in one unit dosage or in a single entity. One example of a “fixed combination” is a pharmaceutical composition wherein the said first active ingredient and the said second active ingredient are present in admixture for simultaneous administration, such as in a

A non-fixed combination or “kit-of-parts” in the present invention is used as known
25 to persons skilled in the art and is defined as a combination wherein the said first active ingredient and the said second active ingredient are present in more than one unit. One example of a non-fixed combination or kit-of-parts is a combination wherein the said first active ingredient and the said second active ingredient are present separately. The components of the non-fixed combination or kit-of-parts
30 may be administered separately, sequentially, simultaneously, concurrently or chronologically staggered.

The compounds of this invention can be administered as the sole pharmaceutical agent or in combination with one or more other pharmaceutical agents where the

combination causes no unacceptable adverse effects. The present invention relates also to such combinations. Methods of Sensitizing Cells to Radiation

In a distinct embodiment of the present invention, a compound of the present invention may be used to sensitize a cell to radiation. That is, treatment of a cell with a compound of the present invention prior to radiation treatment of the cell renders the cell more susceptible to DNA damage and cell death than the cell would be in the absence of any treatment with a compound of the invention. In one aspect, the cell is treated with at least one compound of the invention.

Thus, the present invention also provides a method of killing a cell, wherein a cell is administered one or more compounds of the invention in combination with conventional radiation therapy.

The present invention also provides a method of rendering a cell more susceptible to cell death, wherein the cell is treated with one or more compounds of the invention prior to the treatment of the cell to cause or induce cell death. In one aspect, after the cell is treated with one or more compounds of the invention, the cell is treated with at least one compound, or at least one method, or a combination thereof, in order to cause DNA damage for the purpose of inhibiting the function of the normal cell or killing the cell.

In one embodiment, a cell is killed by treating the cell with at least one DNA damaging agent. That is, after treating a cell with one or more compounds of the invention to sensitize the cell to cell death, the cell is treated with at least one DNA damaging agent to kill the cell. DNA damaging agents useful in the present invention include, but are not limited to, chemotherapeutic agents (*e.g.*, cisplatinum), ionizing radiation (X-rays, ultraviolet radiation), carcinogenic agents, and mutagenic agents.

In another embodiment, a cell is killed by treating the cell with at least one method to cause or induce DNA damage. Such methods include, but are not limited to, activation of a cell signalling pathway that results in DNA damage when the pathway is activated, inhibiting of a cell signalling pathway that results in DNA damage when the pathway is inhibited, and inducing a biochemical change in a cell, wherein the change results in DNA damage. By way of a non-limiting example, a DNA repair pathway in a cell can be inhibited, thereby preventing the repair of DNA damage and resulting in an abnormal accumulation of DNA damage in a cell.

In one aspect of the invention, a compound of the invention is administered to a cell prior to the radiation or other induction of DNA damage in the cell. In another

aspect of the invention, a compound of the invention is administered to a cell concomitantly with the radiation or other induction of DNA damage in the cell. In yet another aspect of the invention, a compound of the invention is administered to a cell immediately after radiation or other induction of DNA damage in the cell
5 has begun.

In another aspect, the cell is in vitro. In another embodiment, the cell is in vivo.

As mentioned supra, the compounds of the present invention have surprisingly been found to effectively inhibit tankyrases and may therefore be used for the treatment or prophylaxis of diseases of uncontrolled cell growth, proliferation
10 and/or survival, inappropriate cellular immune responses, or inappropriate cellular inflammatory responses, or diseases which are accompanied with uncontrolled cell growth, proliferation and/or survival, inappropriate cellular immune responses, or inappropriate cellular inflammatory responses, particularly in which the uncontrolled cell growth, proliferation and/or survival, inappropriate cellular
15 immune responses, or inappropriate cellular inflammatory responses are affected by inhibition of tankyrases, such as, for example, haematological tumours, solid tumours, and/or metastases thereof, e.g. leukaemias and myelodysplastic syndrome, malignant lymphomas, head and neck tumours including brain tumours and brain metastases, tumours of the thorax including non-small cell and small cell
20 lung tumours, gastrointestinal tumours, endocrine tumours, mammary and other gynaecological tumours, urological tumours including renal, bladder and prostate tumours, skin tumours, and sarcomas, and/or metastases thereof.

