LIST OF TABLES

Table 1 Total Enumerated Population 1970, 1980, 1991 and 2000 Censuses by Sex and Urban/Rural Divisions.

Table 2 Total Enumerated Population and Percent Change 1980, 1991 and 2000 Censuses by Major Divisions.

Group A Population Size, Structure and Distribution

A1 Total Population by Age Group and Sex for Major Divisions.

Group B Selected Characteristics of the Population

B1 Total Population by Ethnicity and Sex for Major Divisions.

B2 Total Population by Religion and Sex for Major Divisions.

B3 Total Population by Fluency in English and Spanish Languages for Major Divisions.

B4 Total Persons with Disability by Sex and Type of Disability for Major Divisions.

B5 Total Population by Sex and Birthplace for Major Division.

Group C International Migration

C1 Total Foreign-born Population by Sex and Country of Birth for Major Divisions

C2 Total Foreign-born Population by Sex and Year of Migration for Major Divisions.

C3 Total Foreign-born Population by Age and Sex for Major Divisions.

C4 Total Emigrants by Age and Sex for Major Divisions.

- C5 Total Emigrants by Sex and Year of Departure for Major Divisions.
- C6 Total Emigrants by Sex and Year of Departure of Major Divisions.
- C7 Total Emigrants by Sex and Education at Time of Departure for Major Divisions.

Group D

Education

- D1 Total Population by Sex and Level of Education Reached for Major Divisions.
- D2 Total Population by Sex, Level of Education Reached for Major Divisions.
- D3 Total Population by Level of Education Reached, Age Group and Sex for Country.
- D4 Local and Foreign-born Population by Level of Education Reached for Country.

Group E

Union Status and Fertility

- E1 Population 14 Years and over by Sex and Union Status for Major Division.
- E2 Population 14 Years and Over by Union Status, Major Ethnic Group and Sex.
- E3 Population 14 Years and Over by Union Status, Religion and Sex.
- E5 Women 14-64 Years by Age Group and Number of Children Ever born.
- E6 Women 14-64 Years by Age Group, Major Ethnic Group and Number of Children Ever born.
- E7 Women 14-64 Years by Age Group, Level and Education Reached and Number of Children Ever born.

Group F	Economic Activity
F1	Population 14 Years and Over by Economic Activity and Sex for Major Divisions.
F2	Population 14 Years and Over by Economic Activity and Age Group for Country and Urban/Rural Divisions.
F3	Employed Population by Industry and Sex for Major Divisions.
F4	Employed Population by Occupation and Sex for Major Divisions.
Group G	Income
G1	Persons Employed Past Week and By and Annual Income for Major Divisions.
G2	Persons Employed Past Week by Annual Income and Highest Level of Education Reached for Major Divisions.
Group H	Housing and Household
H1	Private Household by Age Group and Sex of Head for Urban/Rural Divisions.
H2	Private Households by Household Characteristics for Country.

INTRODUCTION

The fieldwork for the National Population and Housing Census 2000 was carried out during the months of May to August 2000. May 12, 2000 was designated "Census Day", hence all the data collected in the Census relate to the situation as at May 12, 2000. In the previous two censuses of 1991 and 1980, May 12 was also designated as Census Day. Hence, the enumerated population for all three censuses is very comparable.

In any population census, it is often impossible to enumerate everyone, even though most countries make valiant attempts to do so. In many countries, the laws are very strict and are enforced, in order to get 100% cooperation, but in some countries like Belize, even though there are laws, which oblige all members of the population to fully cooperate with the census takers, a small percentage of the population is often not enumerated for various reasons, including outright refusal on the part of the respondent. It is therefore often necessary to conduct post enumeration checks to obtain an indication of the extent of under-coverage. In 1991, a full-fledged post-enumeration survey (PES) was conducted, but because of the high cost of this exercise vis-à-vis the resultant benefits, a PES was not done for census 2000. Nevertheless, the post census checks, referred to earlier, revealed that under-enumeration or under-coverage in the census 2000 was approximately **3.5%¹**. Most of this undercount occurred in Belize City. Following the conventions adopted for the 1991 Population Census therefore, the total enumerated population in 2000 was adjusted by this factor for under-coverage. This adjustment yielded a total of **248,916**. The table below shows comparative results for the two censuses.

CENSUS YEARS 1991 AND 2000

Year	Enumerated	Adjusted	Mid-Year	Growth p.a.
1991	189,392	192,877	194,300	2.6%
2000	240,204	248,916	249,800	2.7%

¹ Very soon, with the assistance of CELADE of the UNECLAC in Santiago, Chile, a more in-depth qualitative and quantitative evaluation of the census will be carried out. Final adjusted figures will then be reported.

The present compendium of Statistical tables represents some of the major results from the Census. Numerous members of the public have recently been requesting various statistics from this exercise, since prior to the fieldwork during our publicity campaign, they were promised results within a year after the data collection exercise. In censuses prior to that of 1991, results were never available until between two to five years after the field enumeration was completed. This delay was often due mainly to the lack of data processing capability within the department. Often, the data processing had to be done outside of Belize at high cost and over prolonged periods. However, the **CENTRAL STATISTICAL OFFICE's (CSO)** data processing capability has been significantly improved over the past few years as a result of prudent and timely investment in the development of our human resources at this department. The present document is only one example of the fruits of these efforts. It should also be noted that the entire census exercise for Census 2000 as was the case with the census of 1991, was planned and conducted with minimal outside assistance. The National Population and Housing Census 2000 of Belize was conducted, this time, even before the Regional Census Coordinator, supported by CARICOM, established its office. This achievement surely manifests the tremendous progress, which has been made in capacity building at the CSO.

