Summary

- This release uses the cohort-component methodology to estimate the 2010 mid-year population of South Africa.
- The estimates cover all the residents of South Africa at the 2010 mid-year, and are based on the latest available information. Estimates may change as new data become available.
- For 2010, Statistics South Africa (Stats SA) estimates the mid-year population as 49,99 million.
- Fifty-one per cent (approximately 25,66 million) of the population is female.
- Gauteng comprises the largest share of the South African population. Approximately 11,19 million people (22,4%) live in this province. KwaZulu-Natal is the province with the second largest population, with 10,65 million people (21,3%) living in this province. With a population of approximately 1,10 million people (2,2%), Northern Cape remains the province with the smallest share of the South African population.
- Nearly one-third (31,0%) of the population is aged younger than 15 years and approximately 7,6% (3,8 million) is 60 years or older. Of those younger than 15 years, approximately 23% (3,52 million) live in KwaZulu-Natal and 19,3% (2,99 million) live in Gauteng.
- Migration is an important demographic process in shaping the age structure and distribution of the provincial population. For the period 2006–2011 it is estimated that approximately 211 600 people will migrate from the Eastern Cape; Limpopo is estimated to experience a net out-migration of just over 140 000 people. During the same period, Gauteng and Western Cape are estimated to experience a net inflow of migrants of approximately 364 400 and 94 600 respectively.
- Life expectancy at birth is estimated at 53,3 years for males and 55,2 years for females.
- The infant mortality rate is estimated at 46,9 per 1 000 live births.
- The estimated overall HIV prevalence rate is approximately 10,5%. The total number of people living with HIV is estimated at approximately 5,24 million. For adults aged 15–49 years, an estimated 17% of the population is HIV positive.
- For 2010, this release estimates that approximately 1,6 million people aged 15 and older; and approximately 183 000 children would be in need of ART.
- The total number of new HIV infections for 2010 is estimated at 410 000. Of these, an estimated 40 000 will be among children.

Table 1: Mid-year population estimates for South Africa by population group and sex, 2010

Population group	Male		Female		Total	
	Number	Percentage of total population	Number	Percentage of total population	Number	Percentage of total population

Total	49 991 300	100,0

PJ Lehohla
Statistician-General

1. Introduction

Statistics South Africa (Stats SA) subscribes to the specifications of the Special Data Dissemination Standards (SDDS) of the International Monetary Fund (IMF) and publishes the mid-year population estimates for the country annually. This release uses the latest available software from UNAIDS. The HIV epidemic curves were derived using the Estimation and Projection Package (EPP-Version 10.0/EPP2010 Beta U). Estimates from EPP were then used as input into SPECTRUM (Version 3.49). Stats SA also used JMP script language (JSL) developed by the SAS institute Inc.

2. Demographic and other assumptions

Our knowledge of the HIV epidemic in South Africa is based primarily on the prevalence data collected annually from pregnant women attending public antenatal clinics (ANC) since 1990. However antenatal surveillance data produce biased prevalence estimates for the general population because only a select group of people (i.e. pregnant women attending public health services) are included in the sample. To correct this bias we adjusted the ANC prevalence estimates by adjusting for relative attendance rates at antenatal clinics and for the difference in prevalence between pregnant women and the general adult population. For a detailed description of the adjustment see: www.statssa.gov.za.

Antiretroviral therapy (ART) for adults and children

Those who become infected with HIV do not need treatment with antiretroviral drugs immediately. There is an asymptomatic period during which the body's immune system controls the HIV infection. After some time the rapid replication of the virus overwhelms the immune system and the patient is in need of antiretroviral treatment (USAID Health Policy Initiative, 2009).

The WHO recommends that cotrimoxazole be provided to all children born to HIV+ mothers until their status can be determined. With normal antibody tests a child's HIV status cannot be determined until 18 months of age because the mother's antibodies are present in the child's blood. Thus all children born to HIV-positive mothers should receive cotrimoxazole until 18 months. For children aged between 18 months and 5 years the WHO recommends cotrimoxazole should be provided to all children who are HIV positive. After the age of 5 years children should be on cotrimoxazole if they have progressed to Stage III or IV. If early diagnosis is available then only HIV-positive children are considered in need of cotrimoxazole (USAID Health Policy Initiative, 2009).

Table 3: Estimated number of adults receiving ART and the percentage of children receiving ART and cotrimoxazole, 2005–2009

	Adults (15+ years)	Children	
		Estimated percentage receiving ART	Estimated percentage receiving cotrimoxazole
2005	133 000	7	2
2006	239 000	8	4
2007	424 000	12	12
2008	679 000	29	21
2009	920 000	38	29

Median time from HIV infection to death

This release assumed the median time from HIV infection to death in line with the UNAIDS Reference Group recommendation of 10,5 years for men and 11,5 years for women.

