Description

Background of the invention

5 [0001] The present invention relates in general to lamps, and more specifically to a high performance lamp which utilizes a light source which has a glass envelope having a critical size and design specifications.

[0002] It has long been a goal and objective in the field for a low wattage, long life, short arc gap lamp which could be used in front and rear projection applications. Changing needs of the marketplace have identified the need for a short arc gap lamp in the range of 50 watts. Such an illumination source would be required to illuminate small, approx-
10 imately less than 1.5 inches, light valves. This source would require a miniature source size, high luminance, good color properties, long life and low power.

[0003] To date, none of the available prior art light sources can provide the combination of the necessary small arc gap, light output and long life in the miniature size required for the above-described applications.

15 [0004] Prior art general service, for example described in EP-A-0 416 937, large area lighting, metal halide lamps have been designed with very long arc gaps which make them unsuitable for precise optical control of the emitted light. These general service lamps have been utilized in projection applications, but provide extremely inefficient and costly performance. Prior art low wattage lamps have shown that metal halide arc lamps with very small arc gaps, or electrode separations, can be designed to yield very effective optical coupling, but did not yield the very high brightness or exhibit acceptable long lifetimes. The present invention provides the advantage of maintaining a very small arc gap, excellent
20 color as associated with metal halide type lamps, long service life, high luminous brightness and low power consumption.

[0005] It is therefore an object of the present invention to overcome the problems of the prior art described above.

[0006] It is a further object of the present invention to provide a high performance illumination or light source which can be used on compact miniature light valve projection systems.

25 [0007] It is a further object of the present invention to provide a high performance lamp for use in systems which require miniaturization and the advantages of increased portability and lower product cost.

[0008] It is yet another object of the present invention to provide a compact miniature light source which exhibits high luminance, good color properties and long life.

30 **Summary of the Invention**

[0009] The present invention is directed to a high performance miniature arc lamp. The lamp has a preferred use as the key component in a projection display system that utilizes a reflector to focus light onto a miniature imaging device. The miniature imaging device can be any one of a number of available technologies such as liquid crystal displays,
35 micro-electromechanized devices, or spatial light monitors. The miniaturization of these systems provides the advantages of increased portability and lower product cost.

[0010] For an illumination source to have utility to be used in compact, miniature light valve projection systems, it is essential that the lamp or illumination source be of an acceptable miniature size, exhibit high luminance, good color properties, long life and low power.

40 [0011] The lamp of the present invention as defined in claims 1 and 9 is a unique combination of a critical envelope size and design in combination with critical fill parameters, and carefully controlled electrode design and specifications. This combination of components and specifications results in a high performance; miniature 50 watt projection lamp having a total output of >3,200 lumens; a color temperature of >5,000 K; and a maintenance of >75%; when using an electrode arc gap of 1.2 mm.

45 **Brief Description of the Drawing**

[0012] For a fuller understanding of the nature and objects of the invention, reference should be made to the following detailed description of a preferred mode of practicing the invention, read in connection with the accompanying drawings,
50 in which:

FIG. 1 is a side sectional view of the light source of the present invention.

FIG. 1a is an enlarged sectional view of the hermetically sealed chamber of the light source shown in Fig. 1.

FIG. 2 is a side sectional view of a lamp containing the light source of Fig. 1.

55 FIG. 3 is a rear view of the lamp shown in Fig. 1.

Detailed Description of the Invention

[0013] The light source 10 of the present invention in the form of an elongated envelope is shown in more detail in Fig. 1 as being a double ended structure having a pair of elongated electrodes 16 (cathode) and 18 (anode) disposed at opposite ends of neck sections 36 and 38, respectively. The electrodes are separated from each other by a predetermined critical distance D or arc gap in the range of about 0.8 mm to about 1.5 mm. The light source is in the shape of an elongated body having an overall length (L in Fig. 1) in the range of about 28 mm to about 32 mm having the neck sections with a diameter in the range of about 3 mm to about 5 mm, and has a generally ellipsoidal shaped central hermetically sealed chamber 12 having a volume 14 of about $130 \text{ mm}^3 \pm 20 \text{ mm}^3$. The wall thickness of chamber 12 is about 1 mm. The light source contains a critical fill mix which comprises an inert noble gas, mercury and metal halides.