Some descriptive commentaries on the tables are made in this document. These commentaries are very cursory however, and highlight only some of the major findings. As was the case with the 1991 Census, it is the intention of the CSO to release census bulletins shortly afterwards, focusing on specific issues as addressed by the Census Questionnaire. In these bulletins, more detailed and in depth commentaries and analyses will be offered. It should also be noted, that further to these publications, it is the intention of the CSO to do even more in depth demographic and socio-economic analyses, and present these in special papers.

SECTION I

POPULATION SIZE & GENERAL CHARACTERISTICS

Size and Growth

Tables 1 to 4 are based on what is usually termed the ENUMERATED POPULATION. The Enumerated Population includes both the non-institutional and institutional (i.e. persons in prisons, hospitals, old folks' home etc.) populations, together with the members of the population who could not be contacted for various reasons e.g. these persons may not have been at home during the fieldwork after several call backs were made; or they may have been unable to answer the questions in the census due to illness, old age, or serious language problems (e.g. some Chinese); or, they may have refused outrightly. In such cases, census interviewers were instructed to at least do a headcount where possible. The other tables from section A onwards are based on the TABULABLE POPULATION i.e. the population for which most or all answers were obtained.

Table 1 shows the population count in 2000 compared with that in the censuses of 1991, 1980 and 1970. This is further broken down by URBAN/RURAL and by DISTRICTS. Some of the main features here are as follows. In absolute terms, the inter-censal population change between 1970 and 1980 was 25,708. Between 1980 and 1991 however, this change was 44,139, which is almost double the previous inter-censal change. Between the most recent censuses of 2000 and 1991, this absolute change is 50,712. Without going into details, it can be stated with much certainty that a major cause of this larger increase during the latter periods is due to Migration - particularly Immigration. These numbers are indicating that immigration has been even more pronounced in the last nine (9) years than in the eleven (11) years between 1980 and 1991. This conclusion can be substantiated by the fact that many other sources of data, such as the recently completed report on the Family Health Survey of females, indicate that overall fertility, which could be the only other demographic variable affecting positive population change, has been declining between 1980 and 1991, and even more so, between 1991 and 2000. If this trend continues, our population will take only twenty-six (26) years more for it to

DOUBLE. This is certainly a short doubling time compared with many other countries in the Latin American and Caribbean region.

In terms of the Urban/Rural dichotomy, another interesting result has surfaced from this table. For both censuses of 1970 and 1980, Belize's urban population was larger than the rural population. This situation was reversed in 1991, however. The respective ratios for these three (3) censuses were 54% to 46%, 51% to 49%, and 48% to 52%. In the census of 2000, the situation existing in 1991 is replicated with 48% of the population being urban and 52% rural. This pattern is different from the scenario in most developing countries today where urbanization has become a phenomenal problem. The pattern may also be indicative of the need to shift resources to the rural areas for genuine Economic Development.

If Table 1 is analyzed district wise, it becomes clear that the Cayo district continues to be the fastest growing district, over the past four (4) censuses, with growth in absolute terms of 6,814 between 1970-1980, 14,856 between 1980-1991 and 14,871 between 1991 and 2000. In percentage terms, this growth was 26.5%, 33.7% and 29.3% for the respective periods. Obviously, this district had an acceleration of growth during the latter periods. This finding is true for all districts, reflecting the point made earlier that overall growth has been faster during 1980-1991 and 1991-2000, than in previous decades. A surprising feature in line with the same trend occurs with respect to the Belize and Stann Creek districts. Growth between 1970-1980 was 1,186 and 1,169 respectively for the Belize and Stann Creek districts, but increased to 6,329 and 3,904 respectively during 1980-1991, and to 11,067 and 6,463 during the last inter-censal period. Traditionally, these two districts have been the highest 'emigrant' districts. However, these figures are showing that either the trend of high emigration in these districts is reversing and/or that these districts have experienced unprecedented high levels of immigration during this period, which have offset emigration. It should also be noted here that the observation made earlier about the 'rural drift' is true at the overall country level, but the growth figures for the Belize district which has the largest urban centre, may be indicative of the potential for urbanization and its attendant problems in Belize City. Indeed, Table 2, which displays growth rates

between 1980-1991, does show that of the increase of 6,329 in the Belize district during this period, 4,296 or almost 70% of it occurred in Belize City. For the period 1991-2000, growth in Belize City accounted for 45% of this overall increase. On the other hand, Dangriga, the capital of the Stann Creek district experienced negative population growth (-3.39%) during the period 1980-1991. During the last inter-censal period, however, the population of Dangriga grew by 36.7% as Table 2 shows. Hence, even though in 1980-1991 the population of the Stann Creek district increased solely because of the growth in the rural areas, between the last decade, the urban area, Dangriga, was also growing positively.

Table 3 compares the non-institutional and institutional populations at census day, May 12, 1991 and 2000. The respective ratio is approximately 179:1 or 188,341 persons living in conventional households as compared with 1,051 living in institutions.

As is usual, there are many more males living in institutions than there are females. Even though these figures are not shown here, but will be in one of the bulletins, it is interesting to note that in 1991, of the 1,051 in institutions, 735 are males and 316 females, or a sex ratio of 2.33 i.e. 233 males for every 100 females. Census 2000 reveals that the corresponding sex ratios were very similar.

