Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

Description

This invention relates to materials which can be added to a dye-donor element in order to improve the dye transfer efficiency.

5 In recent years, thermal transfer systems have been developed to obtain prints from pictures which have been generated electronically from a color video camera. According to one way of obtaining such prints, an electronic picture is first subjected to color separation by color filters. The respective color-separated images are then converted into electrical signals. These signals are then operated on to produce cyan, magenta and yellow electrical signals. These signals are then transmitted to a thermal printer. To
10 obtain the print, a cyan, magenta or yellow dye-donor element is placed face-to-face with a dye-receiving element. The two are then inserted between a thermal printing head and a platen roller. A line-type thermal printing head is used to apply heat from the back of the dye-donor sheet. The thermal printing head has many heating elements and is heated up sequentially in response to the cyan, magenta and yellow signals. The process is then repeated for the other two colors. A color hard copy is thus obtained which
15 corresponds to the original picture viewed on a screen. Further details of this process and an apparatus for carrying it out are contained in U.S. Patent No. 4,621,271 by Brownstein entitled "Apparatus and Method For Controlling A Thermal Printer Apparatus," issued November 4, 1986.

It is always desirable to transfer as much dye as possible with the lowest thermal energy in dye transfer systems using a thermal head. The amount of dye which can be transferred from a dye-donor to a receiving
20 element by thermal dye transfer depends upon the dye transfer efficiency. There are compounds which have been added to the dye-donor in order to increase the dye transfer efficiency which would enable a given amount of dye to be transferred with less energy. However, these compounds have suffered from one or more shortcomings. For example, some compounds which have been tried cause crystallization of the dye. Other compounds have a beneficial effect on dye transfer initially, but lose that effect upon storage of
25 the dye-donor.

In JP 62/132,676, there is a disclosure of compounds described as "diffusion promoters". These compounds are coated in a blank frame or blank patch of a dye-donor element by themselves, separate from the dye patches.

There are problems with having such a diffusion-promoting material coated in a blank patch separate
30 from the dye patch. Such a procedure would necessitate a separate heating step during processing in order to apply the material to the receiver. There would also be additional manufacturing costs involved in coating the material separately from the dye, as well as additional costs in the thermal transfer of such material.

It is an object of this invention to provide a way to employ a material to increase dye transfer efficiency without having to coat it separately from the dye layer. It is another object of the invention to provide such a
35 material which would not promote crystallization of the dye in the dye-donor and which would retain its beneficial effects upon storage.

These and other objects are achieved in accordance with this invention which comprises a dye-donor element for thermal dye transfer comprising a support having on one side thereof a dye dispersed in a polymeric binder, characterized in that the dye-donor element contains a colorless, nonpolymeric material
40 for increasing dye transfer efficiency having the following formula:

wherein D is -CO-, -SO₂NR-, -CONR-, -CO-CHR-CO-,

wherein R is H or a substituted or unsubstituted alkyl group having from 1 to 10 carbon atoms, such as methyl, ethyl, propyl, isopropyl, butyl, pentyl, hexyl, methoxyethyl, benzyl, 2-cyanoethyl, methoxycarbonyl-

methyl, etc.

These compounds provide an increase in dye transfer efficiency by providing equivalent density with less energy than a dye-donor which does not contain the compounds.

The materials described above may be incorporated directly into the dye layer of the dye-donor or in an adjacent layer where it will be in effective contact with the dye. The material may be employed in any amount which is effective for the intended use. In general, good results have been obtained at a concentration of from 0.05 to 0.3 g/m² or 30% to 300% by weight of coated dye.

In a preferred embodiment of the invention, D in the above formula is -CO-CHR-CO-, wherein R is hydrogen. In another preferred embodiment, D is -SO₂NR-, wherein R is -C₂H₅. In still another preferred embodiment, D is -CONR-, wherein R is methyl or ethyl.

Any dye can be used in the dye layer of the dye-donor element of the invention provided it is transferable to the dye-receiving layer by the action of heat. Especially good results have been obtained with sublimable dyes such as

or any of the dyes disclosed in U.S. Patent 4,541,830. The above dyes may be employed singly or in combination to obtain a monochrome. The dyes may be used at a coverage of from 0.05 to 1 g/m² and are preferably hydrophobic.

