# MOBILE FIRST

---

FOREWORD BY Jeffrey Zeldman

“More often than not, the mobile experience for a Web application or site is designed and built after the PC version is complete. Here's three reasons why Web applications should be designed for **mobile first** instead.”

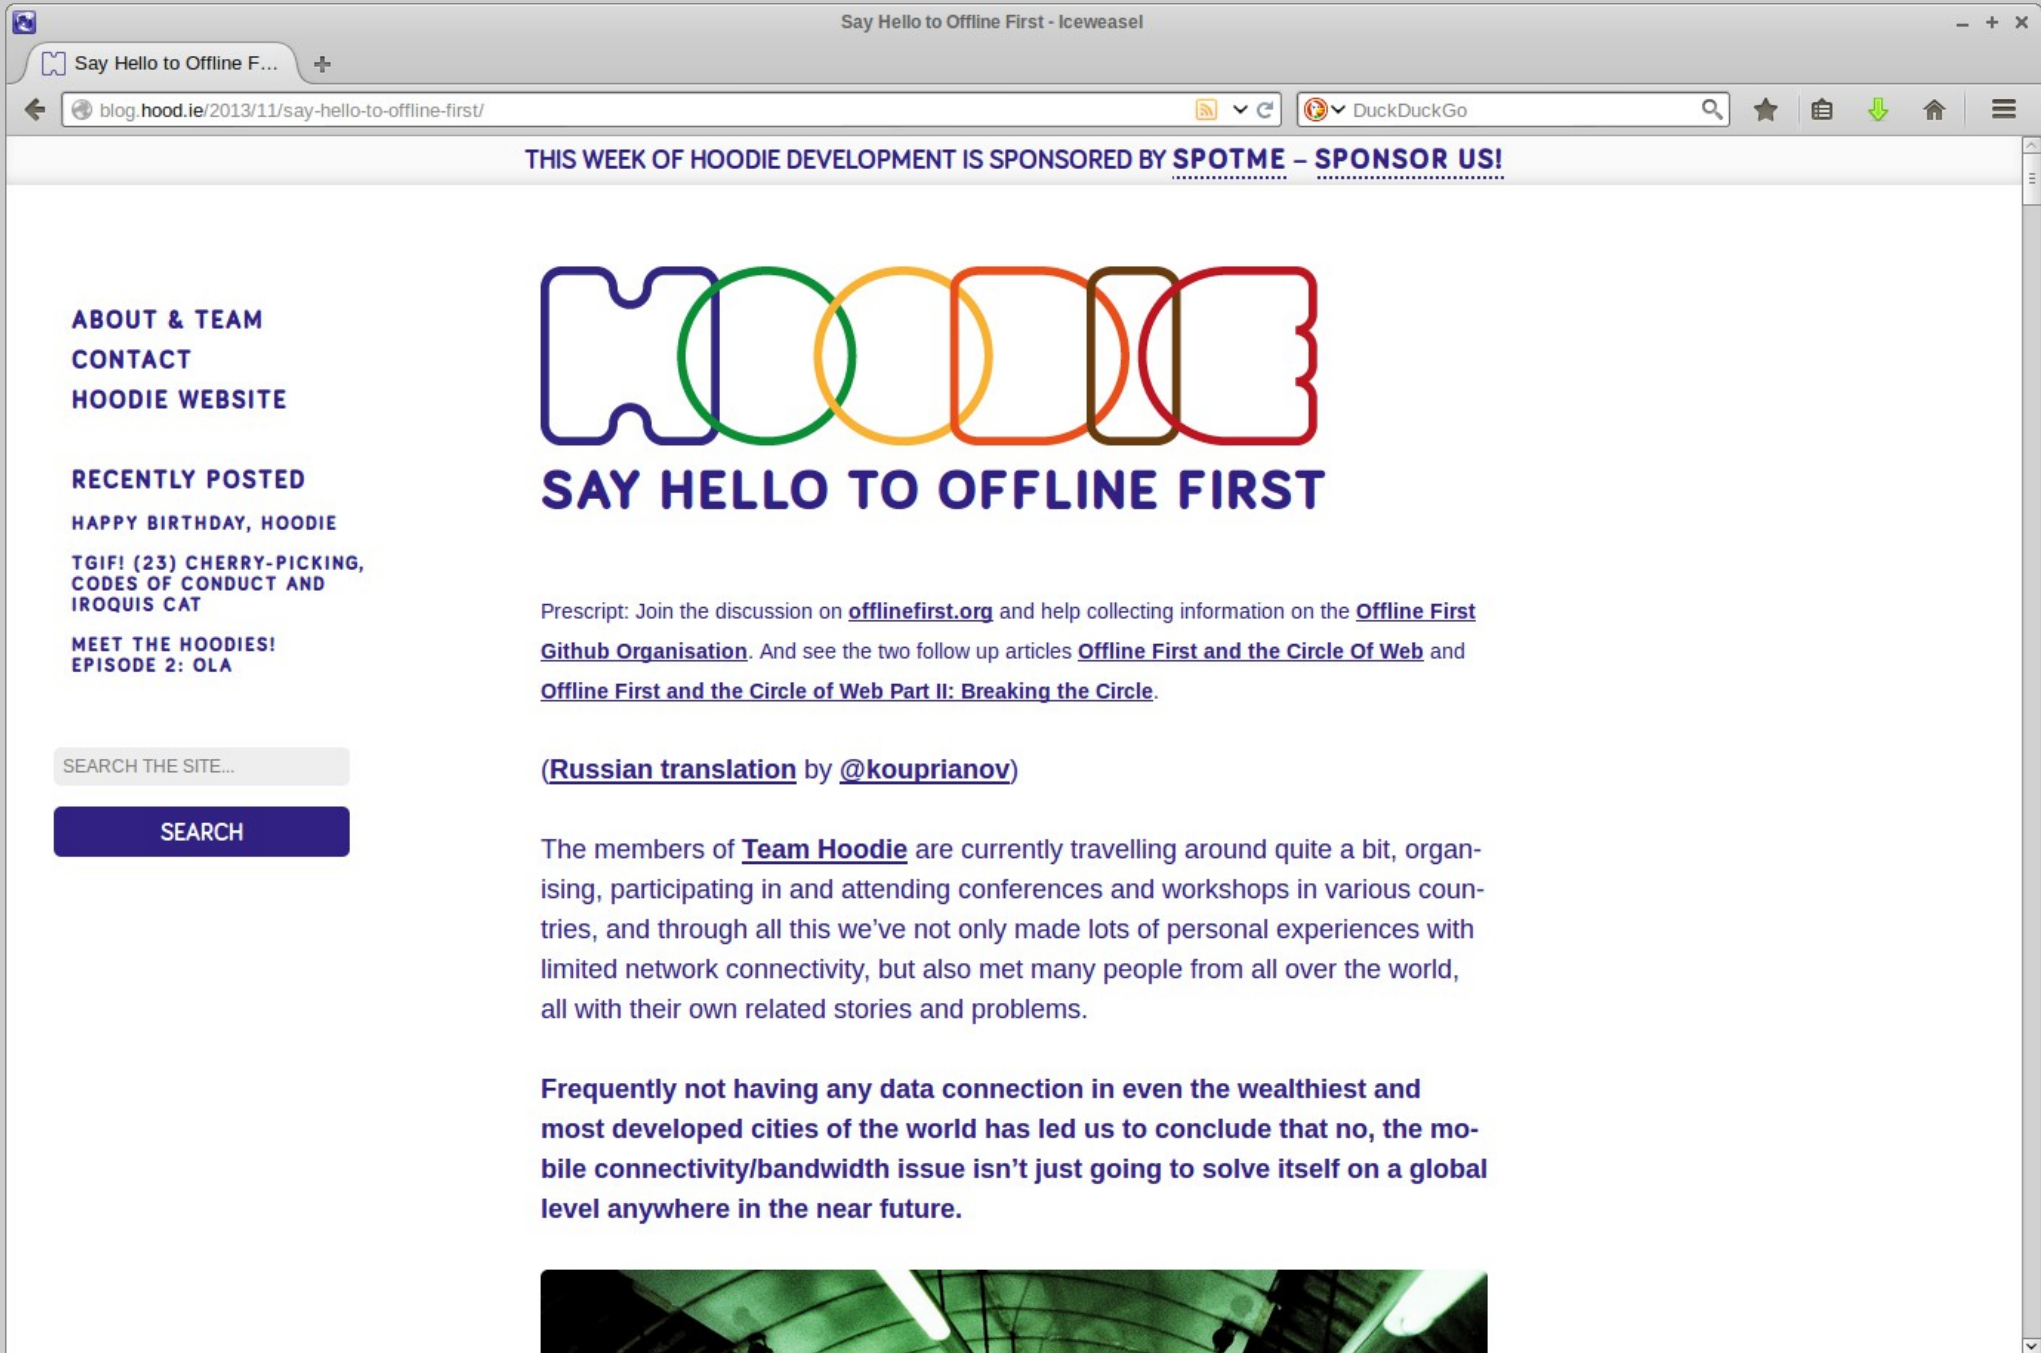

- Luke Wroblewski (2009)

# **1. Mobile is exploding**

1. Mobile is exploding
- 2. Mobile forces you to focus**

# localForage: Offline Storage, Improved

on February 12, 2014 by [tofumatt](#), [Robert Nyman \[Editor\]](#) and [Angelina Fabbro](#)  
in [Featured Article](#) [IndexedDB](#) [localStorage](#) [Offline](#)

33 comments Share This

Web apps have had offline capabilities like saving large data sets and binary files for some time. You can even do things like [cache MP3 files](#). Browser technology can store data offline and plenty of it. The problem, though, is that the technology choices for how you do this are fragmented.

`localStorage` gets you really basic data storage, but it's slow and can't handle binary blobs. `IndexedDB` and `WebSQL` are asynchronous, fast, and support large data sets, but their APIs aren't very straightforward. Even still, neither `IndexedDB` nor `WebSQL` have support from all of the major browser vendors and that doesn't seem like something that will change in the near future.

