(57) **ABSTRACT**

According to the present invention there is provided a personal cleansing composition comprising an anionic and/or amphoteric surfactant and a polymeric ester comprising: (i) a polyol; (ii) a monocarboxylic acid having from 4 to 30 carbon atoms; and (iii) a dicarboxylic acid. The compositions of the present invention provide improved in-use sensory feel while at the same time being exceptionally mild to the skin.

32 Claims, No Drawings

CLEANSING COMPOSITIONS

The present invention relates to cleansing compositions. In particular it relates to mild personal cleansing compositions which display improved rinse feel in combination with good skin feel attributes, and foaming properties which are suitable for simultaneously cleansing and conditioning the skin and/or the hair and which may be used, for example, in the form of foam bath preparations, shower products, skin cleansers, hand, face and body cleansers, shampoos, etc.

BACKGROUND OF THE INVENTION

Mild cleansing compositions must satisfy a number of criteria including cleansing power, foaming properties and mildness/low irritancy/good feel with respect to the skin, hair and the ocular mucosae. Skin is made up of several layers of cells which coat and protect the underlying tissue. The keratin and collagen fibrous proteins that form the skeleton of its structure. The outermost of these layers is referred to as the stratum corneum. Hair similarly has a protective outer coating enclosing the hair fibre which is called the cuticle. Anionic surfactants can penetrate the stratum corneum membrane and the cuticle and, by delipidization destroy membrane integrity and loss of barrier and water retention functions. This interference with skin and hair protective membranes can lead to a rough skin feel and eye irritation and may eventually permit the surfactant to trigger immune response creating irritation.

Ideal cosmetic cleansers should cleanse the skin or hair gently, without defatting and/or drying the hair and skin and without irritating the ocular mucosae or leaving skin taut after frequent use. Most lathering soaps, shower and bath products, shampoos and bars fail in this respect.

Certain synthetic surfactants are known to be mild. However, a major drawback of some mild synthetic surfactant systems when formulated for shampooing or personal cleansing is that they have what can be described as a "slippy" or "non-draggy" rinse feel which is not liked by some consumers.

The use of certain surfactants such as potassium laurate, on the other hand, can yield a "draggy" rinse feel but at the expense of clinical skin mildness. Other synthetic surfactants do not provide the soft/smooth skin feel that is desired by consumers.

These facts make the selection of suitable surfactants in the rinse feel and mildness benefit formulation process a delicate balancing act.

Thus a need exists for personal cleansing compositions which deliver a "draggy" rinse feel and/or soft/smooth skin feel while at the same time having excellent skin mildness, in addition to excellent product characteristics such as lather, cleansing, stability, thickening, and rheology.

Surprisingly, it has now been found that personal cleansing compositions having a "draggy" rinse feel and/or soft smooth in use characteristics while at the same time having excellent mildness characteristics are provided by the combination of polymeric esters of polyols with an anionic and/or amphoteric surfactant system.

Polymeric esters of polyols are well known in the field of mechanical lubrication. For example, GB-A-2 134 538, U.S. Pat. No. 3,694,382, JP-A-5 331 482, all of which are incorporated herein by reference, disclose esters of alcohols for use as lubricants; JP-A-5 120 209 discloses the use of polymeric esters of alcohols in compositions for plastic.

JP-A-55 085 510, herein incorporated by reference, dis-

closes the use of the polymeric ester of dipentaerythritol in cosmetic stick and emulsion compositions. JP-A-56 145 209, herein incorporated by reference, discloses the use of the polymeric ester of dipentaerythritol as a lanolin substitute for cosmetics.

Whilst not wishing to be bound by theory, the "draggy" rinse feel is considered to be associated with an increase in wet skin friction. An important mechanism for action of such polymeric esters of polyols is considered to be their ability to deposit and change the surface energy of the skin, i.e. making the skin surface more hydrophobic. During rinsing, the water film is considered to be the lubricant for the skin, and as surface hydrophobicity increases so the water film is destabilised and the surface de-wetted. As a result the water film is at first thinned and then displaced, allowing some direct contact between the surfaces. Both changes increase friction and produce "draggy rinsing".

SUMMARY OF THE INVENTION

According to the present invention there is provided a personal cleansing composition comprising an anionic and/or amphoteric surfactant and a polymeric ester, the polymeric ester comprising:

- (i) a polyol;
- (ii) a monocarboxylic acid having from 4 to 30 carbon atoms; and
- (iii) a dicarboxylic acid.

The compositions of the present invention provide an improvement in rinse feel while at the same time being exceptionally mild to the skin.

All concentrations and ratios herein are by weight of the cleansing composition, unless otherwise specified. Surfactant chain lengths are also on a weight average chain length basis, unless otherwise specified.

DETAILED DESCRIPTION OF THE INVENTION

The liquid cleansing compositions herein comprise an anionic and/or amphoteric surfactant and a polymeric ester of polyol which will be described below.

As used herein the term "rinse feel" means the feeling of the skin during the process of rinsing lather from the skin after cleansing with a cleansing composition. The type of rinse feel which is provided by the compositions of the present invention can be described by terms such as a "draggy" rinse feel, a "soap-like" rinse feel and a "non-slippy" or "non-slimy" rinse feel. Such a "draggy", "soap-like", "non-slippy" or "non-slimy" rinse feel can be detected by an increase in friction between the hand and skin during the process of rinsing lather from the skin.

As used herein the term "water-insoluble" in relation to oils is a material which is substantially insoluble in distilled water at room temperature without the addition of other adjuncts and/or ingredients such as described herein.

As used herein the term "hindered polyol" means a polyol not susceptible to base catalysed elimination as the carbon alpha to any hydroxy methyl moiety is fully substituted.

Polymeric Esters of Polyols

An essential feature of the compositions of the present invention is a polymeric ester of polyol. The polymeric esters used herein are obtained by esterification of three components:

- (i) a polyol;
- (ii) a monocarboxylic acid; and
- (iii) a dicarboxylic acid.

Each of these components will be described in detail below.

Polyol

Suitable polyols for use herein can generally be selected from polyols having from 2 to about 20 carbon atoms; preferably from about 3 to about 15; more preferably from about 4 to about 10. Preferred polyols for use herein are hindered polyols. Examples of polyols useful herein are pentaerythritol, dipentaerythritol, tripentaerythritol, trimethylol propane, neopentyl glycol, glycerol and mixtures thereof. Preferred polyols for use herein are selected from pentaerythritol, trimethylol propane, neopentyl glycol and mixtures thereof. Particularly preferred for use in the polymeric ester compounds herein is pentaerythritol.

Monocarboxylic Acid

Suitable monocarboxylic acids for use herein generally have from 4 to 30 carbon atoms and are selected from straight chain, branched chain, aromatic monocarboxylic acids and mixtures thereof, preferably straight chain monocarboxylic acids. Preferred monocarboxylic acids for use herein are selected from C_4 to C_{18} monocarboxylic acids, preferably C_6 to C_{12} monocarboxylic acids and mixtures thereof, more preferably C_7 to C_{10} monocarboxylic acids and mixtures thereof. Particularly preferred for use herein are C_8 or C_{10} monocarboxylic acids and mixtures thereof.

Dicarboxylic Acid

Suitable dicarboxylic acids for use herein can be selected from straight chain, branched chain, cyclic dicarboxylic acids and mixtures thereof, preferably straight chain dicarboxylic acids. Preferred dicarboxylic acids for use herein are selected from C_2 to C_{12} dicarboxylic acids or mixtures thereof, preferably C_4 to C_{10} dicarboxylic acids or mixtures thereof, more preferably C_5 to C_8 dicarboxylic acids and mixture thereof. Examples of such dicarboxylic acids are those selected from adipic, succinic and heptandioic acids. Particularly preferred for use herein is adipic acid.

