### Benzazole analogues and uses thereof

The present invention relates to benzazoles of the general formula (I) or a salt or a physiologically functional derivative or a stereoisomer thereof, for use as a medicament.

5 The compounds of the invention are exceptionally useful for the treatment of diseases associated with abnormal and hyperproliferation of cells in a mammal, especially humans. In particular, they are useful for the treatment of all forms of cancer.

Furthermore a process of preparing said benzazole derivatives is disclosed.

#### 10 Background of the invention

Protein kinases play a central role in the regulation of cellular functions. This includes processes like cell growth and division, cell differentiation and cell death, but also many other cellular activities. Protein kinases catalyze the transfer of phosphate residues from ATP on target proteins which as a consequence of this protein kinase mediated phosphorylation change their three-dimensional structure and thereby their physiological function. Depending on the amino acid which becomes phosphorylated by a protein kinase these enzymes are grouped in two families, the so-called serine/threonine protein kinases and the tyrosine protein kinases.

15 Based on the human genome project it is known that in human beings there exist 518 DNA sequences which encode for a protein kinase-like protein sequence. In the last about 20 years for several of these 518 proteins it could be shown that modifications in their related gene sequences (e.g. point mutations, deletions or gene amplifications) result in pathological changes of the cellular activities of the corresponding protein kinase. This is in particular true for protein kinases which are involved in cell proliferation and cell cycle control, in survival of cells and cell death, in tumor angiogenesis, and in formation of tumor metastases.

Several so-called oncogenes are pathologically modified genes which in their proto-oncogenic form encode for protein kinases involved in normal, physiological regulation of cell growth and division.

30 Since protein kinases are key regulators of cell functions and since they can show dysregulated enzymatic activity in cells they are promising targets for the development of therapeutic agents. There are many ongoing drug discovery projects in the pharmaceutical industry with the goal to identify modulators of protein kinases. The major focus is currently on protein kinases involved in inflammation and cancer, but besides this protein kinases are currently discussed as promising targets in almost every disease area.

35 In the tumor field the first protein kinase inhibitors (Gleevec, Iressa) have already reached

the market. In addition, a great number of protein kinase inhibitors are currently in various phases of clinical development. In most cases these compounds are either targeting subtypes of the EGF (Epidermal Growth Factor) receptor or of the VEGF (Vascular Endothelial Growth Factor) receptor. All these compounds have been developed with the goal to specifically inhibit one particular protein kinase, for which there is evidence that it interferes with one of the four major molecular processes of tumor progression. These four processes are (1) cell proliferation/cell cycle control, (2) regulation of programmed cell death (apoptosis) and cell survival, (3) tumor angiogenesis and (4) tumor metastasis.

The present invention relates to benzazole derivatives which may be useful for inhibition of protein kinases involved in diseases besides cancer, but which are especially useful as anti-tumor agents. This includes monospecific protein kinase inhibitors, which preferentially inhibit one protein kinase which is causatively involved in tumor progression, but also so-called multi-target protein kinase inhibitors, which inhibit at least two different protein kinases which play a role in two or more different molecular mechanisms of tumor progression. As an example, such a compound could be an inhibitor of tumor angiogenesis and, in addition, also a stimulator of apoptosis.

The concept of multi-target protein kinase inhibitors is a new approach although the idea of developing "multiplex protein kinase inhibitors" has already been described by J. Adams et al., *Current Opinion in Chemical Biology* 6, 486-492, 2002. Therein compounds are described, which, at the same time, inhibit several protein kinases, which however all are involved in one molecular mechanism of tumor progression, namely tumor angiogenesis.

In WO 2004085425 benzazoles are described as kinase inhibitors. In WO 9924035 2-aminobenzothiazoles are described. These compounds have also been published in Das et al., *Bioorg. Med. Chem. Lett* 13, 2003, 2587-2590 and in Das et al., *Bioorg. Med. Chem. Lett* 13, 2003, 2145-2149. In WO 2000061580 benzimidazolyl- and benzoxazolylacetylaminopyridylbutyrates are described as integrin antagonists. In WO 9940072 five-membered, benzo-condensed heterocycles used as antithrombotics are described.

The object of the present invention is solved by the teaching of the independent claims. Further advantageous features, aspects and details of the invention are evident from the dependent claims, the description, the figures, and the examples of the present application.

