

## **1.6 Conversion tables for units**

The table below gives conversion factors from a variety of units to the corresponding SI unit. Examples of the use of this table have already been given in the preceding section. For each physical quantity the name is given, followed by the recommended symbol(s). The SI unit is given, followed by the esu, emu, Gaussian unit (Gau), atomic unit (au), and other units in common use, with their conversion factors to SI. The constant  $\zeta$  which occurs in some of the electromagnetic conversion factors is the (exact) pure number  $2.997\,924\,58 \times 10^{10} = c_0/(\text{cm s}^{-1})$ .

The inclusion of non-SI units in this table should not be taken to imply that their use is to be encouraged. With some exceptions, SI units are always to be preferred to non-SI units. However, since many of the units below are to be found in the scientific literature, it is convenient to tabulate their relation to the SI.

For convenience units in the esu and Gaussian systems are quoted in terms of the four dimensions *length*, *mass*, *time*, and *electric charge*, by including the franklin (Fr) as an abbreviation for the electrostatic unit of charge and  $4\pi\epsilon_0$  as a constant with dimensions  $(\text{charge})^2/(\text{energy} \times \text{length})$ . This gives each physical quantity the same dimensions in all systems, so that all conversion factors are pure numbers. The factors  $4\pi\epsilon_0$  and the Fr may be eliminated by writing  $\text{Fr} = \text{esu of charge} = \text{erg}^{1/2} \text{cm}^{1/2} = \text{cm}^{3/2} \text{g}^{1/2} \text{s}^{-1}$ , and  $4\pi\epsilon_0 = \epsilon^{\text{ir}} = 1 \text{Fr}^2 \text{erg}^{-1} \text{cm}^{-1} = 1$ , to recover esu expressions in terms of three base units (see section 7.3 below). The symbol Fr should be regarded as a compact representation of (esu of charge).

Conversion factors are either given exactly (when the = sign is used), or they are given to the approximation that the corresponding physical constants are known (when the  $\approx$  sign is used). In the latter case the uncertainty is always less than  $\pm 5$  in the last digit quoted.

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
<i>length, l</i>		
metre (SI unit)	m	
centimetre (cgs unit)	cm	$= 10^{-2} \text{ m}$
ångström	Å	$= 10^{-10} \text{ m}$
micron	$\mu$	$= \mu\text{m} = 10^{-6} \text{ m}$
millimicron	m $\mu$	$= \text{nm} = 10^{-9} \text{ m}$
x unit	X	$\approx 1.002 \times 10^{-13} \text{ m}$
fermi	f, fm	$= \text{fm} = 10^{-15} \text{ m}$
inch	in	$= 2.54 \times 10^{-2} \text{ m}$
foot	ft	$= 12 \text{ in} = 0.3048 \text{ m}$
yard	yd	$= 3 \text{ ft} = 0.9144 \text{ m}$
mile	mi	$= 1760 \text{ yd} = 1609.344 \text{ m}$
nautical mile		$= 1852 \text{ m}$
astronomical unit	AU	$= 1.496 \ 00 \times 10^{11} \text{ m}$
parsec	pc	$\approx 3.085 \ 68 \times 10^{16} \text{ m}$
light year	l.y.	$\approx 9.460 \ 528 \times 10^{15} \text{ m}$
light second		$= 299 \ 792 \ 458 \text{ m}$
<i>area, A</i>		
square metre (SI unit)	m <sup>2</sup>	
barn	b	$= 10^{-28} \text{ m}^2$
acre		$\approx 4046.856 \text{ m}^2$
are	a	$= 100 \text{ m}^2$
hectare	ha	$= 10^4 \text{ m}^2$
<i>volume, V</i>		
cubic metre (SI unit)	m <sup>3</sup>	
litre	l, L	$= \text{dm}^3 = 10^{-3} \text{ m}^3$
lambda	$\lambda$	$= \mu\text{l} = 10^{-6} \text{ dm}^3$
barrel (US)		$\approx 158.987 \text{ dm}^3$
gallon (US)	gal (US)	$= 3.785 \ 41 \text{ dm}^3$
gallon (UK)	gal (UK)	$= 4.546 \ 09 \text{ dm}^3$