The polymeric esters of the present invention preferably have a viscosity in the range of from about 400 cst to about 50,000 cst, more preferably from about 1000 cst to about 10,000 cst, and especially from about 2000 cst to about 6000 cst, measured at 40° C. using the ASTM method D-445 for measuring viscosity. Particularly preferred are polymeric esters having a viscosity of from about 3000 cst to about 5000 cst, measured at 40° C. using the ASTM method D445 for measuring viscosity.

The polymeric esters of the present invention are preferably substantially fully esterified. As used herein "substantially fully esterified" means that at least 70%, preferably at least 90%, more preferably at least 95%, of the free hydroxyl groups are esterified.

In preferred embodiments the number average particle diameter for the polymeric esters used herein lies in the range of from about 1 Micron to about 500 microns, preferably from about 5 to about 200 microns, more preferably from about 5 to 50 microns, especially from about 5 to about 20 microns.

The polymeric esters of the present invention are manufactured by standard esterification techniques as disclosed in a variety of sources. See, for example, WO-A-93/25628,

U.S. Pat. No. 3,694,382, GB-A-2 134 538 and JP-A-5 585 510 (all incorporated herein by reference).

The compositions of the present invention preferably comprise in a range of from about 0.01% to about 20%, more preferably from about 0.1% to about 10%, even more preferably from about 1% to about 8%, by weight, of polymeric ester.

Surfactant System

As a further essential feature the compositions of the present invention comprise an anionic and/or amphoteric surfactant system.

Anionic surfactants suitable for inclusion in the compositions of the invention include alkyl sulfates, ethoxylated alkyl sulfates, alkyl ethoxy carboxylates, alkyl glyceryl ether sulfonates, ethoxy ether sulfonates, methyl acyl taurates, fatty acyl glycinates, N-acyl glutamates, acyl isethionates, alkyl sulfosuccinates, alkyl ethoxysulphosuccinates, alpha-sulfonated fatty acids, their salts and/or their esters, alkyl phosphate esters, ethoxylated alkyl phosphate esters, acyl sarcosinates and fatty acid/protein condensates, soaps such as ammonium, magnesium, potassium, triethanolamine and sodium salts of lauric acid, myristic acid and palmitic acid, acyl aspartates, alkoxy cocamide carboxylates, (ethoxylated) alkanolamine sulphosuccinates, ethoxylated alkyl citrate sulphosuccinates, acyl ethylene diamine triacetates, acylhydroxyethyl isethionates, acyl amide alkoxy sulfates, linear alkyl benzene sulfonates, paraffin sulfonates, alpha olefin sulfonates, alkyl alkoxy sulfates, and mixtures thereof. Alkyl and/or acyl chain lengths for these surfactants are C_6 - C_{22} , preferably C_{12} - C_{18} more preferably C_{12} - C_{14} .

Additional anionic surfactants suitable for use in the compositions according to the present invention are the salts of sulfuic acid esters of the reaction product of 1 mole of a higher fatty alcohol and from about 1 to about 12 moles of ethylene oxide, with sodium, ammonium and magnesium being the preferred counterions. Particularly preferred are the alkyl ethoxy sulfates containing from about 2 to 6, preferably 2 to 4 moles of ethylene oxide, such as sodium laureth-2 sulfate, sodium laureth-3 sulfate, ammonium laureth-3 sulfate and magnesium sodium laureth-3.6 sulfate. In preferred embodiments, the anionic surfactant contains at least about 50% especially at least about 75% by weight of ethoxylated alkyl sulfate.

In addition to the broad range ethoxylated alkyl sulfates obtained via conventional sodium catalysed ethoxylation techniques and subsequent sulphation processes, ethoxylated alkyl sulfates obtained from narrow range ethoxylates (NREs) are also suitable anionic surfactants for use in the present compositions. Narrow range ethoxylated alkyl sulfates suitable for use herein are selected from sulphated alkyl ethoxylates containing on average from about 1 to about 6, preferably from about 2 to about 4 and especially about 3 moles of ethylene oxide such as NRE sodium laureth-3 sulfate. NRE materials suitable for use herein contain distributions of the desired ethylene oxide (EO_n) in the ranges of from 15% to about 30% by weight of EO_n , from about 10% to about 20% by weight of EO_{n+1} and from about 10% to about 20% by weight of EO_{n-1} . Highly preferred NRE materials contain less than about 9% by weight of ethoxylated alkyl sulfate having 7 or more moles of ethylene oxide and less than about 13% by weight of non-ethoxylated alkyl sulfate. Suitable laureth 3 sulfate NRE materials are available from Hoechst under the trade names GENAPOL ZRO Narrow Range and GENAPOL Narrow Range.

5

The compositions of the present invention may contain, as an anionic surfactant alkyl ethoxy carboxylate surfactant at a level of from about 0.5% to about 15%, preferably from about 1% to about 10%, more preferably from about 1% to about 6% and especially from about 1% to about 4% by weight. Alkyl ethoxy carboxylate surfactant is particularly valuable in the compositions according to the present invention for the delivery of excellent skin mildness attributes in combination with excellent rinsing performance and desirable lather characteristics.

Alkyl ethoxy carboxylates suitable for use herein have the general formula (I):

wherein R^3 is a C_{10} to C_{16} alkyl or alkenyl group, preferably a C_{11} – C_{15} more preferably a C_{12} – C_{14} alkyl or C_{12} – C_{13} alkyl group, k is an average value of ethoxylation ranging from 2 to about 7, preferably from about 3 to about 6, more preferably from about 3.5 to about 5.5, especially from about 4 to about 5, most preferably from about 4 to about 4.5, and M is a water-solubilizing cation, preferably an alkali metal, alkaline earth metal, ammonium, lower alkanol ammonium, and mono-, di-, and tri-ethanol ammonium, more preferably sodium, potassium and ammonium, most preferably sodium and ammonium and mixtures thereof with magnesium and calcium ions.

Particularly preferred as anionic surfactants suitable for use herein are alkyl ethoxy carboxylate surfactants having a selected distribution of alkyl chain length and/or ethoxylate. Thus, the alkyl ethoxy carboxylate surfactants suitable for use in the compositions according to the present invention may comprise a distribution of alkyl ethoxy carboxylates having different average values of R^3 and/or k .

The average value of k will generally fall in the range of from about 3 to about 6 when the average R^3 is C_{11} , C_{12} , C_{13} or C_{14} . Preferred anionic alkyl ethoxy carboxylate surfactants suitable for use herein are the C_{12} to C_{14} (average EO 3–6) ethoxy carboxylates and the C_{12} to C_{13} (average EO 3–6) ethoxy carboxylates. Suitable materials include salts of NEODOX 23-4 (RTM) available from Shell Inc. (Houston, Tex., USA) and EMPICOL (RTM) CBCS (Albriglit & Wilson). Highly preferred for use herein are alkyl ethoxy carboxylate surfactants wherein, when R^3 is a C_{12} – C_{14} or C_{12} – C_{13} alkyl group and the average value of k is in the range of from about 3 to about 6, more preferably from about 3.5 to about 5.5, especially from about 4 to about 5 and most preferably from about 4 to about 4.5.

The anionic surfactants of the present invention preferably comprise from about 0.1% to about 30%; preferably from about 1% to about 20%; most preferably from about 2% to about 15% of the total composition. Particularly preferred are compositions that comprise from about 3% to about 10% of anionic surfactant.