Table A1 presents data by Age, Sex and by District for the entire population. A notable feature here is the continuing 'youngness' of our population, with about 44% below the age of 15 years in 1991, and 41% in 2000. In 1980, the corresponding figure was 46% below this age. Associated problems of a young population are many, since dependency ratios are very high under these circumstances. This means, among other things, that considerable investment has to be made in the social sectors, such as Health and Education, and the returns from this investment can be prolonged. In the urban areas, in 2000, the population below age fifteen (15) years is 37.3%, which is smaller than it is in the rural parts (44%) of the country. In the year 2000, in all the districts except the Belize District, this proportion is above 40% of the district's population, reflecting the fact that at the district level, the population remains young. In the Toledo District, it is as high as 48% of this District's population. In the Belize District, however, 36.5% of its population is below age fifteen (15) years.

Ethnicity

Table B1 shows the ethnic makeup of Belize's population at the country and district levels, with respect to Census 2000. The data as presented here, are for the entire country, and by urban/rural and district levels. The largest ethnic group in the country is the Mestizo (48.7%) followed by the Creole (24.9%). In 1991, Mestizos accounted for 43.6% of the population, whereas Creoles accounted for 29.8%. The relevant figures for Mestizo and Creole as obtained from the 1980 census of population and housing were 33.4% and 40.0%, respectively. The 1991 results thus showed an 'Ethnic Shift' in the composition of Belize's population with the Mestizos representing the largest percentage share. From the Census 2000 results, it is clear that the percentage share accounted for by the Mestizos, has increased by over five percentage points over 1991.

As mentioned above, Table B1 also shows percentage distribution by the various ethnic groups, at the urban and rural levels, as well as at the district level. It is interesting to note that in 1991, Creoles (44%) were the dominant ethnic group in the urban areas, and Mestizos (50.2%) in the rural parts. In the year 2000, however, both urban (43%) and rural (53.4%) areas are predominantly Mestizo. At the district level, in 2000, Mestizos were the largest ethnic group in the districts of Corozal (76%), Orange Walk (77%), Cayo (63.7%) and, were only slightly less (30.2% vs. 31%) than the Garifuna group in Stann Creek. In the Belize District, Creoles (59%) are the largest group, and in Toledo, the Mayas (65.4%) outnumber all other ethnic groups. In 1991, the Mestizos also dominated the Corozal (74.1%), Orange Walk (71.7%) and Cayo (58%) Districts, but the Garifuna ethnic group was the largest (36.2%) in the Stann Creek District. Just as in the year 2000, in 1991, Creoles (67.9%) outnumbered all other ethnic groups in the Belize District, and the Mayas (62.6%) also dominated the Toledo District.

Religion

Similar data to that for Ethnicity are presented in Table B2 for Religion. In the year 2000, the Roman Catholic denomination continued to attract the largest number of followers in the country with a share of 49.6%, of the total population. The corresponding figure for 1991 was 57.7%, indicating a

decline in percentage share, but as is obvious from the table, the number of Roman Catholic followers increased in absolute terms during the period, from 106,596 in 1991 to 115,035 in 2000. Another interesting observation here is that even though the Anglican denomination was the second largest in 1991 with a share of 6.9% of the total population, this figure declined to 5.3% in 2000, and the corresponding numbers in absolute terms also declined from 12,836 to 12,386. It is further interesting to note that the percentage share of the Pentecostal followers increased from 6.3% in 1991 to 7.4% in 2000. Lastly, it may be worth noting the growing number of non-believers - from 11,025 in 1991 to 21,795 in 2000 or a share of 6.0% and 9.4% respectively.

Language

The census questionnaire asked of all respondents four years old and over, whether they spoke English and/or Spanish "Very Well", "Not So Well", or "Not At All". Table B3 presents major frequencies corresponding to these options, again at the Country level, by Urban/Rural and by District. With respect to fluency in English, our official language, census 2000 reveals that 53.6% of the population of the country reported that they speak this language very well. Another 26.0% speak English not so well, whereas 19.9% do not speak it at all. The comparative figures for the previous census in 1991 are 54.3%, 22.5% and 23.2% respectively. The fact that just over a half of our population speak the official language very well, points to the need for some serious corrective measures, especially in view of the fact that fluency in an established language is an indispensable tool for the acquisition of any other form of knowledge.

With respect to fluency in Spanish, in 1991, 43.8% of the country's population spoke this language very well. Another 11.1% spoke it not so well, and a further 45.1% did not speak Spanish at all. Census 2000 shows that the corresponding percentages were 52.1%, 10.7% and 35.8%. This is an interesting finding since the percentage of the population which, in 1991 and 2000, regarded themselves as Mestizos (43.6% and 48.7% respectively) is almost identical to the percentage who report that they are fluent in Spanish. Further tabulation and analysis are needed however, to determine whether all

Mestizos reported that they speak Spanish very well. This will certainly be taken up in much more detail in one of the proposed CSO's bulletins.

Looking at the district-wise analyses, it is not surprising that in the year 2000, the Belize district has one of the largest percentage shares of the English speaking population (73.0%). Nor is it surprising that the two (2) northern districts have the largest shares of the Spanish speaking population i.e. Corozal – 80.7%, and Orange Walk – 81.2%. It is interesting to note however, that in the Western district of Cayo, which is often regarded as a Spanish-speaking district, only 55.3% of this district's population reported that they speak Spanish very well. This district-wise pattern was the same in 1991.