If you need to write a web app with offline support and don't know where to start, then this is the article for you. If you've ever tried to start working with offline support but it made your head spin, this article is for you too. Mozilla has made a library called `localForage` that makes storing data offline in *any*

## ABOUT THE AUTHORS

**tofumatt**  
Matt is a front-end developer from the Mozilla Apps team. He lives in Montreal, where he writes web apps and libraries for developers. Check out his [code on GitHub](#) or chat with him about motorcycles on [Twitter](#).

# The Database that Syncs!

PouchDB is an Open Source JavaScript Database inspired by [Apache CouchDB](#) that is designed to run well within the browser.

PouchDB was created to help web developers build applications that work equally as well offline as they do online. It enables applications to store data locally while offline, and synchronise it with CouchDB and compatible servers when the application is back online, keeping the user's data in sync no matter where they next login.

```
1 var db = new PouchDB('dbname');
2
3 db.put({
4   _id: 'dave@gmail.com',
5   name: 'David',
6   age: 66
7 });
8
9 db.changes({
10  onChange: function() {
11    console.log('Ch-Ch-Changes');
12  }
13 });
14
15 db.replicate.to('http://example.com/mydb');
```

## Cross Browser

Works in Firefox, Chrome, Opera, Safari, IE and Node.js

## Lightweight

PouchDB is just a script tag and 65KB away in the browser, or  
`$ npm install pouchdb`  
away in node.

# Helvetimail

a minimalist Gmail skin

**Update:** Maintaining Helvetimail is not easy, because Google's CSS is a mess and keeps changing. It demands more time than I am able to regularly devote. I've never meant to make Helvetimail a paid upgrade. But now I would like to kindly ask you for even a tiny donation, so that I can spend a few more hours/days on Helvetimail, fix what's still unfixed, maybe prepare an **iPad version**, etc. Please note this is not to make me rich, but just to cover at least a part of the time cost needed to maintain Helvetimail. The economic downturn makes me do more work for less money, so spare time for hobbies like Helvetimail is scarce. Thank you very much!

[Donate](#)

The screenshot shows a web browser window with the title "Gmail - Inbox (86) - richter.josef@gmail.com - (Build 20090801173925)". The browser's address bar and navigation menu are visible at the top. The main content area displays the Helvetimail interface, which includes a search bar, a list of navigation links (Compose Mail, Inbox (86), Starred, Sent Mail, Drafts (3), confirmation, Ireland, 4 more, Contacts, Tasks), and a list of email messages. The messages are displayed in a table-like format with columns for sender, subject, and time. The interface is clean and minimalist, with a focus on readability and ease of use.