Suitable amphoteric surfactants for use herein include (a) ammonium derivatives of formula [V]:

wherein R_1 is C_5 – C_{22} alkyl or alkenyl, R_2 is CH_2CH_2OH or CH_2CO_2M , M is H, alkali metal, alkaline earth metal, ammonium or alkanolammonium and R_3 is CH_2CH_2OH or H;

6

(b) aminoalkanoates of formula [VI]

iminodialkanoates of formula [VII]

and iminopolyalkanoates of formula (VIII)

wherein n , m , p , and q are numbers from 1 to 4, and R_1 and M are independently selected from the groups specified above; and

(c) mixtures thereof

Suitable amphoteric surfactants of type (a) include compounds of formula (V) in which R_1 is C_8H_{17} (especially isocapryl), C_9H_{19} and $C_{11}H_{23}$ alkyl. Suitable amphoteric surfactants of type (a) are marketed under the trade name Miranol and Empigen.

In CTFA nomenclature, materials suitable for use in the present invention include cocoamphocarboxypropionate, cocoamphocarboxy propionic acid, cocoamphoacetate, cocoamphodiaceate (otherwise referred to as cocoamphocarboxyglycinate), sodium lauroamphoacetate (otherwise referred to as sodium lauroamphocarboxyglycinate). Specific commercial products include those sold under the trade names of Ampholak 7TX (sodium carboxy methyl tallow polypropyl amine), Empigen CDL60 and CDR 60 (Albright & Wilson), Miranol H2M Conc. Miranol C_2M Conc. N.P., Miranol C_2M Conc. O.P., Miranol C_2M SF, Miranol CM Special, Miranol Ultra L32 and C32 (Rhône-Poulenc); Alkateric 2CIB (Alkaril Chemicals); Amphoterger W-2 (Lonza, Inc.); Monateric CDX-38, Monateric CSH-32 (Mona Industries); Rewoteric AM-2C (Rewo Chemical Group); and Schercotic MS-2 (Scher Chemicals).

It will be understood that a number of commercially-available amphoteric surfactants of this type are manufactured and sold in the form of electroneutral complexes with, for example, hydroxide counterions or with anionic sulfate or sulfonate surfactants, especially those of the sulfated C_8 – C_{18} alcohol, C_8 – C_{18} ethoxylated alcohol or C_8 – C_{18} acyl glyceride types. Preferred from the viewpoint of mildness and product stability, however, are compositions which are essentially free of (non-ethoxylated) sulfated alcohol surfactants. Note also that the concentrations and weight ratios of the amphoteric surfactants are based herein on the uncomplexed forms of the surfactants, any anionic surfactant counterions being considered as part of the overall anionic surfactant component content.

Examples of suitable amphoteric surfactants of type (b) include N-alkyl polytrimethylene poly-, carboxymethylamines sold under the trade names Ampholak X07 and Ampholak 7CX by Berol Nobel and also salts, especially the triethanolammonium salts and salts of N-lauryl-beta-amino propionic acid and N-lauryl-imino-dipropionic acid. Such materials are sold under the trade name Deriphat by Henkel and Mirataine by Rhône-Poulenc.

The amphoteric surfactants of the present invention preferably comprise from about 0.1% to about 30%; preferably from about 1% to about 20%; most preferably from about 2% to about 15% of the total composition. Particularly preferred are compositions that comprise from about 3% to about 10% of amphoteric surfactant.

In preferred embodiments the compositions are substantially free of soap, i.e. they contain less than about 5%, preferably less than about 1%, preferably 0%, by weight, of soap.

The compositions according to the present invention may additionally comprise nonionic surfactant at levels from about 0.1% to about 20%, more preferably from about 0.1% to about 10%, and especially from about 1% to about 8% by weight. Surfactants of this class include sucrose polyester surfactants, C₁₀-C₁₈ alkyl polyglycosides and polyhydroxy fatty acid amide surfactants having the general formula (III).

The preferred N-alkyl, N-alkoxy or N-aryloxy, polyhydroxy fatty acid amide surfactants according to formula (III) are those in which R₈ is C₅-C₃₁ hydrocarbyl, preferably C₆-C₁₉ hydrocarbyl, including straight-chain and branched chain alkyl and alkenyl, or mixtures thereof and R₉ is typically, hydrogen, C₁-C₈ alkyl or hydroxyalkyl, preferably methyl, or a group of formula —R¹—O—R² wherein R¹ is C₂-C₈ hydrocarbyl including straight-chain, branched-chain and cyclic (including aryl), and is preferably C₂-C₄ alkylene, R² is C₁-C₈ straight-chain, branched-chain and cyclic hydrocarbyl including aryl and oxyhydrocarbyl, and is preferably C₁-C₄ alkyl, especially methyl, or phenyl. Z₂ is a polyhydroxyhydrocarbyl moiety having a linear hydrocarbyl chain with at least 2 (in the case of glyceraldehyde) or at least 3 hydroxyls (in the case of other reducing sugars) directly connected to the chain, or an alkoxyated derivative (preferably ethoxyated or propoxyated) thereof. Z₂ preferably will be derived from a reducing sugar in a reductive amination reaction, most preferably Z₂ is a glyceryl moiety. Suitable reducing sugars include glucose, fructose, maltose, lactose, galactose, mannose, and xylose, as well as glyceraldehyde. As raw materials, high dextrose corn syrup, high fructose corn syrup, and high maltose corn syrup can be utilised as well as the individual sugars listed above. These corn syrups may yield a mix of sugar components for Z₂. It should be understood that it is by no means intended to exclude other suitable raw materials. Z₂ preferably will be selected from the group consisting of CH₂—(CHOH)_n—CH₂OH, CH(CH₂OH)—(CHOH)_{n-1}—CH₂OH, CH₂(CHOH)₂(CHOR')CHOH)CH₂OH, where n is an integer from 1 to 5, inclusive, and R' is H or a cyclic mono- or poly-saccharide, and alkoxyated derivatives thereof. As noted, most preferred are glyceryls wherein n is 4, particularly CH₂—(CHOH)₄—CH₂OH.

The most preferred polyhydroxy fatty acid amide has the formula R₈(CO)N(CH₃)CH₂(CHOH)₄CH₂OH wherein R₈ is a C₆-C₁₉ straight chain alkyl or alkenyl group. In compounds of the above formula, R₈—CO—N< can be, for example, cocoamide, stearamide, oleamide, lauramide, myristamide, capricamide, caprylicamide, palmitamide, tallowamide, etc.

Exemplary non-ionic surfactants suitable for use in the compositions according to the present invention include primary amines such as cocamine (available as Adagen 160D (TM) from Witco) and alkanolamides such as cocamide MEA (available as Empilan CME (TM) from Albright and Wilson), PEG-3 cocamide, cocamide DEA (available as Empilan CDE (TM) from Albright and Wilson), lauramide MEA (available as Empilan LME (TM) from Albright and Wilson), lauramide MIPA, lauramide DEA, and mixtures thereof.

The compositions herein can also contain from about 0.1% to about 20%, more preferably from about 0.1% to about 10%, and especially from about 1% to about 8% by weight of a zwitterionic surfactant.

Betaine surfactants suitable for inclusion in the compositions of the present invention include alkyl betaines of the formula R₅R₆R₇N⁺(CH₂)_nCO₂M and amido betaines of the formula (IX)

wherein R₅ is C₅-C₂₂ alkyl or alkenyl, R₆ and R₇ are independently C₁-C₃ alkyl, M is H, alkali metal, alkaline earth metal, ammonium or alkanolammonium, and n, m are each numbers from 1 to 4. Preferred betaines include cocamidopropyl dimethylcarboxymethyl betaine, commercially available from TH Goldschmidt under the tradename Tego betaine, and laurylanidopropyl dimethylcarboxymethyl betaine, commercially available from Albright and Wilson under the tradename Empigen BR and from TH Goldschmidt under the tradename Tegobetaine L10S.