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
<i>mass, m</i>		
kilogram (SI unit)	kg	
gram (cgs unit)	g	= $10^{-3}$ kg
electron mass (au)	$m_e$	$\approx 9.109\,39 \times 10^{-31}$ kg
unified atomic mass unit, daltonS	u, Da	= $m_a(^{12}\text{C})/12 \approx 1.660\,540 \times 10^{-27}$ kg
gamma	$\gamma$	= $\mu\text{g}$
tonne	t	= Mg = $10^3$ kg
pound (avoirdupois)	lb	= 0.453 592 37 kg
ounce (avoirdupois)	oz	$\approx 28.3495$ g
ounce (troy)	oz (trou)	$\approx 31.1035$ g
grain	gr	= 64.798 91 mg
<i>time, t</i>		
second (SI, cgs unit)	s	
au of time	$h/E_h$	$\approx 2.418\,88 \times 10^{-17}$ s
minute	min	= 60 s
hour	h	= 3600 s
day <sup>1</sup>	d	= 86 400 s
year <sup>2</sup>	a	$\approx 31\,556\,952$ s
svedberg	Sv	= $10^{-13}$ s

- 
- (1) Note that the day is not exactly in terms of the second since so-called leap-seconds are added or subtracted from the day semiannually in order to keep the annual average occurrence of midnight at 24:00 on the clock.
- (2) The year is not commensurable with the day and not a constant. Prior to 1967, when the atomic standard was introduced, the tropical year 1900 served as the basis for the definition of the second. For the epoch 1900.0. it amounted to  $365.242\,198\,79\text{ d} \approx 31\,556\,925.975$  s and it decreases by 0.530 seconds per century. The calendar years are exactly defined in terms of the day:

$$\begin{aligned} \text{Julian year} &= 365.25\text{ d} \\ \text{Gregorian year} &= 365.2425\text{ d}. \end{aligned}$$

The definition in the table corresponds to the Gregorian year. This is an average based on a year of length 365 days, with leap years of 366 days; leap years are taken *either* when the year is divisible by 4 but is not divisible by 100, *or* when the year is divisible by 400. Whether the year 3200 should be a leap year is still open, but this does not have to be resolved until sometime in the middle of the 32nd century.

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
<i>acceleration, a</i>		
SI unit	$\text{m s}^{-2}$	
standard acceleration of free fall	$g_n$	$= 9.806\ 65\ \text{m s}^{-2}$
gal, galileo	Gal	$= 10^{-2}\ \text{m s}^{-2}$
<i>force, F</i>		
newton (SI unit) <sup>3</sup>	N	$= \text{kg m s}^{-2}$
dyne (cgs unit)	dyn	$= \text{g cm s}^{-2} = 10^{-5}\ \text{N}$
au of force	$E_h/a_0$	$\approx 8.238\ 73 \times 10^{-8}\ \text{N}$
kilogram-force	kgf	$= 9.806\ 65\ \text{N}$
<i>energy, U</i>		
joule (SI unit)	J	$= \text{kg m}^2 \text{s}^{-2}$
erg (cgs unit)	erg	$= \text{g cm}^2 \text{s}^{-2} = 10^{-7}\ \text{J}$
rydberg	Ry	$= E_h/2 \approx 2.179\ 87 \times 10^{-18}\ \text{J}$
electronvolt	eV	$= e \times V \approx 1.602\ 18 \times 10^{-19}\ \text{J}$
calorie, thermochemical	cal <sub>th</sub>	$= 4.184\ \text{J}$
calorie, international	cal <sub>IT</sub>	$= 4.1868\ \text{J}$
15 °C calorie	cal <sub>15</sub>	$\approx 4.1855\ \text{J}$
litre atmosphere	l atm	$= 101.325\ \text{J}$
British thermal unit	Btu	$= 1055.06\ \text{J}$
<i>pressure, p</i>		
pascal (SI unit)	Pa	$= \text{N m}^{-2} = \text{kg m}^{-1} \text{s}^{-2}$
atmosphere	atm	$= 101\ 325\ \text{Pa}$
bar	bar	$= 10^5\ \text{Pa}$
torr	Torr	$= (101\ 325/760)\ \text{Pa} \approx 133.322\ \text{Pa}$
millimetre of mercury (conventional)	mmHg	$= 13.5951 \times 980.665 \times 10^{-2}\ \text{Pa} \approx 133.322\ \text{Pa}$
pounds per square inch	psi	$\approx 6.894\ 757 \times 10^3\ \text{Pa}$
<i>power, P</i>		
watt (SI unit)	W	$= \text{kg m}^2 \text{s}^{-3}$
horse power	hp	$= 745.7\ \text{W}$

(3) 1 N is approximately the force exerted by the earth upon an apple.