Disabilities

An innovation in the region's census questionnaires both in 1991 and in the census of 2000 was the inclusion of a few questions on disabilities. Never before have such questions been included, but because of growing concerns of several governments of the region, non-government organizations, as well as some international agencies, most CARICOM states agreed to include similar questions on disabilities, during the 1990 and 2000 rounds of population censuses. It was decided from the beginning that such questions have to be few and rather general, since so many other variables were included in the questionnaire. It was therefore suggested that the results from the census could serve mainly as broad indicators, which are crucial however, in guiding more in depth studies of the disabled population.

Some statistics on our disabled population are presented in table B4 for the country as a whole, by Urban/Rural and by district, for both the 1991 and 2000 censuses. Of the total population in 2000, 13,774 persons or approximately 6% reported that they are suffering from some kind of disability. This figure is similar to that in 1991, when 6.7% reported suffering from a disability. A cautionary note should be taken here, however, since, because of the very subjective nature of the term 'disability', research findings on this topic are often vague and could therefore be misleading. Indeed, several persons suffering from ailments like Hypertension, Diabetes, old age etc. classified themselves as being disabled. It may be argued, that such persons do not fit into the conventional definition of disability.

Of the conventional set of disabilities, in the year 2000 just as in 1991, 'Sight' problems seemed to be the most common, since, as Table B4 shows, 3% reported suffering from this disability. This is true for both urban (3.2%) and rural areas (2.8%), and for all the individual districts. The second most prevalent disability is that related to the movement of the body or limbs. Again, this is the second most prevalent disability in both urban and rural areas of the country. Less than 2% of the population are affected by Hearing or Learning disabilities. This is also true at the urban/rural levels and at the district level.

It is obvious that many more interesting analyses can be done on this topic as well as on others e.g. disability by age, ethnicity etc. However, such analyses will have to be addressed in one of the bulletins.

Birthplace

The census question on birthplace determines whether the person was born in Belize or 'Abroad'. The figures for 2000 show that 85% of the total population were born in Belize and the remaining 15% were born abroad. This distribution is slightly different from 1991 when 86% were born in Belize and 14% abroad. A comparison by sex shows little difference at the country level. A higher proportion of the rural population (16%) compared to the urban population (13%) were born abroad. However, during the 1990s the urban areas experienced higher growth in the absolute number and proportion of foreign-born persons, while the proportion in rural areas decreased. This indicates that the foreign-born persons who came to live in Belize during the 1990s settled mainly in urban areas and that there was internal migration from rural to urban areas among foreign-born persons.

A closer look at the district level shows that Cayo has the highest number and proportion of foreign-born persons compared to any other districts. For every 5 persons in Cayo, at least one of them is a foreign-born person. Stann Creek district also has a similarly high proportion of foreign-born persons (20%). These districts attract immigrants mainly for the economic activities in the citrus and banana industries and access to arable land for subsistence farming. Comparisons with the 1991

distribution at the district level show that the proportion of foreign-born persons decreased in Corozal, Orange Walk and Cayo while the proportion increased in the Belize, Stann Creek and Toledo. Belize district experienced the highest increase in absolute number and proportion, which indicates immigration and internal migration of foreign-born persons mainly to this district during the 1990s. A more detailed description of the foreign-born population is presented in Section II of this report.

SECTION II

INTERNATIONAL MIGRATION

Foreign-born Population

In 2000, the foreign-born population was 34,276. This figure is higher compared to 1991 when the foreign-born population was 25,548. It should be noted that the number of foreign-born persons excludes those who did not provide information for the census for various reasons and, is therefore an underestimation of the actual number of foreign-born persons living in Belize. Even though there was an amnesty in 1999, it is suspected that the foreign-born persons who have not legalized their status did not provide census information for fear of the law. Furthermore, language barriers might have prevented some foreign-born persons, especially the Chinese, from providing census information. This was despite the efforts made to recruit Chinese interviewers and interpreter for the census.

Selected characteristics of the foreign-born population are presented in Tables C1 to C4. The majority of the foreign-born population is from Central American countries. Their proportion of the total foreign-born population has increased from 74% in 1991 to 76% in 2000. The foreign-born persons from Guatemala have remained the single biggest group accounting for 42.5% of the foreign born population. The second biggest group is from El Salvador (17.6%). However, their proportion is lower compared to 1991 (22%). The proportion of foreign-born persons from Honduras has increased from 9% in 1991 to 14% in 2000.

The United States of America (USA) and Mexico together accounted for 12% of the foreign-born population. Compared to 1991, the proportions for both countries have decreased. Even though the proportion of foreign-born persons from China and Taiwan is small the figures represent an increase compared to 1991.

The majority (60%) of foreign-born persons have settled in the rural areas and they represent 16% of the total rural population. Those who came from Guatemala, El. Salvador and Mexico have

settled mainly in the rural areas. However, those from the USA, China and Taiwan have settled mainly in urban areas. The foreign-born persons from Honduras are evenly divided between the rural and urban areas.

Table C2 presents data on the foreign-born population by year of migration. The figures show that the majority of them came during the 1990s. The flow of foreign-born persons during the nineties was even higher than in the eighties, but probably not as noticeable. Figures from the 1991 Census show that 12,726 foreign-born persons came to Belize during the 1980s while, the figures from the 2000 Census show that 16,366 came in the 1990s. Even though there was no major civil strife in the region during the 1990s, immigrants from the main sending countries in Central America have continued to come to Belize, mainly for economic reasons. The 1990s also brought an increased number of immigrants from China and Taiwan. Many of these Asians came as economic citizens.