Sultaine surfactants suitable for inclusion in the compositions of the present invention include alkylamido sultaines of the formula;

wherein R₁ is C₇ to C₂₂ alkyl or alkenyl, R₂ and R₃ are independently C₁ to C₃ alkyl, M is H, alkali metal, alkaline earth metal, ammonium or alkanolammonium and m and n are numbers from 1 to 4. Suitable for use herein is coco amido propylhydroxy sultaine which is commercially available under the tradename Mirataine CBS from Rhone-Poulenc.

Amine oxide surfactants suitable for inclusion in the compositions of the present invention include alkyl amine oxide R₅R₆R₇NO and amido amine oxides of the formula

wherein R₅ is C₁₁ to C₂₂ alkyl or alkenyl, R₆ and R₇ are independently C₁ to C₃ alkyl, M is H, alkali metal, alkaline earth metal, ammonium or alkanolammonium and m is a number from 1 to 4. Preferred amine oxides include cocamidopropylamine oxide, lauryl dimethyl amine oxide and myristyl dimethyl amine oxide.

Polymeric Cationic Conditioning Agent

The compositions according to the present invention can optionally include a polymeric cationic conditioning agent. Polymeric cationic conditioning agents are valuable in the compositions according to the present invention for provision of desirable skin feel attributes. The polymeric skin conditioning agent is preferably present at a level from about 0.01% to about 5%, preferably from about 0.01% to about 3% and especially from about 0.01% to about 2% by weight.

Suitable polymers are high molecular weight materials (mass-average molecular weight determined, for instance, by light scattering, being generally from about 2,000 to about 5,000,000, preferably from about 5,000 to about 3,000,000 more preferably from 100,000 to about 1,000,000).

Representative classes of polymers include cationic guar gums, cationic polysaccharides; cationic homopolymers and copolymers derived from acrylic and/or methacrylic acid; cationic cellulose resins, quaternized hydroxy ethyl cellulose ethers; cationic copolymers of dimethyldiallylammonium chloride and acrylamide and/or acrylic acid; cationic homopolymers of dimethyldiallylammonium chloride; copolymers of dimethyl aminoethylmethacrylate and acrylamide, acrylic acid/dimethyldiallylammonium chloride/acrylamide copolymers, quaternized vinyl pyrrolidone acrylate or methacrylate copolymers of amino alcohol, quaternized copolymers of vinyl pyrrolidone and dimethylaminoethylmethacrylamide, vinyl pyrrolidone/vinyl imidazolium methochloride copolymers and polyalkylene and ethoxypolyalkylene imines; quaternized silicones, terpolymers of acrylic acid, methacrylamidopropyl trimethyl ammonium chloride and methyl acrylate, and mixtures thereof.

By way of exemplification, cationic polymers suitable for use herein include cationic guar gums such as hydroxypropyl trimethyl ammonium guar gum (d.s. of from 0.11 to 0.22) available commercially under the trade names Jaguar C-14-S(RTM) and Jaguar C-17(RTM) and also Jaguar C-16 (RTM), which contains hydroxypropyl substituents (d.s. of from 0.8–1.1) in addition to the above-specified cationic groups, and quaternized hydroxy ethyl cellulose ethers available commercially under the trade names Ucare Polymer JR-30M, JR-400, LR400, Catanal (RTM) and Celquat. Other suitable cationic polymers are homopolymers of dimethyldiallylammonium chloride available commercially under the trade name Merquat 100, copolymers of dimethyl aminoethylmethacrylate and acrylamide, copolymers of dimethyldiallylammonium chloride and acrylamide, available commercially under the trade names Merquat 550 and Merquat S, acrylic acid/dimethyldiallylammonium chloride/acrylamide copolymers available under the trade name Merquat 3330, terpolymers of acrylic acid, methacrylamidopropyl trimethyl ammonium chloride and methyl acrylate commercially available under the tradename Merquat 2001, quaternized vinyl pyrrolidone acrylate or methacrylate copolymers of amino alcohol available commercially under the trade name Gafquat, for example Polyquaternium 11, 23 and 28 (quaternized copolymers of vinyl pyrrolidone and dimethyl aminoethylmethacrylate—Gafquat 755N and quaternized copolymers of vinyl pyrrolidone and dimethyl aminoethylmethacrylamide—HS-100), vinyl pyrrolidone/vinyl imidazolium methochloride copolymers available under the trade names Luviquat FC₃₇₀, Polyquaternium 2, and polyalkyleneimines such as polyethylenimine and ethoxylated polyethylenimine. Also suitable for use herein are those cationic polymers commercially available under the tradename Aqualon N-Hance.

The compositions of the invention may also contain from about 0.1% to about 20%, preferably from about 1% to about 15%, and more preferably from about 2% to about 10% by weight of an oil derived nonionic surfactant or mixture of oil derived nonionic surfactants. Oil derived nonionic surfactants are valuable in compositions according to the invention for the provision of skin feel benefits both in use and after use. Suitable oil derived nonionic surfactants for use herein include water soluble vegetable and animal-derived emol-

lients such as triglycerides with a polyethyleneglycol chain inserted; ethoxylated mono and di-glycerides, polyethoxylated lanolins and ethoxylated butter derivatives. One preferred class of oil-derived nonionic surfactants for use herein have the general formula (XII)

wherein n is from about 5 to about 200, preferably from about 20 to about 100, more preferably from about 30 to about 85, and wherein R comprises an aliphatic radical having on average from about 5 to 20 carbon atoms, preferably from about 7 to 18 carbon atoms.

Suitable ethoxylated oils and fats of this class include polyethyleneglycol derivatives of glyceryl cocoate, glyceryl caproate, glyceryl caprylate, glyceryl tallowate, glyceryl palmate, glyceryl stearate, glyceryl laurate, glyceryl oleate, glyceryl ricinoleate, and glyceryl fatty esters derived from triglycerides, such as palm oil, almond oil, and corn oil, preferably glyceryl tallowate and glyceryl cocoate.

Suitable oil derived nonionic surfactants of this class are available from Croda Inc. (New York, USA) under their Crovol line of materials such as Crovol EP40 (PEG 20 evening primrose glyceride), Crovol EP 70 (PEG 60 evening primrose glyceride) Crovol A-40 (PEG 20 almond glyceride), Crovol A-70 (PEG 60 almond glyceride), Crovol M-40 (PEG 20 maize glyceride), Crovol M-70 (PEG 60 maize glyceride), Crovol PK-40 (PEG 12 palm kernel glyceride), and Crovol PK-70 (PEG 45 palm kernel glyceride) and under their Solan range of materials such as Solan E, E50 and X polyethoxylated lanolins and Aqualose L-20 (PEG 24 lanolin alcohol) and Aqualose W15 (PEG 15 lanolin alcohol) available from Westbrook Lanolin. Further suitable surfactants of this class are commercially available from Sherex Chemical Co. (Dublin, Ohio, USA) under their Varonic LI line of surfactants and from Rewo under their Rewoderm line of surfactants. These include, for example, Varonic LI 48 (polyethylene glycol (n=80) glyceryl tallowate, alternatively referred to as PEG 80 glyceryl tallowate), Varonic LI 2 (PEG 28 glyceryl tallowate), Varonic LI 420 (PEG 200 glyceryl tallowate), and Varonic LI 63 and 67 (PEG 30 and PEG 80 glyceryl cocoates), Rewoderm L15-20 (PEG-200 palmitate), Rewoderm LIS-80 (PEG-200 palmitate with PEG-7 glyceryl cocoate) and Rewoderm LIS-75 (PEG-200 palmitate with PEG-7 glyceryl cocoate) and mixtures thereof Other oil-derived emollients suitable for use are PEG derivatives of corn, avocado, and babassu oil, as well as Softigen 767 (PEG(6) caprylic/capric glycerides).

