About This Document

The **ESP32-C3 Technical Reference Manual** is targeted at developers working on low level software projects that use the ESP32-C3 SoC. It describes the hardware modules listed below for the ESP32-C3 SoC and other products in ESP32-C3 series. The modules detailed in this document provide an overview, list of features, hardware architecture details, any necessary programming procedures, as well as register descriptions.

Navigation in This Document

Here are some tips on navigation through this extensive document:

- Release Status at a Glance on the very next page is a minimal list of all chapters from where you can directly jump to a specific chapter.
- Use the **Bookmarks** on the side bar to jump to any specific chapters or sections from anywhere in the document. Note this PDF document is configured to automatically display **Bookmarks** when open, which is necessary for an extensive document like this one. However, some PDF viewers or browsers ignore this setting, so if you don't see the **Bookmarks** by default, try one or more of the following methods:
  - Install a PDF Reader Extension for your browser;
  - Download this document, and view it with your local PDF viewer;
  - Set your PDF viewer to always automatically display the **Bookmarks** on the left side bar when open.
- Use the native **Navigation** function of your PDF viewer to navigate through the documents. Most PDF viewers support to go **Up**, **Down**, **Previous**, **Next**, **Back**, **Forward** and **Page** with buttons, menu, or hot keys.
- You can also use the built-in **GoBack** button on the upper right corner on each and every page to go back to the previous place before you click a link within the document. Note this feature may only work with some Acrobat-specific PDF viewers (for example, Acrobat Reader and Adobe DC) and browsers with built-in Acrobat-specific PDF viewers or extensions (for example, Firefox).

Release Status at a Glance

No.	ESP32-C3 Chapters	Progress	No.	ESP32-C3 Chapters	Progress

1 ESP-RISC-V CPU

1.1 Overview

ESP-RISC-V CPU is a 32-bit core based upon RISC-V ISA comprising base integer (I), multiplication/division (M) and compressed (C) standard extensions. The core has 4-stage, in-order, scalar pipeline optimized for area, power and performance. CPU core complex has an interrupt-controller (INTC), debug module (DM) and system bus (SYS BUS) interfaces for memory and peripheral access.

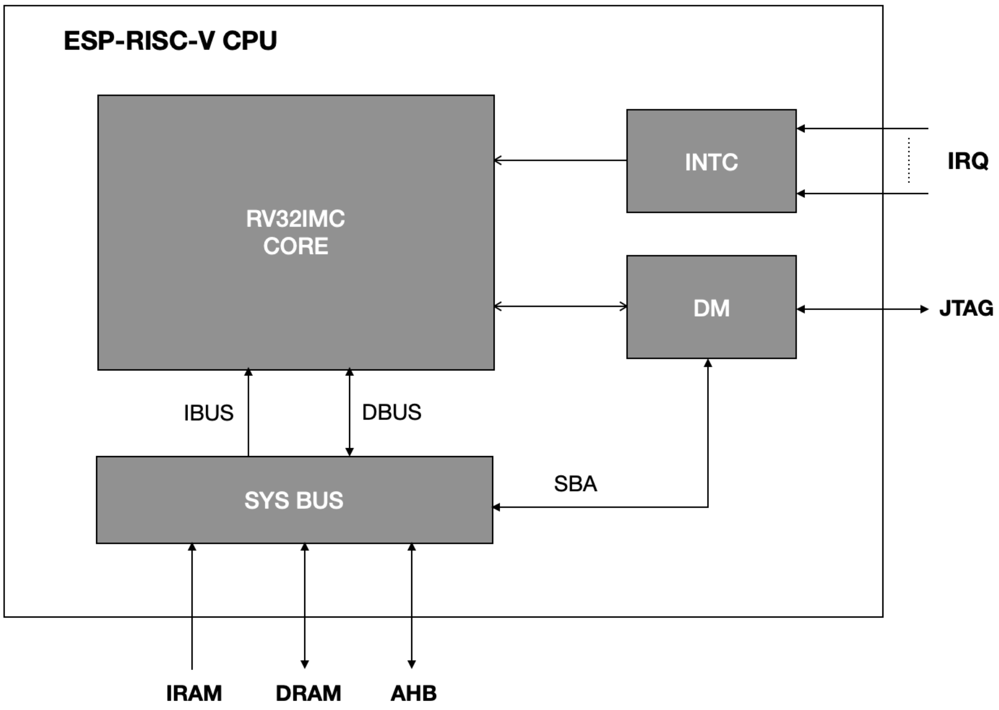

Figure 1-1. CPU Block Diagram

1.2 Features

- Operating clock frequency up to 160 MHz
- Zero wait cycle access to on-chip SRAM and Cache for program and data access over IRAM/DRAM interface
- Interrupt controller (INTC) with up to 31 vectored interrupts with programmable priority and threshold levels
- Debug module (DM) compliant with RISC-V debug specification v0.13 with external debugger support over an industry-standard JTAG/USB port
- Debugger direct system bus access (SBA) to memory and peripherals
- Hardware trigger compliant to RISC-V debug specification v0.13 with up to 8 breakpoints/watchpoints
- Physical memory protection (PMP) for up to 16 configurable regions
- 32-bit AHB system bus for peripheral access

- Configurable events for core performance metrics

1.3 Address Map

Below table shows address map of various regions accessible by CPU for instruction, data, system bus peripheral and debug.

Table 1-1. CPU Address Map

Name	Description	Starting Address	Ending Address	Access
IRAM	Instruction Address Map	0x4000_0000	0x47FF_FFFF	R/W
DRAM	Data Address Map	0x3800_0000	0x3FFF_FFFF	R/W
DM	Debug Address Map	0x2000_0000	0x27FF_FFFF	R/W
AHB	AHB Address Map	*default	*default	R/W

*default : Address not matching any of the specified ranges (IRAM, DRAM, DM) are accessed using AHB bus.

1.4 Configuration and Status Registers (CSRs)

1.4.1 Register Summary

Below is a list of CSRs available to the CPU. Except for the custom performance counter CSRs, all the implemented CSRs follow the standard mapping of bit fields as described in the RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10. It must be noted that even among the standard CSRs, not all bit fields have been implemented, limited by the subset of features implemented in the CPU. Refer to the next section for detailed description of the subset of fields implemented under each of these CSRs.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Machine Information CSRs			
mvendorid	Machine Vendor ID	0xF11	RO
marchid	Machine Architecture ID	0xF12	RO
mimpid	Machine Implementation ID	0xF13	RO
mhartid	Machine Hart ID	0xF14	RO
Machine Trap Setup CSRs			
mstatus	Machine Mode Status	0x300	R/W
misa [1]	Machine ISA	0x301	R/W
mtvec [2]	Machine Trap Vector	0x305	R/W
Machine Trap Handling CSRs			
mscratch	Machine Scratch	0x340	R/W
mepc	Machine Trap Program Counter	0x341	R/W
mcause [3]	Machine Trap Cause	0x342	R/W

[1] Although misa is specified as having both read and write access (R/W), its fields are hardwired and thus write has no effect. This is what would be termed WARL (Write Any Read Legal) in RISC-V terminology

[2] mtvec only provides configuration for trap handling in vectored mode with the base address aligned to 256 bytes

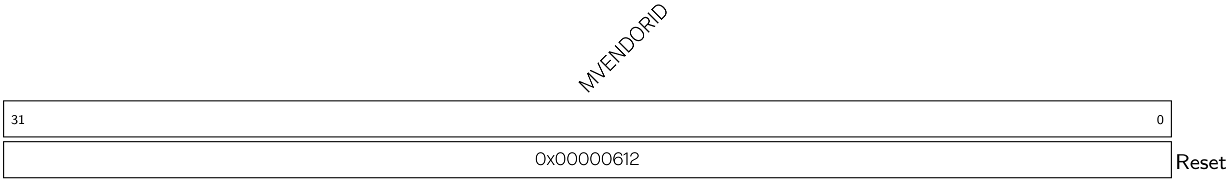
[3] External interrupt IDs reflected in mcause include even those IDs which have been reserved by RISC-V standard for core internal sources.

Name	Description	Address	Access
mtval	Machine Trap Value	0x343	R/W
Physical Memory Protection (PMP) CSRs			
pmpcfg0	Physical memory protection configuration	0x3A0	R/W
pmpcfg1	Physical memory protection configuration	0x3A1	R/W
pmpcfg2	Physical memory protection configuration	0x3A2	R/W
pmpcfg3	Physical memory protection configuration	0x3A3	R/W
pmpaddr0	Physical memory protection address register	0x3B0	R/W
pmpaddr1	Physical memory protection address register	0x3B1	R/W
....			
pmpaddr15	Physical memory protection address register	0x3BF	R/W
Trigger Module CSRs (shared with Debug Mode)			
tselect	Trigger Select Register	0x7A0	R/W
tdata1	Trigger Abstract Data 1	0x7A1	R/W
tdata2	Trigger Abstract Data 2	0x7A2	R/W
tcontrol	Global Trigger Control	0x7A5	R/W
Debug Mode CSRs			
dcsr	Debug Control and Status	0x7B0	R/W
dpc	Debug PC	0x7B1	R/W
dscratch0	Debug Scratch Register 0	0x7B2	R/W
dscratch1	Debug Scratch Register 1	0x7B3	R/W
Performance Counter CSRs (Custom) [4]			
mpcer	Machine Performance Counter Event	0x7E0	R/W
mpcmr	Machine Performance Counter Mode	0x7E1	R/W
mpccr	Machine Performance Counter Count	0x7E2	R/W
GPIO Access CSRs (Custom)			
cpu_gpio_oen	GPIO Output Enable	0x803	R/W
cpu_gpio_in	GPIO Input Value	0x804	RO
cpu_gpio_out	GPIO Output Value	0x805	R/W

Note that if write/set/clear operation is attempted on any of the CSRs which are read-only (RO), as indicated in the above table, the CPU will generate illegal instruction exception.

1.4.2 Register Description

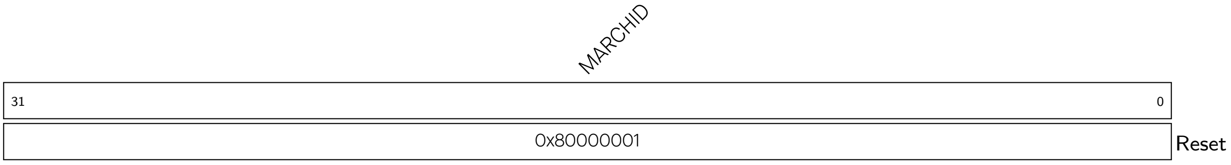
Register 1.1. mvendorid (0xF11)



MVENDORID Vendor ID. (RO)

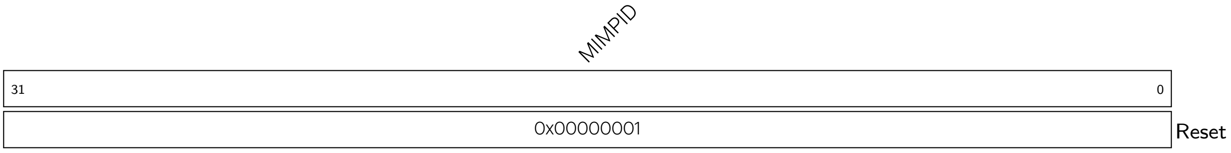
[4] These custom CSRs have been implemented in the address space reserved by RISC-V standard for custom use

Register 1.2. marchid (0xF12)



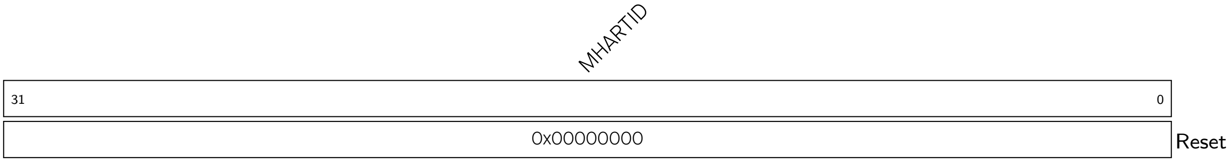
MARCHID Architecture ID. (RO)

Register 1.3. mimpid (0xF13)



MIMPID Implementation ID. (RO)

Register 1.4. mhartid (0xF14)



MHARTID Hart ID. (RO)

Register 1.5. mstatus (0x300)

(reserved)	TW	(reserved)	MPP	(reserved)	MPIE	(reserved)	MIE	(reserved)	
31 22	21	20 13	12 11	10 8	7	6 4	3	2 0	
0x000	0	0x00	0x0	0x0	0	0x0	0	0x0	Reset

MIE Global machine mode interrupt enable. (R/W)

MPIE Machine previous interrupt enable (before trap). (R/W)

MPP Machine previous privilege mode (before trap). (R/W)
Possible values:

- 0x0: User mode
- 0x3: Machine mode

Note : Only lower bit is writable. Write to the higher bit is ignored as it is directly tied to the lower bit.

TW Timeout wait. (R/W)
If this bit is set, executing WFI (Wait-for-Interrupt) instruction in User mode will cause illegal instruction exception.

Register 1.6. misa (0x301)

MXL	(reserved)	Z	Y	X	W	V	U	T	S	R	Q	P	O	N	M	L	K	J	I	H	G	F	E	D	C	B	A	
31 30	29 26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0x1	0x0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0	0	1	0	0	Reset

MXL Machine XLEN = 1 (32-bit). (RO)

Z Reserved = 0. (RO)

Y Reserved = 0. (RO)

X Non-standard extensions present = 0. (RO)

W Reserved = 0. (RO)

V Reserved = 0. (RO)

U User mode implemented = 1. (RO)

T Reserved = 0. (RO)

S Supervisor mode implemented = 0. (RO)

R Reserved = 0. (RO)

Q Quad-precision floating-point extension = 0. (RO)

P Reserved = 0. (RO)

O Reserved = 0. (RO)

N User-level interrupts supported = 0. (RO)

M Integer Multiply/Divide extension = 1. (RO)

L Reserved = 0. (RO)

K Reserved = 0. (RO)

J Reserved = 0. (RO)

I RV32I base ISA = 1. (RO)

H Hypervisor extension = 0. (RO)

G Additional standard extensions present = 0. (RO)

F Single-precision floating-point extension = 0. (RO)

E RV32E base ISA = 0. (RO)

D Double-precision floating-point extension = 0. (RO)

C Compressed Extension = 1. (RO)

B Reserved = 0. (RO)

A Atomic Extension = 0. (RO)

Register 1.7. mtvec (0x305)

BASE		(reserved)		MODE		
31	8	7	2	1	0	
0x000000		0x00		0x1		Reset

MODE Only vectored mode **0x1** is available. (RO)

BASE Higher 24 bits of trap vector base address aligned to 256 bytes. (R/W)

Register 1.8. mscratch (0x340)

MSCRATCH		
31	0	
0x00000000		Reset

MSCRATCH Machine scratch register for custom use. (R/W)

Register 1.9. mepc (0x341)

MEPC		
31	0	
0x00000000		Reset

MEPC Machine trap/exception program counter. (R/W)

This is automatically updated with address of the instruction which was about to be executed while CPU encountered the most recent trap.

Register 1.10. mcause (0x342)

Interrupt Flag	(reserved)		Exception Code		
31	30	5	4	0	
0	0x0000000		0x00		Reset

Exception Code This field is automatically updated with unique ID of the most recent exception or interrupt due to which CPU entered trap. (R/W)

Possible exception IDs are:

- 0x1: PMP Instruction access fault
- 0x2: Illegal Instruction
- 0x3: Hardware Breakpoint/Watchpoint or EBREAK
- 0x5: PMP Load access fault
- 0x7: PMP Store access fault
- 0x8: ECALL from U mode
- 0xb: ECALL from M mode

Note : Exception ID 0x0 (instruction access misaligned) is not present because CPU always masks the lowest bit of the address during instruction fetch.

Interrupt Flag This flag is automatically updated when CPU enters trap. (R/W)

If this is found to be set, indicates that the latest trap occurred due to interrupt. For exceptions it remains unset.

Note : The interrupt controller is using up IDs in range 1-31 for all external interrupt sources. This is different from the RISC-V standard which has reserved IDs in range 0-15 for core internal interrupt sources.

Register 1.11. mtval (0x343)

MTVAL		
31	0	
0x00000000		Reset

MTVAL Machine trap value. (R/W)

This is automatically updated with an exception dependent data which may be useful for handling that exception.

Data is to be interpreted depending upon exception IDs:

- 0x1: Faulting virtual address of instruction
- 0x2: Faulting instruction opcode
- 0x5: Faulting data address of load operation
- 0x7: Faulting data address of store operation

Note : The value of this register is not valid for other exception IDs and interrupts.

Register 1.12. mpcer (0x7E0)

(reserved)	INST_COMP	(BRANCH_TAKEN	BRANCH	JMP_UNCOND	STORE	LOAD	IDLE	JMP_HAZARD	LD_HAZARD	INST	CYCLE	
31 11	10	9	8	7	6	5	4	3	2	1	0	
0x000	0	0	0	0	0	0	0	0	0	0	0	Reset

INST_COMP Count Compressed Instructions. (R/W)

BRANCH_TAKEN Count Branches Taken. (R/W)

BRANCH Count Branches. (R/W)

JMP_UNCOND Count Unconditional Jumps. (R/W)

STORE Count Stores. (R/W)

LOAD Count Loads. (R/W)

IDLE Count IDLE Cycles. (R/W)

JMP_HAZARD Count Jump Hazards. (R/W)

LD_HAZARD Count Load Hazards. (R/W)

INST Count Instructions. (R/W)

CYCLE Count Clock Cycles. Cycle count does not increment during WFI mode. (R/W)

Note: Each bit selects a specific event for counter to increment. If more than one event is selected and occurs simultaneously, then counter increments by one only.

Register 1.13. mpcmr (0x7E1)

(reserved)	COUNT_SAT	COUNT_EN	
31 2	1	0	
0	1	1	Reset

COUNT_SAT Counter Saturation Control. (R/W)

Possible values:

- 0: Overflow on maximum value
- 1: Halt on maximum value

COUNT_EN Counter Enable Control. (R/W)

Possible values:

- 0: Disabled
- 1: Enabled

Register 1.14. mpccr (0x7E2)

MPCCR	
31 0	
0x00000000	Reset

MPCCR Machine Performance Counter Value. (R/W)

Register 1.15. cpu_gpio_oen (0x803)

(reserved)	CPU_GPIO_OEN[7]	CPU_GPIO_OEN[6]	CPU_GPIO_OEN[5]	CPU_GPIO_OEN[4]	CPU_GPIO_OEN[3]	CPU_GPIO_OEN[2]	CPU_GPIO_OEN[1]	CPU_GPIO_OEN[0]	
31 8	7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	0	Reset

CPU_GPIO_OEN GPIOn (n=0 ~ 21) Output Enable. CPU_GPIO_OEN[7:0] correspond to output enable signals cpu_gpio_out_oen[7:0] in Table 5-2 *Peripheral Signals via GPIO Matrix*. CPU_GPIO_OEN value matches that of cpu_gpio_out_oen.
CPU_GPIO_OEN is the enable signal of CPU_GPIO_OUT. (R/W)

- 0: GPIO output disable
- 1: GPIO output enable

Register 1.16. cpu_gpio_in (0x804)

(reserved)	CPU_GPIO_IN[7]	CPU_GPIO_IN[6]	CPU_GPIO_IN[5]	CPU_GPIO_IN[4]	CPU_GPIO_IN[3]	CPU_GPIO_IN[2]	CPU_GPIO_IN[1]	CPU_GPIO_IN[0]	
31 8	7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	0	Reset

CPU_GPIO_IN GPIOn (n=0 ~ 21) Input Value. It is a CPU CSR to read input value (1=high, 0=low) from SoC GPIO pin.
CPU_GPIO_IN[7:0] correspond to input signals cpu_gpio_in[7:0] in Table 5-2 *Peripheral Signals via GPIO Matrix*.
CPU_GPIO_IN[7:0] can only be mapped to GPIO pins through GPIO matrix. For details please refer to Section 5.4 in Chapter *IO MUX and GPIO Matrix (GPIO, IO MUX)*. (RO)

Register 1.17. cpu_gpio_out (0x805)

(reserved)		CPU_GPIO_OUT[7]	CPU_GPIO_OUT[6]	CPU_GPIO_OUT[5]	CPU_GPIO_OUT[4]	CPU_GPIO_OUT[3]	CPU_GPIO_OUT[2]	CPU_GPIO_OUT[1]	CPU_GPIO_OUT[0]	
31	8	7	6	5	4	3	2	1	0	
0		0	0	0	0	0	0	0	0	Reset

CPU_GPIO_OUT GPIOn (n=0 ~ 21) Output Value. It is a CPU CSR to write value (1=high, 0=low) to SoC GPIO pin. The value takes effect only when CPU_GPIO_OEN is set.

CPU_GPIO_OUT[7:0] correspond to output signals cpu_gpio_out[7:0] in Table 5-2 *Peripheral Signals via GPIO Matrix*.

CPU_GPIO_OUT[7:0] can only be mapped to GPIO pins through GPIO matrix. For details please refer to Section 5.5 in Chapter *IO MUX and GPIO Matrix (GPIO, IO MUX)*. (R/W)

1.5 Interrupt Controller

1.5.1 Features

The interrupt controller allows capturing, masking and dynamic prioritization of interrupt sources routed from peripherals to the RISC-V CPU. It supports:

- Up to 31 asynchronous interrupts with unique IDs (1-31)
- Configurable via read/write to memory mapped registers
- 15 levels of priority, programmable for each interrupt
- Support for both level and edge type interrupt sources
- Programmable global threshold for masking interrupts with lower priority
- Interrupts IDs mapped to trap-vector address offsets

For the complete list of interrupt registers and detailed configuration information, please refer to Chapter 8 *Interrupt Matrix (INTERRUPT)*, section 8.4, register group "CPU Interrupt Registers".

1.5.2 Functional Description

Each interrupt ID has 5 properties associated with it:

1. Enable State (0-1):
   - Determines if an interrupt is enabled to be captured and serviced by the CPU.
   - Programmed by writing the corresponding bit in INTERRUPT_CORE0_CPU_INT_ENABLE_REG.
2. Type (0-1):
   - Enables latching the state of an interrupt signal on its rising edge.
   - Programmed by writing the corresponding bit in INTERRUPT_CORE0_CPU_INT_TYPE_REG.
   - An interrupt for which type is kept 0 is referred as a 'level' type interrupt.
   - An interrupt for which type is set to 1 is referred as an 'edge' type interrupt.
3. Priority (1-15):
   - Determines which interrupt, among multiple pending interrupts, the CPU will service first.
   - Programmed by writing to the INTERRUPT_CORE0_CPU_INT_PRI_*n*_REG for a particular interrupt ID *n* in range (1-31).
   - Enabled interrupts with priorities zero or less than the threshold value in INTERRUPT_CORE0_CPU_INT_THRESH_REG are masked.
   - Priority levels increase from 1 (lowest) to 15 (highest).
   - Interrupts with same priority are statically prioritized by their IDs, lowest ID having highest priority.
4. Pending State (0-1):
   - Reflects the captured state of an enabled and unmasked interrupt signal.
   - For each interrupt ID, the corresponding bit in read-only INTERRUPT_CORE0_CPU_INT_EIP_STATUS_REG gives its pending state.

- A pending interrupt will cause CPU to enter trap if no other pending interrupt has higher priority.
- A pending interrupt is said to be 'claimed' if it preempts the CPU and causes it to jump to the corresponding trap vector address.
- All pending interrupts which are yet to be serviced are termed as 'unclaimed'.

5. Clear State (0-1):
   - Toggling this will clear the pending state of claimed edge-type interrupts only.
   - Toggled by first setting and then clearing the corresponding bit in INTERRUPT_CORE0_CPU_INT_CLEAR_REG.
   - Pending state of a level type interrupt is unaffected by this and must be cleared from source.
   - Pending state of an unclaimed edge type interrupt can be flushed, if required, by first clearing the corresponding bit in INTERRUPT_CORE0_CPU_INT_ENABLE_REG and then toggling same bit in INTERRUPT_CORE0_CPU_INT_CLEAR_REG.

When CPU services a pending interrupt, it:

- saves the address of the current un-executed instruction in mepc for resuming execution later.
- updates the value of mcause with the ID of the interrupt being serviced.
- copies the state of MIE into MPIE, and subsequently clears MIE, thereby disabling interrupts globally.
- enters trap by jumping to a word-aligned offset of the address stored in mtvec.

Table 1-3 shows the mapping of each interrupt ID with the corresponding trap-vector address. In short, the word aligned trap address for an interrupt with a certain $ID = i$ can be calculated as $(mtvec + 4i)$.

Note : $ID = 0$ is unavailable and therefore cannot be used for capturing interrupts. This is because the corresponding trap vector address (mtvec + 0x00) is reserved for exceptions.

Table 1-3. ID wise map of Interrupt Trap-Vector Addresses

ID	Address	ID	Address	ID	Address	ID	Address
0	NA	8	mtvec + 0x20	16	mtvec + 0x40	24	mtvec + 0x60
1	mtvec + 0x04	9	mtvec + 0x24	17	mtvec + 0x44	25	mtvec + 0x64
2	mtvec + 0x08	10	mtvec + 0x28	18	mtvec + 0x48	26	mtvec + 0x68
3	mtvec + 0x0c	11	mtvec + 0x2c	19	mtvec + 0x4c	27	mtvec + 0x6c
4	mtvec + 0x10	12	mtvec + 0x30	20	mtvec + 0x50	28	mtvec + 0x70
5	mtvec + 0x14	13	mtvec + 0x34	21	mtvec + 0x54	29	mtvec + 0x74
6	mtvec + 0x18	14	mtvec + 0x38	22	mtvec + 0x58	30	mtvec + 0x78
7	mtvec + 0x1c	15	mtvec + 0x3c	23	mtvec + 0x5c	31	mtvec + 0x7c

After jumping to the trap-vector, the execution flow is dependent on software implementation, although it can be presumed that the interrupt will get handled (and cleared) in some interrupt service routine (ISR) and later the normal execution will resume once the CPU encounters MRET instruction.

Upon execution of MRET instruction, the CPU:

- copies the state of MPIE back into MIE, and subsequently clears MPIE. This means that if previously MPIE was set, then, after MRET, MIE will be set, thereby enabling interrupts globally.

- jumps to the address stored in mepc and resumes execution.

It is possible to perform software assisted nesting of interrupts inside an ISR as explained in 1.5.3.

The below listed points outline the functional behavior of the controller:

- Only if an interrupt has non-zero priority, higher or equal to the value in the threshold register, will it be reflected in INTERRUPT_CORE0_CPU_INT_EIP_STATUS_REG.
- If an interrupt is visible in INTERRUPT_CORE0_CPU_INT_EIP_STATUS_REG and has yet to be serviced, then it's possible to mask it (and thereby prevent the CPU from servicing it) by either lowering the value of its priority or increasing the global threshold.
- If an interrupt, visible in INTERRUPT_CORE0_CPU_INT_EIP_STATUS_REG, is to be flushed (and prevented from being serviced at all), then it must be disabled (and cleared if it is of edge type).

1.5.3 Suggested Operation

1.5.3.1 Latency Aspects

There is latency involved while configuring the Interrupt Controller.

In steady state operation, the Interrupt Controller has a fixed latency of 4 cycles. Steady state means that no changes have been made to the Interrupt Controller registers recently. This implies that any interrupt that is asserted to the controller will take exactly 4 cycles before the CPU starts processing the interrupt. This further implies that CPU may execute up to 5 instructions before the preemption happens.

Whenever any of its registers are modified, the Interrupt Controller enters into transient state, which may take up to 4 cycles for it to settle down into steady state again. During this transient state, the ordering of interrupts may not be predictable, and therefore, a few safety measures need to be taken in software to avoid any synchronization issues.

Also, it must be noted that the Interrupt Controller configuration registers lie in the APB address range, hence any R/W access to these registers may take multiple cycles to complete.

In consideration of above mentioned characteristics, users are advised to follow the sequence described below, whenever modifying any of the Interrupt Controller registers:

1. save the state of MIE and clear MIE to 0
2. read-modify-write one or more Interrupt Controller registers
3. execute FENCE instruction to wait for any pending write operations to complete
4. finally, restore the state of MIE

Due to its critical nature, it is recommended to disable interrupts globally (MIE=0) beforehand, whenever configuring interrupt controller registers, and then restore MIE right after, as shown in the sequence above.

After execution of the sequence above, the Interrupt Controller will resume operation in steady state.

1.5.3.2 Configuration Procedure

By default, interrupts are disabled globally, since the reset value of MIE bit in mstatus is 0. Software must set MIE=1 after initialization of the interrupt stack (including setting mtvec to the interrupt vector address) is done.

During normal execution, if an interrupt *n* is to be enabled, the below sequence may be followed:

1. save the state of MIE and clear MIE to 0
2. depending upon the type of the interrupt (edge/level), set/unset the *n*th bit of INTERRUPT_CORE0_CPU_INT_TYPE_REG
3. set the priority by writing a value to INTERRUPT_CORE0_CPU_INT_PRI_*n*_REG in range 1(lowest) to 15 (highest)
4. set the *n*th bit of INTERRUPT_CORE0_CPU_INT_ENABLE_REG
5. execute FENCE instruction
6. restore the state of MIE

When one or more interrupts become pending, the CPU acknowledges (claims) the interrupt with the highest priority and jumps to the trap vector address corresponding to the interrupt's ID. Software implementation may read mcause to infer the type of trap (mcause(31) is 1 for interrupts and 0 for exceptions) and then the ID of the interrupt (mcause(4-0) gives ID of interrupt or exception). This inference may not be necessary if each entry in the trap vector are jump instructions to different trap handlers. Ultimately, the trap handler(s) will redirect execution to the appropriate ISR for this interrupt.

Upon entering into an ISR, software must toggle the *n*th bit of INTERRUPT_CORE0_CPU_INT_CLEAR_REG if the interrupt is of edge type, or clear the source of the interrupt if it is of level type.

Software may also update the value of INTERRUPT_CORE0_CPU_INT_THRESH_REG and program MIE=1 for allowing higher priority interrupts to preempt the current ISR (nesting), however, before doing so, all the state CSRs must be saved (mepc, mstatus, mcause, etc.) since they will get overwritten due to occurrence of such an interrupt. Later, when exiting the ISR, the values of these CSRs must be restored.

Finally, after the execution returns from the ISR back to the trap handler, MRET instruction is used to resume normal execution.

Later, if the *n* interrupt is no longer needed and needs to be disabled, the following sequence may be followed:

1. save the state of MIE and clear MIE to 0
2. check if the interrupt is pending in INTERRUPT_CORE0_CPU_INT_EIP_STATUS_REG
3. set/unset the *n*th bit of INTERRUPT_CORE0_CPU_INT_ENABLE_REG
4. if the interrupt is of edge type and was found to be pending in step 2 above, *n*th bit of INTERRUPT_CORE0_CPU_INT_CLEAR_REG must be toggled, so that its pending status gets flushed
5. execute FENCE instruction
6. restore the state of MIE

Above is only a suggested scheme of operation. Actual software implementation may vary.

1.5.4 Register Summary

The addresses in this section are relative to Interrupt Controller base address provided in Table 3-3 in Chapter *3 System and Memory*.

For the complete list of interrupt registers and detailed configuration information, please refer to Chapter 8 *Interrupt Matrix (INTERRUPT)*, section 8.4, register group "CPU Interrupt Registers".

1.5.5 Register Description

The addresses in this section are relative to Interrupt Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

For the complete list of interrupt registers and detailed configuration information, please refer to Chapter 8 *Interrupt Matrix (INTERRUPT)*, section 8.4, register group "CPU Interrupt Registers".

1.6 Debug

1.6.1 Overview

This section describes how to debug and test software running on CPU core. Debug support is provided through standard JTAG pins and complies to RISC-V External Debug Support Specification version 0.13.

Figure 1-2 below shows the main components of External Debug Support.

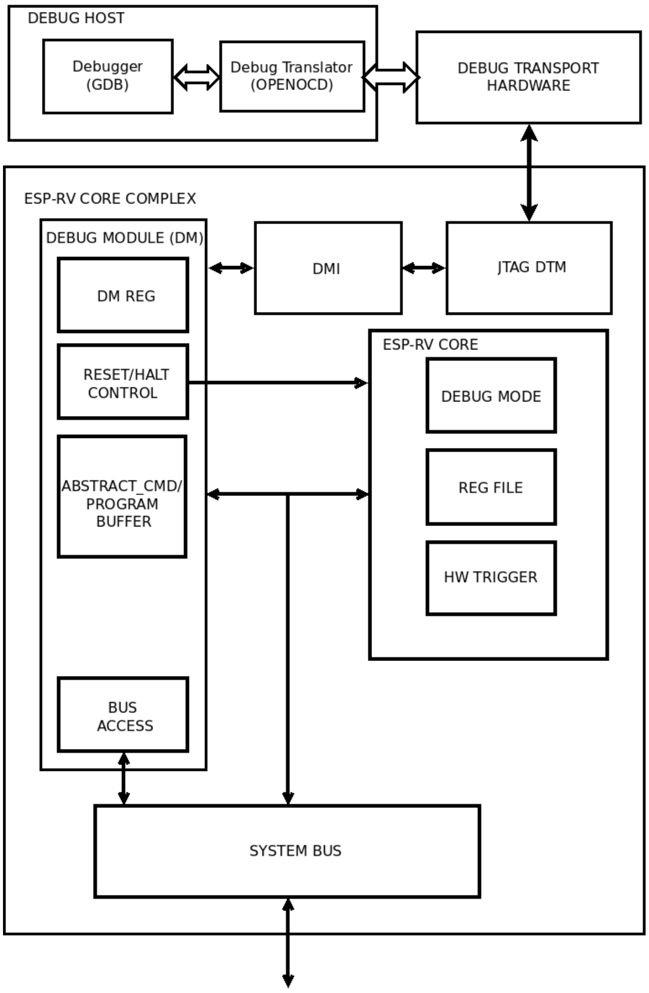


Figure 1-2. Debug System Overview

The user interacts with the Debug Host (eg. laptop), which is running a debugger (eg. gdb). The debugger communicates with a Debug Translator (eg. OpenOCD, which may include a hardware driver) to communicate with Debug Transport Hardware (eg. Olimex USB-JTAG adapter). The Debug Transport Hardware connects the Debug Host to the ESP-RV Core's Debug Transport Module (DTM) through standard JTAG interface. The DTM provides access to the Debug Module (DM) using the Debug Module Interface (DMI).

The DM allows the debugger to halt the core. Abstract commands provide access to its GPRs (general purpose registers). The Program Buffer allows the debugger to execute arbitrary code on the core, which allows access to additional CPU core state. Alternatively, additional abstract commands can provide access to additional CPU core state. ESP-RV core contains Trigger Module supporting 8 triggers. When trigger conditions are met, cores will halt spontaneously and inform the debug module that they have halted.

System bus access block allows memory and peripheral register access without using RISC-V core.

1.6.2 Features

Basic debug functionality supports below features.

- Provides necessary information about the implementation to the debugger.
- Allows the CPU core to be halted and resumed.
- CPU core registers (including CSR's) can be read/written by debugger.
- CPU can be debugged from the first instruction executed after reset.
- CPU core can be reset through debugger.
- CPU can be halted on software breakpoint (planted breakpoint instruction).
- Hardware single-stepping.
- Execute arbitrary instructions in the halted CPU by means of the program buffer. 16-word program buffer is supported.
- System bus access is supported through word aligned address access.
- Supports eight Hardware Triggers (can be used as breakpoints/watchpoints) as described in Section 1.7.

1.6.3 Functional Description

As mentioned earlier, Debug Scheme conforms to RISC-V External Debug Support Specification version 0.13. Please refer the specs for functional operation details.

1.6.4 Register Summary

Below is the list of Debug CSR's supported by ESP-RV core.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
dcsr	Debug Control and Status	0x7B0	R/W
dpc	Debug PC	0x7B1	R/W
dscratch0	Debug Scratch Register 0	0x7B2	R/W
dscratch1	Debug Scratch Register 1	0x7B3	R/W

All the debug module registers are implemented in conformance to RISC-V External Debug Support Specification version 0.13. Please refer it for more details.

1.6.5 Register Description

Below are the details of Debug CSR's supported by ESP-RV core

Register 1.18. dcsr (0x7B0)

xdebugver	reserved	ebreakm	reserved	ebreaku	reserved	stopcount	stoptime	cause	reserved	step	prv	
31 28	27 16	15	14 13	12	11	10	9	8 6	5 3	2	1 0	
4	0	0	0	0	0	0	0	0	0	0	0	Reset

xdebugver Debug version. (RO)

- 4: External debug support exists

ebreakm When 1, ebreak instructions in Machine Mode enter Debug Mode. (R/W)

ebreaku When 1, ebreak instructions in User/Application Mode enter Debug Mode. (R/W)

stopcount This bit is not implemented. Debugger will always read this bit as 0. (RO)

stoptime This feature is not implemented. Debugger will always read this bit as 0. (RO)

cause Explains why Debug Mode was entered. When there are multiple reasons to enter Debug Mode in a single cycle, the cause with the highest priority number is the one written.

1. An ebreak instruction was executed. (priority 3)
2. The Trigger Module caused a halt. (priority 4)
3. haltreq was set. (priority 2)
4. The CPU core single stepped because step was set. (priority 1)

Other values are reserved for future use. (RO)

step When set and not in Debug Mode, the core will only execute a single instruction and then enter Debug Mode. Interrupts are **enabled*** when this bit is set. If the instruction does not complete due to an exception, the core will immediately enter Debug Mode before executing the trap handler, with appropriate exception registers set. (R/W)

prv Contains the privilege level the core was operating in when Debug Mode was entered. A debugger can change this value to change the core's privilege level when exiting Debug Mode. Only **0x3** (machine mode) and **0x0**(user mode) are supported.

***Note**: Different from RISC-V Debug specification 0.13

Register 1.19. dpc (0x7B1)

dpc	
31 0	
0	Reset

dpc Upon entry to debug mode, dpc is written with the virtual address of the instruction that encountered the exception. When resuming, the CPU core's PC is updated to the virtual address stored in dpc. A debugger may write dpc to change where the CPU resumes. (R/W)

Register 1.20. dscratch0 (0x7B2)

dscratch0	
31 0	
0	Reset

dscratch0 Used by Debug Module internally. (R/W)

Register 1.21. dscratch1 (0x7B3)

dscratch1	
31 0	
0	Reset

dscratch1 Used by Debug Module internally. (R/W)

1.7 Hardware Trigger

1.7.1 Features

Hardware Trigger module provides breakpoint and watchpoint capability for debugging. It includes the following features:

- 8 independent trigger units
- each unit can be configured for matching the address of program counter or load-store accesses
- can preempt execution by causing breakpoint exception
- can halt execution and transfer control to debugger
- support NAPOT (naturally aligned power of two) address encoding

1.7.2 Functional Description

The Hardware Trigger module provides four CSRs, which are listed under register summary section. Among these, tdata1 and tdata2 are abstract CSRs, which means they are shadow registers for accessing internal registers for each of the eight trigger units, one at a time.

To choose a particular trigger unit write the index (0-7) of that unit into tselect CSR. When tselect is written with a valid index, the abstract CSRs tdata1 and tdata2 are automatically mapped to reflect internal registers of that trigger unit. Each trigger unit has two internal registers, namely mcontrol and maddress, which are mapped to tdata1 and tdata2, respectively.

Writing larger than allowed indexes to tselect will clip the written value to the largest valid index, which can be read back. This property may be used for enumerating the number of available triggers during initialization or when using a debugger.

Since software or debugger may need to know the type of the selected trigger to correctly interpret tdata1 and tdata2, the 4 bits (31-28) of tdata1 encodes the type of the selected trigger. This type field is read-only and always provides a value of 0x2 for every trigger, which stands for match type trigger, hence, it is inferred that tdata1 and tdata2 are to be interpreted as mcontrol and maddress. The information regarding other possible values can be found in the RISC-V Debug Specification v0.13, but this trigger module only supports type 0x2.

Once a trigger unit has been chosen by writing its index to tselect, it will become possible to configure it by setting the appropriate bits in mcontrol CSR (tdata1) and writing the target address to maddress CSR (tdata2).

Each trigger unit can be configured to either cause breakpoint exception or enter debug mode, by writing to the action bit of mcontrol. This bit can only be written from debugger, thus by default a trigger, if enabled, will cause breakpoint exception.

mcontrol for each trigger unit has a hit bit which may be read, after CPU halts or enters exception, to find out if this was the trigger unit that fired. This bit is set as soon as the corresponding trigger fires, but it has to be manually cleared before resuming operation. Although, failing to clear it doesn't affect normal execution in any way.

Each trigger unit only supports match on address, although this address could either be that of a load/store access or the virtual address of an instruction. The address and size of a region are specified by writing to maddress (tdata2) CSR for the selected trigger unit. Larger than 1 byte region sizes are specified through NAPOT (naturally aligned power of two) encoding (see Table 1-5) and enabled by setting match bit in mcontrol. Note that for NAPOT encoded addresses, by definition, the start address is constrained to be aligned to (i.e. an integer multiple of) the region size.

Table 1-5. NAPOT encoding for maddress

maddress(31-0)	Start Address	Size (bytes)
aaa...aaaaaaaaa0	aaa...aaaaaaaaa0	2
aaa...aaaaaaaa01	aaa...aaaaaaaa00	4
aaa...aaaaaaa011	aaa...aaaaaaa000	8
aaa...aaaaaa0111	aaa...aaaaaa0000	16
....		
a01...1111111111	a00...0000000000	2^{31}

tcontrol CSR is common to all trigger units. It is used for preventing triggers from causing repeated exceptions in machine-mode while execution is happening inside a trap handler. This also disables breakpoint exceptions inside ISRs by default, although, it is possible to manually enable this right before entering an ISR, for debugging purposes. This CSR is not relevant if a trigger is configured to enter debug mode.

1.7.3 Trigger Execution Flow

When hart is halted and enters debug mode due to the firing of a trigger (action = 1):

- dpc is set to current PC (in decode stage)
- cause field in dcsr is set to 2, which means halt due to trigger
- hit bit is set to 1, corresponding to the trigger(s) which fired

When hart goes into trap due to the firing of a trigger (action = 0) :

- mepc is set to current PC (in decode stage)
- mcause is set to 3, which means breakpoint exception
- mpte is set to the value in mte right before trap
- mte is set to 0
- hit bit is set to 1, corresponding to the trigger(s) which fired

Note : If two different triggers fire at the same time, one with action = 0 and another with action = 1, then hart is halted and enters debug mode.

1.7.4 Register Summary

Below is a list of Trigger Module CSRs supported by the CPU. These are only accessible from machine-mode.

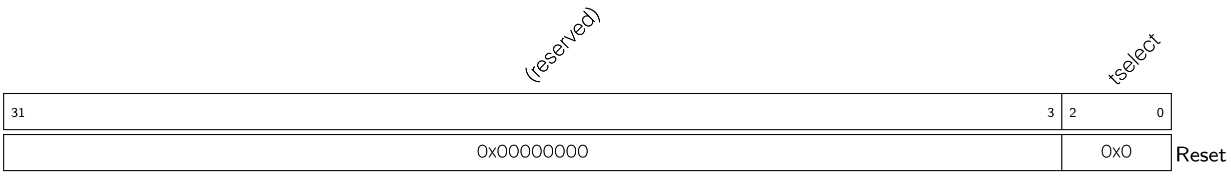
The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
tselect	Trigger Select Register	0x7A0	R/W

Name	Description	Address	Access
tdata1	Trigger Abstract Data 1	0x7A1	R/W
tdata2	Trigger Abstract Data 2	0x7A2	R/W
tcontrol	Global Trigger Control	0x7A5	R/W

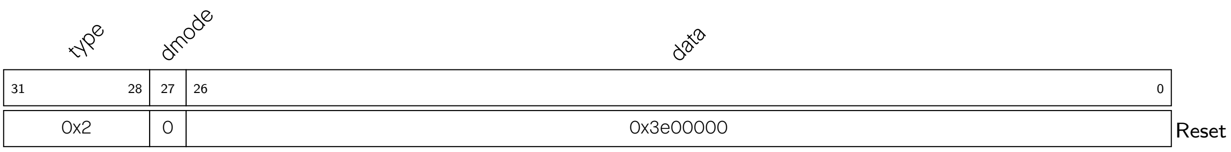
1.7.5 Register Description

Register 1.22. tselect (0x7A0)



tselect Index (0-7) of the selected trigger unit. (R/W)

Register 1.23. tdata1 (0x7A1)



type Type of trigger. (RO)

This field is reserved since only match type (0x2) triggers are supported.

dmode This is set to 1 if a trigger is being used by the debugger. (R/W *)

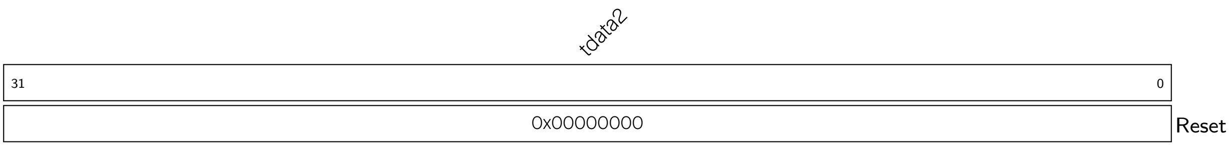
- 0: Both Debug and M-mode can write the tdata1 and tdata2 registers at the selected tselect.
- 1: Only Debug Mode can write the tdata1 and tdata2 registers at the selected tselect. Writes from other modes are ignored.

* *Note : Only writable from debug mode.*

data Abstract tdata1 content. (R/W)

This will always be interpreted as fields of mcontrol since only match type (0x2) triggers are supported.

Register 1.24. tdata2 (0x7A2)



tdata2 Abstract tdata2 content. (R/W)

This will always be interpreted as maddress since only match type (0x2) triggers are supported.

Register 1.25. tcontrol (0x7A5)

(reserved)	mpte	(reserved)	mte	
31 … 8	7	6 … 1	0	
0x000000	0	0x00	0	Reset

mpte Machine mode previous trigger enable bit. (R/W)

- When CPU is taking a machine mode trap, the value of mte is automatically pushed into this.
- When CPU is executing MRET, its value is popped back into mte, so this becomes 0.

mte Machine mode trigger enable bit. (R/W)

- When CPU is taking a machine mode trap, its value is automatically pushed into mpte, so this becomes 0 and triggers with action=0 are disabled globally.
- When CPU is executing MRET, the value of mpte is automatically popped back into this.

Register 1.26. mcontrol (0x7A1)

(reserved)	dmode	(reserved)	hit	(reserved)	action	(reserved)	match	m	(reserved)	u	execute	store	load	
31 28	27	26 21	20	19 16	15 12	11	10 7	6	5 4	3	2	1	0	
0x2	0	0x1f	0	0	0	0	0	0	0	0	0	0	0	Reset

dmode Same as dmode in tdata1.

hit This is found to be 1 if the selected trigger had fired previously. (R/W)
This bit is to be cleared manually.

action Write this for configuring the selected trigger to perform one of the available actions when firing. (R/W)
Valid options are:

- 0x0: cause breakpoint exception.
- 0x1: enter debug mode (only valid when dmode = 1)

Note : Writing an invalid value will set this to the default value 0x0.

match Write this for configuring the selected trigger to perform one of the available matching operations on a data/instruction address. (R/W) Valid options are:

- 0x0: exact byte match, i.e. address corresponding to one of the bytes in an access must match the value of maddress exactly.
- 0x1: NAPOT match, i.e. at least one of the bytes of an access must lie in the NAPOT region specified in maddress.

Note : Writing a larger value will clip it to the largest possible value 0x1.

m Set this for enabling selected trigger to operate in machine mode. (R/W)

u Set this for enabling selected trigger to operate in user mode. (R/W)

execute Set this for configuring the selected trigger to fire right before an instruction with matching virtual address is executed by the CPU. (R/W)

store Set this for configuring the selected trigger to fire right before a store operation with matching data address is executed by the CPU. (R/W)

load Set this for configuring the selected trigger to fire right before a load operation with matching data address is executed by the CPU. (R/W)

Register 1.27. maddress (0x7A2)

	maddress	
	31 0	
	0x00000000	Reset

maddress Address used by the selected trigger when performing match operation. (R/W)

This is decoded as NAPOT when match=1 in mcontrol.

1.8 Memory Protection

1.8.1 Overview

The CPU core includes a physical memory protection unit, which can be used by software to set memory access privileges (read, write and execute permissions) for required memory regions. However it is not fully compliant to the Physical Memory Protection (PMP) description specified in **RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10**. Details of existing non-conformance are provided in next section.

For detailed understanding of the RISC-V PMP concept, please refer to RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10.

1.8.2 Features

The PMP unit can be used to restrict access to physical memory. It supports 16 regions and a minimum granularity of 4 bytes. Below are the current non-conformance with PMP description from RISC-V Privilege specifications:

- Static priority i.e. overlapping regions are not supported
- Maximum supported NAPOT range is 1 GB

As per RISC-V Privilege specifications, PMP entries should be statically prioritized and the lowest-numbered PMP entry that matches any address byte of an access will determine whether that access succeeds or fails. This means, when any address matches more than one PMP entry i.e. overlapping regions among different PMP entries, lowest number PMP entry will decide whether such address access will succeed or fail.

However, RISC-V CPU PMP unit in ESP32-C3 does not implement static priority. So, software should make sure that all enabled PMP entries are programmed with unique regions i.e. without any region overlap among them. If software still tries to program multiple PMP entries with overlapping region having contradicting permissions, then access will succeed if it matches at least one of enabled PMP entries. An exception will be generated, if access matches none of the enabled PMP entries.

1.8.3 Functional Description

Software can program the PMP unit's configuration and address registers in order to contain faults and support secure execution. PMP CSR's can only be programmed in machine-mode. Once enabled, write, read and execute permission checks are applied to all the accesses in user-mode as per programmed values of enabled 16 pmpcfgX and pmpaddrX registers (refer Register Summary).

By default, PMP grants permission to all accesses in machine-mode and revokes permission of all access in user-mode. This implies that it is mandatory to program address range and valid permissions in pmpcfg and pmpaddr registers (refer Register Summary) for any valid access to pass through in user-mode. However, it is not required for machine-mode as PMP permits all accesses to go through by deafult. In cases where PMP checks are also required in machine-mode, software can set the lock bit of required PMP entry to enable permission checks on it. Once lock bit is set, it can only be cleared through CPU reset.

When any instruction is being fetched from memory region without execute permissions, exception is generated at processor level and exception cause is set as instruction access fault in mcause CSR. Similarly, any load/store access without valid read/write permissions, will result in exception generation with mcause updated as load access and store access fault respectively. In case of load/store access faults, violating address is captured in mtval CSR.

1.8.4 Register Summary

Below is a list of PMP CSRs supported by the CPU. These are only accessible from machine-mode.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
pmpcfg0	Physical memory protection configuration.	0x3A0	R/W
pmpcfg1	Physical memory protection configuration.	0x3A1	R/W
pmpcfg2	Physical memory protection configuration.	0x3A2	R/W
pmpcfg3	Physical memory protection configuration.	0x3A3	R/W
pmpaddr0	Physical memory protection address register.	0x3B0	R/W
pmpaddr1	Physical memory protection address register.	0x3B1	R/W
pmpaddr2	Physical memory protection address register.	0x3B2	R/W
pmpaddr3	Physical memory protection address register.	0x3B3	R/W
pmpaddr4	Physical memory protection address register.	0x3B4	R/W
pmpaddr5	Physical memory protection address register.	0x3B5	R/W
pmpaddr6	Physical memory protection address register.	0x3B6	R/W
pmpaddr7	Physical memory protection address register.	0x3B7	R/W
pmpaddr8	Physical memory protection address register.	0x3B8	R/W
pmpaddr9	Physical memory protection address register.	0x3B9	R/W
pmpaddr10	Physical memory protection address register.	0x3BA	R/W
pmpaddr11	Physical memory protection address register.	0x3BB	R/W
pmpaddr12	Physical memory protection address register.	0x3BC	R/W
pmpaddr13	Physical memory protection address register.	0x3BD	R/W
pmpaddr14	Physical memory protection address register.	0x3BE	R/W
pmpaddr15	Physical memory protection address register.	0x3BF	R/W

1.8.5 Register Description

PMP unit implements all pmpcfg0-3 and pmpaddr0-15 CSRs as defined in **RISC-V Instruction Set Manual Volume II: Privileged Architecture, Version 1.10.**

2 GDMA Controller (GDMA)

2.1 Overview

General Direct Memory Access (GDMA) is a feature that allows peripheral-to-memory, memory-to-peripheral, and memory-to-memory data transfer at a high speed. The CPU is not involved in the GDMA transfer, and therefore it becomes more efficient with less workload.

The GDMA controller in ESP32-C3 has six independent channels, i.e. three transmit channels and three receive channels. These six channels are shared by peripherals with GDMA feature, namely SPI2, UHCI0 (UART0/UART1), I2S, AES, SHA, and ADC. Users can assign the six channels to any of these peripherals. UART0 and UART1 use UHCI0 together.

The GDMA controller uses fixed-priority and round-robin channel arbitration schemes to manage peripherals' needs for bandwidth.

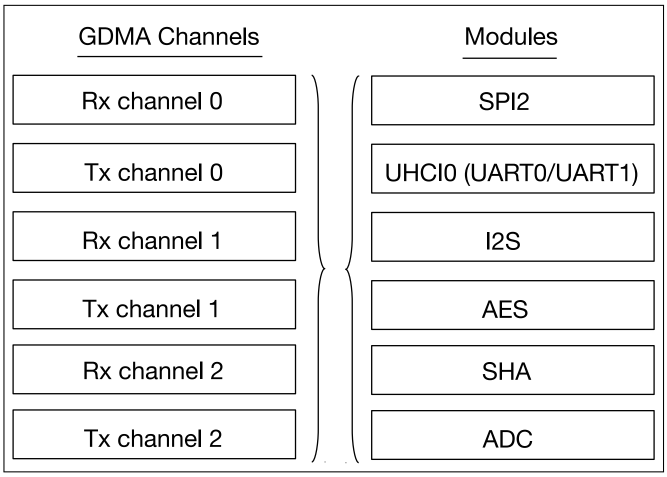


Figure 2-1. Modules with GDMA Feature and GDMA Channels

2.2 Features

The GDMA controller has the following features:

- AHB bus architecture
- Programmable length of data to be transferred in bytes
- Linked list of descriptors
- INCR burst transfer when accessing internal RAM
- Access to an address space of 384 KB at most in internal RAM
- Three transmit channels and three receive channels
- Software-configurable selection of peripheral requesting its service
- Fixed channel priority and round-robin channel arbitration

2.3 Architecture

In ESP32-C3, all modules that need high-speed data transfer support GDMA. The GDMA controller and CPU data bus have access to the same address space in internal RAM. Figure 2-2 shows the basic architecture of the GDMA engine.

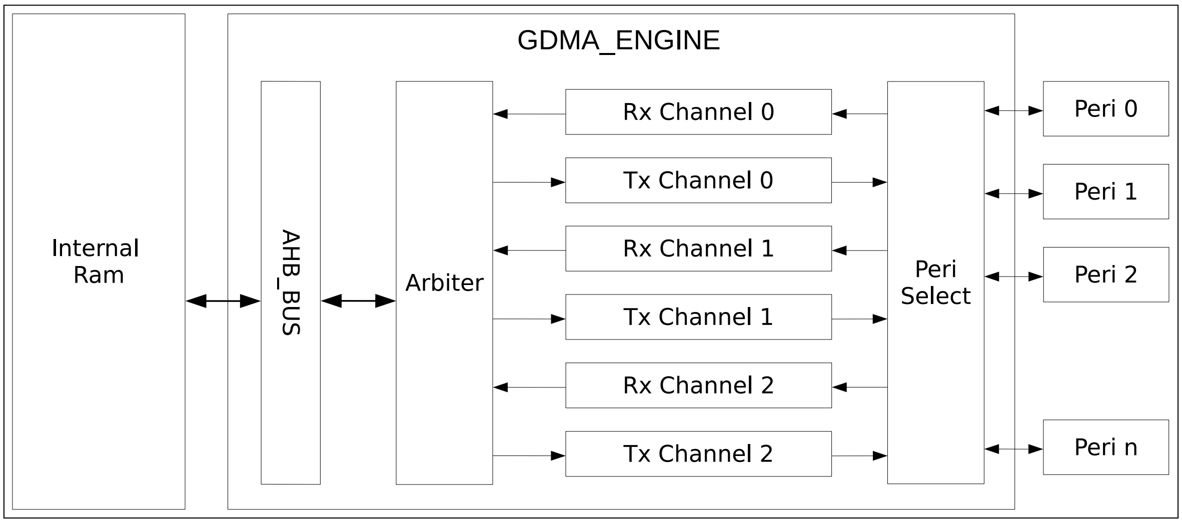

Figure 2-2. GDMA Engine Architecture

The GDMA controller has six independent channels, i.e. three transmit channels and three receive channels. Every channel can be connected to different peripherals. In other words, channels are general-purpose, shared by peripherals.

The GDMA engine reads data from or writes data to internal RAM via the AHB_BUS. Before this, the GDMA controller uses fixed-priority arbitration scheme for channels requesting read or write access. For available address range of Internal RAM, please see Chapter 3 *System and Memory*.

Software can use the GDMA engine through linked lists. These linked lists, stored in internal RAM, consist of outlink*n* and inlink*n*, where *n* indicates the channel number (ranging from 0 to 2). The GDMA controller reads an outlink*n* (i.e. a linked list of transmit descriptors) from internal RAM and transmits data in corresponding RAM according to the outlink*n*, or reads an inlink*n* (i.e. a linked list of receive descriptors) and stores received data into specific address space in RAM according to the inlink*n*.

2.4 Functional Description

2.4.1 Linked List

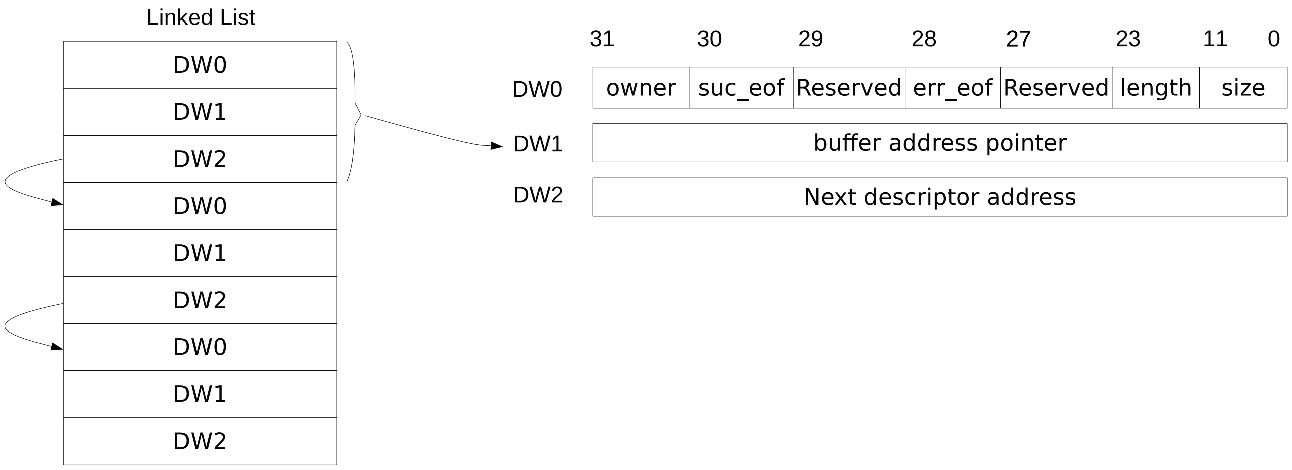

Figure 2-3. Structure of a Linked List

Figure 2-3 shows the structure of a linked list. An outlink and an inlink have the same structure. A linked list is formed by one or more descriptors, and each descriptor consists of three words. Linked lists should be in internal RAM for the GDMA engine to be able to use them. The meaning of each field is as follows:

- Owner (DW0) [31]: Specifies who is allowed to access the buffer that this descriptor points to.
  1'b0: CPU can access the buffer;
  1'b1: The GDMA controller can access the buffer.
  When the GDMA controller stops using the buffer, this bit in a receive descriptor is automatically cleared by hardware, and this bit in a transmit descriptor is automatically cleared by hardware only if GDMA_OUT_AUTO_WRBACK_CH*n* is set to 1. Software can disable automatic clearing by hardware by setting GDMA_OUT_LOOP_TEST_CH*n* or GDMA_IN_LOOP_TEST_CH*n* bit. When software loads a linked list, this bit should be set to 1.
  Note: GDMA_OUT is the prefix of transmit channel registers, and GDMA_IN is the prefix of receive channel registers.

- suc_eof (DW0) [30]: Specifies whether this descriptor is the last descriptor in the list.
  1'b0: This descriptor is not the last one;
  1'b1: This descriptor is the last one.
  Software clears suc_eof bit in receive descriptors. When a frame or packet has been received, this bit in the last receive descriptor is set by hardware, and this bit in the last transmit descriptor is set by software.

- Reserved (DW0) [29]: Reserved. Value of this bit does not matter.

- err_eof (DW0) [28]: Specifies whether the received data has errors.
  This bit is used only when UHCI0 uses GDMA to receive data. When an error is detected in the received frame or packet, this bit in the receive descriptor is set to 1 by hardware.

- Reserved (DW0) [27:24]: Reserved.

- Length (DW0) [23:12]: Specifies the number of valid bytes in the buffer that this descriptor points to. This field in a transmit descriptor is written by software and indicates how many bytes can be read from the buffer; this field in a receive descriptor is written by hardware automatically and indicates how many valid bytes have been stored into the buffer.

- Size (DW0) [11:0]: Specifies the size of the buffer that this descriptor points to.
- Buffer address pointer (DW1): Address of the buffer. This field can only point to internal RAM.
- Next descriptor address (DW2): Address of the next descriptor. If the current descriptor is the last one (suc_eof = 1), this value is 0. This field can only point to internal RAM.

If the length of data received is smaller than the size of the buffer, the GDMA controller will not use available space of the buffer in the next transaction.

2.4.2 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer

The GDMA controller can transfer data from memory to peripheral (transmit) and from peripheral to memory (receive). A transmit channel transfers data in the specified memory location to a peripheral's transmitter via an outlink*n*, whereas a receive channel transfers data received by a peripheral to the specified memory location via an inlink*n*.

Every transmit and receive channel can be connected to any peripheral with GDMA feature. Table 2-1 illustrates how to select the peripheral to be connected via registers. When a channel is connected to a peripheral, the rest channels can not be connected to that peripheral.

Table 2-1. Selecting Peripherals via Register Configuration

GDMA_PERI_IN_SEL_CH*n* GDMA_PERI_OUT_SEL_CH*n*	Peripheral
0	SPI2
1	Reserved
2	UHCI0
3	I2S
4	Reserved
5	Reserved
6	AES
7	SHA
8	ADC
9 ~ 63	Invalid

2.4.3 Memory-to-Memory Data Transfer

The GDMA controller also allows memory-to-memory data transfer. Such data transfer can be enabled by setting GDMA_MEM_TRANS_EN_CH*n*, which connects the output of transmit channel *n* to the input of receive channel *n*. Note that a transmit channel is only connected to the receive channel with the same number (*n*).

2.4.4 Enabling GDMA

Software uses the GDMA controller through linked lists. When the GDMA controller receives data, software loads an inlink, configures GDMA_INLINK_ADDR_CH*n* field with address of the first receive descriptor, and sets GDMA_INLINK_START_CH*n* bit to enable GDMA. When the GDMA controller transmits data, software loads an outlink, prepares data to be transmitted, configures GDMA_OUTLINK_ADDR_CH*n* field with address of the first transmit descriptor, and sets GDMA_OUTLINK_START_CH*n* bit to enable GDMA. GDMA_INLINK_START_CH*n* bit and GDMA_OUTLINK_START_CH*n* bit are cleared automatically by hardware.

In some cases, you may want to append more descriptors to a DMA transfer that is already started. Naively, it would seem to be possible to do this by clearing the EOF bit of the final descriptor in the existing list and setting its next descriptor address pointer field (DW2) to the first descriptor of the to-be-added list. However, this strategy fails if the existing DMA transfer is almost or entirely finished. Instead, the GDMA engine has specialized logic to make sure a DMA transfer can be continued or restarted: if it is still ongoing, it will make sure to take the appended descriptors into account; if the transfer has already finished, it will restart with the new descriptors. This is implemented in the Restart function.

When using the Restart function, software needs to rewrite address of the first descriptor in the new list to DW2 of the last descriptor in the loaded list, and set GDMA_INLINK_RESTART_CH*n* bit or GDMA_OUTLINK_RESTART_CH*n* bit (these two bits are cleared automatically by hardware). As shown in Figure 2-4, by doing so hardware can obtain the address of the first descriptor in the new list when reading the last descriptor in the loaded list, and then read the new list.

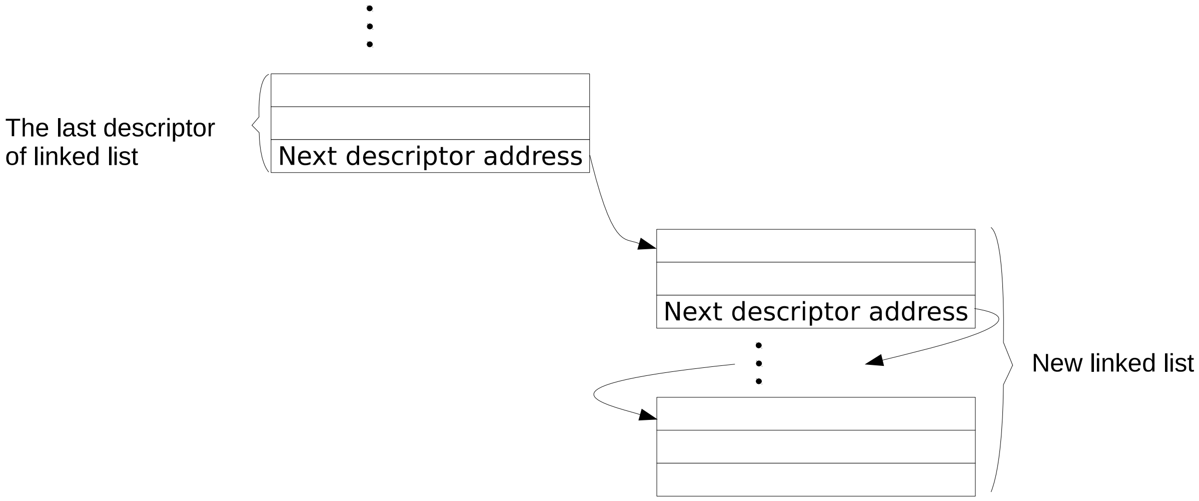

Figure 2-4. Relationship among Linked Lists

2.4.5 Linked List Reading Process

Once configured and enabled by software, the GDMA controller starts to read the linked list from internal RAM. The GDMA performs checks on descriptors in the linked list. Only if descriptors pass the checks, will the corresponding GDMA channel transfer data. If the descriptors fail any of the checks, hardware will trigger descriptor error interrupt (either GDMA_IN_DSCR_ERR_CH*n*_INT or GDMA_OUT_DSCR_ERR_CH*n*_INT), and the channel will halt.

The checks performed on descriptors are:

- Owner bit check when GDMA_IN_CHECK_OWNER_CH*n* or GDMA_OUT_CHECK_OWNER_CH*n* is set to 1. If the owner bit is 0, the buffer is accessed by the CPU. In this case, the owner bit fails the check. The owner bit will not be checked if GDMA_IN_CHECK_OWNER_CH*n* or GDMA_OUT_CHECK_OWNER_CH*n* is 0;
- Buffer address pointer (DW1) check. If the buffer address pointer points to 0x3FC80000 ~ 0x3FCDFFFF (please refer to Section 2.4.7), it passes the check.

After software detects a descriptor error interrupt, it must reset the corresponding channel, and enable GDMA by setting GDMA_OUTLINK_START_CH*n* or GDMA_INLINK_START_CH*n* bit.

Note: The third word (DW2) in a descriptor can only point to a location in internal RAM, given that the third word points to the next descriptor to use and that all descriptors must be in internal memory.

2.4.6 EOF

The GDMA controller uses EOF (end of frame) flags to indicate the end of data frame or packet transmission.

Before the GDMA controller transmits data, GDMA_OUT_TOTAL_EOF_CH*n*_INT_ENA bit should be set to enable GDMA_OUT_TOTAL_EOF_CH*n*_INT interrupt. If data in the buffer pointed by the last descriptor (with EOF) has been transmitted, a GDMA_OUT_TOTAL_EOF_CH*n*_INT interrupt is generated.

Before the GDMA controller receives data, GDMA_IN_SUC_EOF_CH*n*_INT_ENA bit should be set to enable GDMA_IN_SUC_EOF_CH*n*_INT interrupt. If a data frame or packet has been received successfully, a GDMA_IN_SUC_EOF_CH*n*_INT interrupt is generated. In addition, when GDMA channel is connected to UHCI0, the GDMA controller also supports GDMA_IN_ERR_CH*n*_EOF_INT interrupt. This interrupt is enabled by setting GDMA_IN_ERR_EOF_CH*n*_INT_ENA bit, and it indicates that a data frame or packet has been received with errors.

When detecting a GDMA_OUT_TOTAL_EOF_CH*n*_INT or a GDMA_IN_SUC_EOF_CH*n*_INT interrupt, software can record the value of GDMA_OUT_EOF_DES_ADDR_CH*n* or GDMA_IN_SUC_EOF_DES_ADDR_CH*n* field, i.e. address of the last descriptor. Therefore, software can tell which descriptors have been used and reclaim them.

Note: In this chapter, EOF of transmit descriptors refers to suc_eof, while EOF of receive descriptors refers to both suc_eof and err_eof.

2.4.7 Accessing Internal RAM

Any transmit and receive channels of GDMA can access 0x3FC80000 ~ 0x3FCDFFFF in internal RAM. To improve data transfer efficiency, GDMA can send data in burst mode, which is disabled by default. This mode is enabled for receive channels by setting GDMA_IN_DATA_BURST_EN_CH*n*, and enabled for transmit channels by setting GDMA_OUT_DATA_BURST_EN_CH*n*.

Table 2-2. Descriptor Field Alignment Requirements

Inlink/Outlink	Burst Mode	Size	Length	Buffer Address Pointer
Inlink	0	—	—	—
	1	Word-aligned	—	Word-aligned
Outlink	0	—	—	—
	1	—	—	—

Table 2-2 lists the requirements for descriptor field alignment when accessing internal RAM.

When burst mode is disabled, size, length, and buffer address pointer in both transmit and receive descriptors do not need to be word-aligned. That is to say, GDMA can read data of specified length (1 ~ 4095 bytes) from any start addresses in the accessible address range, or write received data of the specified length (1 ~ 4095 bytes) to any contiguous addresses in the accessible address range.

When burst mode is enabled, size, length, and buffer address pointer in transmit descriptors are also not necessarily word-aligned. However, size and buffer address pointer in receive descriptors except length should be word-aligned.

2.4.8 Arbitration

To ensure timely response to peripherals running at a high speed with low latency (such as SPI), the GDMA controller implements a fixed-priority channel arbitration scheme. That is to say, each channel can be assigned a priority from 0 ~ 9. The larger the number, the higher the priority, and the more timely the response. When several channels are assigned the same priority, the GDMA controller adopts a round-robin arbitration scheme.

Please note that the overall throughput of peripherals with GDMA feature cannot exceed the maximum bandwidth of the GDMA, so that requests from low-priority peripherals can be responded to.

2.5 GDMA Interrupts

- GDMA_OUT_TOTAL_EOF_CH*n*_INT: Triggered when all data corresponding to a linked list (including multiple descriptors) has been sent via transmit channel *n*.
- GDMA_IN_DSCR_EMPTY_CH*n*_INT: Triggered when the size of the buffer pointed by receive descriptors is smaller than the length of data to be received via receive channel *n*.
- GDMA_OUT_DSCR_ERR_CH*n*_INT: Triggered when an error is detected in a transmit descriptor on transmit channel *n*.
- GDMA_IN_DSCR_ERR_CH*n*_INT: Triggered when an error is detected in a receive descriptor on receive channel *n*.
- GDMA_OUT_EOF_CH*n*_INT: Triggered when EOF in a transmit descriptor is 1 and data corresponding to this descriptor has been sent via transmit channel *n*. If GDMA_OUT_EOF_MODE_CH*n* is 0, this interrupt will be triggered when the last byte of data corresponding to this descriptor enters GDMA's transmit channel; if GDMA_OUT_EOF_MODE_CH*n* is 1, this interrupt is triggered when the last byte of data is taken from GDMA's transmit channel.
- GDMA_OUT_DONE_CH*n*_INT: Triggered when all data corresponding to a transmit descriptor has been sent via transmit channel *n*.
- GDMA_IN_ERR_EOF_CH*n*_INT: Triggered when an error is detected in the data frame or packet received via receive channel *n*. This interrupt is used only for UHCI0 peripheral (UART0 or UART1).
- GDMA_IN_SUC_EOF_CH*n*_INT: Triggered when the suc_eof bit in a receive descriptor is 1 and the data corresponding to this receive descriptor has been received (i.e. when the data frame or packet corresponding to an inlink has beeen received) via receive channel *n*.
- GDMA_IN_DONE_CH*n*_INT: Triggered when all data corresponding to a receive descriptor has been received via receive channel *n*.

2.6 Programming Procedures

2.6.1 Programming Procedure for GDMA Clock and Reset

GDMA's clock and reset should be configured as follows:

1. Set SYSTEM_DMA_CLK_EN to enable GDMA's clock;

2. Clear SYSTEM_DMA_RST to reset GDMA.

2.6.2 Programming Procedures for GDMA's Transmit Channel

To transmit data, GDMA's transmit channel should be configured by software as follows:

1. Set GDMA_OUT_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer;
2. Load an outlink, and configure GDMA_OUTLINK_ADDR_CH*n* with address of the first transmit descriptor;
3. Configure GDMA_PERI_OUT_SEL_CH*n* with the value corresponding to the peripheral to be connected, as shown in Table 2-1;
4. Set GDMA_OUTLINK_START_CH*n* to enable GDMA's transmit channel for data transfer;
5. Configure and enable the corresponding peripheral (SPI2, UHCI0 (UART0 or UART1), I2S, AES, SHA, and ADC). See details in individual chapters of these peripherals;
6. Wait for GDMA_OUT_EOF_CH*n*_INT interrupt, which indicates the completion of data transfer.