[0014] More specifically, the sealed chamber is formed such that it is approximately ellipsoidal in shape with an internal volume that optimally determines the total internal gas pressure given the quantity of fill material and operating power.

[0015] The volume can be approximated to that of an ellipsoid of semi-major axis, a, and semi-minor axis, b. $V = \frac{4}{3} \pi b^2 \cdot a$ The semi-major axis length (a in Fig. 1a) for the light source of the present invention is one half of the overall chamber length and in a range of about 4 to 6 mm. The semi-minor axis length (b in Fig. 1a) is one half of the chamber inner diameter and has a range of about 2 to 3 mm.

[0016] The range of the chamber volume to yield optimal performance specifications is about 110 to 150 mm^3 . The lamp power divided by the chamber volume is known as the volume-power loading of the lamp. This number calculates out to be 0.4/ mm^3 given the preferred range of design factors. This metric is significant because it relates to the amount of heat dissipated per unit size of the lamp and therefore influences the operating temperature of the lamp.

[0017] The appropriate volume of the chamber is determined in combination with other interrelated design factors, primarily the type and amount of fill materials and operating power. Deviation from the optimal volume could lead to performance degradation as a result of either improper internal operating pressure or improper thermal operation as dictated by the volume-power loading.

[0018] The electrodes respectively consist of a shank portion the ends of which contain wrapped metal coils 20 and 22, respectively. Proper thermal and electrical design of electrodes are required to achieve the desired performance. Coils, or wraps of wire, around the primary electrode shank can be added to properly balance the electrical and thermal requirements. Coils can serve the function of providing an additional thermal radiative surface to control the temperature of the electrode shank. The size and length of the coil can be designed to achieve optimal thermal performance. An additional function of coils is to provide the appropriate electrical field properties for efficient and reliable arc initiation, or lamp starting. In certain applications, the coil on the cathode is optional and is not required. The opposite end of the shank portions are respectively connected to one end of a foil member 28 and 30 respectively sealed in the opposite end of the neck portion. Typically, the foil members are made of molybdenum. The foil members have their other end respectively connected to relatively thicker outer lead wires 32 and 34 which in turn are respectively connected to the structural members shown more clearly in Fig. 2.

[0019] Fig. 2 illustrates the miniature projection lamp 40 of the present invention which includes a reflector 42 containing the light source 10 having an insulating thermally resistant connector 44 having a pair of pins 46 and 48 suitable for connection to a suitable source of power. Structural members 35, 37 and 39 are used to orient the light source in a substantial horizontal axis with respect to the reflector and form the electrical connections along with lead wire 32.

[0020] In the present invention, a refractory insulating material is formed into an elongated envelope into which the following components are inserted and hermetically sealed:

- a. a pair of refractory metal electrodes;
- b. a quantity of metal halide material;
- c. a quantity of metallic mercury; and
- d. a quantity of an inert noble gas.

[0021] The electrodes are aligned in an axial manner facing each other. The light source is operated in a direct current (DC) mode at a low electrical power.

[0022] The envelope material is fused silica. Fused silica is easier to handle and process. The refractory materials for the electrodes typically are tungsten (with or without thorium) or molybdenum, tungsten allows for higher operating temperatures and increases light output and life. The description of electrodes is defined in more detail below. The metal halide materials and quantity of mercury is also described below.

[0023] The opposing electrodes are set apart and separated at a distance to provide optimal performances for projection display applications. Maximum utilization of optical component light collection requires the light source to be as near to "point source" as possible.

[0024] The broad range of separation is 0.8 mm to 1.5 mm.

EP 0 910 111 B1

[0025] The preferred range of separation is 1.2 mm ± 0.2 mm.

[0026] Falling below the preferred range of separation will cause a corresponding loss in lamp luminous efficacy. Exceeding the preferred range will minimize the effectiveness of the lamp as a miniature source for projection optics.