Considering the lack of currently available treatment options for the majority of the conditions associated with protein kinases like ABL1, ACV-R1, AKT1, AKT2, AKT3,

 10 TIE2, TSF1, TSK2, TTK, VEGF-R1, VEGF-R2, VEGF-R3, VRK1, WEE1, YES, ZAP70 especially with protein kinases like EGF-R (cell proliferation), ERBB2 (cell proliferation), PDGFR (cell proliferation), FLT3 (cell proliferation), Aurora-A (cell cycle control), Aurora-B (cell cycle control), IGF1-R (apoptosis), VEGF-R2 (angiogenesis), VEGF-R3 (angiogenesis), TIE2 (angiogenesis), EPHB4 (angiogenesis), FAK (metastasis), and SRC  
 15 kinase (metastasis), there is still a great need for new therapeutic agents that inhibit these protein targets.

Herein described benzazole derivatives are a new group of protein kinase inhibitors which show differential inhibition of protein kinases, each of which can be assigned to one of the four molecular mechanism of tumor development.

25 The compounds of the present invention can further be used for diseases that are caused by protozoal infestations in humans and animals.

The compounds of the present invention can further be used for viral infections or other infections caused for instance by *Pneumocystis carinii*.

30

Furthermore, the invention relates to a method of treatment or prevention of diseases which comprises the administration of an effective amount of compounds of the formula (I) or a pharmaceutically acceptable salt or physiologically functional derivative or a stereoisomer

thereof.

The compounds of the according invention and their pharmacologically acceptable salts can be administered to animals, preferably to mammals, and in particular to humans, as  
5 therapeutics per se, as mixtures with one another or in the form of pharmaceutical preparations which allow enteral or parenteral use and which as active constituent contain an effective dose of at least one compound of the present invention or a salt thereof, in addition to customary pharmaceutically innocuous excipients and additives.

10 The production of medicaments containing the compounds according to the present invention and their application can be performed according to well-known pharmaceutical methods.

While the compounds according to the invention for use in therapy may be administered in  
15 the form of the raw chemical compound, it is preferred to introduce the active ingredient, optionally in the form of a physiologically acceptable salt in a pharmaceutical composition together with one or more adjuvants, excipients, carriers, buffers, diluents, and/or other customary pharmaceutical auxiliaries. Such salts of the compounds may be anhydrous or solvated.

20 In a preferred embodiment, the invention provides medicaments comprising compounds according to the present invention, or a pharmaceutically acceptable salt or physiologically functional derivative or a stereoisomer thereof, together with one or more pharmaceutically acceptable carriers thereof, and, optionally, other therapeutic and/or prophylactic  
25 ingredients. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not harmful to the recipient thereof.

A medicament of the invention may be those suitable for oral, rectal, bronchial, nasal, topical, buccal, sub-lingual, transdermal, vaginal or parenteral (including cutaneous,  
30 subcutaneous, intramuscular, intraperitoneal, intravenous, intraarterial, intracerebral, intraocular injection or infusion) administration, or those in a form suitable for administration by inhalation or insufflation, including powders and liquid aerosol administration, or by sustained release systems. Suitable examples of sustained release

systems include semipermeable matrices of solid hydrophobic polymers containing the compound of the invention, which matrices may be in form of shaped articles, e.g. films or microcapsules.

5 For preparing a medicament from a compounds of the present invention and pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. A solid carrier can be one or more substances which may also act as diluents, flavouring agents, solubilizers, lubricants, suspending agents, binders, preservatives, tablet  
10 disintegrating agents, or an encapsulating material.

In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component. In tablets, the active component is mixed with the carrier having the necessary binding capacity in suitable proportions and compacted in the shape and size  
15 desired. Suitable carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as carrier providing a capsule in which the active component, with  
20 or without carriers, is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid forms suitable for oral administration.

For preparing suppositories, a low melting wax, such as a mixture of fatty acid glyceride or  
25 cocoa butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The molten homogenous mixture is then poured into convenient sized moulds, allowed to cool, and thereby to solidify. Compositions suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or sprays containing in addition to the active ingredient such carriers as are known in the art  
30 to be appropriate. Liquid preparations include solutions, suspensions, and emulsions, for example, water or water-propylene glycol solutions. For example, parenteral injection liquid preparations can be formulated as solutions in aqueous polyethylene glycol solution.

The compounds according to the present invention may thus be formulated for parenteral administration (e.g. by injection, for example bolus injection or continuous infusion) and may be presented in unit dose form in ampoules, pre-filled syringes, small volume infusion or in multi-dose containers with an added preservative. The compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and may contain formulation agents such as suspending, stabilising and/or dispersing agents. Alternatively, the active ingredient may be in powder form, obtained by aseptic isolation of sterile solid or by lyophilization from solution, for constitution with a suitable vehicle, e.g. sterile, pyrogen-free water, before use.

