## Heat Pump Water Heater instead of Solar?

A heat pump is not as efficient as rooftop solar, but may be a cheaper option to install, and still save money on your electric bill. It is a viable alternative when considering your budget or when solar isn't practical. The ideal location for a heat pump is a room 10'x10'x7' or any open area such as a carport or garage.

## Use this checklist to help you through the Heat Pump Rebate Process.

- ✓ Have an existing electric, solar or heat pump water heater. (Propane water heaters and new construction do not qualify)
- ✓ Purchase a qualifying heat pump water heater and have it installed by a licensed plumber and participating contractor.
- ✓ Go to [www.kiuc.coop](http://www.kiuc.coop) to download a rebate application.
- ✓ Complete the application and return it to KIUC with a copy of the invoices showing purchase and installation prices.
- ✓ KIUC will process your request and mail you a rebate check for \$500 within 30-60 days.