A comparison of the number of those who reported in 1991 and 2000 that they came to Belize before 1980 shows a difference of approximately 3,500. One of the main contributing factors to this difference is migration to a third country. Belize is seen as a stepping-stone to move on to the USA or Canada. Other factors such as repatriation and death also contributed to some extent. Central American refugees were given assistance for voluntary repatriation in the 1990s. However, it is suspected that the majority of those who accepted the assistance and repatriated, returned to Belize soon after.

The structure of the foreign born population is presented in Table C3. Approximately 15% are 14 years and younger. This proportion is lower compared with the same age group in the total population (41%), and also lower than the corresponding figure in 1991 (23%). The majority of the immigrants are in the productive age group.

Emigrants

Selected characteristics of the emigrant population are presented in Tables C4 to C7. The data were obtained from households that reported that one or more of its members had migrated in the past 10 years. This method of capturing information on emigrants has its limitations. Some of the households might not have reported this information, especially in cases where a household member does not have legal resident status in the country of migration. Furthermore, entire households that have migrated are missed. The number of emigrants reported in the census is therefore an underestimation. Nevertheless, the information obtained is useful for comparative analysis.

The age distribution of the emigration population presented in Table C4 shows that 51% of the emigrants are in the 15-24 years age group and 20% are in the 25-34 years age group. These figures are similar to the corresponding rates in 1991 and indicate that the trend of youths leaving Belize continues. These figures also indicate that Belize is losing more people in the productive age group than in any other age group.

The majority of the emigrants are females (55%). This rate is even higher in urban areas (58%) and in Belize (56%) and Stann Creek (62%) districts. Belize district reported the highest number of emigrants. However, Stann Creek district has the highest rate of emigrant per person. The majority of emigrants are from urban areas.

The flow of emigrants in the early 1990s was lower than in the latter part of the decade. There was a gradual increase over the 10-year period. This trend was experienced in the urban and rural areas and as well as at the district level. The figures in Table C5 show that 1999 had the highest number of emigrants leaving the country when compared to any other year in the 1990s. The number of emigrants in that year represents a 45% increase compared to 1998. The urge to migrate in 1999 might have been a result of the ‘millennium bug’.

The USA continues to be the number one receiving country for emigrants from Belize. A reported 84% of the emigrants went to the USA. This rate was similar in 1991. A noticeable 5% went

to Central American countries, which is higher than the 1991 rate. These emigrants to Central America are mainly from the rural areas and Stann Creek district. Thirteen percent (13%) from Stann Creek and 9% from rural areas migrated to Central American countries.

Data on the educational level of the emigrants at the time of departure show that most of them (47%) have secondary or higher education. Table C7 shows that there is not much difference between the males and females. However, the corresponding rates are higher in the urban areas and in Belize and Corozal districts. The percentage of emigrants with tertiary level education has increased by 64% compared to 1991. This signifies a continuation of the ‘brain drain’ phenomenon.

During the 1990s, an increased number of Belizeans went abroad, mainly to the USA, to pursue tertiary level education. Data are not available on the exact numbers. Many of them returned to Belize after completing their studies. However, it is suspected that a significant proportion later returned to the USA to work.

The general profile of the emigrant is a person that is young, in the productive age group and has at least a high school education. Therefore, Belize is exporting one of its most valuable resources, the young, educated, and productive people.

SECTION III

EDUCATION

Tables D1 to D4 present data on the level of education reached by the population five (5) years old and over, in the case of the 1991 census, and two (2) years old and over in the case of census 2000. In 2000, approximately 20% or almost 20,000 persons of age 2 years and over reported that they had no formal level of education at all. From the results of Census 2000, it becomes clear that when those who reported reaching Primary, Secondary, Post-Secondary and University levels of education are combined, this combined number represents 68.8% of the population 2 years old or over. According to a convention adopted by several countries, only persons completing standard 5 or above (or equivalent) can be considered literate, and although appropriate figures are not shown here, a considerable number of people reported reaching below this level of primary education. If this convention is adopted for Belize, it means that our literacy rate is more likely somewhere in the lower 70's, rather than 92% as we continue to claim. The CSO intends to do more in depth of analyses of EDUCATION using the data from the 2000 census.

A further notable feature with respect to Education is the Urban/Rural as well as district-wise differences. For example, in the year 2000, whereas 17.4% of the urban population have reached secondary level of education, only 7.4% of the rural population have done so. Similar differences exist at higher levels of education. At the district level, inter-district differences are also prevalent with respect to educational levels reached. For example, 18.7% of the Belize district's population reached the secondary level, whereas only 6.4% in Toledo did so. For the other four (4) districts, between 8-11% of their populations reached this level. Of course, these figures reflect the de facto situation and may well conceal the fact that the more highly educated have migrated to the urban areas. In other words, it may not necessarily be that educational opportunities between districts are unequal, but more likely that job opportunities are more accessible in the Belize district, attracting the more educated.

Table D4 presents some comparison of levels of education reached for the local and foreign-born populations. In 1991, the levels of education reached by each sub-group as a percentage of the total in each sub-group were quite similar, which was contrary to popular belief. For example, 52.5% of the local born population reported that they reached Primary level, whereas 56% of the foreign-born also reached this level. With respect to the Secondary level, the corresponding figures were 14% and 10%, but at the Post-Secondary level, the respective percentages were 3.2% and 5.8%. These figures of course reflected the sizeable percentage of foreign-born from the U.S.A.