5 Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavours, stabilising and thickening agents, as desired. Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water with viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, or other well known  
10 suspending agents.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavours, stabilisers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

In an especially preferred embodiment of the present invention the medicament is applied topically. This reduces possible side effects and limits the necessary treatment to those  
25 areas affected.

Preferably the medicament is prepared in form of an ointment, a gel, a plaster, an emulsion, a lotion, a foam, a cream of a mixed phase or amphiphilic emulsion system (oil/water-water/oil mixed phase), a liposome, a transfersome, a paste or a powder.

30 Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents. Lotions may be formulated with an aqueous or oily base and will in general also contain one or more emulsifying agents,

stabilising agents, dispersing agents, suspending agents, thickening agents, or colouring agents.

5 Compositions suitable for topical administration in the mouth include lozenges comprising the active agent in a flavoured base, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert base such as gelatin and glycerine or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

10 Solutions or suspensions are applied directly to the nasal cavity by conventional means, for example with a dropper, pipette or spray. The compositions may be provided in single or multi-dose form. In the latter case of a dropper or pipette, this may be achieved by the patient administering an appropriate, predetermined volume of the solution or suspension. In the case of a spray, this may be achieved for example by means of a metering atomising spray pump.

15 Administration to the respiratory tract may also be achieved by means of an aerosol formulation in which the active ingredient is provided in a pressurised pack with a suitable propellant such as a chlorofluorocarbon (CFC) for example dichlorodifluoromethane, trichlorofluoromethane, or dichlorotetrafluoroethane, carbon dioxide, or other suitable gas. 20 The aerosol may conveniently also contain a surfactant such as lecithin. The dose of drug may be controlled by provision of a metered valve.

Alternatively the active ingredients may be provided in the form of a dry powder, for example a powder mix of the compound in a suitable powder base such as lactose, starch, 25 starch derivatives such as hydroxypropylmethyl cellulose and polyvinylpyrrolidone (PVP). Conveniently the powder carrier will form a gel in the nasal cavity. The powder composition may be presented in unit dose form for example in capsules or cartridges of, e.g., gelatin, or blister packs from which the powder may be administered by means of an inhaler.

30 In compositions intended for administration to the respiratory tract, including intranasal compositions, the compound will generally have a small particle size for example of the order of 5 microns or less. Such a particle size may be obtained by means known in the art,

for example by micronization.

When desired, compositions adapted to give sustained release of the active ingredient may be employed.

5

The pharmaceutical preparations are preferably in unit dosage forms. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packaged tablets, capsules, and powders in vials  
10 or ampoules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form. Tablets or capsules for oral administration and liquids for intravenous administration and continuous infusion are preferred compositions.

15 Further details on techniques for formulation and administration may be found in the latest edition of Remington's Pharmaceutical Sciences (Maack Publishing Co. Easton, Pa.).

Pharmaceutical compositions can also contain two or more compounds of the present invention or their pharmacologically acceptable salts and also other therapeutically active  
20 substances.

Thus, the compounds of the present invention can be used in the form of one compound alone or in combination with other active compounds - for example with medicaments already known for the treatment of the aforementioned diseases, whereby in the latter case  
25 a favorable additive, amplifying effect is noticed.

To prepare the pharmaceutical preparations, pharmaceutically inert inorganic or organic excipients can be used. To prepare pills, tablets, coated tablets and hard gelatin capsules, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts, etc.  
30 can be used. Excipients for soft gelatin capsules and suppositories are, for example, fats, waxes, semi-solid and liquid polyols, natural or hardened oils etc. Suitable excipients for the production of solutions and syrups are, for example, water, sucrose, invert sugar, glucose, polyols etc. Suitable excipients for the production of injection solutions are, for

example, water, alcohols, glycerol, polyols or vegetable oils.

The dose can vary within wide limits and is to be suited to the individual conditions in each individual case. For the above uses the appropriate dosage will vary depending on the mode of administration, the particular condition to be treated and the effect desired. In general, however, satisfactory results are achieved at dosage rates of about 1 to 100 mg/kg animal body weight preferably 1 to 50 mg/kg. Suitable dosage rates for larger mammals, for example humans, are of the order of from about 10 mg to 3 g/day, conveniently administered once, in divided doses 2 to 4 times a day, or in sustained release form.