The dye in the dye-donor element is dispersed in a polymeric binder such as a cellulose derivative, e.g., cellulose acetate hydrogen phthalate, cellulose acetate, cellulose acetate propionate, cellulose acetate butyrate, cellulose triacetate; a polycarbonate; poly(styrene-co-acrylonitrile), a poly(sulfone) or a poly(phenylene oxide). In a preferred embodiment of the invention, the binder is cellulose acetate propionate or cellulose acetate butyrate. The binder may be used at a coverage of from 0.1 to 5 g/m².

The dye layer of the dye-donor element may be coated on the support or printed thereon by a printing technique such as a gravure process.

Any material can be used as the support for the dye-donor element of the invention provided it is dimensionally stable and can withstand the heat of the thermal printing heads. Such materials include polyesters such as poly(ethylene terephthalate); polyamides; polycarbonates; glassine paper; condenser paper; cellulose esters; fluorine polymers; polyethers; polyacetals; polyolefins; and polyimides. The support generally has a thickness of from 2 to 30 μm. It may also be coated with a subbing layer, if desired.

The reverse side of the dye-donor element may be coated with a slipping layer to prevent the printing head from sticking to the dye-donor element. Such a slipping layer would comprise a lubricating material

such as a surface active agent, a liquid lubricant, a solid lubricant or mixtures thereof, with or without a polymeric binder.

The dye-receiving element that is used with the dye-donor element of the invention usually comprises a support having thereon a dye image-receiving layer. The support may be a transparent film such as poly-
5 (ethylene terephthalate) or reflective such as baryta-coated paper, polyethylene-coated paper, white polyester (polyester with white pigment incorporated therein), etc.

The dye image-receiving layer may comprise, for example, a polycarbonate, a polyurethane, a polyester, polyvinyl chloride, poly(styrene-co-acrylonitrile), poly(caprolactone) or mixtures thereof. The dye image-receiving layer may be present in any amount which is effective for the intended purpose. In general,
10 good results have been obtained at a concentration of from 1 to 5 g/m².

As noted above, the dye-donor elements of the invention are used to form a dye transfer image. Such a process comprises imagewise-heating a dye-donor element as described above and transferring a dye image to a dye-receiving element to form the dye transfer image.

The dye-donor element of the invention may be used in sheet form or in a continuous roll or ribbon. If a
15 continuous roll or ribbon is employed, it may have only one dye or may have alternating areas of other different dyes, such as sublimable cyan and/or magenta and/or yellow and/or black or other dyes. Such dyes are disclosed in U. S. Patents 4,541,830; 4,698,651; 4,695,287; and 4,701,439. Thus, one-, two-, three- or four-color elements (or higher numbers also) are included within the scope of the invention.

In a preferred embodiment of the invention, the dye-donor element comprises a poly(ethylene terephthalate) support coated with sequential repeating areas of cyan, magenta and yellow dye, and the
20 above process steps are sequentially performed for each color to obtain a three-color dye transfer image. Of course, when the process is only performed for a single color, then a monochrome dye transfer image is obtained.

A thermal dye transfer assemblage using the invention comprises

- 25 a) a dye-donor element as described above, and
b) a dye-receiving element as described above,

the dye-receiving element being in a superposed relationship with the dye-donor element so that the dye layer of the donor element is in contact with the dye image-receiving layer of the receiving element.

The above assemblage comprising these two elements may be preassembled as an integral unit when
30 a monochrome image is to be obtained. This may be done by temporarily adhering the two elements together at their margins. After transfer, the dye-receiving element is then peeled apart to reveal the dye transfer image.

When a three-color image is to be obtained, the above assemblage is formed on three occasions during
35 the time when heat is applied by the thermal printing head. After the first dye is transferred, the elements are peeled apart. A second dye-donor element (or another area of the donor element with a different dye area) is then brought in register with the dye-receiving element and the process repeated. The third color is obtained in the same manner.

The following example is provided to illustrate the invention.

40 Example

A magenta dye-donor element was prepared by coating on a 6 μm poly(ethylene terephthalate) support:

- 45 1) a subbing layer of a titanium alkoxide (duPont Tyzor TBT®) (0.12 g/m²) coated from a n-propyl acetate and n-butyl alcohol solvent mixture, and
2) a dye layer containing the magenta dye illustrated above (0.17 g/m²) in a cellulose acetate propionate binder (2.5% acetyl, 45% propionyl) (0.31 g/m²) coated from a toluene, methanol and cyclopentanone solvent mixture, and the aromatic compound indicated in the Table (0.17 g/m²).