25 compound of general formula (I), or a stereoisomer, a tautomer, an N-oxide, a hydrate, a solvate, or a salt thereof, particularly a pharmaceutically acceptable salt thereof, or a mixture of same, as described and defined herein, for use in the treatment or prophylaxis of a disease, as mentioned *supra*.

30 Another particular aspect of the present invention is therefore the use of a compound of general formula (I), described *supra*, or a stereoisomer, a tautomer, an N-oxide, a hydrate, a solvate, or a salt thereof, particularly a pharmaceutically

acceptable salt thereof, or a mixture of same, for the prophylaxis or treatment of a disease.

Another particular aspect of the present invention is therefore the use of a compound of general formula (I) described supra or a stereoisomer, a tautomer, an N-oxide, a hydrate, a solvate, or a salt thereof, particularly a pharmaceutically acceptable salt thereof, or a mixture of same. for manufacturing a pharmaceutical composition for the treatment or prophylaxis of a disease.

Another aspect of the present invention is the use of a compound of formula (I) or a stereoisomer, a tautomer, an N-oxide, a hydrate, a solvate, or a salt thereof, particularly a pharmaceutically acceptable salt thereof, or a mixture of same, as described herein, in the manufacture of a medicament for the treatment or prophylaxis of a disease.

15

The diseases referred to in the three preceding paragraphs are diseases of uncontrolled cell growth, proliferation and/or survival, inappropriate cellular immune responses, or inappropriate cellular inflammatory responses, or diseases which are accompanied with uncontrolled cell growth, proliferation and/or survival, inappropriate cellular immune responses, or inappropriate cellular inflammatory responses, such as, for example, haematological tumours, solid tumours, and/or metastases thereof, e.g. leukaemias and myelodysplastic syndrome, malignant lymphomas, head and neck tumours including brain tumours and brain metastases, tumours of the thorax including non-small cell and small cell lung tumours, gastrointestinal tumours, endocrine tumours, mammary and other gynaecological tumours, urological tumours including renal, bladder and prostate tumours, skin tumours, and sarcomas, and/or metastases thereof.

Those disorders also
20 include lymphomas, sarcomas, and leukaemias.

25 These disorders have been well characterized in humans, but also exist with a similar etiology in other mammals, and can be treated by administering pharmaceutical compositions of the present invention.

30 The term "treating" or "treatment" as stated throughout this document is used conventionally, e.g., the management or care of a subject for the purpose of combating, alleviating, reducing, relieving, improving the condition of, etc., of a disease or disorder, such as a carcinoma.

Methods of treating angiogenic disorders

The present invention also provides methods of treating disorders and diseases associated with excessive and/or abnormal angiogenesis.

Inappropriate and ectopic expression of angiogenesis can be deleterious to an organism. A number of pathological conditions are associated with the growth of
5 extraneous blood vessels. These include, e.g., diabetic retinopathy, ischemic retinal-vein occlusion, and retinopathy of prematurity [Aiello et al. *New Engl. J. Med.* **1994**, 331, 1480 ; Peer et al. *Lab. Invest.* **1995**, 72, 638], age-related macular degeneration [AMD ; see, Lopez et al. *Invest. Ophthalmol. Vis. Sci.* **1996**,
10 37, 855], neovascular glaucoma, psoriasis, retrolental fibroplasias, angiofibroma, inflammation, rheumatoid arthritis (RA), restenosis, in-stent restenosis, vascular graft restenosis, etc. In addition, the increased blood supply associated with cancerous and neoplastic tissue, encourages growth, leading to rapid tumour enlargement and metastasis. Moreover, the growth of new blood and lymph vessels in a tumour provides an escape route for renegade cells, encouraging metastasis
15 and the consequence spread of the cancer. Thus, compounds of the present invention can be utilized to treat and/or prevent any of the aforementioned angiogenesis disorders, e.g., by inhibiting and/or reducing blood vessel formation ; by inhibiting, blocking, reducing, decreasing, etc. endothelial cell proliferation or other types involved in angiogenesis, as well as causing cell death or apoptosis of
20 such cell types.

Dose and administration

Based upon standard laboratory techniques known to evaluate compounds useful
25 for the treatment of hyper-proliferative disorders and angiogenic disorders, by standard toxicity tests and by standard pharmacological assays for the determination of treatment of the conditions identified above in mammals, and by comparison of these results with the results of known medicaments that are used to treat these conditions, the effective dosage of the compounds of this invention
30 can readily be determined for treatment of each desired indication. The amount of the active ingredient to be administered in the treatment of one of these conditions can vary widely according to such considerations as the particular compound and dosage unit employed, the mode of administration, the period of

treatment, the age and sex of the patient treated, and the nature and extent of the condition treated.