2.6.3 Programming Procedures for GDMA's Receive Channel

To receive data, GDMA's receive channel should be configured by software as follows:

1. Set GDMA_IN_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer;
2. Load an inlink, and configure GDMA_INLINK_ADDR_CH*n* with address of the first receive descriptor;
3. Configure GDMA_PERI_IN_SEL_CH*n* with the value corresponding to the peripheral to be connected, as shown in Table 2-1;
4. Set GDMA_INLINK_START_CH*n* to enable GDMA's receive channel for data transfer;
5. Configure and enable the corresponding peripheral (SPI2, UHCI0 (UART0 or UART1), I2S, AES, SHA, and ADC). See details in individual chapters of these peripherals;
6. Wait for GDMA_IN_SUC_EOF_CH*n*_INT interrupt, which indicates that a data frame or packet has been received.

2.6.4 Programming Procedures for Memory-to-Memory Transfer

To transfer data from one memory location to another, GDMA should be configured by software as follows:

1. Set GDMA_OUT_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer;
2. Set GDMA_IN_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer;
3. Load an outlink, and configure GDMA_OUTLINK_ADDR_CH*n* with address of the first transmit descriptor;
4. Load an inlink, and configure GDMA_INLINK_ADDR_CH*n* with address of the first receive descriptor;
5. Set GDMA_MEM_TRANS_EN_CH*n* to enable memory-to-memory transfer;
6. Set GDMA_OUTLINK_START_CH*n* to enable GDMA's transmit channel for data transfer;

7. Set GDMA_INLINK_START_CH*n* to enable GDMA's receive channel for data transfer;
8. Wait for GDMA_IN_SUC_EOF_CH*n*_INT interrupt, which indicates that a data transaction has been completed.

2.7 Register Summary

The addresses in this section are relative to GDMA base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Interrupt Registers			
GDMA_INT_RAW_CH0_REG	Raw status interrupt of RX channel 0	0x0000	R/WTC/SS
GDMA_INT_ST_CH0_REG	Masked interrupt of RX channel 0	0x0004	RO
GDMA_INT_ENA_CH0_REG	Interrupt enable bits of RX channel 0	0x0008	R/W
GDMA_INT_CLR_CH0_REG	Interrupt clear bits of RX channel 0	0x000C	WT
GDMA_INT_RAW_CH1_REG	Raw status interrupt of RX channel 1	0x0010	R/WTC/SS
GDMA_INT_ST_CH1_REG	Masked interrupt of RX channel 1	0x0014	RO
GDMA_INT_ENA_CH1_REG	Interrupt enable bits of RX channel 1	0x0018	R/W
GDMA_INT_CLR_CH1_REG	Interrupt clear bits of RX channel 1	0x001C	WT
GDMA_INT_RAW_CH2_REG	Raw status interrupt of RX channel 2	0x0020	R/WTC/SS
GDMA_INT_ST_CH2_REG	Masked interrupt of RX channel 2	0x0024	RO
GDMA_INT_ENA_CH2_REG	Interrupt enable bits of RX channel 2	0x0028	R/W
GDMA_INT_CLR_CH2_REG	Interrupt clear bits of RX channel 2	0x002C	WT
Configuration Register			
GDMA_MISC_CONF_REG	Miscellaneous register	0x0044	R/W
Version Registers			
GDMA_DATE_REG	Version control register	0x0048	R/W
Configuration Registers			
GDMA_IN_CONF0_CH0_REG	Configuration register 0 of RX channel 0	0x0070	R/W
GDMA_IN_CONF1_CH0_REG	Configuration register 1 of RX channel 0	0x0074	R/W
GDMA_IN_POP_CH0_REG	Pop control register of RX channel 0	0x007C	varies
GDMA_IN_LINK_CH0_REG	Link descriptor configuration and control register of RX channel 0	0x0080	varies
GDMA_OUT_CONF0_CH0_REG	Configuration register 0 of TX channel 0	0x00D0	R/W
GDMA_OUT_CONF1_CH0_REG	Configuration register 1 of TX channel 0	0x00D4	R/W
GDMA_OUT_PUSH_CH0_REG	Push control register of TX channel 0	0x00DC	varies
GDMA_OUT_LINK_CH0_REG	Link descriptor configuration and control register of TX channel 0	0x00E0	varies
GDMA_IN_CONF0_CH1_REG	Configuration register 0 of RX channel 1	0x0130	R/W
GDMA_IN_CONF1_CH1_REG	Configuration register 1 of RX channel 1	0x0134	R/W
GDMA_IN_POP_CH1_REG	Pop control register of RX channel 1	0x013C	varies
GDMA_IN_LINK_CH1_REG	Link descriptor configuration and control register of RX channel 1	0x0140	varies
GDMA_OUT_CONF0_CH1_REG	Configuration register 0 of TX channel 1	0x0190	R/W
GDMA_OUT_CONF1_CH1_REG	Configuration register 1 of TX channel 1	0x0194	R/W
GDMA_OUT_PUSH_CH1_REG	Push control register of TX channel 1	0x019C	varies
GDMA_OUT_LINK_CH1_REG	Link descriptor configuration and control register of TX channel 1	0x01A0	varies

Name	Description	Address	Access
GDMA_IN_CONF0_CH2_REG	Configuration register 0 of RX channel 2	0x01F0	R/W
GDMA_IN_CONF1_CH2_REG	Configuration register 1 of RX channel 2	0x01F4	R/W
GDMA_IN_POP_CH2_REG	Pop control register of RX channel 2	0x01FC	varies
GDMA_IN_LINK_CH2_REG	Link descriptor configuration and control register of RX channel 2	0x0200	varies
GDMA_OUT_CONF0_CH2_REG	Configuration register 0 of TX channel 2	0x0250	R/W
GDMA_OUT_CONF1_CH2_REG	Configuration register 1 of TX channel 2	0x0254	R/W
GDMA_OUT_PUSH_CH2_REG	Push control register of TX channel 2	0x025C	varies
GDMA_OUT_LINK_CH2_REG	Link descriptor configuration and control register of TX channel 2	0x0260	varies
Status Registers			
GDMA_INFIFO_STATUS_CH0_REG	RX FIFO status of RX channel 0	0x0078	RO
GDMA_IN_STATE_CH0_REG	Receive status of RX channel 0	0x0084	RO
GDMA_IN_SUC_EOF_DES_ADDR_CH0_REG	Inlink descriptor address when EOF occurs of RX channel 0	0x0088	RO
GDMA_IN_ERR_EOF_DES_ADDR_CH0_REG	Inlink descriptor address when errors occur of RX channel 0	0x008C	RO
GDMA_IN_DSCR_CH0_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 0	0x0090	RO
GDMA_IN_DSCR_BF0_CH0_REG	Address of the current pre-read receive descriptor on RX channel 0	0x0094	RO
GDMA_IN_DSCR_BF1_CH0_REG	Address of the previous pre-read receive descriptor on RX channel 0	0x0098	RO
GDMA_OUTFIFO_STATUS_CH0_REG	TX FIFO status of TX channel 0	0x00D8	RO
GDMA_OUT_STATE_CH0_REG	Transmit status of TX channel 0	0x00E4	RO
GDMA_OUT_EOF_DES_ADDR_CH0_REG	Outlink descriptor address when EOF occurs of TX channel 0	0x00E8	RO
GDMA_OUT_EOF_BFR_DES_ADDR_CH0_REG	The last outlink descriptor address when EOF occurs of TX channel 0	0x00EC	RO
GDMA_OUT_DSCR_CH0_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 0	0x00F0	RO
GDMA_OUT_DSCR_BF0_CH0_REG	Address of the current pre-read transmit descriptor on TX channel 0	0x00F4	RO
GDMA_OUT_DSCR_BF1_CH0_REG	Address of the previous pre-read transmit descriptor on TX channel 0	0x00F8	RO
GDMA_INFIFO_STATUS_CH1_REG	RX FIFO status of RX channel 1	0x0138	RO
GDMA_IN_STATE_CH1_REG	Receive status of RX channel 1	0x0144	RO
GDMA_IN_SUC_EOF_DES_ADDR_CH1_REG	Inlink descriptor address when EOF occurs of RX channel 1	0x0148	RO
GDMA_IN_ERR_EOF_DES_ADDR_CH1_REG	Inlink descriptor address when errors occur of RX channel 1	0x014C	RO

Name	Description	Address	Access
GDMA_IN_DSCR_CH1_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 1	0x0150	RO
GDMA_IN_DSCR_BF0_CH1_REG	Address of the current pre-read receive descriptor on RX channel 1	0x0154	RO
GDMA_IN_DSCR_BF1_CH1_REG	Address of the previous pre-read receive descriptor on RX channel 1	0x0158	RO
GDMA_OUTFIFO_STATUS_CH1_REG	TX FIFO status of TX channel 1	0x0198	RO
GDMA_OUT_STATE_CH1_REG	Transmit status of TX channel 1	0x01A4	RO
GDMA_OUT_EOF_DES_ADDR_CH1_REG	Outlink descriptor address when EOF occurs of TX channel 1	0x01A8	RO
GDMA_OUT_EOF_BFR_DES_ADDR_CH1_REG	The last outlink descriptor address when EOF occurs of TX channel 1	0x01AC	RO
GDMA_OUT_DSCR_CH1_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 1	0x01B0	RO
GDMA_OUT_DSCR_BF0_CH1_REG	Address of the current pre-read transmit descriptor on TX channel 1	0x01B4	RO
GDMA_OUT_DSCR_BF1_CH1_REG	Address of the previous pre-read transmit descriptor on TX channel 1	0x01B8	RO
GDMA_INFIFO_STATUS_CH2_REG	RX FIFO status of RX channel 2	0x01F8	RO
GDMA_IN_STATE_CH2_REG	Receive status of RX channel 2	0x0204	RO
GDMA_IN_SUC_EOF_DES_ADDR_CH2_REG	Inlink descriptor address when EOF occurs of RX channel 2	0x0208	RO
GDMA_IN_ERR_EOF_DES_ADDR_CH2_REG	Inlink descriptor address when errors occur of RX channel 2	0x020C	RO
GDMA_IN_DSCR_CH2_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 2	0x0210	RO
GDMA_IN_DSCR_BF0_CH2_REG	Address of the current pre-read receive descriptor on RX channel 2	0x0214	RO
GDMA_IN_DSCR_BF1_CH2_REG	Address of the previous pre-read receive descriptor on RX channel 2	0x0218	RO
GDMA_OUTFIFO_STATUS_CH2_REG	TX FIFO status of TX channel 2	0x0258	RO
GDMA_OUT_STATE_CH2_REG	Transmit status of TX channel 2	0x0264	RO
GDMA_OUT_EOF_DES_ADDR_CH2_REG	Outlink descriptor address when EOF occurs of TX channel 2	0x0268	RO
GDMA_OUT_EOF_BFR_DES_ADDR_CH2_REG	The last outlink descriptor address when EOF occurs of TX channel 2	0x026C	RO
GDMA_OUT_DSCR_CH2_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 2	0x0270	RO
GDMA_OUT_DSCR_BF0_CH2_REG	Address of the current pre-read transmit descriptor on TX channel 2	0x0274	RO

Name	Description	Address	Access
GDMA_OUT_DSCR_BF1_CH2_REG	Address of the previous pre-read transmit descriptor on TX channel 2	0x0278	RO
Priority Registers			
GDMA_IN_PRI_CH0_REG	Priority register of RX channel 0	0x009C	R/W
GDMA_OUT_PRI_CH0_REG	Priority register of TX channel 0	0x00FC	R/W
GDMA_IN_PRI_CH1_REG	Priority register of RX channel 1	0x015C	R/W
GDMA_OUT_PRI_CH1_REG	Priority register of TX channel 1	0x01BC	R/W
GDMA_IN_PRI_CH2_REG	Priority register of RX channel 2	0x021C	R/W
GDMA_OUT_PRI_CH2_REG	Priority register of TX channel 2	0x027C	R/W
Peripheral Select Registers			
GDMA_IN_PERI_SEL_CH0_REG	Peripheral selection of RX channel 0	0x00A0	R/W
GDMA_OUT_PERI_SEL_CH0_REG	Peripheral selection of TX channel 0	0x0100	R/W
GDMA_IN_PERI_SEL_CH1_REG	Peripheral selection of RX channel 1	0x0160	R/W
GDMA_OUT_PERI_SEL_CH1_REG	Peripheral selection of TX channel 1	0x01C0	R/W
GDMA_IN_PERI_SEL_CH2_REG	Peripheral selection of RX channel 2	0x0220	R/W
GDMA_OUT_PERI_SEL_CH2_REG	Peripheral selection of TX channel 2	0x0280	R/W

2.8 Registers

The addresses in this section are relative to GDMA base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 2.1. GDMA_INT_RAW_CH*n*_REG (*n*: 0-2) (0x0000+16**n*)

(reserved)	GDMA_OUTFIFO_UDF_CH0_INT_RAW	GDMA_OUTFIFO_OVF_CH0_INT_RAW	GDMA_INFIFO_UDF_CH0_INT_RAW	GDMA_INFIFO_OVF_CH0_INT_RAW	GDMA_OUT_TOTAL_EOF_CH0_INT_RAW	GDMA_IN_DSCR_EMPTY_CH0_INT_RAW	GDMA_OUT_DSCR_ERR_CH0_INT_RAW	GDMA_IN_DSCR_ERR_CH0_INT_RAW	GDMA_OUT_EOF_CH0_INT_RAW	GDMA_OUT_DONE_CH0_INT_RAW	GDMA_IN_ERR_EOF_CH0_INT_RAW	GDMA_IN_SUC_EOF_CH0_INT_RAW	GDMA_IN_DONE_CH0_INT_RAW	
31 13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

GDMA_IN_DONE_CH*n*_INT_RAW The raw interrupt bit turns to high level when the last data pointed by one receive descriptor has been received for RX channel 0. (R/WTC/SS)

GDMA_IN_SUC_EOF_CH*n*_INT_RAW The raw interrupt bit turns to high level for RX channel 0 when the last data pointed by one receive descriptor has been received and the suc_eof bit in this descriptor is 1. For UHCI0, the raw interrupt bit turns to high level when the last data pointed by one receive descriptor has been received and no data error is detected for RX channel 0. (R/WTC/SS)

GDMA_IN_ERR_EOF_CH*n*_INT_RAW The raw interrupt bit turns to high level when data error is detected only in the case that the peripheral is UHCI0 for RX channel 0. For other peripherals, this raw interrupt is reserved. (R/WTC/SS)

GDMA_OUT_DONE_CH*n*_INT_RAW The raw interrupt bit turns to high level when the last data pointed by one transmit descriptor has been transmitted to peripherals for TX channel 0. (R/WTC/SS)

GDMA_OUT_EOF_CH*n*_INT_RAW The raw interrupt bit turns to high level when the last data pointed by one transmit descriptor has been read from memory for TX channel 0. (R/WTC/SS)

GDMA_IN_DSCR_ERR_CH*n*_INT_RAW The raw interrupt bit turns to high level when detecting receive descriptor error, including owner error, the second and third word error of receive descriptor for RX channel 0. (R/WTC/SS)

GDMA_OUT_DSCR_ERR_CH*n*_INT_RAW The raw interrupt bit turns to high level when detecting transmit descriptor error, including owner error, the second and third word error of transmit descriptor for TX channel 0. (R/WTC/SS)

Continued on the next page...

Register 2.1. GDMA_INT_RAW_CH*n*_REG (*n*: 0-2) (0x0000+16**n*)

Continued from the previous page...

GDMA_IN_DSCR_EMPTY_CH*n*_INT_RAW The raw interrupt bit turns to high level when RX buffer pointed by inlink is full and receiving data is not completed, but there is no more inlink for RX channel 0. (R/WTC/SS)

GDMA_OUT_TOTAL_EOF_CH*n*_INT_RAW The raw interrupt bit turns to high level when data corresponding a outlink (includes one descriptor or few descriptors) is transmitted out for TX channel 0. (R/WTC/SS)

GDMA_INFIFO_OVF_CH*n*_INT_RAW This raw interrupt bit turns to high level when level 1 FIFO of RX channel 0 is overflow. (R/WTC/SS)

GDMA_INFIFO_UDF_CH*n*_INT_RAW This raw interrupt bit turns to high level when level 1 FIFO of RX channel 0 is underflow. (R/WTC/SS)

GDMA_OUTFIFO_OVF_CH*n*_INT_RAW This raw interrupt bit turns to high level when level 1 FIFO of TX channel 0 is overflow. (R/WTC/SS)

GDMA_OUTFIFO_UDF_CH*n*_INT_RAW This raw interrupt bit turns to high level when level 1 FIFO of TX channel 0 is underflow. (R/WTC/SS)

Register 2.2. GDMA_INT_ST_CH*n*_REG (*n*: 0-2) (0x0004+16**n*)

(reserved)	GDMA_OUTFIFO_UDF_CH0_INT_ST	GDMA_OUTFIFO_OVF_CH0_INT_ST	GDMA_INFIFO_UDF_CH0_INT_ST	GDMA_INFIFO_OVF_CH0_INT_ST	GDMA_OUT_TOTAL_EOF_CH0_INT_ST	GDMA_IN_DSCR_EMPTY_CH0_INT_ST	GDMA_OUT_DSCR_ERR_CH0_INT_ST	GDMA_IN_DSCR_ERR_CH0_INT_ST	GDMA_OUT_EOF_CH0_INT_ST	GDMA_OUT_DONE_CH0_INT_ST	GDMA_IN_ERR_EOF_CH0_INT_ST	GDMA_IN_SUC_EOF_CH0_INT_ST	GDMA_IN_DONE_CH0_INT_ST	
31 13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

GDMA_IN_DONE_CH*n*_INT_ST The raw interrupt status bit for the GDMA_IN_DONE_CH_INT interrupt. (RO)

GDMA_IN_SUC_EOF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_IN_SUC_EOF_CH_INT interrupt. (RO)

GDMA_IN_ERR_EOF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_IN_ERR_EOF_CH_INT interrupt. (RO)

GDMA_OUT_DONE_CH*n*_INT_ST The raw interrupt status bit for the GDMA_OUT_DONE_CH_INT interrupt. (RO)

GDMA_OUT_EOF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_OUT_EOF_CH_INT interrupt. (RO)

GDMA_IN_DSCR_ERR_CH*n*_INT_ST The raw interrupt status bit for the GDMA_IN_DSCR_ERR_CH_INT interrupt. (RO)

GDMA_OUT_DSCR_ERR_CH*n*_INT_ST The raw interrupt status bit for the GDMA_OUT_DSCR_ERR_CH_INT interrupt. (RO)

GDMA_IN_DSCR_EMPTY_CH*n*_INT_ST The raw interrupt status bit for the GDMA_IN_DSCR_EMPTY_CH_INT interrupt. (RO)

GDMA_OUT_TOTAL_EOF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_OUT_TOTAL_EOF_CH_INT interrupt. (RO)

GDMA_INFIFO_OVF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_INFIFO_OVF_L1_CH_INT interrupt. (RO)

GDMA_INFIFO_UDF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_INFIFO_UDF_L1_CH_INT interrupt. (RO)

GDMA_OUTFIFO_OVF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_OUTFIFO_OVF_L1_CH_INT interrupt. (RO)

GDMA_OUTFIFO_UDF_CH*n*_INT_ST The raw interrupt status bit for the GDMA_OUTFIFO_UDF_L1_CH_INT interrupt. (RO)

Register 2.3. GDMA_INT_ENA_CH*n*_REG (*n*: 0-2) (0x0008+16**n*)

(reserved)	GDMA_OUTFIFO_UDF_CH0_INT_ENA	GDMA_OUTFIFO_OVF_CH0_INT_ENA	GDMA_INFIFO_UDF_CH0_INT_ENA	GDMA_INFIFO_OVF_CH0_INT_ENA	GDMA_OUT_TOTAL_EOF_CH0_INT_ENA	GDMA_IN_DSCR_EMPTY_CH0_INT_ENA	GDMA_OUT_DSCR_ERR_CH0_INT_ENA	GDMA_IN_DSCR_ERR_CH0_INT_ENA	GDMA_OUT_EOF_CH0_INT_ENA	GDMA_OUT_DONE_CH0_INT_ENA	GDMA_IN_ERR_EOF_CH0_INT_ENA	GDMA_IN_SUC_EOF_CH0_INT_ENA	GDMA_IN_DONE_CH0_INT_ENA	
31 13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

GDMA_IN_DONE_CH*n*_INT_ENA The interrupt enable bit for the GDMA_IN_DONE_CH_INT interrupt. (R/W)

GDMA_IN_SUC_EOF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_IN_SUC_EOF_CH_INT interrupt. (R/W)

GDMA_IN_ERR_EOF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_IN_ERR_EOF_CH_INT interrupt. (R/W)

GDMA_OUT_DONE_CH*n*_INT_ENA The interrupt enable bit for the GDMA_OUT_DONE_CH_INT interrupt. (R/W)

GDMA_OUT_EOF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_OUT_EOF_CH_INT interrupt. (R/W)

GDMA_IN_DSCR_ERR_CH*n*_INT_ENA The interrupt enable bit for the GDMA_IN_DSCR_ERR_CH_INT interrupt. (R/W)

GDMA_OUT_DSCR_ERR_CH*n*_INT_ENA The interrupt enable bit for the GDMA_OUT_DSCR_ERR_CH_INT interrupt. (R/W)

GDMA_IN_DSCR_EMPTY_CH*n*_INT_ENA The interrupt enable bit for the GDMA_IN_DSCR_EMPTY_CH_INT interrupt. (R/W)

GDMA_OUT_TOTAL_EOF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_OUT_TOTAL_EOF_CH_INT interrupt. (R/W)

GDMA_INFIFO_OVF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_INFIFO_OVF_L1_CH_INT interrupt. (R/W)

GDMA_INFIFO_UDF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_INFIFO_UDF_L1_CH_INT interrupt. (R/W)

GDMA_OUTFIFO_OVF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_OUTFIFO_OVF_L1_CH_INT interrupt. (R/W)

GDMA_OUTFIFO_UDF_CH*n*_INT_ENA The interrupt enable bit for the GDMA_OUTFIFO_UDF_L1_CH_INT interrupt. (R/W)

Register 2.4. GDMA_INT_CLR_CHn_REG (n: 0-2) (0x000C+16*n)

	(reserved)	GDMA_OUTFIFO_UDF_CH0_INT_CLR	GDMA_OUTFIFO_OVF_CH0_INT_CLR	GDMA_INFIFO_UDF_CH0_INT_CLR	GDMA_INFIFO_OVF_CH0_INT_CLR	GDMA_OUT_TOTAL_EOF_CH0_INT_CLR	GDMA_IN_DSCR_EMPTY_CH0_INT_CLR	GDMA_OUT_DSCR_ERR_CH0_INT_CLR	GDMA_IN_DSCR_ERR_CH0_INT_CLR	GDMA_OUT_EOF_CH0_INT_CLR	GDMA_OUT_DONE_CH0_INT_CLR	GDMA_IN_ERR_EOF_CH0_INT_CLR	GDMA_IN_SUC_EOF_CH0_INT_CLR	GDMA_IN_DONE_CH0_INT_CLR
	31 … 13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0

GDMA_IN_DONE_CHn_INT_CLR Set this bit to clear the GDMA_IN_DONE_CH_INT interrupt. (WT)

GDMA_IN_SUC_EOF_CHn_INT_CLR Set this bit to clear the GDMA_IN_SUC_EOF_CH_INT interrupt. (WT)

GDMA_IN_ERR_EOF_CHn_INT_CLR Set this bit to clear the GDMA_IN_ERR_EOF_CH_INT interrupt. (WT)

GDMA_OUT_DONE_CHn_INT_CLR Set this bit to clear the GDMA_OUT_DONE_CH_INT interrupt. (WT)

GDMA_OUT_EOF_CHn_INT_CLR Set this bit to clear the GDMA_OUT_EOF_CH_INT interrupt. (WT)

GDMA_IN_DSCR_ERR_CHn_INT_CLR Set this bit to clear the GDMA_IN_DSCR_ERR_CH_INT interrupt. (WT)

GDMA_OUT_DSCR_ERR_CHn_INT_CLR Set this bit to clear the GDMA_OUT_DSCR_ERR_CH_INT interrupt. (WT)

GDMA_IN_DSCR_EMPTY_CHn_INT_CLR Set this bit to clear the GDMA_IN_DSCR_EMPTY_CH_INT interrupt. (WT)

GDMA_OUT_TOTAL_EOF_CHn_INT_CLR Set this bit to clear the GDMA_OUT_TOTAL_EOF_CH_INT interrupt. (WT)

GDMA_INFIFO_OVF_CHn_INT_CLR Set this bit to clear the GDMA_INFIFO_OVF_L1_CH_INT interrupt. (WT)

GDMA_INFIFO_UDF_CHn_INT_CLR Set this bit to clear the GDMA_INFIFO_UDF_L1_CH_INT interrupt. (WT)

GDMA_OUTFIFO_OVF_CHn_INT_CLR Set this bit to clear the GDMA_OUTFIFO_OVF_L1_CH_INT interrupt. (WT)

GDMA_OUTFIFO_UDF_CHn_INT_CLR Set this bit to clear the GDMA_OUTFIFO_UDF_L1_CH_INT interrupt. (WT)

Register 2.5. GDMA_MISC_CONF_REG (0x0044)

(reserved)		GDMA_CLK_EN	GDMA_ARB_PRI_DIS	(reserved)	GDMA_AHBM_RST_INTER	
31	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0	0	0	0	Reset

GDMA_AHBM_RST_INTER Set this bit, then clear this bit to reset the internal ahb FSM. (R/W)

GDMA_ARB_PRI_DIS Set this bit to disable priority arbitration function. (R/W)

GDMA_CLK_EN 0: Enable the clock only when application writes registers. 1: Force the clock on for registers. (R/W)

Register 2.6. GDMA_DATE_REG (0x0048)

GDMA_DATE		
31	0	
0x2008250		Reset

GDMA_DATE This is the version control register. (R/W)

Register 2.7. GDMA_IN_CONF0_CHn_REG (n: 0-2) (0x0070+192*n)

(reserved)	GDMA_MEM_TRANS_EN_CH0	GDMA_IN_DATA_BURST_EN_CH0	GDMA_INDSCR_BURST_EN_CH0	GDMA_IN_LOOP_TEST_CH0	GDMA_IN_RST_CH0	
31 5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	Reset

GDMA_IN_RST_CHn This bit is used to reset GDMA channel 0 RX FSM and RX FIFO pointer. (R/W)

GDMA_IN_LOOP_TEST_CHn This bit is used to fill the owner bit of receive descriptor by hardware of receive descriptor. (R/W)

GDMA_INDSCR_BURST_EN_CHn Set this bit to 1 to enable INCR burst transfer for RX channel 0 reading descriptor when accessing internal RAM. (R/W)

GDMA_IN_DATA_BURST_EN_CHn Set this bit to 1 to enable INCR burst transfer for RX channel 0 receiving data when accessing internal RAM. (R/W)

GDMA_MEM_TRANS_EN_CHn Set this bit 1 to enable automatic transmitting data from memory to memory via GDMA. (R/W)

Register 2.8. GDMA_IN_CONF1_CHn_REG (n: 0-2) (0x0074+192*n)

(reserved)	GDMA_IN_CHECK_OWNER_CH0	(reserved)	
31 13	12	11 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0 0 0 0 0 0	Reset

GDMA_IN_CHECK_OWNER_CHn Set this bit to enable checking the owner attribute of the descriptor. (R/W)

Register 2.9. GDMA_IN_POP_CH*n*_REG (*n*: 0-2) (0x007C+192**n*)

(reserved)	GDMA_INFIFO_POP_CH0	GDMA_INFIFO_RDATA_CH0	
31 13	12	11 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x800	Reset

GDMA_INFIFO_RDATA_CH*n* This register stores the data popping from GDMA FIFO (intended for debugging). (RO)

GDMA_INFIFO_POP_CH*n* Set this bit to pop data from GDMA FIFO (intended for debugging). (R/W/SC)

Register 2.10. GDMA_IN_LINK_CH*n*_REG (*n*: 0-2) (0x0080+192**n*)

(reserved)	GDMA_INLINK_PARK_CH0	GDMA_INLINK_RESTART_CH0	GDMA_INLINK_START_CH0	GDMA_INLINK_STOP_CH0	GDMA_INLINK_AUTO_RET_CH0	GDMA_INLINK_ADDR_CH0	
31 25	24	23	22	21	20	19 0	
0 0 0 0 0 0 0	1	0	0	0	1	0x000	Reset

GDMA_INLINK_ADDR_CH*n* This register stores the 20 least significant bits of the first receive descriptor's address. (R/W)

GDMA_INLINK_AUTO_RET_CH*n* Set this bit to return to current receive descriptor's address, when there are some errors in current receiving data. (R/W)

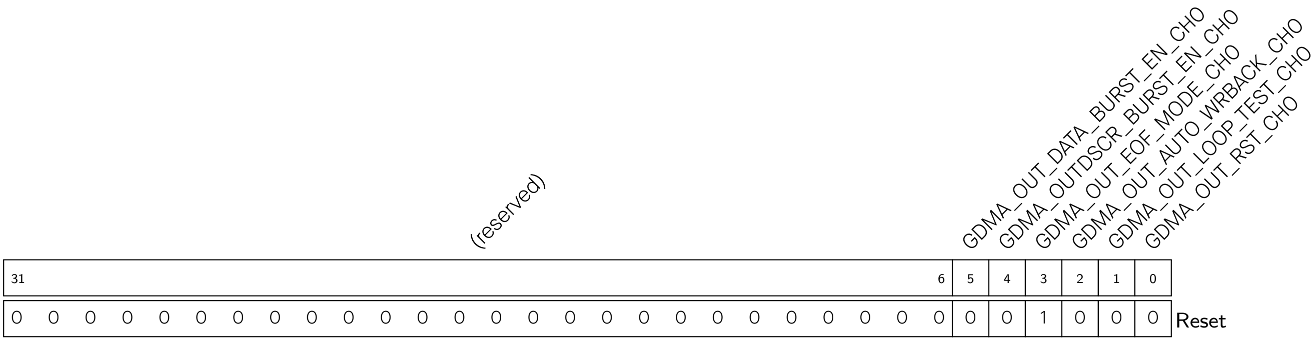
GDMA_INLINK_STOP_CH*n* Set this bit to stop GDMA's receive channel from receiving data. (R/W/SC)

GDMA_INLINK_START_CH*n* Set this bit to enable GDMA's receive channel from receiving data. (R/W/SC)

GDMA_INLINK_RESTART_CH*n* Set this bit to mount a new receive descriptor. (R/W/SC)

GDMA_INLINK_PARK_CH*n* 1: the receive descriptor's FSM is in idle state; 0: the receive descriptor's FSM is working. (RO)

Register 2.11. GDMA_OUT_CONF0_CH*n*_REG (*n*: 0-2) (0x00D0+192**n*)



GDMA_OUT_RST_CH*n* This bit is used to reset GDMA channel 0 TX FSM and TX FIFO pointer. (R/W)

GDMA_OUT_LOOP_TEST_CH*n* Reserved. (R/W)

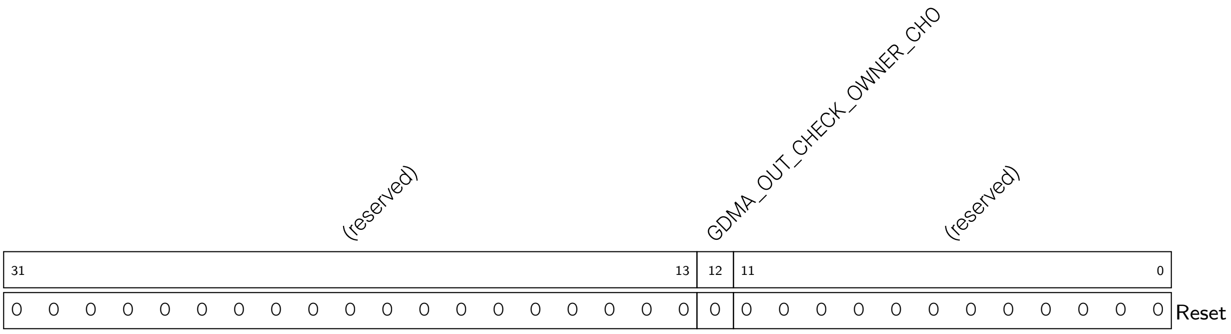
GDMA_OUT_AUTO_WRBACK_CH*n* Set this bit to enable automatic outlink-writeback when all the data in TX buffer has been transmitted. (R/W)

GDMA_OUT_EOF_MODE_CH*n* EOF flag generation mode when transmitting data. 1: EOF flag for TX channel 0 is generated when data need to transmit has been popped from FIFO in GDMA. (R/W)

GDMA_OUTDSCR_BURST_EN_CH*n* Set this bit to 1 to enable INCR burst transfer for TX channel 0 reading descriptor when accessing internal RAM. (R/W)

GDMA_OUT_DATA_BURST_EN_CH*n* Set this bit to 1 to enable INCR burst transfer for TX channel 0 transmitting data when accessing internal RAM. (R/W)

Register 2.12. GDMA_OUT_CONF1_CH*n*_REG (*n*: 0-2) (0x00D4+192**n*)



GDMA_OUT_CHECK_OWNER_CH*n* Set this bit to enable checking the owner attribute of the descriptor. (R/W)

Register 2.13. GDMA_OUT_PUSH_CHn_REG (n: 0-2) (0x00DC+192*n)

(reserved)	GDMA_OUTFIFO_PUSH_CH0	GDMA_OUTFIFO_WDATA_CH0	
31 10	9	8 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x0	Reset

GDMA_OUTFIFO_WDATA_CHn This register stores the data that need to be pushed into GDMA FIFO. (R/W)

GDMA_OUTFIFO_PUSH_CHn Set this bit to push data into GDMA FIFO. (R/W/SC)

Register 2.14. GDMA_OUT_LINK_CHn_REG (n: 0-2) (0x00E0+192*n)

(reserved)	GDMA_OUTLINK_PARK_CH0	GDMA_OUTLINK_RESTART_CH0	GDMA_OUTLINK_START_CH0	GDMA_OUTLINK_STOP_CH0	GDMA_OUTLINK_ADDR_CH0	
31 24	23	22	21	20	19 0	
0 0 0 0 0 0 0 0	1	0	0	0	0x000	Reset

GDMA_OUTLINK_ADDR_CHn This register stores the 20 least significant bits of the first transmit descriptor's address. (R/W)

GDMA_OUTLINK_STOP_CHn Set this bit to stop GDMA's transmit channel from transferring data. (R/W/SC)

GDMA_OUTLINK_START_CHn Set this bit to enable GDMA's transmit channel for data transfer. (R/W/SC)

GDMA_OUTLINK_RESTART_CHn Set this bit to restart a new outlink from the last address. (R/W/SC)

GDMA_OUTLINK_PARK_CHn 1: the transmit descriptor's FSM is in idle state; 0: the transmit descriptor's FSM is working. (RO)

Register 2.15. GDMA_INFIFO_STATUS_CH*n*_REG (*n*: 0-2) (0x0078+192**n*)

(reserved)	GDMA_IN_BUF_HUNGRY_CH0	GDMA_IN_REMAIN_UNDER_4B_CH0	GDMA_IN_REMAIN_UNDER_3B_CH0	GDMA_IN_REMAIN_UNDER_2B_CH0	GDMA_IN_REMAIN_UNDER_1B_CH0	(reserved)	GDMA_INFIFO_CNT_CH0	GDMA_INFIFO_EMPTY_CH0	GDMA_INFIFO_FULL_CH0	
31 28	27	26	25	24	23	22 8	7 2	1	0	
0 0 0 0	0	1	1	1	1	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	1	1	Reset

GDMA_INFIFO_FULL_CH*n* L1 RX FIFO full signal for RX channel 0. (RO)

GDMA_INFIFO_EMPTY_CH*n* L1 RX FIFO empty signal for RX channel 0. (RO)

GDMA_INFIFO_CNT_CH*n* The register stores the byte number of the data in L1 RX FIFO for RX channel 0. (RO)

GDMA_IN_REMAIN_UNDER_1B_CH*n* Reserved. (RO)

GDMA_IN_REMAIN_UNDER_2B_CH*n* Reserved. (RO)

GDMA_IN_REMAIN_UNDER_3B_CH*n* Reserved. (RO)

GDMA_IN_REMAIN_UNDER_4B_CH*n* Reserved. (RO)

GDMA_IN_BUF_HUNGRY_CH*n* Reserved. (RO)

Register 2.16. GDMA_IN_STATE_CH*n*_REG (*n*: 0-2) (0x0084+192**n*)

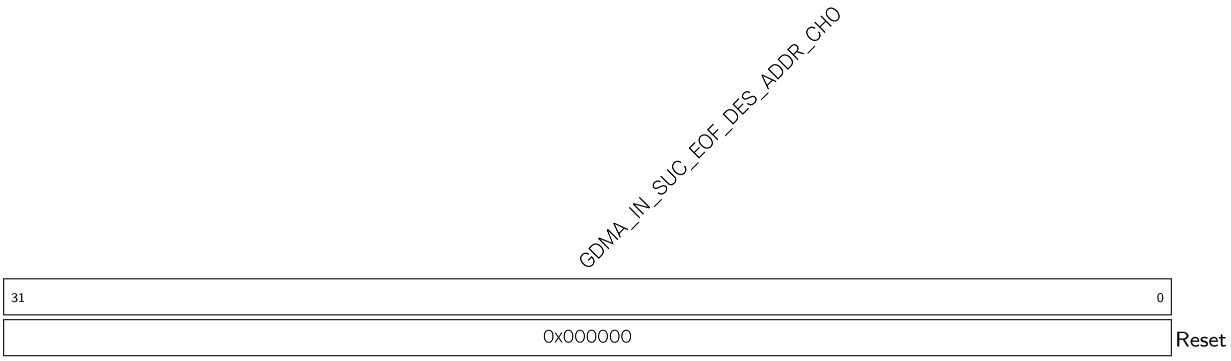
(reserved)	GDMA_IN_STATE_CH0	GDMA_IN_DSCR_STATE_CH0	GDMA_INLINK_DSCR_ADDR_CH0	
31 23	22 20	19 18	17 0	
0 0 0 0 0 0 0 0 0	0	0	0	Reset

GDMA_INLINK_DSCR_ADDR_CH*n* This register stores the lower 18 bits of the next receive descriptor address that is pre-read (but not processed yet). If the current receive descriptor is the last descriptor, then this field represents the address of the current receive descriptor. (RO)

GDMA_IN_DSCR_STATE_CH*n* Reserved. (RO)

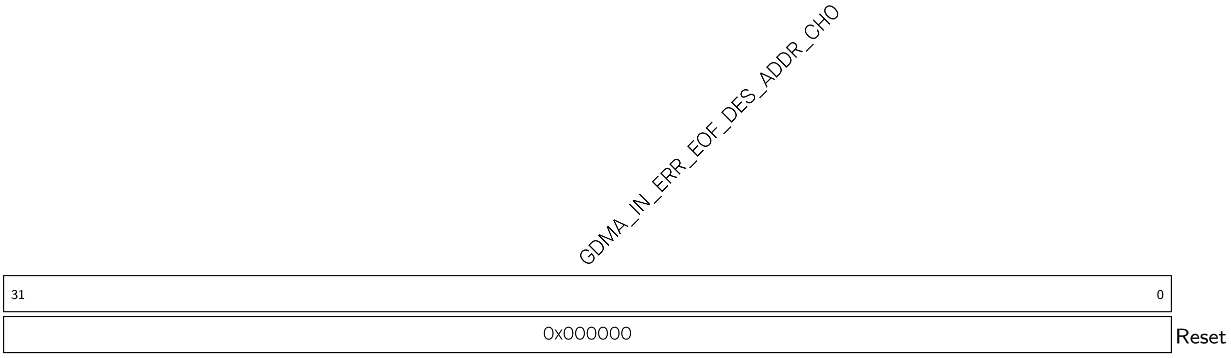
GDMA_IN_STATE_CH*n* Reserved. (RO)

Register 2.17. GDMA_IN_SUC_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x0088+192**n*)



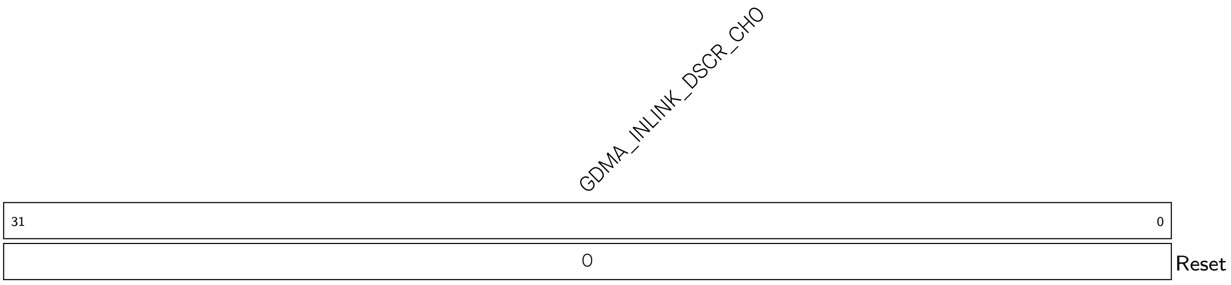
GDMA_IN_SUC_EOF_DES_ADDR_CH*n* This register stores the address of the receive descriptor when the EOF bit in this descriptor is 1. (RO)

Register 2.18. GDMA_IN_ERR_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x008C+192**n*)



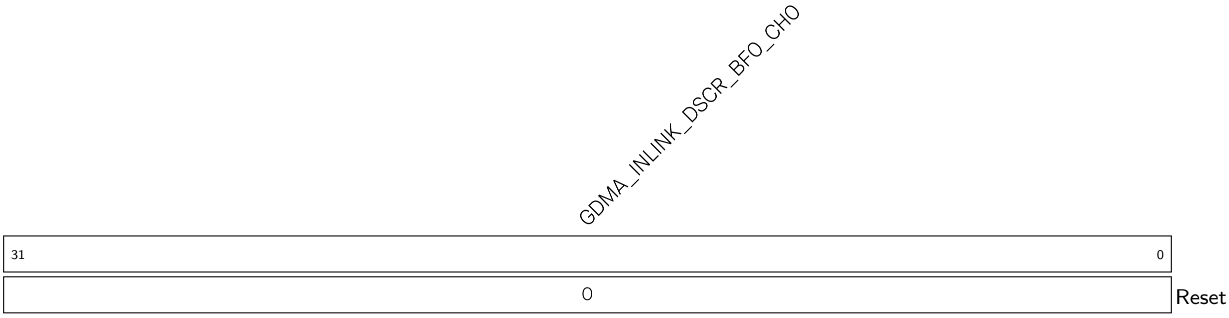
GDMA_IN_ERR_EOF_DES_ADDR_CH*n* This register stores the address of the receive descriptor when there are some errors in current receiving data. Only used when peripheral is UHCI0. (RO)

Register 2.19. GDMA_IN_DSCR_CH*n*_REG (*n*: 0-2) (0x0090+192**n*)



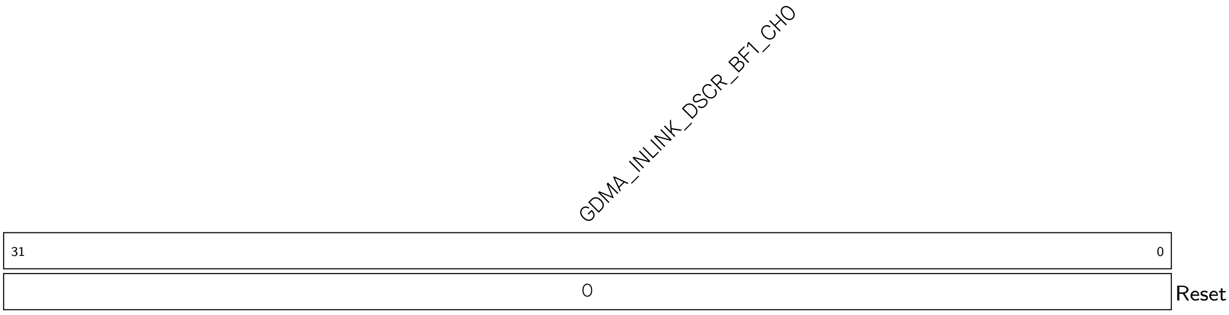
GDMA_INLINK_DSCR_CH*n* Represents the address of the next receive descriptor x+1 pointed by the current receive descriptor that is pre-read. (RO)

Register 2.20. GDMA_IN_DSCR_BF0_CHn_REG (n: 0-2) (0x0094+192*n)



GDMA_INLINK_DSCR_BF0_CHn Represents the address of the current receive descriptor x that is pre-read. (RO)

Register 2.21. GDMA_IN_DSCR_BF1_CHn_REG (n: 0-2) (0x0098+192*n)



GDMA_INLINK_DSCR_BF1_CHn Represents the address of the previous receive descriptor x-1 that is pre-read. (RO)

Register 2.22. GDMA_OUTFIFO_STATUS_CH*n*_REG (*n*: 0-2) (0x00D8+192**n*)

(reserved)	GDMA_OUT_REMAIN_UNDER_4B_CH0	GDMA_OUT_REMAIN_UNDER_3B_CH0	GDMA_OUT_REMAIN_UNDER_2B_CH0	GDMA_OUT_REMAIN_UNDER_1B_CH0	(reserved)	GDMA_OUTFIFO_CNT_CH0	GDMA_OUTFIFO_EMPTY_CH0	GDMA_OUTFIFO_FULL_CH0	
31 27	26	25	24	23	22 8	7 2	1	0	
0 0 0 0 0	1	1	1	1	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	1	0	Reset

GDMA_OUTFIFO_FULL_CH*n* L1 TX FIFO full signal for TX channel 0. (RO)

GDMA_OUTFIFO_EMPTY_CH*n* L1 TX FIFO empty signal for TX channel 0. (RO)

GDMA_OUTFIFO_CNT_CH*n* The register stores the byte number of the data in L1 TX FIFO for TX channel 0. (RO)

GDMA_OUT_REMAIN_UNDER_1B_CH*n* Reserved. (RO)

GDMA_OUT_REMAIN_UNDER_2B_CH*n* Reserved. (RO)

GDMA_OUT_REMAIN_UNDER_3B_CH*n* Reserved. (RO)

GDMA_OUT_REMAIN_UNDER_4B_CH*n* Reserved. (RO)

Register 2.23. GDMA_OUT_STATE_CH*n*_REG (*n*: 0-2) (0x00E4+192**n*)

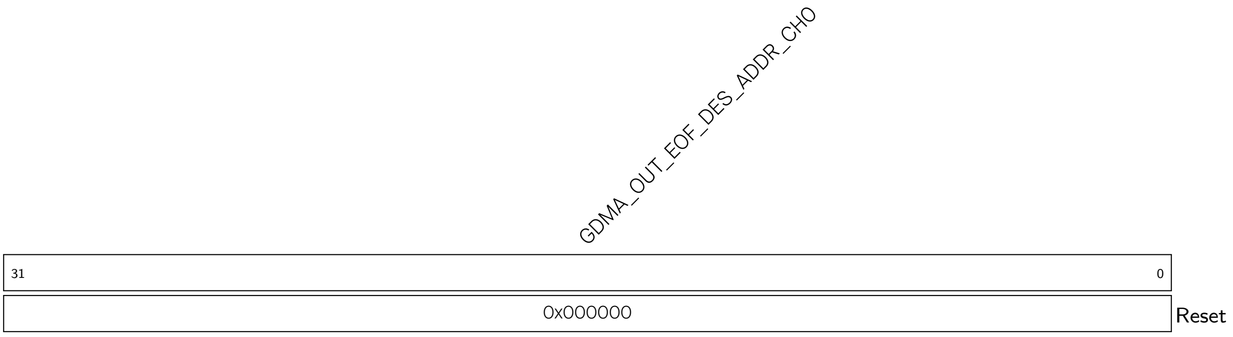
(reserved)	GDMA_OUT_STATE_CH0	GDMA_OUT_DSCR_STATE_CH0	GDMA_OUTLINK_DSCR_ADDR_CH0	
31 23	22 20	19 18	17 0	
0 0 0 0 0 0 0 0 0	0	0	0	Reset

GDMA_OUTLINK_DSCR_ADDR_CH*n* This register stores the lower 18 bits of the next receive descriptor address that is pre-read (but not processed yet). If the current receive descriptor is the last descriptor, then this field represents the address of the current receive descriptor. (RO)

GDMA_OUT_DSCR_STATE_CH*n* Reserved. (RO)

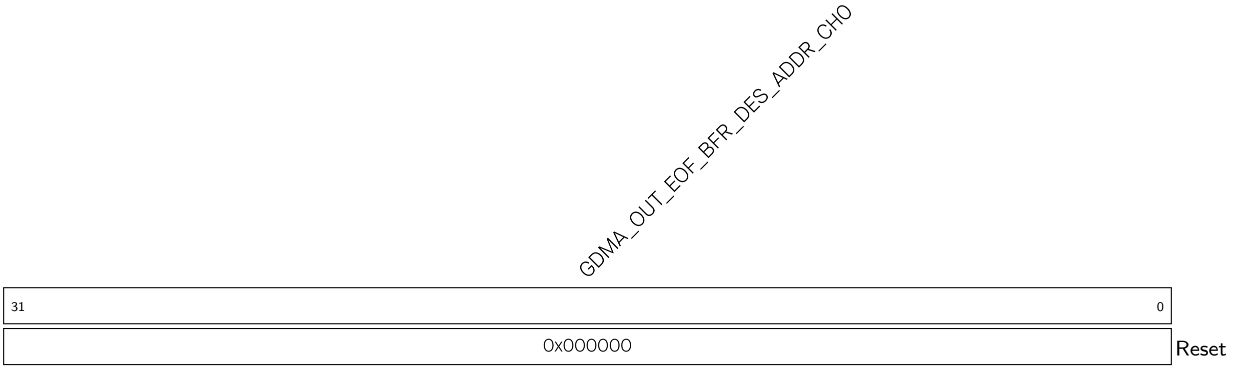
GDMA_OUT_STATE_CH*n* Reserved. (RO)

Register 2.24. GDMA_OUT_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x00E8+192**n*)



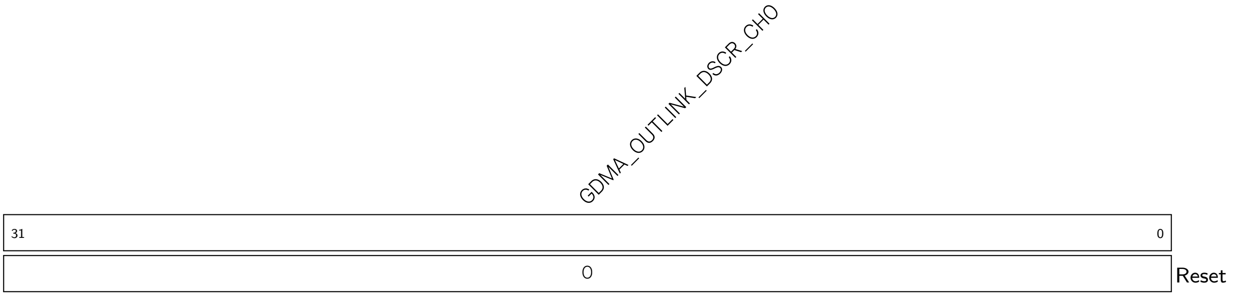
GDMA_OUT_EOF_DES_ADDR_CH*n* This register stores the address of the transmit descriptor when the EOF bit in this descriptor is 1. (RO)

Register 2.25. GDMA_OUT_EOF_BFR_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x00EC+192**n*)



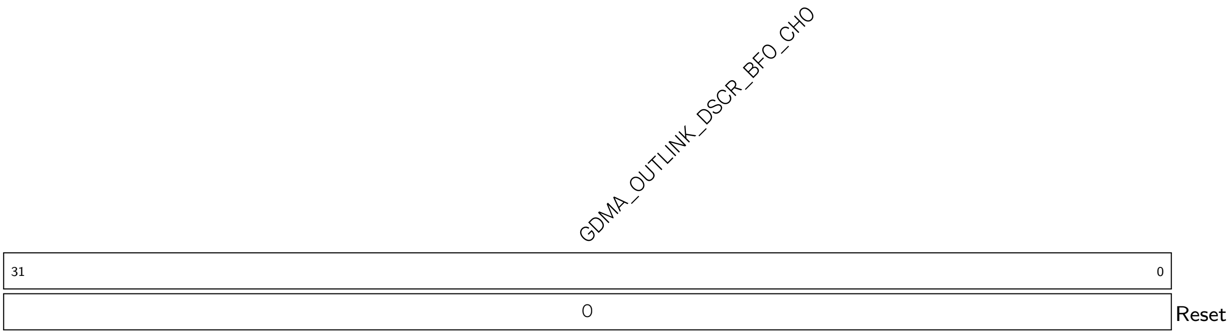
GDMA_OUT_EOF_BFR_DES_ADDR_CH*n* This register stores the address of the transmit descriptor before the last transmit descriptor. (RO)

Register 2.26. GDMA_OUT_DSCR_CH*n*_REG (*n*: 0-2) (0x00F0+192**n*)



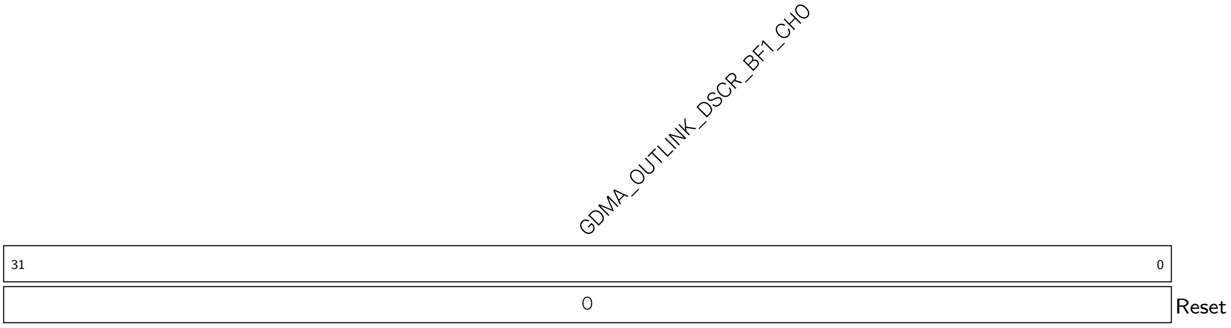
GDMA_OUTLINK_DSCR_CH*n* Represents the address of the next transmit descriptor y+1 pointed by the current transmit descriptor that is pre-read. (RO)

Register 2.27. GDMA_OUT_DSCR_BF0_CH*n*_REG (*n*: 0-2) (0x00F4+192**n*)



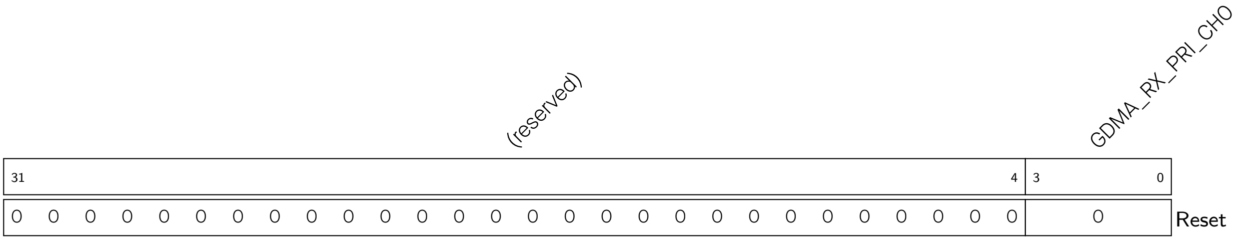
GDMA_OUTLINK_DSCR_BF0_CH*n* Represents the address of the current transmit descriptor y that is pre-read. (RO)

Register 2.28. GDMA_OUT_DSCR_BF1_CH*n*_REG (*n*: 0-2) (0x00F8+192**n*)



GDMA_OUTLINK_DSCR_BF1_CH*n* Represents the address of the previous transmit descriptor y-1 that is pre-read. (RO)

Register 2.29. GDMA_IN_PRI_CH*n*_REG (*n*: 0-2) (0x009C+192**n*)



GDMA_RX_PRI_CH*n* The priority of RX channel 0. The larger the value, the higher the priority. (R/W)

Register 2.30. GDMA_OUT_PRI_CH*n*_REG (*n*: 0-2) (0x00FC+192**n*)

(reserved)	GDMA_TX_PRI_CH0	
31 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

GDMA_TX_PRI_CH*n* The priority of TX channel 0. The larger the value, the higher the priority. (R/W)

Register 2.31. GDMA_IN_PERI_SEL_CH*n*_REG (*n*: 0-2) (0x00A0+192**n*)

(reserved)	GDMA_PERI_IN_SEL_CH0	
31 6	5 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3f	Reset

GDMA_PERI_IN_SEL_CH*n* This register is used to select peripheral for RX channel 0. 0: SPI2. 1: reserved. 2: UHCI0. 3: I2S. 4: reserved. 5: reserved. 6: AES. 7: SHA. 8: ADC; 9 ~ 63: Invalid. (R/W)

GDMA_PERI_OUT_SEL_CH*n* This register is used to select peripheral for TX channel 0. 0: SPI2. 1: reserved. 2: UHCI0. 3: I2S. 4: reserved. 5: reserved. 6: AES. 7: SHA. 8: ADC; 9 ~ 63: Invalid. (R/W)

3 System and Memory

3.1 Overview

The ESP32-C3 is an ultra-low-power and highly-integrated system with a 32-bit RISC-V single-core processor with a four-stage pipeline that operates at up to 160 MHz. All internal memory, external memory, and peripherals are located on the CPU buses.

3.2 Features

- **Address Space**
  - 792 KB of internal memory address space accessed from the instruction bus
  - 552 KB of internal memory address space accessed from the data bus
  - 836 KB of peripheral address space
  - 8 MB of external memory virtual address space accessed from the instruction bus
  - 8 MB of external memory virtual address space accessed from the data bus
  - 384 KB of internal DMA address space
- **Internal Memory**
  - 384 KB of Internal ROM
  - 400 KB of Internal SRAM
  - 8 KB of RTC Memory
- **External Memory**
  - Supports up to 16 MB external flash
- **Peripheral Space**
  - 35 modules/peripherals in total
- **GDMA**
  - 7 GDMA-supported modules/peripherals

Figure 3-1 illustrates the system structure and address mapping.

Figure 3-1. System Structure and Address Mapping

Note:

- The address space with gray background is not available to users.
- The range of addresses available in the address space may be larger than the actual available memory of a particular type.

3.3 Functional Description

3.3.1 Address Mapping

Addresses below 0x4000_0000 are accessed using the data bus. Addresses in the range of 0x4000_0000 ~ 0x4FFF_FFFF are accessed using the instruction bus. Addresses over and including 0x5000_0000 are shared by the data bus and the instruction bus.

Both data bus and instruction bus are little-endian. The CPU can access data via the data bus using single-byte, double-byte, 4-byte alignment. The CPU can also access data via the instruction bus, but only in 4-byte aligned manner.

The CPU can:

- directly access the internal memory via both data bus and instruction bus;
- access the external memory which is mapped into the virtual address space via cache;
- directly access modules/peripherals via data bus.

Figure 3-1 lists the address ranges on the data bus and instruction bus and their corresponding target memory.

Some internal and external memory can be accessed via both data bus and instruction bus. In such cases, the CPU can access the same memory using multiple addresses.

3.3.2 Internal Memory

The ESP32-C3 consists of the following three types of internal memory:

- Internal ROM (384 KB): The Internal ROM of the ESP32-C3 is a Mask ROM, meaning it is strictly read-only and cannot be reprogrammed. Internal ROM contains the ROM code (software instructions and some software read-only data) of some low level system software.
- Internal SRAM (400 KB): The Internal Static RAM (SRAM) is a volatile memory that can be quickly accessed by the CPU (generally within a single CPU clock cycle).
  - A part of the SRAM can be configured to operate as a cache for external memory access.
  - Some parts of the SRAM can only be accessed via the CPU's instruction bus.
  - Some parts of the SRAM can be accessed via both the CPU's instruction bus and the CPU's data bus.
- RTC Memory (8 KB): The RTC (Real Time Clock) memory implemented as Static RAM (SRAM) thus is volatile. However, RTC memory has the added feature of being persistent in deep sleep (i.e., the RTC memory retains its values throughout deep sleep).
  - RTC FAST Memory (8 KB): RTC FAST memory can only be accessed by the CPU and can be generally used to store instructions and data that needs to persist across a deep sleep.

Based on the three different types of internal memory described above, the internal memory of the ESP32-C3 is split into three segments: Internal ROM (384 KB), Internal SRAM (400 KB), RTC FAST Memory (8 KB).

However, within each segment, there may be different bus access restrictions (e.g., some parts of the segment may only be accessible by the CPU's Data bus). Therefore, each some segments are also further divided into parts. Table 3-1 describes each part of internal memory and their address ranges on the data bus and/or instruction bus.

Table 3-1. Internal Memory Address Mapping

Bus Type	Boundary Address		Size (KB)	Target
	Low Address	High Address		
Data bus	0x3FF0_0000	0x3FF1_FFFF	128	Internal ROM 1
	0x3FC8_0000	0x3FCD_FFFF	384	Internal SRAM 1
Instruction bus	0x4000_0000	0x4003_FFFF	256	Internal ROM 0
	0x4004_0000	0x4005_FFFF	128	Internal ROM 1
	0x4037_C000	0x4037_FFFF	16	Internal SRAM 0

Cont'd on next page

Table 3-1 – cont'd from previous page

Bus Type	Boundary Address		Size (KB)	Target
	Low Address	High Address		
	0x4038_0000	0x403D_FFFF	384	Internal SRAM 1
Data/Instruction bus	0x5000_0000	0x5000_1FFF	8	RTC FAST Memory

Note:

All of the internal memories are managed by Permission Control module. An internal memory can only be accessed when it is allowed by Permission Control, then the internal memory can be available to the CPU. For more information about Permission Control, please refer to Chapter 14 *Permission Control (PMS)*.

1. Internal ROM 0

Internal ROM 0 is a 256 KB, read-only memory space, addressed by the CPU only through the instruction bus via 0x4000_0000 ~ 0x4003_FFFF, as shown in Table 3-1.

2. Internal ROM 1

Internal ROM 1 is a 128 KB, read-only memory space, addressed by the CPU through the instruction bus via 0x4004_0000 ~ 0x4005_FFFF or through the data bus via 0x3FF0_0000 ~ 0x3FF1_FFFF in the same order, as shown in Table 3-1.

This means, for example, address 04004_0000 and 0x3FF0_0000 correspond to the same word, 0x4004_0004 and 0x3FF0_0004 correspond to the same word, 0x4004_0008 and 0x3FF0_0008 correspond to the same word, etc (the same ordering applies for Internal SRAM 1).

3. Internal SRAM 0

Internal SRAM 0 is a 16 KB, read-and-write memory space, addressed by the CPU through the instruction bus via the range described in Table 3-1.

This memory managed by Permission Control, can be configured as instruction cache to store cache instructions or read-only data of the external memory. In this case, the memory cannot be accessed by the CPU. For more information about Permission Control, please refer to Chapter 14 *Permission Control (PMS)*.

4. Internal SRAM 1

Internal SRAM 1 is a 384 KB, read-and-write memory space, addressed by the CPU through the data bus or instruction bus, in the same order, via the ranges described in Table 3-1.

5. RTC FAST Memory

RTC FAST Memory is a 8 KB, read-and-write SRAM, addressed by the CPU through the data/instruction bus via the shared address 0x5000_0000 ~ 0x5000_1FFF, as described in Table 3-1.

3.3.3 External Memory

ESP32-C3 supports SPI, Dual SPI, Quad SPI, and QPI interfaces that allow connection to multiple external flash. It supports hardware manual encryption and automatic decryption based on XTS_AES to protect user programs and data in the external flash.

3.3.3.1 External Memory Address Mapping

The CPU accesses the external memory via the cache. According to the MMU (Memory Management Unit) settings, the cache maps the CPU's address to the external memory's physical address. Due to this address mapping, the ESP32-C3 can address up to 16 MB external flash.

Using the cache, ESP32-C3 is able to support the following address space mappings. Note that the instruction bus address space (8MB) and the data bus address space (8 MB) is always shared.

- Up to 8 MB instruction bus address space can be mapped into the external flash. The mapped address space is organized as individual 64-KB blocks.
- Up to 8 MB data bus (read-only) address space can be mapped into the external flash. The mapped address space is organized as individual 64-KB blocks.

Table 3-2 lists the mapping between the cache and the corresponding address ranges on the data bus and instruction bus.

Table 3-2. External Memory Address Mapping

Bus Type	Boundary Address		Size (MB)	Target
	Low Address	High Address		
Data bus (read-only)	0x3C00_0000	0x3C7F_FFFF	8	Uniform Cache
Instruction bus	0x4200_0000	0x427F_FFFF	8	Uniform Cache

Note:

Only if the CPU obtains permission for accessing the external memory, can it be responded for memory access. For more detailed information about permission control, please refer to Chapter 14 *Permission Control (PMS)*.

3.3.3.2 Cache

As shown in Figure 3-2, ESP32-C3 has a read-only uniform cache which is eight-way set-associative, its size is 16 KB and its block size is 32 bytes. When cache is active, some internal memory space will be occupied by cache (see Internal SRAM 0 in Section 3.3.2).

The uniform cache is accessible by the instruction bus and the data bus at the same time, but can only respond to one of them at a time. When a cache miss occurs, the cache controller will initiate a request to the external memory.

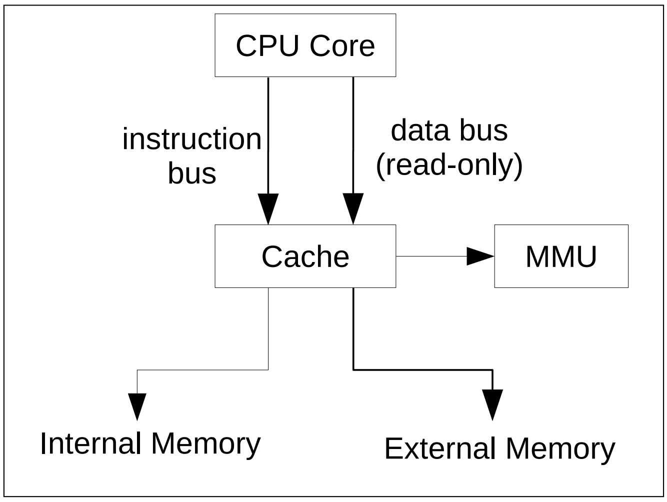

Figure 3-2. Cache Structure

3.3.3.3 Cache Operations

ESP32-C3 cache support the following operations:

1. **Invalidate**: This operation is used to clear valid data in the cache. After this operation is completed, the data will only be stored in the external memory. The CPU needs to access the external memory in order to read this data. There are two types of invalidate-operation: automatic invalidation (Auto-Invalidate) and manual invalidation (Manual-Invalidate). Manual-Invalidate is performed only on data in the specified area in the cache, while Auto-Invalidate is performed on all data in the cache.

2. **Preload**: This operation is used to load instructions and data into the cache in advance. The minimum unit of preload-operation is one block. There are two types of preload-operation: manual preload (Manual-Preload) and automatic preload (Auto-Preload). Manual-Preload means that the hardware prefetches a piece of continuous data according to the virtual address specified by the software. Auto-Preload means the hardware prefetches a piece of continuous data according to the current address where the cache hits or misses (depending on configuration).

3. **Lock/Unlock**: The lock operation is used to prevent the data in the cache from being easily replaced. There are two types of lock: prelock and manual lock. When prelock is enabled, the cache locks the data in the specified area when filling the missing data to cache memory, while the data outside the specified area will not be locked. When manual lock is enabled, the cache checks the data that is already in the cache memory and only locks the data in the specified area, and leaves the data outside the specified area unlocked. When there are missing data, the cache will replace the data in the unlocked way first, so the data in the locked way is always stored in the cache and will not be replaced. But when all ways within the cache are locked, the cache will replace data, as if it was not locked. Unlocking is the reverse of locking, except that it only can be done manually.

   Please note that the Manual-Invalidate operations will only work on the unlocked data. If you expect to perform such operation on the locked data, please unlock them first.

3.3.4 GDMA Address Space

The GDMA (General Direct Memory Access) peripheral in ESP32-C3 can provide DMA (Direct Memory Access) services including:

- Data transfers between different locations of internal memory;
- Data transfers between modules/peripherals and internal memory.

GDMA uses the same addresses as the data bus to read and write Internal SRAM 1. Specifically, GDMA uses address range 0x3FC8_0000 ~ 0x3FCD_FFFF to access Internal SRAM 1. Note that GDMA cannot access the internal memory occupied by the cache.

There are 7 peripherals/modules that can work together with GDMA.

As shown in Figure 3-3, these 7 vertical lines in turn correspond to these 7 peripherals/modules with GDMA function, the horizontal line represents a certain channel of GDMA (can be any channel), and the intersection of the vertical line and the horizontal line indicates that a peripheral/module has the ability to access the corresponding channel of GDMA. If there are multiple intersections on the same line, it means that these peripherals/modules cannot enable the GDMA function at the same time.

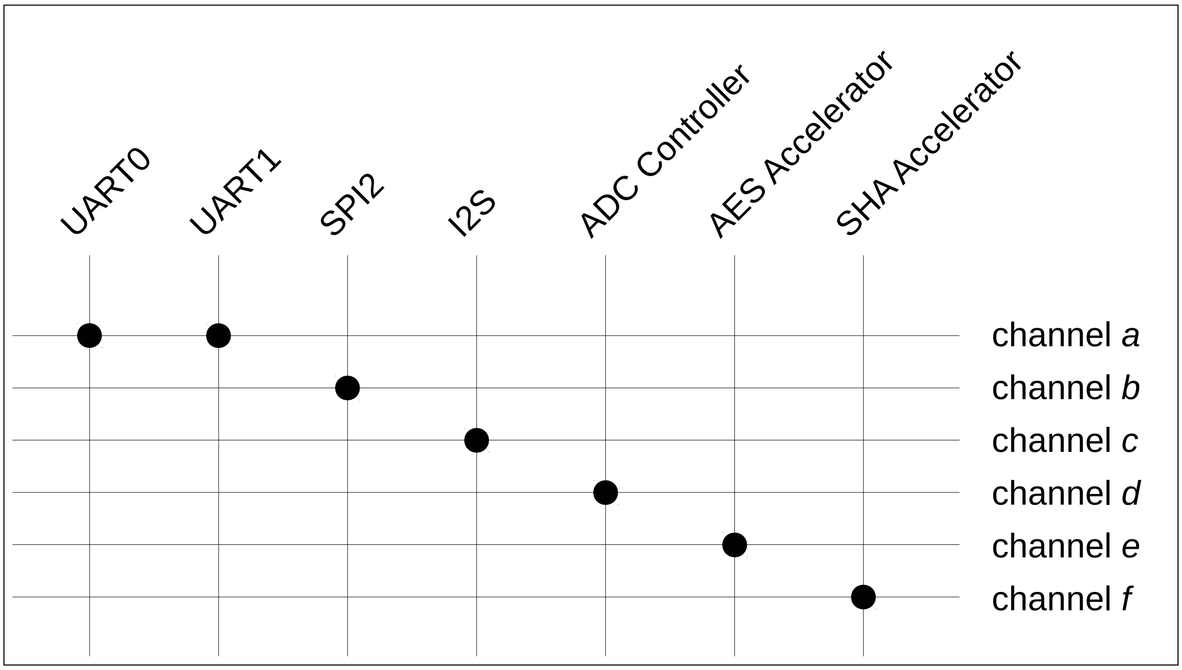

Figure 3-3. Peripherals/modules that can work with GDMA

These peripherals/modules can access any memory available to GDMA. For more information, please refer to Chapter 2 *GDMA Controller (GDMA)*.

Note:

When accessing a memory via GDMA, a corresponding access permission is needed, otherwise this access may fail. For more information about permission control, please refer to Chapter 14 *Permission Control (PMS)*.

3.3.5 Modules/Peripherals

The CPU can access modules/peripherals via 0x6000_0000 ~ 0x600D_0FFF shared by the data/instruction bus.

3.3.5.1 Module/Peripheral Address Mapping

Table 3-3 lists all the modules/peripherals and their respective address ranges. Note that the address space of specific modules/peripherals is defined by "Boundary Address" (including both Low Address and High Address).

Table 3-3. Module/Peripheral Address Mapping

4 eFuse Controller (EFUSE)

4.1 Overview

ESP32-C3 contains a 4096-bit eFuse controller to store parameters. Once an eFuse bit is programmed to 1, it can never be reverted to 0. The eFuse controller programs individual bits of parameters in eFuse according to user configurations. From outside the chip, eFuse data can only be read via the eFuse Controller. If read-protection for some data is not enabled, that data is readable from outside the chip. If read-protection is enabled, that data can not be read from outside the chip. In all cases, however, some keys stored in eFuse can still be used internally by hardware cryptography modules such as Digital Signature, HMAC, etc., without exposing this data to the outside world.

4.2 Features

- 4096-bit One-time programmable storage
- Configurable write protection
- Configurable read protection
- Various hardware encoding schemes against data corruption

4.3 Functional Description

4.3.1 Structure

eFuse data is organized in 11 blocks (BLOCK0 ~ BLOCK10).

BLOCK0, which holds most parameters, has 9 bits that are readable but useless to users, and 60 further bits are reserved for future use.

Table 4-1 lists all the parameters accessible (readable and usable) to users in BLOCK0 and their offsets, bit widths, as well as information on whether their configuration is directly accessible by hardware, and whether they are protected from programming.

The **EFUSE_WR_DIS** parameter is used to disable the writing of other parameters, while **EFUSE_RD_DIS** is used to disable users from reading BLOCK4 ~ BLOCK10. For more information on these two parameters, please see Section 4.3.1.1 and Section 4.3.1.2.