5 **[0027]** In operating the light source in a DC mode, one electrode is identified as the anode, the other as the cathode, and each is sized appropriately for optimal operation for a given lamp power and current. The electrodes are constructed from known techniques that incorporate an overwound refractory metal coil attached to the metal shank. The optimal design is determined given the range of electrical power and current over which the source is intended to operate. The table below tabulates the electrode wire diameters and power and current ranges for the present invention.

10

	Range of Wattage: 40W-60W Range of Current: 0.5A-1.5A	Preferred Wattage: 50W ± 2W Preferred Current: 0.9A ± .2A
Anode Shank	0.020 in. ± 0.008 in.	0.020 in. ± 0.001 in.
Anode Overwind Wire	0.010 in. ± 0.005 in.	0.010 in. ± 0.001 in.
15 Cathode Shank	0.014 in. ± 0.004 in.	0.014 in. ± 0.001 in.
Cathode Overwind Wire	0.005 in. ± 0.005 in.	0.007 in. ± 0.001 in.

15

20

[0028] A mismatch between electrical operating characteristics and electrode design could be disastrous from a product performance standpoint. Generally, a design that permits too high of an operating temperature of the electrodes (high current/small electrodes) will result in rapid electrode erosion, darkening of the envelope, short life and low light output. Too low of an operating temperature of the electrode (low power/large electrodes) will result in an unstable or flickering arc.

25

[0029] The metal halide material is a mixture of individual compounds selected from the following list which includes but is not limited to cesium iodide, indium iodide, lithium iodide, scandium iodide, sodium iodide, and thalium iodide, in amounts ranging from about 50 to 1000 micrograms.

[0030] The preferred mixtures comprise a combination of sodium iodide-indium iodide-scandium iodide, or sodium iodide-indium iodide-scandium iodide-thalium iodide in the amounts of 250 to 300 micrograms.

30

[0031] The proper mixtures are combined to yield a high luminous efficacy of on the order of 60 lumens per watt while maintaining the proper source apparent color temperature of about 5,000 K to 6,000 K. Color balance of the spectral output is achieved utilizing the preferred ranges and provide the red, green and blue colors needed for proper color projection.

35

[0032] The quantity of mercury is added such that it will evaporate and enter the discharge in a gaseous state and regulate the electrical operational parameters.

[0033] The amount of mercury can range from 5 to 15 milligrams and is a function of the internal volume of the envelope.

[0034] The preferred amount being about 9 milligrams ± -10%.

40

[0035] Excess mercury will cause excess pressure within the bulb and could result in early failure. Too low of an amount of Hg could result in improper electrical operating characteristics, primarily thereby reducing luminous efficacy.

[0036] The fill inert gas is added to provide a gas that can be ionized to aid in the starting of the lamp. Suitable fill gasses include Ne, Ar, Kr, and Xe with cold fill pressures in the range of .5 atm to about 2.0 atmospheres.

[0037] A preferred gas for use in the present invention is Ar at about 500 Torr ± 2%. Excess Ar would cause the required voltage to initiate the discharge to be very high and impose large costs on the electrical operating circuitry.

45

[0038] The above specification for the electrode arc gap, quantity of metal halide, mercury, and noble gas must be used in conjunction with an hermetically sealed chamber having a critical volume, which in the case of the present invention is about 130 mm³ ± 20 mm³.

[0039] The performance of the light source is characterized as having high luminous efficacy, high color temperature as required for color critical projection display applications, miniature source size, and long service life.

50

[0040] The range of luminous efficacies are to exceed 60 lpw. The color temperature can be controlled through selection of metal halide mixtures in a range of 3,000 K to 9,000 K. The source size is dictated by the electrode separation (arc gap) in the range of .8 mm to 1.5 mm. The overall length of the envelope and associated structure being about 2 inches long. The service life exceeding 2,000 hrs.

[0041] The preferred performance specifications as demonstrated are luminous efficacies greater than 64 1pw, Color temperature of 4,000 K - 6,000 K, electrode separation of 1.0 mm to 1.4 mm and service lifetimes exceeding 2,000 hours.

