# **International Alloy Designations and Chemical Composition Limits for Wrought Aluminum and Wrought Aluminum Alloys**

1525 Wilson Boulevard, Arlington, VA 22209  
[www.aluminum.org](http://www.aluminum.org)

**With Support for On-line Access From:**  
Aluminum Extruders Council  
Aluminium Federation of South Africa  
Australian Aluminium Council Ltd.  
European Aluminium Association  
Japan Aluminium Association  
Alro S.A., Romania

**Revised:** February 2009

**Supersedes:** April 2006

### ***Use of the Information***

*The Aluminum Association has used its best efforts in compiling the information contained in this publication. Although the Association believes that its compilation procedures are reliable, it does not warrant, either expressly or impliedly, the accuracy or completeness of this information. The Aluminum Association assumes no responsibility or liability for the use of the information herein.*

*All Aluminum Association published standards, data, specifications and other material are reviewed at least every five years and revised, reaffirmed or withdrawn. Users are advised to contact The Aluminum Association to ascertain whether the information in this publication has been superseded in the interim between publication and proposed use.*

DECLARATION OF ACCORD .....	28

## FOREWORD

Listed herein are designations and chemical composition limits for wrought aluminum and wrought aluminum alloys registered with The Aluminum Association. Numerical designations are assigned in accordance with the *Recommendation—International Designation System for Wrought Aluminum and Wrought Aluminum Alloys*, which is printed on pages 25 through 27. Additions may be made in accordance with the rules outlined in the Declaration of Accord printed on page 28, and alloys will be deleted when no longer in commercial use (see table of inactive alloys printed on pages 21-22).

Since the International Designation System for Wrought Aluminum and Wrought Aluminum Alloys is based on USA's national standard "*American National Standard Alloy and Temper Designation System for Aluminum ANSI H35.1*," the system limits introduction of experimental alloy compositions to USA registrations. An experimental alloy registered by USA under this system is indicated by the prefix "X" and is subject to the following rules:

1. A composition shall not be designated as experimental ("X") for more than five years.
2. During its experimental status, the registering organization may request changes in the composition limit of the alloy, provided that it does not invalidate any assigned designation.
3. The "X" is dropped when the alloy is no longer experimental.
4. An experimental composition that is inactivated shall retain the prefix "X" for the duration of its inactive status. If reactivated, the "X" shall be removed.

**Some of the registered alloys may be the subject of patent or patent applications, and their listing herein is not to be construed in any way as the granting of a license under such patent right.**

A list of the organizations that are signatories to the Declaration of Accord on the Recommendation is printed on pages ii-iii.

## SIGNATORIES TO THE DECLARATION OF ACCORD

The following organizations are signatories to the Declaration of Accord on an International Alloy Designation System for Wrought Aluminum and Wrought Aluminum Alloys which is printed on page 28 of this publication.

## FOOTNOTES

1. Composition in weight percent maximum unless shown as a range or a minimum. Standard limits for alloying elements and impurities are expressed to the following places:

Less than 0.001 percent .....	0.000X
0.001 but less than 0.01.....	0.00X
0.01 but less than 0.10 percent Unalloyed aluminum made by a refining process.....	0.0XX
Alloys and unalloyed aluminum not made by a refining process.....	0.X
0.10 through 0.55 percent..... (It is customary to express limits of 0.30 percent through 0.55 percent as 0.X0 or 0.X5).	0.XX
Over 0.55 percent..... (except that combined Si +Fe limits for 1xxx designations must be expressed as 0.XX or 1.XX).	.X, X.X., etc.

2. Except for "Aluminum" and "Others," analysis normally is made for elements for which specific limits are shown. For purposes of determining conformance to these limits, an observed value or calculated value obtained from analysis is rounded off to the nearest unit in the last right hand place of figures used in expressing the specified limit, in accordance with the following:

When the figure next beyond the last figure or place to be retained is less than 5, the figure in the last place retained should be kept unchanged.

When the figure next beyond the last figure or place to be retained is greater than 5, the figure in the last place retained should be increased by 1.

When the figure next beyond the last figure or place to be retained is 5 and

- (1) there are no figures or only zeros beyond this 5, if the figure in the last place to be retained is odd, it should be increased by 1; if even, it should be kept unchanged;
- (2) if the 5 next beyond the figure in the last place to be retained is followed by any figures other than zero, the figure in the last place retained should be increased by 1, whether odd or even.