Table 4-1. Parameters in eFuse BLOCK0

Parameters	Bit Width	Accessible by Hardware	Programming-Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_WR_DIS	32	Y	N/A	Represents whether writing of individual eFuses is disabled.
EFUSE_RD_DIS	7	Y	0	Represents whether users' reading from BLOCK4 ~ 10 is disabled.
EFUSE_DIS_ICACHE	1	Y	2	Represents whether iCache is disabled.
EFUSE_DIS_USB_JTAG	1	Y	2	Represents whether the USB-to-JTAG function is disabled.
EFUSE_DIS_DOWNLOAD_ICACHE	1	Y	2	Represents whether iCache is disabled in Download mode.
EFUSE_DIS_USB_SERIAL_JTAG	1	Y	2	Represents whether the usb_serial_jtag peripheral is disabled.
EFUSE_DIS_FORCE_DOWNLOAD	1	Y	2	Represents whether the function to force the chip into Download mode is disabled.
EFUSE_DIS_TWAI	1	Y	2	Represents whether the TWAI controller is disabled.
EFUSE_JTAG_SEL_ENABLE	1	Y	2	Represents whether to use JTAG directly.
EFUSE_SOFT_DIS_JTAG	3	Y	31	Represents whether JTAG is disabled in the soft way.
EFUSE_DIS_PAD_JTAG	1	Y	2	Represents whether JTAG is disabled in the hard way (permanently).
EFUSE_DIS_DOWNLOAD_ MANUAL_ENCRYPT	1	Y	2	Represents whether flash encryption is disabled in Download boot mode.
EFUSE_USB_EXCHG_PINS	1	Y	30	Represents whether the D+ and D- pins are exchanged.
EFUSE_VDD_SPI_AS_GPIO	1	N	30	Represents whether the VDD_SPI pin is used as a regular GPIO.
EFUSE_WDT_DELAY_SEL	2	Y	3	Represents whether RTC watchdog timeout threshold is selected.
EFUSE_SPI_BOOT_CRYPT_CNT	3	Y	4	Represents whether SPI boot encryption/decryption is enabled.

Cont'd on next page

Table 4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Programming-Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_SECURE_BOOT_KEY_ REVOKE0	1	N	5	Represents whether revoking the first Secure Boot key is enabled.
EFUSE_SECURE_BOOT_KEY_ REVOKE1	1	N	6	Represents whether revoking the second Secure Boot key is enabled..
EFUSE_SECURE_BOOT_KEY_ REVOKE2	1	N	7	Represents whether revoking the third Secure Boot key is enabled.
EFUSE_KEY_PURPOSE_0	4	Y	8	Represents Key0 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_1	4	Y	9	Represents Key1 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_2	4	Y	10	Represents Key2 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_3	4	Y	11	Represents Key3 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_4	4	Y	12	Represents Key4 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_5	4	Y	13	Represents Key5 purpose, see Table 4-2.
EFUSE_SECURE_BOOT_EN	1	N	15	Represents whether Secure Boot is enabled.
EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE	1	N	16	Represents whether aggressive revocation of Secure Boot is enabled.
EFUSE_FLASH_TPUW	4	N	18	Represents the flash waiting time after power-up.
EFUSE_DIS_DOWNLOAD_MODE	1	N	18	Represents whether all download modes are disabled.
EFUSE_USB_PRINT_CHANNEL	1	N	18	Represents whether USB printing is disabled.
EFUSE_DIS_USB_SERIAL_JTAG_DOWNLOAD_MODE	1	N	18	Represents whether the USB-Serial-JTAG download function is disabled.
EFUSE_ENABLE_SECURITY_DOWNLOAD	1	N	18	Represents whether UART secure download mode is enabled.
EFUSE_UART_PRINT_CONTROL	2	N	18	Represents the UART boot message output mode.
EFUSE_FORCE_SEND_RESUME	1	N	18	Represents whether ROM code is forced to send a resume command during SPI boot.

Cont'd on next page

Table 4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Programming-Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_SECURE_VERSION	16	N	18	Represents the version used by ESP-IDF anti-rollback feature.
EFUSE_ERR_RST_ENABLE	1	N	19	Represents whether to use BLOCK0 to check error record registers.

Table 4-2 lists all key purpose and their values. Setting the eFuse parameter EFUSE_KEY_PURPOSE_*n* declares the purpose of KEY*n* (*n*: 0 ~ 5).

Table 4-2. Secure Key Purpose Values

Key Purpose Values	Purposes
0	User purposes
1	Reserved
2	Reserved
3	Reserved
4	XTS_AES_128_KEY (flash/SRAM encryption and decryption)
5	HMAC Downstream mode (both JTAG and DS)
6	JTAG in HMAC Downstream mode
7	Digital Signature peripheral in HMAC Downstream mode
8	HMAC Upstream mode
9	SECURE_BOOT_DIGEST0 (secure boot key digest)
10	SECURE_BOOT_DIGEST1 (secure boot key digest)
11	SECURE_BOOT_DIGEST2 (secure boot key digest)

Table 4-3 provides the details of parameters in BLOCK1 ~ BLOCK10.

Table 4-3. Parameters in BLOCK1 to BLOCK10

BLOCK	Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Read Protection byEFUSE_RD_DIS Bit Number	Description
BLOCK1	EFUSE_MAC	48	N	20	N/A	MAC address
	EFUSE_SPI_PAD_CONFIGURE	[0:5]	N	20	N/A	CLK
		[6:11]	N	20	N/A	Q (D1)
		[12:17]	N	20	N/A	D (D0)
		[18:23]	N	20	N/A	CS
		[24:29]	N	20	N/A	HD (D3)
		[30:35]	N	20	N/A	WP (D2)
		[36:41]	N	20	N/A	DQS
		[42:47]	N	20	N/A	D4
		[48:53]	N	20	N/A	D5
		[54:59]	N	20	N/A	D6
		[60:65]	N	20	N/A	D7
	EFUSE_SYS_DATA_PART0	78	N	20	N/A	System data
BLOCK2	EFUSE_SYS_DATA_PART1	256	N	21	N/A	System data
BLOCK3	EFUSE_USR_DATA	256	N	22	N/A	User data
BLOCK4	EFUSE_KEY0_DATA	256	Y	23	0	KEY0 or user data
BLOCK5	EFUSE_KEY1_DATA	256	Y	24	1	KEY1 or user data
BLOCK6	EFUSE_KEY2_DATA	256	Y	25	2	KEY2 or user data
BLOCK7	EFUSE_KEY3_DATA	256	Y	26	3	KEY3 or user data
BLOCK8	EFUSE_KEY4_DATA	256	Y	27	4	KEY4 or user data
BLOCK9	EFUSE_KEY5_DATA	256	Y	28	5	KEY5 or user data
BLOCK10	EFUSE_SYS_DATA_PART2	256	N	29	6	System data

Among these blocks, BLOCK4 ~ 9 stores KEY0 ~ 5, respectively. Up to six 256-bit keys can be written into eFuse. Whenever a key is written, its purpose value should also be written (see table 4-2). For example, when a key for the JTAG function in HMAC Downstream mode is written to KEY3 (i.e., BLOCK7), its key purpose value 6 should also be written to EFUSE_KEY_PURPOSE_3.

Note:

Do not program the XTS-AES key into the KEY5 block, i.e., BLOCK9. Otherwise, the key may be unreadable. Instead, program it into the preceding blocks, i.e., BLOCK4 ~ BLOCK8. The last block, BLOCK9, is used to program other keys.

BLOCK1 ~ BLOCK10 use the RS coding scheme, so there are some restrictions on writing to these parameters. For more detailed information, please refer to Section 4.3.1.3 and Section 4.3.2.

4.3.1.1 EFUSE_WR_DIS

Parameter EFUSE_WR_DIS determines whether individual eFuse parameters are write-protected. After EFUSE_WR_DIS has been programmed, execute an eFuse read operation so the new values would take effect.

Column "Write Protection by EFUSE_WR_DIS Bit Number" in Table 4-1 and Table 4-3 list the specific bits in EFUSE_WR_DIS that disable writing.

When the write protection bit of a parameter is set to 0, it means that this parameter is not write-protected and can be programmed, unless it has been programmed before.

When the write protection bit of a parameter is set to 1, it means that this parameter is write-protected and none of its bits can be modified, with non-programmed bits always remaining 0 while programmed bits always remain 1.

4.3.1.2 EFUSE_RD_DIS

Only the eFuse blocks in BLOCK4 ~ BLOCK10 can be individually read protected to prevent any access from outside the chip, as shown in column "Read Protection by EFUSE_RD_DIS Bit Number" of Table 4-3. After EFUSE_RD_DIS has been programmed, execute an eFuse read operation so the new values would take effect.

If the corresponding EFUSE_RD_DIS bit is 0, then the eFuse block can be read by users; if the corresponding EFUSE_RD_DIS bit is 1, then the parameter controlled by this bit is user protected.

Other parameters that are not in BLOCK4 ~ BLOCK10 can always be read by users.

When BLOCK4 ~ BLOCK10 are set to be read-protected, the data in these blocks are not readable by users, but they can still be read by hardware cryptography modules, if the EFUSE_KEY_PURPOSE_*n* bit is set accordingly.

4.3.1.3 Data Storage

Internally, eFuses use hardware encoding schemes to protect data from corruption, which are invisible for users.

All BLOCK0 parameters except for EFUSE_WR_DIS are stored with four backups, meaning each bit is stored four times. This backup scheme is not visible to users.

BLOCK1 ~ BLOCK10 use RS (44, 32) coding scheme that supports up to 6 bytes of automatic error correction. The primitive polynomial of RS (44, 32) is $p(x) = x^8 + x^4 + x^3 + x^2 + 1$.

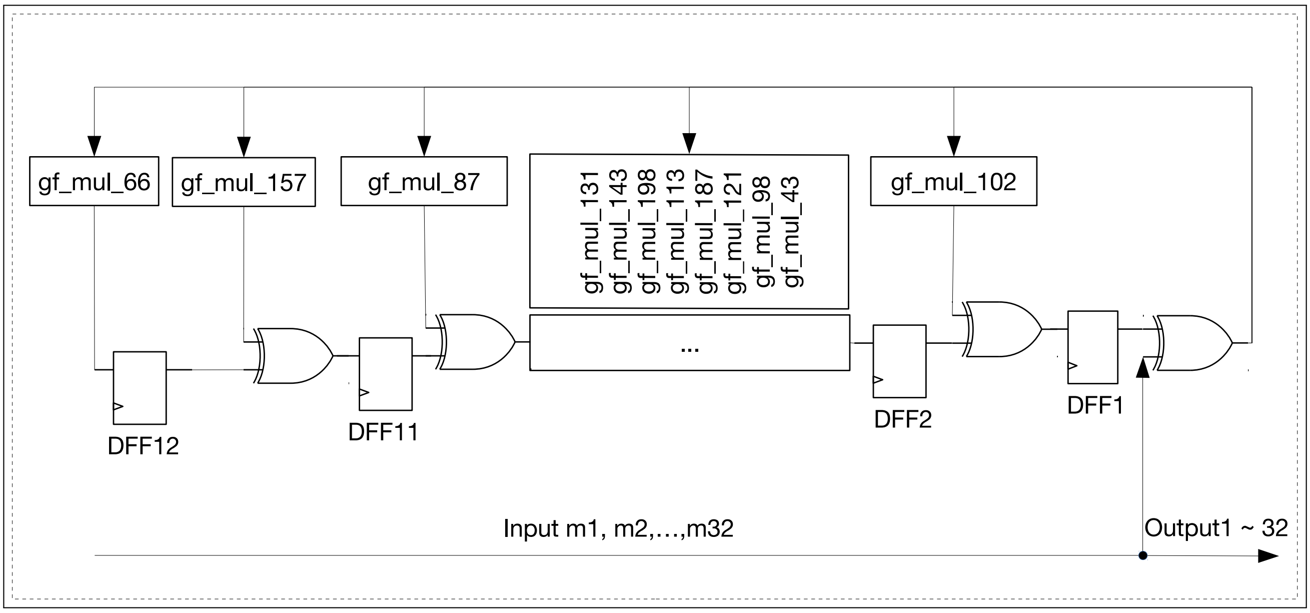

Figure 4-1. Shift Register Circuit (first 32 output)

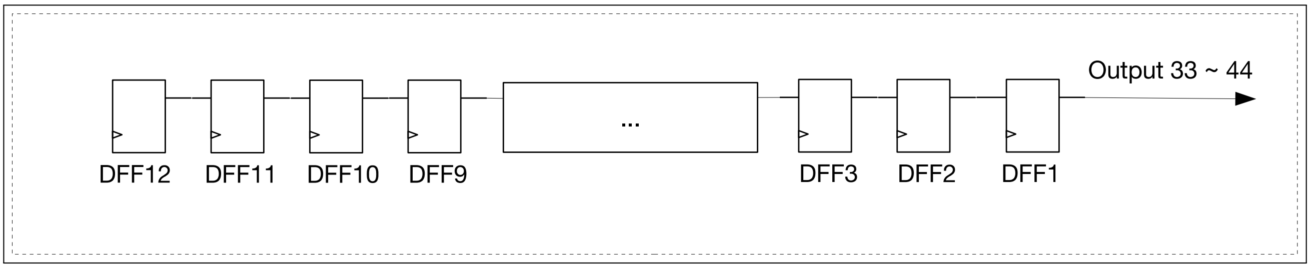

Figure 4-2. Shift Register Circuit (last 12 output)

The shift register circuit shown in Figure 4-1 and 4-2 processes 32 data bytes using RS (44, 32). This coding scheme encodes 32 bytes of data into 44 bytes:

- Bytes [0:31] are the data bytes itself
- Bytes [32:43] are the encoded parity bytes stored in 8-bit flip-flops DFF1, DFF2, ..., DFF12 (gf_mul_n, where n is an integer, is the result of multiplying a byte of data ...)

After that, the hardware burns into eFuse the 44-byte codeword consisting of the data bytes followed by the parity bytes.

When the eFuse block is read back, the eFuse controller automatically decodes the codeword and applies error correction if needed.

Because the RS check codes are generated on the entire 256-bit eFuse block, each block can only be written once.

4.3.2 Programming of Parameters

The eFuse controller can only program eFuse parameters in one block at a time. BLOCK0 ~ BLOCK10 share the same address range to store the parameters to be programmed. Configure parameter EFUSE_BLK_NUM to indicate which block should be programmed.

Programming BLOCK0

When EFUSE_BLK_NUM is set to 0, BLOCK0 will be programmed. Register EFUSE_PGM_DATA0_REG stores EFUSE_WR_DIS. Registers EFUSE_PGM_DATA1_REG ~ EFUSE_PGM_DATA5_REG store the information of parameters to be programmed. Note that 9 BLOCK0 bits are readable but useless to users and must always be set to 0 in the programming registers. The specific bits are:

- EFUSE_PGM_DATA1_REG[24:21]
- EFUSE_PGM_DATA1_REG[31:27]

Data in registers EFUSE_PGM_DATA6_REG ~ EFUSE_PGM_DATA7_REG and EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG are ignored when programming BLOCK0.

Programming BLOCK1

When EFUSE_BLK_NUM is set to 1, registers EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA5_REG store the BLOCK1 parameters to be programmed. Registers EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_DATA2_REG store the corresponding RS check codes. Data in registers EFUSE_PGM_DATA6_REG ~ EFUSE_PGM_DATA7_REG are ignored when programming BLOCK1, and the RS check codes will be calculated with these bits all treated as 0.

Programming BLOCK2 ~ 10

When EFUSE_BLK_NUM is set to 2 ~ 10, registers EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG store the parameters to be programmed to this block. Registers EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG store the corresponding RS check codes.

Programming process

The process of programming parameters is as follows:

1. Configure the value of parameter EFUSE_BLK_NUM to determine the block to be programmed.
2. Write parameters to be programmed to registers EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG and EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG.
3. Make sure the eFuse programming voltage VDDQ is configured correctly as described in Section 4.3.4.
4. Configure the field EFUSE_OP_CODE of register EFUSE_CONF_REG to 0x5A5A.
5. Configure the field EFUSE_PGM_CMD of register EFUSE_CMD_REG to 1.
6. Poll register EFUSE_CMD_REG until it is 0x0, or wait for a PGM_DONE interrupt. For more information on how to identify a PGM/READ_DONE interrupt, please see the end of Section 4.3.3.
7. Clear the parameters in EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG and EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG.
8. Trigger an eFuse read operation (see Section 4.3.3) to update eFuse registers with the new values.
9. Check error record registers. If the values read in error record registers are not 0, the programming process should be performed again following above steps 1 ~ 7. Please check the following error record registers for different eFuse blocks:

- BLOCK0: EFUSE_RD_REPEAT_ERR0_REG ~ EFUSE_RD_REPEAT_ERR4_REG
- BLOCK1: EFUSE_RD_RS_ERR0_REG[2:0], EFUSE_RD_RS_ERR0_REG[7]
- BLOCK2: EFUSE_RD_RS_ERR0_REG[6:4], EFUSE_RD_RS_ERR0_REG[11]
- BLOCK3: EFUSE_RD_RS_ERR0_REG[10:8], EFUSE_RD_RS_ERR0_REG[15]
- BLOCK4: EFUSE_RD_RS_ERR0_REG[14:12], EFUSE_RD_RS_ERR0_REG[19]
- BLOCK5: EFUSE_RD_RS_ERR0_REG[18:16], EFUSE_RD_RS_ERR0_REG[23]
- BLOCK6: EFUSE_RD_RS_ERR0_REG[22:20], EFUSE_RD_RS_ERR0_REG[27]
- BLOCK7: EFUSE_RD_RS_ERR0_REG[26:24], EFUSE_RD_RS_ERR0_REG[31]
- BLOCK8: EFUSE_RD_RS_ERR0_REG[30:28], EFUSE_RD_RS_ERR1_REG[3]
- BLOCK9: EFUSE_RD_RS_ERR1_REG[2:0], EFUSE_RD_RS_ERR1_REG[2:0][7]
- BLOCK10: EFUSE_RD_RS_ERR1_REG[2:0][6:4]

Limitations

In BLOCK0, each bit can be programmed separately. However, we recommend to minimize programming cycles and program all the bits of a parameter in one programming action. In addition, after all parameters controlled by a certain bit of EFUSE_WR_DIS are programmed, that bit should be immediately programmed. The programming of parameters controlled by a certain bit of EFUSE_WR_DIS, and the programming of the bit itself can even be completed at the same time. Repeated programming of already programmed bits is strictly forbidden, otherwise, programming errors will occur.

BLOCK1 cannot be programmed by users as it has been programmed at manufacturing.

BLOCK2 ~ 10 can only be programmed once. Repeated programming is not allowed.

4.3.3 User Read of Parameters

Users cannot read eFuse bits directly. The eFuse Controller hardware reads all eFuse bits and stores the results to their corresponding registers in its memory space. Then, users can read eFuse bits by reading the registers that start with EFUSE_RD_. Details are provided in Table 4-4.

Table 4-4. Registers Information

BLOCK	Read Registers	Registers When Programming This Block
0	EFUSE_RD_WR_DIS_REG	EFUSE_PGM_DATA0_REG
0	EFUSE_RD_REPEAT_DATA0 ~ 4_REG	EFUSE_PGM_DATA1 ~ 5_REG
1	EFUSE_RD_MAC_SPI_SYS_0 ~ 5_REG	EFUSE_PGM_DATA0 ~ 5_REG
2	EFUSE_RD_SYS_DATA_PART1_0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG
3	EFUSE_RD_USR_DATA0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG
4-9	EFUSE_RD_KEY*n*_DATA0 ~ 7_REG (*n*: 0 ~ 5)	EFUSE_PGM_DATA0 ~ 7_REG
10	EFUSE_RD_SYS_DATA_PART2_0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG

Updating eFuse read registers

The eFuse Controller reads internal eFuses to update corresponding registers. This read operation happens on system reset and can also be triggered manually by users as needed (e.g., if new eFuse values have been programmed). The process of triggering a read operation by users is as follows:

1. Configure the field EFUSE_OP_CODE in register EFUSE_CONF_REG to 0x5AA5.
2. Configure the field EFUSE_READ_CMD in register EFUSE_CMD_REG to 1.
3. Poll register EFUSE_CMD_REG until it is 0x0, or wait for a READ_DONE interrupt. Information on how to identify a PGM/READ_DONE interrupt is provided below in this section.
4. Read the values of each parameter from memory.

The eFuse read registers will hold all values until the next read operation.

Error detection

Error record registers allow users to detect if there are any inconsistencies in the stored backup eFuse parameters.

Registers EFUSE_RD_REPEAT_ERR0 ~ 3_REG indicate if there are any errors of programmed parameters (except for EFUSE_WR_DIS) in BLOCK0 (value 1 indicates an error is detected, and the bit becomes invalid; value 0 indicates no error).

Registers EFUSE_RD_RS_ERR0 ~ 1_REG store the number of corrected bytes as well as the result of RS decoding during eFuse reading BLOCK1 ~ BLOCK10.

The values of above registers will be updated every time after the eFuse read registers have been updated.

Identifying program/read operation

The methods to identify the completion of a program/read operation are described below. Please note that bit 1 corresponds to a program operation, and bit 0 corresponds to a read operation.

- Method one:
  1. Poll bit 1/0 in register EFUSE_INT_RAW_REG until it becomes 1, which represents the completion of a program/read operation.
- Method two:
  1. Set bit 1/0 in register EFUSE_INT_ENA_REG to 1 to enable the eFuse Controller to post a PGM/READ_DONE interrupt.
  2. Configure the Interrupt Matrix to enable the CPU to respond to eFuse interrupt signals, see Chapter *8 Interrupt Matrix (INTERRUPT)*.
  3. Wait for the PGM/READ_DONE interrupt.
  4. Set bit 1/0 in register EFUSE_INT_CLR_REG to 1 to clear the PGM/READ_DONE interrupt.

Note

When eFuse controller updating its registers, it will use EFUSE_PGM_DATA*n*_REG (n=0□1□..,7) again to store data. So please do not write important data into these registers before this updating process initiated. During the chip boot process, eFuse controller will update eFuse data into registers which can be accessed by users automatically. Users can get programmed eFuse data by reading corresponding registers. Thus, it is no need to update eFuse read registers in such case.

4.3.4 eFuse VDDQ Timing

The eFuse Controller operates with 20 MHz of clock frequency, and its programming voltage VDDQ should be configured as follows:

- EFUSE_DAC_NUM (the rising period of VDDQ): The default value of VDDQ is 2.5 V and the voltage increases by 0.01 V in each clock cycle. Thus, the default value of this parameter is 255;
- EFUSE_DAC_CLK_DIV (the clock divisor of VDDQ): The clock period to program VDDQ should be larger than 1 μs;
- EFUSE_PWR_ON_NUM (the power-up time for VDDQ): The programming voltage should be stabilized after this time, which means the value of this parameter should be configured to exceed the result of EFUSE_DAC_CLK_DIV times EFUSE_DAC_NUM;
- EFUSE_PWR_OFF_NUM (the power-out time for VDDQ): The value of this parameter should be larger than 10 μs.

Table 4-5. Configuration of Default VDDQ Timing Parameters

EFUSE_DAC_NUM	EFUSE_DAC_CLK_DIV	EFUSE_PWR_ON_NUM	EFUSE_PWR_OFF_NUM
0xFF	0x28	0x3000	0x190

4.3.5 The Use of Parameters by Hardware Modules

Some hardware modules are directly connected to the eFuse peripheral in order to use the parameters listed in Table 4-1 and Table 4-3, specifically those marked with “Y” in columns “Accessible by Hardware”. Users cannot intervene in this process.

4.3.6 Interrupts

- PGM_DONE interrupt: Triggered when eFuse programming has finished. To enable this interrupt, set the EFUSE_PGM_DONE_INT_ENA field of register EFUSE_INT_ENA_REG to 1;
- READ_DONE interrupt: Triggered when eFuse reading has finished. To enable this interrupt, set the EFUSE_READ_DONE_INT_ENA field of register EFUSE_INT_ENA_REG to 1.

4.4 Register Summary

The addresses in this section are relative to eFuse Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
PGM Data Register			
EFUSE_PGM_DATA0_REG	Register 0 that stores data to be programmed	0x0000	R/W
EFUSE_PGM_DATA1_REG	Register 1 that stores data to be programmed	0x0004	R/W
EFUSE_PGM_DATA2_REG	Register 2 that stores data to be programmed	0x0008	R/W
EFUSE_PGM_DATA3_REG	Register 3 that stores data to be programmed	0x000C	R/W
EFUSE_PGM_DATA4_REG	Register 4 that stores data to be programmed	0x0010	R/W
EFUSE_PGM_DATA5_REG	Register 5 that stores data to be programmed	0x0014	R/W
EFUSE_PGM_DATA6_REG	Register 6 that stores data to be programmed	0x0018	R/W
EFUSE_PGM_DATA7_REG	Register 7 that stores data to be programmed	0x001C	R/W
EFUSE_PGM_CHECK_VALUE0_REG	Register 0 that stores the RS code to be programmed	0x0020	R/W
EFUSE_PGM_CHECK_VALUE1_REG	Register 1 that stores the RS code to be programmed	0x0024	R/W
EFUSE_PGM_CHECK_VALUE2_REG	Register 2 that stores the RS code to be programmed	0x0028	R/W
Read Data Register			
EFUSE_RD_WR_DIS_REG	BLOCK0 data register 0	0x002C	RO
EFUSE_RD_REPEAT_DATA0_REG	BLOCK0 data register 1	0x0030	RO
EFUSE_RD_REPEAT_DATA1_REG	BLOCK0 data register 2	0x0034	RO
EFUSE_RD_REPEAT_DATA2_REG	BLOCK0 data register 3	0x0038	RO
EFUSE_RD_REPEAT_DATA3_REG	BLOCK0 data register 4	0x003C	RO
EFUSE_RD_REPEAT_DATA4_REG	BLOCK0 data register 5	0x0040	RO
EFUSE_RD_MAC_SPI_SYS_0_REG	BLOCK1 data register 0	0x0044	RO
EFUSE_RD_MAC_SPI_SYS_1_REG	BLOCK1 data register 1	0x0048	RO
EFUSE_RD_MAC_SPI_SYS_2_REG	BLOCK1 data register 2	0x004C	RO
EFUSE_RD_MAC_SPI_SYS_3_REG	BLOCK1 data register 3	0x0050	RO
EFUSE_RD_MAC_SPI_SYS_4_REG	BLOCK1 data register 4	0x0054	RO
EFUSE_RD_MAC_SPI_SYS_5_REG	BLOCK1 data register 5	0x0058	RO
EFUSE_RD_SYS_PART1_DATA0_REG	Register 0 of BLOCK2 (system)	0x005C	RO
EFUSE_RD_SYS_PART1_DATA1_REG	Register 1 of BLOCK2 (system)	0x0060	RO
EFUSE_RD_SYS_PART1_DATA2_REG	Register 2 of BLOCK2 (system)	0x0064	RO
EFUSE_RD_SYS_PART1_DATA3_REG	Register 3 of BLOCK2 (system)	0x0068	RO
EFUSE_RD_SYS_PART1_DATA4_REG	Register 4 of BLOCK2 (system)	0x006C	RO
EFUSE_RD_SYS_PART1_DATA5_REG	Register 5 of BLOCK2 (system)	0x0070	RO
EFUSE_RD_SYS_PART1_DATA6_REG	Register 6 of BLOCK2 (system)	0x0074	RO
EFUSE_RD_SYS_PART1_DATA7_REG	Register 7 of BLOCK2 (system)	0x0078	RO
EFUSE_RD_USR_DATA0_REG	Register 0 of BLOCK3 (user)	0x007C	RO
EFUSE_RD_USR_DATA1_REG	Register 1 of BLOCK3 (user)	0x0080	RO

Name	Description	Address	Access
EFUSE_RD_USR_DATA2_REG	Register 2 of BLOCK3 (user)	0x0084	RO
EFUSE_RD_USR_DATA3_REG	Register 3 of BLOCK3 (user)	0x0088	RO

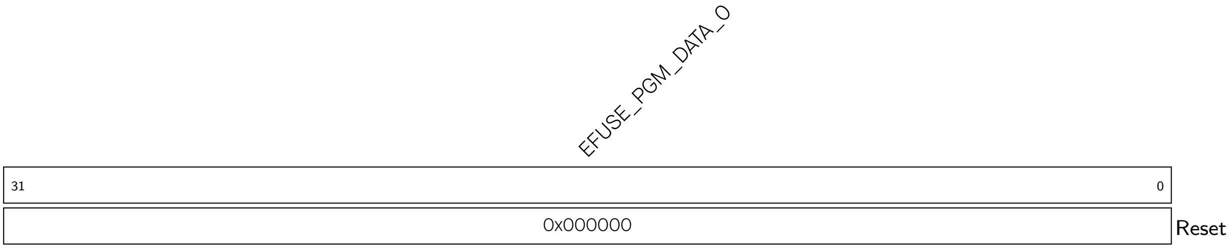
4.5 Registers

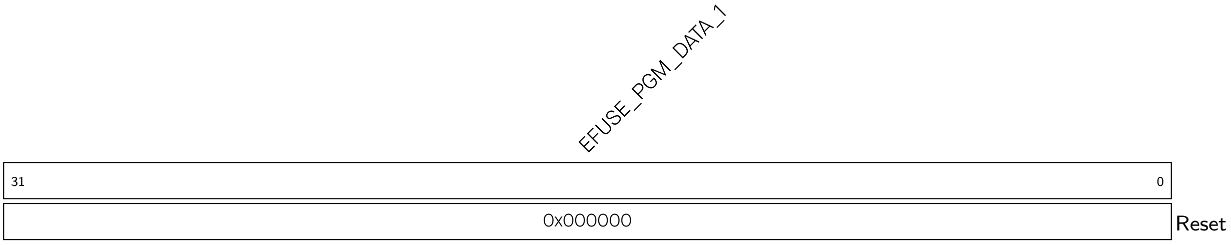
The addresses in this section are relative to eFuse Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 4.1. EFUSE_PGM_DATA0_REG (0x0000)



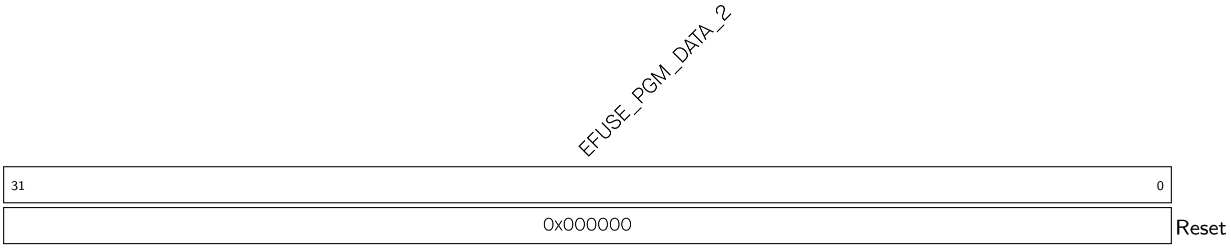
EFUSE_PGM_DATA_0 The content of the 0th 32-bit data to be programmed. (R/W)

Register 4.2. EFUSE_PGM_DATA1_REG (0x0004)



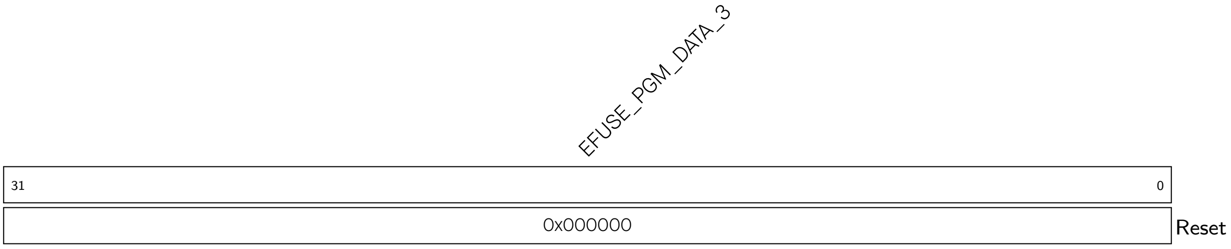
EFUSE_PGM_DATA_1 The content of the 1st 32-bit data to be programmed. (R/W)

Register 4.3. EFUSE_PGM_DATA2_REG (0x0008)



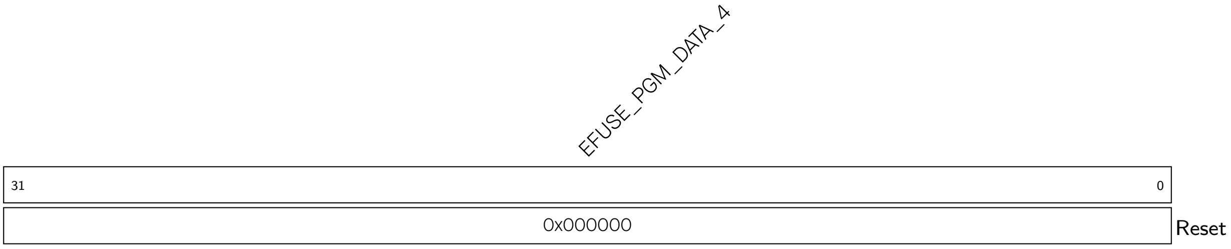
EFUSE_PGM_DATA_2 The content of the 2nd 32-bit data to be programmed. (R/W)

Register 4.4. EFUSE_PGM_DATA3_REG (0x000C)



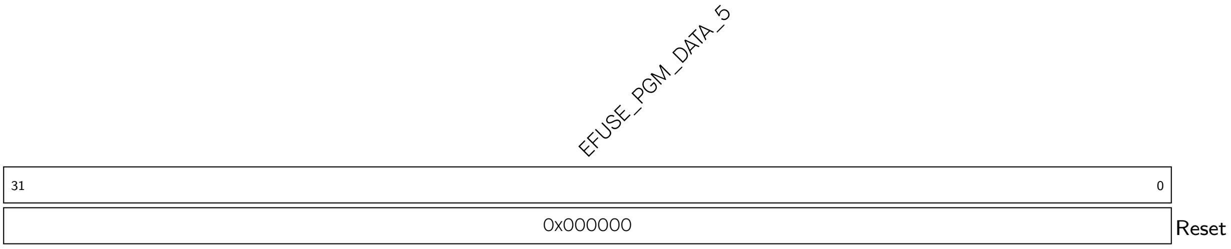
EFUSE_PGM_DATA_3 The content of the 3rd 32-bit data to be programmed. (R/W)

Register 4.5. EFUSE_PGM_DATA4_REG (0x0010)



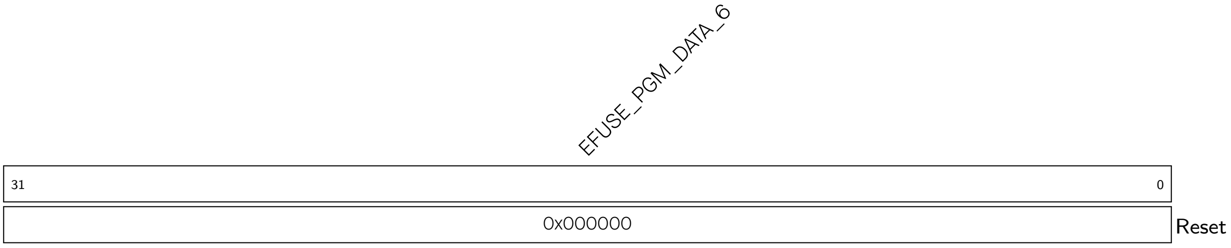
EFUSE_PGM_DATA_4 The content of the 4th 32-bit data to be programmed. (R/W)

Register 4.6. EFUSE_PGM_DATA5_REG (0x0014)



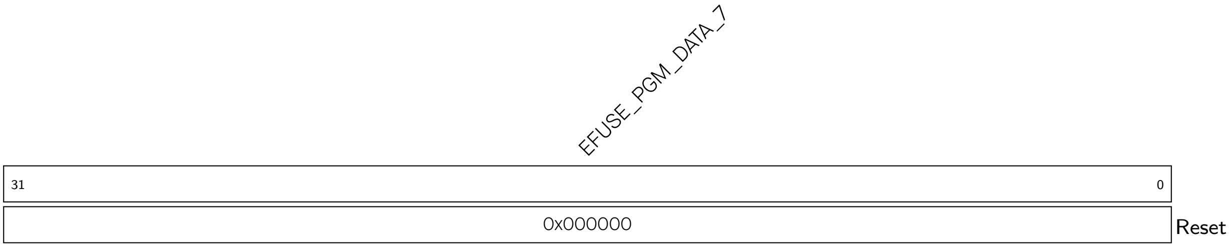
EFUSE_PGM_DATA_5 The content of the 5th 32-bit data to be programmed. (R/W)

Register 4.7. EFUSE_PGM_DATA6_REG (0x0018)



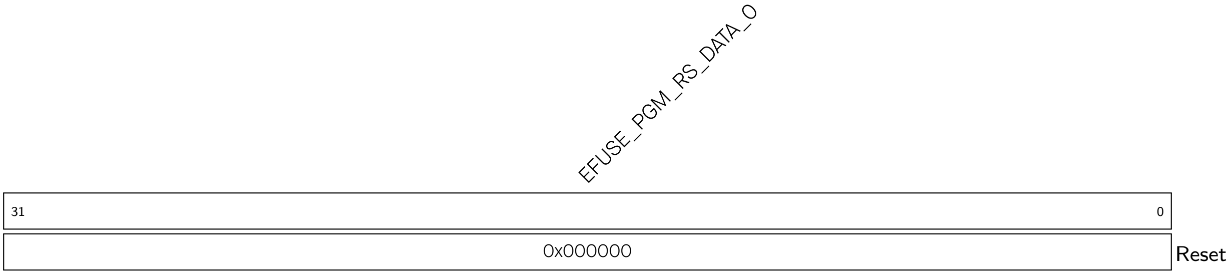
EFUSE_PGM_DATA_6 The content of the 6th 32-bit data to be programmed. (R/W)

Register 4.8. EFUSE_PGM_DATA7_REG (0x001C)



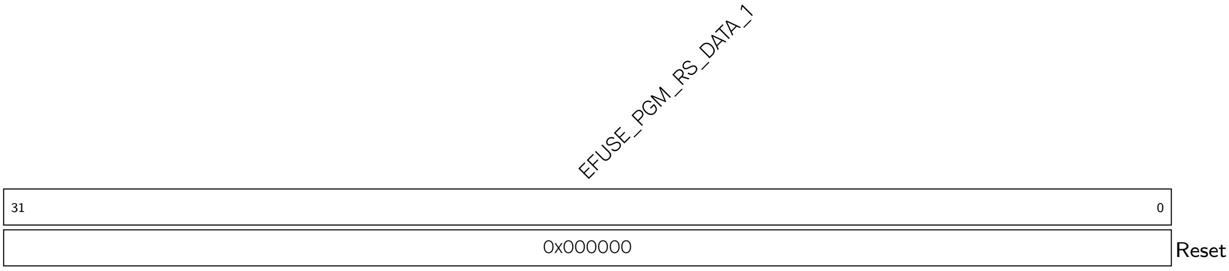
EFUSE_PGM_DATA_7 The content of the 7th 32-bit data to be programmed. (R/W)

Register 4.9. EFUSE_PGM_CHECK_VALUE0_REG (0x0020)



EFUSE_PGM_RS_DATA_0 The content of the 0th 32-bit RS code to be programmed. (R/W)

Register 4.10. EFUSE_PGM_CHECK_VALUE1_REG (0x0024)



EFUSE_PGM_RS_DATA_1 The content of the 1st 32-bit RS code to be programmed. (R/W)

Register 4.11. EFUSE_PGM_CHECK_VALUE2_REG (0x0028)

EFUSE_PGM_RS_DATA_2		
31	0	
0x000000		Reset

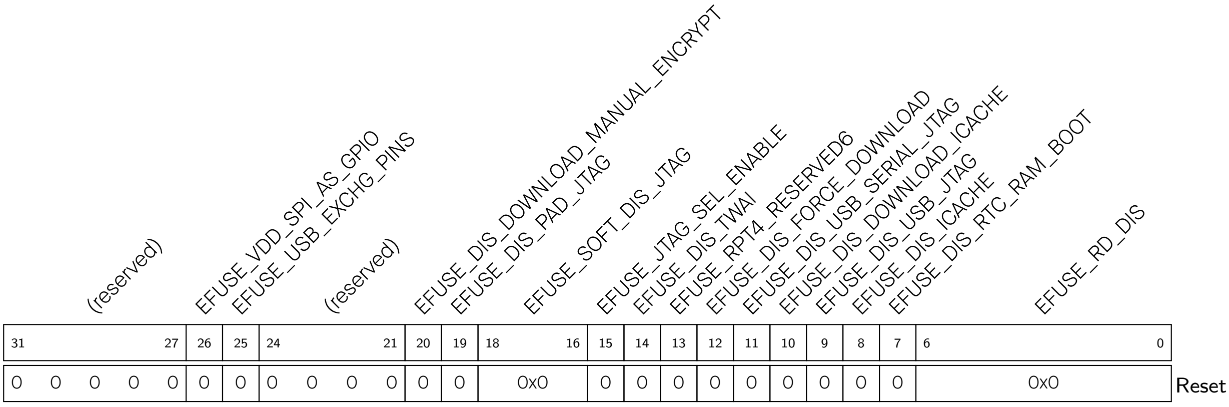
EFUSE_PGM_RS_DATA_2 The content of the 2nd 32-bit RS code to be programmed. (R/W)

Register 4.12. EFUSE_RD_WR_DIS_REG (0x002C)

EFUSE_WR_DIS		
31	0	
0x000000		Reset

EFUSE_WR_DIS Represents whether programming of corresponding eFuse part is disabled or enabled. 1: Disabled. 0: Enabled. (RO)

Register 4.13. EFUSE_RD_REPEAT_DATA0_REG (0x0030)



(reserved)	EFUSE_VDD_SPI_AS_GPIO	EFUSE_USB_EXCHG_PINS	(reserved)	EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT	EFUSE_DIS_PAD_JTAG	EFUSE_SOFT_DIS_JTAG	EFUSE_JTAG_SEL_ENABLE	EFUSE_DIS_TWAI	EFUSE_RPT4_RESERVED6	EFUSE_DIS_FORCE_DOWNLOAD	EFUSE_DIS_USB_SERIAL_JTAG	EFUSE_DIS_DOWNLOAD_ICACHE	EFUSE_DIS_USB_JTAG	EFUSE_DIS_ICACHE	EFUSE_DIS_RTC_RAM_BOOT	EFUSE_RD_DIS	
31 27	26	25	24 21	20	19	18 16	15	14	13	12	11	10	9	8	7	6 0	
0 0 0 0 0	0	0	0 0 0 0	0	0	0x0	0	0	0	0	0	0	0	0	0	0x0	Reset

EFUSE_RD_DIS Represents whether users' reading from BLOCK4 ~ 10 is disabled or enabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_DIS_RTC_RAM_BOOT Reserved (used for four backups method). (RO)

EFUSE_DIS_ICACHE Represents whether iCache is disabled or enabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_DIS_USB_JTAG Represents whether the USB-to-JTAG function is disabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_DIS_DOWNLOAD_ICACHE Represents whether iCache is disabled in download mode (boot_mode[3:0] is 0, 1, 2, 3, 6, 7). 1: Disabled. 0: Enabled. (RO)

EFUSE_DIS_USB_SERIAL_JTAG Represents whether USB-Serial-JTAG is disabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_DIS_FORCE_DOWNLOAD Represents whether the function that forces chip into download mode is disabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_RPT4_RESERVED6 Reserved (used for four backups method). (RO)

EFUSE_DIS_TWAI Represents whether TWAI function is disabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_JTAG_SEL_ENABLE Represents whether to use JTAG directly. 1: Use directly. 0: Not use directly. (RO)

EFUSE_SOFT_DIS_JTAG Represents whether JTAG is disabled in the soft way. Odd count of bits with a value of 1: Disabled. It can still be restarted via HMAC. Even count of bits with a value of 1: Enabled. (RO)

EFUSE_DIS_PAD_JTAG Represents whether JTAG is disabled in the hard way (permanently). 1: Disabled. 0: Enabled. (RO)

Continued on the next page...

Register 4.13. EFUSE_RD_REPEAT_DATA0_REG (0x0030)

Continued from the previous page...

EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT Represents whether flash encryption is disabled (except in SPI boot mode). 1: Disabled. 0: Enabled. (RO)

EFUSE_USB_EXCHG_PINS Represents whether or not USB D+ and D- pins are swapped. 1: Swapped. 0: Not swapped. (RO)

Note: The eFuse has a design flaw and does **not** move the pullup (needed to detect USB speed), resulting in the PC thinking the chip is a low-speed device, which stops communication. For detailed information, please refer to Chapter 30 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*.

EFUSE_VDD_SPI_AS_GPIO Represents whether the VDD_SPI pin is used as a regular GPIO. 1: Used as a regular GPIO. 0: Not used as a regular GPIO. (RO)

Register 4.14. EFUSE_RD_REPEAT_DATA1_REG (0x0034)

EFUSE_KEY_PURPOSE_1	EFUSE_KEY_PURPOSE_0	EFUSE_SECURE_BOOT_KEY_REVOKE2	EFUSE_SECURE_BOOT_KEY_REVOKE1	EFUSE_SECURE_BOOT_KEY_REVOKE0	EFUSE_SPI_BOOT_CRYPT_CNT	EFUSE_WDT_DELAY_SEL	EFUSE_RPT4_RESERVED2

0x0	0x0	0	0	0	0x0	0x0	0x00	Reset

EFUSE_RPT4_RESERVED2 Reserved (used for four backups method). (RO)

EFUSE_WDT_DELAY_SEL Represents RTC watchdog timeout threshold. Measurement unit: slow clock cycle. 00: 40000, 01: 80000, 10: 160000, 11:320000. (RO)

EFUSE_SPI_BOOT_CRYPT_CNT Represents whether SPI boot encrypt/decrypt is disabled or enabled. Odd count of bits with a value of 1: Enabled. Even count of bits with a value of 1: Disabled. (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE0 Represents whether or not the first secure boot key is revoked. 1: Revoked. 0: Not revoked. (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE1 Represents whether or not the second secure boot key is revoked. 1: Revoked. 0: Not revoked. (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE2 Represents whether or not the third secure boot key is revoked. 1: Revoked. 0: Not revoked. (RO)

EFUSE_KEY_PURPOSE_0 Represents purpose of Key0. (RO)

EFUSE_KEY_PURPOSE_1 Represents purpose of Key1. (RO)

Register 4.15. EFUSE_RD_REPEAT_DATA2_REG (0x0038)

EFUSE_FLASH_TPUW	EFUSE_RPT4_RESERVED0	EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE	EFUSE_SECURE_BOOT_EN	EFUSE_RPT4_RESERVED3	EFUSE_KEY_PURPOSE_5	EFUSE_KEY_PURPOSE_4	EFUSE_KEY_PURPOSE_3	EFUSE_KEY_PURPOSE_2

EFUSE_KEY_PURPOSE_2 Represents purpose of Key2. (RO)

EFUSE_KEY_PURPOSE_3 Represents purpose of Key3. (RO)

EFUSE_KEY_PURPOSE_4 Represents purpose of Key4. (RO)

EFUSE_KEY_PURPOSE_5 Represents purpose of Key5. (RO)

EFUSE_RPT4_RESERVED3 Reserved (used for four backups method). (RO)

EFUSE_SECURE_BOOT_EN Represents whether secure boot is enabled or disabled. 1: Enabled. 0: Disabled. (RO)

EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE Represents whether aggressive revoke of secure boot keys is enabled or disabled. 1: Enabled. 0: Disabled. (RO)

EFUSE_RPT4_RESERVED0 Reserved (used for four backups method). (RO)

EFUSE_FLASH_TPUW Represents flash waiting time after power-up. Measurement unit: ms. If the value is less than 15, the waiting time is the configurable value. Otherwise, the waiting time is always 30 ms. (RO)

Register 4.16. EFUSE_RD_REPEAT_DATA3_REG (0x003C)

0	0	0x00	0	0	0x0	0	0	0	0	0	0	Reset

EFUSE_DIS_DOWNLOAD_MODE Represents whether download mode (boot_mode[3:0] = 0, 1, 2, 3, 6, 7) is disabled or enabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_RPT4_RESERVED8 Reserved (used for four backups method). (RO)

EFUSE_USB_PRINT_CHANNEL Represents whether USB printing is disabled or enabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_RPT4_RESERVED7 Reserved (used for four backups method). (RO)

EFUSE_DIS_USB_SERIAL_JTAG_DOWNLOAD_MODE Represents whether download through USB-Serial-JTAG is disabled or enabled. 1: Disabled. 0: Enabled. (RO)

EFUSE_ENABLE_SECURITY_DOWNLOAD Represents whether secure UART download mode is enabled or disabled (read/write flash only). 1: Enabled. 0: Disabled. (RO)

EFUSE_UART_PRINT_CONTROL Represents the UART boot message output mode. 00: Enabled. 01: Enabled when GPIO8 is low at reset. 10: Enabled when GPIO8 is high at reset. 11: Disabled. (RO)

EFUSE_RPT4_RESERVED5 Reserved (used for four backups method). (RO)

EFUSE_FORCE_SEND_RESUME Represents whether or not to force ROM code to send a resume command during SPI boot. 1: Send. 0: Not send. (RO)

EFUSE_SECURE_VERSION Represents the values of version control register (used by ESP-IDF anti-rollback feature). (RO)

EFUSE_RPT4_RESERVED1 Reserved (used for four backups method). (RO)

EFUSE_ERR_RST_ENABLE Represents whether to enable the check for error registers of block0. 1: Enabled. 0: Disabled. (RO)

Register 4.17. EFUSE_RD_REPEAT_DATA4_REG (0x0040)

5 IO MUX and GPIO Matrix (GPIO, IO MUX)

5.1 Overview

The ESP32-C3 chip features 22 physical GPIO pins. Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through GPIO matrix and IO MUX, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O.

Note that the GPIO pins are numbered from 0 ~ 21.

5.2 Features

GPIO Matrix Features

- A full-switching matrix between the peripheral input/output signals and the pins.
- 42 peripheral input signals can be sourced from the input of any GPIO pins.
- The output of any GPIO pins can be from any of the 78 peripheral output signals.
- Supports signal synchronization for peripheral inputs based on APB clock bus.
- Provides input signal filter.
- Supports sigma delta modulated output.
- Supports GPIO simple input and output.

IO MUX Features

- Provides one configuration register IO_MUX_GPIO*n*_REG for each GPIO pin. The pin can be configured to
  - perform GPIO function routed by GPIO matrix;
  - or perform direct connection bypassing GPIO matrix.
- Supports some high-speed digital signals (SPI, JTAG, UART) bypassing GPIO matrix for better high-frequency digital performance. In this case, IO MUX is used to connect these pins directly to peripherals.

5.3 Architectural Overview

This section provides an overview to the architecture of IO MUX and GPIO matrix with the following figures:

- Figure 5-1 shows the general work flow of IO MUX and GPIO matix.
- Figure 5-2 shows in details how IO MUX and GPIO matrix route signals from pins to peripherals, and from peripherals to pins.
- Figure 5-3 shows the interface logic for a GPIO pin.

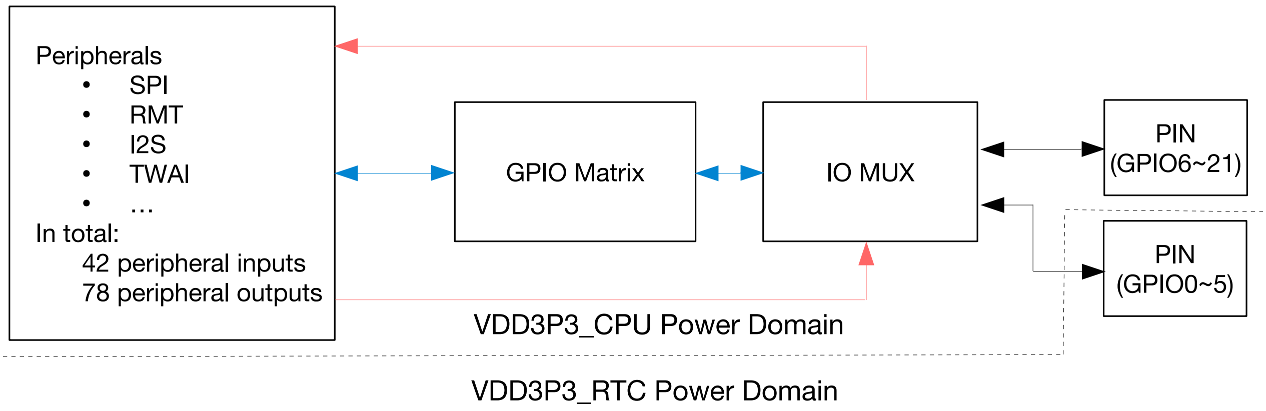

Figure 5-1. Diagram of IO MUX and GPIO Matrix

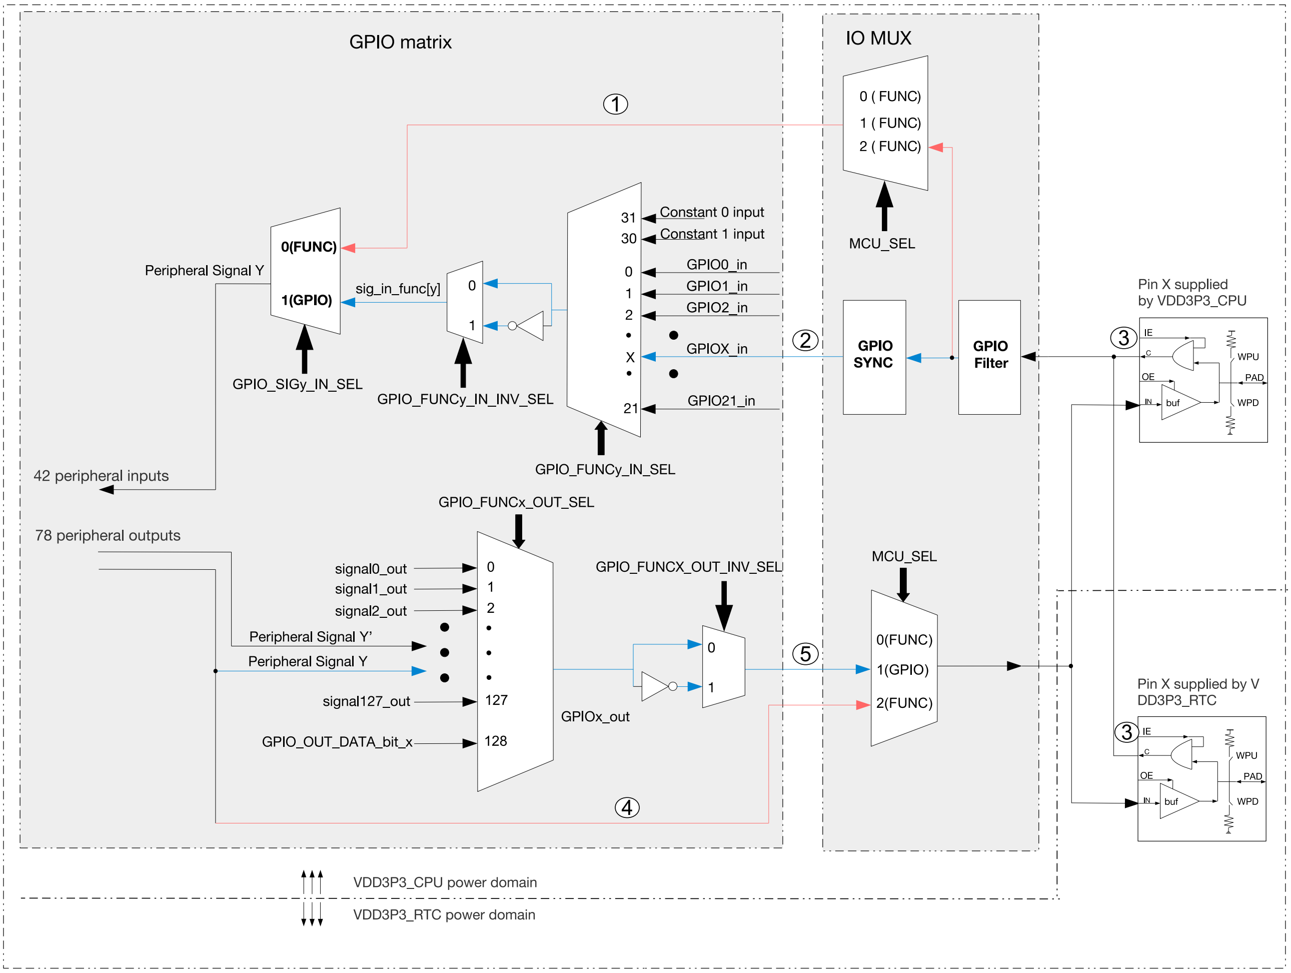

Figure 5-2. Architecture of IO MUX and GPIO Matrix

1. Only part of peripheral input signals (marked "yes" in column "Direct input through IO MUX" in Table 5-2) can bypass GPIO matrix. The other input signals can only be routed to peripherals via GPIO matrix.

2. There are only 22 inputs from GPIO SYNC to GPIO matrix, since ESP32-C3 provides 22 GPIO pins in total.

3. The pins supplied by VDD3P3_CPU or by VDD3P3_RTC are controlled by the signals: IE, OE, WPU, and WPD.

4. Only part of peripheral outputs (marked "yes" in column "Direct output through IO MUX" in Table 5-2) can

be routed to pins bypassing GPIO matrix. See Table 5-2.

5. There are only 22 outputs (GPIO pin X: 0 ~ 21) from GPIO matrix to IO MUX.

Figure 5-3 shows the internal structure of a pad, which is an electrical interface between the chip logic and the GPIO pin. The structure is applicable to all 22 GPIO pins and can be controlled using IE, OE, WPU, and WPD signals.

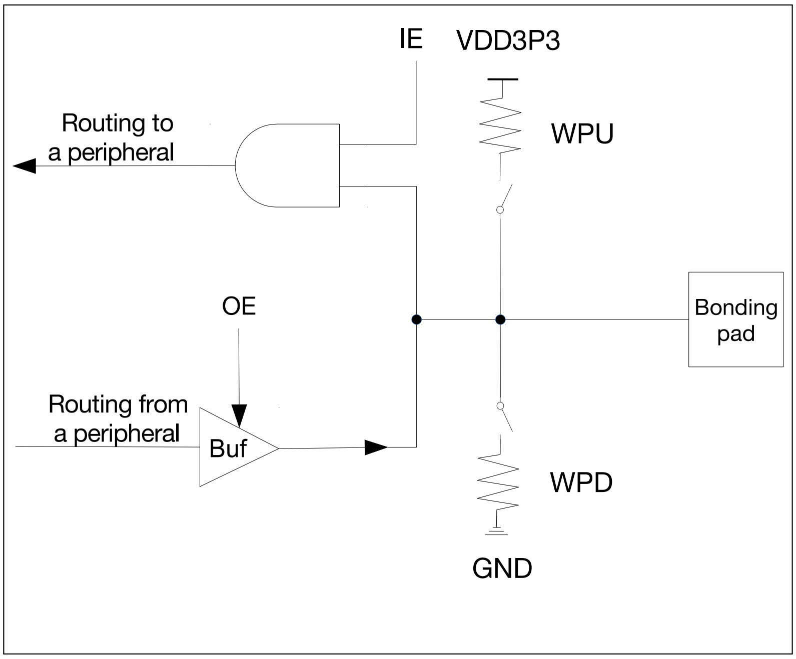

Figure 5-3. Internal Structure of a Pad

Note:

- IE: input enable
- OE: output enable
- WPU: internal weak pull-up
- WPD: internal weak pull-down
- Bonding pad: a terminal point of the chip logic used to make a physical connection from the chip die to GPIO pin in the chip package.

5.4 Peripheral Input via GPIO Matrix

5.4.1 Overview

To receive a peripheral input signal via GPIO matrix, the matrix is configured to source the peripheral input signal from one of the 22 GPIOs (0 ~ 21), see Table 5-2. Meanwhile, register corresponding to the peripheral signal should be set to receive input signal via GPIO matrix.

5.4.2 Signal Synchronization

When signals are directed from pins using GPIO matrix, the signals will be synchronized to the APB bus clock by GPIO SYNC hardware, then go to GPIO matrix. This synchronization applies to all GPIO matrix signals but does not apply when using the IO MUX, see Figure 5-2.

Figure 5-4. GPIO Input Synchronized on APB Clock Rising Edge or on Falling Edge

Figure 5-4 shows the functionality of GPIO SYNC. In the figure, negative sync and positive sync mean GPIO input is synchronized on APB clock falling edge and on APB clock rising edge, respectively.

5.4.3 Functional Description

To read GPIO pin *X*[1] into peripheral signal *Y*, follow the steps below:

1. Configure register GPIO_FUNC*y*_IN_SEL_CFG_REG corresponding to peripheral signal *Y* in GPIO matrix:
   - Set GPIO_SIG*y*_IN_SEL to enable peripheral signal input via GPIO matrix.
   - Set GPIO_FUNC*y*_IN_SEL to the desired GPIO pin, i.e. *X* here.

   Note that some peripheral signals have no valid GPIO_SIG*y*_IN_SEL bit, namely, these peripherals can only receive input signals via GPIO matrix.

2. Optionally enable the filter for pin input signals by setting the register IO_MUX_GPIO*n*_FILTER_EN. Only the signals with a valid width of more than two clock cycles can be sampled, see Figure 5-5.

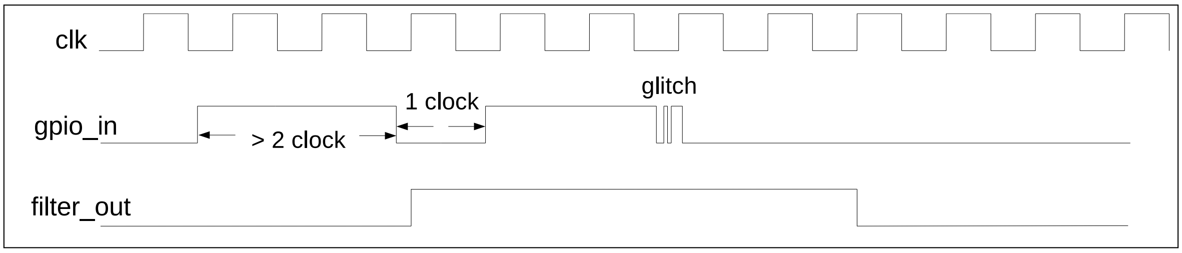

Figure 5-5. Filter Timing of GPIO Input Signals

3. Synchronize GPIO input. To do so, please set GPIO_PIN*x*_REG corresponding to GPIO pin *X* as follows:

- Set GPIO_PINx_SYNC1_BYPASS to enable input signal synchronized on rising edge or on falling edge in the first clock, see Figure 5-4.
- Set GPIO_PINx_SYNC2_BYPASS to enable input signal synchronized on rising edge or on falling edge in the second clock, see Figure 5-4.

4. Configure IO MUX register to enable pin input. For this end, please set IO_MUX_GPIOx_REG corresponding to GPIO pin X as follows:
   - Set IO_MUX_GPIOx_FUN_IE to enable input[2].
   - Set or clear IO_MUX_GPIOx_FUN_WPU and IO_MUX_GPIOx_FUN_WPD, as desired, to enable or disable pull-up and pull-down resistors.

For example, to connect I2S MCLK input signal[3] (I2S_MCLK_in, signal index 12) to GPIO7, please follow the steps below. Note that GPIO7 is also named as MTDO pin.

1. Set GPIO_SIG12_IN_SEL in register GPIO_FUNC12_IN_SEL_CFG_REG to enable peripheral signal input via GPIO matrix.
2. Set GPIO_FUNC12_IN_SEL in register GPIO_FUNC12_IN_SEL_CFG_REG to 7.
3. Set IO_MUX_GPIO7_FUN_IE in register IO_MUX_GPIO7_REG to enable pin input.

Note:

1. One input pin can be connected to multiple peripheral input signals.
2. The input signal can be inverted by configuring GPIO_FUNCy_IN_INV_SEL.
3. It is possible to have a peripheral read a constantly low or constantly high input value without connecting this input to a pin. This can be done by selecting a special GPIO_FUNCy_IN_SEL input, instead of a GPIO number:
   - When GPIO_FUNCy_IN_SEL is set to 0x1F, input signal is always 0.
   - When GPIO_FUNCy_IN_SEL is set to 0x1E, input signal is always 1.

5.4.4 Simple GPIO Input

GPIO_IN_REG holds the input values of each GPIO pin. The input value of any GPIO pin can be read at any time without configuring GPIO matrix for a particular peripheral signal. However, it is necessary to enable the input via IO MUX by setting IO_MUX_GPIOx_FUN_IE bit in register IO_MUX_GPIOx_REG corresponding to pin X, as mentioned in Section 5.4.2.

5.5 Peripheral Output via GPIO Matrix

5.5.1 Overview

To output a signal from a peripheral via GPIO matrix, the matrix is configured to route peripheral output signals (only signals with a name assigned in the column "Output signal" in Table 5-2) to one of the 22 GPIOs (0 ~ 21). See Table 5-2.

The output signal is routed from the peripheral into GPIO matrix and then into IO MUX. IO MUX must be configured to set the chosen pin to GPIO function. This enables the output GPIO signal to be connected to the pin.

Note:

There is a range of peripheral output signals (97 ~ 100) which are not connected to any peripheral, but to the input signals (97 ~ 100 in Table 5-2) directly. These can be used to input a signal from one GPIO pin and output directly to another GPIO pin.

5.5.2 Functional Description

Some of the 78 output signals (signals with a name assigned in the column "Output signal" in Table 5-2) can be set to go through GPIO matrix into IO MUX and then to a pin. Figure 5-2 illustrates the configuration.

To output peripheral signal *Y* to a particular GPIO pin *X*[1], follow these steps:

1. Configure register GPIO_FUNC*x*_OUT_SEL_CFG_REG and GPIO_ENABLE_REG[*x*] corresponding to GPIO pin *X* in GPIO matrix. Recommended operation: use corresponding W1TS (write 1 to set) and W1TC (write 1 to clear) registers to set or clear GPIO_ENABLE_REG.
   - Set the GPIO_FUNC*x*_OUT_SEL field in register GPIO_FUNC*x*_OUT_SEL_CFG_REG to the index of the desired peripheral output signal *Y*.
   - If the signal should always be enabled as an output, set the GPIO_FUNC*x*_OEN_SEL bit in register GPIO_FUNC*x*_OUT_SEL_CFG_REG and the bit in register GPIO_ENABLE_W1TS_REG, corresponding to GPIO pin *X*. To have the output enable signal decided by internal logic (for example, the SPIQ_oe in column "Output enable signal when GPIO_FUNC*n*_OEN_SEL = 0" in Table 5-2), clear GPIO_FUNC*x*
     _OEN_SEL bit instead.
   - Set the corresponding bit in register GPIO_ENABLE_W1TC_REG to disable the output from the GPIO pin.
2. For an open drain output, set the GPIO_PIN*x*_PAD_DRIVER bit in register GPIO_PIN*x*_REG corresponding to GPIO pin *X*.
3. Configure IO MUX register to enable output via GPIO matrix. Set the IO_MUX_GPIO*x*_REG corresponding to GPIO pin *X* as follows:
   - Set the field IO_MUX_GPIO*x*_MCU_SEL to desired IO MUX function corresponding to GPIO pin*X*. This is Function 1 (GPIO function), numeric value 1, for all pins.
   - Set the IO_MUX_GPIO*x*_FUN_DRV field to the desired value for output strength (0 ~ 3). The higher the driver strength, the more current can be sourced/sunk from the pin.
     - 0: ~5 mA
     - 1: ~10 mA
     - 2: ~20 mA (default value)
     - 3: ~40 mA
   - If using open drain mode, set/clear the IO_MUX_GPIO*x*_FUN_WPU and IO_MUX_GPIO*x*_FUN_WPD bits to enable/disable the internal pull-up/pull-down resistors.

Note:

1. The output signal from a single peripheral can be sent to multiple pins simultaneously.

2. The output signal can be inverted by setting GPIO_FUNCx_OUT_INV_SEL bit.

5.5.3 Simple GPIO Output

GPIO matrix can also be used for simple GPIO output. This can be done as below:

- Set GPIO matrix GPIO_FUNCn_OUT_SEL with a special peripheral index 128 (0x80);
- Set the corresponding bit in GPIO_OUT_REG register to the desired GPIO output value.

Note:

- GPIO_OUT_REG[0] ~ GPIO_OUT_REG[21] correspond to GPIO0 ~ GPIO21, and GPIO_OUT_REG[25:22] are invalid.
- Recommended operation: use corresponding W1TS and W1TC registers, such as GPIO_OUT_W1TS/GPIO_OUT_W1TC to set or clear the registers GPIO_OUT_REG.

5.5.4 Sigma Delta Modulated Output (SDM)

5.5.4.1 Functional Description

Four out of the 125 peripheral outputs (output index: 55 ~ 58 in Table 5-2) support 1-bit second-order sigma delta modulation. By default output is enabled for these four channels. This modulator can also output PDM (pulse density modulation) signal with configurable duty cycle. The transfer function of this second-order SDM modulator is:

$$H(z) = \text{X(z)z}^{-1} + \text{E(z)(1-z}^{-1})^2$$

E(z) is quantization error and X(z) is the input.
Sigma Delta modulator supports scaling down of APB_CLK by divider 1 ~ 256:

- Set GPIOSD_FUNCTION_CLK_EN to enable the modulator clock.
- Configure register GPIOSD_SDn_PRESCALE (n is 0 ~ 3 for four channels).

After scaling, the clock cycle is equal to one pulse output cycle from the modulator.

GPIOSD_SDn_IN is a signed number with a range of [-128, 127] and is used to control the duty cycle [1] of PDM output signal.

- GPIOSD_SDn_IN = -128, the duty cycle of the output signal is 0%.
- GPIOSD_SDn_IN = 0, the duty cycle of the output signal is near 50%.
- GPIOSD_SDn_IN = 127, the duty cycle of the output signal is close to 100%.

The formula for calculating PDM signal duty cycle is shown as below:

$$Duty\_Cycle = \frac{GPIOSD\_SDn\_IN + 128}{256}$$

Note:
For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period (several pulse cycles, for example 256 pulse cycles).

5.5.4.2 SDM Configuration

The configuration of SDM is shown below:

- Route one of SDM outputs to a pin via GPIO matrix, see Section 5.5.2.
- Enable the modulator clock by setting the register GPIOSD_FUNCTION_CLK_EN.
- Configure the divider value by setting the register GPIOSD_SD*n*_PRESCALE.
- Configure the duty cycle of SDM output signal by setting the register GPIOSD_SD*n*_IN.

5.6 Direct Input and Output via IO MUX

5.6.1 Overview

Some high-speed signals (SPI and JTAG) can bypass GPIO matrix for better high-frequency digital performance. In this case, IO MUX is used to connect these pins directly to peripherals.

This option is less flexible than routing signals via GPIO matrix, as the IO MUX register for each GPIO pin can only select from a limited number of functions, but high-frequency digital performance can be improved.

5.6.2 Functional Description

Two registers must be configured in order to bypass GPIO matrix for peripheral input signals:

1. IO_MUX_GPIO*n*_MCU_SEL for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Section 5.12.
2. Clear GPIO_SIG*n*_IN_SEL to route the input directly to the peripheral.

To bypass GPIO matrix for peripheral output signals, IO_MUX_GPIO*n*_MCU_SEL for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Section 5.12.

Note:
Not all signals can be directly connected to peripheral via IO MUX. Some input/output signals can only be connected to peripheral via GPIO matrix.

5.7 Analog Functions of GPIO Pins

Some GPIO pins in ESP32-C3 provide analog functions. When the pin is used for analog purpose, make sure that pull-up and pull-down resistors are disabled by following configuration:

- Set IO_MUX_GPIO*n*_MCU_SEL to 1, and clear IO_MUX_GPIO*n*_FUN_IE, IO_MUX_GPIO*n*_FUN_WPU, IO_MUX_GPIO*n*_FUN_WPD.

- Write 1 to GPIO_ENABLE_W1TC[*n*], to clear output enable.

See Table 5-5 for analog functions of ESP32-C3 pins.

5.8 Pin Functions in Light-sleep

Pins may provide different functions when ESP32-C3 is in Light-sleep mode. If IO_MUX_SLP_SEL in register IO_MUX_*n*_REG for a GPIO pin is set to 1, a different set of bits will be used to control the pin when the chip is in Light-sleep mode.

Table 5-1. Bits Used to Control IO MUX Functions in Light-sleep Mode

IO MUX Functions	Normal Execution OR IO_MUX_SLP_SEL = 0	Light-sleep Mode AND IO_MUX_SLP_SEL = 1
Output Drive Strength	IO_MUX_FUN_DRV	IO_MUX_MCU_DRV
Pull-up Resistor	IO_MUX_FUN_WPU	IO_MUX_MCU_WPU
Pull-down Resistor	IO_MUX_FUN_WPD	IO_MUX_MCU_WPD
Output Enable	OEN_SEL from GPIO matrix *	IO_MUX_MCU_OE

Note:
If IO_MUX_SLP_SEL is set to 0, pin functions remain the same in both normal execution and Light-sleep mode. Please refer to Section 5.5.2 for how to enable output in normal execution.

5.9 Pin Hold Feature

Each GPIO pin (including the RTC pins: GPIO0 ~ GPIO5) has an individual hold function controlled by a RTC register. When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified. Users can use the hold function for the pins to retain the pin state through a core reset triggered by watchdog time-out or Deep-sleep events.

Note:

- For digital pins (GPIO6 ~21), to maintain pin input/output status in Deep-sleep mode, users can set RTC_CNTL_DIG_PAD_HOLD*n* in register RTC_CNTL_DIG_PAD_HOLD_REG to 1 before powering down. To disable the hold function after the chip is woken up, users can set RTC_CNTL_DIG_PAD_HOLD*n* to 0.
- For RTC pins (GPIO0 ~5), the input and output values are controlled by the corresponding bits of register RTC_CNTL_PAD_HOLD_REG, and users can set it to 1 to hold the value or set it to 0 to unhold the value.

5.10 Power Supplies and Management of GPIO Pins

5.10.1 Power Supplies of GPIO Pins

For more information on the power supply for GPIO pins, please refer to Pin Definition in *ESP32-C3 Datasheet*. All the pins can be used to wake up the chip from Light-sleep mode, but only the pins (GPIO0 ~ GPIO5) in VDD3P3_RTC domain can be used to wake up the chip from Deep-sleep mode.

5.10.2 Power Supply Management

Each ESP32-C3 pin is connected to one of the two different power domains.

- VDD3P3_RTC: the input power supply for both RTC and CPU
- VDD3P3_CPU: the input power supply for CPU

5.11 Peripheral Signal List

Table 5-2 shows the peripheral input/output signals via GPIO matrix.