Ratio of new infections

Adult HIV incidence is disaggregated into female and male incidence by specifying the ratio of new female infections to new male infections. This report assumes a ratio of female to male prevalence for those aged 15–49 of 1,5 by 2010.

HIV prevalence

Table 4 shows the prevalence estimates and the total number of people living with HIV from 2001 to 2010. The total number of persons living with HIV in South Africa increased from an estimated 4,10 million in 2001 to 5,24 million by 2010. For 2010 an estimated 10,5% of the total population is HIV positive. Shisana, et al. (2009) estimated the HIV prevalence for 2008 at 10,9%. Approximately one-fifth of South African women in their reproductive ages are HIV positive.

Table 4: HIV prevalence estimates and the number of people living with HIV, 2001–2010

Year	Population 15–49 years		Percentage of the total population	Total number of people living with HIV (in millions)
	Percentage of women	Percentage of the population		
2001	18,7	15,4	9,4	4,10
2002	19,2	15,8	9,6	4,38
2003	19,4	16,1	9,8	4,53
2004	19,6	16,3	9,9	4,64
2005	19,7	16,5	10,0	4,74
2006	19,7	16,6	10,1	4,85
2007	19,7	16,7	10,2	4,93
2008	19,7	16,9	10,3	5,02
2009	19,6	17,0	10,3	5,11
2010	19,7	17,3	10,5	5,24

International migration

This release assumes an inflow of 1,3 million for the Black/Africa population since 1996. For the same period it assumes an out-migration of 440 000 whites.

Expectation of life at birth and Total fertility

This report makes assumptions about life expectancy at birth by sex and uses a model life table of age-specific mortality rates. Stats SA used the UN East Asia model life tables. Table 5 shows the life expectancies used to generate survival ratios from the UN East Asia model life tables. It also shows the estimates of the fertility assumptions and the infant mortality rates associated with the given mortality pattern. Life expectancy at birth had declined between 2001 and 2005 but has since increased partly due to the roll-out of antiretrovirals. For 2010 life expectancy at birth is estimated at 53,3 years for males and 55,2 years for females. This increase in life expectancy at birth is expected to continue.

While still high, infant mortality has declined from an estimated 57 live births per 1 000 in 2001 to 47 per 1 000 live births in 2010.

Fertility has declined from an average of 2,86 children per woman in 2001 to 2,38 children in 2010.

Table 5: Assumptions about fertility, life expectancy and infant mortality levels, 2001–2010

	Crude birth rate	Total fertility rate (TFR)	Male life expectancy at birth	Female life expectancy at birth	Infant mortality rate (IMR)	Crude death rate
2001	25,43	2,86	52,7	56,6	56,9	11,6
2002	25,03	2,81	51,6	55,0	56,4	12,4
2003	24,61	2,75	50,9	53,8	56,0	13,2
2004	24,16	2,70	50,3	52,8	55,4	13,8
2005	23,71	2,65	50,3	52,6	54,6	14,1
2006	23,27	2,59	50,8	52,9	52,4	14,2
2007	22,78	2,54	51,4	53,4	51,3	14,1
2008	22,28	2,48	52,5	54,6	49,3	13,7
2009	21,81	2,43	53,2	55,3	48,2	13,6
2010	21,33	2,38	53,3	55,2	46,9	13,9

3. National population estimates

Table 6 shows the mid-year estimates by population group and sex. The mid-year population is estimated at 49,99 million. The Black Africans are in the majority (39,68 million) and constitute just more than 79% of the total South African population. The white population is estimated at 4,58 million, the coloured population at 4,42 million and the Indian/Asian population at 1,30 million. Fifty-one per cent (25,66 million) of the population is female.

Table 6: Mid-year estimates by population group and sex, 2010

Population group	Male		Female		Total	
	Number	Percentage of total population	Number	Percentage of total population	Number	Percentage of total population
African	19 314 500	79,4	20 368 100	79,4	39 682 600	79,4
Coloured	2 124 900	8,7	2 299 200	9,0	4 424 100	8,8
Indian/Asian	646 600	2,7	653 300	2,5	1 299 900	2,6
White	2 243 000	9,2	2 341 700	9,1	4 584 700	9,2
Total	24 329 000	100,0	25 662 300	100,0	49 991 300	100,0

Table 7 shows that the implied rate of growth for the South African population has declined between 2001 and 2010. The estimated overall growth rate declined from approximately 1,40% between 2001–2002 to 1,06% for 2009–2010. The growth rate for females is lower than that of males.