3. The sum of those "Others" metallic elements 0.010 or more each, expressed to the second decimal before determining the sum.

4. The aluminum content for unalloyed aluminum not made by a refining process is the difference between 100.00 percent and the sum of all other analyzed metallic elements together with silicon present in amounts of 0.010 percent or more each, expressed to the second decimal before determining the sum. For alloys and unalloyed aluminum not made by a refining process, when the specified maximum limit is 0.XX, an observed value or a calculated value greater than 0.005 but less than 0.010% is rounded off and shown as "less than 0.01".

5. The aluminum content for unalloyed aluminum made by a refining process is the difference between 100.00 percent and the sum of all other metallic elements together with silicon present in amounts of 0.0010 percent or more each, expressed to the third decimal before determining the sum, which is rounded to the second decimal before subtracting. When an element's specified maximum limit is 0.0XX, an observed value or a calculated value greater than 0.0005 but less than 0.0010% is rounded off and shown as "less than 0.001".

6. 0.0003 max Be for welding electrode, welding rod and filler wire.

7. A Zr+Ti limit of 0.20 percent maximum may be used with this alloy designation for extruded and forged products only, but only when the supplier or producer and the purchaser have mutually so agreed. Agreement may be indicated, for example, by reference to a standard, by letter, by order note, or other means which allow the Zr+Ti limit.

8. This designation is considered the sole original alloy for this alloy family.

9. 45-65% of Mg.

10. A Zr +Ti limit of 0.25 percent maximum may be used with this alloy designation for extruded and forged products only, but only when the supplier or producer and the purchaser have mutually so agreed.

Agreement may be indicated, for example, by reference to a standard, by letter, by order note, or other means which allow the Zr +Ti limit.

11. Formerly designated EC.

12. Inactive alloys can be reactivated with their original designation and original chemical composition limits. When possible, the original chemical composition limits shall be restored. An inactive experimental alloy can only be reactivated if the "X" is dropped. Inactive designations may be eligible for reassignment for registration of new compositions only if:

- (a) All available designations in this alloy family have been exhausted.
- (b) Ten (10) years have passed from the date of deactivation.
- (c) The alloy is not an "original" alloy. (Note: An inactive "original" alloy may be eligible for registration of new compositions with different limits if it has neither active nor inactive modification nor national variations assigned.)

13. "Others" includes listed elements for which no specific limit is shown as well as unlisted metallic elements. The producer may analyze samples for trace elements not specified in the registration or specification. However, such analysis is not required and may not cover all metallic "other" elements. Should any analysis by the producer or the purchaser establish that an "others" element exceeds the limit of "Each" or that the aggregate of several "others" elements exceeds the limit of Total, the material shall be considered non-conforming.

14. Alloy 5056A redesignated 5019.

15. Cladding is a main use.

16. 0.0005 max Be for welding electrode, welding rod and filler wire.

17. Various organizations include a prefix to these registered designations that do not change the registered composition and should be considered equivalent to those listed in this document. Examples of such equivalent designations are the AW-xxxx used in European EN standards and the A9xxxx designations used in the Unified Numbering System.

18. Designation listed for informational purposes only. Alloy 6064 is considered the sole original alloy for this alloy family.

+ Designation added since previous issue.

++ Composition limits revised since previous issue.

\* "X" removed from designation since previous issue.

## CALCULATED NOMINAL DENSITIES FOR ACTIVE WROUGHT ALUMINUM AND WROUGHT ALUMINUM ALLOYS

Density is dependent upon composition and nominal density is determined by computation rather than by a weight method. The values shown below have been computed in accordance with the Aluminum and Aluminum Alloy Density Calculation Procedure appearing on pages 2-12 and 2-13 of Aluminum Standards and Data. These calculated densities are nominal values and should not be specified as engineering requirements but may be used in calculating nominal values for weight per unit length, weight per unit area, covering area, etc.

Limiting the expression of nominal density to the number of decimal places indicated is based on the fact that composition variations are discernible from one cast to another for most alloys. The expression of nominal density to more decimal places than allowed by the following implies higher precision than is justified and should not be used.