Please pay attention to the configuration of the bit GPIO_FUNC*n*_OEN_SEL:

- GPIO_FUNC*n*_OEN_SEL = 1: the output enable is controlled by the corresponding bit *n* of GPIO_ENABLE_REG:
  - GPIO_ENABLE_REG = 0: output is disabled;
  - GPIO_ENABLE_REG = 1: output is enabled;
- GPIO_FUNC*n*_OEN_SEL = 0: use the output enable signal from peripheral, for example SPIQ_oe in the column "Output enable signal when GPIO_FUNC*n*_OEN_SEL = 0" of Table 5-2. Note that the signals such as SPIQ_oe can be 1 (1'd1) or 0 (1'd0), depending on the configuration of corresponding peripherals. If it's 1'd1 in the "Output enable signal when GPIO_FUNC*n*_OEN_SEL = 0", it indicates that once the register GPIO_FUNC*n*_OEN_SEL is cleared, the output signal is always enabled by default.

Note:

Signals are numbered consecutively, but not all signals are valid.

- Only the signals with a name assigned in the column "Input signal" in Table 5-2 are valid input signals.
- Only the signals with a name assigned in the column "Output signal" in Table 5-2 are valid output signals.

Table 5-2. Peripheral Signals via GPIO Matrix

Signal No.	Input Signal	Default value	Direct Input via IO MUX	Output Signal	Output enable signal when GPIO_FUNC*n*_OEN_SEL = 0	Direct Output via IO MUX
0	SPIQ_in	0	yes	SPIQ_out	SPIQ_oe	yes

5.12 IO MUX Functions List

Table 5-3 shows the IO MUX functions of each pin.

Table 5-3. IO MUX Pin Functions

Pin No.	Pin Name	Function 0	Function 1	Function 2	Function 3	DRV	Reset	Notes
4	XTAL_32K_P	GPIO0	GPIO0	-	-	2	0	R
5	XTAL_32K_N	GPIO1	GPIO1	-	-	2	0	R
6	GPIO2	GPIO2	GPIO2	FSPIQ	-	2	1	R
8	GPIO3	GPIO3	GPIO3	-	-	2	1	R
9	MTMS	MTMS	GPIO4	FSPIHD	-	2	1	R
10	MTDI	MTDI	GPIO5	FSPIWP	-	2	1	R
12	MTCK	MTCK	GPIO6	FSPICLK	-	2	1*	G
13	MTDO	MTDO	GPIO7	FSPID	-	2	1	G
14	GPIO8	GPIO8	GPIO8	-	-	2	1	-
15	GPIO9	GPIO9	GPIO9	-	-	2	3	-
16	GPIO10	GPIO10	GPIO10	FSPICS0	-	2	1	G
18	VDD_SPI	GPIO11	GPIO11	-	-	2	0	-
19	SPIHD	SPIHD	GPIO12	-	-	2	3	-
20	SPIWP	SPIWP	GPIO13	-	-	2	3	-
21	SPICS0	SPICS0	GPIO14	-	-	2	3	-
22	SPICLK	SPICLK	GPIO15	-	-	2	3	-
23	SPID	SPID	GPIO16	-	-	2	3	-
24	SPIQ	SPIQ	GPIO17	-	-	2	3	-
25	GPIO18	GPIO18	GPIO18	-	-	3	0	USB, G
26	GPIO19	GPIO19	GPIO19	-	-	3	0*	USB
27	U0RXD	U0RXD	GPIO20	-	-	2	3	G
28	U0TXD	U0TXD	GPIO21	-	-	2	4	-

Drive Strength

"DRV" column shows the drive strength of each pin after reset:

- **0** - Drive current = ~5 mA
- **1** - Drive current = ~10 mA
- **2** - Drive current = ~20 mA
- **3** - Drive current = ~40 mA

Reset Configurations

"Reset" column shows the default configuration of each pin after reset:

- **0** - IE = 0 (input disabled)
- **1** - IE = 1 (input enabled)

- **2** - IE = 1, WPD = 1 (input enabled, pull-down resistor enabled)
- **3** - IE = 1, WPU = 1 (input enabled, pull-up resistor enabled)
- **4** - OE = 1, WPU = 1 (output enabled, pull-up resistor enabled)
- **0*** - IE = 0, WPU = 0. The USB pull-up value of GPIO19 is 1 by default, therefore, the pin's pull-up resistor is enabled. For more information, see the note below.
- **1*** - If eFuse bit EFUSE_DIS_PAD_JTAG = 1, the pin MTCK is left floating after reset, i.e. IE = 1. If eFuse bit EFUSE_DIS_PAD_JTAG = 0, the pin MTCK is connected to internal pull-up resistor, i.e. IE = 1, WPU = 1.

Note:

- **R** - Pins in VDD3P3_RTC domain, and part of them have analog functions, see Table 5-5.
- **USB** - GPIO18 and GPIO19 are USB pins. The pull-up value of the two pins are controlled by the pins' pull-up value together with USB pull-up value. If any one of the pull-up value is 1, the pin's pull-up resistor will be enabled. The pull-up resistors of USB pins are controlled by USB_SERIAL_JTAG_DP_PULLUP.
- **G** - These pins have glitches during power-up. See details in Table 5-4.

Table 5-4. Power-Up Glitches on Pins

Pin	Glitch	Typical Time Period (ns)
MTCK	Low-level glitch	5
MTDO	Low-level glitch	5
GPIO10	Low-level glitch	5
U0RXD	Low-level glitch	5
GPIO18	High-level glitch	50000

5.13 Analog Functions List

Table 5-5 shows the IO MUX pins with analog functions.

Table 5-5. Analog Functions of IO MUX Pins

GPIO Num	Pin Name	Analog Function 0	Analog Function 1
0	XTAL_32K_P	XTAL_32K_P	ADC1_CH0
1	XTAL_32K_N	XTAL_32K_N	ADC1_CH1
2	GPIO2	-	ADC1_CH2
3	GPIO3	-	ADC1_CH3
4	MTMS	-	ADC1_CH4

5.14 Register Summary

5.14.1 GPIO Matrix Register Summary

The addresses in this section are relative to the GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
GPIO_BT_SELECT_REG	GPIO bit select register	0x0000	R/W
GPIO_OUT_REG	GPIO output register	0x0004	R/W/SS
GPIO_OUT_W1TS_REG	GPIO output set register	0x0008	WT
GPIO_OUT_W1TC_REG	GPIO output clear register	0x000C	WT
GPIO_ENABLE_REG	GPIO output enable register	0x0020	R/W/SS
GPIO_ENABLE_W1TS_REG	GPIO output enable set register	0x0024	WT
GPIO_ENABLE_W1TC_REG	GPIO output enable clear register	0x0028	WT
GPIO_STRAP_REG	pin strapping register	0x0038	RO
GPIO_IN_REG	GPIO input register	0x003C	RO
GPIO_STATUS_REG	GPIO interrupt status register	0x0044	R/W/SS
GPIO_STATUS_W1TS_REG	GPIO interrupt status set register	0x0048	WT
GPIO_STATUS_W1TC_REG	GPIO interrupt status clear register	0x004C	WT
GPIO_PCPU_INT_REG	GPIO PRO_CPU interrupt status register	0x005C	RO
GPIO_STATUS_NEXT_REG	GPIO interrupt source register	0x014C	RO
Pin Configuration Registers			
GPIO_PIN0_REG	GPIO pin0 configuration register	0x0074	R/W
GPIO_PIN1_REG	GPIO pin1 configuration register	0x0078	R/W
GPIO_PIN2_REG	GPIO pin2 configuration register	0x007C	R/W
GPIO_PIN3_REG	GPIO pin3 configuration register	0x0080	R/W
GPIO_PIN4_REG	GPIO pin4 configuration register	0x0084	R/W
GPIO_PIN5_REG	GPIO pin5 configuration register	0x0088	R/W
GPIO_PIN6_REG	GPIO pin6 configuration register	0x008C	R/W
GPIO_PIN7_REG	GPIO pin7 configuration register	0x0090	R/W
GPIO_PIN8_REG	GPIO pin8 configuration register	0x0094	R/W
GPIO_PIN9_REG	GPIO pin9 configuration register	0x0098	R/W
GPIO_PIN10_REG	GPIO pin10 configuration register	0x009C	R/W
GPIO_PIN11_REG	GPIO pin11 configuration register	0x00A0	R/W
GPIO_PIN12_REG	GPIO pin12 configuration register	0x00A4	R/W
GPIO_PIN13_REG	GPIO pin13 configuration register	0x00A8	R/W
GPIO_PIN14_REG	GPIO pin14 configuration register	0x00AC	R/W
GPIO_PIN15_REG	GPIO pin15 configuration register	0x00B0	R/W
GPIO_PIN16_REG	GPIO pin16 configuration register	0x00B4	R/W
GPIO_PIN17_REG	GPIO pin17 configuration register	0x00B8	R/W
GPIO_PIN18_REG	GPIO pin18 configuration register	0x00BC	R/W
GPIO_PIN19_REG	GPIO pin19 configuration register	0x00C0	R/W
GPIO_PIN20_REG	GPIO pin20 configuration register	0x00C4	R/W
GPIO_PIN21_REG	GPIO pin21 configuration register	0x00C8	R/W
Input Function Configuration Registers			
GPIO_FUNC0_IN_SEL_CFG_REG	Configuration register for input signal 0	0x0154	R/W
GPIO_FUNC1_IN_SEL_CFG_REG	Configuration register for input signal 1	0x0158	R/W
...	...	...	...

Name	Description	Address	Access
GPIO_FUNC126_IN_SEL_CFG_REG	Configuration register for input signal 126	0x034C	R/W
GPIO_FUNC127_IN_SEL_CFG_REG	Configuration register for input signal 127	0x0350	R/W
Output Function Configuration Registers			
GPIO_FUNC0_OUT_SEL_CFG_REG	Configuration register for GPIO0 output	0x0554	R/W
GPIO_FUNC1_OUT_SEL_CFG_REG	Configuration register for GPIO1 output	0x0558	R/W
GPIO_FUNC2_OUT_SEL_CFG_REG	Configuration register for GPIO2 output	0x055C	R/W
GPIO_FUNC3_OUT_SEL_CFG_REG	Configuration register for GPIO3 output	0x0560	R/W
GPIO_FUNC4_OUT_SEL_CFG_REG	Configuration register for GPIO4 output	0x0564	R/W
GPIO_FUNC5_OUT_SEL_CFG_REG	Configuration register for GPIO5 output	0x0568	R/W
GPIO_FUNC6_OUT_SEL_CFG_REG	Configuration register for GPIO6 output	0x056C	R/W
GPIO_FUNC7_OUT_SEL_CFG_REG	Configuration register for GPIO7 output	0x0570	R/W
GPIO_FUNC8_OUT_SEL_CFG_REG	Configuration register for GPIO8 output	0x0574	R/W
GPIO_FUNC9_OUT_SEL_CFG_REG	Configuration register for GPIO9 output	0x0578	R/W
GPIO_FUNC10_OUT_SEL_CFG_REG	Configuration register for GPIO10 output	0x057C	R/W
GPIO_FUNC11_OUT_SEL_CFG_REG	Configuration register for GPIO11 output	0x0580	R/W
GPIO_FUNC12_OUT_SEL_CFG_REG	Configuration register for GPIO12 output	0x0584	R/W
GPIO_FUNC13_OUT_SEL_CFG_REG	Configuration register for GPIO13 output	0x0588	R/W
GPIO_FUNC14_OUT_SEL_CFG_REG	Configuration register for GPIO14 output	0x058C	R/W
GPIO_FUNC15_OUT_SEL_CFG_REG	Configuration register for GPIO15 output	0x0590	R/W
GPIO_FUNC16_OUT_SEL_CFG_REG	Configuration register for GPIO16 output	0x0594	R/W
GPIO_FUNC17_OUT_SEL_CFG_REG	Configuration register for GPIO17 output	0x0598	R/W
GPIO_FUNC18_OUT_SEL_CFG_REG	Configuration register for GPIO18 output	0x059C	R/W
GPIO_FUNC19_OUT_SEL_CFG_REG	Configuration register for GPIO19 output	0x05A0	R/W
GPIO_FUNC20_OUT_SEL_CFG_REG	Configuration register for GPIO20 output	0x05A4	R/W
GPIO_FUNC21_OUT_SEL_CFG_REG	Configuration register for GPIO21 output	0x05A8	R/W
Version Register			
GPIO_DATE_REG	GPIO version register	0x06FC	R/W
Clock Gate Register			
GPIO_CLOCK_GATE_REG	GPIO clock gate register	0x062C	R/W

5.14.2 IO MUX Register Summary

The addresses in this section are relative to the IO MUX base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
IO_MUX_PIN_CTRL_REG	Clock output configuration Register	0x0000	R/W
IO_MUX_GPIO0_REG	IO MUX configuration register for pin XTAL_32K_P	0x0004	R/W
IO_MUX_GPIO1_REG	IO MUX configuration register for pin XTAL_32K_N	0x0008	R/W
IO_MUX_GPIO2_REG	IO MUX configuration register for pin GPIO2	0x000C	R/W

Name	Description	Address	Access
IO_MUX_GPIO3_REG	IO MUX configuration register for pin GPIO3	0x0010	R/W
IO_MUX_GPIO4_REG	IO MUX configuration register for pin MTMS	0x0014	R/W
IO_MUX_GPIO5_REG	IO MUX configuration register for pin MTDI	0x0018	R/W
IO_MUX_GPIO6_REG	IO MUX configuration register for pin MTCK	0x001C	R/W
IO_MUX_GPIO7_REG	IO MUX configuration register for pin MTDO	0x0020	R/W
IO_MUX_GPIO8_REG	IO MUX configuration register for pin GPIO8	0x0024	R/W
IO_MUX_GPIO9_REG	IO MUX configuration register for pin GPIO9	0x0028	R/W
IO_MUX_GPIO10_REG	IO MUX configuration register for pin GPIO10	0x002C	R/W
IO_MUX_GPIO11_REG	IO MUX configuration register for pin VDD_SPI	0x0030	R/W
IO_MUX_GPIO12_REG	IO MUX configuration register for pin SPIHD	0x0034	R/W
IO_MUX_GPIO13_REG	IO MUX configuration register for pin SPIWP	0x0038	R/W
IO_MUX_GPIO14_REG	IO MUX configuration register for pin SPICS0	0x003C	R/W
IO_MUX_GPIO15_REG	IO MUX configuration register for pin SPICLK	0x0040	R/W
IO_MUX_GPIO16_REG	IO MUX configuration register for pin SPID	0x0044	R/W
IO_MUX_GPIO17_REG	IO MUX configuration register for pin SPIQ	0x0048	R/W
IO_MUX_GPIO18_REG	IO MUX configuration register for pin GPIO18	0x004C	R/W
IO_MUX_GPIO19_REG	IO MUX configuration register for pin GPIO19	0x0050	R/W
IO_MUX_GPIO20_REG	IO MUX configuration register for pin U0RXD	0x0054	R/W
IO_MUX_GPIO21_REG	IO MUX configuration register for pin U0TXD	0x0058	R/W
Version Register			
IO_MUX_DATE_REG	IO MUX Version Control Register	0x00FC	R/W

5.14.3 SDM Register Summary

The addresses in this section are relative to (GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory* + 0x0F00).

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

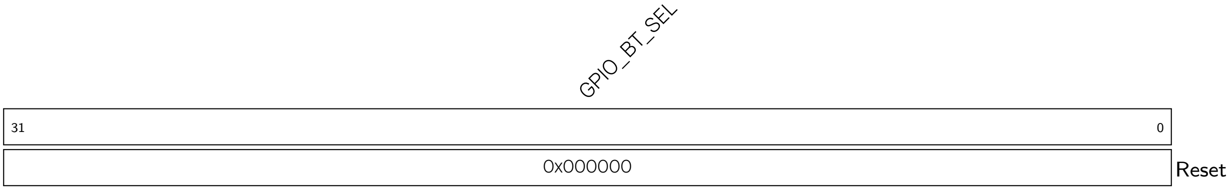
Name	Description	Address	Access
Configuration registers			
GPIOSD_SIGMADELTA0_REG	Duty Cycle Configuration Register of SDM0	0x0000	R/W
GPIOSD_SIGMADELTA1_REG	Duty Cycle Configuration Register of SDM1	0x0004	R/W
GPIOSD_SIGMADELTA2_REG	Duty Cycle Configuration Register of SDM2	0x0008	R/W
GPIOSD_SIGMADELTA3_REG	Duty Cycle Configuration Register of SDM3	0x000C	R/W
GPIOSD_SIGMADELTA_CG_REG	Clock Gating Configuration Register	0x0020	R/W
GPIOSD_SIGMADELTA_MISC_REG	MISC Register	0x0024	R/W
Version register			
GPIOSD_SIGMADELTA_VERSION_REG	Version Control Register	0x0028	R/W

5.15 Registers

5.15.1 GPIO Matrix Registers

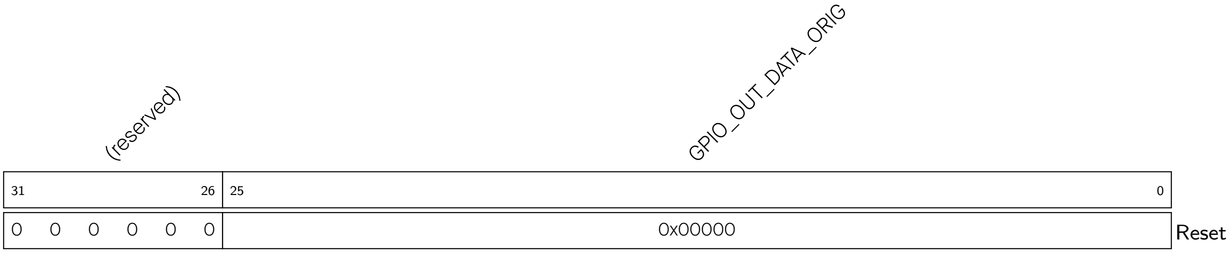
The addresses in this section are relative to the GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 5.1. GPIO_BT_SELECT_REG (0x0000)



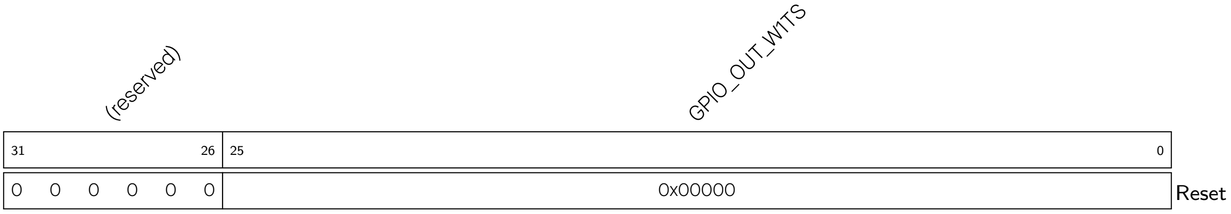
GPIO_BT_SEL Reserved (R/W)

Register 5.2. GPIO_OUT_REG (0x0004)



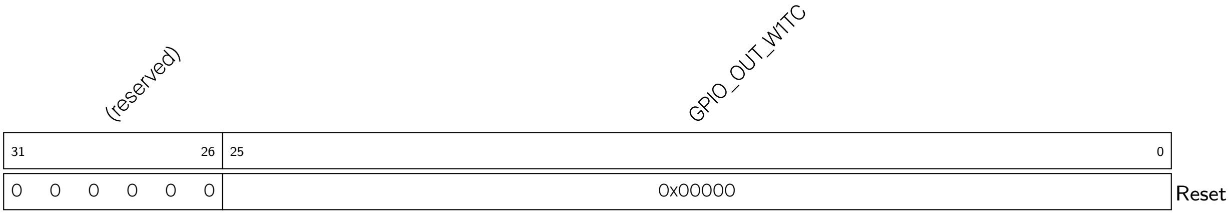
GPIO_OUT_DATA_ORIG GPIO0 ~ 21 output value in simple GPIO output mode. The values of bit0 ~ bit21 correspond to the output value of GPIO0 ~ GPIO21 respectively, and bit22 ~ bit25 are invalid. (R/W/SS)

Register 5.3. GPIO_OUT_W1TS_REG (0x0008)



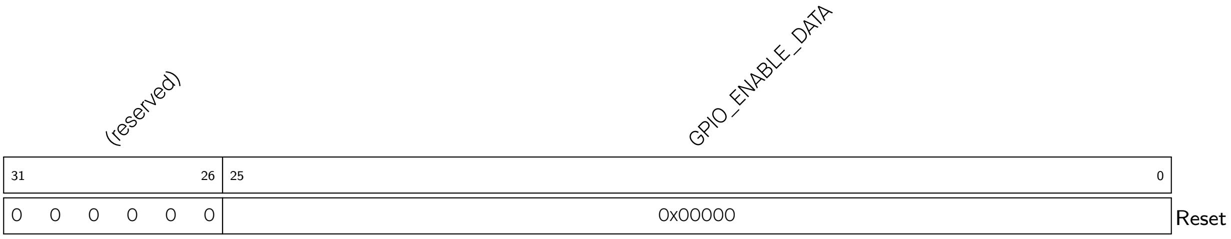
GPIO_OUT_W1TS GPIO0 ~ 21 output set register. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. If the value 1 is written to a bit here, the corresponding bit in GPIO_OUT_REG will be set to 1. Recommended operation: use this register to set GPIO_OUT_REG. (WT)

Register 5.4. GPIO_OUT_W1TC_REG (0x000C)



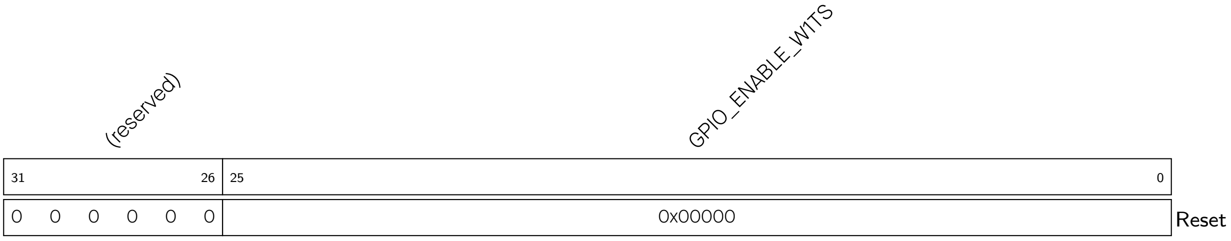
GPIO_OUT_W1TC GPIO0 ~ 21 output clear register. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. If the value 1 is written to a bit here, the corresponding bit in GPIO_OUT_REG will be cleared. Recommended operation: use this register to clear GPIO_OUT_REG. (WT)

Register 5.5. GPIO_ENABLE_REG (0x0020)



GPIO_ENABLE_DATA GPIO output enable register for GPIO0 ~ 21. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. (R/W/SS)

Register 5.6. GPIO_ENABLE_W1TS_REG (0x0024)



GPIO_ENABLE_W1TS GPIO0 ~ 21 output enable set register. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. If the value 1 is written to a bit here, the corresponding bit in GPIO_ENABLE_REG will be set to 1. Recommended operation: use this register to set GPIO_ENABLE_REG. (WT)

Register 5.7. GPIO_ENABLE_W1TC_REG (0x0028)

(reserved)	GPIO_ENABLE_W1TC	
31 26	25 0	
0 0 0 0 0 0	0x00000	Reset

GPIO_ENABLE_W1TC GPIO0 ~ 21 output enable clear register. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. If the value 1 is written to a bit here, the corresponding bit in GPIO_ENABLE_REG will be cleared. Recommended operation: use this register to clear GPIO_ENABLE_REG. (WT)

Register 5.8. GPIO_STRAP_REG (0x0038)

(reserved)	GPIO_STRAPPING	
31 16	15 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x00	Reset

GPIO_STRAPPING GPIO strapping values. (RO)

- bit 0: GPIO2
- bit 2: GPIO8
- bit 3: GPIO9

Register 5.9. GPIO_IN_REG (0x003C)

(reserved)	GPIO_IN_DATA_NEXT	
31 26	25 0	
0 0 0 0 0 0	0x00000	Reset

GPIO_IN_DATA_NEXT GPIO0 ~ 21 input value. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. Each bit represents a pin input value, 1 for high level and 0 for low level. (RO)

Register 5.10. GPIO_STATUS_REG (0x0044)

(reserved)	GPIO_STATUS_INTERRUPT	
31 26	25 0	
0 0 0 0 0 0	0x00000	Reset

GPIO_STATUS_INTERRUPT GPIO0 ~ 21 interrupt status register. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. (R/W/SS)

Register 5.11. GPIO_STATUS_W1TS_REG (0x0048)

(reserved)	GPIO_STATUS_W1TS	
31 26	25 0	
0 0 0 0 0 0	0x00000	Reset

GPIO_STATUS_W1TS GPIO0 ~ 21 interrupt status set register. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. If the value 1 is written to a bit here, the corresponding bit in GPIO_STATUS_INTERRUPT will be set to 1. Recommended operation: use this register to set GPIO_STATUS_INTERRUPT. (WT)

Register 5.12. GPIO_STATUS_W1TC_REG (0x004C)

(reserved)	GPIO_STATUS_W1TC	
31 26	25 0	
0 0 0 0 0 0	0x00000	Reset

GPIO_STATUS_W1TC GPIO0 ~ 21 interrupt status clear register. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. If the value 1 is written to a bit here, the corresponding bit in GPIO_STATUS_INTERRUPT will be cleared. Recommended operation: use this register to clear GPIO_STATUS_INTERRUPT. (WT)

Register 5.13. GPIO_PCPU_INT_REG (0x005C)

(reserved)	GPIO_PROCPU_INT	
31 26	25 0	
0 0 0 0 0 0	0x00000	Reset

GPIO_PROCPU_INT GPIO0 ~ 21 PRO_CPU interrupt status. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. This interrupt status is corresponding to the bit in GPIO_STATUS_REG when assert (high) enable signal (bit13 of GPIO_PIN*n*_REG). (RO)

Register 5.14. GPIO_PIN*n*_REG (*n*: 0-21) (0x0074+4**n*)

(reserved)	GPIO_PIN*n*_INT_ENA	GPIO_PIN*n*_CONFIG	GPIO_PIN*n*_WAKEUP_ENABLE	GPIO_PIN*n*_INT_TYPE	(reserved)	GPIO_PIN*n*_SYNC1_BYPASS	GPIO_PIN*n*_PAD_DRIVER	GPIO_PIN*n*_SYNC2_BYPASS	
31 18	17 13	12 11	10	9 7	6 5	4 3	2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	0x0	0	0x0	0 0	0x0	0	0x0	Reset

GPIO_PIN*n*_SYNC2_BYPASS For the second stage synchronization, GPIO input data can be synchronized on either edge of the APB clock. 0: no synchronization; 1: synchronized on falling edge; 2 and 3: synchronized on rising edge. (R/W)

GPIO_PIN*n*_PAD_DRIVER pin drive selection. 0: normal output; 1: open drain output. (R/W)

GPIO_PIN*n*_SYNC1_BYPASS For the first stage synchronization, GPIO input data can be synchronized on either edge of the APB clock. 0: no synchronization; 1: synchronized on falling edge; 2 and 3: synchronized on rising edge. (R/W)

GPIO_PIN*n*_INT_TYPE Interrupt type selection. 0: GPIO interrupt disabled; 1: rising edge trigger; 2: falling edge trigger; 3: any edge trigger; 4: low level trigger; 5: high level trigger. (R/W)

GPIO_PIN*n*_WAKEUP_ENABLE GPIO wake-up enable bit, only wakes up the CPU from Light-sleep. (R/W)

GPIO_PIN*n*_CONFIG reserved (R/W)

GPIO_PIN*n*_INT_ENA Interrupt enable bits. bit13: CPU interrupt enabled; bit14: CPU non-maskable interrupt enabled. (R/W)

Register 5.15. GPIO_STATUS_NEXT_REG (0x014C)

(reserved)	GPIO_STATUS_INTERRUPT_NEXT	
31 26	25 0	
0 0 0 0 0 0	0x00000	Reset

GPIO_STATUS_INTERRUPT_NEXT Interrupt source signal of GPIO0 ~ 21, could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt. Bit0 ~ bit21 are corresponding to GPIO0 ~ 21, and bit22 ~ bit25 are invalid. (RO)

Register 5.16. GPIO_FUNC*n*_IN_SEL_CFG_REG (*n*: 0-127) (0x0154+4**n*)

(reserved)	GPIO_SIG*n*_IN_SEL	GPIO_FUNC*n*_IN_INV_SEL	GPIO_FUNC*n*_IN_SEL	
31 7	6	5	4 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0x0	Reset

GPIO_FUNC*n*_IN_SEL Selection control for peripheral input signal *n*, selects a pin from the 22 GPIO matrix pins to connect this input signal. Or selects 0x1e for a constantly high input or 0x1f for a constantly low input. (R/W)

GPIO_FUNC*n*_IN_INV_SEL Invert the input value. 1: invert enabled; 0: invert disabled. (R/W)

GPIO_SIG*n*_IN_SEL Bypass GPIO matrix. 1: route signals via GPIO matrix, 0: connect signals directly to peripheral configured in IO MUX. (R/W)

Register 5.17. GPIO_FUNCn_OUT_SEL_CFG_REG (n: 0-21) (0x0554+4*n)

(reserved)	GPIO_FUNCn_OEN_INV_SEL	GPIO_FUNCn_OEN_SEL	GPIO_FUNCn_OUT_INV_SEL	GPIO_FUNCn_OUT_SEL	
31 11	10	9	8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0x80	Reset

GPIO_FUNCn_OUT_SEL Selection control for GPIO output *n*. If a value *Y* (0<=Y<128) is written to this field, the peripheral output signal *Y* will be connected to GPIO output *n*. If a value 128 is written to this field, bit *n* of GPIO_OUT_REG and GPIO_ENABLE_REG will be selected as the output value and output enable. (R/W)

GPIO_FUNCn_OUT_INV_SEL 0: Do not invert the output value; 1: Invert the output value. (R/W)

GPIO_FUNCn_OEN_SEL 0: Use output enable signal from peripheral; 1: Force the output enable signal to be sourced from bit *n* of GPIO_ENABLE_REG. (R/W)

GPIO_FUNCn_OEN_INV_SEL 0: Do not invert the output enable signal; 1: Invert the output enable signal. (R/W)

Register 5.18. GPIO_CLOCK_GATE_REG (0x062C)

(reserved)	GPIO_CLK_EN	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	Reset

GPIO_CLK_EN Clock gating enable bit. If set to 1, the clock is free running. (R/W)

Register 5.19. GPIO_DATE_REG (0x06FC)

(reserved)	GPIO_DATE_REG	
31 28	27 0	
0 0 0 0	0x2006130	Reset

GPIO_DATE_REG Version control register (R/W)

5.15.2 IO MUX Registers

The addresses in this section are relative to the IO MUX base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 5.20. IO_MUX_PIN_CTRL_REG (0x0000)

(reserved)	IO_MUX_CLK_OUT3	IO_MUX_CLK_OUT2	IO_MUX_CLK_OUT1	
31 12	11 8	7 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x7	0xf	0xf	Reset

IO_MUX_CLK_OUT*x* If you want to output clock for I2S to CLK_OUT_out*x*, set IO_MUX_CLK_OUT*x* to 0x0. CLK_OUT_out*x* can be found in Table 5-2. (R/W)

Register 5.21. IO_MUX_GPIOn_REG (n: 0-21) (0x0004+4*n)

(reserved)	IO_MUX_GPIOn_FILTER_EN	IO_MUX_GPIOn_MCU_SEL	IO_MUX_GPIOn_FUN_DRV	IO_MUX_GPIOn_FUN_IE	IO_MUX_GPIOn_FUN_WPU	IO_MUX_GPIOn_FUN_WPD	IO_MUX_GPIOn_MCU_DRV	IO_MUX_GPIOn_MCU_IE	IO_MUX_GPIOn_MCU_WPU	IO_MUX_GPIOn_MCU_WPD	IO_MUX_GPIOn_SLP_SEL	IO_MUX_GPIOn_MCU_OE	
31 16	15	14 12	11 10	9	8	7	6 5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x0	0x2	1	1	0	0 0	0	0	0	0	0	Reset

IO_MUX_GPIOn_MCU_OE Output enable of the pin in sleep mode. 1: output enabled; 0: output disabled. (R/W)

IO_MUX_GPIOn_SLP_SEL Sleep mode selection of this pin. Set to 1 to put the pin in sleep mode. (R/W)

IO_MUX_GPIOn_MCU_WPD Pull-down enable of the pin in sleep mode. 1: internal pull-down enabled; 0: internal pull-down disabled. (R/W)

IO_MUX_GPIOn_MCU_WPU Pull-up enable of the pin during sleep mode. 1: internal pull-up enabled; 0: internal pull-up disabled. (R/W)

IO_MUX_GPIOn_MCU_IE Input enable of the pin during sleep mode. 1: input enabled; 0: input disabled. (R/W)

IO_MUX_GPIOn_MCU_DRV Configures the drive strength of GPIOn during sleep mode.

0: ~5 mA
1: ~ 10 mA
2: ~ 20 mA
3: ~40 mA
(R/W)

IO_MUX_GPIOn_FUN_WPD Pull-down enable of the pin. 1: internal pull-down enabled; 0: internal pull-down disabled. (R/W)

IO_MUX_GPIOn_FUN_WPU Pull-up enable of the pin. 1: internal pull-up enabled; 0: internal pull-up disabled. (R/W)

IO_MUX_GPIOn_FUN_IE Input enable of the pin. 1: input enabled; 0: input disabled. (R/W)

IO_MUX_GPIOn_FUN_DRV Select the drive strength of the pin. 0: ~5 mA; 1: ~ 10 mA; 2: ~ 20 mA; 3: ~40mA. (R/W)

IO_MUX_GPIOn_MCU_SEL Select IO MUX function for this signal. 0: Select Function 0; 1: Select Function 1; etc. (R/W)

IO_MUX_GPIOn_FILTER_EN Enable filter for pin input signals. 1: Filter enabled; 0: Filter disabled. (R/W)

Register 5.22. IO_MUX_DATE_REG (0x00FC)

(reserved)	IO_MUX_DATE_REG	
31 28	27 0	
0 0 0 0	0x2006050	Reset

IO_MUX_DATE_REG Version control register (R/W)

5.15.3 SDM Output Registers

The addresses in this section are relative to (GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory* + 0x0F00).

Register 5.23. GPIOSD_SIGMADELTA*n*_REG (*n*: 0-3) (0x0000+4**n*)

(reserved)	GPIOSD_SD*n*_PRESCALE	GPIOSD_SD*n*_IN	
31 16	15 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0xff	0x0	Reset

GPIOSD_SD*n*_IN This field is used to configure the duty cycle of sigma delta modulation output. (R/W)

GPIOSD_SD*n*_PRESCALE This field is used to set a divider value to divide APB clock. (R/W)

Register 5.24. GPIOSD_SIGMADELTA_CG_REG (0x0020)

GPIOSD_CLK_EN	(reserved)	
31	30 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

GPIOSD_CLK_EN Clock enable bit of configuration registers for sigma delta modulation. (R/W)

Register 5.25. GPIOSD_SIGMADELTA_MISC_REG (0x0024)

	GPIOSD_SPI_SWAP	GPIOSD_FUNCTION_CLK_EN	(reserved)
	31	30	29 … 0
Reset	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

GPIOSD_FUNCTION_CLK_EN Clock enable bit of sigma delta modulation. (R/W)

GPIOSD_SPI_SWAP Reserved. (R/W)

Register 5.26. GPIOSD_SIGMADELTA_VERSION_REG (0x0028)

	(reserved)	GPIOSD_DATE
	31 … 28	27 … 0
Reset	0 0 0 0	0x2006230

GPIOSD_DATE Version Control Register. (R/W)

6 Reset and Clock

6.1 Reset

6.1.1 Overview

ESP32-C3 provides four types of reset that occur at different levels, namely CPU Reset, Core Reset, System Reset, and Chip Reset. All reset types mentioned above (except Chip Reset) maintain the data stored in internal memory. Figure 6-1 shows the scope of affected subsystems by each type of reset.

6.1.2 Architectural Overview

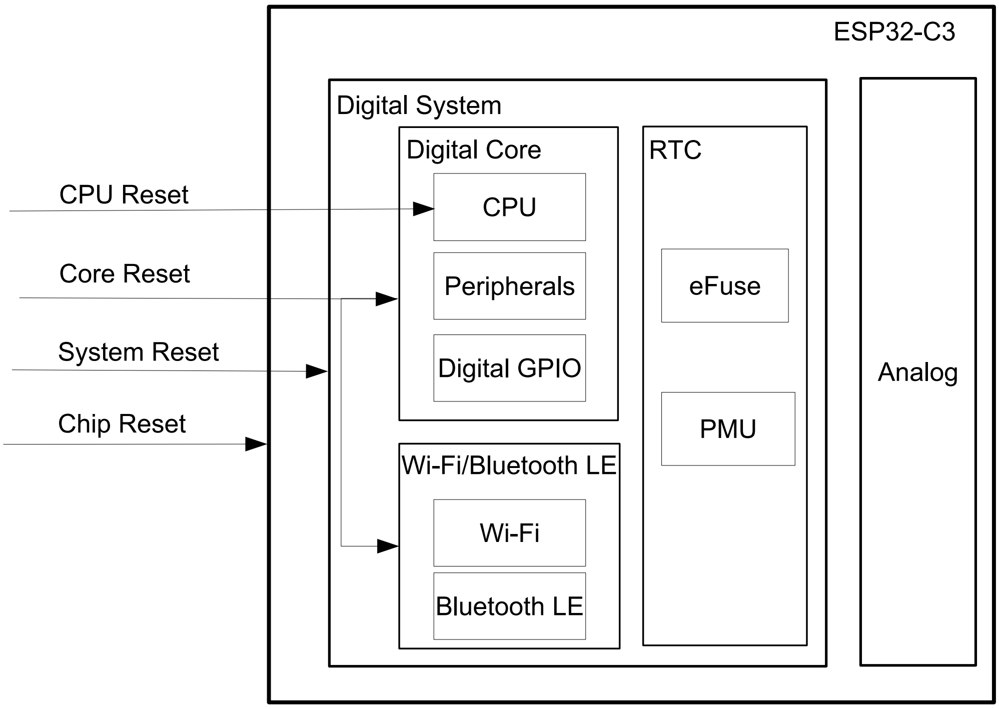


Figure 6-1. Reset Types

6.1.3 Features

- Support four reset levels:
  - CPU Reset: Only resets CPU core. Once such reset is released, the instructions from the CPU reset vector will be executed.
  - Core Reset: Resets the whole digital system except RTC, including CPU, peripherals, Wi-Fi, Bluetooth® LE, and digital GPIOs.
  - System Reset: Resets the whole digital system, including RTC.
  - Chip Reset: Resets the whole chip.
- Support software reset and hardware reset:
  - Software Reset: the CPU can trigger a software reset by configuring the corresponding registers, see Chapter 9 *Low-power Management*.

- Hardware Reset: Hardware reset is directly triggered by the circuit.

Note:
If CPU is reset, PMS registers will be reset, too.

6.1.4 Functional Description

CPU will be reset immediately when any of the reset above occurs. Users can get reset source codes by reading register RTC_CNTL_RESET_CAUSE_PROCPU after the reset is released.

Table 6-1 lists possible reset sources and the types of reset they trigger.

Table 6-1. Reset Sources

Code	Source	Reset Type	Comments
0x01	Chip reset[1]	Chip Reset	-
0x0F	Brown-out system reset	Chip Reset or System Reset	Triggered by brown-out detector[2]
0x10	RWDT system reset	System Reset	See Chapter 12 *Watchdog Timers (WDT)*
0x12	Super Watchdog reset	System Reset	See Chapter 12 *Watchdog Timers (WDT)*
0x13	CLK GLITCH reset	System Reset	See Chapter 24 *Clock Glitch Detection*
0x03	Software system reset	Core Reset	Triggered by configuring RTC_CNTL_SW_SYS_RST
0x05	Deep-sleep reset	Core Reset	See Chapter 9 *Low-power Management*
0x07	MWDT0 core reset	Core Reset	See Chapter 12 *Watchdog Timers (WDT)*
0x08	MWDT1 core reset	Core Reset	See Chapter 12 *Watchdog Timers (WDT)*
0x09	RWDT core reset	Core Reset	See Chapter 12 *Watchdog Timers (WDT)*
0x14	eFuse reset	Core Reset	Triggered by eFuse CRC error
0x15	USB (UART) reset	Core Reset	Triggered when external USB host sends a specific command to the Serial interface of USB-Serial-JTAG. See 30 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*
0x16	USB (JTAG) reset	Core Reset	Triggered when external USB host sends a specific command to the JTAG interface of USB-Serial-JTAG. See 30 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*
0x17	Power glitch reset	Core Reset	Triggered by power glitch
0x0B	MWDT0 CPU reset	CPU Reset	See Chapter 12 *Watchdog Timers (WDT)*
0x0C	Software CPU reset	CPU Reset	Triggered by configuring RTC_CNTL_SW_PROCPU_RST
0x0D	RWDT CPU reset	CPU Reset	See Chapter 12 *Watchdog Timers (WDT)*
0x11	MWDT1 CPU reset	CPU Reset	See Chapter 12 *Watchdog Timers (WDT)*

[1] Chip Reset can be triggered by the following two sources:
- Triggered by chip power-on.
- Triggered by brown-out detector.

[2] Once brown-out status is detected, the detector will trigger System Reset or Chip Reset, depending on register configuration. See Chapter 9 *Low-power Management*.

6.2 Clock

6.2.1 Overview

ESP32-C3 clocks are mainly sourced from oscillator (OSC), RC, and PLL circuit, and then processed by the dividers or selectors, which allows most functional modules to select their working clock according to their power consumption and performance requirements. Figure 6-2 shows the system clock structure.

6.2.2 Architectural Overview

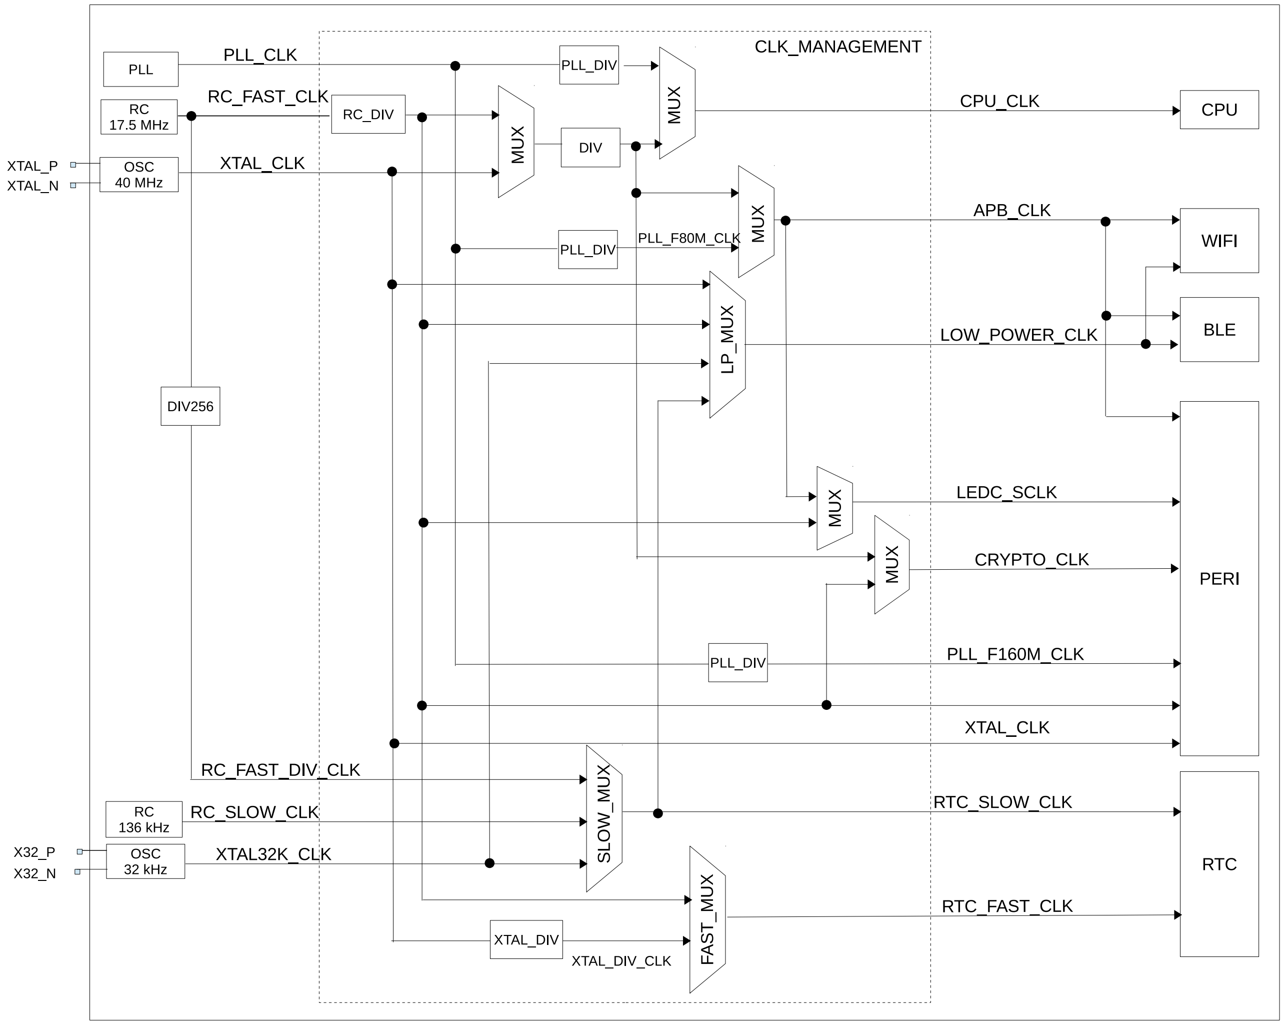

Figure 6-2. System Clock

6.2.3 Features

ESP32-C3 clocks can be classified in two types depending on their frequencies:

- High speed clocks for devices working at a higher frequency, such as CPU and digital peripherals
  - PLL_CLK (320 MHz or 480 MHz): internal PLL clock
  - XTAL_CLK (40 MHz): external crystal clock
- Slow speed clocks for low-power devices, such as RTC module and low-power peripherals
  - XTAL32K_CLK (32 kHz): external crystal clock
  - RC_FAST_CLK (17.5 MHz by default): internal fast RC oscillator with adjustable frequency

- RC_FAST_DIV_CLK: internal fast RC oscillator derived from RC_FAST_CLK divided by 256
- RC_SLOW_CLK (136 kHz by default): internal low RC oscillator with adjustable frequency

6.2.4 Functional Description

6.2.4.1 CPU Clock

As Figure 6-2 shows, CPU_CLK is the master clock for CPU and it can be as high as 160 MHz when CPU works in high performance mode. Alternatively, CPU can run at lower frequencies, such as at 2 MHz, to lower power consumption. Users can set PLL_CLK, RC_FAST_CLK or XTAL_CLK as CPU_CLK clock source by configuring register SYSTEM_SOC_CLK_SEL, see Table 6-2 and Table 6-3. By default, the CPU clock is sourced from XTAL_CLK with a divider of 2, i.e. the CPU clock is 20 MHz.

Table 6-2. CPU Clock Source

SYSTEM_SOC_CLK_SEL Value	CPU Clock Source
0	XTAL_CLK
1	PLL_CLK
2	RC_FAST_CLK

Table 6-3. CPU Clock Frequency

CPU Clock Source	SEL_0*	SEL_1*	SEL_2*	CPU Clock Frequency
XTAL_CLK	0	-	-	CPU_CLK = XTAL_CLK/(SYSTEM_PRE_DIV_CNT + 1) SYSTEM_PRE_DIV_CNT ranges from 0 ~ 1023. Default is 1
PLL_CLK (480 MHz)	1	1	0	CPU_CLK = PLL_CLK/6 CPU_CLK frequency is 80 MHz
PLL_CLK (480 MHz)	1	1	1	CPU_CLK = PLL_CLK/3 CPU_CLK frequency is 160 MHz
PLL_CLK (320 MHz)	1	0	0	CPU_CLK = PLL_CLK/4 CPU_CLK frequency is 80 MHz
PLL_CLK (320 MHz)	1	0	1	CPU_CLK = PLL_CLK/2 CPU_CLK frequency is 160 MHz
RC_FAST_CLK	2	-	-	CPU_CLK = RC_FAST_CLK/(SYSTEM_PRE_DIV_CNT + 1) SYSTEM_PRE_DIV_CNT ranges from 0 ~ 1023. Default is 1

* The value of SYSTEM_SOC_CLK_SEL.
* The value of SYSTEM_PLL_FREQ_SEL.
* The value of SYSTEM_CPUPERIOD_SEL.

6.2.4.2 Peripheral Clock

Peripheral clocks include APB_CLK, CRYPTO_CLK, PLL_F160M_CLK, LEDC_SCLK, XTAL_CLK, and RC_FAST_CLK. Table 6-4 shows which clock can be used by each peripheral.

Table 6-4. Peripheral Clocks

Peripheral	XTAL_CLK	APB_CLK	PLL_F160M_CLK	RTC_FAST_CLK	RC_FAST_CLK	CRYPTO_CLK	LEDC_CLK	PLL_D2_CLK
TIMG	Y	Y						
I2S	Y		Y					Y
UHCI		Y						
UART	Y	Y			Y			
RMT	Y	Y			Y			
I2C	Y				Y			
SPI	Y	Y						
eFuse Controller	Y			Y				
SARADC		Y						
Temperature Sensor	Y				Y			
USB		Y						
CRYPTO						Y		
TWAI Controller		Y						
LEDC	Y	Y	Y		Y		Y	
SYS_TIMER	Y	Y						

APB_CLK

The frequency of APB_CLK is determined by the clock source of CPU_CLK as shown in Table 6-5.

Table 6-5. APB_CLK Clock Frequency

CPU_CLK Source	APB_CLK Frequency
PLL_CLK	80 MHz
XTAL_CLK	CPU_CLK
RC_FAST_CLK	CPU_CLK

CRYPTO_CLK

The frequency of CRYPTO_CLK is determined by the CPU_CLK source, as shown in Table 6-6.

Table 6-6. CRYPTO_CLK Frequency

CPU_CLK Source	CRYPTO_CLK Frequency
PLL_CLK	160 MHz
XTAL_CLK	CPU_CLK
RC_FAST_CLK	CPU_CLK

PLL_F160M_CLK

PLL_F160M_CLK is divided from PLL_CLK according to current PLL frequency.

LEDC_SCLK

LEDC module uses RC_FAST_CLK as clock source when APB_CLK is disabled. In other words, when the system is in low-power mode, most peripherals will be halted (as APB_CLK is turned off), but LEDC can still work normally via RC_FAST_CLK.

6.2.4.3 Wi-Fi and Bluetooth LE Clock

Wi-Fi and Bluetooth LE can only work when CPU_CLK uses PLL_CLK as its clock source. Suspending PLL_CLK requires that Wi-Fi and Bluetooth LE have entered low-power mode first.

LOW_POWER_CLK uses XTAL32K_CLK, XTAL_CLK, RC_FAST_CLK or RTC_SLOW_CLK (the low clock selected by RTC) as its clock source for Wi-Fi and Bluetooth LE in low-power mode.

6.2.4.4 RTC Clock

The clock sources for RTC_SLOW_CLK and RTC_FAST_CLK are low-frequency clocks. RTC module can operate when most other clocks are stopped. RTC_SLOW_CLK derived from RC_SLOW_CLK, XTAL32K_CLK or RC_FAST_DIV_CLK is used to clock Power Management module. RTC_FAST_CLK is used to clock On-chip Sensor module. It can be sourced from a divided XTAL_CLK or from a divided RC_FAST_CLK.

7 Chip Boot Control

7.1 Overview

ESP32-C3 has three strapping pins:

- GPIO2
- GPIO8
- GPIO9

These strapping pins are used to control the following functions during chip power-on or hardware reset:

- control chip boot mode
- enable or disable ROM code printing to UART

During power-on reset, RTC watchdog reset, brownout reset, analog super watchdog reset, and crystal clock glitch detection reset (see Chapter 6 *Reset and Clock*), hardware captures samples and stores the voltage level of strapping pins as strapping bit of "0" or "1" in latches, and holds these bits until the chip is powered down or shut down. Software can read the latch status (strapping value) from GPIO_STRAPPING.

By default, GPIO9 is connected to the chip's internal pull-up resistor. If GPIO9 is not connected or connected to an external high-impedance circuit, the internal weak pull-up determines the default input level of this strapping pin (see Table 7-1).

Table 7-1. Default Configuration of Strapping Pins

Strapping Pin	Defualt Configuration
GPIO2	N/A
GPIO8	N/A
GPIO9	Pull-up

To change the strapping bit values, users can apply external pull-down/pull-up resistors, or use host MCU GPIOs to control the voltage level of these pins when powering on ESP32-C3. After the reset is released, the strapping pins work as normal-function pins.

Note:
The following section provides description of the chip functions and the pattern of the strapping pins values to invoke each function. Only documented patterns should be used. If some pattern is not documented, it may trigger unexpected behavior.

7.2 Boot Mode Control

The values of GPIO2, GPIO3, GPIO8, and GPIO9 at reset determine the boot mode after the reset is released. Table 7-2 shows the strapping pin values of GPIO9, GPIO8, GPIO3, and GPIO2, and the associated boot modes.

Table 7-2. Boot Mode Control

Boot Mode	GPIO9	GPIO8	GPIO3	GPIO2
SPI Boot mode	1	x[1]	x	x
Joint Download Boot mode[2]	0	1	x	x
SPI Download Boot mode[3]	0	0	0	1
Invalid Combination[4]	0	0	x	0

[1] x: values that have no effect on the result and can therefore be ignored.

[2] Joint Download Boot mode: Joint Download Boot mode supports the following download methods:

- USB-Serial-JTAG Download Boot
- UART Download Boot

[3] SPI Download Boot mode: GPIO3 and GPIO2 need to be reserved only when using SPI Download Boot mode. GPIO3 and GPIO2 are floating by default and are in a high-impedance state at reset.

[4] Invalid Combination: This combination can trigger unexpected behavior and should be avoided.

In SPI Boot mode, the ROM bootloader loads and executes the program from SPI flash to boot the system. SPI Boot mode can be further classified as follows:

- Normal Flash Boot: supports Security Boot. The ROM bootloader loads the program from flash into SRAM and executes it. In most practical scenarios, this program is the 2nd stage bootloader, which later boots the target application.
- Direct Boot: does not support Security Boot and programs run directly from flash. To enable this mode, make sure that the first two words of the bin file downloaded to flash (address: 0x42000000) are 0xaedb041d.

In Joint Download Boot mode, users can download binary files into flash using UART0 or USB interface. It is also possible to download binary files into SRAM and execute it in this mode.

In SPI Download Boot mode, users can download binary files into flash using SPI interface. It is also possible to download binary files into SRAM and execute it from SRAM.

The following eFuses control boot mode behaviors:

- EFUSE_DIS_FORCE_DOWNLOAD
  - If this eFuse is 0 (default), software can force switch the chip from SPI Boot mode to Joint Download Boot mode by setting RTC_CNTL_FORCE_DOWNLOAD_BOOT and triggering a CPU reset. In this case, hardware overwrites GPIO_STRAPPING[3:2] from "1x" to "01".
  - If this eFuse is 1, RTC_CNTL_FORCE_DOWNLOAD_BOOT is disabled. GPIO_STRAPPING can not be overwritten.
- EFUSE_DIS_DOWNLOAD_MODE

  If this eFuse is 1, Joint Download Boot mode is disabled. GPIO_STRAPPING will not be overwritten by RTC_CNTL_FORCE_DOWNLOAD_BOOT.

- EFUSE_ENABLE_SECURITY_DOWNLOAD

  If this eFuse is 1, Joint Download Boot mode only allows reading, writing, and erasing plaintext flash and does not support any SRAM or register operations. Ignore this eFuse if Joint Download Boot mode is disabled.

- EFUSE_DIS_DIRECT_BOOT

  If this eFuse is 1, Direct Boot mode is disabled.

USB Serial/JTAG Controller can also force the chip into Joint Download Boot mode from SPI Boot mode, as well as force the chip into SPI Boot mode from Joint Download Boot mode. For detailed information, please refer to Chapter 30 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*.

7.3 ROM Code Printing Control

GPIO8 controls ROM code printing of information during the early boot process. This GPIO is used together with EFUSE_UART_PRINT_CONTROL.

Table 7-3. ROM Code Printing Control

eFuse[1]	GPIO8	ROM Code Printing
0	x	ROM code is always printed to UART during boot. The value of GPIO8 is ignored.
1	0	Print is enabled during boot.
	1	Print is disabled during boot.
2	0	Print is disabled during boot.
	1	Print is enabled during boot.
3	x	Print is always disabled during boot. The value of GPIO8 is ignored.

[1] eFuse: EFUSE_UART_PRINT_CONTROL

ROM code will print to pin U0TXD (default) or to USB Serial/JTAG Controller during power-on, depending on the eFuse bit EFUSE_USB_PRINT_CHANNEL (0: USB; 1: UART). Note that if this eFuse bit is set to 0, i.e., USB is selected, but USB Serial/JTAG Controller is disabled, then ROM code will not print.

8 Interrupt Matrix (INTERRUPT)

8.1 Overview

The interrupt matrix embedded in ESP32-C3 independently routes peripheral interrupt sources to the ESP-RISC-V CPU's peripheral interrupts, to timely inform CPU to process the coming interrupts.

The ESP32-C3 has 62 peripheral interrupt sources. To map them to 31 CPU interrupts, this interrupt matrix is needed.

> **Note:**
> This chapter focuses on how to map peripheral interrupt sources to CPU interrupts. For more details about interrupt configuration, vector, and ISA suggested operations, please refer to Chapter 1 *ESP-RISC-V CPU*.

8.2 Features

- Accept 62 peripheral interrupt sources as input
- Generate 31 CPU peripheral interrupts to CPU as output
- Query current interrupt status of peripheral interrupt sources
- Configure priority, type, threshold, and enable signal of CPU interrupts

Figure 8-1 shows the structure of the interrupt matrix.

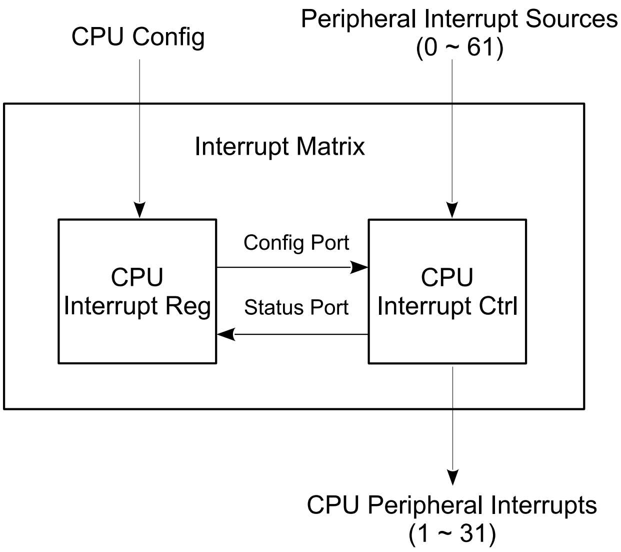

Figure 8-1. Interrupt Matrix Structure

8.3 Functional Description

8.3.1 Peripheral Interrupt Sources

The ESP32-C3 has 62 peripheral interrupt sources in total. Table 8-1 lists all these sources and their configuration/status registers.

- Column "No.": Peripheral interrupt source number, can be 0 ~ 61.
- Column "Chapter": in which chapter the interrupt source is described in detailed.
- Column "Source": Name of the peripheral interrupt source.
- Column "Configuration Register": Registers used for routing the peripheral interrupt sources to CPU peripheral interrupts
- Column "Status Register": Registers used for indicating the interrupt status of peripheral interrupt sources.
  - Column "Status Register - Bit": Bit position in status register, indicating the interrupt status.
  - Column "Status Register - Name": Name of status registers.

8.3.2 CPU Interrupts

The ESP32-C3 implements its interrupt mechanism using an interrupt controller instead of RISC-V Privileged ISA specification. The ESP-RISC-V CPU has 31 interrupts, numbered from 1 ~ 31. Each CPU interrupt has the following properties.

- Priority levels from 1 (lowest) to 15 (highest).
- Configurable as level-triggered or edge-triggered.
- Lower-priority interrupts mask-able by setting interrupt threshold.

Note:
For detailed information about how to configure CPU interrupts, see Chapter 1 *ESP-RISC-V CPU*.

8.3.3 Allocate Peripheral Interrupt Source to CPU Interrupt

In this section, the following terms are used to describe the operation of the interrupt matrix.

- Source_*X*: stands for a peripheral interrupt source, wherein *X* means the number of this interrupt source in Table 8-1.
- INTERRUPT_CORE0_SOURCE_*X*_MAP_REG: stands for a configuration register for the peripheral interrupt source (Source_*X*).
- Num_P: the index of CPU interrupts, can be 1 ~ 31.
- Interrupt_P: stands for the CPU interrupt numbered as Num_P.

8.3.3.1 Allocate one peripheral interrupt source (Source_*X*) to CPU

Setting the corresponding configuration register INTERRUPT_CORE0_SOURCE_*X*_MAP_REG of Source_*X* to Num_P allocates this interrupt source to Interrupt_P.

8.3.3.2 Allocate multiple peripheral interrupt sources (Source_X*n*) to CPU

Setting the corresponding configuration register INTERRUPT_CORE0_SOURCE_X*n*_MAP_REG of each interrupt source to the same Num_P allocates multiple sources to the same Interrupt_P. Any of these sources can trigger CPU Interrupt_P. When an interrupt signal is generated, CPU should check the interrupt status registers to figure out which peripheral generated the interrupt. For more information, see Chapter 1 *ESP-RISC-V CPU*.

8.3.3.3 Disable CPU peripheral interrupt source (Source_*X*)

Clearing the configuration register INTERRUPT_CORE0_SOURCE_*X*_MAP_REG disables the corresponding interrupt source.

8.3.4 Query Current Interrupt Status of Peripheral Interrupt Source

Users can query current interrupt status of a peripheral interrupt source by reading the bit value in INTERRUPT_CORE0

_INTR_STATUS_*n*_REG (read only). For the mapping between INTERRUPT_CORE0_INTR_STATUS_*n*_REG and peripheral interrupt sources, please refer to Table 8-1.

8.4 Register Summary

The addresses in this section are relative to the interrupt matrix base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Interrupt Source Mapping Registers			
INTERRUPT_CORE0_PWR_INTR_MAP_REG	PWR_INTR mapping register	0x0008	R/W

8.5 Registers

The addresses in this section are relative to the interrupt matrix base address provided in Table 3-3 in Chapter *3 System and Memory*.

Register 8.1. INTERRUPT_CORE0_*PWR_INTR_MAP*_REG (0x0008)

Register 8.2. INTERRUPT_CORE0_*I2C_MST_INT_MAP*_REG (0x002C)

Register 8.3. INTERRUPT_CORE0_*SLC0_INTR_MAP*_REG (0x0030)

Register 8.4. INTERRUPT_CORE0_*SLC1_INTR_MAP*_REG (0x0034)

Register 8.5. INTERRUPT_CORE0_*SYSCON_INTR_MAP*_REG (0x0038)

Register 8.6. INTERRUPT_CORE0_*UHCI0_INTR_MAP*_REG (0x003C)

Register 8.7. INTERRUPT_CORE0_*GPIO_INTERRUPT_PRO_MAP*_REG (0x0040)

Register 8.8. INTERRUPT_CORE0_*SPI_INTR_1_MAP*_REG (0x0048)

Register 8.9. INTERRUPT_CORE0_*SPI_INTR_2_MAP*_REG (0x004C)

Register 8.10. INTERRUPT_CORE0_*I2S1_INT_MAP*_REG (0x0050)

Register 8.11. INTERRUPT_CORE0_*UART_INTR_MAP*_REG (0x0054)

Register 8.12. INTERRUPT_CORE0_*UART1_INTR_MAP*_REG (0x0058)

Register 8.13. INTERRUPT_CORE0_*LEDC_INT_MAP*_REG (0x005C)

Register 8.14. INTERRUPT_CORE0_*EFUSE_INT_MAP*_REG (0x0060)

Register 8.15. INTERRUPT_CORE0_*TWAI_INT_MAP*_REG (0x0064)

Register 8.16. INTERRUPT_CORE0_*USB_INTR_MAP*_REG (0x0068)

Register 8.17. INTERRUPT_CORE0_*RTC_CORE_INTR_MAP*_REG (0x006C)

Register 8.18. INTERRUPT_CORE0_*RMT_INTR_MAP*_REG (0x0070)

Register 8.19. INTERRUPT_CORE0_*I2C_EXT0_INTR_MAP*_REG (0x0074)

Register 8.20. INTERRUPT_CORE0_*TIMER_INT1_MAP*_REG (0x0078)

Register 8.21. INTERRUPT_CORE0_*TIMER_INT2_MAP*_REG (0x007C)

Register 8.22. INTERRUPT_CORE0_*TG_T0_INT_MAP*_REG (0x0080)

Register 8.23. INTERRUPT_CORE0_*TG_WDT_INT_MAP*_REG (0x0084)

Register 8.24. INTERRUPT_CORE0_*TG1_T0_INT_MAP*_REG (0x0088)

Register 8.25. INTERRUPT_CORE0_*TG1_WDT_INT_MAP*_REG (0x008C)

Register 8.26. INTERRUPT_CORE0_*CACHE_IA_INT_MAP*_REG (0x0090)

Register 8.27. INTERRUPT_CORE0_*SYSTIMER_TARGET0_INT_MAP*_REG (0x0094)

Register 8.28. INTERRUPT_CORE0_*SYSTIMER_TARGET1_INT_MAP*_REG (0x0098)

Register 8.29. INTERRUPT_CORE0_*SYSTIMER_TARGET2_INT_MAP*_REG (0x009C)

Register 8.30. INTERRUPT_CORE0_*SPI_MEM_REJECT_INTR_MAP*_REG (0x00A0)

Register 8.31. INTERRUPT_CORE0_*ICACHE_PRELOAD_INT_MAP*_REG (0x00A4)

Register 8.32. INTERRUPT_CORE0_*ICACHE_SYNC_INT_MAP*_REG (0x00A8)

Register 8.33. INTERRUPT_CORE0_APB_ADC_INT_MAP_REG (0x00AC)

Register 8.34. INTERRUPT_CORE0_DMA_CH0_INT_MAP_REG (0x00B0)

Register 8.35. INTERRUPT_CORE0_DMA_CH1_INT_MAP_REG (0x00B4)

Register 8.36. INTERRUPT_CORE0_DMA_CH2_INT_MAP_REG (0x00B8)

Register 8.37. INTERRUPT_CORE0_RSA_INT_MAP_REG (0x00BC)

Register 8.38. INTERRUPT_CORE0_AES_INT_MAP_REG (0x00C0)

Register 8.39. INTERRUPT_CORE0_SHA_INT_MAP_REG (0x00C4)

Register 8.40. INTERRUPT_CORE0_CPU_INTR_FROM_CPU_0_MAP_REG (0x00C8)

Register 8.41. INTERRUPT_CORE0_CPU_INTR_FROM_CPU_1_MAP_REG (0x00CC)

Register 8.42. INTERRUPT_CORE0_CPU_INTR_FROM_CPU_2_MAP_REG (0x00D0)

Register 8.43. INTERRUPT_CORE0_CPU_INTR_FROM_CPU_3_MAP_REG (0x00D4)

Register 8.44. INTERRUPT_CORE0_ASSIST_DEBUG_INTR_MAP_REG (0x00D8)

Register 8.45. INTERRUPT_CORE0_DMA_APBPERI_PMS_MONITOR_VIOLATE_INTR_MAP_REG (0x00DC)

Register 8.46. INTERRUPT_CORE0_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG (0x00E0)

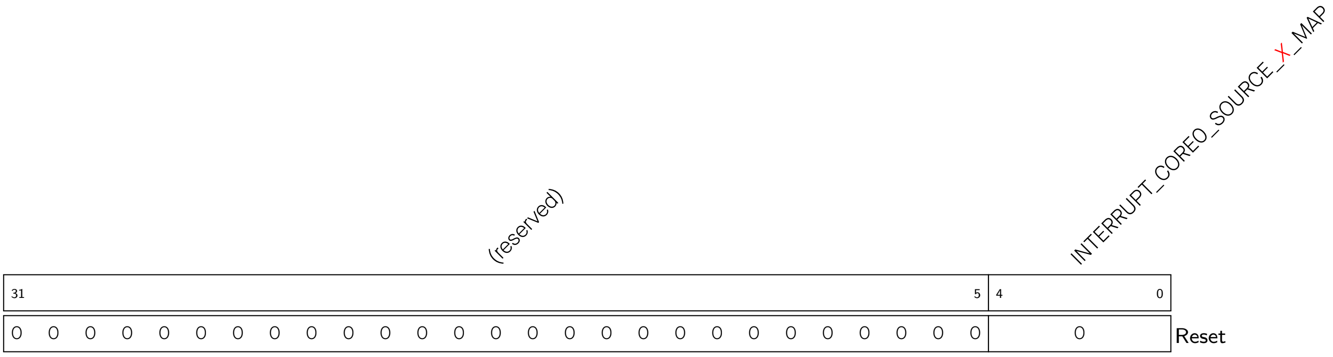
Register 8.47. INTERRUPT_CORE0_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG (0x00E4)

Register 8.48. INTERRUPT_CORE0_CORE_0_PIF_PMS_MONITOR_VIOLATE_INTR_MAP_REG (0x00E8)

Register 8.49. INTERRUPT_CORE0_CORE_0_PIF_PMS_MONITOR_VIOLATE_SIZE_INTR_MAP_REG (0x00EC)

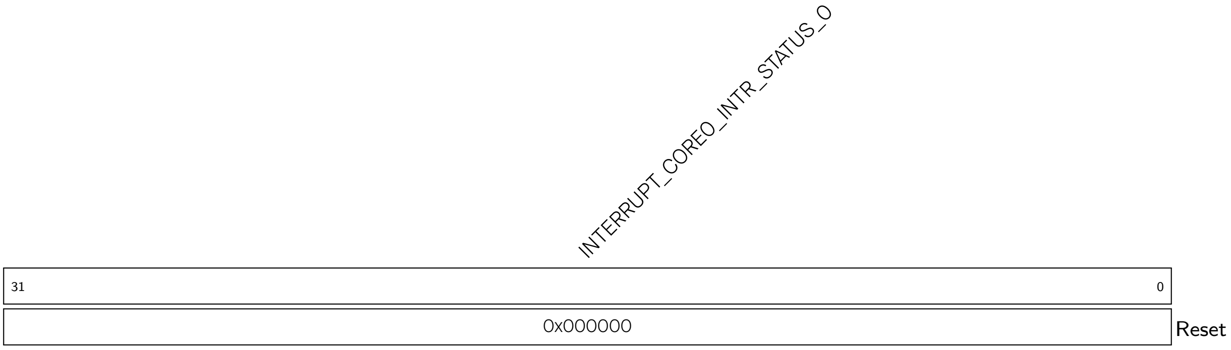
Register 8.50. INTERRUPT_CORE0_BACKUP_PMS_VIOLATE_INTR_MAP_REG (0x00F0)

Register 8.51. INTERRUPT_CORE0_CACHE_CORE0_ACS_INT_MAP_REG (0x00F4)



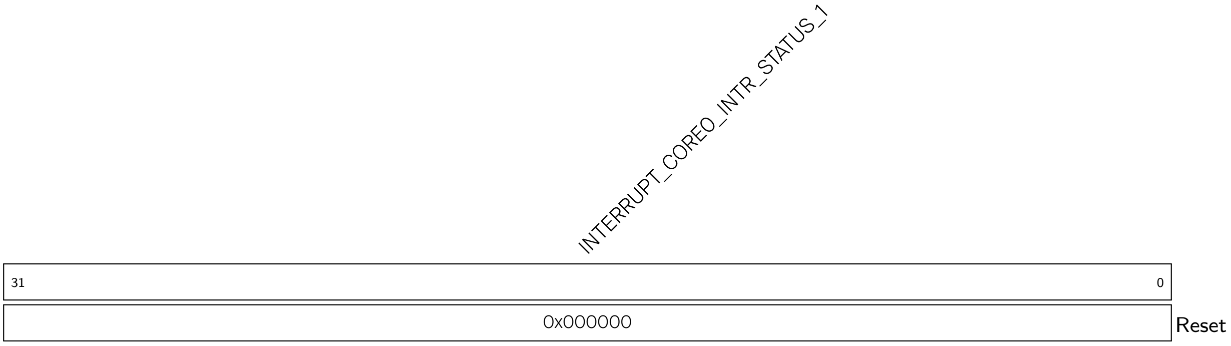
INTERRUPT_CORE0_SOURCE_X_MAP Map the interrupt source (SOURCE_X) into one CPU interrupt. For the information of SOURCE_X, see Table 8-1. (R/W)

Register 8.52. INTERRUPT_CORE0_INTR_STATUS_0_REG (0x00F8)



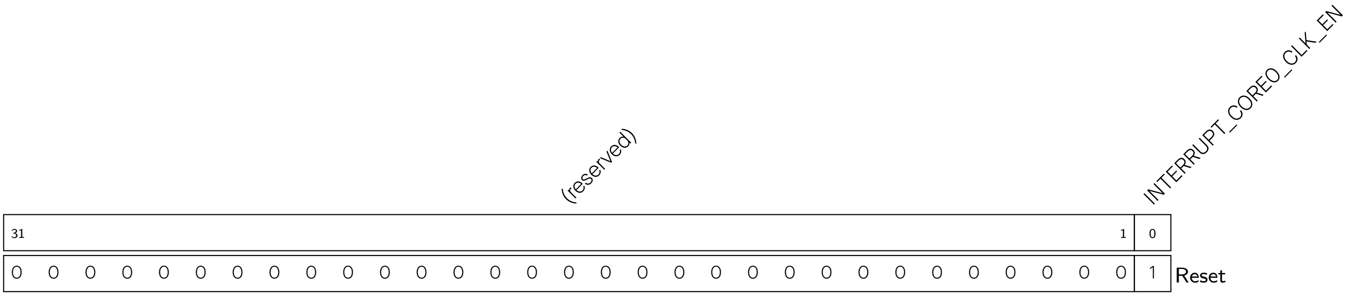
INTERRUPT_CORE0_INTR_STATUS_0 This register stores the status of the first 32 interrupt sources: 0 ~ 31. If the bit is 1 here, it means the corresponding source triggered an interrupt. (RO)

Register 8.53. INTERRUPT_CORE0_INTR_STATUS_1_REG (0x00FC)



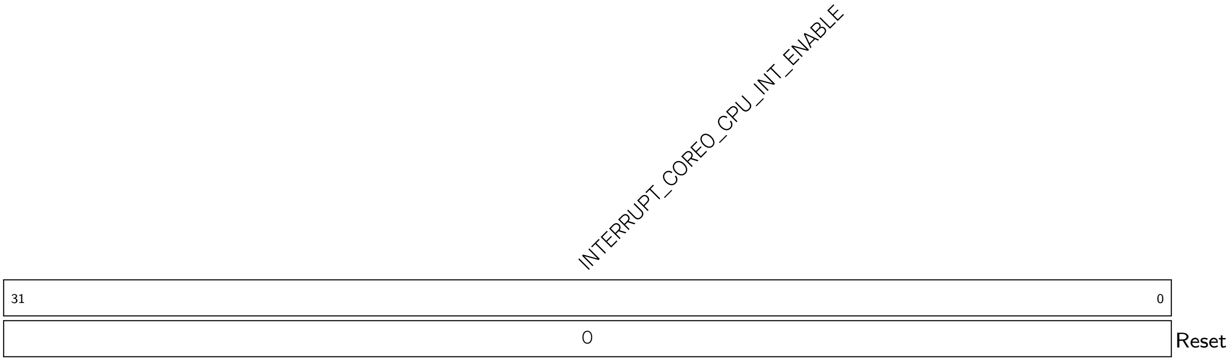
INTERRUPT_CORE0_INTR_STATUS_1 This register stores the status of the first 32 interrupt sources: 32 ~ 61. If the bit is 1 here, it means the corresponding source triggered an interrupt. (RO)

Register 8.54. INTERRUPT_CORE0_CLOCK_GATE_REG (0x0100)



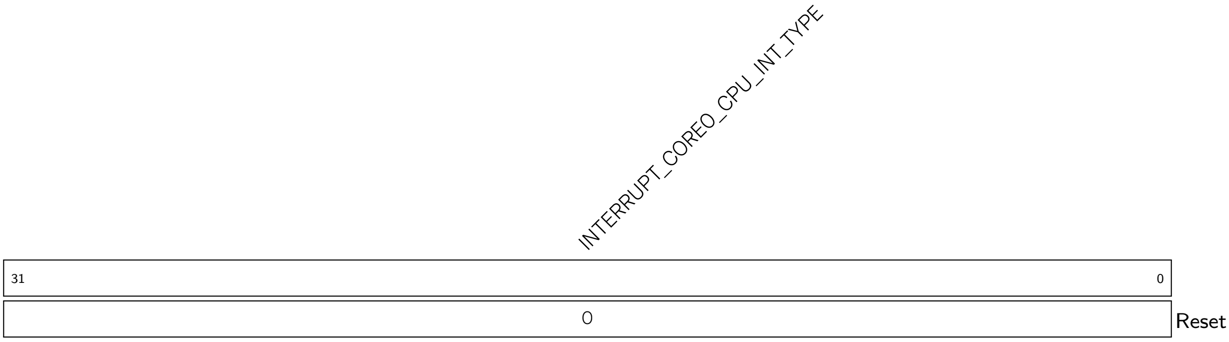
INTERRUPT_CORE0_CLK_EN Set 1 to force interrupt register clock-gate on. (R/W)

Register 8.55. INTERRUPT_CORE0_CPU_INT_ENABLE_REG (0x0104)



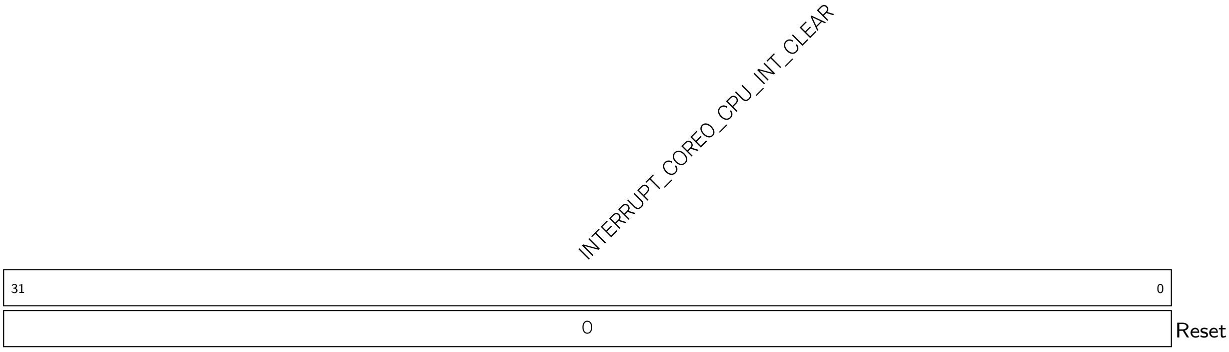
INTERRUPT_CORE0_CPU_INT_ENABLE Writing 1 to the bit here enables its corresponding CPU interrupt. For more information about how to use this register, see Chapter 1 *ESP-RISC-V CPU*. (R/W)

Register 8.56. INTERRUPT_CORE0_CPU_INT_TYPE_REG (0x0108)



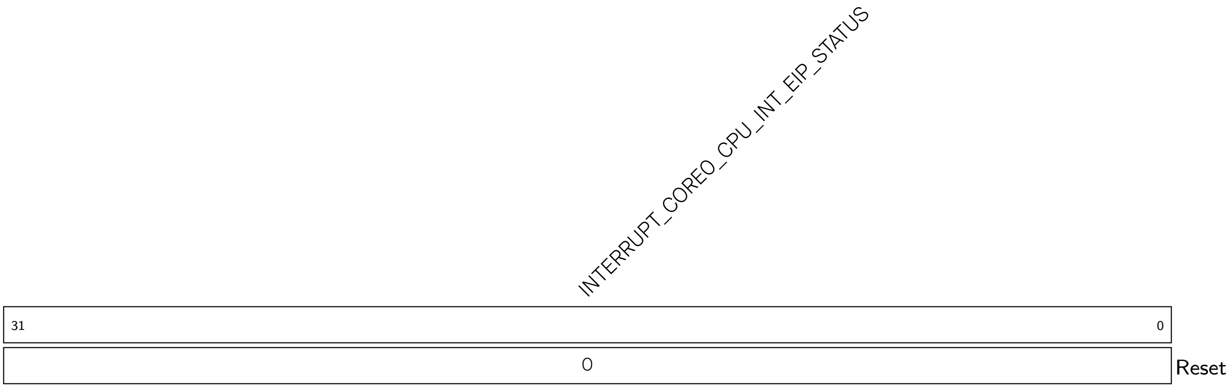
INTERRUPT_CORE0_CPU_INT_TYPE Configure CPU interrupt type. 0: level-triggered; 1: edge-triggered. For more information about how to use this register, see Chapter 1 *ESP-RISC-V CPU*. (R/W)

Register 8.57. INTERRUPT_CORE0_CPU_INT_CLEAR_REG (0x010C)



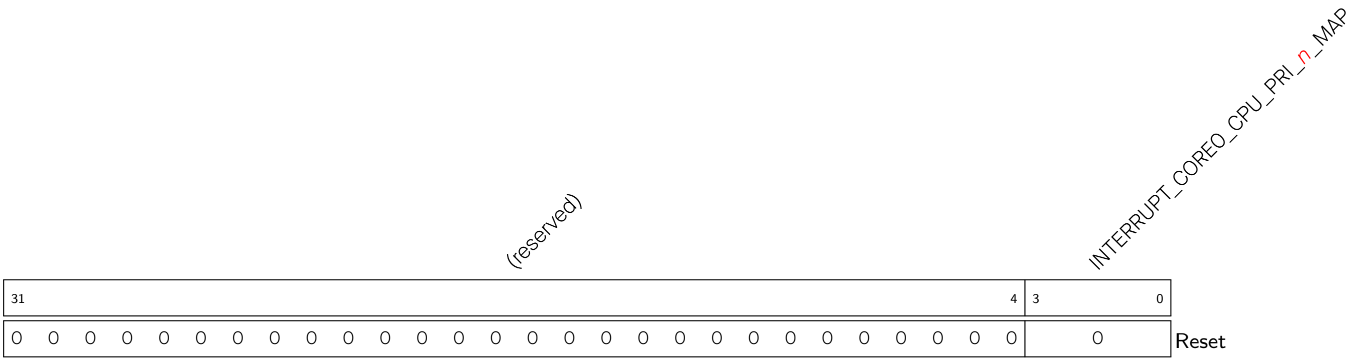
INTERRUPT_CORE0_CPU_INT_CLEAR Writing 1 to the bit here clears its corresponding CPU interrupt. For more information about how to use this register, see Chapter 1 *ESP-RISC-V CPU*. (R/W)

Register 8.58. INTERRUPT_COREO_CPU_INT_EIP_STATUS_REG (0x0110)



INTERRUPT_COREO_CPU_INT_EIP_STATUS Store the pending status of CPU interrupts. For more information about how to use this register, see Chapter 1 *ESP-RISC-V CPU*. (RO)

Register 8.59. INTERRUPT_COREO_CPU_INT_PRI_*n*_REG (n: 1 - 31)(0x0118 + 0x4**n*)



INTERRUPT_COREO_CPU_PRI_*n*_MAP Set the priority for CPU interrupt *n*. The priority here can be 1 (lowest) ~ 15 (highest). For more information about how to use this register, see Chapter 1 *ESP-RISC-V CPU*. (R/W)

Register 8.60. INTERRUPT_CORE0_CPU_INT_THRESH_REG (0x0194)

(reserved)	INTERRUPT_CORE0_CPU_INT_THRESH	
31 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

INTERRUPT_CORE0_CPU_INT_THRESH Set threshold for interrupt assertion to CPU. Only when the interrupt priority is equal to or higher than this threshold, CPU will respond to this interrupt. For more information about how to use this register, see Chapter 1 *ESP-RISC-V CPU*. (R/W)

Register 8.61. INTERRUPT_CORE0_INTERRUPT_DATE_REG (0x07FC)

(reserved)	INTERRUPT_CORE0_INTERRUPT_DATE	
31 28	27 0	
0 0 0 0	0x2007210	Reset

INTERRUPT_CORE0_INTERRUPT_DATE Version control register. (R/W)

9 Low-power Management

9.1 Introduction

ESP32-C3 has an advanced Power Management Unit (PMU), which can flexibly power up different power domains of the chip, to achieve the best balance among chip performance, power consumption, and wakeup latency. To simplify power management for typical scenarios, ESP32-C3 has predefined four power modes, which are preset configurations that power up different combinations of power domains. On top of that, the chip also allows the users to independently power up any particular power domain to meet more complex requirements.