55

[0042] The light source and lamp of the present invention are manufactured by conventional well known methods known to the art.

[0043] While the present invention has been particularly shown and described with reference to the preferred mode

as illustrated in the drawing, it will be understood by one skilled in the art that various changes in detail may be effected therein without departing from the scope of the invention as defined by the claims.

5 **Claims**

1. A high performance miniature projection lamp comprising:

10 an elongated fused silica envelope having a pair of opposite neck portions each with a coaxial central opening having a reduced section and a central hermetically sealed chamber (12) having a volume of about $130 \text{ mm}^3 \pm 20 \text{ mm}^3$ containing a fill comprising :

(a) an inert noble gas pressure at room temperature at a range of about 0.5 atmospheres to about 2.0 atmospheres ;

15 mercury in an amount in the range of about 5 mg to about 15 mg;

a mixture of metal halide material in an amount from about 50 up to 1000 micrograms; and

(b) a pair of axially aligned electrodes (16, 18) respectively positioned at said opposite neck portions and separated from each other by a predetermined distance of about 0.8 to 1.5mm.

20 2. The lamp of claim 1 in which each (16, 18) has a shank portion which includes a distal end, with at least one of said ends having a coil (20, 22) wrapped around said end.

3. The lamp of claim 1 in which the distance between the electrodes is about 1.2 mm.

25 4. The lamp of claim 1 in which the inert noble gas is selected from the group consisting of Ne, Ar, Kr and Xe.

5. The lamp of any of claims 1 to 4, in which the inert noble gas pressure is about 500 Torr.

6. The lamp of claim 1 in which the concentration of mercury is about 9 mg.

30 7. The lamp of claim 1 in which the metal halide comprises a combination of sodium iodide-indium iodide-scandium iodide, or sodium iodide-indium iodide-scandium iodide-thallium iodide, in the amounts from about 250 to 300 micrograms.

35 8. The lamp of claim 1 in which the electrodes (16, 18) are made of refractory metal

9. A high performance miniature projection lamp comprising:

40 a fused silica envelope having a pair of opposite neck portions each with a coaxial central opening having a reduced section and a central hermetically sealed chamber (12) in the general shape of an ellipsoid having a volume of about $130 \text{ mm}^3 \pm 20 \text{ mm}^3$ containing a fill comprising;

(a) an argon pressure at room temperature of about 500 Torr;

45 mercury in an amount in the range of about 5 mg to about 15 mg;

a mixture of metal halide material in a concentration of about 250 to 300 micrograms; and

(b) a pair of tungsten electrodes (16, 18) respectively positioned at said opposite neck portions and separated from each other by a distance of about 0.8 to 1.5 mm, said electrodes each having a shank portion which includes a distal end, with at least one of said ends having a refractory metal coil (20,22) wrapped around said end.

50 10. The lamp of claim 9 in which the metal halide comprises a combination of sodium iodide-indium iodide-scandium iodide, or sodium iodide-indium iodide-scandium iodide-thallium iodide, in the amounts from about 250 to 300 micrograms.

55 11. The lamp of claim 9 in which the overall length of the envelope and associated structure is about two inches long and the lamp exhibits the following performance specifications:

Wattage	50 watts
Total Output	>3,200 Lumens
Median Life	4,000 Hours
Color Temp.	>5,000 K
Maintenance	>75%
Arc Gap	1.2 mm

1. Hochleistungs-Miniaturprojektionslampe mit:

15

einem länglichen Quarzglasmantel mit einem Paar von gegenüberliegenden Ansatzteilen, von denen jedes mit einer koaxial zentralen Öffnung versehen ist, die einen verjüngten Abschnitt aufweist, und mit einer zentralen hermetisch verschlossenen Kammer (12) mit einem Volumen von ungefähr $130 \text{ mm}^3 \pm 20 \text{ mm}^3$, die eine Füllung enthält mit:

20

(a) einem inerten Edelgasdruck bei Raumtemperatur im Bereich von ungefähr 0,5 Atmosphären bis ungefähr 2,0 Atmosphären; Quecksilber in einer Menge im Bereich von ungefähr 5 mg bis ungefähr 15 mg; einer Mischung von Metall-Halogenmaterial in einer Menge von ungefähr 50 bis 1000 Mikrogramm; und
(b) einem Paar axial ausgerichteter Elektroden (16,18), von denen jeweils eine an einem der gegenüberliegenden Ansatzteile angeordnet ist und die mit einem vorbestimmten Abstand von ungefähr 0,8 bis 1,5 mm voneinander getrennt sind.