1. Alloys listed below which have a minimum aluminum content of 99.35% or greater have nominal density values which are rounded in the US customary system (lbs/in.<sup>3</sup>) to the nearest multiple of 0.0005 and in the metric system [(kg/m<sup>3</sup>) x 10<sup>3</sup>] to the nearest multiple of 0.005.
2. Alloys listed below which have a minimum aluminum content of less than 99.35% have nominal density values which are rounded in the US customary system (lbs/in.<sup>3</sup>) to the nearest multiple of 0.001 and in the metric system [(kg/m<sup>3</sup>) x 10<sup>3</sup>] to the nearest multiple of 0.01.

The US customary (lbs/in.<sup>3</sup>) unit values are derived from metric values and subsequently rounded and are not to be back-converted to metric values.

\*Source: ISO 209-1.

NOTE: This table is included for informational purposes only. ISO 209-1 has been withdrawn and replaced by ISO 209 which references the Teal Sheets as the normative reference and the source for international alloy designations.

This Recommendation is based on the numerical designation system for wrought aluminum and wrought aluminum alloys which was adopted in the U.S.A. in 1954, and became its national standard in 1957. This Recommendation was officially adopted by the International Signatories of the Declaration of Accord on December 15, 1970.

Designations in accordance with this Recommendation may be used by any country, but there is no obligation to use them. For use, see Appendixes A, B, and C.

A numerical designation assigned in conformance with this Recommendation should only be used to indicate an aluminum or an aluminum alloy having chemical composition limits identical to those registered with the Signatories to the Declaration of Accord on an International Alloy Designation System for Wrought Aluminum and Wrought Aluminum Alloys.

### 1. Scope

This recommendation describes a four-digit numerical system for designating wrought aluminum and wrought aluminum alloys.

### 2. Alloy Groups

The first of the four digits in the designation indicates the alloy group as follows:

Aluminum, 99.00 percent and greater.....	1xxx
Aluminum alloys grouped by major alloying elements <sup>1,2,3</sup>	
Copper .....	2xxx
Manganese .....	3xxx
Silicon .....	4xxx
Magnesium .....	5xxx
Magnesium and Silicon .....	6xxx
Zinc .....	7xxx
Other elements .....	8xxx
Unused series .....	9xxx

### 3. 1xxx Group

The designation assigned shall be in the 1xxx group whenever the minimum aluminum content is specified as 99.00 percent and greater. In the 1xxx group, the last two of the four digits in the designation indicate the minimum aluminum percentage<sup>4</sup>. These digits are the same as the two digits to the right of the decimal point in minimum aluminum percentage when it is expressed to the nearest 0.01 percent. The second digit in the alloy designation indicates alloy modifications in impurity limits or alloying elements. If the second digit in the designation is zero, it indicates unalloyed aluminum having natural impurity limits; integers 1 through 9, which are assigned consecutively as needed, indicate special control of one or more individual impurities or alloying elements.

### 4. 2xxx-8xxx Groups

The alloy designation in the 2xxx through 8xxx groups is determined by the alloying element ( $Mg_2Si$  for 6xxx alloys) present in the greatest mean percentage. If the greatest mean percentage is common to more than one alloying element, choice of group will be in order of group sequence Cu, Mn, Si, Mg,  $Mg_2Si$ , Zn or Others. In the 2xxx through 8xxx alloy groups the last two of the four digits in the designation have no special significance but serve only to identify the different aluminum alloys in the group. The second digit in the alloy designation indicates the original alloy<sup>5</sup> and alloy modifications; integers 1 through 9, which are assigned consecutively, indicate alloy modifications.

### 5. Modifications

A modification of the original alloy<sup>5</sup> is limited to any one or a combination of the following:

- (a) Change of not more than the following amounts in the arithmetic mean of the limits for an individual alloying element or combination of elements expressed as an alloying element or both:

Arithmetic Mean of Limits for Alloying Elements in Original Alloy	Maximum Change
Up through 1.0 percent	0.15
Over 1.0 through 2.0 percent	0.20
Over 2.0 through 3.0 percent	0.25
Over 3.0 through 4.0 percent	0.30
Over 4.0 through 5.0 percent	0.35
Over 5.0 through 6.0 percent	0.40
Over 6.0 percent	0.50

To determine compliance when maximum and minimum limits are specified for a combination of two or more elements in one alloy composition, the arithmetic mean of such combination is compared to the sum of the mean values of the same individual elements, or any combination thereof, in another alloy composition.