Census 2000, however, shows some differences from the 1991 trends. The proportion of the Local-Born population in 2000 who reached primary level was 53.5%, and the corresponding figure for the foreign born population was 34.2%. The respective proportions for secondary school level were 12.4% and 9.5%. Obviously, differences in the percentages of subgroups reaching primary level between the two censuses are quite large. This points to the need for further analyses to test whether their differences are real.

SECTION IV

UNION STATUS AND FERTILITY

Union Status

The question on union status was asked only of the population 14 years and older. A list of options was read to each respondent who then selected the union status that best describes him/her. The options clearly define a person's union status but do not give a clear indication of the marital status. This is especially so for those who are in a visiting relationship and common-law union. There is no way to tell if these persons have been married before or, if they are still married and currently with someone other than their spouse. The data for 1991 are based on the marital status rather than the union status. Therefore, no comparisons could be made.

Tables E1 to E4 present the union status by selected characteristics. Approximately 56% of the population are in union i.e. either legally married or in common-law union. Forty-one percent (41%) are not in union. This includes those that are still married, but not in union, those legally separated, divorced and widowed. Only 2.5% reported that they are in visiting relationship.

A higher proportion of persons in the rural (60%) compared to the urban (52%) areas is in a union. Toledo district, compared to the other districts, reported the highest proportion (62%) of its population in a union while Belize district reported the lowest (51%). Corozal district stands out as having the highest proportion of legally married and lowest proportion of common-law union. Common-law union is most common in the Stann Creek district.

Fertility

Figures on some selected characteristics of women in the reproductive age group (14-64 years) by the number of children ever born are presented in Tables E5 to E7. The figures indicate that women have an average of 3 children. The average number of children per woman is higher in rural areas (3.4 children) and lower in urban areas (2.5 children).

Further analysis by ethnicity and education show that Creole women, on average, have fewer children and Maya women more children than women in the other major ethnic groups (see Table E6). As the level of education increases the average number of children ever born per woman decreases. The figures in Table E7 indicate that women with no education have an average of 4 children, while women who have completed high school have an average of 1.2 children.

These figures on the average number of children ever born are based on women's historical fertility and do not give an indication of the prevailing fertility patterns. Total Fertility Rate (TFR) is used to indicate the prevailing fertility levels. Figures produced elsewhere indicate that the TFR has declined over the past 10 years.

SECTION V

ECONOMIC ACTIVITY

While a census provides some broad measures of economic activity, statistical theory, now evidenced by country experiences, underscores the need to be very cautious in the use and interpretation of labour force indicators from a census. As a consequence, census and survey experts in the field have now concluded that labour force indicators from specialized labour force surveys (LFS) are more robust and reliable than those obtained from a census.

The Belize experience with labour force indicators from censuses in both the 1991 and 2000 suggests that such indicators are different from the labour force trends intimated by surveys and other economic indicators. Such experience is by no means unique to Belize since a number of institutions including the Barbados Statistical Service and the United States Bureau of Labor Statistics have reported similar experiences.

The publication, **1991 Population Census - Major Findings** (p. 22-23), indicated that unemployment and participation rates from the 1991 census were understated and went on to provide alternative estimates based on other data available. This participation rate refers to the total number of persons either with jobs or available to work as a proportion of the total number of persons older than thirteen years. LFS trends from 1993 to 1999 indicate that the unemployment and participation rates from the 2000 census were overstated. As there was no LFS conducted in 2000, the trends provide the basis for the estimation of alternative unemployment and participation rates for the year 2000.

Labour Force

Table F1 shows that 50% of the working age population were employed in 2000. This includes persons 14 years and older who worked or had a job but were not at work. The corresponding rate for 1991 is slightly lower (49%).

Further analysis of the economically active population shows that 70% of males are employed compared to 30% of females. These figures compared to 1991 indicate that the percentage of females who are working has increased by 32% while, there has been a 4% decrease in the percentage of working males. Comparisons at the urban/rural level show that urban areas have a higher percentage of employed persons (52%) compared to rural areas (49%). However, a higher percentage of rural males are employed compared to urban males, while the reverse situation occurred among the females.

The distribution by age group presented in Table F2 shows that the highest proportion of employed persons is among the 35-39 age group (65%). The 14-19 age group has the lowest proportion that is employed. However, most of them in this age group are attending school (44%). At the urban/rural level, 18% of urban teenagers are employed compared to 29% of rural teenagers.

No attempt is made to present in-depth analysis on the intercensal change in labour force participation and unemployment rates. However, data from Census 2000 and the 1999 LFS have been used as a basis for estimating these rates for 2000. The estimates show labour force participation rate at 59.3% and unemployment rate at 11%, which are in line with the trend that has been established by the 1993 to 1999 LFS.

Persons out of the labour force are those that are not employed and are not available to work or do not want to work. These include the retired, students, the disabled or those engaged in home duties. Even though there have been on going debates on whether home duties should be considered as economic activities, those engaged in such activities are still classified as being out of the labour force.

Table 1 shows that approximately 17% of the working age population are engaged in 'Home duties'. A comparison by sex shows that 33% of females, whereas only 1% of males is so engaged. Even though the rate is so much higher for females it represents a drastic decline compared to 1991 when 63% of females were engaged in home duties. These figures signify that females are no longer primarily engaged in home duties. So, then, what are they doing instead? The proportion of females in school has increased from 10% in 1991 to 11% in 2000 and the proportion of employed females has increased by 32%. Furthermore, 15% are available to work. In 1991 less than 1% of women wanted or looked for work.