Also suitable for use herein are nonionic surfactants derived from composite vegetable fats extracted from the fruit of the Shea Tree (*Butyrospermum Karkii* Kotschy) and derivatives thereof. This vegetable fat, known as Shea Butter is widely used in Central Africa for a variety of means such as soap making and as a barrier cream, it is marketed by Sederma (78610 Le Perray En Yvelines, France). Particularly suitable are ethoxylated derivatives of Shea butter available from Karlshamn Chemical Co. (Columbos, Ohio, USA) under their Lipex range of chemicals, such as Lipex 102 E-75 and Lipex 102 E-3 (ethoxylated mono, di-glycerides of Shea butter) and from Croda Inc. (New York, USA) under their Crovol line of materials such as Crovol SB-70 (ethoxylated mono, di-glycerides of Shea butter). Similarly, ethoxylated derivatives of Mango, Cocoa and Illipe butter may be used in compositions according to

11

the invention. Although these are classified as ethoxylated nonionic surfactants it is understood that a certain proportion may remain as non-ethoxylated vegetable oil or fat.

Other suitable oil-derived nonionic surfactants include ethoxylated derivatives of almond oil, peanut oil, rice bran oil, wheat germ oil, linseed oil, jojoba oil, oil of apricot pits, walnuts, palm nuts, pistachio nuts, sesame seeds, rapeseed, cade oil, corn oil, peach pit oil, poppyseed oil, pine oil, castor oil, soybean oil, avocado oil, safflower oil, coconut oil, hazelnut oil, olive oil, grapeseed oil, and sunflower seed oil.

Oil derived nonionic surfactants highly preferred for use herein from the viewpoint of optimum mildness and skin feel characteristics are Lipex 102-3 (RTM) (PEG-3 ethoxylated derivatives of Shea Butter) and Softigen 767 (RTM) (PEG-6 caprylic/capric glycerides).

The compositions according to the present invention can also comprise lipophilic emulsifiers as skin care actives. Suitable lipophilic skin care actives include anionic food grade emulsifiers which comprise a di-acid mixed with a monoglyceride such as succinylated monoglycerides, monostearyl citrate, glyceryl monostearate diacetyl tartrate and mixtures thereof

Optional Ingredients

The compositions herein can additionally comprise a wide variety of optional ingredients. Non-limiting examples of such ingredients are described below.

Water-insoluble oils can optionally be used herein. Preferred are those selected from (a) highly branched polyal-phaolefins having the following formula:

wherein R^1 is H or C_1 - C_{20} alkyl, R^4 is C_1 - C_{20} alkyl, R^2 is H or C_1 - C_{20} , and R^3 is C_5 - C_{20} , n is an integer from 0 to 3 and m is an integer of from 1 to 1000 and having a number average molecular weight of from about 1000 to about 25,000, preferably from about 2500 to about 6000, more preferably from about 2500 to about 4000. Preferably the polyal-phaolefins of type (a) use herein have a viscosity of from about 300 cst to about 50,000 cst, preferably from about 1000 cst to about 12,000 cst, more preferably from about 1000 cst to about 4000 cst at 40° C. using the ASTM D-445 method for measuring viscosity. The oils of type (a) may also have a degree of unsaturation, but are preferably saturated.

Suitable polyal-phaolefins of type (a) as described above can be derived from 1-alkene monomers having from about 4 to about 20 carbon atoms, preferably from about 6 to about 12 carbon atoms, especially from about 8 to about 12 carbon atoms. The polyal-phaolefins useful herein are preferably hydrogenated polyal-phaolefin polymers.

Non-limiting examples of 1-alkene monomers for use in preparing the polyal-phaolefin polymers herein include 1-hexene, 1-octene, 1-decene, 1-dodecene, 1-tetradecene, branched chain isomers such as 4-methyl-1-pentene, and combinations thereof. Also suitable for preparing the poly-olefin liquids are 1-hexene to 1-hexadecenes and combinations thereof, more preferably 1-octene to 1-dodecene or combinations thereof.

Examples of such oils include polydecene oils such as those commercially available from Mobil Chemical Company, P.O. Box 3140, Edison, N.J. 08818, USA, under the tradename Puresyn 40 and Puresyn 100.

12

Particularly preferred from the viewpoint of improving rinse feel of the composition is a highly branched polyal-phaolefin material of type (a) having a number average molecular weight of from about 2500 to about 4000 and a viscosity of from about 100 cst to about 2000 cst (ASTM D445 at 45° C.) such as that commercially available from Mobil under the tradename Puresyn 100.

Mixtures of the above oils are also suitable for use herein.

Other water-insoluble oils can be used in the compositions of the present invention. Additional water-insoluble oils for use in the personal cleansing compositions of the present invention those of type (b) which are branched alk(en)yl materials having the following formula:

wherein R_1 is H or C_1 - C_4 alkyl, R^4 is C_1 - C_4 alkyl, R^2 is H or C_1 - C_4 alkyl or C_2 - C_4 alkenyl, and R^3 is H or C_1 - C_4 alkyl or C_2 - C_4 alkenyl, n is an integer from 0 to 3 and m is an integer of from 1 to 1000 and having a number average molecular weight of from about 600 to about 1000, preferably from about 750 to about 1000, especially from about 800 to about 1000. Preferably the branched alk(en)yl materials of type have a viscosity in the range of from about 500 cst to about 50,000 cst, preferably from about 1000 cst to about 10,000 cst measured at 40° C. using the ASTM method D-445 for measuring viscosity.

Suitable alk(en)yl materials of type (b) for use herein are polymers of butene, isoprene, terpene, styrene or isobutene, preferably butene or isobutene.

Examples of alk(en)yl oils of type (b) include polybutene oils such as those commercially available from Amoco under the tradename Indopol 40 and Indopol 100 and polyisobutene oils such as those commercially available from Presperse Inc. under the tradename Permethyl 104A and Parapol 950 from Exxon Chemicals Co.

Also suitable for use herein are hydrophobically modified silicones having the following formula: hydrophobically modified silicones having the following formula:

wherein R is C_1 - C_4 alkyl or phenyl, R' is C_1 - C_{20} alkyl or phenyl, z is 5 to 21, and x has a number average value in the range of from about 20 to 400, y has a number average value in the range of from about 0 to about 10 and $x+y$ lies in the range of 30 to 400. Preferred materials have values for x of from 40 to 200, preferably 60 to 100, values for y of from 0 to 5, preferably 0, and values for the sum of x and y of from 60 to 100. The alkylene chain z may be linear or branched. In addition, the silicone backbone may contain a small degree of branching to yield a resin (eg. MDQ or MDT resins).

Examples of such oils include those hydrophobically modified silicones available from GE Silicones under the tradename SF1632 (C_{16} - C_{18} alkyl methicone), and octyl and decyl methicone.

In preferred embodiments the number average particle diameter for the additional water-insoluble oil used herein

lies in the range of from about 1 micron to about 500 microns, preferably from about 5 to about 200 microns, more preferably from about 5 to 50 microns, especially from about 5 to about 20 microns.