9.2 Features

ESP32-C3's low-power management supports the following features:

- Four predefined power modes to simplify power management for typical scenarios
- Up to 8 KB of retention memory
- 8 x 32-bit retention registers
- RTC Boot supported for reduced wakeup latency

In this chapter, we first introduce the working process of ESP32-C3's low-power management, then introduce the predefined power modes of the chip, and at last, introduce the RTC boot of the chip.

9.3 Functional Description

ESP32-C3's low-power management involves the following components:

- Power management unit: controls the power supply to Analog, RTC and Digital power domains.
- Power isolation unit: isolates different power domains, so any powered down power domain does not affect the powered up ones.
- Low-power clocks: provide clocks to power domains working in low-power modes.
- RTC timer: logs the status of the RTC main state machine in dedicated registers.
- 8 x 32-bit "always-on" retention registers: These registers are always powered up and are not affected by any low-power modes, thus can be used for storing data that cannot be lost.
- 6 x "always-on" pins: These pins are always powered up and are not affected by any low-power modes, which makes them suitable for working as wakeup sources when the chip is working in the low-power modes (for details, please refer to Section 9.4.3), or can be used as regular GPIOs (for details, please refer to Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)*).
- RTC fast memory: 8 KB SRAM that works under CPU clock (CPU_CLK), which can be used as extended memory.
- Voltage regulators: regulate the power supply to different power domains.

The schematic diagram of ESP32-C3's low-power management is shown in Figure 9-1.

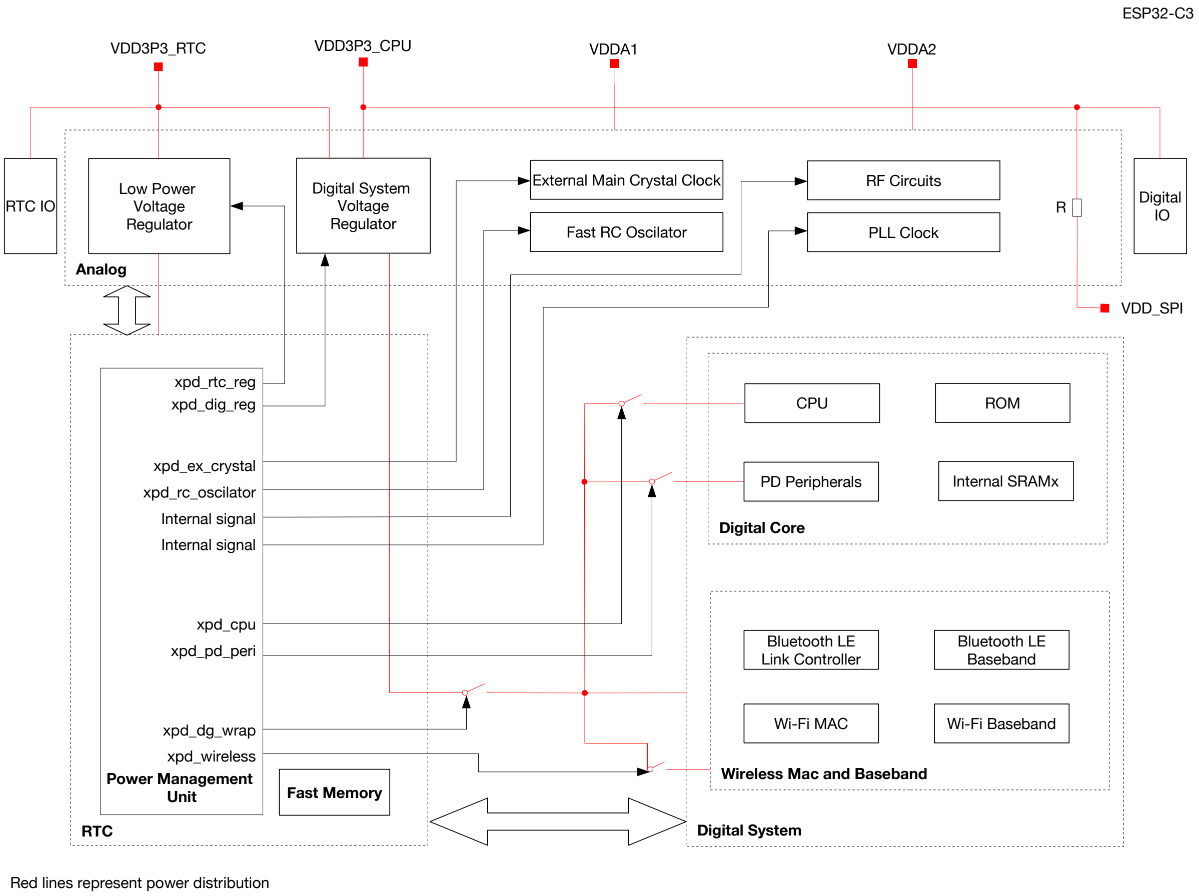


Figure 9-1. Low-power Management Schematics

Note:

- For more information about different power domains, please check Section 9.4.1.
- Switches in the above diagram can be controlled by Register RTC_CNTL_DIG_PWC_REG.
- Signals in the above diagram are described below:
  - xpd_rtc_reg:
    - * When RTC_CNTL_REGULATOR_FORCE_PU is set to 1, low power voltage regulator is always-on;
    - * Otherwise, the low power voltage regulator is off when chip enters Light-sleep and Deep-sleep modes. In this case, the RTC domain is powered by an ultra low-power internal power source.
  - xpd_dig_reg:
    - * When RTC_CNTL_DG_WRAP_PD_EN is enabled, the digital system voltage regulator is off when the chip enters Light-sleep and Deep-sleep modes;
    - * Otherwise, the digital system voltage regulator is always-on.
  - xpd_ex_crystal:
    - * When RTC_CNTL_XTL_FORCE_PU is set to 1, the external main crystal clock is always-on;
    - * Otherwise, the external main crystal clock is off when chip enters Light-sleep and Deep-sleep modes.
  - xpd_rc_oscilator:
    - * when RTC_CNTL_FOSC_FORCE_PU is set to 1, the fast RC oscillator is always-on;
    - * Otherwise, the fast RC oscillator is off when chip enters Light-sleep and Deep-sleep modes.

9.3.1 Power Management Unit (PMU)

ESP32-C3's power management unit controls the power supply to different power domains. The main components of the power management unit include:

- RTC main state machine: generates power gating, clock gating, and reset signals.
- Power controllers: power up and power down different power domains, according to the power gating signals from the main state machine.
- Sleep / wakeup controllers: send sleep or wakeup requests to the RTC main state machine.
- Clock controller: selects and powers up/down clock sources.
- Protection Timer: controls the transition interval between main state machine states.

In ESP32-C3's power management unit, the sleep / wakeup controllers send sleep or wakeup requests to the RTC main state machine, which then generates power gating, clock gating, and reset signals. Then, the power controller and clock controller power up and power down different power domains and clock sources, according to the signals generated by the RTC main state machine, so that the chip enters or exits the low-power modes. The main workflow is shown in Figure 9-2.

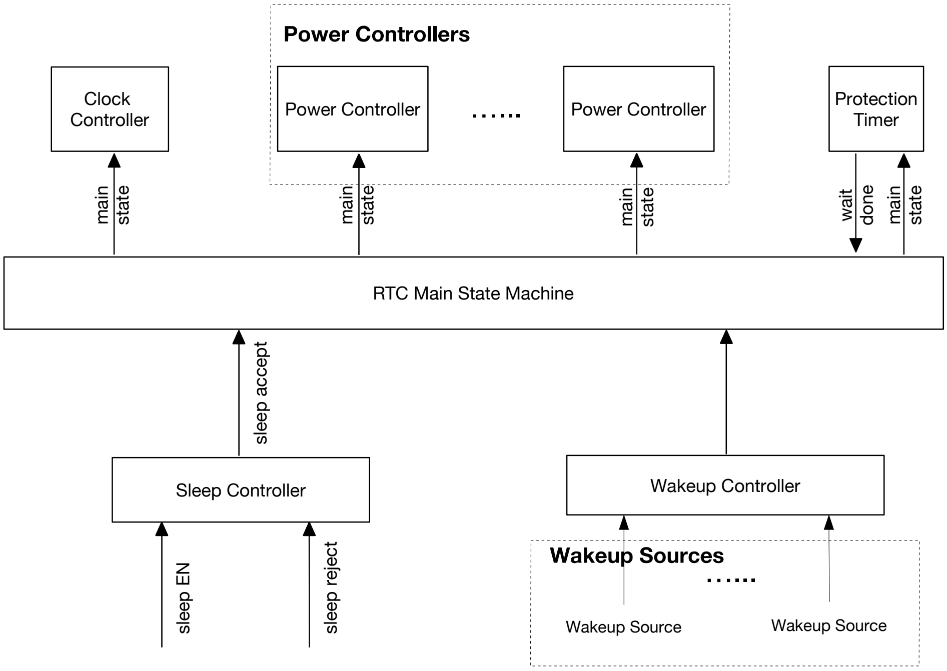

Figure 9-2. Power Management Unit Workflow

Note:

1. Each power domain has its own power controller. For a complete list of all the available power controllers controlling different power domains, please refer to Section 9.4.1.
2. For a complete list of all the available wakeup sources, please refer to Table 9-4.

9.3.2 Low-Power Clocks

In general, ESP32-C3 powers down its external main crystal oscillator XTAL_CLK and PLL to reduce power consumption when working in low-power modes. During this time, the chip's low-power clocks remain on to provide clocks to low power domains, such as the power management unit.

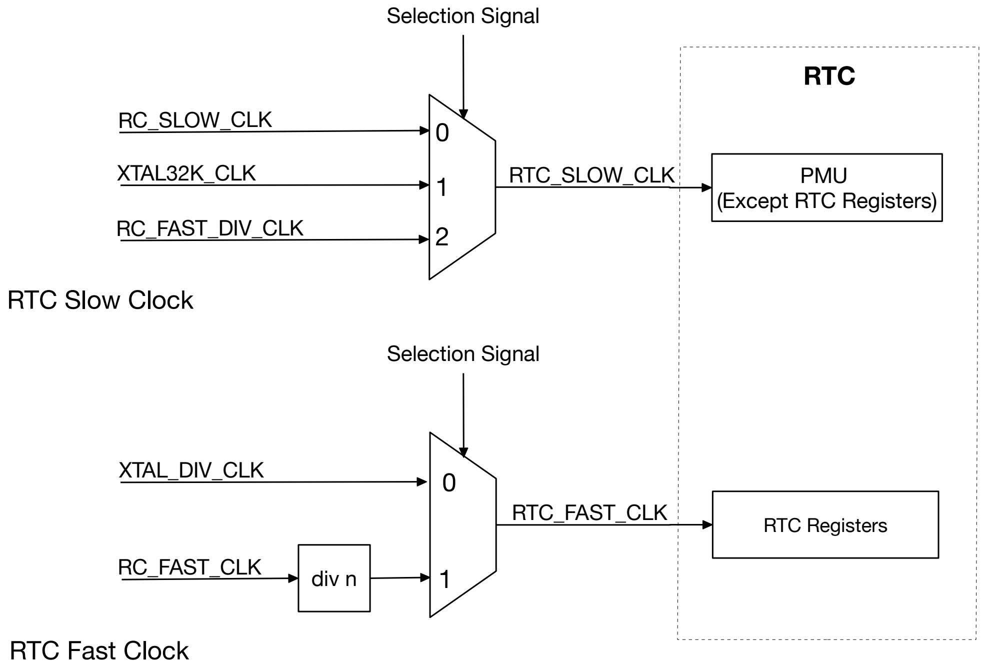

Figure 9-3. RTC Clocks

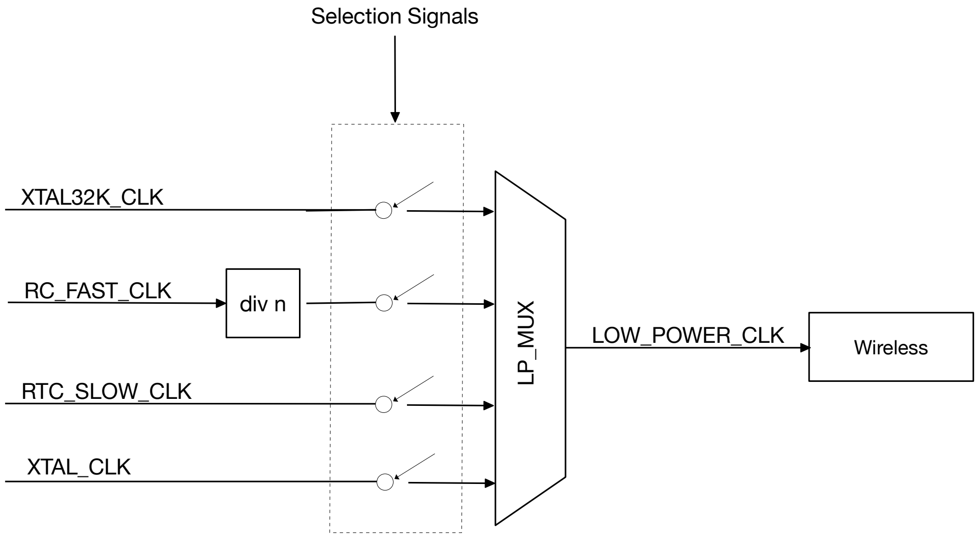

Figure 9-4. Wireless Clock

Table 9-1. Low-power Clocks

Clock Type	Clock Source	Selection Signal	Power Domain
RTC Fast Clock	RC_FAST_CLK divided by n (Default)	RTC_CNTL_FAST_CLK_RTC_SEL	RTC Registers
	XTAL_DIV_CLK		
RTC Slow Clock	XTAL32K_CLK	RTC_CNTL_ANA_CLK_RTC_SEL	Power Management System (except RTC registers)
	RC_FAST_DIV_CLK		
	RC_SLOW_CLK (default)		
Wireless Clock	XTAL32K_CLK	SYSTEM_LPCLK_SEL_XTAL32K	Wireless modules (Wi-Fi/BT) in the digital system domain working in low-power modes
	RC_FAST_CLK divided by n	SYSTEM_LPCLK_SEL_20M	
	RTC_SLOW_CLK	SYSTEM_LPCLK_RTC_SLOW	
	XTAL_CLK	SYSTEM_LPCLK_SEL_XTAL	

When working under low-power modes, ESP32-C3's XTAL_CLK and PLL are usually powered down to reduce power consumption. However, the low-power clock remains on so the chip can operate properly under low-power modes. For more detailed description about clocks, please refer to 6 *Reset and Clock*.

9.3.3 Timers

ESP32-C3's low-power management uses RTC timer. The readable 48-bit RTC timer is a real-time counter (using RTC slow clock) that can be configured to log the time when one of the following events happens. For details, see Table 9-2.

Table 9-2. The Triggering Conditions for the RTC Timer

Enabling Options	Descriptions
RTC_CNTL_TIMER_XTL_OFF	1. RTC main state machine powers down; 2. 40 MHz crystal powers up.
RTC_CNTL_TIMER_SYS_STALL	CPU enters or exits the stall state. This is to ensure the SYS_TIMER is continuous in time.
RTC_CNTL_TIMER_SYS_RST	Resetting digital system completes.
RTC_CNTL_TIME_UPDATE	Register RTC_CNTL_TIME_UPDATE is configured by CPU (i.e. users).

The RTC timer updates two groups of registers upon any new trigger. The first group logs the time of the current trigger, and the other logs the previous trigger. Detailed information about these two register groups is shown below:

- Register group 0: logs the status of RTC timer at the current trigger.
  - RTC_CNTL_TIME_HIGH0_REG
  - RTC_CNTL_TIME_LOW0_REG
- Register group 1: logs the status of RTC timer at the previous trigger.
  - RTC_CNTL_TIME_HIGH1_REG
  - RTC_CNTL_TIME_LOW1_REG

On a new trigger, information on previous trigger is moved from register group 0 to register group 1 (and the original trigger logged in register group 1 is overwritten), and this new trigger is logged in register group 0. Therefore, only the last two triggers can be logged at any time.

It should be noted that any reset / sleep other than power-up reset will not stop or reset the RTC timer.

Also, the RTC timer can be used as a wakeup source. For details, see Section 9.4.3.

9.3.4 Voltage Regulators

ESP32-C3 has two regulators to maintain a constant power supply voltage to different power domains:

- Digital system voltage regulator for digital power domains;
- Low-power voltage regulator for RTC power domains;

Note:
For more detailed description about power domains, please refer to Section 9.4.1.

9.3.4.1 Digital System Voltage Regulator

ESP32-C3's built-in digital system voltage regulator converts the external power supply (typically 3.3 V) to 1.1 V for digital power domains. This regulator is controlled by the xpd_dig_reg signal. For details, see description in 9-1. For the architecture of the ESP32-C3 digital system voltage regulator, see Figure 9-5.

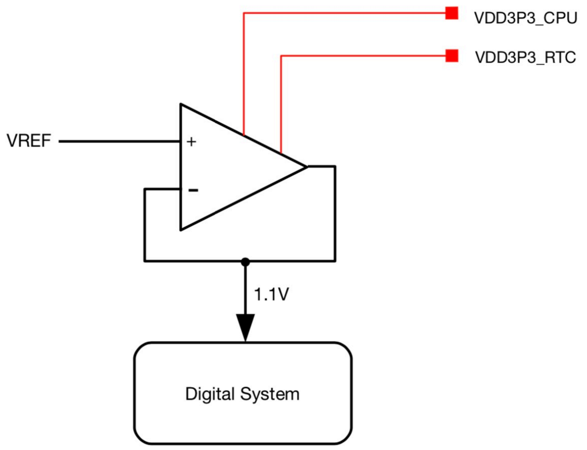

Figure 9-5. Digital System Regulator

9.3.4.2 Low-power Voltage Regulator

ESP32-C3's built-in low-power voltage regulator converts the external power supply (typically 3.3 V) to 1.1 V for RTC power domains. Note when the pin CHIP_PU is at a high level, the low-power voltage regulator cannot be turned off. Otherwise, the low power voltage regulator is off when chip enters Light-sleep and Deep-sleep modes. In this case, the RTC domain is powered by an ultra low-power internal power source.

For the architecture of the ESP32-C3 low-power voltage regulator, see Figure 9-6.

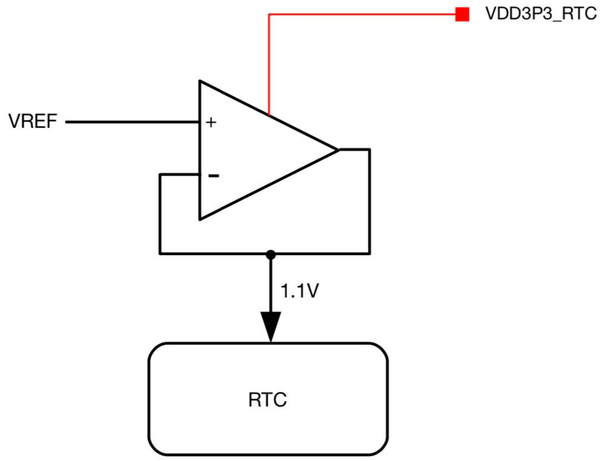

Figure 9-6. Low-power voltage regulator

9.3.4.3 Brownout Detector

The brownout detector checks the voltage of pins VDD3P3_RTC, VDD3P3_CPU, VDDA1, and VDDA2. If the voltage of these pins drops below the predefined threshold (2.7 V by default), the detector would trigger a signal to shut down some power-consuming blocks (such as LNA, PA, etc.) to allow extra time for the digital system to save and transfer important data.

RTC_CNTL_BROWN_OUT_DET indicates the output level of brown-out detector. This register is low level by default, and outputs high level when the voltage of the detected pin drops below the predefined threshold.

RTC_CNTL_BROWN_OUT_RST_SEL configures the reset type. For more information regarding chip reset and system reset, please refer to 6 *Reset and Clock*.

- 0: resets the chip
- 1: resets the system

The brownout detector has ultra-low power consumption and remains enabled whenever the chip is powered up. For the architecture of the ESP32-C3 brownout detector, see Figure 9-7.

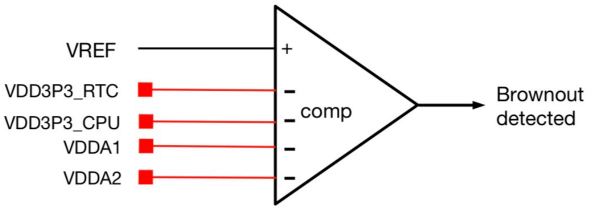

Figure 9-7. Brown-out detector

9.4 Power Modes Management

9.4.1 Power Domain

ESP32-C3 has 9 power domains in three power domain categories:

- RTC
  - Power management unit (PMU), including RTC timer, fast memory, Always-on registers
- Digital
  - PD peripherals, including SPI2, GDMA, SHA, RSA, AES, HMAC, DS, Secure Boot
  - Digital system
  - Wireless digital circuits
  - CPU
- Analog
  - RC_FAST_CLK
  - XTAL_CLK
  - PLL
  - RF circuits

9.4.2 Pre-defined Power Modes

As mentioned earlier, ESP32-C3 has four power modes, which are predefined configurations that power up different combinations of power domains. For details, please refer to Table 9-3.

Table 9-3. Predefined Power Modes

Power Mode	Power Domain								
	PMU	PD Peripherals	Digital System	Wireless Digital Circuits	CPU	FOSC_ CLK	XTAL_ CLK	PLL	RF Circuits
Active	ON	ON	ON	ON	ON	ON	ON	ON	ON
Modem-sleep	ON	ON	ON	ON[*]	ON	ON	ON	ON	OFF
Light-sleep	ON	ON	ON	OFF[*]	OFF[*]	OFF[*]	OFF	OFF	OFF
Deep-sleep	ON	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF

[*] Configurable

By default, ESP32-C3 first enters the Active mode after system resets, then enters different low-power modes (including Modem-sleep, Light-sleep, and Deep-sleep) to save power after the CPU stalls for a specific time (For example, when CPU is waiting to be wakened up by an external event). From modes Active to Deep-sleep, the number of available functionalities [1] and power consumption[2] decreases and wakeup latency increases. Also, the supported wakeup sources for different power modes are different[3]. Users can choose a power mode based on their requirements of functionality, power consumption, wakeup latency, and available wakeup sources.

Note:

1. For details, please refer to Table 9-3.

2. For details on power consumption, please refer to the Current Consumption Characteristics in *ESP32-C3 Datasheet*.
3. For details on the supported wakeup sources, please refer to Section 9.4.3.

9.4.3 Wakeup Source

The ESP32-C3 supports various wakeup sources, which could wake up the CPU in different sleep modes. The wakeup source is determined by RTC_CNTL_WAKEUP_ENA as shown in Table 9-4.

Table 9-4. Wakeup Source

WAKEUP_ENA	Wakeup Source[5]	Light-sleep	Deep-sleep
0x4	GPIO[1]	Y	Y
0x8	RTC Timer	Y	Y
0x20	Wi-Fi[2]	Y	-
0x40	UART0[3]	Y	-
0x80	UART1[3]	Y	-
0x400	Bluetooth	Y	-
0x1000	XTAL32K_CLK[4]	Y	Y

[1] In Deep-sleep mode, only the RTC GPIOs (not regular GPIOs) can work as a wakeup source.

[2] To wake up the chip with a Wi-Fi source, the chip switches between the Active, Modem-sleep, and Light-sleep modes. The CPU and RF modules are woken up at predetermined intervals to keep Wi-Fi connections active.

[3] A wakeup is triggered when the number of RX pulses received exceeds the setting in the threshold register UART_SLEEP_CONF_REG. For details, please refer to Chapter *26 UART Controller (UART)*.

[4] When the 32 kHz crystal is working as RTC slow clock, a wakeup is triggered upon any detection of any crystal stop by the 32 kHz watchdog timer.

[5] All wakeup sources can also be configured as the causes to reject sleep, except UART.

9.4.4 Reject Sleep

ESP32-C3 implements a hardware mechanism that equips the chip with the ability to reject to sleep, which prevents the chip from going to sleep unexpectedly when some peripherals are still working but not detected by the CPU, thus guaranteeing the proper functioning of the peripherals.

All the wakeup sources specified in Table 9-4 (except UART) can also be configured as the causes to reject sleep.

Users can configure the reject to sleep option via the following registers.

- Configure the RTC_CNTL_SLEEP_REJECT_ENA field to enable or disable the option to reject to sleep:
  - Set RTC_CNTL_LIGHT_SLP_REJECT_EN to enable reject-to-light-sleep.

  - Set RTC_CNTL_DEEP_SLP_REJECT_EN to enable reject-to-deep-sleep.

- Read RTC_CNTL_SLP_REJECT_CAUSE_REG to check the reason for rejecting to sleep.

9.5 Retention DMA

ESP32-C3 can power off the CPU in Light_sleep mode to further reduce the power consumption. To facilitate the CPU to wake up from light_sleep and resume execution from the previous breakpoint, ESP32-C3 introduced a retention module.

ESP32-C3's retention module stores CPU information to the Internal SRAM Block9 to Block12 before CPU enters into sleep, and restore such information from Internal SRAM to CPU after CPU wakes up from sleep, thus enabling the CPU to resume execution from the previous breakpoint.

ESP32-C3's Retention DMA:

- Retention DMA operates 128-bit wide data, and only supports address alignment of four words.
- Retention DMA's link list is specifically designed that it can be used to execute both write and read transactions. The configuration of Retention DMA is similar to that of GDMA:
  1. First allocate enough memory in SRAM before CPU enters sleep to store 432 words*: CPU registers (428 words) and configuration information (4 words).
  2. Then configure the link list according to the memory allocated in the first step. See details in Chapter 2 *GDMA Controller (GDMA)*.

> **Note:**
> * Note that if the memory allocated is smaller than 432 words, then chip can only enter the Light_sleep mode and cannot further power down CPU.

After configuration, users can enable the Retention function by configuring the RTC_CNTL_RETENTION_EN field in Register RTC_CNTL_RETENTION_CTRL_REG to:

- Use Retention DMA to store CPU information before the chip enters sleep
- Restore information from Retention DMA to CPU after CPU wakes up.

9.6 RTC Boot

The wakeup time from Deep-sleep is much longer, compared to the Light-sleep and Modem-sleep, because the ROMs and RAMs are both powered down in this case, and the CPU needs more time for SPI booting. However, it's worth noting that the RTC fast memory remains powered up in the Deep-sleep mode. Therefore, users can store code (so called "deep sleep wake stub" of up to 8 KB) in the RTC fast memory to avoid the above-mentioned SPI booting, thus speeding up the wakeup process. To use this function, see steps described below:

1. Set RTC_CNTL_STAT_VECTOR_SEL_PROCPU to 1.
2. Calculate CRC for the RTC fast memory, and save the result in RTC_CNTL_STORE7_REG[31:0].
3. Set RTC_CNTL_STORE6_REG[31:0] to the entry address of RTC fast memory.
4. Send the chip into sleep.

5. SPI boot and some of the initialization starts after the CPU is powered up. After that, calculate the CRC for the RTC fast memory again. If the result matches with register RTC_CNTL_STORE7_REG[31:0], the CPU jumps to the entry address.

The boot flow after ESP32-C3 wakeup is shown in Figure 9-8.

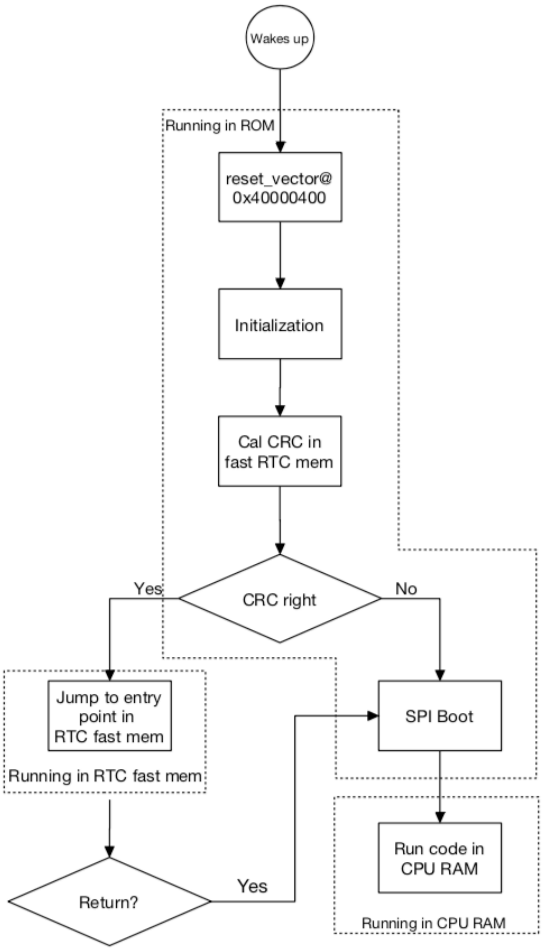

Figure 9-8. ESP32-C3 Boot Flow

9.7 Register Summary

The addresses in this section are relative to low-power management base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
RTC_CNTL_OPTIONS0_REG	Sets the power options of crystal and PLL clocks, and initiates reset by software	0x0000	Varies
RTC_CNTL_SLP_TIMER0_REG	RTC timer threshold register 0	0x0004	R/W
RTC_CNTL_SLP_TIMER1_REG	RTC timer threshold register 1	0x0008	varies
RTC_CNTL_TIME_UPDATE_REG	RTC timer update control register	0x000C	varies
RTC_CNTL_TIME_LOW0_REG	Stores the lower 32 bits of RTC timer 0	0x0010	RO
RTC_CNTL_TIME_HIGH0_REG	Stores the higher 16 bits of RTC timer 0	0x0014	RO
RTC_CNTL_STATE0_REG	Configures the sleep / reject / wakeup state	0x0018	varies
RTC_CNTL_TIMER1_REG	Configures CPU stall options	0x001C	R/W
RTC_CNTL_TIMER2_REG	Configures RTC slow clock and touch controller	0x0020	R/W
RTC_CNTL_TIMER5_REG	Configures the minimal sleep cycles	0x002C	R/W
RTC_CNTL_ANA_CONF_REG	Configures the power options for I2C and PLLA	0x0034	R/W
RTC_CNTL_RESET_STATE_REG	Indicates the CPU reset source	0x0038	varies
RTC_CNTL_WAKEUP_STATE_REG	Wakeup bitmap enabling register□	0x003C	R/W
RTC_CNTL_INT_ENA_RTC_REG	RTC interrupt enabling register	0x0040	R/W
RTC_CNTL_INT_RAW_RTC_REG	RTC interrupt raw register	0x0044	RO
RTC_CNTL_INT_ST_RTC_REG	RTC interrupt state register	0x0048	RO
RTC_CNTL_INT_CLR_RTC_REG	RTC interrupt clear register	0x004C	WO
RTC_CNTL_STORE0_REG	Reservation register 0	0x0050	R/W
RTC_CNTL_STORE1_REG	Reservation register 1	0x0054	R/W
RTC_CNTL_STORE2_REG	Reservation register 2	0x0058	R/W
RTC_CNTL_STORE3_REG	Reservation register 3	0x005C	R/W
RTC_CNTL_EXT_XTL_CONF_REG	32 kHz crystal oscillator configuration register	0x0060	varies
RTC_CNTL_EXT_WAKEUP_CONF_REG	GPIO wakeup configuration register	0x0064	R/W
RTC_CNTL_SLP_REJECT_CONF_REG	Configures sleep / reject options	0x0068	R/W
RTC_CNTL_CLK_CONF_REG	RTC timer configuration register	0x0070	R/W
RTC_CNTL_SLOW_CLK_CONF_REG	RTC slow clock configuration register	0x0074	R/W
RTC_CNTL_REG	RTC configuration register	0x0080	R/W
RTC_CNTL_PWC_REG	RTC power configuration register	0x0084	R/W
RTC_CNTL_DIG_PWC_REG	Digital system power configuration register	0x0088	R/W
RTC_CNTL_DIG_ISO_REG	Digital system isolation configuration register	0x008C	varies
RTC_CNTL_WDTCONFIG0_REG	RTC watchdog configuration register	0x0090	R/W
RTC_CNTL_WDTCONFIG1_REG	Configures the hold time of RTC watchdog at level 1	0x0094	R/W
RTC_CNTL_WDTCONFIG2_REG	Configures the hold time of RTC watchdog at level 2	0x0098	R/W

Name	Description	Address	Access
RTC_CNTL_WDTCONFIG3_REG	Configures the hold time of RTC watchdog at level 3	0x009C	R/W
RTC_CNTL_WDTCONFIG4_REG	Configures the hold time of RTC watchdog at level 4	0x00A0	R/W
RTC_CNTL_WDTFEED_REG	RTC watchdog SW feed configuration register	0x00A4	WO
RTC_CNTL_WDTWPROTECT_REG	RTC watchdog write protection configuration register	0x00A8	R/W
RTC_CNTL_SWD_CONF_REG	Super watchdog configuration register	0x00AC	varies
RTC_CNTL_SWD_WPROTECT_REG	Super watchdog write protection configuration register	0x00B0	R/W
RTC_CNTL_SW_CPU_STALL_REG	CPU stall configuration register	0x00B4	R/W
RTC_CNTL_STORE4_REG	Reservation register 4	0x00B8	R/W
RTC_CNTL_STORE5_REG	Reservation register 5	0x00BC	R/W
RTC_CNTL_STORE6_REG	Reservation register 6	0x00C0	R/W
RTC_CNTL_STORE7_REG	Reservation register 7	0x00C4	R/W
RTC_CNTL_LOW_POWER_ST_REG	RTC main state machine state register	0x00C8	RO
RTC_CNTL_PAD_HOLD_REG	Configures the hold options for RTC GPIOs	0x00D0	R/W
RTC_CNTL_DIG_PAD_HOLD_REG	Configures the hold options for digital GPIOs	0x00D4	R/W
RTC_CNTL_BROWN_OUT_REG	Brownout configuration register	0x00D8	varies
RTC_CNTL_TIME_LOW1_REG	Stores the lower 32 bits of RTC timer 1	0x00DC	RO
RTC_CNTL_TIME_HIGH1_REG	Stores the higher 16 bits of RTC timer 1	0x00E0	RO
RTC_CNTL_XTAL32K_CLK_FACTOR_REG	Configures the divider for the backup clock of 32 kHz crystal oscillator	0x00E4	R/W
RTC_CNTL_XTAL32K_CONF_REG	32 kHz crystal oscillator configuration register	0x00E8	R/W
RTC_CNTL_USB_CONF_REG	IO_MUX configuration register	0x00EC	R/W
RTC_CNTL_SLP_REJECT_CAUSE_REG	Stores the reject-to-sleep cause	0x00F0	RO
RTC_CNTL_OPTION1_REG	RTC option register	0x00F4	R/W
RTC_CNTL_SLP_WAKEUP_CAUSE_REG	Stores the sleep-to-wakeup cause	0x00F8	RO
RTC_CNTL_INT_ENA_RTC_W1TS_REG	RTC RTC interrupt enabling register (W1TS)	0x0100	WO
RTC_CNTL_INT_ENA_RTC_W1TC_REG	RTC RTC interrupt clear register (W1TC)	0x0104	WO
RTC_CNTL_RETENTION_CTRL_REG	Retention configuration register	0x0108	R/W
RTC_CNTL_GPIO_WAKEUP_REG	GPIO wakeup configuration register	0x0110	varies
RTC_CNTL_SENSOR_CTRL_REG	SAR ADC control register	0x011C	R/W

9.8 Registers

The addresses in this section are relative to low-power management base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 9.1. RTC_CNTL_OPTIONS0_REG (0x0000)

RTC_CNTL_SW_SYS_RST	RTC_CNTL_DG_WRAP_FORCE_NORST	RTC_CNTL_DG_WRAP_FORCE_RST	(reserved)	RTC_CNTL_XTL_FORCE_PU	RTC_CNTL_XTL_FORCE_PD	RTC_CNTL_BBPLL_FORCE_PU	RTC_CNTL_BBPLL_FORCE_PD	RTC_CNTL_BBPLL_I2C_FORCE_PU	RTC_CNTL_BBPLL_I2C_FORCE_PD	RTC_CNTL_BB_I2C_FORCE_PU	RTC_CNTL_BB_I2C_FORCE_PD	RTC_CNTL_SW_PROCPU_RST	(reserved)	RTC_CNTL_SW_STALL_PROCPU_C0	(reserved)	
31	30	29	28 14	13	12	11	10	9	8	7	6	5	4	3 2	1 0	
0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	0	0	0	0	0	0	0	0	0	0	0	Reset

RTC_CNTL_SW_STALL_PROCPU_C0 When RTC_CNTL_SW_STALL_PROCPU_C1 is configured to 0x21, setting this bit to 0x2 stalls the CPU by SW. (R/W)

RTC_CNTL_SW_PROCPU_RST Set this bit to reset the CPU by SW. (WO)

RTC_CNTL_BB_I2C_FORCE_PD Set this bit to FPD BB_I2C. (R/W)

RTC_CNTL_BB_I2C_FORCE_PU Set this bit to FPU BB_I2C. (R/W)

RTC_CNTL_BBPLL_I2C_FORCE_PD Set this bit to FPD BB_PLL_I2C. (R/W)

RTC_CNTL_BBPLL_I2C_FORCE_PU Set this bit to FPU BB_PLL_I2C. (R/W)

RTC_CNTL_BBPLL_FORCE_PD Set this bit to FPD BB_PLL. (R/W)

RTC_CNTL_BBPLL_FORCE_PU Set this bit to FPU BB_PLL. (R/W)

RTC_CNTL_XTL_FORCE_PD Set this bit to FPD the crystal oscillator. (R/W)

RTC_CNTL_XTL_FORCE_PU Set this bit to FPU the crystal oscillator. (R/W)

RTC_CNTL_DG_WRAP_FORCE_RST Set this bit to force reset the digital system in deep-sleep. (R/W)

RTC_CNTL_DG_WRAP_FORCE_NORST Set this bit to disable force reset to digital system in deep-sleep. (R/W)

RTC_CNTL_SW_SYS_RST Set this bit to reset the system via SW. (WO)

Register 9.2. RTC_CNTL_SLP_TIMER0_REG (0x0004)

RTC_CNTL_SLP_VAL_LO	
31 0	
0x000000	Reset

RTC_CNTL_SLP_VAL_LO Sets the lower 32 bits of the trigger threshold for the RTC timer. (R/W)

Register 9.3. RTC_CNTL_SLP_TIMER1_REG (0x0008)

(reserved)	RTC_CNTL_MAIN_TIMER_ALARM_EN	RTC_CNTL_SLP_VAL_HI	
31 17	16	15 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x00	Reset

RTC_CNTL_SLP_VAL_HI Sets the higher 16 bits of the trigger threshold for the RTC timer. (R/W)

RTC_CNTL_MAIN_TIMER_ALARM_EN Sets this bit to enable the timer alarm. (WO)

Register 9.4. RTC_CNTL_TIME_UPDATE_REG (0x000C)

RTC_CNTL_TIME_UPDATE	(reserved)	RTC_CNTL_TIMER_SYS_RST	RTC_CNTL_TIMER_XTL_OFF	RTC_CNTL_TIMER_SYS_STALL	(reserved)	
31	30	29	28	27	26 0	
0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

RTC_CNTL_TIMER_SYS_STALL Selects the triggering condition for the RTC timer. (R/W)

RTC_CNTL_TIMER_XTL_OFF Selects the triggering condition for the RTC timer. (R/W)

RTC_CNTL_TIMER_SYS_RST Selects the triggering condition for the RTC timer. (R/W)

RTC_CNTL_TIME_UPDATE Selects the triggering condition for the RTC timer. (WO)

Register 9.5. RTC_CNTL_TIME_LOW0_REG (0x0010)

RTC_CNTL_TIMER_VALUE0_LOW	
31 0	
0x000000	Reset

RTC_CNTL_TIMER_VALUE0_LOW Stores the lower 32 bits of RTC timer 0. (RO)

Register 9.6. RTC_CNTL_TIME_HIGH0_REG (0x0014)

(reserved)	RTC_CNTL_TIMER_VALUE0_HIGH	
31 16	15 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x00	Reset

RTC_CNTL_TIMER_VALUE0_HIGH Stores the higher 16 bits of RTC timer 0. (RO)

Register 9.7. RTC_CNTL_STATE0_REG (0x0018)

RTC_CNTL_SLEEP_EN	RTC_CNTL_SLP_REJECT	RTC_CNTL_SLP_WAKEUP	(reserved)	RTC_CNTL_APB2RTC_BRIDGE_SEL	(reserved)	RTC_CNTL_SLP_REJECT_CAUSE_CLR	RTC_CNTL_SW_CPU_INT	
31	30	29	27 23	22	21 2	1	0	
0	0	0	0 0 0 0 0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

RTC_CNTL_SW_CPU_INT Sends a SW RTC interrupt to CPU. (WO)

RTC_CNTL_SLP_REJECT_CAUSE_CLR Clears the RTC reject-to-sleep cause. (WO)

RTC_CNTL_APB2RTC_BRIDGE_SEL 1: APB to RTC using bridge (R/W)

RTC_CNTL_SLP_WAKEUP Sleep wakeup bit. (R/W)

RTC_CNTL_SLP_REJECT Sleep reject bit. (R/W)

RTC_CNTL_SLEEP_EN Sends the chip to sleep. (R/W)

Register 9.8. RTC_CNTL_TIMER1_REG (0x001C)

RTC_CNTL_PLL_BUF_WAIT	RTC_CNTL_XTL_BUF_WAIT	RTC_CNTL_FOSC_WAIT	RTC_CNTL_CPU_STALL_WAIT	RTC_CNTL_CPU_STALL_EN	
31 24	23 14	13 6	5 1	0	
40	80	0x10	1	1	Reset

RTC_CNTL_CPU_STALL_EN Enables the CPU stalling. (R/W)

RTC_CNTL_CPU_STALL_WAIT Sets the CPU stall waiting cycles (using the RTC fast clock). (R/W)

RTC_CNTL_FOSC_WAIT Sets the FOSC clock waiting cycles (using the RTC slow clock). (R/W)

RTC_CNTL_XTL_BUF_WAIT Sets the XTAL waiting cycles (using the RTC slow clock). (R/W)

RTC_CNTL_PLL_BUF_WAIT Sets the PLL waiting cycles (using the RTC slow clock). (R/W)

Register 9.9. RTC_CNTL_TIMER2_REG (0x0020)

RTC_CNTL_MIN_TIME_FOSC_OFF	(reserved)	
31 24	23 0	
0x1	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

RTC_CNTL_MIN_TIME_FOSC_OFF Sets the minimal cycles for FOSC clock (using the RTC slow clock) when powered down. (R/W)

Register 9.10. RTC_CNTL_TIMER5_REG (0x002C)

(reserved)	RTC_CNTL_MIN_SLP_VAL	(reserved)	
31 16	15 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x80	0 0 0 0 0 0 0 0	Reset

RTC_CNTL_MIN_SLP_VAL Sets the minimal sleep cycles (using the RTC slow clock). (R/W)

Register 9.11. RTC_CNTL_ANA_CONF_REG (0x0034)

Bit	Field	Reset
31	RTC_CNTL_PLL_I2C_PU	0
30	RTC_CNTL_CKGEN_I2C_PU	0
29	(reserved)	0
28	RTC_CNTL_RFRX_PBUS_PU	0
27	RTC_CNTL_TXRF_I2C_PU	0
26	(reserved)	0
25	(reserved)	0
24	(reserved)	0
23	(reserved)	1
22	RTC_CNTL_SAR_I2C_PU	1
21	(reserved)	0
20	RTC_CNTL_GLITCH_RST_EN	0
19	RTC_CNTL_RESET_POR_FORCE_PU	0
18	RTC_CNTL_RESET_POR_FORCE_PD	1
17–0	(reserved)	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

RTC_CNTL_RESET_POR_FORCE_PD Set this bit to force not bypass I2C power-on reset. (R/W)

RTC_CNTL_RESET_POR_FORCE_PU Set this bit to force bypass I2C power-on reset. (R/W)

RTC_CNTL_GLITCH_RST_EN Set this bit to enable reset when the system detects a glitch. (R/W)

RTC_CNTL_SAR_I2C_PU Set this bit to FPU the SAR_I2C. (R/W)

RTC_CNTL_TXRF_I2C_PU Set this bit to PU TXRF_I2C. (R/W)

RTC_CNTL_RFRX_PBUS_PU Set this bit to PU RFRX_PBUS. (R/W)

RTC_CNTL_CKGEN_I2C_PU Set this bit to PU CKGEN_I2C. (R/W)

RTC_CNTL_PLL_I2C_PU Set this bit to PU PLL I2C. (R/W)

Register 9.12. RTC_CNTL_RESET_STATE_REG (0x0038)

(reserved)	RTC_CNTL_DRESET_MASK_PROCPU	(reserved)	(reserved)	RTC_CNTL_JTAG_RESET_FLAG_CLR_PROCPU	(reserved)	RTC_CNTL_JTAG_RESET_FLAG_PROCPU	RTC_CNTL_OCD_HALT_ON_RESET_PROCPU	(reserved)	(reserved)	RTC_CNTL_ALL_RESET_FLAG_CLR_PROCPU	(reserved)	RTC_CNTL_ALL_RESET_FLAG_PROCPU	RTC_CNTL_STAT_VECTOR_SEL_PROCPU	(reserved)	(reserved)	RTC_CNTL_RESET_CAUSE_PROCPU	
31 26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11 6	5 0	
0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	Reset

RTC_CNTL_RESET_CAUSE_PROCPU Stores the CPU reset cause. (RO)

RTC_CNTL_STAT_VECTOR_SEL_PROCPU Selects the CPU static vector. (R/W)

RTC_CNTL_ALL_RESET_FLAG_PROCPU Indicates the CPU reset flag. (RO)

RTC_CNTL_ALL_RESET_FLAG_CLR_PROCPU Clears the CPU reset flag. (WO)

RTC_CNTL_OCD_HALT_ON_RESET_PROCPU Set this bit to send CPU into halt state upon CPU reset. (R/W)

RTC_CNTL_JTAG_RESET_FLAG_PROCPU Indicates the JTAG reset flag. (RO)

RTC_CNTL_JTAG_RESET_FLAG_CLR_PROCPU Sets the JTAG reset flag. (WO)

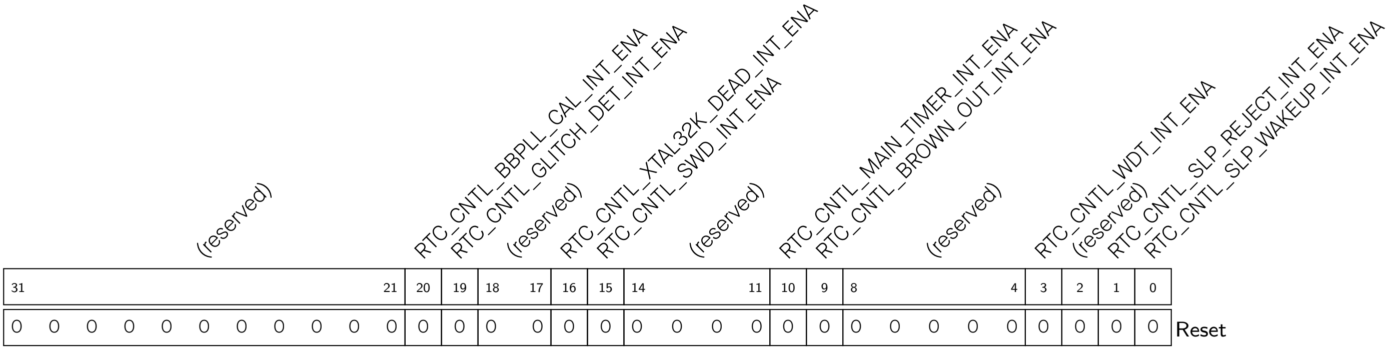
RTC_CNTL_DRESET_MASK_PROCPU Set this bit to bybass D-reset. (R/W)

Register 9.13. RTC_CNTL_WAKEUP_STATE_REG (0x003C)

RTC_CNTL_WAKEUP_ENA	(reserved)	
31 15	14 0	
12	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

RTC_CNTL_WAKEUP_ENA Selects the wakeup source. For details, please refer to Table 9-4. (R/W)

Register 9.14. RTC_CNTL_INT_ENA_RTC_REG (0x0040)



RTC_CNTL_SLP_WAKEUP_INT_ENA Enables interrupts when chip wakes up from sleep. (R/W)

RTC_CNTL_SLP_REJECT_INT_ENA Enables interrupts when chip rejects to go to sleep. (R/W)

RTC_CNTL_WDT_INT_ENA Enables the RTC watchdog interrupt. (R/W)

RTC_CNTL_BROWN_OUT_INT_ENA Enables the brown-out interrupt. (R/W)

RTC_CNTL_MAIN_TIMER_INT_ENA Enables the RTC timer interrupt. (R/W)

RTC_CNTL_SWD_INT_ENA Enables the super watchdog interrupt. (R/W)

RTC_CNTL_XTAL32K_DEAD_INT_ENA Enables interrupts when the XTAL32K is dead. (R/W)

RTC_CNTL_GLITCH_DET_INT_ENA Enables interrupts when a glitch is detected. (R/W)

RTC_CNTL_BBPLL_CAL_INT_ENA Enables interrupts upon the ending of a bb_pll call. (R/W)

Register 9.15. RTC_CNTL_INT_RAW_RTC_REG (0x0044)

(reserved)	RTC_CNTL_BBPLL_CAL_INT_RAW	RTC_CNTL_GLITCH_DET_INT_RAW	(reserved)	RTC_CNTL_XTAL32K_DEAD_INT_RAW	RTC_CNTL_SWD_INT_RAW	(reserved)	RTC_CNTL_MAIN_TIMER_INT_RAW	RTC_CNTL_BROWN_OUT_INT_RAW	(reserved)	RTC_CNTL_WDT_INT_RAW	(reserved)	RTC_CNTL_SLP_REJECT_INT_RAW	RTC_CNTL_SLP_WAKEUP_INT_RAW	
31 21	20	19	18 17	16	15	14 11	10	9	8 4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0	0	0	0 0	0	0	0 0 0 0	0	0	0 0 0 0 0	0	0	0	0	Reset

RTC_CNTL_SLP_WAKEUP_INT_RAW Stores the raw interrupt triggered when the chip wakes up from sleep. (RO)

RTC_CNTL_SLP_REJECT_INT_RAW Stores the raw interrupt triggered when the chip rejects to go to sleep. (RO)

RTC_CNTL_WDT_INT_RAW Stores the raw watchdog interrupt. (RO)

RTC_CNTL_BROWN_OUT_INT_RAW Stores the raw brownout interrupt. (RO)

RTC_CNTL_MAIN_TIMER_INT_RAW Stores the raw RTC main timer interrupt. (RO)

RTC_CNTL_SWD_INT_RAW Stores the raw super watchdog interrupt. (RO)

RTC_CNTL_XTAL32K_DEAD_INT_RAW Stores the raw interrupt triggered when the XTAL32K is dead. (RO)

RTC_CNTL_GLITCH_DET_INT_RAW Stores the raw interrupt triggered when a glitch is detected. (RO)

RTC_CNTL_BBPLL_CAL_INT_RAW Stores the raw interrupt upon the ending of a bb_pll call. (RO)

Register 9.16. RTC_CNTL_INT_ST_RTC_REG (0x0048)

(reserved)	RTC_CNTL_BBPLL_CAL_INT_ST	RTC_CNTL_GLITCH_DET_INT_ST	(reserved)	RTC_CNTL_XTAL32K_DEAD_INT_ST	RTC_CNTL_SWD_INT_ST	(reserved)	RTC_CNTL_MAIN_TIMER_INT_ST	RTC_CNTL_BROWN_OUT_INT_ST	(reserved)	RTC_CNTL_WDT_INT_ST	(reserved)	RTC_CNTL_SLP_REJECT_INT_ST	RTC_CNTL_SLP_WAKEUP_INT_ST	
31 21	20	19	18 17	16	15	14 11	10	9	8 4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0	0	0	0 0	0	0	0 0 0 0	0	0	0 0 0 0 0	0	0	0	0	Reset

RTC_CNTL_SLP_WAKEUP_INT_ST Stores the status of the interrupt triggered when the chip wakes up from sleep. (RO)

RTC_CNTL_SLP_REJECT_INT_ST Stores the status of the interrupt triggered when the chip rejects to go to sleep. (RO)

RTC_CNTL_WDT_INT_ST Stores the status of the RTC watchdog interrupt. (RO)

RTC_CNTL_BROWN_OUT_INT_ST Stores the status of the brownout interrupt. (RO)

RTC_CNTL_MAIN_TIMER_INT_ST Stores the status of the RTC main timer interrupt. (RO)

RTC_CNTL_SWD_INT_ST Stores the status of the super watchdog interrupt. (RO)

RTC_CNTL_XTAL32K_DEAD_INT_ST Stores the status of the interrupt triggered when the XTAL32K is dead. (RO)

RTC_CNTL_GLITCH_DET_INT_ST Stores the status of the interrupt triggered when a glitch is detected. (RO)

RTC_CNTL_BBPLL_CAL_INT_ST Stores the status of the interrupt triggered upon the ending of a bbpll call. (RO)

Register 9.17. RTC_CNTL_INT_CLR_RTC_REG (0x004C)

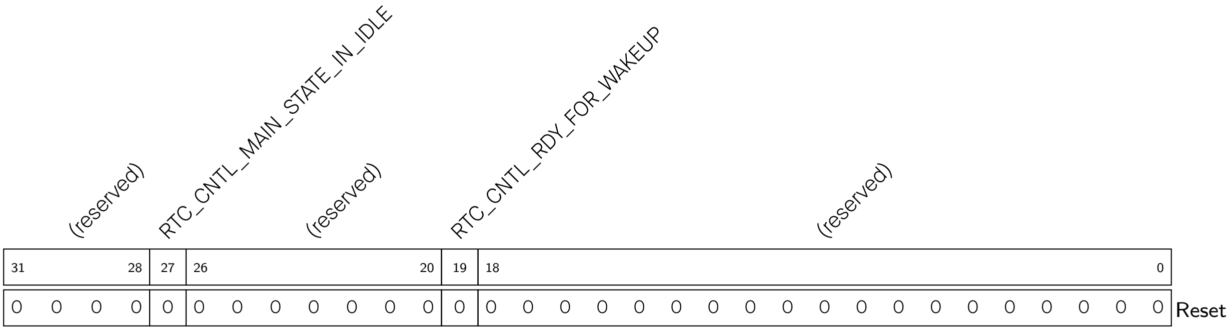
Register 9.45. RTC_CNTL_LOW_POWER_ST_REG (0x00C8)



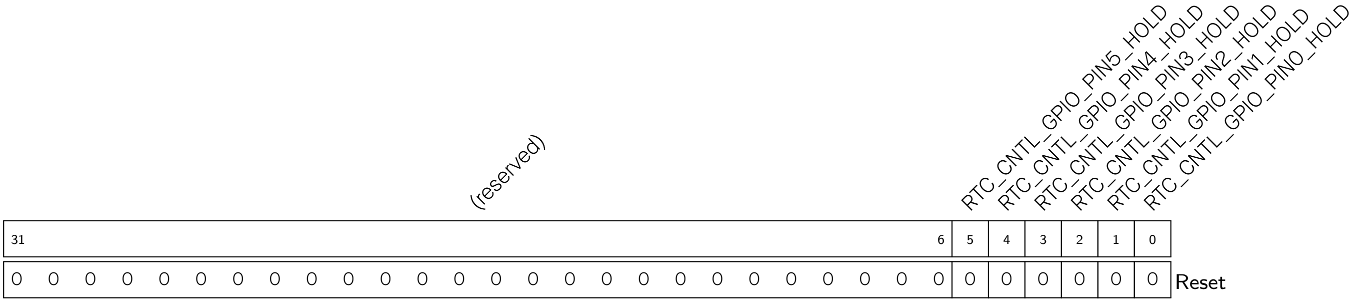
RTC_CNTL_RDY_FOR_WAKEUP Indicates the RTC is ready to be triggered by any wakeup source. (RO)

RTC_CNTL_MAIN_STATE_IN_IDLE Indicates the RTC state.

- 0: the chip can be either
  - in sleep modes.
  - entering sleep modes. In this case, wait until RTC_CNTL_RDY_FOR_WAKEUP bit is set, then you can wake up the chip.
  - exiting sleep mode. In this case, RTC_CNTL_MAIN_STATE_IN_IDLE will eventually become 1.
- 1: the chip is not in sleep modes (i.e. running normally).