Table 7: Estimated annual population growth rates, 2001–2010

	2001–2002	2002–2003	2003–2004	2004–2005	2005–2006	2006–2007	2007–2008	2008–2009	2009–2010
Male	1,53	1,43	1,34	1,30	1,27	1,25	1,26	1,25	1,18
Female	1,29	1,18	1,08	1,03	1,00	0,99	1,00	1,01	0,94
Total	1,40	1,30	1,21	1,16	1,13	1,11	1,13	1,12	1,06

Selected indicators

Tables 8, 9 and 10 show estimates for selected indicators¹.

Table 8: Births and deaths for the period 2001–2010

	Number of births	Total number of deaths	Total number of AIDS deaths	Percentage AIDS deaths
2001	1 142 909	526 052	198 030	37,6
2002	1 140 844	569 535	236 390	41,5
2003	1 136 390	609 562	271 488	44,5
2004	1 129 598	645 371	302 530	46,9
2005	1 121 455	661 664	314 196	47,5
2006	1 113 087	666 473	314 309	47,2
2007	1 101 612	662 969	306 154	46,2
2008	1 089 916	646 187	284 658	44,1
2009	1 078 767	637 301	270 107	42,1
2010	1 066 401	654 360	281 404	43,0

From the Spectrum model, the need for ART may be determined. These estimates are shown in Table 9. The need for ART has increased between 2005 and 2010. By 2010 it is estimated that approximately 1,6 million people are in need of ART.

Table 9: Number of persons in need for ART, 2005–2010

Year	Adults (15+ years)	Children
2005	1 069 000	93 000
2006	1 153 000	99 000
2007	1 238 000	129 000
2008	1 332 000	132 000
2009	1 438 000	139 000
2010	1 555 000	183 000

Table 10: Other HIV related estimates, 2010

Indicator	Estimate
AIDS orphans	1,99 million
Number of new HIV infections among adults aged 15+	370 000
New infections among children	40 000

Table 11 shows the 2010 mid-year population estimates by age, sex and population group for the medium variant. Approximately one-third of the population is aged 0–14 years and approximately 7,6% is 60 years and older.

¹ Births, deaths and AIDS deaths as well as the need for ART and the estimated number of orphans refer to events from July_{t-1} to July_t. New infections refer to events during the calendar year.

Table 11: Mid-year population estimates by population group age and sex, 2010

Total	19 314 500	20 368 100	39 682 600	2 124 900	2 299 200	4 424 100	646 600	653 300	1 299 900	2 243 000	2 341 700	4 584 700	24 329 000	25 662 300	49 991 300

All numbers have been rounded off to the nearest hundred and may therefore lead to small differences in the overall totals by age and sex.

4. Provincial population estimates

When provincial population estimates are desired and the appropriate data are available a multi-regional approach should be considered as this is the only way to guarantee that the total migration flows between regions will sum to zero (United Nations, 1992). The methods developed for this purpose by Willekens and Rogers (1978) have not been widely used in developing countries, partly due to the lack of adequate migration data and the difficulty of applying these methods.