Another water-insoluble, skin/hair care ingredient suitable for use in the foaming compositions herein is a liquid, polyol carboxylic acid ester.

The polyol ester preferred for use herein is a nonocclusive liquid or liquifiable polyol carboxylic acid ester. These polyol esters are derived from a polyol radical or moiety and one or more carboxylic acid radicals or moieties. In other words, these esters contain a moiety derived from a polyol and one or more moieties derived from a carboxylic acid. These carboxylic acid esters can also be described as liquid polyol fatty acid esters, because the terms carboxylic acid and fatty acid are often used interchangeably by those skilled in the art.

The preferred liquid polyol polyesters employed in this invention comprise certain polyols, especially sugars or sugar alcohols, esterified with at least four fatty acid groups. Accordingly, the polyol starting material must have at least four esterifiable hydroxyl groups. Examples of preferred polyols are sugars, including monosaccharides and disaccharides, and sugar alcohols. Examples of monosaccharides containing four hydroxyl groups are xylose and arabinose and the sugar alcohol derived from xylose, which has five hydroxyl groups, i.e., xylitol. The monosaccharide, erythrose, is not suitable in the practice of this invention since it only contains three hydroxyl groups, but the sugar alcohol derived from erythrose, i.e., erythritol, contains four hydroxyl groups and accordingly can be used. Suitable five hydroxyl group-containing monosaccharides are galactose, fructose, and sorbose. Sugar alcohols containing six —OH groups derived from the hydrolysis products of sucrose, as well as glucose and sorbose, e.g., sorbitol, are also suitable. Examples of disaccharide polyols which can be used include maltose, lactose, and sucrose, all of which contain eight hydroxyl groups.

Preferred polyols for preparing the polyesters for use in the present invention are selected from the group consisting of erythritol, xylitol, sorbitol, glucose, and sucrose. Sucrose is especially preferred.

The polyol starting material having at least four hydroxyl groups is esterified on at least four of the —OH groups with a fatty acid containing from about 8 to about 22 carbon atoms. Examples of such fatty acids include caprylic, capric, lauric, myristic, myristoleic, palmitic, palmitoleic, stearic, oleic, ricinoleic, linoleic, linolenic, eleostearic, arachidic, arachidonic, behenic, and erucic acid. The fatty acids can be derived from naturally occurring or synthetic fatty acids; they can be saturated or unsaturated, including positional and geometrical isomers. However, in order to provide liquid polyesters preferred for use herein, at least about 50% by weight of the fatty acid incorporated into the polyester molecule should be unsaturated. Oleic and linoleic acids, and mixtures thereof, are especially preferred.

The polyol fatty acid polyesters useful in this invention should contain at least four fatty acid ester groups. It is not necessary that all of the hydroxyl groups of the polyol be esterified with fatty acid, but it is preferable that the polyester contain no more than two unesterified hydroxyl groups. Most preferably, substantially all of the hydroxyl groups of the polyol are esterified with fatty acid, i.e., the polyol moiety is substantially completely esterified. The fatty acids esterified to the polyol molecule can be the same or mixed, but as noted above, a substantial amount of the unsaturated acid ester groups must be present to provide liquidity.

To illustrate the above points, a sucrose fatty triester would not be suitable for use herein because it does not contain the required four fatty acid ester groups. A sucrose

tetra-fatty acid ester would be suitable, but is not preferred because it has more than two unesterified hydroxyl groups. A sucrose hexa-fatty acid ester would be preferred because it has no more than two unesterified hydroxyl groups. Highly preferred compounds in which all the hydroxyl groups are esterified with fatty acids include the liquid sucrose octa-substituted fatty acid esters.

The following are non-limiting examples of specific polyol fatty acid polyesters containing at least four fatty acid ester groups suitable for use in the present invention: glucose tetraoleate, the glucose tetraesters of soybean oil fatty acids (unsaturated), the mannose tetraesters of mixed soybean oil fatty acids, the galactose tetraesters of oleic acid, the arabinose tetraesters of linoleic acid, xylose tetralinoleate, galactose pentaoleate, sorbitol tetraoleate, the sorbitol hexaesters of unsaturated soybean oil fatty acids, xylitol pentaoleate, sucrose tetraoleate, sucrose pentaoleate, sucrose hexaoleate, sucrose heptaoleate, sucrose octaoleate, and mixtures thereof.

As noted above, highly preferred polyol fatty acid esters are those wherein the fatty acids contain from about 14 to about 18 carbon atoms.

The polyol fatty acid polyesters suitable for use herein can be prepared by a variety of methods well known to those skilled in the art. These methods include: transesterification of the polyol with methyl, ethyl or glycerol fatty acid esters using a variety of catalysts; acylation of the polyol with a fatty acid chloride; acylation of the polyol with a fatty acid anhydride; and acylation of the polyol with a fatty acid, per se. See U.S. Pat. No. 2,831,854; U.S. Pat. No. 4,005,196, to Jandacek, issued Jan. 25, 1977; U.S. Pat. No. 4,005,196, to Jandacek, issued Jan. 25, 1977.

The present compositions can also comprise an auxiliary nonionic or anionic polymeric thickening component, especially a water-soluble polymeric material, having a molecular weight greater than about 20,000. By "water-soluble polymer" is meant that the material will form a substantially clear solution in water at a 1% concentration at 25° C. and the material will increase the viscosity of the water. Examples of water-soluble polymers which may desirably be used as an additional thickening component in the present compositions, are hydroxyethylcellulose, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyethylene glycol, polyacrylamide, polyacrylic acid, polyvinyl alcohol (examples include PVA 217 from Kurary Chemical Co., Japan), polyvinyl pyrrolidone K-120, dextrans, for example Dextran purified crude Grade 2P, available from D&O Chemicals, carboxymethyl cellulose, plant exudates such as acacia, ghatti, and tragacanth, seaweed extracts such as sodium alginate, propylene glycol alginate and sodium carrageenan. Preferred as the additional thickeners for the present compositions are natural polysaccharide materials. Examples of such materials are guar gum, locust bean gum, and xanthan gum. Also suitable herein preferred is hydroxyethyl cellulose having a molecular weight of about 700,000.

Hydrotrope

The compositions according to the present invention may contain as an optional feature a hydrotrope. Suitable for use herein as hydrotropes are those well known in the art, including sodium xylene sulphonate, ammonium xylene sulphonate, sodium cuinene sulphonate, short chain alkyl sulphate and mixtures thereof. Hydrotrope may be present in the compositions according to the invention at a level of from about 0.01% to about 5%, preferably from about 0.1% to about 4%, more preferably from about 0.5% to about 3% by weight. Hydrotrope, as defined herein, means, a material which, when added to a non-dilute, water-soluble surfactant system can modify its viscosity and rheological profile.

In addition to the water-insoluble oil described above, the compositions of the invention may also include an insoluble

perfume or cosmetic oil or wax or a mixture thereof at a level up to about 10%, preferably up to about 3% by weight wherein the oil or wax is insoluble in the sense of being insoluble in the product matrix at a temperature of 25° C.