- (b) Addition or deletion of not more than one alloying element with limits having an arithmetic mean of not more than 0.30 percent, or addition or deletion of not more than one combination of elements expressed as an alloying element with limits having a combined arithmetic mean of not more than 0.40 percent.
- (c) Substitution of one alloying element for another element serving the same purpose.
- (d) Change in limits for impurities expressed singly or as a combination.
- (e) Change in limits for grain refining elements.
- (f) Maximum iron or silicon limits of 0.12 percent and 0.10 percent, or less, respectively, reflecting high purity base metal.

An alloy should not be registered as a modification if it meets the requirements for a national variation.

### 6. National Variations

National variations of wrought aluminum and wrought aluminum alloys registered by another country in accordance with this Recommendation are identified by a serial letter after the numerical designation. The serial letters are assigned in alphabetical sequence starting with A for the first national variation registered, but omitting I, O, and Q.

A national variation has composition limits which are similar but not identical to a modification or an original alloy registered by another country, with differences such as:

- (a) Differences in arithmetic mean of limits for an individual alloying element or combination of elements expressed as an alloying element, or both, not exceeding the following amounts:

Arithmetic Mean of Limits for Alloying Elements in Original Alloy or Modification	Maximum Difference
Up through 1.0 percent	0.15
Over 1.0 through 2.0 percent	0.20
Over 2.0 through 3.0 percent	0.25
Over 3.0 through 4.0 percent	0.30
Over 4.0 through 5.0 percent	0.35
Over 5.0 through 6.0 percent	0.40
Over 6.0 percent	0.50

To determine compliance when maximum and minimum limits are specified for a combination of two or more elements in one alloy composition, the arithmetic mean of such combination is compared to the sum of the mean values of the same individual elements, or any combination thereof, in another alloy composition.

- (b) Substitution of one alloying element for another element serving the same purpose.
- (c) Different limits of impurities except for low iron. Iron maximum of 0.12 percent or less, reflecting high purity base metal, should be considered an alloy modification. See 5(f).
- (d) Different limits on grain refining elements.
- (e) Inclusion of a minimum limit for iron or silicon, or both.

An alloy meeting these requirements should not be registered as a new alloy or alloy modification.

See footnotes on page 26

## RECOMMENDATION - FOOTNOTES

1. For codification purposes an alloying element is any element which is intentionally added for any purpose other than grain refinement and for which minimum and maximum limits are specified.

2. Standard limits for alloying elements and impurities are expressed to the following places:

Less than 0.001 percent .....	0.000X
0.001 but less than 0.01 percent .....	0.00X
0.01 but less than 0.10 percent .....	0.0XX
Unalloyed aluminum made by a refining process .....	0.0XX
Alloys and unalloyed aluminum not made by a refining process .....	0.X
0.10 through 0.55 percent .....	0.XX
(It is customary to express limits of 0.30 through 0.55 percent as 0.X0 or 0.X5.)	
Over 0.55 percent .....	0.X; X.X; etc. (except that combined Si+ Fe limits for 1xxx designations must be expressed as 0.XX or 1.XX)

3. Standard limits for alloying elements and impurities are expressed in the following sequence: Silicon; Iron; Copper; Manganese; Magnesium; Chromium; Nickel; Zinc; Titanium (See Note 1); Other (See Note 2) Elements, Each; Other Elements, Total; Aluminum (See Note 3).

Note 1—Additional specified elements having limits are inserted in alphabetical order by their chemical symbols between Titanium and Other Elements, Each, or are specified in footnotes.

Note 2—"Others" includes listed elements for which no specific limit is shown as well as unlisted metallic elements. The producer may analyze samples for trace elements not specified in the registration or specification; however, such analysis is not required and may not cover all metallic "Others" elements. Should any analysis by the producer or the purchaser establish that an "Others" element exceeds the limit of "Each" or that the aggregate of several "Others" elements exceeds the limit of "Total", the material shall be considered non-conforming.

Note 3—Aluminum is specified as minimum for unalloyed aluminum, and as a remainder for aluminum alloys.