## 15 **Syntheses of Intermediates.**

**Intermediate 1:** *N*-(6-Aminobenzoxazol-2-yl)benzamide.

Step 1. A solution of cyanogen bromide (3.50 g, 33 mmol; caution: highly toxic! Waste disposal: addition of excess NaOCl to a basic aqueous solution of cyanogen bromide) in tetrahydrofuran (3 mL) was added to a solution of 2-amino-5-nitrophenol (4.62 g, 30  
20 mmol) in tetrahydrofuran (20 mL). After stirring for 1 day at r.t., a precipitate had formed which was dissolved by addition of water (5 mL). After stirring further 3 days at r.t., water (10 mL) was added and NaOH was added until the mixture turned basic. The tetrahydrofuran was removed *in vacuo* and the precipitate formed in the remaining aqueous phase was separated by filtration, washed with water and recrystallized from methanol (100 mL).  
25 Upon additional fractional crystallisation of the mother liquor, a total of 3.80 g (21.2 mmol, 71 %) of 2-amino-6-nitrobenzoxazole was obtained as a brown solid. LC/ESI-MS:  $m/z = 180$  [M+H]<sup>+</sup>;  $m/z = 178$  [M-H]<sup>-</sup>;  $R_t = 2.52$  min.

Step 2. Benzoyl chloride (1.17 mL, 10.0 mmol) was added to a suspension of 2-amino-6-nitrobenzoxazole (1.50 g, 8.37 mmol) in pyridine (10 mL). After stirring for 24 h at 80°C,  
30 the solution was poured into water (250 mL). The mixture was stirred overnight at r.t. and the resulting precipitate was separated by filtration. *N*-(6-Nitrobenzoxazol-2-yl)benzamide (2.08 g, 7.32 mmol, 88 %) was thus obtained as a yellow solid. LC/ESI-MS:  $m/z = 284$

[M+H]<sup>+</sup>;  $m/z = 282$  [M-H]<sup>-</sup>;  $R_t = 3.13$  min.

Step 3. To a solution of *N*-(6-nitrobenzoxazol-2-yl)benzamide (2.03 g, 7.17 mmol) in dimethylformamide (60 mL), palladium on charcoal (1.52 g, 10 % Pd, 1.43 mmol Pd) was added and the air was replaced with hydrogen (1 bar). The mixture was stirred for 2 h at 5 60°C and then overnight at r.t.. The palladium was removed by filtration through a pad of celite. After concentration to 20 mL, water was added and the resulting precipitate was separated by filtration to obtain *N*-(6-aminobenzoxazol-2-yl)benzamide (0.823 g, 3.25 mmol, 45 %) as a brown solid. LC/ESI-MS:  $m/z = 254$  [M+H]<sup>+</sup>;  $m/z = 252$  [M-H]<sup>-</sup>;  $R_t = 1.92$  min.

10 **Intermediate 2:** *N*-(6-Aminobenzothiazol-2-yl)benzamide.

Step 1. To a suspension of 2-amino-6-nitrobenzothiazole (Sigma Aldrich, 2.93 g, 15 mmol) in pyridine (20 mL), benzoyl chloride (1.74 mL, 15 mmol) was added. After stirring overnight at r.t., additional benzoyl chloride (1.74 mL, 15 mmol) was added and the mixture was stirred at 60°C. After completion of the reaction, the mixture was poured into water 15 (250 mL) and stirred overnight at r.t.. Separation of the resulting precipitate yielded *N*-(6-nitrobenzothiazol-2-yl)benzamide (3.87 g, 12.9 mmol, 86 %) as a yellow solid. LC/ESI-MS:  $m/z = 300$  [M+H]<sup>+</sup>;  $m/z = 298$  [M-H]<sup>-</sup>;  $R_t = 3.93$  min.

Step 2. A mixture of *N*-(6-nitrobenzothiazol-2-yl)benzamide (3.77 g, 12.6 mmol), palladium on charcoal (2 g, 10 % Pd, 1.88 mmol Pd), dimethyl formamide (80 mL) and ethyl 20 acetate (20 mL) was hydrogenated (1 bar) for 2 h at 60°C. The palladium was removed by filtration through a pad of celite. After concentration to 20 mL, water was added and the resulting precipitate was separated by filtration to obtain *N*-(6-aminobenzothiazol-2-yl)-benzamide (3.15 g, 11.7 mmol, 93 %) as a grey solid. LC/ESI-MS:  $m/z = 270$  [M+H]<sup>+</sup>;  $m/z = 268$  [M-H]<sup>-</sup>;  $R_t = 2.27$  min.