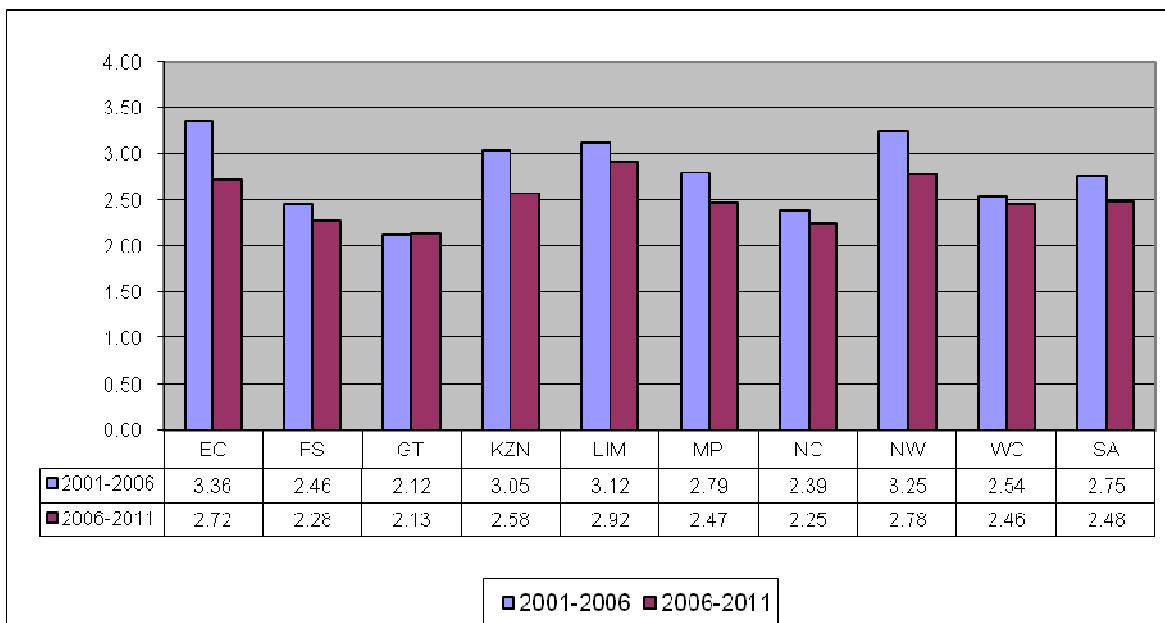

Multi-regional methods require the estimation of separate age-specific migration rates between every region of the country and every other region and such detailed data are rarely available. Although it is possible to estimate some of the missing data (see Willekens et al., 1979) the task of preparing data can become overwhelming if there are many regions. If there are only a few streams however the multi-regional method is the best method to use. In South Africa 2448 (9x8x17x2) migration streams are derived if the multi-regional model is applied in calculating migration streams by age group (17 in total) and sex for each of the nine provinces.

The cohort-component approach suggested by the United Nations (United Nations, 1992) was used to undertake the provincial projections for this report. The programming was done through JMP script language (JSL). JMP was developed by the SAS Institute Inc. JMP is not a part of the SAS System though portions of JMP were adapted from routines in the SAS System particularly for linear algebra and probability calculations. Version 8.01 was used to develop the projection for the 2010 provincial mid-year estimates and used the matrix algebra approach. A detailed description of the methodology that Stats SA used for the provincial projections is available at: www.statssa.gov.za