On the back side of the dye-donor was coated:

- 50 1) a subbing layer of a titanium alkoxide (duPont Tyzor TBT®) (0.12 g/m²) coated from a n-propyl acetate and n-butyl alcohol solvent mixture, and
2) a slipping layer containing the following material for Sets A and D:
Emralon 329® (Acheson Colloids Corp.) dry film lubricant of poly(tetrafluoroethylene) particles in a cellulose nitrate resin binder (0.54 g/m²), coated from a n-propyl acetate, toluene, isopropyl alcohol and
55 n-butyl alcohol solvent mixture;

For Set B, the same as Set A, but also containing Petrarch Systems PS513® amino-terminated polysiloxane (0.004 g/m²); p-toluenesulfonic acid (2.5% of the wt. of the polysiloxane); and BYK-320® (BYK Chemie, USA) copolymer of a polyalkylene oxide and a methyl alkylsiloxane (0.008 g/m²);

For Set C, the same as Set A, but also containing S-232® wax (Shamrock Technologies) (micronized blend of polyethylene and carnauba wax particles (0.016 g/m²).

The dye-donors were then incubated for 7 days at 49 ° C, 50% RH.

5 A dye-receiver was prepared by obtaining a commercially produced paper stock 165 μm thick mixture of hard woodkraft and soft wood-sulfite bleached pulp. The paper stock was then extrusion overcoated with an approximately 1:4 ratio of medium density:high density polyethylene (12 g/m²) with approximately 6 wt. percent titanium dioxide and 1.5 wt. percent zinc oxide. The support was then coated with the following layers:

10 (a) Subbing layer of poly(acrylonitrile)-co-vinylidene chloride-co-acrylic acid (14:79:7 wt. ratio) (0.54 g/m²) coated from a butanone and cyclopentanone solvent mixture; and

(b) Dye-receiving layer of Makrolon 5705® polycarbonate (Bayer AG) (2.9 g/m²), 1,4-didecoxy-2,5-dimethoxybenzene (0.38 g/m²), and FC-431® (3M Corp.) surfactant (0.016 g/m²) coated from methylene chloride.

15 The dye side of the dye-donor element strip approximately 10 cm x 13 cm in area was placed in contact with the dye image-receiving layer of the dye-receiver element of the same area. The assemblage was clamped to a stepper-motor driven 60 mm diameter rubber roller and a TDK Thermal Head (No. L-231) (thermostatted at 26 ° C) was pressed with a force of 8.0 pounds (3.6 kg) against the dye-donor element side of the assemblage pushing it against the rubber roller.

20 The imaging electronics were activated causing the donor/receiver assemblage to be drawn between the printing head and roller at 6.9 mm/sec. Coincidentally, the resistive elements in the thermal print head were pulsed for 29 μsec/pulse at 128 μsec intervals during the 33 msec/dot printing time. Graduated density test images were generated using a "pulsed-imaging" technique as described in U.S. Patent 4,621,271 of Brownstein referred to above. Pulses/dot were incrementally increased from 0 to 255. The voltage supplied to the print head was approximately 23.5 volts, resulting in an instantaneous peak power of 1.3 watts/dot and a maximum total energy of 9.6 mjoules/dot.

25 The dye-receiver was separated from the dye-donor and the Status A green densities of each transferred image consisting of a series of eleven graduated density steps one cm square were read, and the maximum density, D-max, was tabulated. The energy (number of pulses) required to produce a density of 2.0 was also calculated. In this manner, the relative efficiency of thermal dye transfer (pulses for 2.0 density) can be effectively compared.

30 In general, materials suitable for the practice of the invention had to produce a 2.0 density after donor incubation with at least 5% less energy (approximately 12-15 pulses less) and not show a maximum density loss greater than 0.5 as compared to a control with no material added. The following results were obtained.

D	-CON(C ₂ H ₅)-	2-CON(C ₂ H ₅)(C ₆ H ₅)	H	206	-13	3.2	+0.2

The above results indicate that materials used in accordance with the invention produced at least a 2.0 density after donor incubation, with at least 5% less energy (approximately 12-15 pulses less), without showing a maximum density loss greater than 0.5 as compared to a control with no material added.