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
<i>action, L, J (angular momentum)</i>		
SI unit	J s	= kg m <sup>2</sup> s <sup>-1</sup>
cgs unit	erg s	= 10 <sup>-7</sup> J s
au of action	$\hbar = h / 2\pi$	$\approx 1.054\ 57 \times 10^{-34}$ J s
<i>dynamic viscosity, <math>\eta</math></i>		
SI unit	Pa s	= kg m <sup>-1</sup> s <sup>-1</sup>
poise	P	= 10 <sup>-1</sup> Pa s
centipoise	cP	= mPa s
<i>kinematic viscosity, <math>\nu</math></i>		
SI unit	m <sup>2</sup> s <sup>-1</sup>	
stokes	St	= 10 <sup>-4</sup> m <sup>2</sup> s <sup>-1</sup>
<i>thermodynamic temperature, T</i>		
kelvin (SI unit)	K	
degree Rankine <sup>4</sup>	°R	= (5/9) K
<i>entropy, S</i>		
<i>heat capacity, C</i>		
SI unit	J K <sup>-1</sup>	
clausius	Cl	= cal <sub>th</sub> /K = 4.184 J K <sup>-1</sup>
<i>molar entropy, S<sub>m</sub></i>		
<i>molar heat capacity, C<sub>m</sub></i>		
SI unit	J K <sup>-1</sup> mol <sup>-1</sup>	
entropy unit	e.u.	= cal <sub>th</sub> K <sup>-1</sup> mol <sup>-1</sup> = 4.184 J K <sup>-1</sup> mol <sup>-1</sup>

- 
- (4)  $T/^{\circ}\text{R} = (9/5) T/\text{K}$ . Also, Celsius temperature  $\theta$  is related to thermodynamic temperature  $T$  by equation

$$\theta/^{\circ}\text{C} = T/\text{K} - 273.15$$

Similarly Fahrenheit temperature  $\theta_{\text{F}}$  is related to Celsius temperature  $\theta$  by the equation

$$\theta_{\text{F}}/^{\circ}\text{F} = (9/5) (\theta/^{\circ}\text{C}) + 32$$

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
<i>molar volume, <math>V_m</math></i>		
SI unit	$\text{m}^3 \text{mol}^{-1}$	
amagat	amagat	$= V_m$ of real gas at 1 atm and 273.15 K $\approx 22.4 \times 10^{-3} \text{ m}^3 \text{mol}^{-1}$
<i>plane angle, <math>\alpha</math></i>		
radian (SI unit)	rad	
degree	$^\circ$	$= \text{rad} \times 2\pi/360 \approx (1/57.295\ 78) \text{ rad}$
minute	'	$= \text{degree}/60$
second	"	$= \text{degree}/3600$
grade	grad	$= \text{rad} \times 2\pi/400 \approx (1/63.661\ 98) \text{ rad}$
<i>radioactivity, <math>A</math></i>		
becquerel (SI unit)	Bq	$= \text{s}^{-1}$
curie	Ci	$= 3.7 \times 10^{10} \text{ Bq}$
<i>absorbed dose of radiation<sup>5</sup></i>		
gray (SI unit)	Gy	$= \text{J kg}^{-1}$
rad	rad	$= 0.01 \text{ Gy}$
<i>dose equivalent</i>		
sievert (SI unit)	Sv	$= \text{J kg}^{-1}$
rem	rem	$\approx 0.01 \text{ Sv}$

- 
- (5) The unit röntgen, employed to express exposure to X or  $\gamma$  radiation, is equal to:  $R = 2.58 \times 10^{-4} \text{ C kg}^{-1}$

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
<i>electric current, I</i>		
ampere (SI unit)	A	
esu, Gau	(10/ζ)A	≈ 3.335 64×10 <sup>-10</sup> A
biot (emu)	Bi	= 10 A
<i>electric charge, Q</i>		
coulomb (SI unit)	C	= A s
franklin (esu, Gau)	Fr	= (10/ζ)C ≈ 3.335 64×10 <sup>-10</sup> C
emu (abcoulomb)		= 10 C
proton charge (au)	<i>e</i>	≈ 1.602 18×10 <sup>-19</sup> C ≈ 4.803 21×10 <sup>-10</sup> Fr
<i>charge density, ρ</i>		
SI unit	C m <sup>-3</sup>	
esu, Gau	Fr cm <sup>-3</sup>	= 10 <sup>7</sup> ζ <sup>-1</sup> C m <sup>-3</sup> ≈ 3.335 64×10 <sup>-4</sup> C m <sup>-3</sup>
<i>electrical potential, V, φ</i>		
volt (SI unit)	V	= J C <sup>-1</sup> = J A <sup>-1</sup> s <sup>-1</sup>
esu, Gau	erg Fr <sup>-1</sup>	= Fr cm <sup>-1</sup> /4πε <sub>0</sub> = 299.792 458 V
mean international volt		= 1.00034 V
US international volt		= 1.000 330 V
<i>electric resistance, R</i>		
ohm (SI unit)	Ω	= V A <sup>-1</sup> = m <sup>2</sup> kg s <sup>-3</sup> A <sup>-2</sup>
mean international ohm		= 1.000 49 Ω
US international ohm		= 1.000 495 Ω
<i>electric field, E</i>		
SI unit	V m <sup>-1</sup>	= J C <sup>-1</sup> m <sup>-1</sup>
esu, Gau	Fr cm <sup>-2</sup> /4πε <sub>0</sub>	= 2.997 924 58×10 <sup>4</sup> V m <sup>-1</sup>
<i>electric field gradient, E<sub>β</sub>, q<sub>αβ</sub></i>		
SI unit	V m <sup>-2</sup>	= J C <sup>-1</sup> m <sup>-2</sup>
esu, Gau	Fr cm <sup>-3</sup> /4πε <sub>0</sub>	= 2.997 924 58×10 <sup>6</sup> V m <sup>-2</sup>
<i>electric dipol moment, p, μ</i>		
SI unit	C m	
esu, Gau	Fr cm	≈ 3.335 64×10 <sup>-12</sup> C m
debye	D	= 10 <sup>-18</sup> Fr cm ≈ 3.335 64×10 <sup>-30</sup> C m