(RO)

Register 9.46. RTC_CNTL_PAD_HOLD_REG (0x00D0)



RTC_CNTL_GPIO_PIN0_HOLD Sets the GPIO 0 to the holding state. (R/W)

RTC_CNTL_GPIO_PIN1_HOLD Sets the GPIO 1 to the holding state. (R/W)

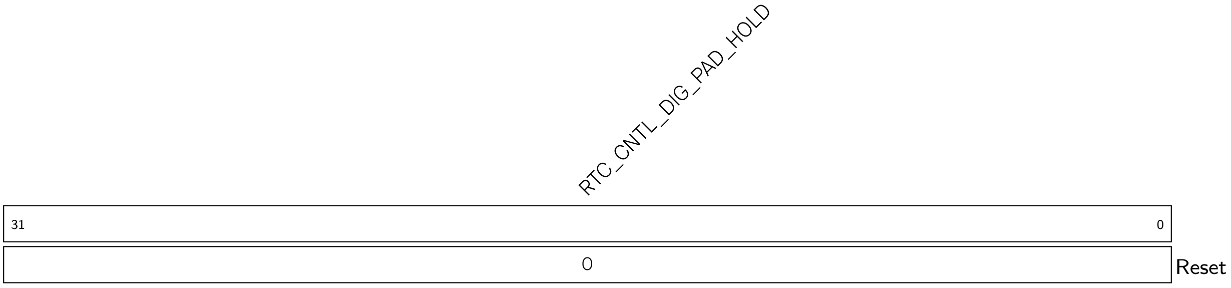
RTC_CNTL_GPIO_PIN2_HOLD Sets the GPIO 2 to the holding state. (R/W)

RTC_CNTL_GPIO_PIN3_HOLD Sets the GPIO 3 to the holding state. (R/W)

RTC_CNTL_GPIO_PIN4_HOLD Sets the GPIO 4 to the holding state. (R/W)

RTC_CNTL_GPIO_PIN5_HOLD Sets the GPIO 5 to the holding state. (R/W)

Register 9.47. RTC_CNTL_DIG_PAD_HOLD_REG (0x00D4)



RTC_CNTL_DIG_PAD_HOLD Set GPIO 6 to GPIO 21 to the holding state. (See bitmap to locate any GPIO). (R/W)

Register 9.48. RTC_CNTL_BROWN_OUT_REG (0x00D8)

RTC_CNTL_BROWN_OUT_DET	RTC_CNTL_BROWN_OUT_ENA	RTC_CNTL_BROWN_OUT_CNT_CLR	RTC_CNTL_BROWN_OUT_ANA_RST_EN	RTC_CNTL_BROWN_OUT_RST_SEL	RTC_CNTL_BROWN_OUT_RST_ENA	RTC_CNTL_BROWN_OUT_RST_WAIT	RTC_CNTL_BROWN_OUT_PD_RF_ENA	RTC_CNTL_BROWN_OUT_CLOSE_FLASH_ENA	RTC_CNTL_BROWN_OUT_INT_WAIT	(reserved)	
31	30	29	28	27	26	25 16	15	14	13 4	3 0	
0	1	0	0	0	0	0x3ff	0	0	0x1	0 0 0 0	Reset

RTC_CNTL_BROWN_OUT_INT_WAIT Configures the waiting cycles before sending an interrupt. (R/W)

RTC_CNTL_BROWN_OUT_CLOSE_FLASH_ENA Set this bit to enable PD the flash when a brown-out happens. (R/W)

RTC_CNTL_BROWN_OUT_PD_RF_ENA Set this bit to enable PD the RF circuits when a brown-out happens. (R/W)

RTC_CNTL_BROWN_OUT_RST_WAIT Configures the waiting cycles before the reset after a brown-out. (R/W)

RTC_CNTL_BROWN_OUT_RST_ENA Enables to reset brown-out. (R/W)

RTC_CNTL_BROWN_OUT_RST_SEL Selects the reset type when a brown-out happens. 1: chip reset, 0: system reset. (R/W)

RTC_CNTL_BROWN_OUT_ANA_RST_EN Enables to reset brown-out. (R/W)

RTC_CNTL_BROWN_OUT_CNT_CLR Clears the brown-out counter. (WO)

RTC_CNTL_BROWN_OUT_ENA Set this bit to enable brown-out detection. (R/W)

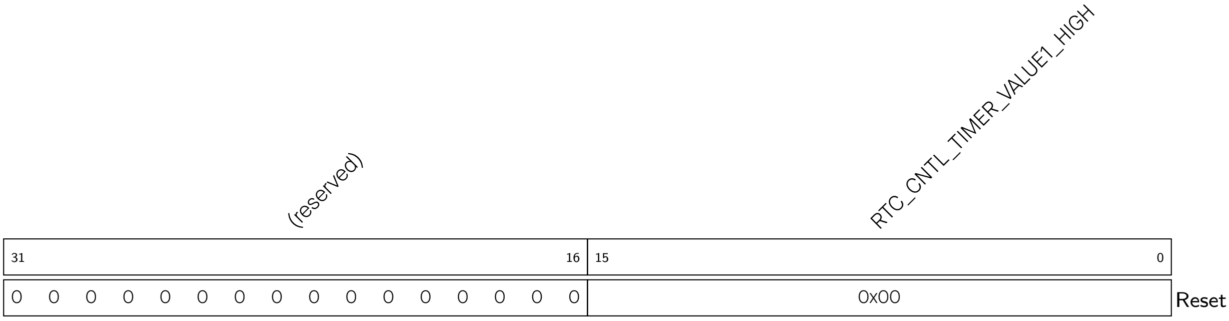
RTC_CNTL_BROWN_OUT_DET Indicates the status of the brown-out signal. (RO)

Register 9.49. RTC_CNTL_TIME_LOW1_REG (0x00DC)

RTC_CNTL_TIMER_VALUE1_LOW	
31 0	
0x000000	Reset

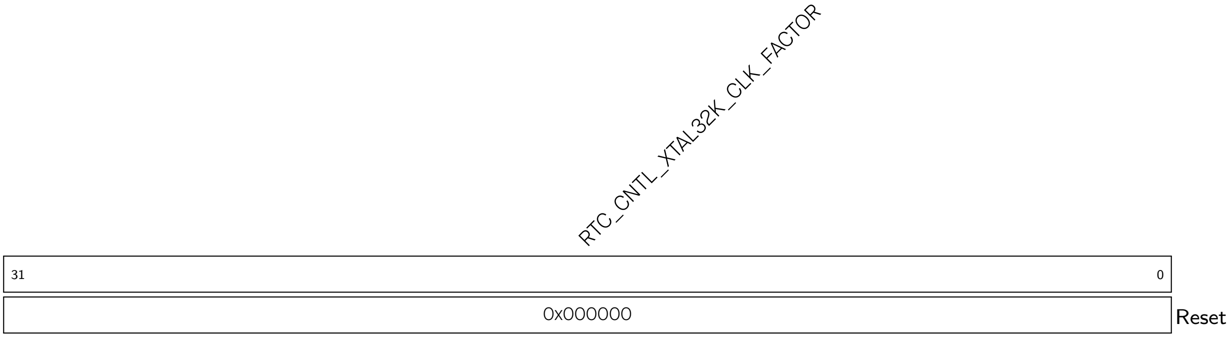
RTC_CNTL_TIMER_VALUE1_LOW Stores the lower 32 bits of RTC timer 1. (RO)

Register 9.50. RTC_CNTL_TIME_HIGH1_REG (0x00E0)



RTC_CNTL_TIMER_VALUE1_HIGH Stores the higher 16 bits of RTC timer. (RO)

Register 9.51. RTC_CNTL_XTAL32K_CLK_FACTOR_REG (0x00E4)



RTC_CNTL_XTAL32K_CLK_FACTOR Configures the divider factor for the XTAL32K oscillator. (R/W)

Register 9.52. RTC_CNTL_XTAL32K_CONF_REG (0x00E8)

RTC_CNTL_XTAL32K_STABLE_THRES	RTC_CNTL_XTAL32K_WDT_TIMEOUT	RTC_CNTL_XTAL32K_RESTART_WAIT	RTC_CNTL_XTAL32K_RETURN_WAIT	
31 28	27 20	19 4	3 0	
0x0	0xff	0x00	0x0	Reset

RTC_CNTL_XTAL32K_RETURN_WAIT Defines the waiting cycles before returning to the normal XTAL32K oscillator. (R/W)

RTC_CNTL_XTAL32K_RESTART_WAIT Defines the waiting cycles before restarting the XTAL32K oscillator. (R/W)

RTC_CNTL_XTAL32K_WDT_TIMEOUT Defines the waiting period for clock detection. If no clock is detected after this period, the XTAL32K oscillator can be regarded as dead. (R/W)

RTC_CNTL_XTAL32K_STABLE_THRES Defines the allowed restarting period, within which the XTAL32K oscillator can be regarded as stable. (R/W)

Register 9.53. RTC_CNTL_USB_CONF_REG (0x00EC)

(reserved)	RTC_CNTL_IO_MUX_RESET_DISABLE	(reserved)	
31 19	18	17 0	
0 0 0 0 0 0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

RTC_CNTL_IO_MUX_RESET_DISABLE Set this bit to disable io_mux reset. (R/W)

Register 9.54. RTC_CNTL_SLP_REJECT_CAUSE_REG (0x00F0)

(reserved)	RTC_CNTL_REJECT_CAUSE	
31 18	17 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RTC_CNTL_REJECT_CAUSE Stores the reject-to-sleep cause. (RO)

Register 9.55. RTC_CNTL_OPTION1_REG (0x00F4)

(reserved)	RTC_CNTL_FORCE_DOWNLOAD_BOOT	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RTC_CNTL_FORCE_DOWNLOAD_BOOT Set this bit to force the chip to boot from the download mode. (R/W)

Register 9.56. RTC_CNTL_SLP_WAKEUP_CAUSE_REG (0x00F8)

(reserved)	RTC_CNTL_WAKEUP_CAUSE	
31 17	16 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RTC_CNTL_WAKEUP_CAUSE Stores the wakeup cause. (RO)

Register 9.57. RTC_CNTL_INT_ENA_RTC_W1TS_REG (0x0100)

(reserved)	RTC_CNTL_BBPLL_CAL_INT_ENA_W1TS	RTC_CNTL_GLITCH_DET_INT_ENA_W1TS	(reserved)	RTC_CNTL_XTAL32K_DEAD_INT_ENA_W1TS	RTC_CNTL_SWD_INT_ENA_W1TS	(reserved)	RTC_CNTL_MAIN_TIMER_INT_ENA_W1TS	RTC_CNTL_BROWN_OUT_INT_ENA_W1TS	(reserved)	RTC_CNTL_WDT_INT_ENA_W1TS	(reserved)	RTC_CNTL_SLP_REJECT_INT_ENA_W1TS	RTC_CNTL_SLP_WAKEUP_INT_ENA_W1T	
31 21	20	19	18 17	16	15	14 11	10	9	8 4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0	0	0	0 0	0	0	0 0 0 0	0	0	0 0 0 0 0	0	0	0	0	Reset

RTC_CNTL_SLP_WAKEUP_INT_ENA_W1TS Enables interrupts when the chip wakes up from sleep by writing 1 to set (W1TS). (WO)

RTC_CNTL_SLP_REJECT_INT_ENA_W1TS Enables interrupts when the chip rejects to go to sleep by writing 1 to set (W1TS). (WO)

RTC_CNTL_WDT_INT_ENA_W1TS Enables the RTC watchdog interrupt by writing 1 to set (W1TS). (WO)

RTC_CNTL_BROWN_OUT_INT_ENA_W1TS Enables the brownout interrupt by writing 1 to set. (WO)

RTC_CNTL_MAIN_TIMER_INT_ENA_W1TS Enables the RTC main timer interrupt by writing 1 to set (W1TS). (WO)

RTC_CNTL_SWD_INT_ENA_W1TS Enables the super watchdog interrupt by writing 1 to set (W1TS). (WO)

RTC_CNTL_XTAL32K_DEAD_INT_ENA_W1TS Enables interrupts when the XTAL32K is dead by writing 1 to set (W1TS). (WO)

RTC_CNTL_GLITCH_DET_INT_ENA_W1TS Enables interrupts when a glitch is detected by writing 1 to set (W1TS). (WO)

RTC_CNTL_BBPLL_CAL_INT_ENA_W1TS Enables interrupts upon the ending of a bb_pll call by writing 1 to set (W1TS). (WO)

Register 9.58. RTC_CNTL_INT_ENA_RTC_W1TC_REG (0x0104)

(reserved)	RTC_CNTL_BBPLL_CAL_INT_ENA_W1TC	RTC_CNTL_GLITCH_DET_INT_ENA_W1TC	(reserved)	RTC_CNTL_XTAL32K_DEAD_INT_ENA_W1TC	RTC_CNTL_SWD_INT_ENA_W1TC	(reserved)	RTC_CNTL_MAIN_TIMER_INT_ENA_W1TC	RTC_CNTL_BROWN_OUT_INT_ENA_W1TC	(reserved)	RTC_CNTL_WDT_INT_ENA_W1TC	(reserved)	RTC_CNTL_SLP_REJECT_INT_ENA_W1TC	RTC_CNTL_SLP_WAKEUP_INT_ENA_W1T

0 0 0 0 0 0 0 0 0 0 0	0	0	0 0	0	0	0 0 0 0	0	0	0 0 0 0 0	0	0	0	0	Reset

RTC_CNTL_SLP_WAKEUP_INT_ENA_W1TC Clear the interrupt enable bit when the chip wakes up from sleep by writing 1 to clear. (W1TC). (WO)

RTC_CNTL_SLP_REJECT_INT_ENA_W1TC Clear the interrupt enable bit when the chip rejects to go to sleep by writing 1 to clear (W1TC). (WO)

RTC_CNTL_WDT_INT_ENA_W1TC Clear the RTC watchdog interrupt enable bit by writing 1 to clear (W1TC). (WO)

RTC_CNTL_BROWN_OUT_INT_ENA_W1TC Clear the brownout interrupt enable bit by writing 1 to clear (W1TC). (WO)

RTC_CNTL_MAIN_TIMER_INT_ENA_W1TC Clear the RTC timer interrupt enable bit by writing 1 to clear. (W1TC). (WO)

RTC_CNTL_SWD_INT_ENA_W1TC Clear the super watchdog interrupt enable bit by writing 1 to clear (W1TC). (WO)

RTC_CNTL_XTAL32K_DEAD_INT_ENA_W1TC Clear the interrupt enable bit when the XTAL32K is dead by writing 1 to clear (W1TC). (WO)

RTC_CNTL_GLITCH_DET_INT_ENA_W1TC Clear the interrupt enable bit when a glitch is detected by writing 1 to clear (W1TC). (WO)

RTC_CNTL_BBPLL_CAL_INT_ENA_W1TC Clear the interrupt enable bit upon the ending of a bb_pll call by writing 1 to clear (W1TC).(WO)

Register 9.59. RTC_CNTL_RETENTION_CTRL_REG (0x0108)

(reserved)	RTC_CNTL_RETENTION_EN	(reserved)	(reserved)	RTC_CNTL_RETENTION_CLK_SEL	(reserved)	
31 27	26	25 22	21 19	18	17 0	
20	0	3	2	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

RTC_CNTL_RETENTION_CLK_SEL Selects the retention clock. 0: RC_FAST_CLK; 1: XTAL_CLK. (R/W)

RTC_CNTL_RETENTION_EN Set to enable the CPU retention in light sleep. (R/W)

Register 9.60. RTC_CNTL_GPIO_WAKEUP_REG (0x0110)

RTC_CNTL_GPIO_PIN0_WAKEUP_ENABLE	RTC_CNTL_GPIO_PIN1_WAKEUP_ENABLE	RTC_CNTL_GPIO_PIN2_WAKEUP_ENABLE	RTC_CNTL_GPIO_PIN3_WAKEUP_ENABLE	RTC_CNTL_GPIO_PIN4_WAKEUP_ENABLE	RTC_CNTL_GPIO_PIN5_WAKEUP_ENABLE	RTC_CNTL_GPIO_PIN0_INT_TYPE	RTC_CNTL_GPIO_PIN1_INT_TYPE	RTC_CNTL_GPIO_PIN2_INT_TYPE	RTC_CNTL_GPIO_PIN3_INT_TYPE	RTC_CNTL_GPIO_PIN4_INT_TYPE	RTC_CNTL_GPIO_PIN5_INT_TYPE	RTC_CNTL_GPIO_PIN_CLK_GATE	RTC_CNTL_GPIO_WAKEUP_STATUS_CLR	RTC_CNTL_GPIO_WAKEUP_STATUS	
31	30	29	28	27	26	25 23	22 20	19 17	16 14	13 11	10 8	7	6	5 0	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

RTC_CNTL_GPIO_WAKEUP_STATUS Indicates the RTC GPIO that woke up the chip, with Bit0 to Bit5 representing RTC GPIO 0 to RTC GPIO 5, respectively. For example, 010000 indicates it is the RTC GPIO 4 that woke up the chip. (RO)

RTC_CNTL_GPIO_WAKEUP_STATUS_CLR Clears the RTC GPIO wakeup flag. (R/W)

RTC_CNTL_GPIO_PIN_CLK_GATE Enables the RTC GPIO clock gate. (R/W)

RTC_CNTL_GPIO_PIN5_INT_TYPE Configures RTC GPIO 5 wakeup type.
0: disable wakeup by RTC GPIO
1: wake up the chip upon the rising edge
2: wake up the chip upon the failing edge
3: wake up the chip upon the rising edge or the failing edge
4: wake up the chip upon low level
5: wake up the chip upon high level
(R/W)

RTC_CNTL_GPIO_PIN4_INT_TYPE Configures RTC GPIO 4 wakeup type.
0: disable wakeup by RTC GPIO
1: wake up the chip upon the rising edge
2: wake up the chip upon the failing edge
3: wake up the chip upon the rising edge or the failing edge
4: wake up the chip upon low level
5: wake up the chip upon high level
(R/W)

RTC_CNTL_GPIO_PIN3_INT_TYPE Configures RTC GPIO 3 wakeup type.
0: disable wakeup by RTC GPIO
1: wake up the chip upon the rising edge
2: wake up the chip upon the failing edge
3: wake up the chip upon the rising edge or the failing edge
4: wake up the chip upon low level
5: wake up the chip upon high level
(R/W)

Continued on the next page...

Register 9.60. RTC_CNTL_GPIO_WAKEUP_REG (0x0110)

Continued from the previous page...

RTC_CNTL_GPIO_PIN2_INT_TYPE Configures RTC GPIO 2 wakeup type.
0: disable wakeup by RTC GPIO
1: wake up the chip upon the rising edge
2: wake up the chip upon the failing edge
3: wake up the chip upon the rising edge or the failing edge
4: wake up the chip upon low level
5: wake up the chip upon high level
(R/W)

RTC_CNTL_GPIO_PIN1_INT_TYPE Configures RTC GPIO 1 wakeup type.
0: disable wakeup by RTC GPIO
1: wake up the chip upon the rising edge
2: wake up the chip upon the failing edge
3: wake up the chip upon the rising edge or the failing edge
4: wake up the chip upon low level
5: wake up the chip upon high level
(R/W)

RTC_CNTL_GPIO_PIN0_INT_TYPE Configures RTC GPIO 0 wakeup type.
0: disable wakeup by RTC GPIO
1: wake up the chip upon the rising edge
2: wake up the chip upon the failing edge
3: wake up the chip upon the rising edge or the failing edge
4: wake up the chip upon low level
5: wake up the chip upon high level
(R/W)

RTC_CNTL_GPIO_PIN5_WAKEUP_ENABLE Enables wakeup from RTC GPIO 5. (R/W)

RTC_CNTL_GPIO_PIN4_WAKEUP_ENABLE Enables wakeup from RTC GPIO 4. (R/W)

RTC_CNTL_GPIO_PIN3_WAKEUP_ENABLE Enables wakeup from RTC GPIO 3. (R/W)

RTC_CNTL_GPIO_PIN2_WAKEUP_ENABLE Enables wakeup from RTC GPIO 2. (R/W)

RTC_CNTL_GPIO_PIN1_WAKEUP_ENABLE Enables wakeup from RTC GPIO 1. (R/W)

RTC_CNTL_GPIO_PIN0_WAKEUP_ENABLE Enables wakeup from RTC GPIO 0. (R/W)

Register 9.61. RTC_CNTL_SENSOR_CTRL_REG (0x011C)

RTC_CNTL_FORCE_XPD_SAR	(reserved)	(reserved)	
31 30	29 27	26 0

RTC_CNTL_FORCE_XPD_SAR Set this field to FPU SAR ADC. (R/W)

10 System Timer (SYSTIMER)

10.1 Overview

ESP32-C3 provides a 52-bit timer, which can be used to generate tick interrupts for operating system, or be used as a general timer to generate periodic interrupts or one-time interrupts.

The timer consists of two counters UNIT0 and UNIT1. The count values can be monitored by three comparators COMP0, COMP1 and COMP2. See the timer block diagram on Figure 10-1.

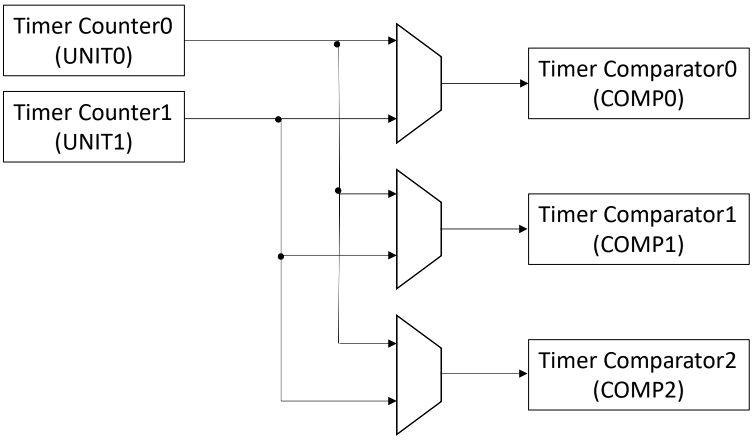

Figure 10-1. System Timer Structure

10.2 Features

- Consist of two 52-bit counters and three 52-bit comparators
- Software accessing registers is clocked by APB_CLK
- Use CNT_CLK for counting, with an average frequency of 16 MHz in two counting cycles
- Use 40 MHz XTAL_CLK as the clock source of CNT_CLK
- Support for 52-bit alarm values (t) and 26-bit alarm periods (δt)
- Provide two modes to generate alarms:
  - Target mode: only a one-time alarm is generated based on the alarm value (t)
  - Period mode: periodic alarms are generated based on the alarm period (δt)
- Three comparators can generate three independent interrupts based on configured alarm value (t) or alarm period (δt)
- Software configuring the reference count value. For example, the system timer is able to load back the sleep time recorded by the RTC timer via software after Light-sleep
- Can be configured to stall or continue running when CPU stalls or enters on-chip-debugging mode

10.3 Clock Source Selection

The counters and comparators are driven using XTAL_CLK. After scaled by a fractional divider, a $f_{XTAL\_CLK}/3$ clock is generated in one count cycle and a $f_{XTAL\_CLK}/2$ clock in another count cycle. The average clock frequency is $f_{XTAL\_CLK}/2.5$, which is 16 MHz, i.e. the CNT_CLK in Figure 10-2. The timer counting is incremented by 1/16 μs on each CNT_CLK cycle.

Software operation such as configuring registers is clocked by APB_CLK. For more information about APB_CLK, see Chapter 6 *Reset and Clock*.

The following two bits of system registers are also used to control the system timer:

- SYSTEM_SYSTIMER_CLK_EN in register SYSTEM_PERIP_CLK_EN0_REG: enable APB_CLK signal to system timer.
- SYSTEM_SYSTIMER_RST in register SYSTEM_PERIP_RST_EN0_REG: reset system timer.

Note that if the timer is reset, its registers will be restored to their default values. For more information, please refer to Table Peripheral Clock Gating and Reset in Chapter 16 *System Registers (SYSREG)*.

10.4 Functional Description

CPU Interrupt Matrix

Figure 10-2. System Timer Alarm Generation

Figure 10-2 shows the procedure to generate alarm in system timer. In this process, one timer counter and one timer comparator are used. An alarm interrupt will be generated accordingly based on the comparison result in comparator.

10.4.1 Counter

The system timer has two 52-bit timer counters, shown as UNIT*n* (*n* = 0 or 1). Their counting clock source is a 16 MHz clock, i.e. CNT_CLK. Whether UNIT*n* works or not is controlled by two bits in register SYSTIMER_CONF_REG:

- SYSTIMER_TIMER_UNIT*n*_WORK_EN: set this bit to enable the counter UNIT*n* in system timer.
- SYSTIMER_TIMER_UNIT*n*_CORE0_STALL_EN: if this bit is set, the counter UNIT*n* stops when CPU is stalled. The counter continues its counting after the CPU resumes.

The configuration of the two bits to control the counter UNIT*n* is shown below, assuming that CPU is stalled.

Table 10-1. UNIT*n* Configuration Bits

SYSTIMER_TIMER_ UNIT*n*_WORK_EN	SYSTIMER_TIMER_ UNIT*n*_CORE0_STALL_EN	Counter UNIT*n*
0	x*	Not at work
1	1	Stop counting, but will continue its counting after the CPU resumes.
1	0	Keep counting

* x: Don't-care.

When the counter UNIT*n* is at work, the count value is incremented on each counting cycle. When the counter UNIT*n* is stopped, the count value stops increasing and keeps unchanged.

The lower 32 and higher 20 bits of initial count value are loaded from the registers SYSTIMER_TIMER_UNIT*n*_LOAD
_LO and SYSTIMER_TIMER_UNIT*n*_LOAD_HI. Writing 1 to the bit SYSTIMER_TIMER_UNIT*n*_LOAD will trigger a reload event, and the current count value will be changed immediately. If UNIT*n* is at work, the counter will continue to count up from the new reloaded value.

Writing 1 to SYSTIMER_TIMER_UNIT*n*_UPDATE will trigger an update event. The lower 32 and higher 20 bits of current count value will be locked into the registers SYSTIMER_TIMER_UNIT*n*_VALUE_LO and SYSTIMER_TIMER_
UNIT*n*_VALUE_HI, and then SYSTIMER_TIMER_UNIT*n*_VALUE_VALID is asserted. Before the next update event, the values of SYSTIMER_TIMER_UNIT*n*_VALUE_LO and SYSTIMER_TIMER_UNIT*n*_VALUE_HI remain unchanged.

10.4.2 Comparator and Alarm

The system timer has three 52-bit comparators, shown as COMP*x* (*x* = 0, 1, or 2). The comparators can generate independent interrupts based on different alarm values (t) or alarm periods (δt).

Configure SYSTIMER_TARGET*x*_PERIOD_MODE to choose from the two alarm modes for each COMP*x*:

- 1: select period mode
- 0: select target mode

In period mode, the alarm period (δt) is provided by the register SYSTIMER_TARGET*x*_PERIOD. Assuming that current count value is t1, when it reaches (t1 + δt), an alarm interrupt will be generated. Another alarm interrupt also will be generated when the count value reaches (t1 + 2*δt). By such way, periodic alarms are generated.

In target mode, the lower 32 bits and higher 20 bits of the alarm value (t) are provided by SYSTIMER_TIMER_TARGET
*x*_LO and SYSTIMER_TIMER_TARGET*x*_HI. Assuming that current count value is t2 (t2 <= t), an alarm interrupt will be generated when the count value reaches the alarm value (t). Unlike in period mode, only one alarm interrupt is generated in target mode.

SYSTIMER_TARGET*x*_TIMER_UNIT_SEL is used to choose the count value from which timer counter to be compared for alarm:

- 1: use the count value from UNIT*1*

- 0: use the count value from UNIT0

Finally, set SYSTIMER_TARGETx_WORK_EN and COMPx starts to compare the count value with the alarm value (t) in target mode or with the alarm period (t1 + n*δt) in period mode.

An alarm is generated when the count value equals to the alarm value (t) in target mode or to the start value + n*alarm period δt (n = 1,2,3...) in period mode. But if the alarm value (t) set in registers is less than current count value, i.e. the target has already passed, or current count value is larger than the target value (t) within a range (0 ~ 2^{51} -1), an alarm interrupt also is generated immediately. The relationship between current count value t_c, the alarm value t_t and alarm trigger point is shown below.

Table 10-2. Trigger Point

Relationship Between t_c and t_t	Trigger Point
t_c- t_t <= 0	t_c = t_t, an alarm is triggered.
0 <= t_c - t_t < 2^{51} - 1 (t_c < 2^{51} and t_t < 2^{51}, or t_c >= 2^{51} and t_t >= 2^{51})	An alarm is triggered immediately.
t_c - t_t >= 2^{51} - 1	t_c overflows after counting to its maximum value 52'hfffffffffffff, and then starts counting up from 0. When its value reaches t_t, an alarm is triggered.

10.4.3 Synchronization Operation

The clock (APB_CLK) used in software operation is not the same one as the timer counters and comparators working on CNT_CLK. Synchronization is needed for some configuration registers. A complete synchronization action takes two steps:

1. Software writes suitable values to configuration fields, see the first column in Table 10-3.
2. Software writes 1 to corresponding bits to start synchronization, see the second column in Table 10-3.

Table 10-3. Synchronization Operation

Configuration Fields	Synchronization Enable Bit
SYSTIMER_TIMER_UNITn_LOAD_LO SYSTIMER_TIMER_UNITn_LOAD_HI	SYSTIMER_TIMER_UNITn_LOAD
SYSTIMER_TARGETx_PERIOD SYSTIMER_TIMER_TARGETx_HI SYSTIMER_TIMER_TARGETx_LO	SYSTIMER_TIMER_COMPx_LOAD

10.4.4 Interrupt

Each comparator has one level-type alarm interrupt, named as SYSTIMER_TARGETx_INT. Interrupts signal is asserted high when the comparator starts to alarm. Until the interrupt is cleared by software, it remains high. To enable interrupts, set the bit SYSTIMER_TARGETx_INT_ENA.

10.5 Programming Procedure

When configuring COMPx and UNITn, please ensure the corresponding COMP and UNIT are at work.

10.5.1 Read Current Count Value

1. Set SYSTIMER_TIMER_UNITn_UPDATE to update the current count value into SYSTIMER_TIMER_UNITn_VALUE_HI and SYSTIMER_TIMER_UNITn_VALUE_LO.
2. Poll the reading of SYSTIMER_TIMER_UNITn_VALUE_VALID, till it's 1, which means user now can read the count value from SYSTIMER_TIMER_UNITn_VALUE_HI and SYSTIMER_TIMER_UNITn_VALUE_LO.
3. Read the lower 32 bits and higher 20 bits from SYSTIMER_TIMER_UNITn_VALUE_LO and SYSTIMER_TIMER_UNITn_VALUE_HI.

10.5.2 Configure One-Time Alarm in Target Mode

1. Set SYSTIMER_TARGETx_TIMER_UNIT_SEL to select the counter (UNIT0 or UNIT1) used for COMPx.
2. Read current count value, see Section 10.5.1. This value will be used to calculate the alarm value (t) in Step 4.
3. Clear SYSTIMER_TARGETx_PERIOD_MODE to enable target mode.
4. Set an alarm value (t), and fill its lower 32 bits to SYSTIMER_TIMER_TARGETx_LO, and the higher 20 bits to SYSTIMER_TIMER_TARGETx_HI.
5. Set SYSTIMER_TIMER_COMPx_LOAD to synchronize the alarm value (t) to COMPx, i.e. load the alarm value (t) to the COMPx.
6. Set SYSTIMER_TARGETx_WORK_EN to enable the selected COMPx. COMPx starts comparing the count value with the alarm value (t).
7. Set SYSTIMER_TARGETx_INT_ENA to enable timer interrupt. When Unitn counts to the alarm value (t), a SYSTIMER_TARGETx_INT interrupt is triggered.

10.5.3 Configure Periodic Alarms in Period Mode

1. Set SYSTIMER_TARGETx_TIMER_UNIT_SEL to select the counter (UNIT0 or UNIT1) used for COMPx.
2. Set an alarm period (δt), and fill it to SYSTIMER_TARGETx_PERIOD.
3. Set SYSTIMER_TIMER_COMPx_LOAD to synchronize the alarm period (δt) to COMPx, i.e. load the alarm period (δt) to COMPx.
4. Clear and then set SYSTIMER_TARGETx_PERIOD_MODE to configure COMPx into period mode.
5. Set SYSTIMER_TARGETx_WORK_EN to enable the selected COMPx. COMPx starts comparing the count value with the sum of start value + n*δt (n = 1, 2, 3...).
6. Set SYSTIMER_TARGETx_INT_ENA to enable timer interrupt. A SYSTIMER_TARGETx_INT interrupt is triggered when Unitn counts to start value + n*δt (n = 1, 2, 3...) set in step 2.

10.5.4 Update After Light-sleep

1. Configure the RTC timer before the chip goes to Light-sleep, to record the exact sleep time. For more information, see Chapter 9 *Low-power Management*.
2. Read the sleep time from the RTC timer when the chip is woken up from Light-sleep.
3. Read current count value of system timer, see Section 10.5.1.

4. Convert the time value recorded by the RTC timer from the clock cycles based on RTC_SLOW_CLK to that based on 16 MHz CNT_CLK. For example, if the frequency of RTC_SLOW_CLK is 32 KHz, the recorded RTC timer value should be converted by multiplying by 500.
5. Add the converted RTC value to the current count value of the system timer:
   - Fill the new value into SYSTIMER_TIMER_UNIT*n*_LOAD_LO (low 32 bits) and SYSTIMER_TIMER_UNIT*n*_LOAD_HI (high 20 bits).
   - Set SYSTIMER_TIMER_UNIT*n*_LOAD to load new timer value into system timer. By such way, the system timer is updated.

10.6 Register Summary

The addresses in this section are relative to system timer base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Clock Control Register			
SYSTIMER_CONF_REG	Configure system timer clock	0x0000	R/W
UNIT*0* Control and Configuration Registers			
SYSTIMER_UNIT0_OP_REG	Read UNIT0 value to registers	0x0004	varies
SYSTIMER_UNIT0_LOAD_HI_REG	High 20 bits to be loaded to UNIT0	0x000C	R/W
SYSTIMER_UNIT0_LOAD_LO_REG	Low 32 bits to be loaded to UNIT0	0x0010	R/W
SYSTIMER_UNIT0_VALUE_HI_REG	UNIT0 value, high 20 bits	0x0040	RO
SYSTIMER_UNIT0_VALUE_LO_REG	UNIT0 value, low 32 bits	0x0044	RO
SYSTIMER_UNIT0_LOAD_REG	UNIT0 synchronization register	0x005C	WT
UNIT*1* Control and Configuration Registers			
SYSTIMER_UNIT1_OP_REG	Read UNIT1 value to registers	0x0008	varies
SYSTIMER_UNIT1_LOAD_HI_REG	High 20 bits to be loaded to UNIT1	0x0014	R/W
SYSTIMER_UNIT1_LOAD_LO_REG	Low 32 bits to be loaded to UNIT1	0x0018	R/W
SYSTIMER_UNIT1_VALUE_HI_REG	UNIT1 value, high 20 bits	0x0048	RO
SYSTIMER_UNIT1_VALUE_LO_REG	UNIT1 value, low 32 bits	0x004C	RO
SYSTIMER_UNIT1_LOAD_REG	UNIT1 synchronization register	0x0060	WT
Comparator*0* Control and Configuration Registers			
SYSTIMER_TARGET0_HI_REG	Alarm value to be loaded to COMP0, high 20 bits	0x001C	R/W
SYSTIMER_TARGET0_LO_REG	Alarm value to be loaded to COMP0, low 32 bits	0x0020	R/W
SYSTIMER_TARGET0_CONF_REG	Configure COMP0 alarm mode	0x0034	R/W
SYSTIMER_COMP0_LOAD_REG	COMP0 synchronization register	0x0050	WT
Comparator*1* Control and Configuration Registers			
SYSTIMER_TARGET1_HI_REG	Alarm value to be loaded to COMP1, high 20 bits	0x0024	R/W
SYSTIMER_TARGET1_LO_REG	Alarm value to be loaded to COMP1, low 32 bits	0x0028	R/W

Name	Description	Address	Access
SYSTIMER_TARGET1_CONF_REG	Configure COMP1 alarm mode	0x0038	R/W
SYSTIMER_COMP1_LOAD_REG	COMP1 synchronization register	0x0054	WT
Comparator2 Control and Configuration Registers			
SYSTIMER_TARGET2_HI_REG	Alarm value to be loaded to COMP2, high 20 bits	0x002C	R/W
SYSTIMER_TARGET2_LO_REG	Alarm value to be loaded to COMP2, low 32 bits	0x0030	R/W
SYSTIMER_TARGET2_CONF_REG	Configure COMP2 alarm mode	0x003C	R/W
SYSTIMER_COMP2_LOAD_REG	COMP2 synchronization register	0x0058	WT
Interrupt Registers			
SYSTIMER_INT_ENA_REG	Interrupt enable register of system timer	0x0064	R/W
SYSTIMER_INT_RAW_REG	Interrupt raw register of system timer	0x0068	R/WTC/SS
SYSTIMER_INT_CLR_REG	Interrupt clear register of system timer	0x006C	WT
SYSTIMER_INT_ST_REG	Interrupt status register of system timer	0x0070	RO
Version Register			
SYSTIMER_DATE_REG	Version control register	0x00FC	R/W

10.7 Registers

The addresses in this section are relative to system timer base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 10.1. SYSTIMER_CONF_REG (0x0000)

SYSTIMER_CLK_EN	SYSTIMER_TIMER_UNIT0_WORK_EN	SYSTIMER_TIMER_UNIT1_WORK_EN	SYSTIMER_TIMER_UNIT0_CORE0_STALL_EN	(reserved)	SYSTIMER_TIMER_UNIT1_CORE0_STALL_EN	(reserved)	SYSTIMER_TARGET0_WORK_EN	SYSTIMER_TARGET1_WORK_EN	SYSTIMER_TARGET2_WORK_EN	(reserved)	
31	30	29	28	27	26	25	24	23	22	21 0	
0	1	0	0	0	1	1	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

SYSTIMER_TARGET2_WORK_EN COMP2 work enable bit. (R/W)

SYSTIMER_TARGET1_WORK_EN COMP1 work enable bit. (R/W)

SYSTIMER_TARGET0_WORK_EN COMP0 work enable bit. (R/W)

SYSTIMER_TIMER_UNIT1_CORE0_STALL_EN UNIT1 is stalled when CPU stalled. (R/W)

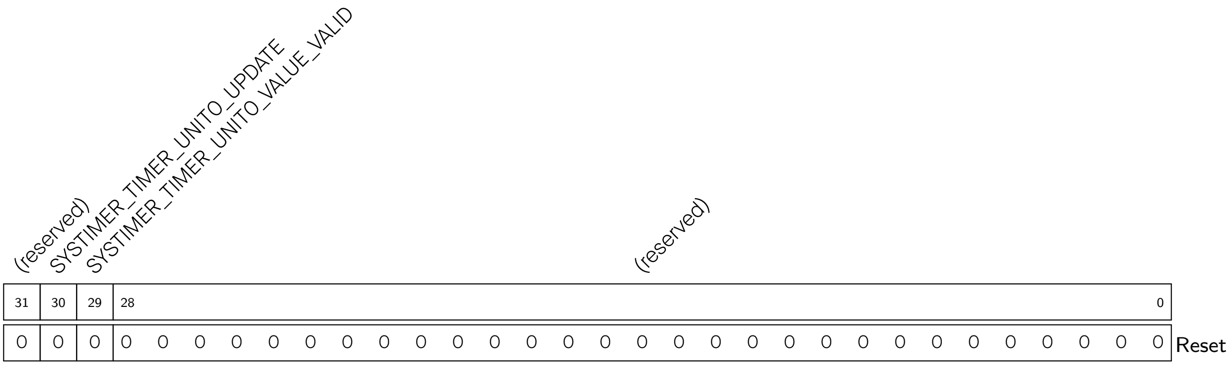
SYSTIMER_TIMER_UNIT0_CORE0_STALL_EN UNIT0 is stalled when CPU stalled. (R/W)

SYSTIMER_TIMER_UNIT1_WORK_EN UNIT1 work enable bit. (R/W)

SYSTIMER_TIMER_UNIT0_WORK_EN UNIT0 work enable bit. (R/W)

SYSTIMER_CLK_EN Register clock gating. 1: Register clock is always enabled for read and write operations. 0: Only enable needed clock for register read or write operations. (R/W)

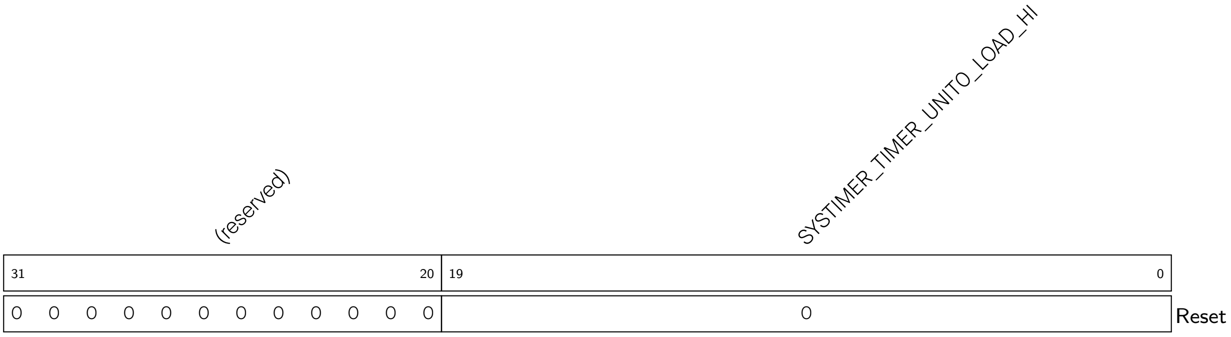
Register 10.2. SYSTIMER_UNIT0_OP_REG (0x0004)



SYSTIMER_TIMER_UNIT0_VALUE_VALID Timer value is synchronized and valid. (R/SS/WTC)

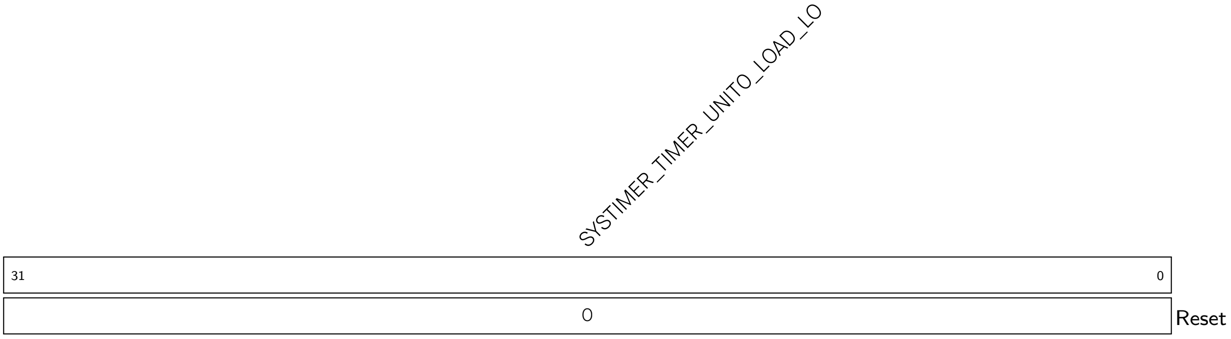
SYSTIMER_TIMER_UNIT0_UPDATE Update timer UNIT0, i.e. read the UNIT0 count value to SYSTIMER_TIMER_UNIT0_VALUE_HI and SYSTIMER_TIMER_UNIT0_VALUE_LO. (WT)

Register 10.3. SYSTIMER_UNIT0_LOAD_HI_REG (0x000C)



SYSTIMER_TIMER_UNIT0_LOAD_HI The value to be loaded to UNIT0, high 20 bits. (R/W)

Register 10.4. SYSTIMER_UNIT0_LOAD_LO_REG (0x0010)



SYSTIMER_TIMER_UNIT0_LOAD_LO The value to be loaded to UNIT0, low 32 bits. (R/W)

Register 10.5. SYSTIMER_UNIT0_VALUE_HI_REG (0x0040)

(reserved)	SYSTIMER_TIMER_UNIT0_VALUE_HI	
31 20	19 0	
0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SYSTIMER_TIMER_UNIT0_VALUE_HI UNIT0 read value, high 20 bits. (RO)

Register 10.6. SYSTIMER_UNIT0_VALUE_LO_REG (0x0044)

SYSTIMER_TIMER_UNIT0_VALUE_LO	
31 0	
0	Reset

SYSTIMER_TIMER_UNIT0_VALUE_LO UNIT0 read value, low 32 bits. (RO)

Register 10.7. SYSTIMER_UNIT0_LOAD_REG (0x005C)

(reserved)	SYSTIMER_TIMER_UNIT0_LOAD	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SYSTIMER_TIMER_UNIT0_LOAD UNIT0 synchronization enable signal. Set this bit to reload the values of SYSTIMER_TIMER_UNIT0_LOAD_HI and SYSTIMER_TIMER_UNIT0_LOAD_LO to UNIT0. (WT)

Register 10.8. SYSTIMER_UNIT1_OP_REG (0x0008)

(reserved)	SYSTIMER_TIMER_UNIT1_UPDATE	SYSTIMER_TIMER_UNIT1_VALUE_VALID	(reserved)	
31	30	29	28 0	
0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

SYSTIMER_TIMER_UNIT1_VALUE_VALID UNIT1 value is synchronized and valid. (R/SS/WTC)

SYSTIMER_TIMER_UNIT1_UPDATE Update timer UNIT1, i.e. read the UNIT1 count value to SYSTIMER_TIMER_UNIT1_VALUE_HI and SYSTIMER_TIMER_UNIT1_VALUE_LO. (WT)

Register 10.9. SYSTIMER_UNIT1_LOAD_HI_REG (0x0014)

(reserved)	SYSTIMER_TIMER_UNIT1_LOAD_HI	
31 20	19 0	
0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

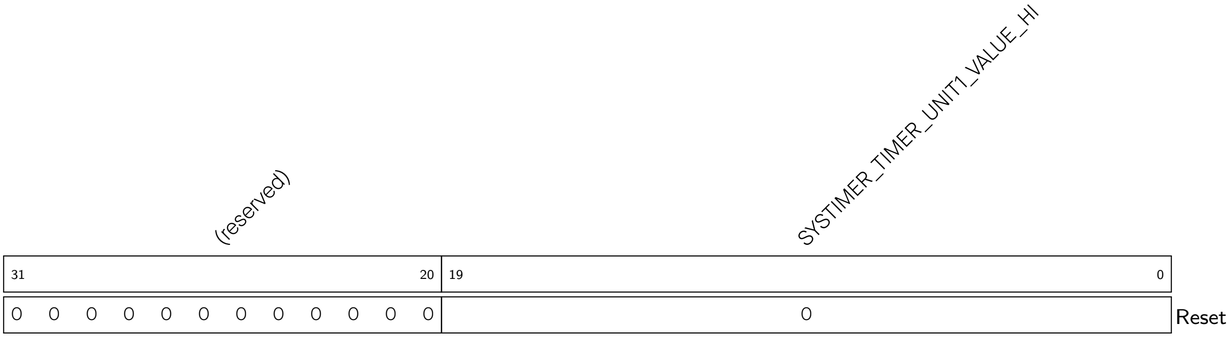
SYSTIMER_TIMER_UNIT1_LOAD_HI The value to be loaded to UNIT1, high 20 bits. (R/W)

Register 10.10. SYSTIMER_UNIT1_LOAD_LO_REG (0x0018)

SYSTIMER_TIMER_UNIT1_LOAD_LO	
31 0	
0	Reset

SYSTIMER_TIMER_UNIT1_LOAD_LO The value to be loaded to UNIT1, low 32 bits. (R/W)

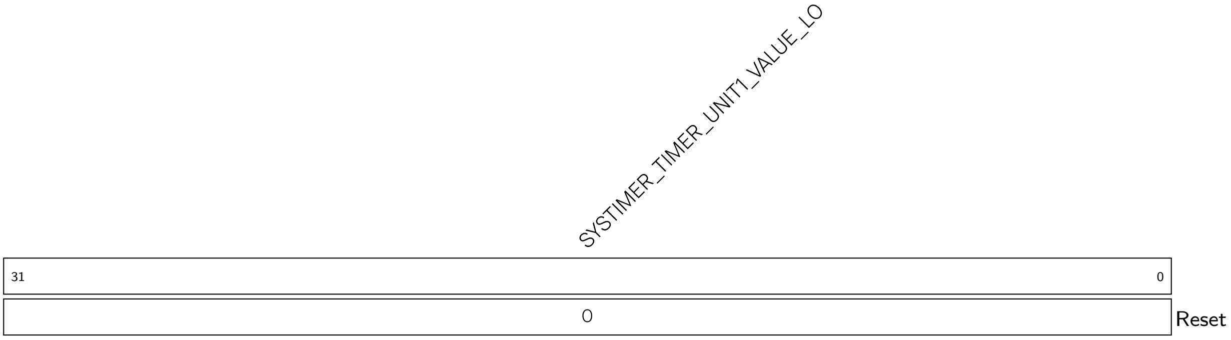
Register 10.11. SYSTIMER_UNIT1_VALUE_HI_REG (0x0048)



(reserved)	SYSTIMER_TIMER_UNIT1_VALUE_HI	
31 … 20	19 … 0	
0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SYSTIMER_TIMER_UNIT1_VALUE_HI UNIT1 read value, high 20 bits. (RO)

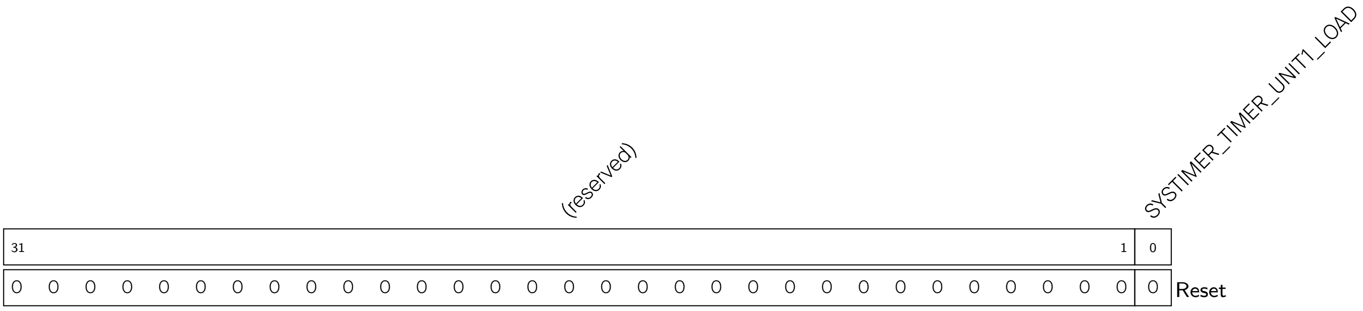
Register 10.12. SYSTIMER_UNIT1_VALUE_LO_REG (0x004C)



SYSTIMER_TIMER_UNIT1_VALUE_LO	
31 … 0	
0	Reset

SYSTIMER_TIMER_UNIT1_VALUE_LO UNIT1 read value, low 32 bits. (RO)

Register 10.13. SYSTIMER_UNIT1_LOAD_REG (0x0060)



(reserved)	SYSTIMER_TIMER_UNIT1_LOAD	
31 … 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SYSTIMER_TIMER_UNIT1_LOAD UNIT1 synchronization enable signal. Set this bit to reload the values of SYSTIMER_TIMER_UNIT1_LOAD_HI and SYSTIMER_TIMER_UNIT1_LOAD_LO to UNIT1. (WT)

Register 10.14. SYSTIMER_TARGET0_HI_REG (0x001C)

(reserved)	SYSTIMER_TIMER_TARGET0_HI	
31 20	19 0	
0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SYSTIMER_TIMER_TARGET0_HI The alarm value to be loaded to COMP0, high 20 bits. (R/W)

Register 10.15. SYSTIMER_TARGET0_LO_REG (0x0020)

SYSTIMER_TIMER_TARGET0_LO	
31 0	
0	Reset

SYSTIMER_TIMER_TARGET0_LO The alarm value to be loaded to COMP0, low 32 bits. (R/W)

Register 10.16. SYSTIMER_TARGET0_CONF_REG (0x0034)

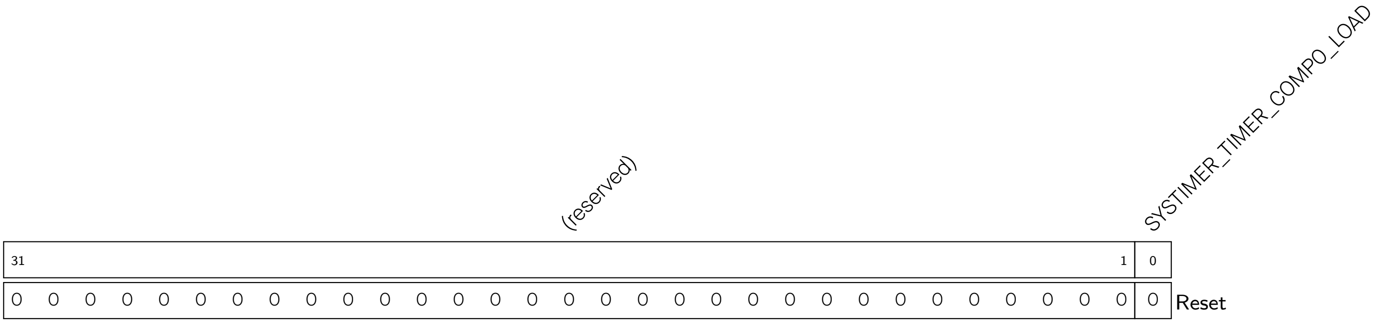
SYSTIMER_TARGET0_TIMER_UNIT_SEL	SYSTIMER_TARGET0_PERIOD_MODE	(reserved)	SYSTIMER_TARGET0_PERIOD	
31	30	29 26	25 0	
0	0	0 0 0 0	0x00000	Reset

SYSTIMER_TARGET0_PERIOD COMP0 alarm period. (R/W)

SYSTIMER_TARGET0_PERIOD_MODE Set COMP0 to period mode. (R/W)

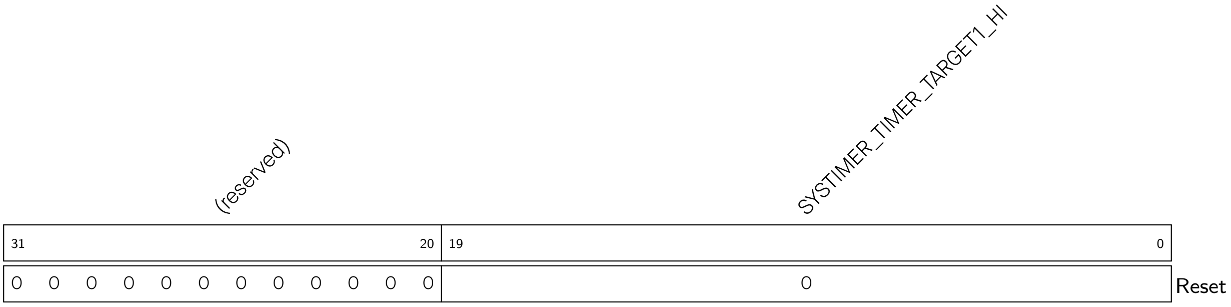
SYSTIMER_TARGET0_TIMER_UNIT_SEL Select which unit to compare for COMP0. (R/W)

Register 10.17. SYSTIMER_COMP0_LOAD_REG (0x0050)



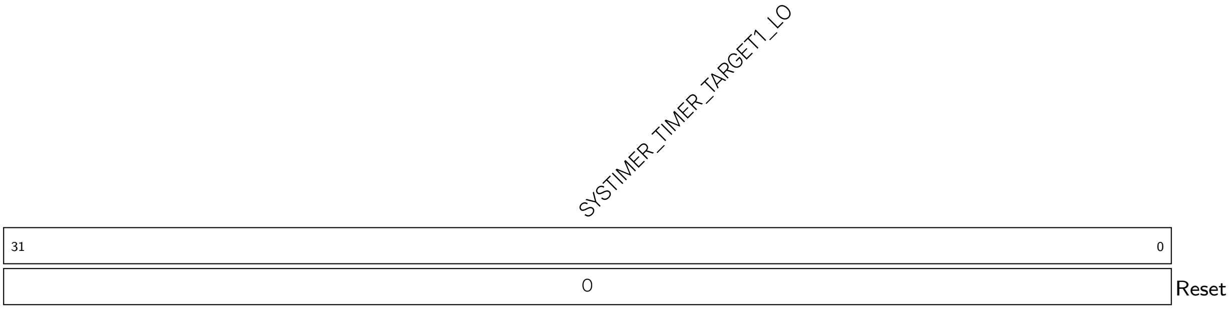
SYSTIMER_TIMER_COMP0_LOAD COMP0 synchronization enable signal. Set this bit to reload the alarm value/period to COMP0. (WT)

Register 10.18. SYSTIMER_TARGET1_HI_REG (0x0024)



SYSTIMER_TIMER_TARGET1_HI The alarm value to be loaded to COMP1, high 20 bits. (R/W)

Register 10.19. SYSTIMER_TARGET1_LO_REG (0x0028)



SYSTIMER_TIMER_TARGET1_LO The alarm value to be loaded to COMP1, low 32 bits. (R/W)

Register 10.20. SYSTIMER_TARGET1_CONF_REG (0x0038)

SYSTIMER_TARGET1_TIMER_UNIT_SEL	SYSTIMER_TARGET1_PERIOD_MODE	(reserved)	SYSTIMER_TARGET1_PERIOD	
31	30	29 26	25 0	
0	0	0 0 0 0	0x00000	Reset

SYSTIMER_TARGET1_PERIOD COMP1 alarm period. (R/W)

SYSTIMER_TARGET1_PERIOD_MODE Set COMP1 to period mode. (R/W)

SYSTIMER_TARGET1_TIMER_UNIT_SEL Select which unit to compare for COMP1. (R/W)

Register 10.21. SYSTIMER_COMP1_LOAD_REG (0x0054)

(reserved)	SYSTIMER_TIMER_COMP1_LOAD	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

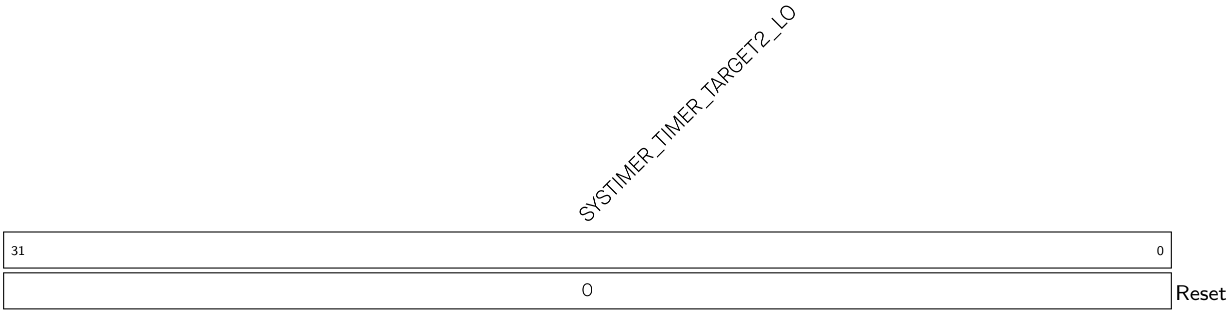
SYSTIMER_TIMER_COMP1_LOAD COMP1 synchronization enable signal. Set this bit to reload the alarm value/period to COMP1. (WT)

Register 10.22. SYSTIMER_TARGET2_HI_REG (0x002C)

(reserved)	SYSTIMER_TIMER_TARGET2_HI	
31 20	19 0	
0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

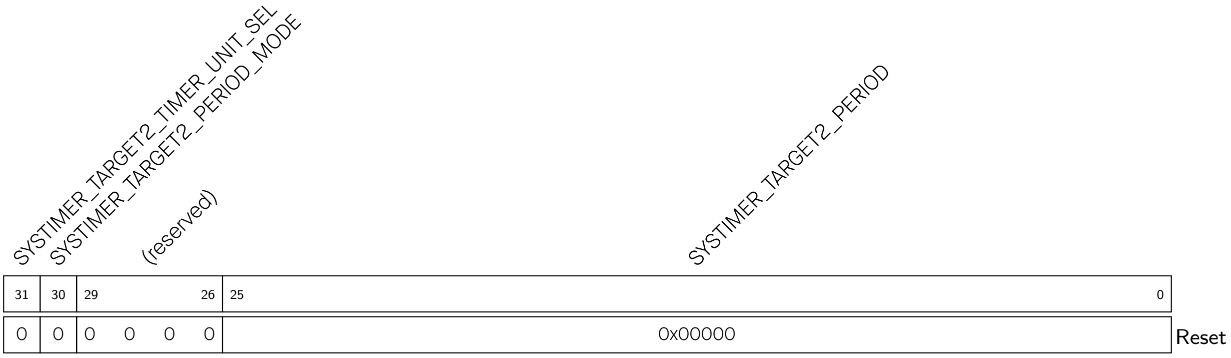
SYSTIMER_TIMER_TARGET2_HI The alarm value to be loaded to COMP2, high 20 bits. (R/W)

Register 10.23. SYSTIMER_TARGET2_LO_REG (0x0030)



SYSTIMER_TIMER_TARGET2_LO The alarm value to be loaded to COMP2, low 32 bits. (R/W)

Register 10.24. SYSTIMER_TARGET2_CONF_REG (0x003C)

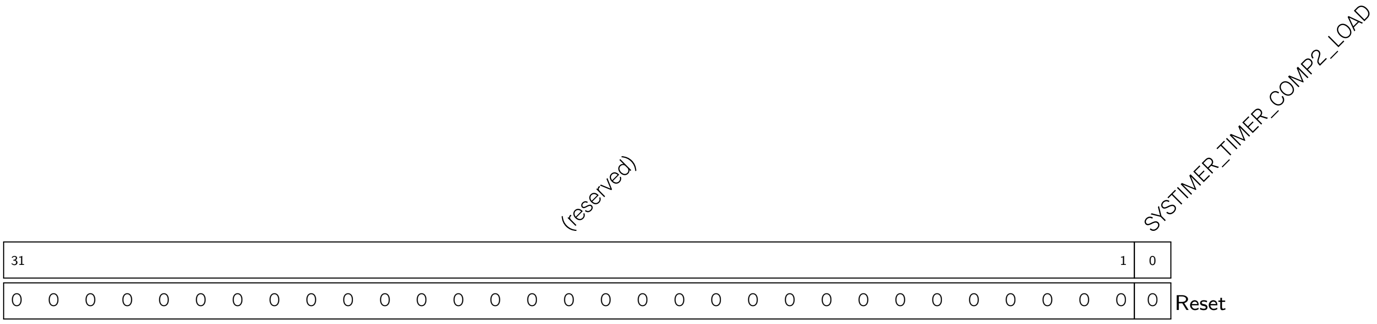


SYSTIMER_TARGET2_PERIOD COMP2 alarm period. (R/W)

SYSTIMER_TARGET2_PERIOD_MODE Set COMP2 to period mode. (R/W)

SYSTIMER_TARGET2_TIMER_UNIT_SEL Select which unit to compare for COMP2. (R/W)

Register 10.25. SYSTIMER_COMP2_LOAD_REG (0x0058)



SYSTIMER_TIMER_COMP2_LOAD COMP2 synchronization enable signal. Set this bit to reload the alarm value/period to COMP2. (WT)

Register 10.26. SYSTIMER_INT_ENA_REG (0x0064)

(reserved)		SYSTIMER_TARGET2_INT_ENA	SYSTIMER_TARGET1_INT_ENA	SYSTIMER_TARGET0_INT_ENA	
31	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0	0	0	Reset

SYSTIMER_TARGET0_INT_ENA SYSTIMER_TARGET0_INT enable bit. (R/W)

SYSTIMER_TARGET1_INT_ENA SYSTIMER_TARGET1_INT enable bit. (R/W)

SYSTIMER_TARGET2_INT_ENA SYSTIMER_TARGET2_INT enable bit. (R/W)

Register 10.27. SYSTIMER_INT_RAW_REG (0x0068)

(reserved)		SYSTIMER_TARGET2_INT_RAW	SYSTIMER_TARGET1_INT_RAW	SYSTIMER_TARGET0_INT_RAW	
31	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0	0	0	Reset

SYSTIMER_TARGET0_INT_RAW SYSTIMER_TARGET0_INT raw bit. (R/WTC/SS)

SYSTIMER_TARGET1_INT_RAW SYSTIMER_TARGET1_INT raw bit. (R/WTC/SS)

SYSTIMER_TARGET2_INT_RAW SYSTIMER_TARGET2_INT raw bit. (R/WTC/SS)

Register 10.28. SYSTIMER_INT_CLR_REG (0x006C)

(reserved)		SYSTIMER_TARGET2_INT_CLR	SYSTIMER_TARGET1_INT_CLR	SYSTIMER_TARGET0_INT_CLR	
31	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0	0	0	Reset

SYSTIMER_TARGET0_INT_CLR SYSTIMER_TARGET0_INT clear bit. (WT)

SYSTIMER_TARGET1_INT_CLR SYSTIMER_TARGET1_INT clear bit. (WT)

SYSTIMER_TARGET2_INT_CLR SYSTIMER_TARGET2_INT clear bit. (WT)

Register 10.29. SYSTIMER_INT_ST_REG (0x0070)

(reserved)		SYSTIMER_TARGET2_INT_ST	SYSTIMER_TARGET1_INT_ST	SYSTIMER_TARGET0_INT_ST	
31	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0	0	0	Reset

SYSTIMER_TARGET0_INT_ST SYSTIMER_TARGET0_INT status bit. (RO)

SYSTIMER_TARGET1_INT_ST SYSTIMER_TARGET1_INT status bit. (RO)

SYSTIMER_TARGET2_INT_ST SYSTIMER_TARGET2_INT status bit. (RO)

Register 10.30. SYSTIMER_DATE_REG (0x00FC)

SYSTIMER_DATE		
31	0	
0x2006171		Reset

SYSTIMER_DATE Version control register. (R/W)

11 Timer Group (TIMG)

11.1 Overview

General purpose timers can be used to precisely time an interval, trigger an interrupt after a particular interval (periodically and aperiodically), or act as a hardware clock. As shown in Figure 11-1, the ESP32-C3 chip contains two timer groups, namely timer group 0 and timer group 1. Each timer group consists of one general purpose timer referred to as T0 and one Main System Watchdog Timer. All general purpose timers are based on 16-bit prescalers and 54-bit auto-reload-capable up-down counters.

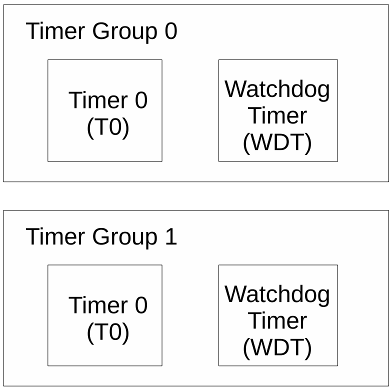


Figure 11-1. Timer Units within Groups

Note that while the Main System Watchdog Timer registers are described in this chapter, their functional description is included in the Chapter 12 *Watchdog Timers (WDT)*. Therefore, the term 'timers' within this chapter refers to the general purpose timers.

The timers' features are summarized as follows:

- A 16-bit clock prescaler, from 2 to 65536
- A 54-bit time-base counter programmable to incrementing or decrementing
- Able to read real-time value of the time-base counter
- Halting and resuming the time-base counter
- Programmable alarm generation
- Timer value reload (Auto-reload at alarm or software-controlled instant reload)
- Level interrupt generation

11.2 Functional Description

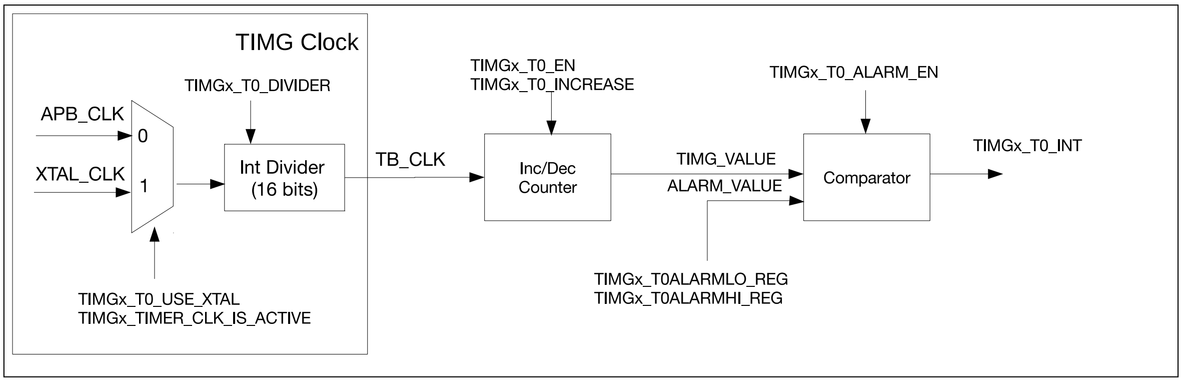

Figure 11-2. Timer Group Architecture

Figure11-2 is a diagram of timer T0 in a timer group. T0 contains a clock selector, a 16-bit integer divider as a prescaler, a timer-based counter and a comparator for alarm generation.

11.2.1 16-bit Prescaler and Clock Selection

The timer can select between the APB clock (APB_CLK) or external clock (XTAL_CLK) as its clock source by setting the TIMG_T0_USE_XTAL field of the TIMG_T0CONFIG_REG register. The selected clock is switched on by setting TIMG_TIMER_CLK_IS_ACTIVE field of the TIMG_REGCLK_REG register to 1 and switched off by setting it to 0. The clock is then divided by a 16-bit prescaler to generate the time-base counter clock (TB_CLK) used by the time-base counter. When the TIMG_T0_DIVIDER field is configured as 2 ~ 65536, the divisor of the prescaler would be 2 ~ 65536. Note that programming value 0 to TIMG_T0_DIVIDER will result in the divisor being 65536. When the TIMG_T0_DIVIDER is set to 1, the actual divisor is 2 so the timer counter value represents the half of real time.

To modify the 16-bit prescaler, please first configure the TIMG_T0_DIVIDER field, and then set TIMG_T0_DIVIDER_RST to 1. Meanwhile, the timer must be disabled (i.e. TIMG_T0_EN should be cleared). Otherwise, the result can be unpredictable.

11.2.2 54-bit Time-base Counter

The 54-bit time-base counters are based on TB_CLK and can be configured to increment or decrement via the TIMG_T0_INCREASE field. The time-base counter can be enabled or disabled by setting or clearing the TIMG_T0_EN field, respectively. When enabled, the time-base counter increments or decrements on each cycle of TB_CLK. When disabled, the time-base counter is essentially frozen. Note that the TIMG_T0_INCREASE field can be changed while TIMG_T0_EN is set and this will cause the time-base counter to change direction instantly.

To read the 54-bit value of the time-base counter, the timer value must be latched to two registers before being read by the CPU (due to the CPU being 32-bit). By writing any value to the TIMG_T0UPDATE_REG, the current value of the 54-bit timer starts to be latched into the TIMG_T0LO_REG and TIMG_T0HI_REG registers containing the lower 32-bits and higher 22-bits, respectively. When TIMG_T0UPDATE_REG is cleared by hardware, it indicates the latch operation has been completed and current timer value can be read from the TIMG_T0LO_REG and TIMG_T0HI_REG registers. TIMG_T0LO_REG and TIMG_T0HI_REG registers will remain unchanged for the CPU to read in its own time until TIMG_T0UPDATE_REG is written to again.

11.2.3 Alarm Generation

A timer can be configured to trigger an alarm when the timer's current value matches the alarm value. An alarm will cause an interrupt to occur and (optionally) an automatic reload of the timer's current value (see Section 11.2.4).

The 54-bit alarm value is configured using TIMG_TOALARMLO_REG and TIMG_TOALARMHI_REG, which represent the lower 32-bits and higher 22-bits of the alarm value, respectively. However, the configured alarm value is ineffective until the alarm is enabled by setting the TIMG_TO_ALARM_EN field. To avoid alarm being enabled 'too late' (i.e. the timer value has already passed the alarm value when the alarm is enabled), the hardware will trigger the alarm immediately if the current timer value is higher than the alarm value (within a defined range) when the up-down counter increments, or lower than the alarm value (within a defined range) when the up-down counter decrements. Table 11-1 and Table 11-2 show the relationship between the current value of the timer, the alarm value, and when an alarm is triggered.The current time value and the alarm value are defined as follows:

- TIMG_VALUE = {TIMG_TOHI_REG, TIMG_TOLO_REG}
- ALARM_VALUE = {TIMG_TOALARMHI_REG, TIMG_TOALARMLO_REG}

Table 11-1. Alarm Generation When Up-Down Counter Increments

Scenario	Range	Alarm
1	ALARM_VALUE $-$ TIMG_VALUE $> 2^{53}$	Triggered
2	0 $<$ ALARM_VALUE $-$ TIMG_VALUE $\leq 2^{53}$	Triggered when the up-down counter counts TIMG_VALUE up to ALARM_VALUE
3	0 $\leq$ TIMG_VALUE $-$ ALARM_VALUE $< 2^{53}$	Triggered
4	TIMG_VALUE $-$ ALARM_VALUE $\geq 2^{53}$	Triggered when the up-down counter restarts counting up from 0 after reaching the timer's maximum value and counts TIMG_VALUE up to ALARM_VALUE

Table 11-2. Alarm Generation When Up-Down Counter Decrements

Scenario	Range	Alarm
5	TIMG_VALUE $-$ ALARM_VALUE $> 2^{53}$	Triggered
6	0 $<$ TIMG_VALUE $-$ ALARM_VALUE $\leq 2^{53}$	Triggered when the up-down counter counts TIMG_VALUE down to ALARM_VALUE
7	0 $\leq$ ALARM_VALUE $-$ TIMG_VALUE $< 2^{53}$	Triggered
8	ALARM_VALUE $-$ TIMG_VALUE $\geq 2^{53}$	Triggered when the up-down counter restarts counting down from the timer's maximum value after reaching the minimum value and counts TIMG_VALUE down to ALARM_VALUE

When an alarm occurs, the TIMG_TO_ALARM_EN field is automatically cleared and no alarm will occur again until the TIMG_TO_ALARM_EN is set next time.

11.2.4 Timer Reload

A timer is reloaded when a timer's current value is overwritten with a reload value stored in the TIMG_T0_LOAD_LO and TIMG_T0_LOAD_HI fields that correspond to the lower 32-bits and higher 22-bits of the timer's new value, respectively. However, writing a reload value to TIMG_T0_LOAD_LO and TIMG_T0_LOAD_HI will not cause the timer's current value to change. Instead, the reload value is ignored by the timer until a reload event occurs. A reload event can be triggered either by a software instant reload or an auto-reload at alarm.

A software instant reload is triggered by the CPU writing any value to TIMG_T0LOAD_REG, which causes the timer's current value to be instantly reloaded. If TIMG_T0_EN is set, the timer will continue incrementing or decrementing from the new value. If TIMG_T0_EN is cleared, the timer will remain frozen at the new value until counting is re-enabled.

An auto-reload at alarm will cause a timer reload when an alarm occurs, thus allowing the timer to continue incrementing or decrementing from the reload value. This is generally useful for resetting the timer's value when using periodic alarms. To enable auto-reload at alarm, the TIMG_T0_AUTORELOAD field should be set. If not enabled, the timer's value will continue to increment or decrement past the alarm value after an alarm.

11.2.5 RTC_SLOW_CLK Frequency Calculation

Via XTAL_CLK, a timer could calculate the frequency of clock sources for RTC_SLOW_CLK (i.e. RC_RTC_SLOW_CLK, RC_FAST_DIV_CLK, and XTAL32K_CLK) as follows:

1. Start periodic or one-shot frequency calculation;
2. Once receiving the signal to start calculation, the counter of XTAL_CLK and the counter of RTC_SLOW_CLK begin to work at the same time. When the counter of RTC_SLOW_CLK counts to C0, the two counters stop counting simultaneously;
3. Assume the value of XTAL_CLK's counter is C1, and the frequency of RTC_SLOW_CLK would be calculated as: $f\_rtc = \frac{C0 \times f\_XTAL\_CLK}{C1}$

11.2.6 Interrupts

Each timer has its own interrupt line that can be routed to the CPU, and thus each timer group has a total of two interrupt lines. Timers generate level interrupts that must be explicitly cleared by the CPU on each triggering.

Interrupts are triggered after an alarm (or stage timeout for watchdog timers) occurs. Level interrupts will be held high after an alarm (or stage timeout) occurs, and will remain so until manually cleared. To enable a timer's interrupt, the TIMG_T0_INT_ENA bit should be set.

The interrupts of each timer group are governed by a set of registers. Each timer within the group has a corresponding bit in each of these registers:

- TIMG_T0_INT_RAW : An alarm event sets it to 1. The bit will remain set until the timer's corresponding bit in TIMG_T0_INT_CLR is written.
- TIMG_WDT_INT_RAW : A stage time out will set the timer's bit to 1. The bit will remain set until the timer's corresponding bit in TIMG_WDT_INT_CLR is written.

- TIMG_T0_INT_ST : Reflects the status of each timer's interrupt and is generated by masking the bits of TIMG_T0_INT_RAW with TIMG_T0_INT_ENA.
- TIMG_WDT_INT_ST : Reflects the status of each watchdog timer's interrupt and is generated by masking the bits of TIMG_WDT_INT_RAW with TIMG_WDT_INT_ENA.
- TIMG_T0_INT_ENA : Used to enable or mask the interrupt status bits of timers within the group.
- TIMG_WDT_INT_ENA : Used to enable or mask the interrupt status bits of watchdog timer within the group.
- TIMG_T0_INT_CLR : Used to clear a timer's interrupt by setting its corresponding bit to 1. The timer's corresponding bit in TIMG_T0_INT_RAW and TIMG_T0_INT_ST will be cleared as a result. Note that a timer's interrupt must be cleared before the next interrupt occurs.
- TIMG_WDT_INT_CLR : Used to clear a timer's interrupt by setting its corresponding bit to 1. The watchdog timer's corresponding bit in TIMG_WDT_INT_RAW and TIMG_WDT_INT_ST will be cleared as a result. Note that a watchdog timer's interrupt must be cleared before the next interrupt occurs.

11.3 Configuration and Usage

11.3.1 Timer as a Simple Clock

1. Configure the time-base counter
   - Select clock source by setting or clearing TIMG_T0_USE_XTAL field.
   - Configure the 16-bit prescaler by setting TIMG_T0_DIVIDER.
   - Configure the timer direction by setting or clearing TIMG_T0_INCREASE.
   - Set the timer's starting value by writing the starting value to TIMG_T0_LOAD_LO and TIMG_T0_LOAD_HI, then reloading it into the timer by writing any value to TIMG_T0LOAD_REG.
2. Start the timer by setting TIMG_T0_EN.
3. Get the timer's current value.
   - Write any value to TIMG_T0UPDATE_REG to latch the timer's current value.
   - Wait until TIMG_T0UPDATE_REG is cleared by hardware.
   - Read the latched timer value from TIMG_T0LO_REG and TIMG_T0HI_REG.

11.3.2 Timer as One-shot Alarm

1. Configure the time-base counter following step 1 of Section 11.3.1.
2. Configure the alarm.
   - Configure the alarm value by setting TIMG_T0ALARMLO_REG and TIMG_T0ALARMHI_REG.
   - Enable interrupt by setting TIMG_T0_INT_ENA.
3. Disable auto reload by clearing TIMG_T0_AUTORELOAD.
4. Start the alarm by setting TIMG_T0_ALARM_EN.
5. Handle the alarm interrupt.

- Clear the interrupt by setting the timer's corresponding bit in TIMG_TO_INT_CLR.
- Disable the timer by clearing TIMG_TO_EN.

11.3.3 Timer as Periodic Alarm

1. Configure the time-base counter following step 1 in Section 11.3.1.
2. Configure the alarm following step 2 in Section 11.3.2.
3. Enable auto reload by setting TIMG_TO_AUTORELOAD and configure the reload value via TIMG_TO_LOAD_LO and TIMG_TO_LOAD_HI.
4. Start the alarm by setting TIMG_TO_ALARM_EN.
5. Handle the alarm interrupt (repeat on each alarm iteration).
    - Clear the interrupt by setting the timer's corresponding bit in TIMG_TO_INT_CLR.
    - If the next alarm requires a new alarm value and reload value (i.e. different alarm interval per iteration), then TIMG_TOALARMLO_REG, TIMG_TOALARMHI_REG, TIMG_TO_LOAD_LO, and TIMG_TO_LOAD_HI should be reconfigured as needed. Otherwise, the aforementioned registers should remain unchanged.
    - Re-enable the alarm by setting TIMG_TO_ALARM_EN.
6. Stop the timer (on final alarm iteration).
    - Clear the interrupt by setting the timer's corresponding bit in TIMG_TO_INT_CLR.
    - Disable the timer by clearing TIMG_TO_EN.