4. The aluminum content for unalloyed aluminum made by a refining process is the difference between 100.00 percent and the sum of all other metallic elements together with silicon present in amounts of 0.0010 percent or more, each expressed to the third decimal before determining the sum, which is rounded to the second decimal before subtracting; for unalloyed aluminum not made by a refining process it is the difference between 100.00 percent and the sum of all other analyzed metallic elements together with silicon present in amounts of 0.010 percent or more, each expressed to the second decimal before determining the sum. For unalloyed aluminum made by a refining process, when the specified maximum limit is 0.0XX, an observed value or a calculated value greater than 0.0005 but less than 0.0010 percent is rounded off and shown as "less than 0.001". For alloys and unalloyed aluminum not made by a refining process, when the specified maximum limit is 0.XX, an observed value or a calculated value greater than 0.005 but less than 0.010 percent is rounded off and shown as "less than 0.01".

5. The term "original" alloy as used in the Registration Record is defined based on the following guidelines:

- (a) Only one alloy in any alloy family (having the same first, third and fourth digits) is considered the "original" alloy, and it is always used as the basis for registration of a modification.
- (b) All active and inactive alloys whose second digit is "0" are considered the "original" alloys for each specific alloy family.
- (c) For those alloy families with no second digit "0" registered, the alloy with the lowest second digit is considered the "original" alloy whether the alloy is active or inactive and a note (8)\* is added following the designation. No registration shall be granted for a designation with a lower second digit for these alloy families.
- (d) No designation changes are made to any and all of the currently registered original alloys whether active or inactive.

\* See footnote 8 on page 14.

**APPENDIX A**  
**USE OF DESIGNATIONS**

- A.1 All countries using designations in accordance with this Recommendation should use the same numerical designation for those wrought aluminum or wrought aluminum alloys having identical chemical composition limits. They should register the limits and the designations should be used by all other countries using these designations.
- A.2 A numerical designation should be used without a suffix letter to indicate the initial chemical composition limits registered for that numerical designation.
- A.3 A numerical designation should be used with a serial suffix letter to indicate chemical composition limits which are different from but closely similar to the initial chemical composition limits registered for that numerical designation by another country. Such designations shall be considered to be national variations.
- A.4 A new numerical designation should be assigned only for wrought aluminum or a wrought aluminum alloy having chemical composition limits significantly different from other wrought aluminum or wrought aluminum alloys for which designations have previously been assigned.
- A.5 Designations should be allotted in the following order of precedence:
  - A.5.1 The registered designation should be used if composition limits are identical to those previously registered by another country.
  - A.5.2 A suffix letter should be used with the previously registered numerical designation for an alloy if composition limits meet the requirements for a national variation.
  - A.5.3 The numerical designation for an alloy modification should be assigned if the composition limits meet the requirements for an alloy modification unless the limits also meet the requirements for a national variation.
  - A.5.4 A new numerical designation should be assigned only for a significantly different alloy composition exceeding the allowable limits for a national variation and modification from any original alloy and not meeting the requirements A.5.2 or A.5.3. In this case a number must be assigned which has not been used and which will not be assigned by any other country using numerical designations conforming to this Recommendation.

**APPENDIX B**  
**DEACTIVATION OF REGISTERED ALLOYS**

- B.1 All countries using designations in accordance with this Recommendation should review, at least once in every five years, the alloys registered by them to see if these alloys are still commercially active. If not, alloys should be proposed for deactivation. Any inactive alloy can still be reactivated when such need arises.

**APPENDIX C**

**GENERAL GUIDELINES FOR DETERMINING COMPLIANCE WITH "SALE OF ALLOY" AND  
"COMMERCIAL QUANTITY" FOR PURPOSES OF REGISTERING WROUGHT ALUMINUM  
AND WROUGHT ALUMINUM ALLOYS**  
**(See Declaration of Accord, Item 1)**

- C.1 Sale of Alloy
  - Sale of an alloy shall have been made to external users/customers (i.e., internal use and/or transfer of an alloy within a company does not meet the stated criteria).
- C.2 Commercial Quantity
  - C.2.1 The alloy has undergone bona fide mill production and is NOT a "laboratory" scale volume used for evaluations or experimental purposes.
  - C.2.2 The alloy is cast and fabricated in standard production facilities and is NOT a one-time production.
  - C.2.3 There is an expected and ongoing commercial demand and/or need for the alloy.
  - C.2.4 The alloy must be purchased and sold in a standard business context which indicates that the alloy is actually "sold" and not "given away" for uses such as promotional evaluations.