25

2. Lampe nach Anspruch 1, wobei jede (16,18) eine Körperabschnitt aufweist, der ein distales Ende aufweist, wobei mindestens eines dieser Enden eine Spule (20,22) aufweist, die um das Ende gewickelt ist.

30

3. Lampe nach Anspruch 1, wobei der Abstand zwischen den Elektroden ungefähr 1,2 mm beträgt.

4. Lampe nach Anspruch 1, wobei das inerte Edelgas aus der Gruppe bestehend aus Ne, Ar, Kr und Xe ausgewählt wird.

35

5. Lampe nach einem der Ansprüche 1 bis 4, wobei der inerte Edelgasdruck ungefähr 500 Torr beträgt.

6. Lampe nach Anspruch 1, wobei die Konzentration von Quecksilber ungefähr 9 mg beträgt.

40

7. Lampe nach Anspruch 1, wobei das Metall-Halogen eine Kombination von Natriumiodid-Indiumiodid-Scandiumiodid oder Natriumiodid-Indiumiodid-Scandiumiodid-Thalliumiodid in der Menge von ungefähr 250 bis 300 Mikrogramm umfaßt.

8. Lampe nach Anspruch 1, wobei die Elektroden (16,18) aus einem feuerfesten Metall gebildet sind.

45

9. Hochleistungs-Miniaturprojektionslampe mit:

50

einem Quarzglasmantel mit einem Paar von gegenüberliegenden Ansatzteilen, von denen jedes mit einer koaxialen zentralen Öffnung versehen ist, die einen verjüngten Abschnitt aufweist, und mit einer zentralen hermetisch verschlossenen Kammer (12) im wesentlichen in der Form eines Ellipsoids mit einem Volumen von ungefähr $130 \text{ mm}^3 \pm 20 \text{ mm}^3$, die eine Füllung enthält mit:

55

(a) einem Argondruck bei Raumtemperatur von ungefähr 500 Torr; Quecksilber in einer Menge im Bereich von ungefähr 5 mg bis ungefähr 15 mg; einer Mischung von Metall-Halogenmaterial in einer Konzentration von ungefähr 250 bis 300 Mikrogramm; und

(b) einem Paar von Wolfram-Elektroden (16,18), welche jeweils an einem der gegenüberliegenden Ansatzteile angeordnet sind und die durch einen Abstand von ungefähr 0,8 bis 1,5 mm voneinander getrennt sind, wobei die Elektroden jeweils einen Körperteil aufweisen, der ein distales Ende aufweist, wobei

EP 0 910 111 B1

mindestens eines dieser Enden eine feuerfeste Metallspule (20,22) aufweist, die um das Ende gewickelt ist.

5 10. Lampe nach Anspruch 9, wobei das Metall-Halogen eine Kombination von Natriumiodid-Indiumiodid-Scandiumiodid oder Natriumiodid-Indiumiodid-Scandiumiodid-Thalliumiodid in der Menge von ungefähr 250 bis 300 Mikrogramm umfaßt.