Industry and Occupation

One quarter of the employed population is engaged in agriculture and forestry activity (see Table F3). This represents a decrease in agriculture and forestry activities compared to 1991 when 30% of the employed population were so engaged. Wholesale and retail trade is the second biggest industry accounting for 16% of the employed population, followed by general government services (13%), construction (9%) and tourism (9%). The construction industry increased by 44% compared to 1991, which reflects government's initiative to provide low-income housing and consequently generating labour in this sector. Tourism was not coded as an industry in 1991. However, hotels and restaurants, which were coded, accounted for 4% of the employed population. These and some of the activities that used to be in the transportation industry are now coded as tourism. In 1991, transportation was 5%. Even though there is no direct comparison with 1991, these figures suggest that the tourism industry has increased.

Further analysis by sex shows that males are mainly engaged in the agriculture (33%), wholesale and retail sales (14%), and construction industry (13%). Meanwhile, females are mainly engaged in Community, social and personal service (21%), General government service (21%) and wholesale and retail trade (20%).

The main industry in the urban areas is wholesale and retail sales while, agriculture is the main industry in the rural areas. The agriculture industry was strongest in Toledo, Corozal and Stann Creek districts. Sugar is strongest in Corozal (28%) even though the factory is located in Orange Walk. Fishing and fish processing is strongest in Stann Creek accounting for 5% of their employed population. This district is home to most of the shrimp farms in the country. Tourism is strongest in Belize (12%), Stann Creek (11%) and Cayo (10%) districts.

The employed population by occupation is presented in Table F4. Most of the employed population (33%) is employed in elementary occupations. The rate is almost the same for males and females. Apart from elementary occupation, the males are mainly occupied as craft and related workers (19%) and agriculture, forestry and fishery workers (14%). The females are mainly technicians and associate professionals (16%), service workers and shop sales workers (15%) and clerks (14%).

A comparison by sex of the senior officials and professionals shows that 12% of females and 7% of males hold these occupations. The difference increases when the technicians and associate professionals are considered.

SECTION VI

INCOME

Many people are reluctant to disclose information on their income. Even though respondents were asked to identify their income range rather than to state their exact income there were still high levels of non-response. Eleven percent (11%) of the employed population did not provide the information on income. The rate was even higher in urban areas and in Belize district where 24% did not give the information on income.

The mean income is \$835.00 per month. This represents an increase compared to 1991 when the mean monthly income was \$628.00. The mean income is higher for males than for females.

A closer look at the lowest and highest range of the income groups shows that the difference by sex are minimal. Three percent (3%) of males and females earn less than \$1,440 while, approximately 2% males and females earn \$34,600 or more per year. There is a noticeable difference at the urban/rural level. Only 1% in the urban areas earned less than \$1,440 compared to 6% in the rural areas. At the highest end of the income range, the percentage that earn \$34,560 and over per annum is three times as high in the urban areas compared to the rural.

Toledo district reported the highest percentage (23%) that earned less than \$1,400 per annum while Belize district reported the lowest, less than 1%. Belize district also reported the highest percentage that earned more than \$34,560.

Employed persons who earn less than \$20,000 per year are exempted from paying income tax. Further analysis of the income data indicates that 8% of the employed population are above this threshold and therefore, are taxed on their income. There is little difference between males and

females. However, 12% in urban areas compared to 4% in rural areas are above the threshold. Belize district has the highest percentage (12%) that is above the tax exemption threshold and Toledo district has the lowest (5%). These figures indicate the low percentage of employed persons that are required to pay income tax.

The data on income level by education are in the expected direction where, income increases with education level. The percentage earning less than \$1,400 per annum is 7% for those with no education and less than 1% for those with tertiary level education. At the highest end of the income levels, less than one percent of those with no education earn \$34,560 or higher, while 15% of those with a university degree earn within this range.

A comparison at the district level of persons with university degree who earn \$34,559 or higher shows that in Cayo district 18% of those with university degree are in this income bracket. This is the highest rate compared to other districts. The rate was lowest in Corozal (8%). There are several factors that might have contributed to this difference. Some of these income earners might be working in jobs that do not require a degree and therefore are not paid for their qualifications. The age and years of employment with this educational level could also influence the income. Further analysis of income by these factors would add more explanation.

SECTION VII

HOUSING AND HOUSEHOLD

Tables H1 and H2 provide some data on households in Belize as well as on housing characteristics. In the 1991 Census, a total of approximately 38,000 households were counted. This represented an increase of over 35% on the total (28,000) enumerated in the 1980 Census. Census 2000 enumerated approximately 52,000 households, representing an increase of 36.8%. In both censuses, a household was defined as: one or more persons living under the same roof for most nights of the week, and sharing at least one (1) daily meal. Of the total number of households in 1991, 78% were headed by males and 22% by females. In the year 2000, the corresponding figures were 76% and 24%. Table H1 further shows heads of households by age group, by Urban/Rural, and by District for both 1991 and 2000.