25 **Intermediate 3:** *N*-(6-Aminobenzothiazol-2-yl)isonicotinamide.

Step 1. To a mixture of 2-amino-6-nitrobenzothiazole (Sigma Aldrich, 1.95 g, 10 mmol) and pyridine (40 mL), benzoyl chloride (2.1 mL, 18 mmol) was added. After stirring for 5 h at 80°C, water (10 mL) was added. The mixture was stirred for 0.5 h at r.t., then methanol (30 mL) and water (50 mL) were added. The precipitated *N*-(6-nitrobenzothiazol-2-yl)- 30 isonicotinamide was separated by filtration. The crude product was taken up in dimethylformamide and precipitated again by addition of methanol and water (2.53 g, 8.42 mmol, 84 %). LC/ESI-MS:  $m/z = 301$  [M+H]<sup>+</sup>;  $m/z = 299$  [M-H]<sup>-</sup>;  $R_t = 3.48$  min.

Step 2. *N*-(6-Nitrobenzothiazol-2-yl)isonicotinamide (2.42 g, 8.04 mmol) was suspended in ethyl acetate (150 mL), and dimethylformamide was added until dissolution occurred. After addition of palladium on charcoal (4.25 g, 10 % Pd, 4 mmol Pd) the mixture was hydrogenated (1 bar) at 60°C until completion of the reaction. The palladium was removed by  
5 filtration through a pad of celite and the solvent was evaporated. The residue was taken up in little methanol and precipitated by addition of water to obtain *N*-(6-aminobenzothiazol-2-yl)isonicotinamide (1.73 g, 6.4 mmol, 80 %). LC/ESI-MS:  $m/z = 271$   $[M+H]^+$ ;  $m/z = 269$   $[M-H]^-$ ;  $R_t = 1.43$  min.

**Intermediate 4:** *N*-(6-Aminobenzothiazol-2-yl)nicotinamide.

10 Step 1. A mixture of 2-amino-6-nitrobenzothiazole (0.976 g, 5 mmol), nicotinoyl chloride hydrochloride (1.07 g, 6 mmol), triethylamine (1.9 ml, 13.8 mmol), DMAP (catalytic amount) and dioxane (50 mL) was heated to reflux for 7 h. After addition of nicotinoyl chloride hydrochloride (0.89 g, 5 mmol) and triethylamine (1.8 mL, 12.5 mmol), heating was continued for 5 h. After cooling to r.t., the precipitate was separated by filtration. The  
15 solid was treated with boiling methanol (25 mL) to remove soluble impurities. There was thus obtained *N*-(6-nitrobenzothiazol-2-yl)nicotinamide (1.36 g, 4.53 mmol, 91 %). LC/ESI-MS:  $m/z = 301$   $[M+H]^+$ ;  $m/z = 299$   $[M-H]^-$ ;  $R_t = 3.54$  min.

Step 2. *N*-(6-Nitrobenzothiazol-2-yl)nicotinamide (0.50 g, 1.67 mmol) was dissolved in dimethylsulfoxide (50 mL) by warming. After addition of palladium on charcoal (0.089 g,  
20 10 % Pd, 0.08 mmol Pd), the mixture was hydrogenated for 5.5 h at 80°C. The palladium was removed by hot filtration through a pad of silica. After removal of the solvent, *N*-(6-aminobenzothiazol-2-yl)nicotinamide (0.45 g, 1.67 mmol, 100 %) was obtained as a brownish solid. **Intermediate 5:** *N*-(5-Aminobenzothiazol-2-yl)benzamide.

25 Step 1. Ammonium thiocyanate (8.55 g, 112.5 mmol) was dissolved in acetone (80 mL) and acetyl chloride (8.83 g, 112.5 mmol) was added dropwise. After stirring for 1 h at r.t., the solid was filtered off, and the filtrate was added to a solution of 2-fluoro-5-nitroaniline in acetone (45 mL). The mixture was refluxed for 6 h, then the solution was concentrated and stored overnight at r.t.. The precipitated 1-acetyl-3-(2-fluoro-5-nitrophenyl)thiourea

## Materials and methods

### Protein Kinase Assay

5 The effect of the benzazole derivatives was tested on recombinant, human protein kinases. All protein kinases were expressed in Sf9 insect cells as human recombinant GST-fusion proteins or as His-tagged proteins by means of the baculovirus expression system. Protein kinases were purified by affinity chromatography using either GSH-agarose or Ni-NTH-agarose. The purity and identity of each was checked by SDS-PAGE/silver staining and by  
10 western blot analysis with specific antibodies.