10 11. Lampe nach Anspruch 9, wobei die Gesamtlänge des Mantels und der zugeordneten Struktur ungefähr 2 Inch lang ist und die Lampe die folgenden Leistungsspezifikationen aufweist:

Leistung	50 Watt
Gesamtabgabe	> 3.200 Lumen
mittlere Lebensdauer	4.000 Stunden
Farbtemperatur	> 5.000 K
Erhalt	> 75%
Bogenlücke	1,2 mm

20 Revendications

1. Lampe de projection miniature haute performance, comportant :

25 une enveloppe allongée de silice fondue ayant une paire de parties de col opposées, chacune ayant une ouverture centrale coaxiale présentant une section réduite et une chambre centrale étanchéifiée hermétiquement (12) ayant un volume d'environ $130 \text{ mm}^3 \pm 20 \text{ mm}^3$ contenant un garnissage comportant :

30 (a) une pression de gaz noble inerte à température ambiante dans une plage d'environ 0,5 atmosphère à environ 2,0 atmosphères,

du mercure selon une quantité dans la plage d'environ 5 mg à environ 15 mg,

un mélange de matériau d'halogénure métallique selon une quantité allant d'environ 50 jusqu'à 1000 microgrammes, et

35 (b) une paire d'électrodes alignées axialement (16, 18) positionnées respectivement sur lesdites parties de col opposées et séparées l'une de l'autre d'une distance prédéterminée d'environ 0,8 à 1,5 mm.

40 2. Lampe selon la revendication 1, dans laquelle chaque électrode (16, 18) a une partie de queue qui comporte une extrémité distale, au moins une desdites extrémités ayant une bobine (20, 22) enroulée autour de ladite extrémité.

45 3. Lampe selon la revendication 1, dans laquelle la distance entre les électrodes est d'environ 1,2 mm.

50 4. Lampe selon la revendication 1, dans laquelle le gaz noble inerte est sélectionné parmi le groupe constitué de Ne, Ar, Kr et Xe.

55 5. Lampe selon l'une quelconque des revendications 1 à 4, dans laquelle la pression du gaz noble inerte est d'environ 500 Torr.

6. Lampe selon la revendication 1, dans laquelle la concentration en mercure est d'environ 9 mg.

7. Lampe selon la revendication 1, dans laquelle l'halogénure métallique comporte une combinaison d'iodure de sodium-iodure d'indium-iodure de scandium, ou d'iodure de sodium-iodure d'indium-iodure de scandium-iodure de thallium, selon des quantités allant d'environ 250 à 300 microgrammes.

8. Lampe selon la revendication 1, dans laquelle les électrodes (16, 18) sont constituées d'un métal réfractaire.

9. Lampe de projection miniature haute performance, comportant :

une enveloppe allongée de silice fondue ayant une paire de parties de col opposées, ayant chacune une ouverture centrale coaxiale présentant une section réduite et une chambre centrale étanchéifiée hermétique-

EP 0 910 111 B1

ment (12) ayant la forme générale d'un ellipsoïde ayant un volume d'environ $130 \text{ mm}^3 \pm 20 \text{ mm}^3$ contenant un garnissage comportant

5 (a) une pression d'argon à température ambiante d'environ 500 Torr, du mercure selon une quantité dans la plage d'environ 5 mg à environ 15 mg, un mélange de matériau d'halogénure métallique selon une concentration d'environ 250 à 300 microgrammes, et

10 (b) une paire d'électrodes de tungstène (16, 18) positionnées respectivement sur lesdites parties de col opposées et séparées l'une de l'autre d'une distance comprise entre environ 0,8 et 1,5 mm, lesdites électrodes ayant chacune une partie de queue qui comporte une extrémité distale, au moins une desdites extrémités ayant une bobine de métal réfractaire (20, 22) enroulée autour de ladite extrémité.

15 **10.** Lampe selon la revendication 9, dans laquelle l'halogénure métallique comporte une combinaison d'iodure de sodium-iodure d'indium-iodure de scandium, ou d'iodure de sodium-iodure d'indium-iodure de scandium-iodure de thallium, selon des quantités allant d'environ 250 à 300 microgrammes.

11. Lampe selon la revendication 9, dans laquelle la longueur totale de l'enveloppe et de la structure associée est d'environ 5,08 cm (deux pouces) et la lampe présente les spécifications de performance suivantes :

20

Puissance	50 watts
Sortie Totale	> 3200 Lumens
Durée de Vie Moyenne	4000 heures
Température de Couleur	> 5000 K
Maintenance	> 75 %
Ecartement d'Arc	1,2 mm