Table H2 highlights some of the main findings on the housing situation. The top panel of this table provides some indication of household size. In 1991, over 50% of households in the country comprised five (5) or more persons, and just over 22% comprised one (1) or two (2) persons. From Census 2000, 44.1% of households comprised five (5) or more persons and approximately 25% comprised one (1) or two (2) persons. Average household size in the rural areas in 1991, was higher than it was in the urban parts, with 56.1% of rural households comprising five (5) persons or more. The corresponding statistic for the urban areas was 45.3%. In the year 2000, average household size remained larger in the rural areas with 50.4% of households in these areas comprising five (5) or more persons. In the urban areas in the year 2000, only 37.8% of households comprised five (5) or more persons. In both census years, the Corozal, Orange Walk, Cayo and Toledo districts all had larger households than the Belize and Stann Creek districts. Another indicator of 'overcrowdedness' is the

number of bedrooms per dwelling unit. Panel two (2) of this same table shows that, in 1991, over 63% of all dwelling units had two (2), or less than two (2) bedrooms, which indicates 'overcrowdedness' when the average household size is over five (5) persons per household. In 2000, only 59.8% had two (2) or less than two (2) bedrooms, indicating that overcrowdedness continues to be a problem.

Panel three (3) shows type of ownership of the dwelling units. In 1991, approximately 66% of all dwelling units in the country were either owned outright or being bought on hire purchase basis. In the year 2000, 63% of the total dwelling units were owned. This represents a decrease in ownership of 3.4 percentage points from the 1991 level of ownership. Also, in 1991, almost twenty-two percent (22%) of all dwelling units were rented. The 2000 data show that the corresponding figure was 24%, representing a small increase of two percentage points, in the rental of dwelling units. In the urban areas, in 1991, 56.7% of the dwellings were owned and 36% rented, whereas in the rural areas, the corresponding figures were 75.2% and 7.2% respectively. Census 2000 shows that in urban areas, almost 53% of the dwellings are owned and 36% rented, whereas in the rural parts of the country, 72% are owned and only 12% rented. Just as in 1991, census 2000 results show that more dwelling units are either owned or are being bought on hire purchase in the Corozal, Orange Walk, Cayo, and the Toledo Districts than in the Belize or Stann Creek Districts. In these latter two (2) districts, more rental of dwelling units occur.

Table H2 also shows that sheet metal (zinc) continues to be the most popular type of roofing material in the year 2000 as it was in 1991, with 80% using this type of material. However, in the Toledo District, about the same proportion use sheet metal (46.8%) and thatched roof (46.5%). In 1991 also, wood was the main material used for the outer walls of 60.8% of all dwelling units. In that year, concrete accounted for only 24.8% of dwelling units' outer walls. In 2000 however, the data show that while wood was still the main material for the outer walls (44.1%) of dwelling units, there were 40.3% of dwelling units, which used concrete for their outer walls. In 1991, also, wood seemed to be the preferred material for floor (44.4%). In the year 2000 however, concrete floors are the most common (58.6%). It is obvious that a significant number of dwelling units have adopted concrete material for outer walls and floor over the past two decades.

Of all households in Belize in 1991, approximately 37.5% got their drinking water from public pipes, either directly into the dwelling units (19.5%) or into their yard (18%). In 2000, 26% got their drinking water from public pipes directly into the dwelling units and 17% from public piped into the yard. It is noted from the data that almost 17% of households in 2000 use purified water for drinking. Also in 2000, only 3.5% of dwellings got their drinking water from river/stream or from other sources.

More than half, (51.3%) the total number of dwelling units in 1991, used pit latrines as the main type of toilet facilities. In the urban areas, almost twenty-six percent used pit latrines while in the rural areas, the percent using pit latrine was 77.4. Census 2000 data show, however, that 43.9% of the country's dwelling units continue to use pit latrines. However, the data also reveal that there has been a marked improvement in the type of such latrines, with the advent of the ventilated types. Also, at the national level, almost 50% of households were linked either to a septic tank (34.4%) or to the WASA (15.5%) sewer system in 2000, compared to 34.7% in 1991. Table H2 further shows that, in 1991, the Belize district had the highest percent (41.2%) of dwelling units linked to a sewer system. In 2000, 43.6% of households in Belize City were connected to a sewer system and a further 39.3% had a septic tank.

More than sixty seven percent of dwelling units in 1991 used electricity as the main type of lighting. This percent has increased to 79% in 2000, and is much higher (95%) in the urban areas. In 1991 also, almost 40% of the dwelling units in the rural areas had access to electricity. In the year 2000, the corresponding figure for the rural areas, according to the census was 63.1%. At the district level, only 24.6% of the dwelling units in the Toledo district were using electricity for lighting. In 2000, 41.3% are using electricity for lighting purposes. The use of electricity for lighting in the other districts in 2000, ranged from 71.6% in Stann Creek to 93.8% in the Belize district.

Table H2 also reveals that the main fuel used for cooking in 2000 was Butane Gas (79%). This increased from its level of 62% in 1991. Wood, which was used by 29.2% of households in 1991 for cooking, continues to be used by 15.8% of all households in 2000. In the Toledo District in 2000, Wood

remained the most popular fuel for cooking purposes (54.8%) as it was in 1991 (69.2%) in this district.

In all other districts, butane gas is used by most households for the purpose of cooking.

Questions on ownership or rental of household commodities such as radios, televisions, video recorders and telephone service, were included for the first time in the 1991 Census questionnaire. In the questionnaire of the census 2000, ownership of these and other household items were also asked. The main purpose for asking these questions is that they provide some objective criteria for assessing 'Quality of Life' or the standard of living. The 1991 results showed that 78.7% owned at least one radio. Corresponding figures for ownership of other household commodities are: Television 62.3%; Video Recorder 14.1%; and Telephone 27.2%. In 2000, 86.2% of all households in Belize owned at least one radio. Ownership of at least one television set also increased to 70.2% in 2000. A much larger increase in 2000 over 1991 was in the ownership of at least one telephone (40.7%).