11.3.4 RTC_SLOW_CLK Frequency Calculation

1. One-shot frequency calculation
    - Select the clock whose frequency is to be calculated (clock source of RTC_SLOW_CLK) via TIMG_RTC_CALI_CLK_SEL, and configure the time of calculation via TIMG_RTC_CALI_MAX.
    - Select one-shot frequency calculation by clearing TIMG_RTC_CALI_START_CYCLING, and enable the two counters via TIMG_RTC_CALI_START.
    - Once TIMG_RTC_CALI_RDY becomes 1, read TIMG_RTC_CALI_VALUE to get the value of XTAL_CLK's counter, and calculate the frequency of RTC_SLOW_CLK.
2. Periodic frequency calculation
    - Select the clock whose frequency is to be calculated (clock source of RTC_SLOW_CLK) via TIMG_RTC_CALI_CLK_SEL, and configure the time of calculation via TIMG_RTC_CALI_MAX.
    - Select periodic frequency calculation by enabling TIMG_RTC_CALI_START_CYCLING.
    - When TIMG_RTC_CALI_CYCLING_DATA_VLD is 1, TIMG_RTC_CALI_VALUE is valid.
3. Timeout
   If the counter of RTC_SLOW_CLK cannot finish counting in TIMG_RTC_CALI_TIMEOUT_RST_CNT cycles, TIMG_RTC_CALI_TIMEOUT will be set to indicate a timeout.

11.4 Register Summary

The addresses in this section are relative to Timer Group base addresses (one for Timer Group 0 and another one for Timer Group 1) provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
T0 control and configuration registers			
TIMG_T0CONFIG_REG	Timer 0 configuration register	0x0000	varies
TIMG_T0LO_REG	Timer 0 current value, low 32 bits	0x0004	RO
TIMG_T0HI_REG	Timer 0 current value, high 22 bits	0x0008	RO
TIMG_T0UPDATE_REG	Write to copy current timer value to TIMGn_T0_(LO/HI)_REG	0x000C	R/W/SC
TIMG_T0ALARMLO_REG	Timer 0 alarm value, low 32 bits	0x0010	R/W
TIMG_T0ALARMHI_REG	Timer 0 alarm value, high bits	0x0014	R/W
TIMG_T0LOADLO_REG	Timer 0 reload value, low 32 bits	0x0018	R/W
TIMG_T0LOADHI_REG	Timer 0 reload value, high 22 bits	0x001C	R/W
TIMG_T0LOAD_REG	Write to reload timer from TIMG_T0_(LOADLO/LOADHI)_REG	0x0020	WT
WDT control and configuration registers			
TIMG_WDTCONFIG0_REG	Watchdog timer configuration register	0x0048	varies
TIMG_WDTCONFIG1_REG	Watchdog timer prescaler register	0x004C	varies
TIMG_WDTCONFIG2_REG	Watchdog timer stage 0 timeout value	0x0050	R/W
TIMG_WDTCONFIG3_REG	Watchdog timer stage 1 timeout value	0x0054	R/W
TIMG_WDTCONFIG4_REG	Watchdog timer stage 2 timeout value	0x0058	R/W
TIMG_WDTCONFIG5_REG	Watchdog timer stage 3 timeout value	0x005C	R/W
TIMG_WDTFEED_REG	Write to feed the watchdog timer	0x0060	WT
TIMG_WDTWPROTECT_REG	Watchdog write protect register	0x0064	R/W
RTC frequency calculation control and configuration registers			
TIMG_RTCCALICFG_REG	RTC frequency calculation configuration register 0	0x0068	varies
TIMG_RTCCALICFG1_REG	RTC frequency calculation configuration register 1	0x006C	RO
TIMG_RTCCALICFG2_REG	RTC frequency calculation configuration register 2	0x0080	varies
Interrupt registers			
TIMG_INT_ENA_TIMERS_REG	Interrupt enable bits	0x0070	R/W
TIMG_INT_RAW_TIMERS_REG	Raw interrupt status	0x0074	R/SS/WTC
TIMG_INT_ST_TIMERS_REG	Masked interrupt status	0x0078	RO
TIMG_INT_CLR_TIMERS_REG	Interrupt clear bits	0x007C	WT
Version register			
TIMG_NTIMERS_DATE_REG	Timer version control register	0x00F8	R/W
Clock configuration registers			
TIMG_REGCLK_REG	Timer group clock gate register	0x00FC	R/W

11.5 Registers

The addresses in this section are relative to Timer Group base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 11.1. TIMG_T0CONFIG_REG (0x0000)

TIMG_T0_EN	TIMG_T0_INCREASE	TIMG_T0_AUTORELOAD	TIMG_T0_DIVIDER	TIMG_T0_DIVIDER_RST	(reserved)	TIMG_T0_ALARM_EN	TIMG_T0_USE_XTAL	(reserved)	
31	30	29	28 13	12	11	10	9	8 0	
0	1	1	0x01	0	0	0	0	0 0 0 0 0 0 0 0 0	Reset

TIMG_T0_USE_XTAL 1: Use XTAL_CLK as the source clock of timer group. 0: Use APB_CLK as the source clock of timer group. (R/W)

TIMG_T0_ALARM_EN When set, the alarm is enabled. This bit is automatically cleared once an alarm occurs. (R/W/SC)

TIMG_T0_DIVIDER_RST When set, Timer 0 's clock divider counter will be reset. (WT)

TIMG_T0_DIVIDER Timer 0 clock (T0_clk) prescaler value. (R/W)

TIMG_T0_AUTORELOAD When set, Timer 0 auto-reload at alarm is enabled. (R/W)

TIMG_T0_INCREASE When set, the Timer 0 time-base counter will increment every clock tick. When cleared, the Timer 0 time-base counter will decrement. (R/W)

TIMG_T0_EN When set, the Timer 0 time-base counter is enabled. (R/W)

Register 11.2. TIMG_T0LO_REG (0x0004)

TIMG_T0_LO	
31 0	
0x000000	Reset

TIMG_T0_LO After writing to TIMG_T0UPDATE_REG, the low 32 bits of the time-base counter of Timer 0 can be read here. (RO)

Register 11.3. TIMG_T0HI_REG (0x0008)

(reserved)	TIMG_T0_HI	
31 22	21 0	
0 0 0 0 0 0 0 0 0 0	0x0000	Reset

TIMG_T0_HI After writing to TIMG_T0UPDATE_REG, the high 22 bits of the time-base counter of Timer 0 can be read here. (RO)

Register 11.4. TIMG_T0UPDATE_REG (0x000C)

TIMG_T0_UPDATE	(reserved)	
31	30 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

TIMG_T0_UPDATE After writing 0 or 1 to TIMG_T0UPDATE_REG, the counter value is latched. (R/W/SC)

Register 11.5. TIMG_T0ALARMLO_REG (0x0010)

TIMG_T0_ALARM_LO	
31 0	
0x000000	Reset

TIMG_T0_ALARM_LO Timer 0 alarm trigger time-base counter value, low 32 bits. (R/W)

Register 11.6. TIMG_T0ALARMHI_REG (0x0014)

(reserved)	TIMG_T0_ALARM_HI	
31 22	21 0	
0 0 0 0 0 0 0 0 0 0	0x0000	Reset

TIMG_T0_ALARM_HI Timer 0 alarm trigger time-base counter value, high 22 bits. (R/W)

Register 11.7. TIMG_T0LOADLO_REG (0x0018)

TIMG_T0_LOAD_LO	
31 0	
0x000000	Reset

TIMG_T0_LOAD_LO Low 32 bits of the value that a reload will load onto Timer 0 time-base counter. (R/W)

Register 11.8. TIMG_T0LOADHI_REG (0x001C)

(reserved)	TIMG_T0_LOAD_HI	
31 22	21 0	
0 0 0 0 0 0 0 0 0 0	0x0000	Reset

TIMG_T0_LOAD_HI High 22 bits of the value that a reload will load onto Timer 0 time-base counter. (R/W)

Register 11.9. TIMG_T0LOAD_REG (0x0020)

TIMG_T0_LOAD	
31 0	
0x000000	Reset

TIMG_T0_LOAD Write any value to trigger a Timer 0 time-base counter reload. (WT)

Register 11.10. TIMG_WDTCONFIG0_REG (0x0048)

TIMG_WDT_EN	TIMG_WDT_STG0	TIMG_WDT_STG1	TIMG_WDT_STG2	TIMG_WDT_STG3	TIMG_WDT_CONF_UPDATE_EN	TIMG_WDT_USE_XTAL	TIMG_WDT_CPU_RESET_LENGTH	TIMG_WDT_SYS_RESET_LENGTH	TIMG_WDT_FLASHBOOT_MOD_EN	TIMG_WDT_PROCPU_RESET_EN	TIMG_WDT_APPCPU_RESET_EN	(reserved)	
31	30 29	28 27	26 25	24 23	22	21	20 18	17 15	14	13	12	11 0	
0	0	0	0	0	0	0	0x1	0x1	1	0	0	0 0 0 0 0 0 0 0 0 0 0 0	Reset

TIMG_WDT_APPCPU_RESET_EN WDT reset CPU enable. (R/W)

TIMG_WDT_PROCPU_RESET_EN WDT reset CPU enable. (R/W)

TIMG_WDT_FLASHBOOT_MOD_EN When set, Flash boot protection is enabled. (R/W)

TIMG_WDT_SYS_RESET_LENGTH System reset signal length selection. 0: 100 ns, 1: 200 ns, 2: 300 ns, 3: 400 ns, 4: 500 ns, 5: 800 ns, 6: 1.6 μs, 7: 3.2 μs. (R/W)

TIMG_WDT_CPU_RESET_LENGTH CPU reset signal length selection. 0: 100 ns, 1: 200 ns, 2: 300 ns, 3: 400 ns, 4: 500 ns, 5: 800 ns, 6: 1.6 μs, 7: 3.2 μs. (R/W)

TIMG_WDT_USE_XTAL Chooses WDT clock. 0: APB_CLK; 1:XTAL_CLK. (R/W)

TIMG_WDT_CONF_UPDATE_EN Updates the WDT configuration registers. (WT)

TIMG_WDT_STG3 Stage 3 configuration. 0: off, 1: interrupt, 2: reset CPU, 3: reset system. (R/W)

TIMG_WDT_STG2 Stage 2 configuration. 0: off, 1: interrupt, 2: reset CPU, 3: reset system. (R/W)

TIMG_WDT_STG1 Stage 1 configuration. 0: off, 1: interrupt, 2: reset CPU, 3: reset system. (R/W)

TIMG_WDT_STG0 Stage 0 configuration. 0: off, 1: interrupt, 2: reset CPU, 3: reset system. (R/W)

TIMG_WDT_EN When set, MWDT is enabled. (R/W)

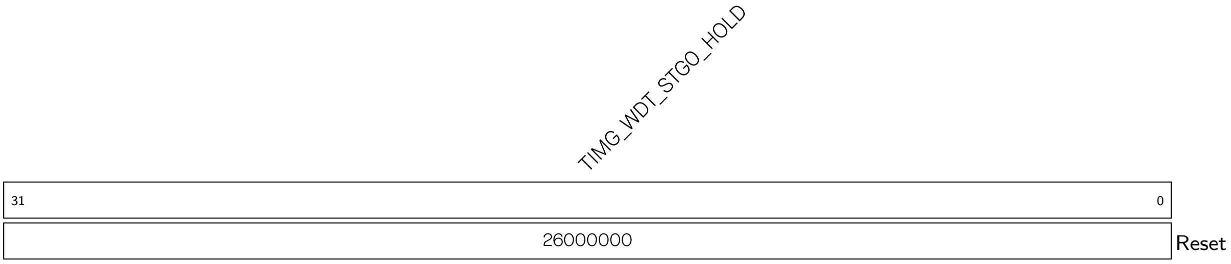
Register 11.11. TIMG_WDTCONFIG1_REG (0x004C)

TIMG_WDT_CLK_PRESCALE	(reserved)	TIMG_WDT_DIVCNT_RST	
31 16	15 1	0	
0x01	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

TIMG_WDT_DIVCNT_RST When set, WDT 's clock divider counter will be reset. (WT)

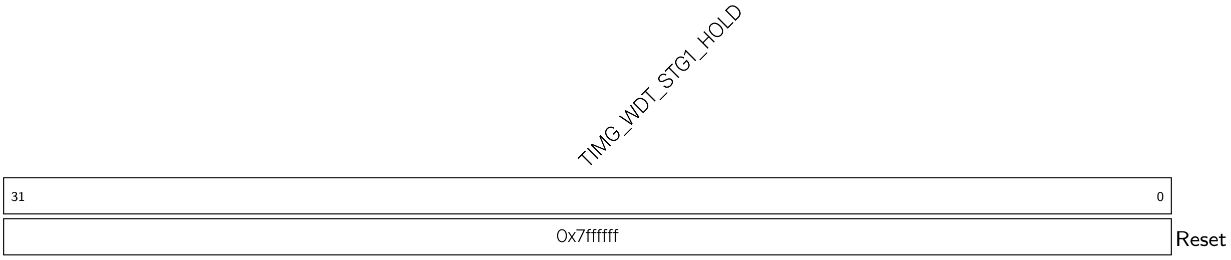
TIMG_WDT_CLK_PRESCALE MWDT clock prescaler value. MWDT clock period = MWDT's clock source period * TIMG_WDT_CLK_PRESCALE. (R/W)

Register 11.12. TIMG_WDTCONFIG2_REG (0x0050)



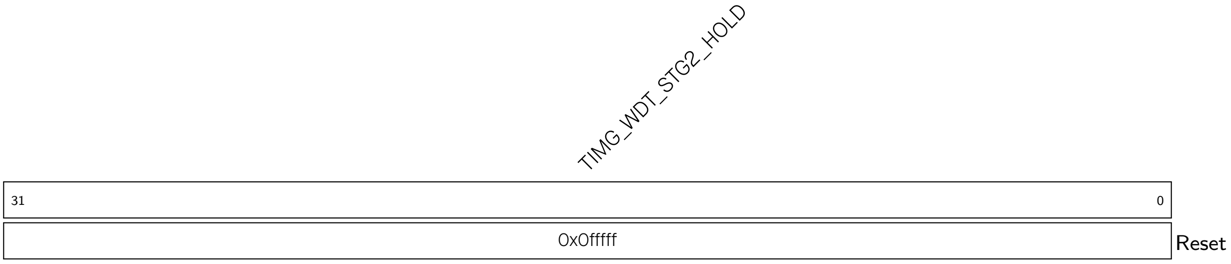
TIMG_WDT_STG0_HOLD Stage 0 timeout value, in MWDT clock cycles. (R/W)

Register 11.13. TIMG_WDTCONFIG3_REG (0x0054)



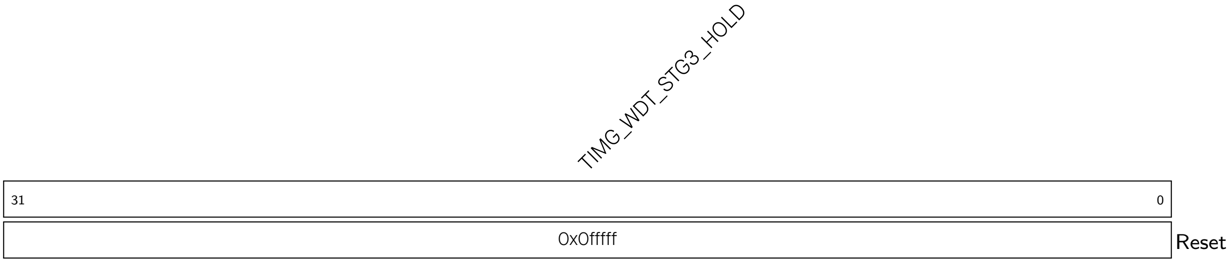
TIMG_WDT_STG1_HOLD Stage 1 timeout value, in MWDT clock cycles. (R/W)

Register 11.14. TIMG_WDTCONFIG4_REG (0x0058)



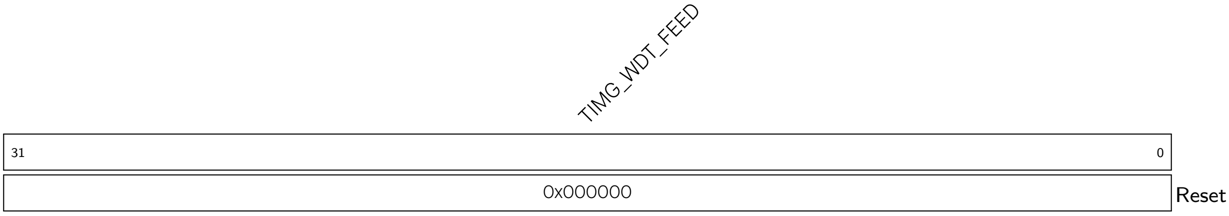
TIMG_WDT_STG2_HOLD Stage 2 timeout value, in MWDT clock cycles. (R/W)

Register 11.15. TIMG_WDTCONFIG5_REG (0x005C)



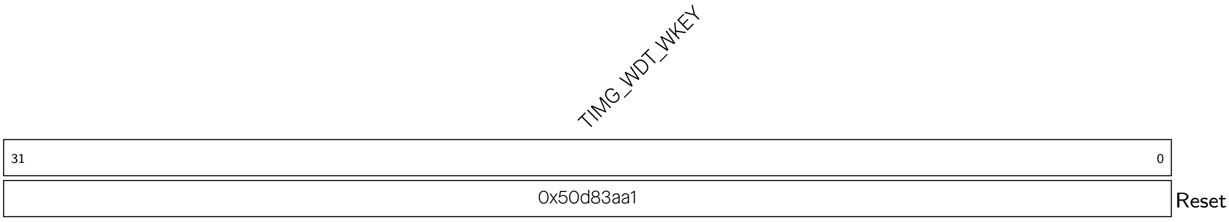
TIMG_WDT_STG3_HOLD Stage 3 timeout value, in MWDT clock cycles. (R/W)

Register 11.16. TIMG_WDTFEED_REG (0x0060)



TIMG_WDT_FEED Write any value to feed the MWDT. (WO) (WT)

Register 11.17. TIMG_WDTWPROTECT_REG (0x0064)



TIMG_WDT_WKEY If the register contains a different value than its reset value, write protection is enabled. (R/W)

Register 11.18. TIMG_RTCCALICFG_REG (0x0068)

TIMG_RTC_CALI_START	TIMG_RTC_CALI_MAX	TIMG_RTC_CALI_RDY	TIMG_RTC_CALI_CLK_SEL	TIMG_RTC_CALI_START_CYCLING	(reserved)	
31	30 16	15	14 13	12	11 0	
0	0x01	0	0x1	1	0 0 0 0 0 0 0 0 0 0 0 0	Reset

TIMG_RTC_CALI_START_CYCLING Enables periodic frequency calculation. (R/W)

TIMG_RTC_CALI_CLK_SEL 0: RC_SLOW_CLK; 1: RC_FAST_DIV_CLK; 2: XTAL32K_CLK. (R/W)

TIMG_RTC_CALI_RDY Marks the completion of one-shot frequency calculation. (RO)

TIMG_RTC_CALI_MAX Configures the time to calculate the frequency of RTC_SLOW_CLK. Measurement unit: RTC_SLOW_CLK cycle. (R/W)

TIMG_RTC_CALI_START Set this bit to enable one-shot frequency calculation. (R/W)

Register 11.19. TIMG_RTCCALICFG1_REG (0x006C)

TIMG_RTC_CALI_VALUE	(reserved)	TIMG_RTC_CALI_CYCLING_DATA_VLD	
31 7	6 1	0	
0x00000	0 0 0 0 0 0	0	Reset

TIMG_RTC_CALI_CYCLING_DATA_VLD Marks the completion of periodic frequency calculation. (RO)

TIMG_RTC_CALI_VALUE When one-shot or periodic frequency calculation completes, read this value to calculate the frequency of RTC_SLOW_CLK. Measurement unit: XTAL_CLK cycle. (RO)

Register 11.20. TIMG_RTCCALICFG2_REG (0x0080)

TIMG_RTC_CALI_TIMEOUT_THRES	TIMG_RTC_CALI_TIMEOUT_RST_CNT	(reserved)	TIMG_RTC_CALI_TIMEOUT	
31 7	6 3	2 1	0	
0x1ffffff	3	0 0	0	Reset

TIMG_RTC_CALI_TIMEOUT Indicates frequency calculation timeout. (RO)

TIMG_RTC_CALI_TIMEOUT_RST_CNT Cycles to reset frequency calculation timeout. (R/W)

TIMG_RTC_CALI_TIMEOUT_THRES Threshold value for the frequency calculation timer. If the timer's value exceeds this threshold, a timeout is triggered. (R/W)

Register 11.21. TIMG_INT_ENA_TIMERS_REG (0x0070)

(reserved)	TIMG_WDT_INT_ENA	TIMG_TO_INT_ENA	
31 2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

TIMG_TO_INT_ENA The interrupt enable bit for the TIMG_TO_INT interrupt. (R/W)

TIMG_WDT_INT_ENA The interrupt enable bit for the TIMG_WDT_INT interrupt. (R/W)

Register 11.22. TIMG_INT_RAW_TIMERS_REG (0x0074)

(reserved)	TIMG_WDT_INT_RAW	TIMG_TO_INT_RAW	
31 2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

TIMG_TO_INT_RAW The raw interrupt status bit for the TIMG_TO_INT interrupt. (R/SS/WTC)

TIMG_WDT_INT_RAW The raw interrupt status bit for the TIMG_WDT_INT interrupt. (R/SS/WTC)

Register 11.23. TIMG_INT_ST_TIMERS_REG (0x0078)

(reserved)	TIMG_WDT_INT_ST	TIMG_TO_INT_ST	
31 2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

TIMG_TO_INT_ST The masked interrupt status bit for the TIMG_TO_INT interrupt. (RO)

TIMG_WDT_INT_ST The masked interrupt status bit for the TIMG_WDT_INT interrupt. (RO)

Register 11.24. TIMG_INT_CLR_TIMERS_REG (0x007C)

(reserved)	TIMG_WDT_INT_CLR	TIMG_TO_INT_CLR	
31 2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

TIMG_TO_INT_CLR Set this bit to clear the TIMG_TO_INT interrupt. (WT)

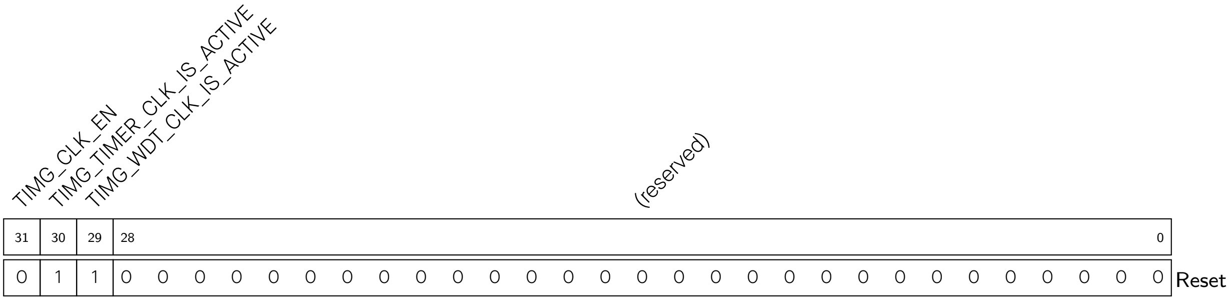
TIMG_WDT_INT_CLR Set this bit to clear the TIMG_WDT_INT interrupt. (WT)

Register 11.25. TIMG_NTIMERS_DATE_REG (0x00F8)

(reserved)	TIMG_NTIMGS_DATE	
31 28	27 0	
0 0 0 0	0x2006191	Reset

TIMG_NTIMGS_DATE Timer version control register (R/W)

Register 11.26. TIMG_REGCLK_REG (0x00FC)



TIMG_WDT_CLK_IS_ACTIVE enable WDT's clock (R/W)

TIMG_TIMER_CLK_IS_ACTIVE enable Timer 0's clock (R/W)

TIMG_CLK_EN Register clock gate signal. 0: The clock used by software to read and write registers is on only when there is software operation. 1: The clock used by software to read and write registers is always on. (R/W)

12 Watchdog Timers (WDT)

12.1 Overview

Watchdog timers are hardware timers used to detect and recover from malfunctions. They must be periodically fed (reset) to prevent a timeout. A system/software that is behaving unexpectedly (e.g. is stuck in a software loop or in overdue events) will fail to feed the watchdog thus trigger a watchdog timeout. Therefore, watchdog timers are useful for detecting and handling erroneous system/software behavior.

As shown in Figure 12-1, ESP32-C3 contains three digital watchdog timers: one in each of the two timer groups in Chapter 11 *Timer Group (TIMG)*(called Main System Watchdog Timers, or MWDT) and one in the RTC Module (called the RTC Watchdog Timer, or RWDT). Each digital watchdog timer allows for four separately configurable stages and each stage can be programmed to take one action upon expiry, unless the watchdog is fed or disabled. MWDT supports three timeout actions: interrupt, CPU reset, and core reset, while RWDT supports four timeout actions: interrupt, CPU reset, core reset, and system reset (see details in Section 12.2.2.2 *Stages and Timeout Actions*). A timeout value can be set for each stage individually.

During the flash boot process, RWDT and the first MWDT in timergroup 0 are enabled automatically in order to detect and recover from booting errors.

ESP32-C3 also has one analog watchdog timer: Super watchdog (SWD). It is an ultra-low-power circuit in analog domain that helps to prevent the system from operating in a sub-optimal state and resets the system if required.

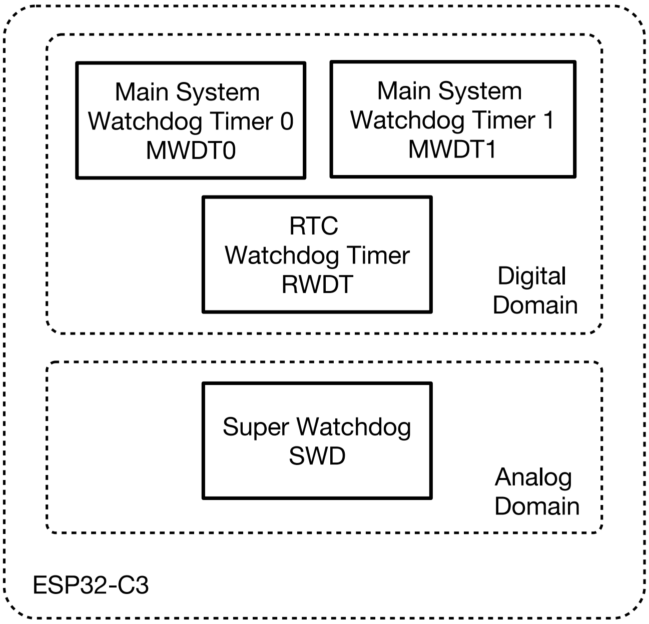


Figure 12-1. Watchdog Timers Overview

Note that while this chapter provides the functional descriptions of the watchdog timer's, their register descriptions are provided in Chapter 11 *Timer Group (TIMG)* and Chapter 9 *Low-power Management*.

12.2 Digital Watchdog Timers

12.2.1 Features

Watchdog timers have the following features:

- Four stages, each with a programmable timeout value. Each stage can be configured and enabled/disabled separately
- Three timeout actions (interrupt, CPU reset, or core reset) for MWDT and four timeout actions (interrupt, CPU reset, core reset, or system reset) for RWDT upon expiry of each stage
- 32-bit expiry counter
- Write protection, to prevent RWDT and MWDT configuration from being altered inadvertently
- Flash boot protection
  If the boot process from an SPI flash does not complete within a predetermined period of time, the watchdog will reboot the entire main system.

12.2.2 Functional Description

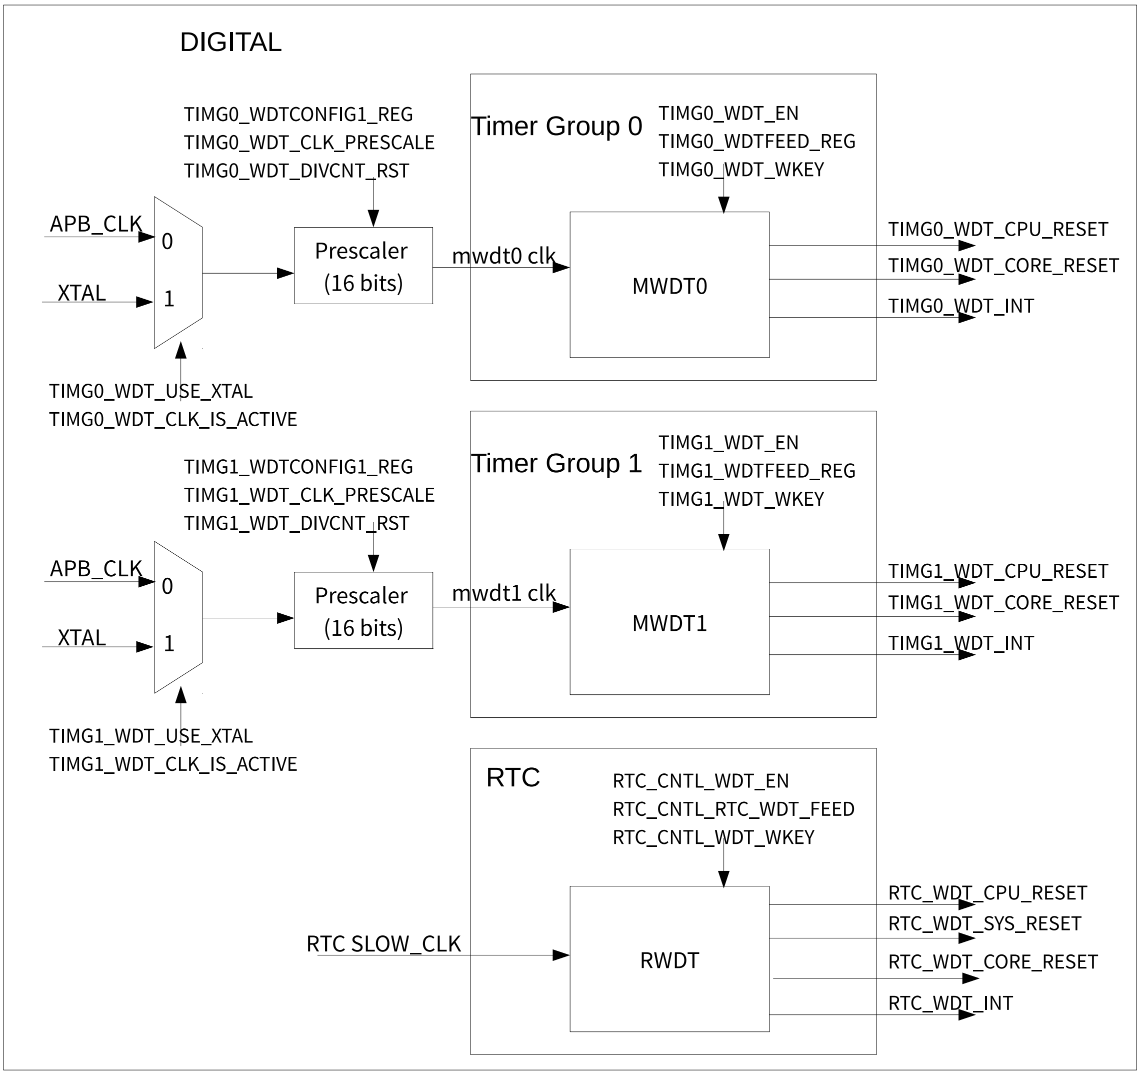

Figure 12-2. Watchdog Timers in ESP32-C3

Figure 12-2 shows the three watchdog timers in ESP32-C3 digital systems.

12.2.2.1 Clock Source and 32-Bit Counter

At the core of each watchdog timer is a 32-bit counter.

MWDTs can select between the APB clock (APB_CLK) or external clock (XTAL_CLK) as its clock source by setting the TIMG_WDT_USE_XTAL field of the TIMG_WDTCONFIG0_REG register. The selected clock is switched on by setting TIMG_WDT_CLK_IS_ACTIVE field of the TIMG_REGCLK_REG register to 1 and switched off by setting it to 0. Then the selected clock is divided by a 16-bit configurable prescaler. The 16-bit prescaler for MWDTs is configured via the TIMG_WDT_CLK_PRESCALE field of TIMG_WDTCONFIG1_REG.When TIMG_WDT_DIVCNT_RST field is set, the prescaler is reset and it can be re-configured at once.

In contrast, the clock source of RWDT is derived directly from an RTC slow clock (the RTC slow clock source shown in Chapter 6 *Reset and Clock*).

MWDTs and RWDT are enabled by setting the TIMG_WDT_EN and RTC_CNTL_WDT_EN fields respectively. When enabled, the 32-bit counters of each watchdog will increment on each source clock cycle until the timeout value of the current stage is reached (i.e. expiry of the current stage). When this occurs, the current counter value is reset to zero and the next stage will become active. If a watchdog timer is fed by software, the timer will return to stage 0 and reset its counter value to zero. Software can feed a watchdog timer by writing any value to TIMG_WDTFEED_REG for MDWTs and RTC_CNTL_WDT_FEED for RWDT.

12.2.2.2 Stages and Timeout Actions

Timer stages allow for a timer to have a series of different timeout values and corresponding expiry action. When one stage expires, the expiry action is triggered, the counter value is reset to zero, and the next stage becomes active. MWDTs/ RWDT provide four stages (called stages 0 to 3). The watchdog timers will progress through each stage in a loop (i.e. from stage 0 to 3, then back to stage 0).

Timeout values of each stage for MWDTs are configured in TIMG_WDTCONFIG*i*_REG (where *i* ranges from 2 to 5), whilst timeout values for RWDT are configured using RTC_CNTL_WDT_STG*j*_HOLD field (where *j* ranges from 0 to 3).

Please note that the timeout value of stage 0 for RWDT (Thold$_0$) is determined by the combination of the
EFUSE_WDT_DELAY_SEL field of eFuse register EFUSE_RD_REPEAT_DATA1_REG and
RTC_CNTL_WDT_STG0_HOLD. The relationship is as follows:

$$T_{hold0} = RTC\_CNTL\_WDT\_STG0\_HOLD << (EFUSE\_WDT\_DELAY\_SEL + 1)$$

where $<<$ is a left-shift operator.

Upon the expiry of each stage, one of the following expiry actions will be executed:

- Trigger an interrupt
  When the stage expires, an interrupt is triggered.
- CPU reset – Reset a CPU core
  When the stage expires, the CPU core will be reset.

- Core reset – Reset the main system
  When the stage expires, the main system (which includes MWDTs, CPU, and all peripherals) will be reset. The power management unit and RTC peripheral will not be reset.
- System reset – Reset the main system, power management unit and RTC peripheral
  When the stage expires the main system, power management unit and RTC peripheral (see details in Chapter 9 *Low-power Management*) will all be reset. This action is only available in RWDT.
- Disabled
  This stage will have no effects on the system.

For MWDTs, the expiry action of all stages is configured in TIMG_WDTCONFIG0_REG. Likewise for RWDT, the expiry action is configured in RTC_CNTL_WDTCONFIG0_REG.

12.2.2.3 Write Protection

Watchdog timers are critical to detecting and handling erroneous system/software behavior, thus should not be disabled easily (e.g. due to a misplaced register write). Therefore, MWDTs and RWDT incorporate a write protection mechanism that prevent the watchdogs from being disabled or tampered with due to an accidental write. The write protection mechanism is implemented using a write-key field for each timer (TIMG_WDT_WKEY for MWDT, RTC_CNTL_WDT_WKEY for RWDT). The value 0x50D83AA1 must be written to the watchdog timer's write-key field before any other register of the same watchdog timer can be changed. Any attempts to write to a watchdog timer's registers (other than the write-key field itself) whilst the write-key field's value is not 0x50D83AA1 will be ignored. The recommended procedure for accessing a watchdog timer is as follows:

1. Disable the write protection by writing the value 0x50D83AA1 to the timer's write-key field.
2. Make the required modification of the watchdog such as feeding or changing its configuration.
3. Re-enable write protection by writing any value other than 0x50D83AA1 to the timer's write-key field.

12.2.2.4 Flash Boot Protection

During flash booting process, MWDT in timer group 0 (see Figure 11-1 *Timer Units within Groups*), as well as RWDT, are automatically enabled. Stage 0 for the enabled MWDT is automatically configured to reset the system upon expiry, known as core reset. Likewise, stage 0 for RWDT is configured to system reset, which resets the main system and RTC when it expires. After booting, TIMG_WDT_FLASHBOOT_MOD_EN and RTC_CNTL_WDT_FLASHBOOT_MOD_EN should be cleared to stop the flash boot protection procedure for both MWDT and RWDT respectively. After this, MWDT and RWDT can be configured by software.

12.3 Super Watchdog

Super watchdog (SWD) is an ultra-low-power circuit in analog domain that helps to prevent the system from operating in a sub-optimal state and resets the system if required. SWD contains a watchdog circuit that needs to be fed for at least once during its timeout period, which is slightly less than one second. About 100 ms before watchdog timeout, it will also send out a WD_INTR signal as a request to remind the system to feed the watchdog.

If the system doesn't respond to SWD feed request and watchdog finally times out, SWD will generate a system level signal SWD_RSTB to reset whole digital circuits on the chip.

12.3.1 Features

SWD has the following features:

- Ultra-low power
- Interrupt to indicate that the SWD timeout period is close to expiring
- Various dedicated methods for software to feed SWD, which enables SWD to monitor the working state of the whole operating system

12.3.2 Super Watchdog Controller

12.3.2.1 Structure

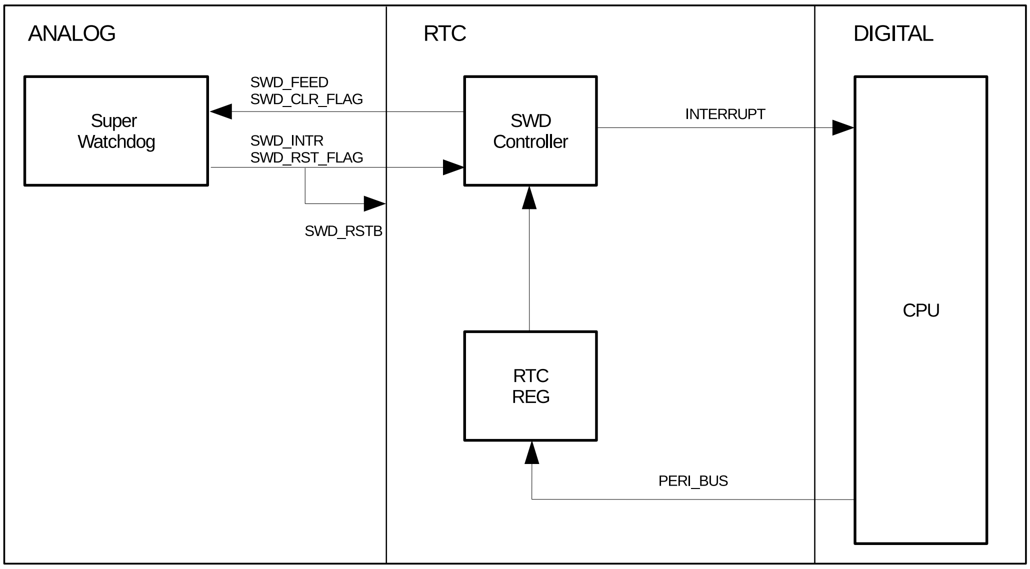

Figure 12-3. Super Watchdog Controller Structure

12.3.2.2 Workflow

In normal state:

- SWD controller receives feed request from SWD.
- SWD controller can send an interrupt to main CPU.
- Main CPU can feed SWD directly by setting RTC_CNTL_SWD_FEED.
- When trying to feed SWD, CPU needs to disable SWD controller's write protection by writing 0x8F1D312A to RTC_CNTL_SWD_WKEY. This prevents SWD from being fed by mistake when the system is operating in sub-optimal state.
- If setting RTC_CNTL_SWD_AUTO_FEED_EN to 1, SWD controller can also feed SWD itself without any interaction with CPU.

After reset:

- Check RTC_CNTL_RESET_CAUSE_PROCPU[5:0] for the cause of CPU reset.
  If RTC_CNTL_RESET_CAUSE_PROCPU[5:0] == 0x12, it indicates that the cause is SWD reset.
- Set RTC_CNTL_SWD_RST_FLAG_CLR to clear the SWD reset flag.

12.4 Interrupts

For watchdog timer interrupts, please refer to Section 11.2.6 *Interrupts* in Chapter 11 *Timer Group (TIMG)*.

12.5 Registers

MWDT registers are part of the timer submodule and are described in Section 11.4 *Register Summary* in Chapter 11 *Timer Group (TIMG)*. RWDT and SWD registers are part of the RTC submodule and are described in Section 9.7 *Register Summary* in Chapter 9 *Low-power Management*.

13 XTAL32K Watchdog Timers (XTWDT)

13.1 Overview

The XTAL32K watchdog timer on ESP32-C3 is used to monitor the status of external crystal XTAL32K_CLK. This watchdog timer can detect the oscillation failure of XTAL32K_CLK, change the clock source of RTC, etc. When XTAL32K_CLK works as the clock source of RTC_SLOW_CLK (for clock description, see Chapter 6 *Reset and Clock*) and stops vibrating, the XTAL32K watchdog timer first switches to BACKUP32K_CLK derived from RC_SLOW_CLK and generates an interrupt (if the chip is in Light-sleep and Deep-sleep mode, the CPU will be woken up), and then switches back to XTAL32K_CLK after it is restarted by software.

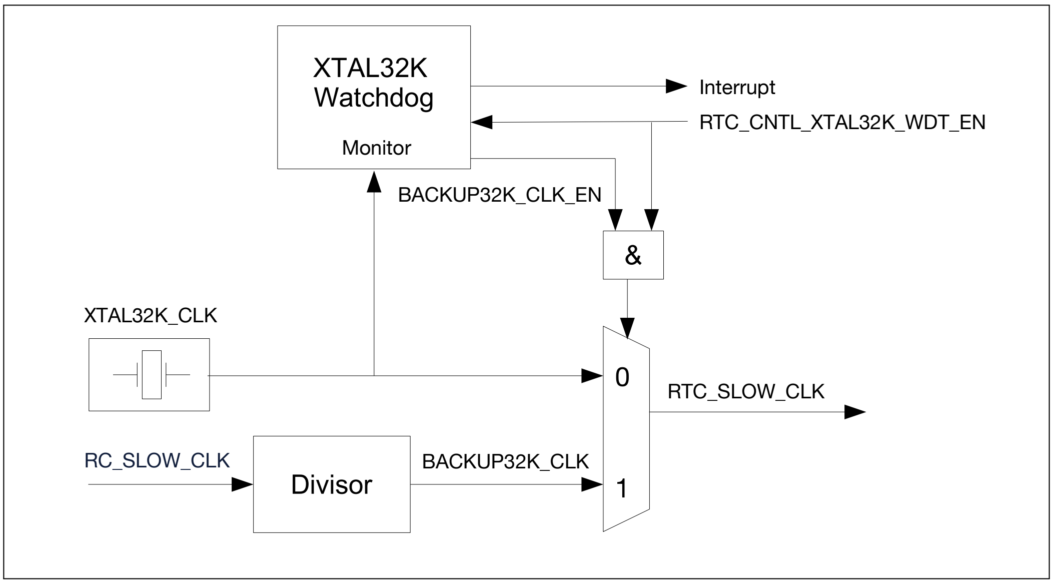

Figure 13-1. XTAL32K Watchdog Timer

13.2 Features

13.2.1 Interrupt and Wake-Up

When the XTAL32K watchdog timer detects the oscillation failure of XTAL32K_CLK, an oscillation failure interrupt RTC_XTAL32K_DEAD_INT (for interrupt description, please refer to Chapter 9 *Low-power Management*) is generated. At this point, the CPU will be woken up if in Light-sleep and Deep-sleep mode.

13.2.2 BACKUP32K_CLK

Once the XTAL32K watchdog timer detects the oscillation failure of XTAL32K_CLK, it replaces XTAL32K_CLK with BACKUP32K_CLK (with a frequency of 32 kHz or so) derived from RC_SLOW_CLK as RTC_SLOW_CLK, so as to ensure proper functioning of the system.

13.3 Functional Description

13.3.1 Workflow

1. The XTAL32K watchdog timer starts counting when RTC_CNTL_XTAL32K_WDT_EN is enabled. The counter based on RC_SLOW_CLK keeps counting until it detects the positive edge of XTAL_32K and is then cleared. When the counter reaches RTC_CNTL_XTAL32K_WDT_TIMEOUT, it generates an interrupt or a wake-up signal and is then reset.
2. If RTC_CNTL_XTAL32K_AUTO_BACKUP is set and step 1 is finished, the XTAL32K watchdog timer will automatically enable BACKUP32K_CLK as the alternative clock source of RTC_SLOW_CLK, to ensure the system's proper functioning and the accuracy of timers running on RTC_SLOW_CLK (e.g. RTC_TIMER). For information about clock frequency configuration, please refer to Section 13.3.2.
3. Software restarts XTAL32K_CLK by turning its XPD (meaning no power-down) signal off and on again via the RTC_CNTL_XPD_XTAL_32K bit. Then, the XTAL32K watchdog timer switches back to XTAL32K_CLK as the clock source of RTC_SLOW_CLK by clearing RTC_CNTL_XTAL32K_WDT_EN (BACKUP32K_CLK_EN is also automatically cleared). If the chip is in Light-sleep and Deep-sleep mode, the XTAL32K watchdog timer will wake up the CPU to finish the above steps.

13.3.2 BACKUP32K_CLK Working Principle

Chips have different RC_SLOW_CLK frequencies due to production process variations. To ensure the accuracy of RTC_TIMER and other timers running on RTC_SLOW_CLK when BACKUP32K_CLK is at work, the divisor of BACKUP32K_CLK should be configured according to the actual frequency of RC_SLOW_CLK (see details in Chapter 9 *Low-power Management*) via the RTC_CNTL_XTAL32K_CLK_FACTOR_REG register. Each byte in this register corresponds to a divisor component (x_0 ~x_7). BACKUP32K_CLK is divided by a fraction where the denominator is always 4, as calculated below.

$$f\_back\_clk/4 = f\_rc\_slow\_clk/S$$

$$S = x_0 + x_1 + ... + x_7$$

f_back_clk is the desired frequency of BACKUP32K_CLK, i.e. 32.768 kHz; f_rc_slow_clk is the actual frequency of RC_SLOW_CLK; x_0 ~x_7 correspond to the pulse width in high and low state of four BACKUP32K_CLK clock signals (unit: RC_SLOW_CLK clock cycle).

13.3.3 Configuring the Divisor Component of BACKUP32K_CLK

Based on principles described in Section 13.3.2, configure the divisor component as follows:

- Calculate the sum of divisor components S according to the frequency of RC_SLOW_CLK and the desired frequency of BACKUP32K_CLK;
- Calculate the integer part of divisor $N = f\_rc\_slow\_clk/f\_back\_clk$;
- Calculate the integer part of divisor component $M = N/2$. The integer part of divisor N are separated into two parts because a divisor component corresponds to a pulse width in high or low state;
- Calculate the number of divisor components that equal M (x_n = M) and the number of divisor components that equal M + 1 (x_n = M + 1) according to the value of M and S. (M + 1) is the fractional part of divisor component.

For example, if the frequency of RC_SLOW_CLK is 163 kHz, then $f\_rc\_slow\_clk = 163000$, $f\_back\_clk = 32768$, $S = 20$, $M = 2$, and $\{x_0, x_1, x_2, x_3, x_4, x_5, x_6, x_7\} = \{2, 3, 2, 3, 2, 3, 2, 3\}$. As a result, the frequency of BACKUP32K_CLK is 32.6 kHz.

14 Permission Control (PMS)

14.1 Overview

ESP32-C3 includes a Permission Controller (PMS), which allocates the hardware resources (memory and peripherals) to two isolated environments, thereby realizing the separation of privileged and unprivileged environments.

- Privileged Environment:
  - Can access all peripherals and memories;
  - Performs all confidential operations, such as user authentication, secure communication, and data encryption and decryption, etc.
- Unprivileged Environment:
  - Can access some peripherals and memories;
  - Performs other operations, such as user operation and different applications, etc.

Besides, ESP32-C3's RISC-V CPU also has a Physical Memory Protection (PMP) unit, which can be used by software to set memory access privileges (read, write, and execute permissions) for required memory regions. However, the PMP unit has some limitations:

- Only supports up to 16 configurable PMP regions, which sometimes are not enough to fully support the access management requirement of ESP32-C3's rich peripherals and different types of memories.
- Can only control CPU, not GDMA.

To this, ESP32-C3 has specially implemented this Permission Controller to complete the Physical Memory Protection unit.

ESP32-C3's completed workflow of permission check can be described below (also see Figure 14-1):

1. Check PMP permission
   - Pass: then continue and further check PMS permission
   - Fail: throw an exception and will not further check PMS permission
2. Check PMS permission
   - Pass: access allowed
   - Fail: trigger an interrupt

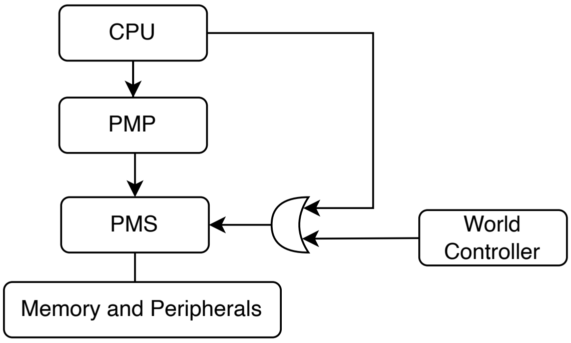

Figure 14-1. Permission Control Overview

For details about PMP, please refer to Section 1.8.1 in Chapter 1 *ESP-RISC-V CPU*. For details about World Controller, please refer to Chapter 15 *World Controller (WCL)*. This chapter only describes ESP32-C3's PMS mechanism.

14.2 Features

ESP32-C3's extended permission control mechanism supports:

- Independent access management in a privileged environment and unprivileged environment
- Independent access management to internal memory, including
  - CPU access to internal memory
  - GDMA access to internal memory
- Independent access management to external memory, including
  - CPU to external memory via SPI1
  - CPU to external memory via Cache
- Independent access management to peripheral regions, including
  - CPU access to peripheral regions
  - Interrupt upon unsupported access alignment
- Address splitting for more flexible access management
- Register locks to secure the integrity of access management related registers
- Interrupt upon unauthorized access

14.3 Privileged Environment and Unprivileged Environment

During PMS check, ESP32-C3 chip:

- When in the privileged environment: check the permission configuration registers for the privileged environment
- When not in the unprivileged environment: check the permission configuration registers for the unprivileged environment

Users can choose either of these two ways below to enter the chip into privileged environment:

- By configuring the world controller
  - Switching to Secure world: entering the privileged environment
  - Switching to Non-secure world: entering the unprivileged environment
- By configuring the privileged level of the 32-bit RISV-V CPU:
  - Switching to Machine mode: entering the privileged environment
  - Switching to User mode: entering the unprivileged environment

Users can configure PMS_PRIVILEGE_MODE_SEL to choose between the above-mentioned two ways to enter the chip into privileged environment:

- 0 (Default): via configuring the world controller. See details in Chapter 15 *World Controller (WCL)*.
- 1: via configuring the CP's privileged level. See details in Chapter 1 *ESP-RISC-V CPU*.

The following sections introduce how to configure the permission to different areas in the privileged environment and the unprivileged environment.

14.4 Internal Memory

ESP32-C3 has the following types of internal memory:

- ROM: 384 KB in total, including 256 KB Internal ROM0 and 128 KB Internal ROM1
- SRAM: 400 KB in total, including 16 KB Internal SRAM0 and 384 KB Internal SRAM1
- RTC FAST Memory: 8 KB in total, which can be further split into two regions each with independent permission configuration

This section describes how to configure the permission to each type of ESP32-C3's internal memory.

14.4.1 ROM

ESP32-C3's ROM can be accessed by CPU's instruction bus (IBUS) and data bus (DBUS) when configured. The ROM ranges accessible for IBUS and DBUS respectively are listed in Table 14-1.

Table 14-1. ROM Address

ROM	IBUS Address		DBUS Address	
	Starting Address	Ending Address	Starting Address	Ending Address
Internal ROM0	0x4000_0000	0x4003_FFFF	-	-
Internal ROM1	0x4004_0000	0x4005_FFFF	0x3FF0_0000	0x3FF1_FFFF

ESP32-C3 uses the registers listed in Table 14-2 to configure the instruction execution (X), write (W) and read (R) accesses of CPU's IBUS and DBUS, in User mode and Machine mode. Note that access configuration to ROM0 and ROM1 cannot be configured separately:

Table 14-2. Access Configuration to ROM (ROM0 and ROM1)

Bus	Environment	Configuration Registers[A]	Access
IBUS	Privileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_2_REG [20:18][B]	X/W/R
	Unprivileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_1_REG [20:18][B]	X/W/R
DBUS	Privileged	PMS_CORE_X_DRAM0_PMS_CONSTRAIN_1_REG [25:24][C]	W/R
	Unprivileged	PMS_CORE_X_DRAM0_PMS_CONSTRAIN_1_REG [27:26]	W/R

[A] 1: with access; 0: without access

[B] For example, configuring this field to 0b101 indicates CPU's IBUS is granted instruction execution and read accesses but not write access to ROM in the unprivileged environment.

[C] For example, configuring this field to 0b01 indicates CPU's DBUS is granted read access but not write access to ROM in privileged environment.

14.4.2 SRAM

ESP32-C3's SRAM can be accessed by CPU's instruction bus (IBUS) and data bus (DBUS) when configured. The SRAM address ranges accessible for IBUS and DBUS respectively are listed in Table 14-3.

Table 14-3. SRAM Address

SRAM	Block	IBUS Address		DBUS Address	
		Starting Address	Ending Address	Starting Address	Ending Address
Internal SRAM0	-	0x4037_C000	0x4037_FFFF	-	-
Internal SRAM1	Block0	0x4038_0000	0x4039_FFFF	0x3FC8_0000	0x3FC9_FFFF
	Block1	0x403A_0000	0x403B_FFFF	0x3FCA_0000	0x3FCB_FFFF
	Block2	0x403C_0000	0x403D_FFFF	0x3FCC_0000	0x3FCD_FFFF

Here, we will first introduce how to configure the permission to Internal SRAM0 and then Internal SRAM1.

14.4.2.1 Internal SRAM0 Access Configuration

ESP32-C3's Internal SRAM0 can be allocated to either CPU or ICACHE.

Users can configure PMS_INTERNAL_SRAM_USAGE_CPU_CACHE to allocate ESP32-C3's Internal SRAM0 to either CPU or ICACHE:

- 1: CPU
- 0: ICACHE

When the Internal SRAM0 is allocated to CPU, ESP32-C3 uses the registers listed in Table 14-4 to configure the instruction execution (X), write (W) and read (R) accesses of CPU's IBUS, in the privileged environment and the unprivileged environment:

Table 14-4. Access Configuration to Internal SRAM0

Bus[A]	Environment	Configuration Registers[B]	Access
IBUS	Privileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_SRAM_M_MODE_CACHEDATAARRAY_PMS_0[C]	X/W/R
	Unprivileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_SRAM_U_MODE_CACHEDATAARRAY_PMS_0	X/W/R

[A] To access the Internal SRAM0, CPU must be configured with both the usage permission and respective access permission.

[B] 1: with access; 0: without access

[C] For example, configuring this field to 0b101 indicates CPU's IBUS is granted with instruction execution and read accesses but not write access to SRAM0 in the privileged environment.

14.4.2.2 Internal SRAM1 Access Configuration

ESP32-C3's Internal SRAM1 includes Block0 ~ Block2 (see details in Table 14-3) and can be:

- Accessed by CPU's DBUS, IBUS and GDMA at the same time
- Further split into up to 6 regions with independent access management for more flexible permission control.

ESP32-C3's Internal SRAM1 can be further split into up to 6 regions with 5 split lines. Users can configure different access to each region independently.

To be more specific, the Internal SRAM1 can be first split into Instruction Region and Data Region by IRam0_DRam0_split_line:

- Instruction Region:
  - Then the Instruction Region should be only configured to be accessed by IBUS;
  - And can be further split into three split regions by IRam0_split_line_0 and IRam0_split_line_1.
- Data Region:
  - The Data Region should be only configured to be accessed by DBUS;
  - And can be further split into three split regions by DRam0_split_line_0 and DRam0_split_line_1.

See illustration in Figure 14-2 and Table 14-5 below.

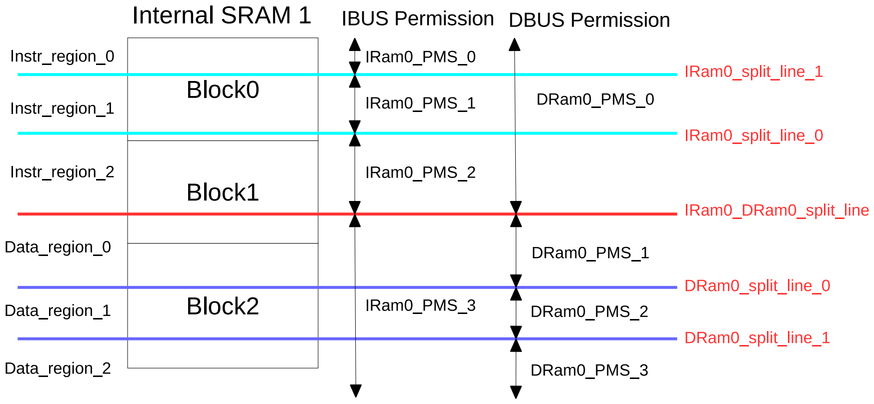

Figure 14-2. Split Lines for Internal SRAM1

Table 14-5. Internal SRAM1 Split Regions

Internal Memory [A]	Instruction / Data Regions	Split Regions[B]
SRAM1	Instruction Region	Instr_Region_0
		Instr_Region_1
		Instr_Region_2
	Data Region	Data_Region_0
		Data_Region_1
		Data_Region_2

[A] Access to each split region can be configured independently. See details in Table 14-6 and 14-7.

[B] See the description below on how to configure the split lines.

Internal SRAM1 Split Regions

ESP32-C3 allows users to configure the split lines to their needs with registers below:

- Split line to split the Instruction and Data regions (IRam0_DRam0_split_line):
  - PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_1_REG
- The first split line to further split the Instruction Region (IRam0_split_line_0):
  - PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_2_REG
- The second split line to further split the Instruction Region (IRam0_split_line_1):
  - PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_3_REG
- The first split line to further split the data Region (DRam0_split_line_0):
  - PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_4_REG
- The second split line to further split the data Region (DRam0_split_line_1):
  - PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_5_REG

When configuring the split lines,

1. First configure the block in which the spilt line is by:
   - Configuring the Category_*x* field for the block in which the split line is to 0x1 or 0x2 (no difference)
   - Configuring the Category_0 ~ Category_*x-1* fields for all the preceding blocks to 0x0
   - Configuring the Category_*x+1* ~ Category_2 fields for all blocks afterwards to 0x3

   For example, assuming you want to configure the split line in Block1, then first configure the Category_1 field for Block1 to 0x1 or 0x2; configure the Category_0 for Block0 to 0x0; and configure the Category_2 for Block2 to 0x3 (see illustration in Figure 14-3). On the other hand, when reading 0x1 or 0x2 from Category_1, then you know the split line is in Block1.

2. Configure the position of the split line inside of the configured block by:
   - Writing the [16:9] bits of the actual address at which you want to split the memory to the SPLITADDR field for the block in which the split line is.
   - Note that the split address must be aligned to 512 bytes, meaning you can only write the integral multiples of 0x200 to the SPLITADDR field.

For example, if you want to split the instruction region at 0x3fc88000, then write the [16:9] bits of this address, which is 0b01000000, to SPLITADDR.

3. The split address applies to both IBUS and DBUS address□For example, DBUS address 0x3fc88000 and IBUS address 0x40388000 indicate the same location in SRAM1. The split address for both buses is [16:9].

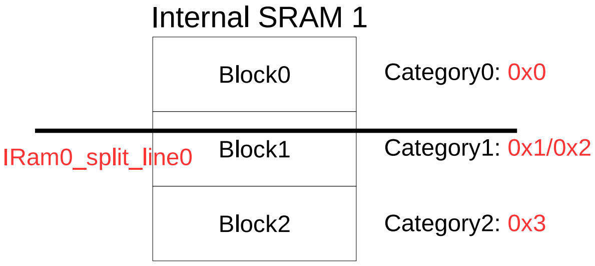

Figure 14-3. An illustration of Configuring the Category fields

Note the following points when configuring the split lines:

- Position:
  - The split line that splitting the Instruction Region and Data Region can be configured anywhere inside Internal SRAM1.
  - The two split lines further splitting the Instruction Region into 3 split regions must stay inside the Instruction Region.
  - The two split lines further splitting the Data Region into 3 split regions must stay inside the Data Region.
- Spilt lines can overlap with each other. For example,
  - When the two split lines inside the Data Region are not overlapping with each other, then the Data Region is split into 3 split regions
  - When the two split lines inside the Data Region are overlapping with each other, then the Data Region is only split into 2 split regions
  - When the two split lines inside the Data Region are not only overlapping with each other but also with the split line that splits the Data Region and the Instruction Region, then the Data Region is not split at all and only has one region.

Access Configuration

After configuring the split lines, users can then use the registers described in the Table 14-6 and Table 14-7 below to configure the access of CPU's IBUS, DBUS and GDMA peripherals, in the privileged environment and the unprivileged environment, to these split regions independently.

Table 14-6. Access Configuration to the Instruction Region of Internal SRAM1

Buses	Environment	Configuration Registers	Instruction Region			Access
			instr_region_0	instr_region_1	instr_region_2	
IBUS	Privileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_2_REG	[2:0]	[5:3]	[8:6]	X/W/R
	Unprivileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_1_REG	[2:0]	[5:3]	[8:6]	X/W/R
DBUS	Privileged	PMS_Core_X_DRAM0_PMS_CONSTRAIN_1_REG	[13:12][A]			W/R
	Unprivileged		[1:0][A]			W/R
GDMA [C]	XX Peripherals [D]	PMS_DMA_APBPERI_XX_PMS_CONSTRAIN_1_REG	[1:0][B]			W/R

[A] Configure DBUS' access to the Instruction Region. However, it's recommended to configure these bits to 0.

[B] Configure GDMA's access to the Instruction Region. However, it's recommended to configure these bits to 0.

[C] GMDA doesn't support the privileged environment and unprivileged environment.

[D] ESP32-C3 has 6 peripherals, including SPI2, UCHI0, I2S, AES, SHA, ADC, which can access Internal SRAM1 via GDMA. Each peripherals can be configured with different access to the Internal SRAM1 independently.

Table 14-7. Access Configuration to the Data Region of Internal SRAM1

Buses	Environment	Configuration Registers	Data Region			Access
			data_region_0	data_region_1	data_region_2	
IBUS	Privileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_2_REG	[11:9][A]			X/W/R
	Unprivileged	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_1_REG	[11:9][A]			X/W/R
DBUS	Privileged	PMS_Core_X_DRAM0_PMS_CONSTRAIN_1_REG	[3:2]	[5:4]	[7:6]	W/R
	Unprivileged		[15:14]	[17:16]	[19:18]	W/R
GDMA [B]	XX □□[C]	PMS_DMA_APBPERI_XX_PMS_CONSTRAIN_1_REG	[3:2]	[5:4]	[7:6]	W/R

[A] Configure IBUS' access to the Data Region. However, it's recommended to configure these bits to 0.

[B] GMDA doesn't support the privileged environment and the unprivileged environment.

[C] ESP32-C3 has 6 peripherals, including SPI2, UCHI0, I2S0, AES, SHA, ADC, which can access Internal SRAM1 via GDMA. Each peripheral can be configured with different access to the Internal SRAM1 independently.

For details on how to configure the split lines, see Section 14.4.2.2.

Note:

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses. See details, see *ESP-IDF api-reference Memory protection*.

14.4.3 RTC FAST Memory

ESP32-C3's RTC FAST Memory is 8 KB. See the address of RTC FAST Memory below:

Table 14-8. RTC FAST Memory Address

Memory	Starting Address	Ending Address
RTC FAST Memory	0x5000_0000	0x5000_1FFF

ESP32-C3's RTC FAST Memory can be further split into 2 regions. Each split region can be configured independently with different access.

The Register for configuring the split line is described below:

Table 14-9. Split RTC FAST Memory into the Higher Region and the Lower Region

	Privileged Environment	Unprivileged Environment
Split Lines Configuration Register[1]	PIF_PMS_CONSTRAN_9_REG [10:0]	PIF_PMS_CONSTRAN_9_REG [21:11]

[1] The word offset from the RTC FAST Memory base address should be used when configuring the split address. For example, if you want to split the RTC FAST Memory at 0x5000_1000, then write 0x400 (0x1000>>2) to this register.

Access configuration for the higher and lower regions of the RTC FAST Memory is described below:

Table 14-10. Access Configuration to the RTC FAST Memory

Bus	RTC FAST Memory	Configuration Registers		Access[A]
		Privileged Environment	Unprivileged Environment	
Peri Bus (PIF)	Higher Region	PIF_PMS_CONSTRAN_10_REG [5:3] [B]	PIF_PMS_CONSTRAN_10_REG [11:9]	X/R/W
	Lower Region	PIF_PMS_CONSTRAN_10_REG [2:0]	PIF_PMS_CONSTRAN_10_REG [8:6]	

[A] 1: with access; 0: without access

[B] For example, configuring this field to 0b101 indicates CPU's peripheral (PIF) bus is granted with the instruction execution and read accesses but not the read access in the privileged environment to the higher region of RTC FAST Memory.

14.5 Peripherals

14.5.1 Access Configuration

ESP32-C3's CPU can be configured with different read (R) and write (W) accesses to most of its modules and peripherals independently, in the privileged environment and in the unprivileged environment, by configuring respective registers
(PMS_CORE_0_PIF_PMS_CONSTRAN_*n*_REG).

Notes on PMS_CORE_0_PIF_PMS_CONSTRAN_*n*_REG:

- *n* can be 1 ~ 8, in which 1 ~ 4 are for the privileged environment and 5 ~ 8 are for the unprivileged environment.

For example, users can configure PMS_CORE_0_PIF_PMS_CONSTRAIN_1_REG [1:0] to 0x2, meaning CPU is granted with read access but not write access in the privileged environment to UART0. In this case, CPU won't be able to modify the UART0's internal registers when in the privileged environment.

Table 14-11. Access Configuration of the Peripherals

Peripherals	Privileged Environment	Unprivileged Environment	Bit[3]
GDMA	**_PMS_CONSTRAN_4_REG	**_PMS_CONSTRAN_8_REG	[7:6]
eFuse Controller & PMU[1]	**_PMS_CONSTRAN_1_REG	**_PMS_CONSTRAN_5_REG	[15:14]

ADC Controller	**_PMS_CONSTRAN_4_REG	**_PMS_CONSTRAN_8_REG	[9:8]

[1] : This is shared by more than one peripherals.

[2] : Accelerators: AES, SHA, RSA, Digital Signatures, HMAC

[3] : Access: R/W

[4] : ** in the table replaces PMS_CORE_0_PIF.

14.5.2 Split Peripheral Regions into Split Regions

On top of what described in the previous section, user can select one of ESP32-C3's peripheral region to split them into 7 regions (from Peri Region0 ~ Peri Region7) for more flexible permission control.

For example, the registers for ESP32-C3's GDMA controller are allocated as:

- 3 sets of registers for each of 3 RX channel
- 3 sets of registers for each of 3 TX channel
- 1 set of registers for configuration

As seen above, GDMA's peripheral region is divided into 7 split regions (implemented in hardware), which can be configured with different permission independently, thus achieving independent permission control for each GDMA channel.

Users can configure CPU’s read (R) and write (W) accesses to a specific split region (Peri Region*n*) in the privileged environment and in the unprivileged environment by configuring PMS_REGION_PMS_CONSTRAN_*n*_REG.

Notes on PMS_REGION_PMS_CONSTRAN_*n*_REG:

- *n* can be 1~10, in which
  - PMS_REGION_PMS_CONSTRAN_1_REG is for configuring CPU’s permission in the privileged environment.
  - PMS_REGION_PMS_CONSTRAN_2_REG is for configuring CPU’s permission in the unprivileged environment.
  - PMS_REGION_PMS_CONSTRAN_*n*_REG□*n* = 3~10□are used to configuring the starting addresses for each Peri Regions. Note the starting address of each Peri Region is also the ending address of the previous Peri Region.

Table 14-12. Access Configuration of Peri Regions

Peri Regions	Starting Address Configuration	Access Configuration	
		Privileged Environment	Unprivileged Environment
Peri Region0	PMS_REGION_PMS_CONSTRAN_3_REG	PMS_REGION_PMS_CONSTRAN_1_REG [1:0]	PMS_REGION_PMS_CONSTRAN_2_REG [1:0]
Peri Region1	PMS_REGION_PMS_CONSTRAN_4_REG	PMS_REGION_PMS_CONSTRAN_1_REG [3:2]	PMS_REGION_PMS_CONSTRAN_2_REG [3:2]
Peri Region2	PMS_REGION_PMS_CONSTRAN_5_REG	PMS_REGION_PMS_CONSTRAN_1_REG [5:4]	PMS_REGION_PMS_CONSTRAN_2_REG [5:4]
Peri Region3	PMS_REGION_PMS_CONSTRAN_6_REG	PMS_REGION_PMS_CONSTRAN_1_REG [7:6]	PMS_REGION_PMS_CONSTRAN_2_REG [7:6]
Peri Region4	PMS_REGION_PMS_CONSTRAN_7_REG	PMS_REGION_PMS_CONSTRAN_1_REG [9:8]	PMS_REGION_PMS_CONSTRAN_2_REG [9:8]
Peri Region5	PMS_REGION_PMS_CONSTRAN_8_REG	PMS_REGION_PMS_CONSTRAN_1_REG [11:10]	PMS_REGION_PMS_CONSTRAN_2_REG [11:10]
Peri Region6*	PMS_REGION_PMS_CONSTRAN_9_REG	PMS_REGION_PMS_CONSTRAN_1_REG [13:12]	PMS_REGION_PMS_CONSTRAN_2_REG [13:12]

* The ending address of Peri Region6 is configured by PMS_REGION_PMS_CONSTRAN_10_REG.

14.6 External Memory

ESP32-C3 can access the external memory via one of the two ways illustrated in Figure 14-4 below.

- CPU via SPI1
- CPU via CACHE

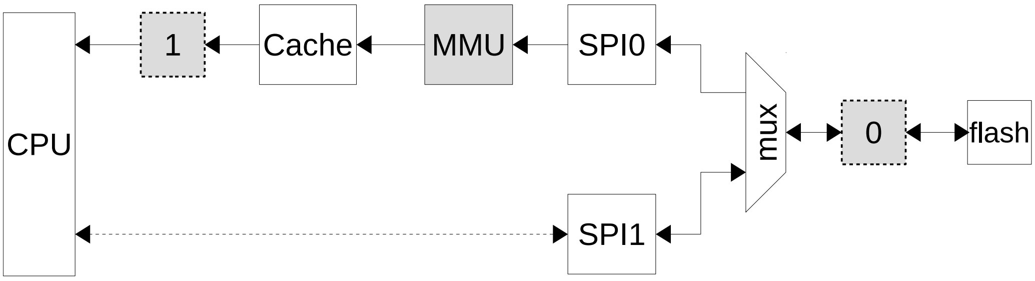

Figure 14-4. Two Ways to Access External Memory

Where,

- Box 0 checks the SPI and Cache’s access to external flash.

- Box 1 checks CPU's access to Cache.

14.6.1 SPI anc Cache's Access to External Flash

14.6.1.1 Address

ESP32-C3's flash can be further split to achieve more flexible permission control. Each split region can be configured with different access independently.

- Flash can be split into 4 regions, the length of each should be the integral multiples of 64 KB.
- Also, the starting address of each region should also be aligned to 64 KB.

The following registers can be used to configure how the flash is split.

Table 14-13. Split the External Memory into Split Regions

Split Regions	Split Region Configuration[3]	
	Starting Address[1]	Length[2]
Flash Region*n* (*n*: 0~3)	SYSCON_FLASH_ACE*n*_ADDR_REG	SYSCON_FLASH_ACE*n*_SIZE_REG

[1] Configuring this field with the actual address, which should be aligned to 64 KB.

[2] When configuring the length of Region*n*, note the total length of all flashregions should be no greater than 16 MB, respectively.

[3] Each region cannot overlap with others.

14.6.1.2 Access Configuration

Each split region for flash can be configured with different permission independently via the register described in the Table below.

Table 14-14. Access Configuration of Flash Regions

Split Regions	Access Configuration		
	Configuration Register	Cache	SPI
Flash Region *n* (*n*: 0 ~ 3)	SYSCON_FLASH_ACE*n*_ATTR	[1:0][A]	[3:2][B]

[A] These bits are configured in order R/X. For example, configuring this field to 2'b10 indicates CACHE is granted with the read access but no instruction execution access to the Flash Region *n*.

[B] These bits are configured in order W/R. For example, configuring this field to 2'b01 indicates SPI is granted with the read access but no write access to the Flash Region *n*.

14.6.2 CPU's Access to Cache

ESP32-C3's CPU access Cache using a virtual address. The memory space in ESP32-C3 that is accessible for CPU to access Cache is called "Virtual Address Region", which can be seen in Table 14-15 below.

Table 14-15. Cache Virtual Address Region

Bus Type	Virtual Address Region		Size (MB)	Target
	Starting Address	Ending Address		
DBus (read-only)	0x3C00_0000	0x3C7F_FFFF	8	Uniform Cache
IBus	0x4200_0000	0x427F_FFFF	8	Uniform Cache

14.6.2.1 Split Regions

Both ESP32-C3's DBUS and IBUS Cache virtual address regions can be further split into up to 4 regions. Users can configure different access to each region independently.

Table 14-16. Split IBUS Cache Virtual Address into 4 Regions

Split Regions[1]	Split Region Configuration	
	Starting Address	Ending Address
IBUS Region0	0x4200_0000	EXTMEM_IBUS_PMS_TBL_BOUNDARY0_REG[2]
IBUS Region1	EXTMEM_IBUS_PMS_TBL_BOUNDARY0_REG[2]	EXTMEM_IBUS_PMS_TBL_BOUNDARY1_REG[2]
IBUS Region2	EXTMEM_IBUS_PMS_TBL_BOUNDARY1_REG[2]	EXTMEM_IBUS_PMS_TBL_BOUNDARY2_REG[2]
IBUS Region3	EXTMEM_IBUS_PMS_TBL_BOUNDARY2_REG[2]	0x4280_0000

[1] The address range of each split region is [Starting Address, Ending Address).

[2] The address represented is "0x4200_0000 + 0x1000 * EXTMEM_IBUS_PMS_TBL_BOUNDARY*n*_REG". For example, when EXTMEM_IBUS_PMS_TBL_BOUNDARY0_REG is configured to 2, then the address range of IBUS Region0 is [0x4200_0000, 0x4200_2000).