A proprietary protein kinase assay (<sup>33</sup>PanQinase<sup>®</sup> Activity Assay) was used for measuring the kinase activity. All kinase assays were performed in 96-well FlashPlates<sup>™</sup> in a 50  $\mu$ l reaction volume. The assay for all enzymes contained 60 mM HEPES-NaOH, pH 7.5, 3 mM MgCl<sub>2</sub>, 3 mM MnCl<sub>2</sub>, 3  $\mu$ M Na-orthovanadate, 1.2 mM DTT, 50  $\mu$ g/ml PEG<sub>20000</sub>  
15 and 1  $\mu$ M [ $\gamma$ -<sup>33</sup>P]-ATP (approx.  $5 \times 10^5$  cpm per well).

The reaction cocktails were incubated at 30°C for 80 minutes. The reaction was stopped with 50  $\mu$ l of 2% (v/v) H<sub>3</sub>PO<sub>4</sub>, plates were aspirated and washed two times with 200  $\mu$ l of 0.9% (w/v) NaCl. Incorporation of <sup>33</sup>P<sub>i</sub> was determined with a microplate scintillation counter. All assays were performed with a BeckmanCoulter/ Sagian robotic system.

### Cellular Receptor Tyrosine Kinase Assay

The effect of thiazole derivatives was tested by determining the inhibition of different receptor tyrosine kinases (RTKs) in various cell lines which expressed the following growth factor receptors: EGF-R, PDGF-R, TIE2, IGF-1R, EPHB4, and VEGF-R2.  
25 Receptor autophosphorylation was induced by specific ligands for each receptor. Stimulation of cells resulted in maximal autophosphorylation in control cells (high control) without inhibitor. Test compounds were applied to cells prior to stimulation. Cells were

lysed using a standard lysis buffer preserving the distinct phosphoprotein levels. RTK-phosphorylation was quantified via sandwich ELISA using receptor-specific capture antibodies and a phosphotyrosine antibody.

Sigmoidal inhibitor curves based on relative inhibition compared with phosphorylation levels under high control conditions were generated which allowed the determination of  $IC_{50}$  values for each test compound.

#### Cellular Aurora-B Kinase Assay

The effect of thiazole derivatives was tested in a cellular Aurora-B assay by measuring the effect of the test compounds on the endoreduplication (EndoR) of genomic DNA. Endoreduplication is detectable in cells as DNA-content higher than 4 n. Propidium Iodine (PI) was used to quantify the DNA content using a fluorescence activated cell sorter (FACS).

In the experiment, HT29 colon-carcinoma cells were treated with test compounds at different concentrations for 3 days. On day 5 cells were harvested and fixed in methanol. On day 6 cells were rehydrated and incubated with RNase A and PI. Incorporated PI was detected by FACS measuring fluorescence emission at 650 nm upon excitation at 488 nm. For each compound concentration the percentage of EndoR-population as compared to the whole cell population was determined. For estimation of  $IC_{50}$  values of Aurora-B inhibition the percentages of EndoR-populations were plotted versus compound concentrations.

#### Cellular Aurora-B Kinase Histone H3 Phosphorylation Assay

The effect of compounds was tested in a cellular Aurora-B assay measuring phosphorylation of the Aurora B-substrate protein Histone H3 at Serine 10 (HisH3-pS10). Inhibition of Aurora B results in reduction of HisH3-pS10 which was detected in a specific immuno-assay.

In the experiment, HT-29 colon-carcinoma cells were seeded on day 1 and on day 2 test compounds at different concentrations were added. Cells were incubated with test compounds for 1 hour. Subsequently, Calyculin A was added for 30 min. For DELFIA®-detection (PerkinElmer) of HisH3-pS10, lysates were transferred to a microtiterplate and incubated with detecting antibody directed against HisH3-pS10 and Europium-labelled secondary anti-IgG-antibody. Emission at 615 nm was measured upon excitation at 340 nm

and the percentage of inhibition was calculated for each concentration of the test compounds relative to controls without inhibitor. Mean values of HisH3-pS10 percentage were plotted versus compound concentration for calculation of IC<sub>50</sub>-values.