The total amount of the active ingredient to be administered will generally range from about 0.001 mg/kg to about 200 mg/kg body weight per day, and preferably from about 0.01 mg/kg to about 20 mg/kg body weight per day. Clinically useful dosing schedules will range from one to three times a day dosing to once every four weeks dosing. In addition, "drug holidays" in which a patient is not dosed with a drug for a certain period of time, may be beneficial to the overall balance between pharmacological effect and tolerability. A unit dosage may contain from about 0.5 mg to about 1500 mg of active ingredient, and can be administered one or more times per day or less than once a day. The average daily dosage for administration by injection, including intravenous, intramuscular, subcutaneous and parenteral injections, and use of infusion techniques will preferably be from 0.01 to 200 mg/kg of total body weight. The average daily rectal dosage regimen will preferably be from 0.01 to 200 mg/kg of total body weight. The average daily vaginal dosage regimen will preferably be from 0.01 to 200 mg/kg of total body weight. The average daily topical dosage regimen will preferably be from 0.1 to 200 mg administered between one to four times daily. The transdermal concentration will preferably be that required to maintain a daily dose of from 0.01 to 200 mg/kg. The average daily inhalation dosage regimen will preferably be from 0.01 to 100 mg/kg of total body weight.

Of course the specific initial and continuing dosage regimen for each patient will vary according to the nature and severity of the condition as determined by the attending diagnostician, the activity of the specific compound employed, the age and general condition of the patient, time of administration, route of administration, rate of excretion of the drug, drug combinations, and the like. The desired mode of treatment and number of doses of a compound of the present invention or a pharmaceutically acceptable salt or ester or composition thereof can be ascertained by those skilled in the art using conventional treatment tests.

Preferably, the diseases of said method are haematological tumours, solid tumour and/or metastases thereof.

The compounds of the present invention can be used in particular in therapy and prevention, i.e. prophylaxis, of tumour growth and metastases, especially in solid tumours of all indications and stages with or without pre-treatment of the tumour growth.

5

Methods of testing for a particular pharmacological or pharmaceutical property are well known to persons skilled in the art.

The example testing experiments described herein serve to illustrate the present invention and the invention is not limited to the examples given.

10

Biological assays:

Examples were tested in selected biological assays one or more times. When tested more than once, data are reported as either average values or as median values,

15

wherein

- the average value, also referred to as the arithmetic mean value, represents the sum of the values obtained divided by the number of times tested, and
- the median value represents the middle number of the group of values when ranked in ascending or descending order. If the number of values in the data set is odd, the median is the middle value. If the number of values in the data set is even, the median is the arithmetic mean of the two middle values.

20

When no meaningful calculation of average values or median values is possible due to the existence of measurement values falling outside of the detection range of the assay (indicated by < or > in the tables below) all individual measurement values are indicated.

25

Examples were synthesized one or more times. When synthesized more than once, data from biological assays represent average values or median values calculated utilizing data sets obtained from testing of one or more synthetic batch.

6 Biochemical assays

In general the potency assessment of the compounds of the present invention reveal consistent data applying orthogonal biochemical test formats (compare identical example Nos. in the tables below showing results for the TNKS1 Assay 1, Modified TNKS1 Assay 2 and Modified TNKS1 Assay 3, or for the TNKS2 Assay 1, Modified TNKS2 Assay 2 and Modified TNKS2 Assay 3). For those particular cases where the correlation of test results between different assays is less good, it could not be excluded that any differences may be due to different potencies of the compound dependent on the assay setup itself. Another factor to explain any potency differences between assays may be the use of different batches of the particular test compound applied in those orthogonal tests. Here, in some cases the test compound has been supplied as stock solution in DMSO, and in other cases the compound has been taken from solid material and dissolved freshly in DMSO solvent prior to the experiment. A different solubilization would have resulted in different apparent concentrations used for testing and would have translated into different apparent potencies.