Claims

1. A dye-donor element for thermal dye transfer comprising a support having on one side thereof a dye dispersed in a polymeric binder, characterized in that said dye-donor element contains a colorless, nonpolymeric material for increasing dye transfer efficiency having the following formula:

5

10

wherein D is -CO-, -SO₂NR-, -CONR-, -CO-CHR-CO-,

15

20

wherein R is H or a substituted or unsubstituted alkyl group having from 1 to 6 carbon atoms.

2. The element of Claim 1 characterized in that said polymeric binder comprises cellulose acetate propionate or cellulose acetate butyrate.
3. The element of Claim 1 characterized in that D is -CO-CHR-CO-, wherein R is hydrogen.
4. The element of Claim 1 characterized in that D is -SO₂NR-, wherein R is -C₂H₅.
5. The element of Claim 1 characterized in that D is -CONR-.
6. The element of Claim 5 characterized in that R is methyl or ethyl.
7. The element of Claim 1 characterized in that said support comprises poly(ethylene terephthalate) and the dye layer comprises sequential repeating areas of cyan, magenta and yellow dye.

35

Patentansprüche

1. Farbstoff-Donorelement für die thermische Farbstoffübertragung mit einem Träger, der auf einer seiner Seiten einen in einem polymeren Bindemittel dispergierten Farbstoff aufweist, dadurch gekennzeichnet, dass das Farbstoff-Donorelement ein farbloses, nicht-polymeres Material für die Erhöhung der Farbstoff-Übertragungswirksamkeit der folgenden Formel enthält :

45

50

in der D für -CO-, -SO₂NR-, -CONR-, -CO-CHR-CO-,

55

worin R gleich H ist oder eine substituierte oder unsubstituierte Alkylgruppe mit 1 bis 6 Kohlenstoffato-

men.

2. Element nach Anspruch 1, dadurch gekennzeichnet, dass das polymere Bindemittel Celluloseacetatpropionat oder Celluloseacetatbutyrat umfasst.

5

3. Element nach Anspruch 1, dadurch gekennzeichnet, dass D für -CO-CHR-CO- steht, worin R gleich Wasserstoff ist.

4. Element nach Anspruch 1, dadurch gekennzeichnet, dass D für -SO₂NR- steht, worin R gleich -C₂H₅ ist.

10

5. Element nach Anspruch 1, dadurch gekennzeichnet, dass D für -CONR- steht.

6. Element nach Anspruch 5, dadurch gekennzeichnet, dass R für Methyl oder Ethyl steht.

15

7. Element nach Anspruch 1, dadurch gekennzeichnet, dass der Träger ein Poly(ethylenterephthalat)träger ist und dass die Farbstoffschicht aufeinanderfolgende, sich wiederholende Bereiche aus blaugrünem, purpurrotem und gelbem Farbstoff aufweist.

Revendications

20

1. Élément donneur de colorant pour transfert de colorant par la chaleur comprenant un support recouvert sur l'un de ses côtés par un colorant dispersé dans un liant polymère, caractérisé en ce que l'élément donneur de colorant contient une substance incolore, non-polymère, pour améliorer l'efficacité du transfert de colorant ayant la formule suivante

25

30

où D est -CO-, -SO₂NR-, -CONR-, -CO-CHR-CO-,

35

40

où R est H ou un groupe alkyle substitué ou non ayant de 1 à 6 atomes de carbone.

2. Élément selon la revendication 1 caractérisé en ce que le liant polymère est l'acétopropionate de cellulose ou l'acétobutyrate de cellulose.

45

3. Élément selon la revendication 1 caractérisé en ce que D est -CO-CHR-CO, où R est l'hydrogène.

4. Élément selon la revendication 1 caractérisé en ce que D est -SO₂NR-, où R est -C₂H₅.

50

5. Élément selon la revendication 1 caractérisé en ce que D est -CONR-.

6. Élément selon la revendication 5 caractérisé en ce que R est méthyle ou éthyle.

55

7. Élément selon la revendication 1 caractérisé en ce que le support est du polytéréphtalate d'éthylène et la couche de colorant comprend des séquences répétitives de zones cyan, magenta et jaune.
