FUSED PYRIMIDINE COMPOUNDS, COMPOSITIONS AND MEDICINAL APPLICATIONS THEREOF

CROSS-REFERENCE

[0001] This application claims the benefit of Indian patent application number 201941039277 filed on September 27, 2019, which application is incorporated herein by reference.

BACKGROUND OF THE INVENTION

[0002] Lung cancer accounts for the greatest number of cancer deaths, and approximately 85% of lung cancer cases are non-small cell lung cancer (NSCLC). The development of targeted therapies for lung cancer has primarily focused on tumors displaying specific oncogenic drivers, namely mutations in epidermal growth factor receptor (EGFR) and anaplastic lymphoma kinase (ALK). Three generations of tyrosine kinase inhibitors (TKIs) have been developed for cancers with the most frequently observed EGFR mutations, however, other oncogenic drivers in the EGFR family of receptor tyrosine kinases have received less research and development focus and several oncogenic drivers, including insertions in the exon 20 gene of EGFR, have no currently approved therapeutics to treat their cancers.

[0003] The mutation, amplification and/or overexpression of human epidermal growth factor receptor 2 (HER2), another member of the human epidermal growth factor receptor family of receptor tyrosine kinases, has been implicated in the oncogenesis of several cancers, including lung, breast, ovarian, and gastric cancers. Although targeted therapies such as trastuzumab and lapatinib have shown clinical efficacy especially in breast tumors, their utility in lung cancer has been limited. It is likely that this variation is due to tissue-specific factors, including the low potency of kinase inhibitors like lapatinib for the mutagenic alterations in HER2 that are observed in the lung cancer patient population, including insertions in the exon 20 gene of HER2.

[0004] Given that many patients with mutations in EGFR and HER2 do not derive clinical benefit from currently available therapies against these targets, there remains a significant unmet need for the development of novel therapies for the treatment of cancers associated with EGFR and HER2 mutations.

Polymorphism generally can occur as a response to changes in temperature or pressure or both,

and can also result from variations in the crystallization process. Polymorphs can be distinguished by various physical characteristics, and typically the X-ray diffraction patterns, solubility behavior, and melting point of the compound are used to distinguish polymorphs.

[0080] Compounds described herein include isotopically-labeled compounds, which are identical to those recited in the various formulae and structures presented herein, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into the present compounds include isotopes of hydrogen, carbon, nitrogen, oxygen, sulfur, fluorine chlorine, iodine, phosphorus, such as, for example, ^{2}H, ^{3}H, ^{13}C, ^{14}C, ^{15}N, ^{18}O, ^{17}O, ^{35}S, ^{18}F, ^{36}Cl, ^{123}I, ^{124}I, ^{125}I, ^{131}I, ^{32}P and ^{33}P. [0164] Pharmaceutical compositions are administered in a manner appropriate to the disease to be treated (or prevented). An appropriate dose and a suitable duration and frequency of administration will be determined by such factors as the condition of the patient, the type and

severity of the patient's disease, the particular form of the active ingredient, and the method of administration. In general, an appropriate dose and treatment regimen provides the composition(s) in an amount sufficient to provide therapeutic and/or prophylactic benefit (e.g., an improved clinical outcome), or a lessening of symptom severity. Optimal doses are generally determined using experimental models and/or clinical trials. The optimal dose depends upon the body mass, weight, or blood volume of the patient.

[0165] Oral doses typically range from about 1.0 mg to about 1000 mg, one to four times, or more, per day.

EXAMPLES

Example 1: Synthetic procedures

[0166] Yields reported herein refer to purified products (unless specified) and are not optimised. Analytical TLC was performed on Merck silica gel 60 F_{254} aluminum-backed plates. Compounds were visualised by UV light and/or stained either with iodine, potassium permanganate or ninhydrin solution. Flash column chromatography was performed on silica gel (100-200 M) or flash chromatography. ^{1}H-NMR spectra were recorded on a Bruker Avance-400 MHz spectrometer with a BBO (Broad Band Observe) and BBFO (Broad Band Fluorine Observe) probe. Chemical shifts (δ) are expressed in parts per million (ppm) downfield by reference to tetramethylsilane (TMS) as the internal standard. Splitting patterns are designated as s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet) and bs (broad singlet). Coupling constants (*J*) are given in hertz (Hz). LC-MS analyses were performed on either an Acquity BEH C-18 column (2.10 × 100 mm, 1.70 μm) or on a Acquity HSS-T3 column (2.10 × 100 mm, 1.80 μm) using the Electrospray Ionisation (ESI) technique.