6.1 TNKS1 Assays

TNKS1 Assay 1

The potency of the compounds according to the invention was assessed by applying an *in vitro* inhibition assay. The TNKS1 catalyzed NAD⁺-dependent ribosylation of a suitable protein substrate was detected using a commercially available biotin/streptavidin binding based assay format [TNKS1 Histone Ribosylation Assay Kit (Biotin-labeled NAD⁺), Catalog #80579; BPS Bioscience, San Diego, USA]. Here, the incorporation of a biotin-labeled NAD⁺ during the TNKS1 catalyzed ribosylation reaction was detected with a streptavidin-HRP coupled chemi-luminescent readout. The intensity of the readout signal is proportional to the incorporated NAD⁺. Inhibition of TNKS1 leads to a decreased incorporation of NAD⁺ and consequently to a lower readout signal intensity. The concentration of a test compound which inhibits the enzyme activity by 50% (corresponds to half of the normed readout signal intensity) is reported as IC₅₀.

Protocol

The assay was conducted in a 384 well MTP format according to the manufacturer's protocol [<http://www.bpsbioscience.com/poly-adp-ribose-polymerase/assay-kit/tnks1-histone-ribosylation-assay-kit-biotin-labeled-nad-80579> referencing: 5 *Brown, J.A., Marala, R.B. J. Pharmacol. Toxicol. Methods 2002 47:137-41*] and using a BMG Pherastar MTP reader [BMG-Labtech, Offenburg, Germany].

Modified TNKS1 Assay 2

The potency of selected compounds according to the invention was assessed applying an modified *in vitro* inhibition assay. Here, the TNKS1 catalyzed NAD⁺-dependent ribosylation of the enzyme itself (auto-parsylation) was detected using [3H]-NAD⁺ as substrate and applying the scintillation proximity assay (SPA) method to detect tritium-labeled, parsylated TNKS1. The intensity of the readout signal is proportional to the incorporated [3H]-NAD⁺. Inhibition of TNKS1 leads to a decreased incorporation of [3H]-NAD⁺ and consequently to a lower readout signal intensity. The concentration of a test compound which inhibits the enzyme activity by 50% (corresponds to half of the normed readout signal intensity) is reported as IC₅₀.

Protocol Auto-Parsylation Assay

The assay was conducted in a 96 well MTP format with the identical TNKS1 enzyme sample and NAD⁺ sample as in the histone ribosylation assay with the following modifications: TNKS1 enzyme sample was diluted with a modified assay buffer (50

mM MES pH 7.0, 1 mM DTT, 0.01% Triton X-100) to a final concentration of 6 nM TNKS1 and 10x NAD⁺ solution was diluted with the modified assay buffer (s. above) to a final 0.445x NAD⁺ solution doped with 100 Bq/ul [³H]-NAD⁺ [Catalog #NET443H050UC, Perkin Elmer, Waltham, Massachusetts, USA]. Substrate solution (10 ul) was incubated with different test compound concentrations (2.5 ul in 10 % DMSO in modified assay buffer) or control (2.5 ul 10 % DMSO in modified assay buffer only) and enzyme (10 ul) over night at room temperature. Incorporated tritium was measured after addition of 50 ul SPA beads (1 mg/ml) [Catalog #RPNQ0095 20 mg/ml, Perkin Elmer, Waltham, Massachusetts, USA; diluted 1:10 with Dulbecco's phosphate buffered saline, PBS Catalog #D8537, Sigma-Aldrich, Steinheim, Germany] and detection of the photon emission with a beta count plate reader [Wallac MicroBeta®, Perkin Elmer, Waltham, Massachusetts, USA].

Modified TNKS1 Assay 3

The potency of the compounds against human TNKS1 according to the invention was assessed using a commercially available biotin/streptavidin binding assay kits from BPS Bioscience, San Diego, USA (Catalog #80573 for TNKS1). The incorporation of a biotin-labeled NAD⁺ during the PAPR1 catalyzed ribosylation of a suitable protein substrate was detected using with a streptavidin-HRP coupled chemiluminescent readout. The intensity of the readout signal is proportional to the incorporated NAD⁺. Inhibition of TNKS1 leads to a decreased incorporation of NAD⁺ and consequently to a lower readout signal intensity in the corresponding TNKS1 assays. The concentration of a test compound that inhibits the enzyme activity by 50% (corresponds to half of the normed readout signal intensity) is reported as IC₅₀.

The assay was conducted in a 96 well MTP format according to the manufacturer's protocol and using a BMG Pherastar MTP reader [BMG-Labtech, Offenburg, Germany].