**DECLARATION OF ACCORD ON AN INTERNATIONAL  
ALLOY DESIGNATION SYSTEM FOR WROUGHT  
ALUMINUM AND WROUGHT ALUMINUM ALLOYS**

It is agreed by the parties hereto that the following rules will apply in assigning alloy designations in accordance with the recommendation dated December 15, 1970 and revised March 2008 for an International Designation System for Wrought Aluminum and Wrought Aluminum Alloys:

1. To be eligible for registration, an aluminum or aluminum alloy shall be offered for sale currently and shall have been supplied in the previous twelve months, in both cases in commercial quantities. The complete composition limits must be registered and the former designation if any, should be shown.
2. All requests for international registration must be submitted to The Aluminum Association by a signatory of the Declaration of Accord. The signatory, in carrying out this function, will endeavor to restrict registrations to those required for international, regional or national standards or standards of equivalent importance in the commercial field. In view of its historic usage of these designations, more latitude is ceded to The Aluminum Association in this regard.
3. It will be the duty of each signatory to inform all other signatories of proposed composition limits or proposed changes in limits. Number assignments will be made by The Aluminum Association when negotiations on composition limits are complete among all signatories to the Declaration of Accord.
4. No designation or chemical composition limits will become final until at least 60 days after announcement to all participating organizations. During this 60-day period, all questions and objections regarding the designation or chemical composition limits must be submitted; or an extension of the period must be requested. Technical objections must be substantially resolved prior to final registration.
5. Only the organization that registered the designation may make a change in chemical composition limits for the alloy, and when a change is proposed, all participating organizations must be notified and given 60 days to comment.
6. After the 60-day period the registering organization shall confirm the registered designation and the composition limits to each participating organization.
7. This Declaration of Accord may be executed in several counterparts and all so executed shall constitute one agreement.

**DECLARATION D'ACCORD SUR UN SYSTEME DE  
DESIGNATION INTERNATIONALE POUR L'ALUMINIUM  
CORROYÉ ET SES ALLIAGES**

Il est convenu entre les participants que les règles suivantes seront appliquées dans la désignation des alliages, en concordance avec la recommandation du 15 décembre 1970, révisée en mars 2008, pour un système de désignation internationale pour l'aluminium et ses alliages corroyés:

1. Pour être admis à l'enregistrement, un aluminium ou alliage d'aluminium doit être alors offert en vente et avoir été fourni au cours des douze derniers mois, en quantités commerciales dans les deux cas. Les limites de composition chimique et la désignation, s'il en existe une, doivent être enregistrées.
2. Toute demande d'enregistrement international doit être soumise à l'Aluminum Association par un signataire de la Déclaration d'Accord. Ledit signataire, dans l'exercice de cette fonction, s'appliquera à limiter les enregistrements à ceux requis pour les normes internationales, régionales ou nationales, ou autres normes d'importance équivalente dans le secteur commercial. Compte tenu de l'utilisation historique de ces désignations, l'Aluminum Association dispose à cet égard d'une assez grande latitude.
3. Il appartiendra à chaque signataire d'informer les organisations correspondantes de tous les pays participants des limites de composition proposées ou des changements proposés de ces limites. Les attributions de numéros seront effectuées par l'Aluminum Association dès l'achèvement des négociations sur les limites de composition par tous les signataires de la Déclaration d'Accord.
4. Aucune désignation ou limites de composition chimique ne deviendra définitive avant moins 60 jours à compter de la date l'information donnée aux organisations participantes. Durant ces 60 jours, toutes questions et objections concernant cette désignation ou limites de composition chimique devront être soumises; ou une extension de la période devra demandée. Toutes objections techniques devront être résolues de façon substantielle avant l'enregistrement final.
5. Seule l'organisation qui a enregistrée la désignation peut faire un changement dans les limites de composition chimique de l'alliage; lorsqu'un changement est proposé, toutes les organisations participantes doivent être avisées et doivent présenter leurs remarques sous 60 jours.
6. Après la période de 60 jours l'organisation enregistrante confirmera la désignation enregistrée et les limites de composition à chaque organisation participante.
7. Cette Déclaration d'Accord pourra être reproduite en plusieurs exemplaires tout en constituant un seul agrément.