Suitable insoluble cosmetic oils and waxes for use herein can be selected from water-insoluble silicones inclusive of non-volatile polyalkyl and polyaryl siloxane gums and fluids, volatile cyclic polydimethylsiloxanes, polyalkoxylated silicones, amino and quaternary ammonium modified silicones, rigid cross-linked and reinforced silicones and mixtures thereof, C₁-C₂₄ esters of C₈-C₃₀ fatty acids such as isopropyl myristate, myristyl myristate and cetyl ricinoleate, C₈-C₃₀ esters of benzoic acid, beeswax, saturated and unsaturated fatty alcohols such as behenyl alcohol, hydrocarbons such as mineral oils, petrolatum, squalane and squalene, fatty sorbitan esters (see U.S. Pat. No. 3,988,255, Seiden, issued Oct. 26th 1976), lanolin and oil-like lanolin derivatives, animal and vegetable triglycerides such as almond oil, peanut oil, wheat germ oil, rice bran oil, linseed oil, jojoba oil; oil of apricot pits, walnuts, palm nuts, pistachio nuts, sesame seeds, rapeseed, cade oil, corn oil, peach pit oil, poppyseed oil, pine oil, castor oil, soyabean oil, avocado oil, safflower oil, coconut oil, hazelnut oil, olive oil, grapeseed oil, and sunflower seed oil, and C₁-C₂₄ esters of dimer and trimer acids such as diisopropyl dimerate, diisostearylmalate, diisostearyldimerate and triisostearyltrimerate.

The viscosity of the final composition (Brookfield DV II, with Cone CP41 or CP52, 25° C., neat) is preferably at least about 500 cps, more preferably from about 1,000 to about 50,000 cps, especially from about 1,000 to about 30,000 cps, more especially from about 1,000 to about 15,000 cps.

The cleansing compositions can optionally include other hair or skin moisturizers which are soluble in the cleansing composition matrix. The preferred level of such moisturizers is from about 0.5% to about 20% by weight. In preferred embodiments, the moisturizer is selected from essential amino acid compounds found naturally occurring in the stratum corneum of the skin and water-soluble nonpolyol nonocclusives and mixtures thereof.

Some examples of more preferred nonocclusive moisturizers are squalane, sodium pyrrolidone carboxylic acid, D-panthenol, lactic acid, L-proline; guanidine, pyrrolidone, hydrolyzed protein and other collagen-derived proteins, aloe vera gel, acetamide MEA and lactamide MEA and mixtures thereof.

The compositions herein may also include one or more suspending agents. Suitable suspending agents for use herein include any of several long chain acyl derivative materials or mixtures of such materials. Included are ethylene glycol esters of fatty acids having from about 16 to about 22 carbon atoms. Preferred are the ethylene glycol stearates, both mono and distearate, but particularly the distearate containing less than about 7% of the mono stearate. Other suspending agents found useful are alkanol amides of fatty acids, having from about 16 to 22 carbon atoms, preferably from about 16 to 18 carbon atoms. Preferred alkanol amides are stearic monoethanolamide, stearic diethanolamide, stearic monoisopropanolamide and stearic monoethanolamide stearate.

Still other suitable suspending agents are alkyl (C₁₆-C₂₂) dimethyl amine oxides such as stearyl dimethyl amino oxide and trihydroxystearin commercially available under the tradename Thixcin (RTM) from Rheox.

The suspending agent is preferably present at a level of from about 0.5% to about 5%, preferably from about 0.5% to about 3%. The suspending agents serves to assist in suspending the water-insoluble oil and may give pearlescence to the product. Mixtures of suspending agents are also suitable for use in the compositions of this invention.

Compositions according to the present invention may also include an opacifier or pearlescing agent. Such materials may be included at a level of from about 0.01% to about 5%, preferably from about 0.2% to about 1.3% by weight.

Opacifiers/pearlescers suitable for inclusion in the compositions of the present invention include: titanium dioxide, TiO₂; EUPERLAN 810 (RTM); TEGO-PEARL (RTM); long chain (C₁₆-C₂₂) acyl derivatives such as glycol or polyethylene glycol esters of fatty acid having from about 16 to about 22 carbon atoms and up to 7 ethyleneoxy units; alkanolamides of fatty acids, having from about 16 to about 22 carbon atoms, preferably about 16 to 18 carbon atoms such as stearic monoethanolamide, stearic diethanolamide, stearic monoisopropanolamide and stearic monoethanolamide and alkyl (C₁₆-C₂₂) dimethyl amine oxides such as stearyl dimethyl amine oxide.

In preferred compositions the opacifier/pearlescer is present in the form of crystals. In highly preferred compositions the opacifier/pearlescer is a particulate polystyrene dispersion having a particle size of from about 0.05 microns to about 0.45 microns, preferably from about 0.17 microns to about 0.3 microns, such dispersions being preferred from the viewpoint of providing optimum rheology and shear-thinning behaviour.

A number of additional optional materials can be added to the cleansing compositions each at a level of from about 0.1% to about 2% by weight. Such materials include proteins and polypeptides and derivatives thereof; water-soluble or solubilizable preservatives such as DMDM Hydantoin, Germall 115, methyl, ethyl, propyl and butyl esters of hydroxybenzoic acid, EDTA, Euxyl (RTM) K400, natural preservatives such as benzyl alcohol, potassium sorbate and bisaballo; sodium benzoate and 2-phenoxyethanol; other moisturizing agents such as hyaluronic acid, chitin, and starch-grafted sodium polyacrylates such as Sanwet (RTM) IM-1000, IM-1500 and IM-2500 available from Celanese Superabsorbent Materials, Portsmouth, Va., USA and described in U.S. Pat. No. 4,076,663; solvents; suitable anti-bacterial agents such as Oxeco (phenoxy isopropanol), Trichlorocarbanilide (TCC) and Triclosan and; low temperature phase modifiers such as ammonium ion sources (e.g. NH₄ Cl); viscosity control agents such as magnesium sulfate and other electrolytes; colouring agents; TiO₂ and TiO₂-coated mica; perfumes and perfume solubilizers; and zeolites such as Valfour BV400 and derivatives thereof and Ca²⁺/Mg²⁺ sequestrants such as polycarboxylates, amino polycarboxylates, polyphosphonates, amino polyphosphonates, EDTA etc, water softening agents such as sodium citrate and insoluble particulates such as zinc stearate and fumed silica. If water is also present it is preferably at a level of from about 20% to about 99.89%, preferably from about 40% to about 90%, more preferably at least about 75% by weight of the compositions herein.

The pH of the compositions is preferably from about 3 to about 10, more preferably from about 5 to about 9, especially from about 5 to about 8 and most preferably from about 5 to 7.

The compositions of the present invention can be used for a variety of skin and hair care applications such as shower gels, body washes, hair shampoos, and the like.

The compositions of the present invention may be applied with the hand or preferably with a personal cleansing implement such as a puff. Suitable personal cleansing implements for use with the compositions of the present invention include those disclosed in the following patent documents which are incorporated herein by reference: U.S. Pat. No. 5,144,744 to Campagnoli, issued Sep. 8, 1992, U.S. Pat. No. 3,343,196 to Barnhouse, WO95/26671 to The Procter & Gamble Company, WO95/00 116 to The Procter & Gamble Company and WO95/26670 to The Procter & Gamble Company.

The compositions according to the present invention are illustrated by the following non-limiting examples.

Method of Manufacture

Compositions can be prepared by firstly making a premix of surfactants and a suspending agent. This premix should

(except sarcosinate), a portion of the water, powder preservatives and the pH adjuster with mild agitation. This mixture is then heated up to about 90° C. during which time, fatty alcohol/fatty acid, the suspending agent and sodium chloride are added with agitation.

35

The mixture is held at high temperatures for five minutes to one hour before being cooled at a controlled rate to approximately 30–40° C. via a heat exchanger causing the suspending agent to crystallize out.

40

To this premix the remaining water is then added followed by polymeric ester of polyol, remaining surfactant, liquid preservatives and perfume. This part of the process is done at room temperature using mild agitation to yield the preferred droplet size of 5 to 20 microns.