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
<i>electric quadrupole moment,</i>		
$Q_{\alpha\beta}, \Theta_{\alpha\beta}, eQ$		
SI unit	$\text{C m}^2$	
esu, Gau	$\text{Fr cm}^2$	$\approx 3.335\,64 \times 10^{-14} \text{ C m}^2$
<i>magnetic flux density, B</i> ( <i>magnetic field</i> )		
tesla (SI unit)	T	$= \text{J A}^{-1} \text{ m}^{-2} = \text{V s m}^{-2} = \text{Wb m}^{-2}$
gauss (emu, Gau)	G	$= 10^{-4} \text{ T}$
<i>magnetic flux, <math>\Phi</math></i>		
weber (SI unit)	Wb	$= \text{J A}^{-1} = \text{V s}$
maxwell (emu, Gau)	Mx	$= \text{G cm}^{-2} = 10^{-8} \text{ Wb}$
<i>magnetic field, H</i> ( <i>volume</i> ) <i>magnetization, M</i>		
SI unit	$\text{A m}^{-1}$	$= \text{C s}^{-1} \text{ m}^{-1}$
oersted (emu, Gau)	Oe	$= 10^3 \text{ A m}^{-1}$
[But note: in practice the oersted, Oe, is only used as a unit for $H^{(\text{ir})} = 4\pi H$ ; thus when $H^{(\text{ir})} = 1 \text{ Oe}$ , $H = (10^3/4\pi) \text{ A m}^{-1}$ .]		
<i>magnetic dipole moment, m, <math>\mu</math></i>		
SI unit	$\text{A m}^2$	$= \text{J T}^{-1}$
emu, Gau	$\text{erg G}^{-1}$	$= 10 \text{ A cm}^2 = 10^{-3} \text{ J T}^{-1}$
Bohr magneton <sup>6</sup>	$\mu_{\text{B}}$	$= eh/2m_e \approx 9.274\,02 \times 10^{-24} \text{ J T}^{-1}$
nuclear magneton	$\mu_{\text{N}}$	$= (m_e/m_p)\mu_{\text{B}} \approx 5.050\,79 \times 10^{-27} \text{ J T}^{-1}$
<i>magnetizability, <math>\zeta</math></i>		
SI unit	$\text{J T}^{-2}$	$= \text{C}^2 \text{ m}^2 \text{ kg}^{-1}$

(6) The Bohr magneton  $\mu_{\text{B}}$  is sometimes denoted BM (or B.M.), but this is not recommended.

<i>Name</i>	<i>Symbol</i>	<i>Relation to SI</i>
-------------	---------------	-----------------------

*magnetic susceptibility,  $\chi$ ,  $\kappa$*

SI unit	1
emu, Gau	1

[But note: in practice susceptibilities quoted in the context of emu or Gaussian units are always values for  $\chi^{(ir)} = \chi/4\pi$ ; thus when  $\chi^{(ir)} = 10^{-6}$ ,  $\chi = 4\pi \times 10^{-6}$ .]

*molar magnetic susceptibility,  $\chi_m$*

SI unit	$\text{m}^3 \text{mol}^{-1}$
emu, Gau	$\text{cm}^3 \text{mol}^{-1} = 10^{-6} \text{m}^3 \text{mol}^{-1}$

[But note: in practice the units  $\text{cm}^3 \text{mol}^{-1}$  usually imply that the irrational molar susceptibility is being quoted,  $\chi_m^{(ir)} = \chi_m/4\pi$ ; thus, for example if  $\chi_m^{(ir)} = -15 \times 10^{-6} \text{cm}^3 \text{mol}^{-1}$ , which is often written as '-15 cgs ppm', then  $\chi_m = -1.88 \times 10^{-10} \text{m}^3 \text{mol}^{-1}$ .]