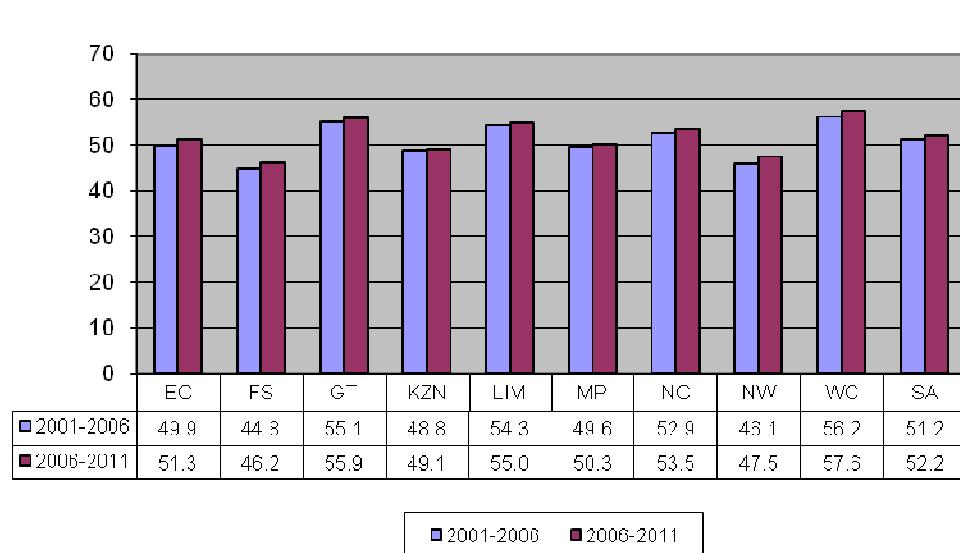

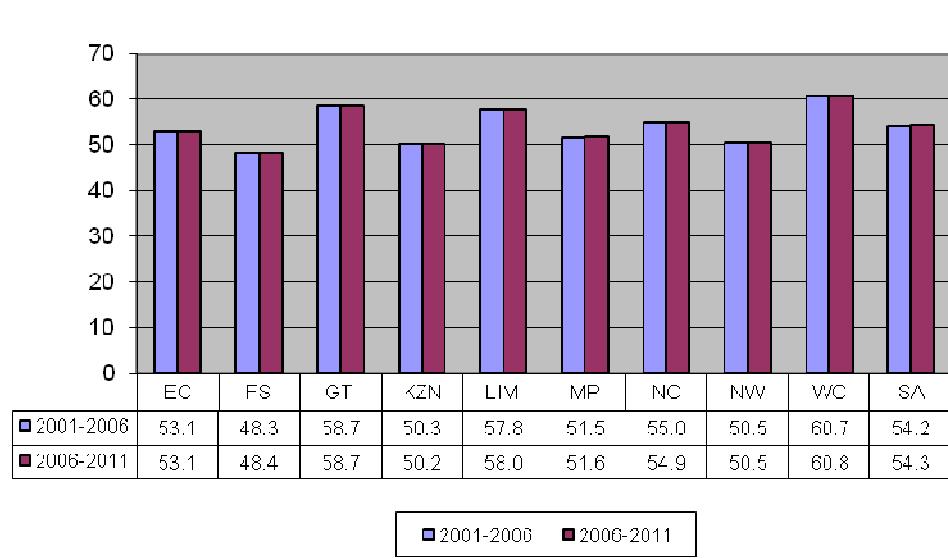

4.1 Demographic assumptions

Figure 1 shows the provincial average total fertility rates for the periods 2001–2006 and 2006–2011. For all the provinces it was assumed that the total fertility rates will decline, although the decline in Western Cape was much smaller and Gauteng experienced a slight increase. This was expected because the rates of these two provinces were already on low levels.

Figure 1: Provincial average total fertility rates for the periods 2001–2006 and 2006–2011

Figures 2 and 3 show the average provincial life expectancies at birth for males and females for the periods 2001–2006 and 2006–2011. The assumptions for this projection were that Western Cape has the highest life expectancy at birth for both males and females; while the Free State has the lowest life expectancy at birth.

Figure 2: Provincial average life expectancy at birth, 2001–2006 and 2006–2011 (males)**Figure 3: Provincial average life expectancy at birth, 2001–2006 and 2006–2011 (females)**

4.2 Provincial distributions

Table 12 shows the estimated percentage of the total population residing in each of the provinces from 2001 to 2010. The provincial estimates show that since 2004 Gauteng had the largest share of the population followed by KwaZulu-Natal and Eastern Cape. Approximately 10% of South Africa's population lives in Western Cape. Northern Cape has the smallest population. Free State has the second smallest share of the South African population, constituting approximately 6% of the population.

Table 12: Percentage distribution of the projected provincial share of the total population 2001–2010

	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
Eastern Cape	14,3	14,2	14,1	14,0	13,9	13,9	13,8	13,7	13,6	13,5
Free State	6,1	6,1	6,0	6,0	5,9	5,8	5,8	5,7	5,7	5,7
Gauteng	21,0	21,2	21,3	21,5	21,7	21,8	21,9	22,1	22,2	22,4
KwaZulu-Natal	21,3	21,3	21,3	21,3	21,4	21,4	21,4	21,4	21,3	21,3
Limpopo	11,1	11,0	11,0	11,0	10,9	10,9	10,9	10,9	10,9	10,9
Mpumalanga	7,4	7,4	7,4	7,4	7,4	7,3	7,3	7,3	7,3	7,2
Northern Cape	2,4	2,4	2,4	2,3	2,3	2,3	2,3	2,2	2,2	2,2
North West	6,6	6,5	6,5	6,5	6,5	6,5	6,4	6,4	6,4	6,4
Western Cape	9,8	9,8	9,9	10,0	10,1	10,2	10,2	10,3	10,4	10,4
Total	100,0									

4.3 Migration patterns

From Census 2001 and the Community Survey that Stats SA undertook in 2007, it was possible to determine out-migration rates for each province. Applying these rates to the age-structures of the province, it was possible to establish migration streams between the provinces. The result of these analyses is shown in Table 13 below. Although the assumptions still implies that Gauteng and Western are the only provinces that receive migrants, the number of migrants is lower in comparison to the estimates in the 2009 release. The Eastern Cape and Limpopo experienced the largest outflow.

4.4 Provincial estimates by age and sex

Table 14 shows the detailed provincial population estimates by age and sex. Where necessary the totals by age were reconciled with the national totals for males and females separately².

Nearly one-third (31,4%) of the population is younger than 15 years and approximately 7 5% (3,7 million) is 60 years or older. Of those younger than 15 years approximately 23% (3,54 million) live in KwaZulu-Natal and 17,9% (2,78 million) live in Gauteng. The smallest province Northern Cape has nearly one-third (32%) of its population aged younger than 15 years.

² Due to the rounding off of data in the tables to the nearest 100, the population totals by sex and age may not always correspond with the totals presented elsewhere.

Table 13: Estimated provincial migration streams, 2006–2011

Province In 2006	Province in 2011								Out- migration	In-migration	Net migration