45

The products provide excellent rinse feel and mildness benefits together with excellent rheological attributes in storage, in dispensing and in-use, in combination with good efficacy benefits including skin conditioning, skin moisturising, good product stability, cleansing and lathering.

50

What is claimed is:

1. A personal cleansing composition comprising an anionic and/or amphoteric surfactant and a polymeric ester, the polymeric ester comprising:

55

- (i) a polyol selected from the group consisting of pentaerythritol, dipentaerythritol, trientaerythritol, trimethylol propane, neopentyl glycol, glycerol and mixtures thereof;
- (ii) a monocarboxylic acid having from 4 to 30 carbon atoms; and
- (iii) a dicarboxylic acid.

60

2. A personal cleansing composition according to claim 1 wherein the polyol is a hindered polyol.

65

3. A personal cleansing composition according to claim 1 wherein the polyol is selected from pentaerythritol, trimethylol propane, neopentyl glycol and mixtures thereof.

4. A personal cleansing composition according to claim 1 wherein the monocarboxylic acids are straight chain monocarboxylic acids.
5. A personal cleansing composition according to claim 4 wherein the monocarboxylic acids are selected from C₄ to C₂₂ monocarboxylic acids and mixtures thereof.
6. A personal cleansing composition according to claim 5 wherein the monocarboxylic acids are selected from C₆ to C₁₂ monocarboxylic acids and mixtures thereof.
7. A personal cleansing composition according to claim 6 wherein the monocarboxylic acids are selected from C₇ to C₁₀ monocarboxylic acids and mixtures thereof.
8. A personal cleansing composition according to claim 7 wherein the monocarboxylic acids are selected from C₈ or C₁₀ monocarboxylic acids and mixtures thereof.
9. A personal cleansing composition according to claim 8 wherein the dicarboxylic acids are straight chain dicarboxylic acids.
10. A personal cleansing composition according to claim 9 wherein the dicarboxylic acids are selected from C₂ to C₁₂ dicarboxylic acids and mixtures thereof.
11. A personal cleansing composition according to claim 9 wherein the dicarboxylic acids are selected from adipic, succinic and heptandioic and mixtures thereof.
12. A personal cleansing composition according to claim 11 comprising from about 0.1% to about 30%, of anionic surfactant.
13. A personal cleansing composition according to claim 12 comprising from about 0.1% to about 30%, of amphoteric surfactant.
14. A personal cleansing composition according to claim 13 wherein the polymeric ester has a viscosity in the range of from about 400 cst to about 50,000 cst.
15. A personal cleansing composition according to claim 14 wherein the polymeric ester is substantially fully esterified.
16. A personal cleansing composition according to claim 15 that contains less than about 5%.
17. A personal cleansing composition according to claim 16 comprising from about 0.01% to about 20%.
18. A personal cleansing composition according to claim 17 wherein the polymeric ester has a number average particle diameter of from about 1 micron to about 500 microns.
19. A personal cleansing composition according to claim 10 wherein the dicarboxylic acids are selected from C₄ to C₁₀ dicarboxylic acids and mixtures thereof.

20. A personal cleansing composition according to claim 12 comprising from about 1% to about 20% by weight of anionic surfactant.
21. A personal cleansing composition according to claim 20 comprising from about 2% to about 15% by weight of anionic surfactant.
22. A personal cleansing composition according to claim 13 comprising from about 1% to about 20% by weight, of amphoteric surfactant.
23. A personal cleansing composition according to claim 22 comprising from about 2% to about 15% by weight, of amphoteric surfactant.
24. A personal cleansing composition according to claim 14 wherein the polymeric ester has a viscosity in the range of from about 1000 cst to about 10,000 cst measured at 40° C. using the ASTM method D-445 for measuring viscosity.
25. A personal cleansing composition according to claim 24 wherein the polymeric ester has a viscosity in the range of from about 2000 cst to about 6000 cst measured at 40° C. using the ASTM method D-445 for measuring viscosity.
26. A personal cleansing composition according to claim 25 wherein the polymeric ester has a viscosity in the range of from about 3000 cst to about 5000 cst measured at 40° C. using the ASTM method D-445 for measuring viscosity.
27. A personal cleansing composition according to claim 16 that contains less than about 1% by weight of soap.
28. A personal cleansing composition according to claim 27 that contains less than about 0% by weight of soap.
29. A personal cleansing composition according to claim 17 comprising from about 0.1% to about 10% by weight of the polymeric ester.
30. A personal cleansing composition according to claim 29 comprising from about 1% to about 8% by weight of the polymeric ester.
31. A personal cleansing composition according to claim 18 wherein the polymeric ester has a number average particle diameter of from about 5 microns to about 200 microns.
32. A personal cleansing composition according to claim 31 wherein the polymeric ester has a number average particle diameter of from about 5 microns to about 50 microns.

UNITED STATES PATENT AND TRADEMARK OFFICE
CERTIFICATE OF CORRECTION

PATENT NO. : 6,627,586 B1
DATED : September 30, 2003
INVENTOR(S) : Deckner et al.

Page 1 of 2

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

Column 2,

Line 1, "dipentaeythritol" should read -- dipentaerythritol --.

Line 48, "tenns" should read -- terms --.

Column 3,

Line 14, "tripentaerytluitol" should read -- tripentaerythritol --.

Line 61, "Micron" should read -- micron --.

Column 4,

Line 21, "triethanolainine" should read -- triethanolamine --.

Line 25, "alkanolainide" should read -- alkanolamide --.

Line 35, "sulfuiric" should read -- sulfuric --.

Column 5,

Line 43, "Albrigit" should read -- Albright --.

Line 56, "anphoteric" should read -- amphoteric --.

Column 7,

Line 21, "bydroxyalkyl" should read -- hydroxyalkyl --.

Line 24, "branclhed" should read -- branched --.

Column 8,

Line 22, "laurylanidopropyldimethylcarboxymethyl" should read -- laurylamidopropyldimethylcarboxymethyl --.

Column 9,

Line 47, "anino" should read -- amino --.

Column 10,

Line 45, "Rewodenn LIS-80" should read -- Rewoderm LIS-80 --.

Column 12,

Line 40, "hydropliobically" should read -- hydrophobically --.

Column 13,

Line 50, "toprovide" should read -- to provide --.

Line 56, "bydroxyl" should read -- hydroxyl --.

INVENTOR(S) : Deckner et al.

Page 2 of 2

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

Column 14,

Line 41, "polyacrylainide" should read -- polyacrylamide --.

Line 50, "gunm" should read -- gum --.

Line 58, "cuinene" should read -- cumene --.

Column 15,

Line 9, "amronium" should read -- ammonium --.

Line 24, "dilsostearylidimerate" should read -- diisostearylidimerate --.

Lines 56-57, "monoethanolarnide" should read -- monoethanolamide --.

Column 16,

Line 65, "WO95/00 116" should read -- WO95/00116 --.

Column 18,

Line 55, "cons" should read -- consisting --.

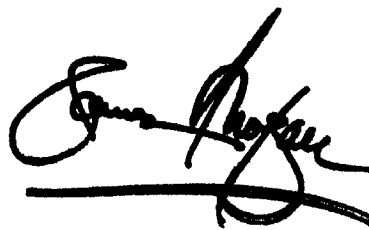

Column 19,

Line 38, "5%." should read -- 5%, by weight of soap. --.

Line 40, "20%." should read -- 20%, by weight of the polymeric ester. --.

Signed and Sealed this

Eighteenth Day of November, 2003

JAMES E. ROGAN
Director of the United States Patent and Trademark Office