6.2 TNKS2 Assays

TNKS2 Assay 1

The potency of the compounds according to the invention was assessed applying an *in vitro* inhibition assay. The TNKS2 catalyzed NAD⁺-dependent ribosylation of a suitable protein substrate was detected using a commercially available biotin/streptavidin binding based assay format [TNKS2 Histone Ribosylation Assay Kit (Biotin-labeled NAD⁺), Catalog #80572; BPS Bioscience, San Diego, USA]. Here, the incorporation of a biotin-labeled NAD⁺ during the TNKS2 catalyzed ribosylation reaction was detected with a streptavidin-HRP coupled chemi-luminescent readout. The intensity of the readout signal is proportional to the incorporated NAD⁺. Inhibition of TNKS2 leads to a decreased incorporation of NAD⁺ and consequently to a lower readout signal intensity. The concentration of a test compound which inhibits the enzyme activity by 50% (corresponds to half of the normed readout signal intensity) is reported as IC₅₀.

Protocol

The assay was conducted in a 384 well MTP format according to the manufacturer's protocol [<http://www.bpsbioscience.com/poly-adp-ribose-polymerase/assay-kit/tnks2-histone-ribosylation-assay-kit-biotin-labeled-nad-80572> referencing: Brown, J.A., Marala, R.B. *J. Pharmacol. Toxicol. Methods* 2002 47:137-41]. and using a BMG Pherastar MTP reader [BMG-Labtech, Offenburg, Germany].

Modified TNKS2 Assay 2

The potency of selected compounds according to the invention was assessed applying an modified *in vitro* inhibition assay. Here, the TNKS2 catalyzed NAD⁺-dependent ribosylation of the enzyme itself (auto-parsylation) was detected using [3H]-NAD⁺ as substrate and applying the scintillation proximity assay (SPA) method to detect tritium-labeled, parsylated TNKS2. The intensity of the readout signal is proportional to the incorporated [3H]-NAD⁺. Inhibition of TNKS2 leads to a decreased incorporation of [3H]-NAD⁺ and consequently to a lower readout signal intensity. The concentration of a test compound which inhibits the enzyme activity by 50% (corresponds to half of the normed readout signal intensity) is reported as IC₅₀.

Protocol Auto-Parsylation Assay

The assay was conducted in a 96 well MTP format with the identical TNKS2 enzyme sample and NAD⁺ sample as in the histone ribosylation assay with the following modifications: TNKS2 enzyme sample was diluted with a modified assay buffer (50 mM MES pH 7.0, 1 mM DTT, 0.01% Triton X-100) to a final concentration of 6 nM TNKS2 and 10x NAD⁺ solution was diluted with the modified assay buffer (s. above) to a final 0.445x NAD⁺ solution doped with 100 Bq/ul [3H]-NAD⁺ [Catalog #NET443H050UC, Perkin Elmer, Waltham, Massachusetts, USA]. Substrate solution (10 ul) was incubated with different test compound concentrations (2.5 ul in 10 % DMSO in modified assay buffer) or control (2.5 ul 10 % DMSO in modified assay buffer only) and enzyme (10 ul) over night at room temperature. Incorporated tritium was measured after addition of 50 ul SPA beads (1 mg/ml) [Catalog #RPNQ0095 20 mg/ml, Perkin Elmer, Waltham, Massachusetts, USA; diluted 1:10 with Dulbecco's phosphate buffered saline, PBS Catalog #D8537, Sigma-Aldrich, Steinheim, Germany] and detection of the photon emission with a beta count plate reader [Wallac MicroBeta®, Perkin Elmer, Waltham, Massachusetts, USA].

Modified TNKS2 Assay 3

The potency of the compounds against human TNKS2 according to the invention was assessed using a commercially available biotin/streptavidin binding assay kits from BPS Bioscience, San Diego, USA (Catalog #80578 for TNKS2). The incorporation of a biotin-labeled NAD⁺ during the PAPR1 catalyzed ribosylation of a suitable protein substrate was detected using with a streptavidin-HRP coupled chemiluminescent readout. The intensity of the readout signal is proportional to the incorporated NAD⁺. Inhibition of TNKS2 leads to a decreased incorporation of NAD⁺ and consequently to a lower readout signal intensity in the corresponding TNKS2 assays. The concentration of a test compound that inhibits the enzyme activity by 50% (corresponds to half of the normed readout signal intensity) is reported as IC₅₀. The assay conducted in a 96 well MTP format according to the manufacturer's protocol and using a BMG Pherastar MTP reader [BMG-Labtech, Offenburg, Germany].