Table 14-17. Split DBUS Cache Virtual Address into 4 Regions

Split Regions[1]	Split Region Configuration	
	Starting Address	Ending Address
DBUS Region0	0x3C00_0000	EXTMEM_DBUS_PMS_TBL_BOUNDARY0_REG[2]
DBUS Region1	EXTMEM_DBUS_PMS_TBL_BOUNDARY0_REG[2]	EXTMEM_DBUS_PMS_TBL_BOUNDARY1_REG[2]
DBUS Region2	EXTMEM_DBUS_PMS_TBL_BOUNDARY1_REG[2]	EXTMEM_DBUS_PMS_TBL_BOUNDARY2_REG[2]
DBUS Region3	EXTMEM_DBUS_PMS_TBL_BOUNDARY2_REG[2]	0x3C80_0000

[1] The address range of each split region is [Starting Address, Ending Address).

[2] The address represented is "0x3C00_0000 + 0x0100 * EXTMEM_DBUS_PMS_TBL_BOUNDARY*n*_REG". For example, when EXTMEM_DBUS_PMS_TBL_BOUNDARY*n*_REG is configured to 2, then the address range of IBUS Split Region0 is [0x3C00_0000, 0x3C00_0200]).

14.6.3 Access Configuration

Each Cache split region can be configured with different permission independently via registers described in Table 14-18 and Table 14-19 below.

Table 14-18. Access Configuration of IBUS to Split Regions

Split Regions	Access Configuration		
	Configuration Register	Privileged[A]	Unprivileged[A]
IBUS Region0[C]	-	-	-
IBUS Region1	EXTMEM_IBUS_PMS_TBL_ATTR_REG	[1:0][B]	[3:2]
IBUS Region2	EXTMEM_IBUS_PMS_TBL_ATTR_REG	[5:4]	[7:6]
IBUS Region3 [C]	-	-	-

[A] These bits are configured in order R/X.

[B] For example, configuring this field to 2'b10 indicates CPU's IBUS is granted read access but no instruction execution access to IBUS region1 in the privileged environment.

[C] IBUS is not allowed to access Region0 and Region3, thus cannot be configured. All attempts will be rejected.

Table 14-19. Access Configuration of DBUS to Split Regions

Split Regions	Access Configuration		
	Configuration Register	Privileged[A]	Unprivileged[A]
DBUS Region0[C]	-	-	-
DBUS Region1	EXTMEM_DBUS_PMS_TBL_ATTR_REG	[0][B]	[1]
DBUS Region2	EXTMEM_DBUS_PMS_TBL_ATTR_REG	[2]	[3]
DBUS Region3[C]	-	-	-

[A] Only the read access can be configured.

[B] For example, configuring this field to 1'b1 indicates CPU's DBUS is granted read access to DBUS region1 in the privileged environment.

[C] DBUS is not allowed to access Region0 and Region3, thus cannot be configured. All attempts will be rejected.

14.7 Unauthorized Access and Interrupts

Any attempt to access ESP32-C3's slave device without configured permission is considered an **unauthorized access** and will be handled as described below:

- This attempt will only be responded with default values, in particular,
  - All instruction execution or read attempts will be responded with 0 (for internal memory and peripheral) or 0xdeadbeaf (for external memory)
  - All write attempts will fail
- An interrupt will be triggered (when enabled). See details below.

Note that only the information of the first interrupt is logged. Therefore, it's advised to handle interrupt signals and clear interrupts in-time, so the information of the next interrupt can be logged correctly.

14.7.1 Interrupt upon Unauthorized IBUS Access

ESP32-C3 can be configured to trigger interrupts when IBUS attempts to access internal ROM and SRAM without configured permission and log the information about this unauthorized access. Note that, once this interrupt is enabled, it's enabled for all internal ROM and SRAM memory, and cannot be only enabled for a certain address field. This interrupt corresponds to the PMS_IBUS_VIO_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 14-20. Interrupt Registers for Unauthorized IBUS Access

Registers	Bit	Description
PMS_CORE_0_IRAM0_PMS_MONITOR_1_REG	[0]	Clears interrupt signal
	[1]	Enables interrupt
PMS_CORE_0_IRAM0_PMS_MONITOR_2_REG	[0]	Stores interrupt status of unauthorized IBUS access
	[1]	Stores the access direction. 1: write; 0: read.
	[2]	Stores the instruction direction. 1: load/store; 0: instruction execution.
	[4:3]	Stores the privileged mode the CPU was in when the unauthorized IBUS access happened. 0b01: privileged environment; 0b10: unprivileged environment
	[28:5]	Stores the address that CPU's IBUS was trying to access unauthorized.

14.7.2 Interrupt upon Unauthorized DBUS Access

ESP32-C3 can be configured to trigger interrupts when DBUS attempts to access internal ROM and SRAM without configured permission and log the information about this unauthorized access. Note that, once this interrupt is enabled, it's enabled for all internal ROM and SRAM memory, and cannot be only enabled for a certain address field. This interrupt corresponds to the PMS_DBUS_VIO_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 14-21. Interrupt Registers for Unauthorized DBUS Access

Registers	Bit	Description
PMS_CORE_0_DRAM0_PMS_MONITOR_1_REG	[0]	Clears interrupt signal
	[1]	Enables interrupt
PMS_CORE_0_DRAM0_PMS_MONITOR_2_REG	[0]	Stores interrupt status of unauthorized DBUS access
	[1]	Flags atomic access. 1: atomic access; 0: not atomic access.
	[3:2]	Stores the privileged mode the CPU was in when the unauthorized DBUS access happened. 0b01: privileged environment; 0b10: unprivileged environment
	[25:4]	Stores the address that CPU's DBUS was trying to access unauthorized.
PMS_CORE_0_DRAM0_PMS_MONITOR_3_REG	[0]	Stores the access direction. 1: write; 0: read.
	[25:4]	Stores the byte information of the unauthorized DBUS access.

14.7.3 Interrupt upon Unauthorized Access to External Memory

ESP32-C3 can be configured to trigger Interrupt upon unauthorized access to external memory, and log the information about this unauthorized access. This interrupt corresponds to the SPI_MEM_REJECT_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 14-22. Interrupt Registers for Unauthorized Access to External Memory

Registers	Bit	Description
SYSCON_SPI_MEM_PMS_CTRL_REG	[0]	Stores exception signal
	[1]	Clears exception signal and logged information
	[2]	Indicates unauthorized instruction execution
	[3]	Indicates unauthorized read
	[4]	Indicates unauthorized write
	[5]	Indicates overlapping split regions
	[6]	Indicates invalid address

14.7.4 Interrupt upon Unauthorized Access to Internal Memory via GDMA

ESP32-C3 can be configured to trigger Interrupt upon unauthorized access to internal memory via GDMA, and log the information about this unauthorized access. This interrupt corresponds to the PMS_DMA_VIO_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 14-23. Interrupt Registers for Unauthorized Access to Internal Memory via GDMA

Registers	Bit	Description
PMS_DMA_APBPERI_PMS_MONITOR_1_REG	[0]	Clears interrupt signal
	[1]	Enables interrupt
PMS_DMA_APBPERI_PMS_MONITOR_2_REG	[0]	Stores interrupt signal
	[2:1]	Stores the privileged mode the CPU was in when the unauthorized access happened. 0b01: privileged environment; 0b10: unprivileged environment
	[24:3]	Stores the address that GDMA was trying to access unauthorized
PMS_DMA_APBPERI_PMS_MONITOR_3_REG	[0]	Stores the access direction. 1: write; 0: read
	[16:1]	Stores the byte information of unauthorized access

For information about Interrupt upon unauthorized access to external memory via GDMA, please refer to Chapter 2 *GDMA Controller (GDMA)*□

14.7.5 Interrupt upon Unauthorized peripheral bus (PIF) Access

ESP32-C3 can be configured to trigger interrupts when PIF attempts to access RTC FAST memory and peripheral regions without configured permission, and log the information about this unauthorized access. Note that, once this interrupt is enabled, it's enabled for all RTC FAST memory and peripheral regions, and cannot be only enabled for a certain address field. This interrupt corresponds to the PMS_PERI_VIO_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 14-24. Interrupt Registers for Unauthorized PIF Access

Registers	Bit	Description
PMS_CORE_0_PIF_PMS_MONITOR_1_REG	[1]	Enables interrupt
	[0]	Clears interrupt signal and logged information
PMS_CORE_0_PIF_PMS_MONITOR_2_REG	[7:6]	Stores the privileged mode the CPU was in when the unauthorized PIF access happened. 0b01: privileged environment; 0b10: unprivileged environment
	[5]	Stores the access direction. 1: write; 0: read
	[4:2]	Stores the data type of unauthorized access. 0: byte; 1: half-word; 2: word
	[1]	Stores the access type. 0: instruction; 1: data
	[0]	Stores the interrupt signal
PMS_CORE_0_PIF_PMS_MONITOR_3_REG	[31:0]	Stores the address of unauthorized access

In particular, ESP32-C3 can also be configured to check the access alignment when PIF attempts to access the peripheral regions and trigger Interrupt upon unauthorized alignment. See the detailed description in the following section.

14.7.6 Interrupt upon Unauthorized PIF Access Alignment

Access to all of ESP32-C3's modules/peripherals is **word aligned.**

ESP32-C3 can be configured to check the access alignment to all modules/peripherals, and trigger Interrupt upon **non-word aligned access.**

This interrupt corresponds to the PMS_PERI_VIO_SIZE_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Note that CPU can convert some non-word aligned access to word aligned access, thus avoiding triggering alignment interrupt.

Table 14-25 below lists all the possible access alignments and their results (when the interrupt is enabled), in which:

- **INTR**: interrupt
- √: access succeeds and no interrupt.

Table 14-25. All Possible Access Alignment and their Results

Accessed Address	Access Alignment	Read	Write
0x0	Byte aligned	√	INTR
	Half-word aligned	√	INTR
	Word aligned	√	√
0x1	Byte aligned	√	INTR
	Half-word aligned	√	INTR
	Word aligned	√	INTR
0x2	Byte aligned	√	INTR
	Half-word aligned	√	INTR

Accessed Address	Access Alignment	Read	Write
	Word aligned	√	INTR
0x3	Byte aligned	√	INTR
	Half-word aligned	√	INTR
	Word aligned	√	INTR

Table 14-26. Interrupt Registers for Unauthorized Access Alignment

Registers	Bit	Description
PMS_CORE_0_PIF_PMS_MONITOR_4_REG	[1]	Enables interrupt
	[0]	Clears interrupt signal and logged information
PMS_CORE_0_PIF_PMS_MONITOR_5_REG	[4:3]	Stores the privileged mode the CPU was in when the unauthorized access happened. 0b01: privileged environment; 0b10: unprivileged environment
	[2:1]	Stores the unauthorized access type. 0: byte aligned; 1: half-word aligned; 2: word aligned
	[0]	Stores the interrupt status. 0: no interrupt; 1: interrupt
PMS_CORE_0_PIF_PMS_MONITOR_6_REG	[31:0]	Stores the address of the unauthorized access

14.8 Register Locks

All ESP32-C3's permission control related registers can be locked by respective lock registers. When the lock registers are configured to 1, these registers themselves and their related permission control registers are all protected from modification until the next CPU reset.

Note that there isn't a one-to-one correspondence between the lock registers and permission control registers. See details in Table 14-27.

14.9 Register Summary

The addresses in this section are relative to the Permission Control base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Register			
PMS_PRIVILEGE_MODE_SEL_LOCK_REG	PMS_PRIVILEGE_MODE_SEL_LOCK_REG	0x0008	R/WL
PMS_PRIVILEGE_MODE_SEL_REG	PMS_PRIVILEGE_MODE_SEL_REG	0x000C	R/WL
PMS_APB_PERIPHERAL_ACCESS_0_REG	APB peripheral configuration register 0	0x0010	R/WL
PMS_APB_PERIPHERAL_ACCESS_1_REG	APB peripheral configuration register 1	0x0014	R/WL
PMS_INTERNAL_SRAM_USAGE_0_REG	Internal SRAM configuration register 0	0x0018	R/WL
PMS_INTERNAL_SRAM_USAGE_1_REG	Internal SRAM configuration register 1	0x001C	R/WL
PMS_INTERNAL_SRAM_USAGE_4_REG	Internal SRAM configuration register 4	0x0024	R/WL
PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_0_REG	SPI2 GDMA Permission Config Register 0	0x0038	R/WL
PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_1_REG	SPI2 GDMA Permission Config Register 1	0x003C	R/WL
PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_0_REG	UCHI0 GDMA Permission Config Register 0	0x0040	R/WL
PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_1_REG	UCHI0 GDMA Permission Config Register 1	0x0044	R/WL
PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_0_REG	I2S0 GDMA Permission Config Register 0	0x0048	R/WL
PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_1_REG	I2S0 GDMA Permission Config Register 1	0x004C	R/WL
PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_0_REG	AES GDMA Permission Config Register 0	0x0068	R/WL
PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_1_REG	AES GDMA Permission Config Register 1	0x006C	R/WL
PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_0_REG	SHA GDMA Permission Config Register 0	0x0070	R/WL
PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_1_REG	SHA GDMA Permission Config Register 1	0x0074	R/WL
PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_0_REG	ADC_DAC GDMA Permission Config Register 0	0x0078	R/WL
PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_1_REG	ADC_DAC GDMA Permission Config Register 1	0x007C	R/WL
PMS_DMA_APBPERI_PMS_MONITOR_0_REG	GDMA Permission Interrupt Register 0	0x0080	R/WL
PMS_DMA_APBPERI_PMS_MONITOR_1_REG	GDMA Permission Interrupt Register 1	0x0084	R/WL
PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_*n*_REG (*n*: 0 - 5)	SRAM split line config register *n*	0x0090 + 4 * *n*	R/WL
PMS_CORE_X_IRAM0_PMS_CONSTRAIN_0_REG	IBUS Permission Config Register 0	0x00A8	R/WL
PMS_CORE_X_IRAM0_PMS_CONSTRAIN_1_REG	IBUS Permission Config Register 1	0x00AC	R/WL

Name	Description	Address	Access
PMS_CORE_X_IRAM0_PMS_CONSTRAIN_2_REG	IBUS Permission Config Register 2	0x00B0	R/WL
PMS_CORE_0_IRAM0_PMS_MONITOR_0_REG	CPU0 IBUS Permission Interrupt Register 0	0x00B4	R/WL
PMS_CORE_0_IRAM0_PMS_MONITOR_1_REG	CPU0 IBUS Permission Interrupt Register 1	0x00B8	R/WL
PMS_CORE_X_DRAM0_PMS_CONSTRAIN_0_REG	DBUS Permission Config Register 0	0x00C0	R/WL
PMS_CORE_X_DRAM0_PMS_CONSTRAIN_1_REG	DBUS Permission Config Register 1	0x00C4	R/WL
PMS_CORE_0_DRAM0_PMS_MONITOR_0_REG	CPU0 dBUS Permission Interrupt Register 0	0x00C8	R/WL
PMS_CORE_0_DRAM0_PMS_MONITOR_1_REG	CPU0 dBUS Permission Interrupt Register 1	0x00CC	R/WL
PMS_CORE_0_PIF_PMS_CONSTRAIN_*n*_REG (*n*: 0 - 10)	Peripheral Permission Configuration Register *n*	0x00D8 + 4 * *n*	R/WL
PMS_REGION_PMS_CONSTRAIN_*n*_REG (*n*: 0 - 10)	CPU Split_Region Permission Register *n*	0x0104 + 4 * *n*	R/WL
PMS_CORE_0_PIF_PMS_MONITOR_0_REG	CPU PIF Permission Interrupt Register 0	0x0130	R/WL
PMS_CORE_0_PIF_PMS_MONITOR_1_REG	CPU PIF Permission Interrupt Register 1	0x0134	R/WL
PMS_CORE_0_PIF_PMS_MONITOR_4_REG	CPU PIF Permission Interrupt Register 4	0x0140	R/WL
Status Register			
PMS_DMA_APBPERI_PMS_MONITOR_2_REG	GDMA Permission Interrupt Register 2	0x0088	RO
PMS_DMA_APBPERI_PMS_MONITOR_3_REG	GDMA Permission Interrupt Register 3	0x008C	RO
PMS_CORE_0_IRAM0_PMS_MONITOR_2_REG	CPU0 IBUS Permission Interrupt Register 2	0x00BC	RO
PMS_CORE_0_DRAM0_PMS_MONITOR_2_REG	CPU0 dBUS Permission Interrupt Register 2	0x00D0	RO
PMS_CORE_0_DRAM0_PMS_MONITOR_3_REG	CPU0 dBUS Permission Interrupt Register 3	0x00D4	RO
PMS_CORE_0_PIF_PMS_MONITOR_2_REG	CPU PIF Permission Interrupt Register 2	0x0138	RO
PMS_CORE_0_PIF_PMS_MONITOR_3_REG	CPU PIF Permission Interrupt Register 3	0x013C	RO
PMS_CORE_0_PIF_PMS_MONITOR_5_REG	CPU PIF Permission Interrupt Register 5	0x0144	RO
PMS_CORE_0_PIF_PMS_MONITOR_6_REG	CPU PIF Permission Interrupt Register 6	0x0148	RO
Version Register			
PMS_CLOCK_GATE_REG_REG	Clock Gate Config Register	0x0170	R/W
PMS_DATE_REG	Sensitive Version Register	0x0FFC	R/W

Name	Description	Address	Access
Configuration Registers			
SYSCON_EXT_MEM_PMS_LOCK_REG	External Memory Permission Lock Register	0x0020	R/W

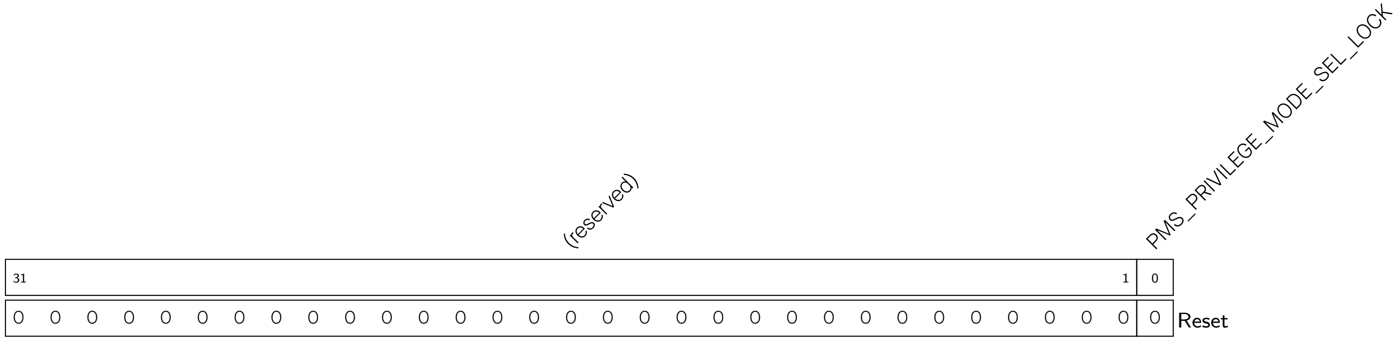
Name	Description	Address	Access
SYSCON_FLASH_ACEn_ATTR_REG (n: 0 - 3)	Flash Arean Permission Config Register	0x0028 + 4 * n	R/W
SYSCON_SRAM_ACEn_ADDR_S (n: 0 - 3)	Flash Arean Starting Address Config Register	0x0038 + 4 * n	R/W
SYSCON_FLASH_ACEn_SIZE_REG (n: 0 - 3)	Flash Arean Length Config Register	0x0048 + 4 * n	R/W
SYSCON_SPI_MEM_PMS_CTRL_REG	External Memory Unauthorized Access Interrupt Register	0x0088	varies
SYSCON_SPI_MEM_REJECT_ADDR_REG	External Memory Unauthorized Access Address Register	0x008C	RO

Name	Description	Address	Access
Permission Configure register			
EXTMEM_IBUS_PMS_TBL_LOCK_REG	Cache IBUS Regions Lock	0x00D8	R/W
EXTMEM_IBUS_PMS_TBL_BOUNDARYn_REG (n: 0 - 2)	Cache IBUS Region(n+1) Starting Address Config Register	0x00DC + 4 * n	R/W
EXTMEM_IBUS_PMS_TBL_ATTR_REG	Cache IBUS Region Permission Register	0x00E8	R/W
EXTMEM_DBUS_PMS_TBL_LOCK_REG	Cache DBUS Regions Lock	0x00EC	R/W
EXTMEM_DBUS_PMS_TBL_BOUNDARYn_REG (n: 0 - 2)	Cache DBUS Region(n+1) Starting Address Config Register	0x00F0 + 4 * n	R/W
EXTMEM_DBUS_PMS_TBL_ATTR_REG	Cache DBUS Region Permission Register	0x00FC	R/W

14.10 Registers

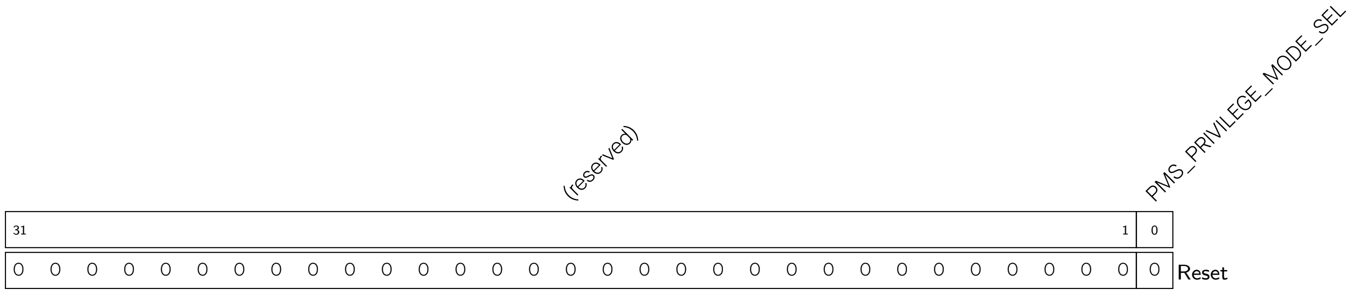
The addresses in this section are relative tothe Permission Control base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 14.1. PMS_PRIVILEGE_MODE_SEL_LOCK_REG (0x0008)



PMS_PRIVILEGE_MODE_SEL_LOCK Set this bit to lock privilege_mode configuration register. (R/WL)

Register 14.2. PMS_PRIVILEGE_MODE_SEL_REG (0x000C)



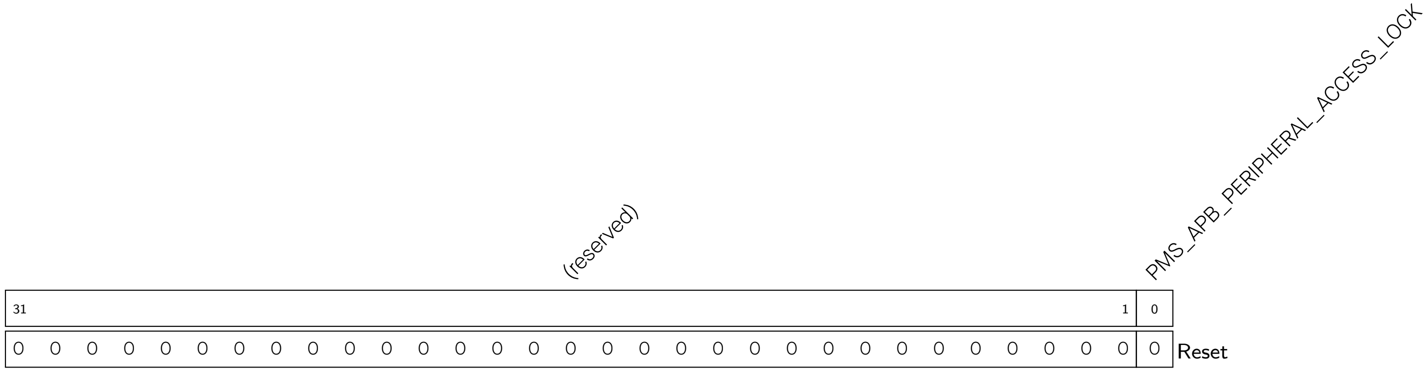
PMS_PRIVILEGE_MODE_SEL Configures how to enter privileged environment:

0: By configuring the World Controller

1: By configuring CPU's privileged level

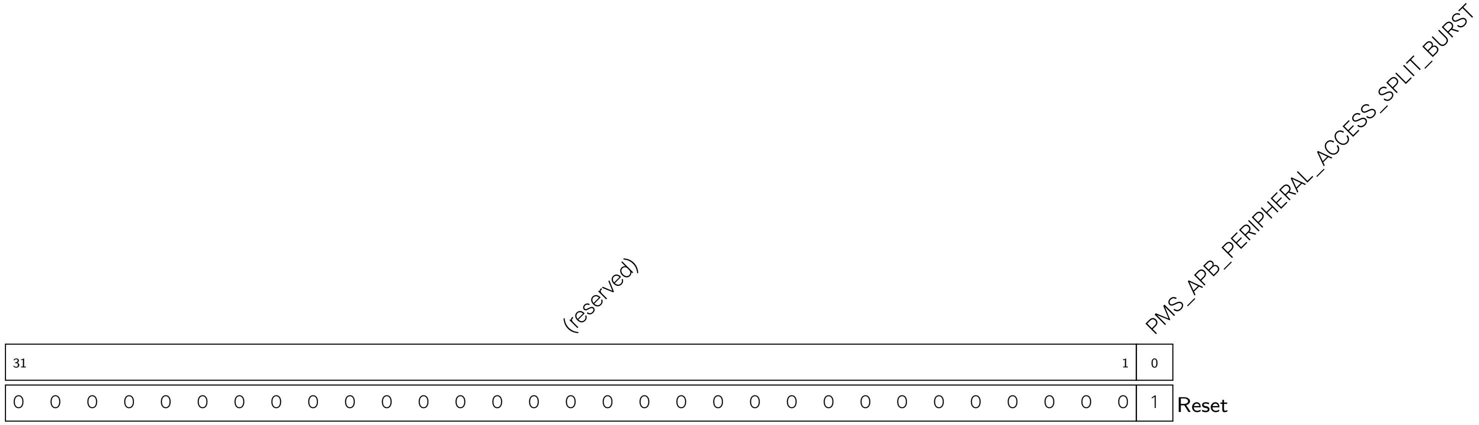
(R/WL)

Register 14.3. PMS_APB_PERIPHERAL_ACCESS_0_REG (0x0010)



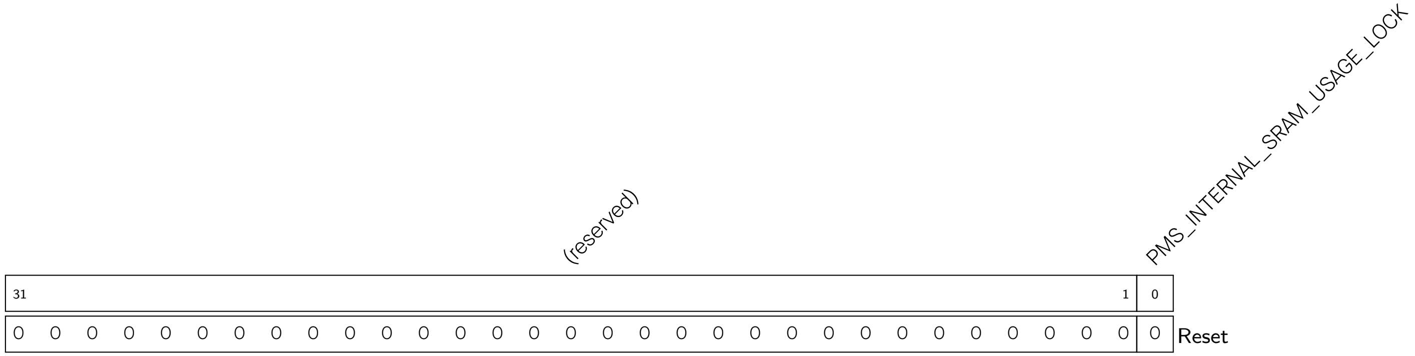
PMS_APB_PERIPHERAL_ACCESS_LOCK Set this bit to lock APB peripheral configuration register. (R/WL)

Register 14.4. PMS_APB_PERIPHERAL_ACCESS_1_REG (0x0014)



PMS_APB_PERIPHERAL_ACCESS_SPLIT_BURST Set this bit to support split function for AHB access to APB peripherals. (R/WL)

Register 14.5. PMS_INTERNAL_SRAM_USAGE_0_REG (0x0018)



PMS_INTERNAL_SRAM_USAGE_LOCK Set this bit to lock internal SRAM Configuration Register. (R/WL)

Register 14.6. PMS_INTERNAL_SRAM_USAGE_1_REG (0x001C)

	(reserved)	(reserved)	PMS_INTERNAL_SRAM_USAGE_CPU_CACHE	
	31 … 4	3 … 1	0	
	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x7	1	Reset

PMS_INTERNAL_SRAM_USAGE_CPU_CACHE Configures SRAM0 is allocated for CPU or ICACHE. (R/WL)

Register 14.7. PMS_INTERNAL_SRAM_USAGE_4_REG (0x0024)

	(reserved)	PMS_INTERNAL_SRAM_USAGE_LOG_SRAM	
	31 … 1	0	
	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

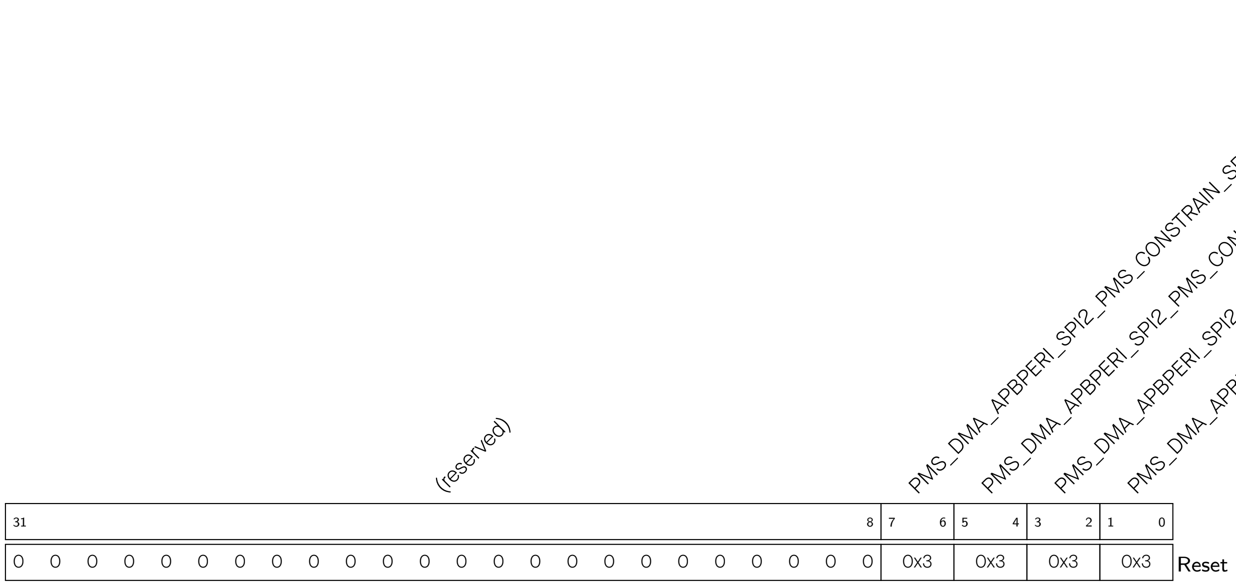
PMS_INTERNAL_SRAM_USAGE_LOG_SRAM Set 1 to enable ASSIST_DEBUG access SRAM1. (R/WL)

Register 14.8. PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_0_REG (0x0038)

(reserved)	PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_LOCK	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_LOCK Set this bit to lock SPI2's DMA permission configuration register. (R/WL)

Register 14.9. PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_1_REG (0x003C)



(reserved)	PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3	PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2	PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1	PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0	
31 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3	0x3	0x3	0x3	Reset

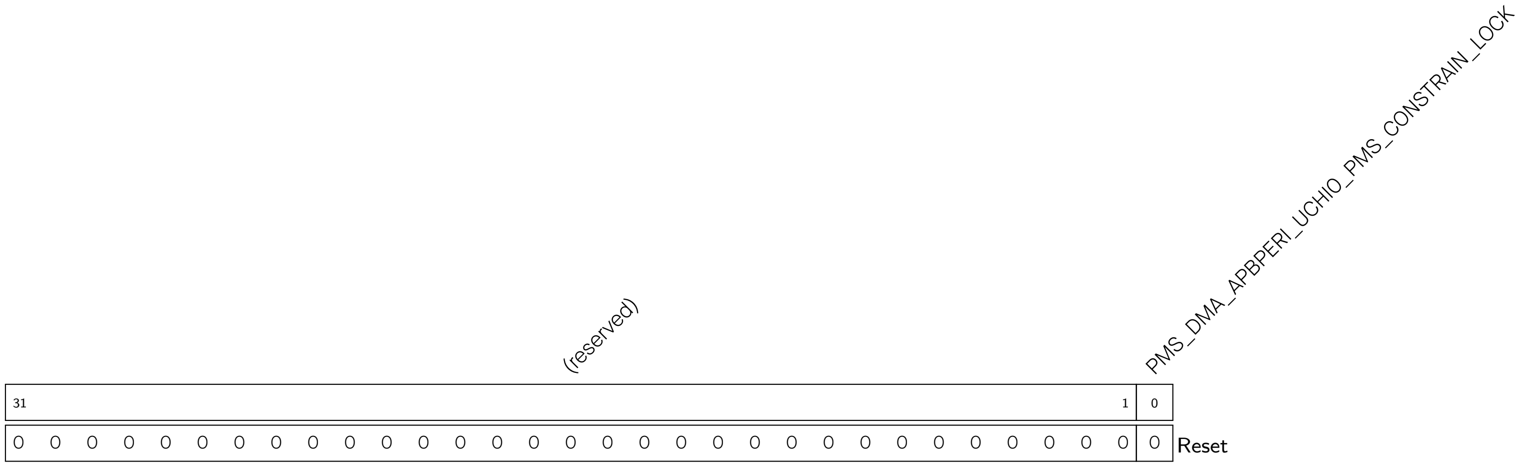
PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0 Configure SPI2's permission to the instruction region. (R/WL)

PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1 Configure SPI2's permission to the data region0 of SRAM. (R/WL)

PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2 Configure SPI2's permission to the data region1 of SRAM. (R/WL)

PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3 Configure SPI2's permission to the data region2 of SRAM. (R/WL)

Register 14.10. PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_0_REG (0x0040)



PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_LOCK Set this bit to lock UHCI0's DMA permission configuration register. (R/WL)

Register 14.11. PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_1_REG (0x0044)

(reserved)	PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3	PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2	PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1	PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0	
31 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3	0x3	0x3	0x3	Reset

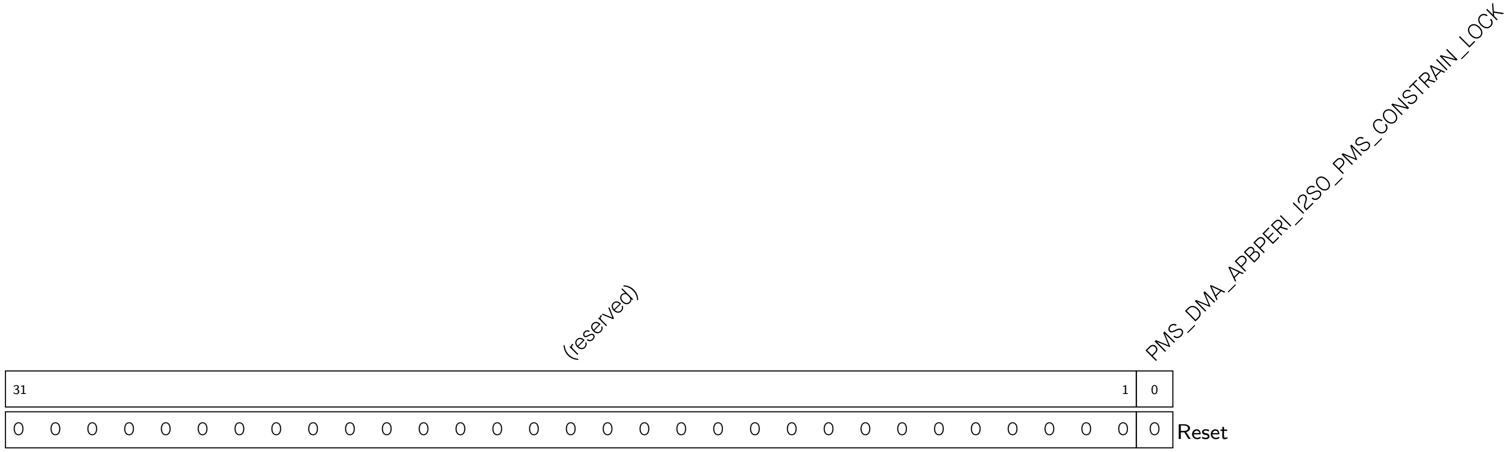
PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0 Configure UHCI0's permission to the instruction region. (R/WL)

PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1 Configure UHCI0's permission to the data region0 of SRAM. (R/WL)

PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2 Configure UHCI0's permission to the data region1 of SRAM. (R/WL)

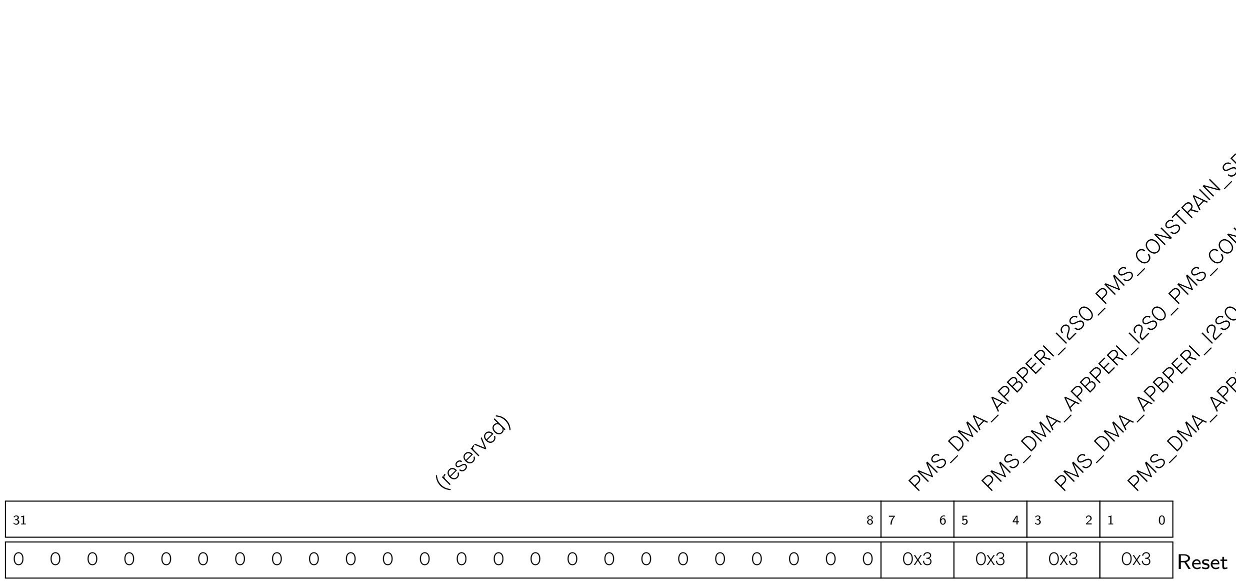
PMS_DMA_APBPERI_UCHI0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3 Configure UHCI0's permission to the data region2 of SRAM. (R/WL)

Register 14.12. PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_0_REG (0x0048)



PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_LOCK Set this bit to lock I2S's DMA permission configuration register. (R/WL)

Register 14.13. PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_1_REG (0x004C)



(reserved)	PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3	PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2	PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1	PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0	
31 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3	0x3	0x3	0x3	Reset

PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0 Configure I2S's permission to the instruction region. (R/WL)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1 Configure I2S's permission to the data region0 of SRAM. (R/WL)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2 Configure I2S's permission to the data region1 of SRAM. (R/WL)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3 Configure I2S's permission to the data region2 of SRAM. (R/WL)

Register 14.14. PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_0_REG (0x0068)

(reserved)	PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_LOCK	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_LOCK Set this bit to lock AES's DMA permission configuration register. (R/WL)

Register 14.15. PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_1_REG (0x006C)

(reserved)	PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3	PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2	PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1	PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0	
31 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3	0x3	0x3	0x3	Reset

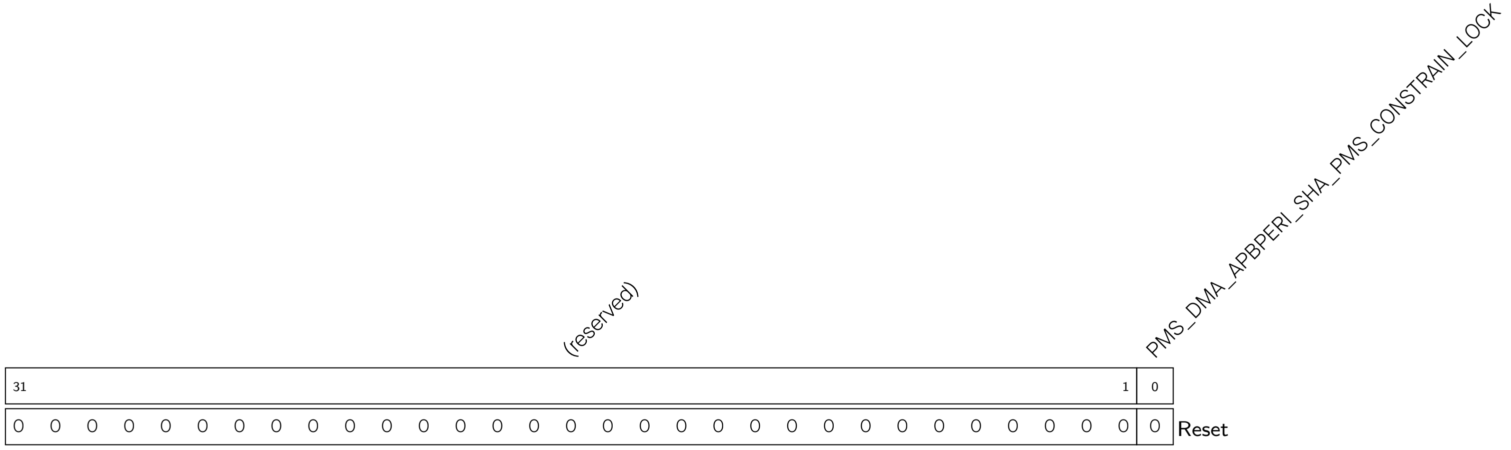
PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0 Configure AES's permission to the instruction region. (R/WL)

PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1 Configure AES's permission to the data region0 of SRAM. (R/WL)

PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2 Configure AES's permission to the data region1 of SRAM. (R/WL)

PMS_DMA_APBPERI_AES_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3 Configure AES's permission to the data region2 of SRAM. (R/WL)

Register 14.16. PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_0_REG (0x0070)



PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_LOCK Set this bit to lock SHA's DMA permission configuration register. (R/WL)

Register 14.17. PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_1_REG (0x0074)

(reserved)	PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3	PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2	PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1	PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0	
31 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3	0x3	0x3	0x3	Reset

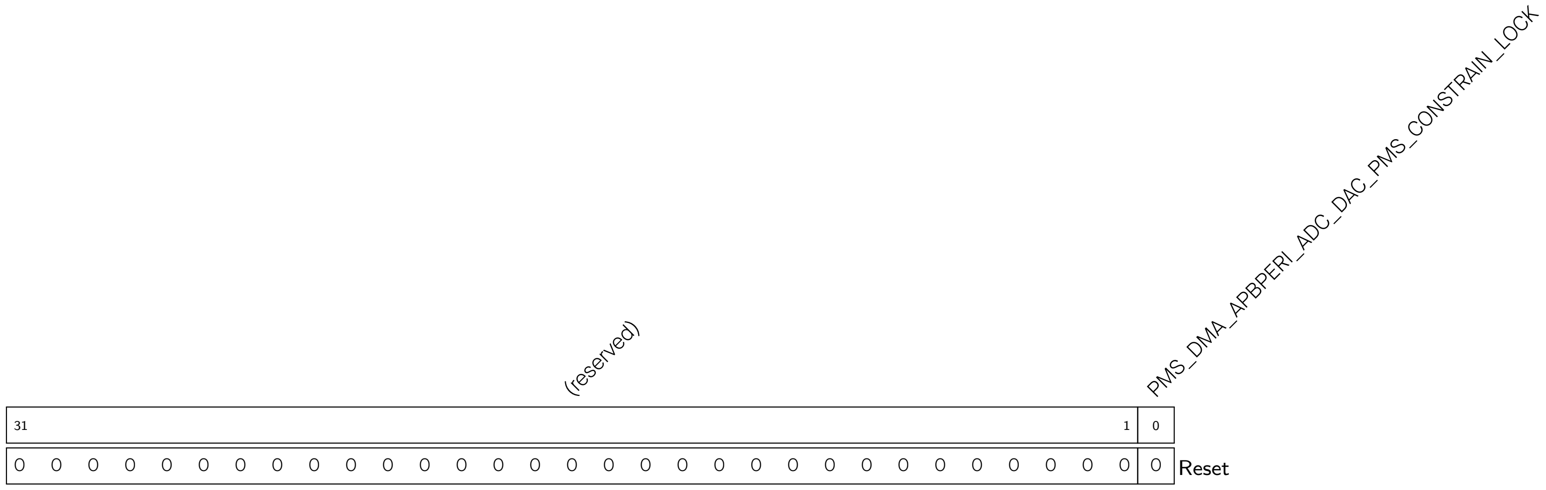
PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0 Configure SHA's permission to the instruction region. (R/WL)

PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1 Configure SHA's permission to the data region0 of SRAM. (R/WL)

PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2 Configure SHA's permission to the data region1 of SRAM. (R/WL)

PMS_DMA_APBPERI_SHA_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3 Configure SHA's permission to the data region2 of SRAM. (R/WL)

Register 14.18. PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_0_REG (0x0078)



PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_LOCK Set this bit to lock ADC_DAC's DMA permission configuration register. (R/WL)

Register 14.19. PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_1_REG (0x007C)

(reserved)	PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3	PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2	PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1	PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0	
31 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3	0x3	0x3	0x3	Reset

PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_0 Configure ADC_DAC's permission to the instruction region. (R/WL)

PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_1 Configure ADC_DAC's permission to the data region0 of SRAM. (R/WL)

PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_2 Configure ADC_DAC's permission to the data region1 of SRAM. (R/WL)

PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRAIN_SRAM_M_MODE_PMS_3 Configure ADC_DAC's permission to the data region2 of SRAM. (R/WL)

Register 14.20. PMS_DMA_APBPERI_PMS_MONITOR_0_REG (0x0080)

(reserved)	PMS_DMA_APBPERI_PMS_MONITOR_LOCK	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

PMS_DMA_APBPERI_PMS_MONITOR_LOCK Set this bit to lock DMA access interrupt configuration register. (R/WL)

Register 14.21. PMS_DMA_APBPERI_PMS_MONITOR_1_REG (0x0084)

(reserved)	PMS_DMA_APBPERI_PMS_MONITOR_VIOLATE_EN	PMS_DMA_APBPERI_PMS_MONITOR_VIOLATE_CLR	
31 2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	1	Reset

PMS_DMA_APBPERI_PMS_MONITOR_VIOLATE_CLR Set this bit to clear DMA access interrupt status. (R/WL)

PMS_DMA_APBPERI_PMS_MONITOR_VIOLATE_EN Set this bit to enable interrupt upon illegal DMA access. (R/WL)

Register 14.22. PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_0_REG (0x0090)

(reserved)	PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_LOCK	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_LOCK Set this bit to lock internal SRAM's split lines configuration. (R/WL)

Register 14.23. PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_1_REG (0x0094)

(reserved)	PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_SPLITADDR	(reserved)	PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_CATEGORY_2	PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_CATEGORY_1	PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_CATEGORY_0	
31 22	21 14	13 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0 0	0	0	0	Reset

PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_CATEGORY_0 Configures Block0's category field for the instruction and data split line IRAM0_DRAM0_Split_Line. (R/WL)

PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_CATEGORY_1 Configures Block1's category field for the instruction and data split line IRAM0_DRAM0_Split_Line. (R/WL)

PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_CATEGORY_2 Configures Block2's category field for the instruction and data split line IRAM0_DRAM0_Split_Line. (R/WL)

PMS_CORE_X_IRAM0_DRAM0_DMA_SRAM_SPLITADDR Configures the split address of the instruction and data split line IRAM0_DRAM0_Split_Line. (R/WL)

Register 14.24. PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_2_REG (0x0098)

(reserved)	PMS_CORE_X_IRAM0_SRAM_LINE_0_SPLITADDR	(reserved)	PMS_CORE_X_IRAM0_SRAM_LINE_0_CATEGORY_2	PMS_CORE_X_IRAM0_SRAM_LINE_0_CATEGORY_1	PMS_CORE_X_IRAM0_SRAM_LINE_0_CATEGORY_0	
31 22	21 14	13 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0 0	0	0	0	Reset

PMS_CORE_X_IRAM0_SRAM_LINE_0_CATEGORY_0 Configures Block0's category field for the instruction internal split line IRAM0_Split_Line_0. (R/WL)

PMS_CORE_X_IRAM0_SRAM_LINE_0_CATEGORY_1 Configures Block1's category field for the instruction internal split line IRAM0_Split_Line_0. (R/WL)

PMS_CORE_X_IRAM0_SRAM_LINE_0_CATEGORY_2 Configures Block2's category field for the instruction internal split line IRAM0_Split_Line_0. (R/WL)

PMS_CORE_X_IRAM0_SRAM_LINE_0_SPLITADDR Configures the split address of the instruction internal split line IRAM0_Split_Line_0. (R/WL)

Register 14.25. PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_3_REG (0x009C)

(reserved)	PMS_CORE_X_IRAM0_SRAM_LINE_1_SPLITADDR	(reserved)	PMS_CORE_X_IRAM0_SRAM_LINE_1_CATEGORY_2	PMS_CORE_X_IRAM0_SRAM_LINE_1_CATEGORY_1	PMS_CORE_X_IRAM0_SRAM_LINE_1_CATEGORY_0	
31 22	21 14	13 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0 0	0	0	0	Reset

PMS_CORE_X_IRAM0_SRAM_LINE_1_CATEGORY_0 Configures Block0's category field for the instruction internal split line IRAM0_Split_Line_1. (R/WL)

15 World Controller (WCL)

15.1 Introduction

ESP32-C3 allows users to allocate its hardware and software resources into Secure World (World0) and Non-secure World (World1), thus protecting resources from unauthorized access (read or write), and from malicious attacks such as malware, hardware-based monitoring, hardware-level intervention, and so on. CPUs can switch between Secure World and Non-secure World with the help of the World Controller.

By default, all resources in ESP32-C3 are shareable. Users can allocate the resources into two worlds by managing respective permission (For details, please refer to Chapter 14 *Permission Control (PMS)*). This chapter only introduces the World Controller and how CPUs can switch between worlds with the help of World Controller.

15.2 Features

ESP32-C3's World Controller:

- Controls the CPUs to switch between the Secure World and Non-secure World
- Logs CPU's world switches

15.3 Functional Description

With the help of World Controller, we can allocate different resources to the Secure World and the Non-secure World:

- Secure World (World0):
  - Can access all peripherals and memories;
  - Performs all security related operations, such user authentication, secure communication, and data encryption and decryption, etc.
- Non-secure World (World1):
  - Can access some peripherals and memories;
  - Performs other operations, such as user operation and different applications, etc.

ESP32-C3's CPU and slave devices are both configurable with permission to either Secure World and/or Non-Secure World:

- CPU can be in either world at a particular time:
  - In Secure World: performs confidential operations;
  - In Non-secure World: performs non-confidential operations;
  - By default, CPU runs in Secure World after power-up, then can be programmed to switch between two worlds.
- All slave devices (including peripherals* and memories) can be configured to be accessible from the Secure World and/or the Non-secure World:

  - Secure World Access: this slave can be called from Secure World only, meaning it can be accessed only when CPU is in Secure World;
  - Non-secure World Access: this slave can be called from Non-secure World only, meaning it can be accessed only when CPU is in Non-secure World.
  - Note that a slave can be configured to be accessible from both Secure World and Non-secure World simultaneously.

For details, please refer to Chapter 14 *Permission Control (PMS)*.

Note:
* World Controller itself is a peripheral, meaning it also can be granted with Secure World access and/or Non-secure World access, just like all other peripherals. However, to secure the world switch mechanism, World Controller should not be accessible from Non-secure world. Therefore, world controller **should not be granted with** Non-secure World access, preventing any modification to world controller from the Non-secure World.

When CPU accesses any slaves:

1. First, CPU notifies the slave about its own world information;
2. Second, slave checks if it can be accessed by CPU based on the CPU's world information and its own world permission configuration.
   - if allowed, then this slave responds to CPU;
   - if not allowed, then this slave will not respond to CPU and trigger an interrupt.

In this way, the resources in the Secure World will not be illegally accessible by the Non-secure World in an unauthorized way.

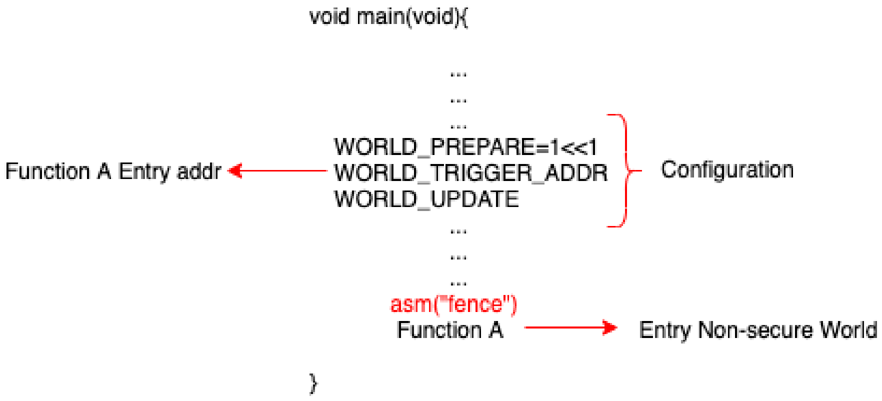
Note that the following CPU interrupt-related CSR registers can only be written to in the Secure World, and can only be read but not written to in the Non-secure World, thus ensuring that interrupts can only be controlled by the Secure World.

Name	Description	Address	Access
Machine Trap Setup CSRs			
mstatus	Machine Mode Status	0x300	R/W
mtvec	Machine Trap Vector	0x305	R/W
Machine Trap Handling CSRs			
mscratch	Machine Scratch	0x340	R/W
mepc	Machine Trap Program Counter	0x341	R/W
mcause	Machine Trap Cause	0x342	R/W
mtval	Machine Trap Value	0x343	R/W

15.4 CPU's World Switch

CPU can switch from Secure World to Non-secure World, and from Non-secure World to Secure World.

15.4.1 From Secure World to Non-secure World



```
void main(void){
    ...
    ...
    ...
    WORLD_PREPARE=1<<1
    WORLD_TRIGGER_ADDR
    WORLD_UPDATE
    ...
    ...
    ...
    asm("fence")
    Function A
}
```

Figure 15-1. Switching From Secure World to Non-secure World

ESP32-C3's CPU only needs to complete the following steps to switch from Secure World to Non-secure World:

1. Write 0x2 to Register WCL_CORE_0_WORLD_PERPARE_REG, indicating the CPU needs to switch to the Non-secure World.
2. Configure Register WCL_CORE_0_World_TRIGGER_ADDR_REG as the entry address to the Non-secure World, i.e., the address of the application in the Non-secure World that needs to be executed.
3. Write any value to Register WCL_CORE_0_World_UPDATE_REG, indicating the configuration is done.

Note:

- Registers WCL_CORE*m*_WORLD_PERPARE_REG and WCL_CORE_0_World_TRIGGER_ADDR_REG can be configured in any order. Register WCL_CORE_0_World_UPDATE_REG must be configured at last.

Afterwards, the World Controller keeps monitoring if CPU is executing the configured address of the application in Non-secure World. CPU switches to the Non-secure World once it executes the configured address, and executes the applications in the Non-secure World.

After configuration, the World Controller:

- Keeps monitoring until the CPU executes the configured address and switches to the Non-secure World.
  – Write any value to Register WCL_CORE_0_World_Cancel_REG to cancel the World Controller configuration. After the cancellation, CPU will not switch to the Non-secure World even it executes to the configured address.
- The World Controller can only switch from the Secure World to Non-secure World once per configuration. Therefore, the World Controller needs to be configured again after each world switch to prepare it for the next world switch.

However, it's worth noting that you cannot call the application in Non-secure world immediately after configuring the World Controller. For reasons such as CPU pre-indexed addressing and pipeline, it is possible that the CPU has already executed the application in Non-secure World before the World Controller configuration is effective, meaning the CPU runs unsecured application in the Secure World.

Therefore, you need to make sure the CPU only calls applications in the Non-secure world after the World Controller configuration takes effect. This can be guaranteed by **declaring the applications in the Non-secure World as "noinline"**.

15.4.2 From Non-secure World to Secure World

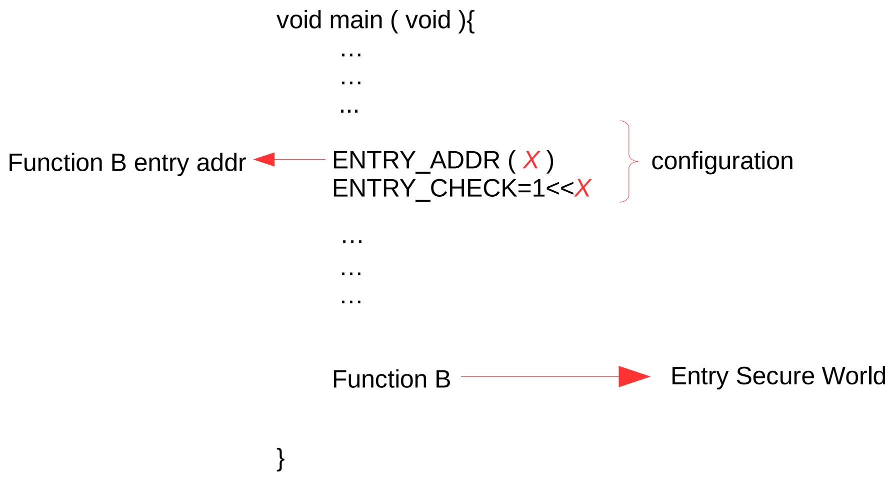


Figure 15-2. Switching From Non-secure World to Secure World

CPU can only switch from Non-secure World to Secure World via **Interrupts (or Exceptions)**. After configuring the World Controller, the CPU can switch back from Non-secure World to Secure World upon the configured Interrupt trigger.

Configuring the World Controller

The detailed steps to configure the World Controller to switch the CPU from Non-secure World to Secure World are described below:

1. Configure the entry base address of interrupts or exception WCL_CORE_0_MTVEC_BASE_REG. After that, the World controller populates the monitored addresses for each entry as follows:
   - Exception entry: WCL_CORE_0_MTVEC_BASE_REG + 0x00
   - Interrupt entries: WCL_CORE_0_MTVEC_BASE_REG + 4* *i* (*i* = 1~31)

   Note that this register must be configured to the mtvec CSR register of the CPU. When modifying the CPU's mtvec CSR registers, this register also must be updated. For details, please refer to Chapter 1 *ESP-RISC-V CPU*.
2. Configure Register WCL_CORE_0_ENTRY_CHECK_REG to enable the monitoring of one or more certain entries (0: disable; 1: enable).

- Bit 0 controls the entry monitoring of exception
- Bit *x* controls the entry monitoring of interrupt Entry *x* (*x* = 1~31), respectively

Note that, once configured, register WCL_CORE_0_ENTRY_CHECK_REG is always effective till it's disabled again, meaning you don't need to configure this register every time after each world switch.

3. Configure WCL_CORE_0_MSTATUS_MIE_REG to enable updating the World Switch Log. Otherwise, this log will not be updated for world switches. For detailed information about the World Switch Log, see Section 15.5.

15.5 World Switch Log

In actual use cases, CPU is switching between two worlds quite frequently and has to deal with nested interrupts. To be able to restore to the previous world, World Controller keeps a world switching log in a series of registers, which is called "World Switch Log Table".

15.5.1 Structure of World Switch Log Register

ESP32-C3's World Switch Log Table consists of 32 WCL_CORE_0_STATUSTABLE*n*_REG(*n*: 0-31) registers (see Figure 15-3). The Entry *x*, is logged in WCL_CORE_0_STATUSTABLE*x*_REG.

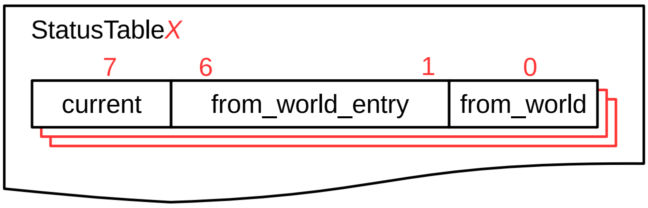

Figure 15-3. World Switch Log Register

- WCL_CORE_0_FROM_WORLD_*n*: logs the world information before the world switch.
  - 0: CPU was in Secure World
  - 1: CPU was in Non-secure World
- WCL_CORE_0_FROM_ENTRY_*n*: logs the entry information before the world switch, in total of 6 bits.
  - 0~31: CPU is currently jumping from another interrupt/exception entry 0~31
  - 32: CPU was not at any interrupts monitored at any entry
- WCL_CORE_0_CURRENT_*n*: indicates if CPU is at the interrupt monitored at the current entry. When CPU is at the interrupt monitored at Entry *x*,
  - WCL_CORE_0_CURRENT_*x* is updated to 1;
  - and the same field of all other entries are updated to 0.

15.5.2 How World Switch Log Registers are Updated

To explain this process, assuming:

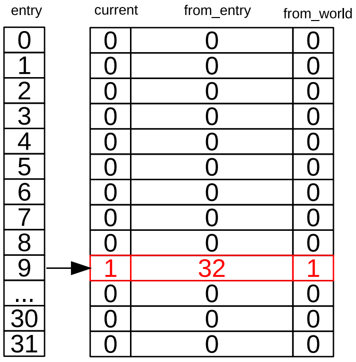
1. At the beginning:
   - CPU is running in the Non-secure World;

- Registers WCL_CORE_0_STATUSTABLE*n*_REG(*n*: 0-31) are all empty.

2. Then an interrupt occurs at Entry 9;
3. Then another interrupt with higher priority occurs at Entry 1;
4. Then the last interrupt with highest priority occurs at Entry 4.

The World Switch Log Table is updated as described below:

1. First, an interrupt occurs at Entry 9. At this time, CPU executes to the entry address of this interrupt. The World Switch Log Table is updated as described in Figure 15-4:



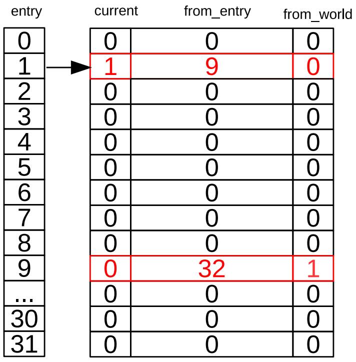
entry	current	from_entry	from_world
0	0	0	0
1	0	0	0
2	0	0	0
3	0	0	0
4	0	0	0
5	0	0	0
6	0	0	0
7	0	0	0
8	0	0	0
9	1	32	1
...	0	0	0
30	0	0	0
31	0	0	0

Figure 15-4. Nested Interrupts Handling - Entry 9

At this time:

- WCL_CORE_0_STATUSTABLE9_REG
  - Field WCL_CORE_0_FROM_WORLD_9 is updated to 1, indicating CPU was in Non-secure World before the interrupt;
  - Field WCL_CORE_0_FROM_ENTRY_9 is updated to 32, indicating there was not any interrupt before this one;
  - Field WCL_CORE_0_CURRENT_9 is updated to 1, indicating the CPU is currently at the interrupt monitored at Entry 9.
- Other WCL_CORE_0_STATUSTABLE*n*_REG registers are not updated.

2. Then another interrupt with higher priority occurs at Entry 1. At this time, CPU executes to the entry address of this interrupt. The World Switch Log Table is updated again as described in Figure 15-5:



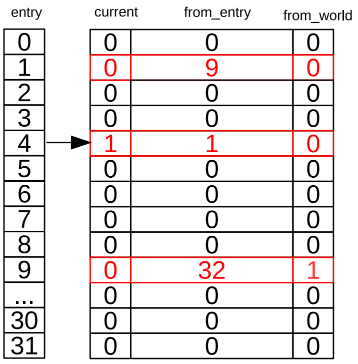
entry	current	from_entry	from_world
0	0	0	0
1	1	9	0
2	0	0	0
3	0	0	0
4	0	0	0
5	0	0	0
6	0	0	0
7	0	0	0
8	0	0	0
9	0	32	1
...	0	0	0
30	0	0	0
31	0	0	0

Figure 15-5. Nested Interrupts Handling - Entry 1

At this time:

- WCL_CORE_0_STATUSTABLE1_REG
  - Field WCL_CORE_0_FROM_WORLD_1 is updated to 0, indicating the CPU was in Secure World before this interrupt.
  - Field WCL_CORE_0_FROM_ENTRY_1 is updated to 9, indicating the CPU was executing the interrupt at Entry 9.
  - Field WCL_CORE_0_CURRENT_1 is updated to 1, indicating CPU is currently at the interrupt monitored at Entry 1.
- WCL_CORE_0_STATUSTABLE9_REG
  - Field WCL_CORE_0_CURRENT_9 is updated to 0, indicating CPU is no longer at the interrupt monitored at Entry 9 (Instead, CPU is at the interrupt monitored at Entry 1 already).
  - Fields WCL_CORE_0_FROM_WORLD_9 and WCL_CORE_0_FROM_ENTRY_9 stay the same.
- Other WCL_CORE_0_STATUSTABLE*n*_REG registers are not updated.

3. Then the last interrupt with highest priority occurs at Entry 4. At this time, CPU executes to the entry address of interrupt 4. The World Switch Log Table is updated again as described in Figure 15-6:



entry	current	from_entry	from_world
0	0	0	0
1	0	9	0
2	0	0	0
3	0	0	0
4	1	1	0
5	0	0	0
6	0	0	0
7	0	0	0
8	0	0	0
9	0	32	1
...	0	0	0
30	0	0	0
31	0	0	0

Figure 15-6. Nested Interrupts Handling - Entry 4

At this time:

- WCL_CORE_0_STATUSTABLE4_REG
  - Field WCL_CORE_0_FROM_WORLD_4 is updated to 0, indicating the CPU was in Secure World before this interrupt.
  - Field WCL_CORE_0_FROM_ENTRY_4 is updated to 1, indicating the CPU was the interrupt at Entry 1.
  - Field WCL_CORE_0_CURRENT_4 is updated to 1, indicating the CPU is currently at the interrupt monitored an Entry 4.
- WCL_CORE_0_STATUSTABLE1_REG
  - Field WCL_CORE_0_CURRENT_1 is updated to 0, indicating the CPU is no longer at the interrupt monitored at Entry 1 (Instead CPU is at the interrupt monitored at Entry 4 already).
  - Fields WCL_CORE_0_FROM_WORLD_1 and WCL_CORE_0_FROM_ENTRY_1 are not updated.

- Other WCL_CORE_0_STATUSTABLE*n*_REG registers are not updated.

15.5.3 How to Read World Switch Log Registers

By reading World Switch Log Registers, we get to understand the information of previous world switches and nested interrupts, thus being able to restore to previous world.

Steps are described below: (See Figure 15-6 as an example):

1. Read Register WCL_CORE_0_STATUSTABLE_CURRENT_REG, and understand CPU is now at the interrupt monitored at Entry 4.
2. Read 1 from Field WCL_CORE_0_FROM_ENTRY_4, and understand the CPU was at an interrupt monitored at Entry 1.
3. Read 9 from Field WCL_CORE_0_FROM_ENTRY_1, and understand the CPU was at an interrupt monitored at Entry 9.
4. Read 32 from WCL_CORE_0_FROM_ENTRY_9, and understand CPU wasn't at any interrupt. Then read 1 from WCL_CORE_0_FROM_WORLD_9, and understand CPU was in Non-secure World at the beginning.

15.5.4 Nested Interrupts

To support interrupt nesting, World controller provides additional configuration to update World Switch Log. See details in Section Programming Procedure below.

15.5.4.1 Programming Procedure

Handling the interrupt at Entry *A*:

1. Save context.
2. Configure WCL_CORE_0_MSTATUS_MIE_REG register to enable updating the World Switch Log table.
   - After entering the interrupt and exception vector, CPU will automatically turn off the global interrupt enable to avoid interrupt nesting. After saving the context, the global interrupt enable can be turned on again to respond to higher-level interrupts.
   - The World Controller WCL_CORE_0_MSTATUS_MIE_REG register also supports a similar feature of global interrupt enable. When any entry trigger is detected, WCL_CORE_0_MSTATUS_MIE_REG will be automatically cleared to 0, and software needs to be enabled again in the interrupt/exception service routine. This register should be configured before turning on the global interrupt enable.
3. Enable the global interrupt enable.
4. Execute the interrupt programs.
5. Disable CPU global interrupt enable.
6. Read Field WCL_CORE_0_FROM_ENTRY_*A* for Entry *A*:
   - 32: indicates all interrupts are handled, and return to a normal program,
     (a) Update Field WCL_CORE_0_CURRENT_*A* of Entry *A* to 0, indicating the CPU is no longer at the interrupt monitored at Entry *A*.
     (b) Go to Step 7.

- 0~31: indicates the CPU returns to another interrupt monitored at Entry *B*,
    - Update the world switch register of Entry *A*:
        - Update Field WCL_CORE_0_CURRENT_*A* to 0, indicating the CPU is no longer at the interrupt monitored at Entry *A*.
        - Fields WCL_CORE_0_FROM_WORLD_*A* and WCL_CORE_0_FROM_ENTRY_*A* stay the same.
    - Update the world switch register of Entry *B*:
        - Update Field WCL_CORE_0_CURRENT_*B* to 1, indicating the CPU will return to Entry *B*.

7. Prepare to exit interrupt.

    (a) Check if CPU needs to switch to the other world:

    - If world switch not required, then go to Step 8.
    - If world switch required, then switch the CPU to the other world following instructions described in Section 15.4, then go to Step 8.

8. Enable interrupts, restore context and exit.

Note:
Steps 6 and 7 should not be interrupted by any interrupts. Therefore, users need to disable all the interrupts before these steps, and enable interrupts once done.

15.6 Register Summary

The addresses in this section are relative to the World Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
WORLD1 to WORLD0 Configuration Registers			
WCL_Core_0_MTVEC_BASE_REG	MTVEC configuration	0x0000	R/W
WCL_Core_0_MSTATUS_MIE_REG	MSTATUS_MIE configuration	0x0004	R/W
WCL_Core_0_ENTRY_CHECK_REG	CPU entry check configuration	0x0008	R/W
StatusTable Registers			
WCL_Core_0_STATUSTABLE*n*_REG (*n*: 0-31)	Entry *n* world switching status	0x0040	R/W
WCL_Core_0_STATUSTABLE_CURRENT_REG	Represetns the entry where the interrupt is currently at	0x00E0	R/W
WORLD0 to WORLD1 Configuration Registers			
WCL_Core_0_World_TRIGGER_ADDR_REG	CPU trigger address configuration	0x0140	RW
WCL_Core_0_World_PREPARE_REG	CPU world switching preparation configuration	0x0144	R/W
WCL_Core_0_World_UPDATE_REG	CPU world switching update configuration	0x0148	WO
WCL_Core_0_World_Cancel_REG	CPU world switching cancel configuration	0x014C	WO
WCL_Core_0_World_IRam0_REG	CPU IBUS world info	0x0150	R/W
WCL_Core_0_World_DRam0_PIF_REG	CPU DBUS and PIF bus world info	0x0154	R/W
WCL_Core_0_World_Phase_REG	CPU world switching readiness	0x0158	RO

15.7 Registers

The addresses in this section are relative to the World Controller base address provided in Table 3-3 in Chapter *3 System and Memory*.

Register 15.1. WCL_Core_0_MTVEC_BASE_REG (0x0000)

WCL_CORE_0_MTVEC_BASE	
31 0	
0	Reset

WCL_CORE_0_MTVEC_BASE Configures the MTVEC base address, which should be kept consistent with the MTVEC in RISC-V. (R/W)

Register 15.2. WCL_Core_0_MSTATUS_MIE_REG (0x0004)

(reserved)	WCL_CORE_0_MSTATUS_MIE	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

WCL_CORE_0_MSTATUS_MIE Write 1 to enable World Switch Log Table. Only when the bit is set, the world switching is recorded in the World Switch Log Table. This bit is cleared once CPU switches from the Non-secure World to Secure World. (R/W)

Register 15.3. WCL_Core_0_ENTRY_CHECK_REG (0x0008)

WCL_CORE_0_ENTRY_CHECK	
31 0	
0x000000	Reset

WCL_CORE_0_ENTRY_CHECK Write 1 to enable CPU switching from Non-secure World to Secure world upon the monitored addresses. (R/W)

Register 15.4. WCL_Core_0_STATUSTABLE*n*_REG(*n*: 0-31) (0x0x0040+4**n*)

(reserved)	WCL_CORE_0_CURRENT_*n*	WCL_CORE_0_FROM_ENTRY_*n*	WCL_CORE_0_FROM_WORLD_*n*	
31 8	7	6 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x0	0	Reset

WCL_CORE_0_FROM_WORLD_*n* Stores the world info before CPU entering entry *n*. (R/W)

WCL_CORE_0_FROM_ENTRY_*n* Stores the previous entry info before CPU entering entry *n*.(R/W)

WCL_CORE_0_CURRENT_*n* Represents if the interrupt is at entry *n*. (R/W)

Register 15.5. WCL_Core_0_STATUSTABLE_CURRENT_REG (0x00E0)

WCL_CORE_0_STATUSTABLE_CURRENT	
31 0	
0	Reset

WCL_CORE_0_STATUSTABLE_CURRENT Represents the entry where the interrupt is currently at. (R/W)

Register 15.6. WCL_Core_0_World_TRIGGER_ADDR_REG (0x0140)

WCL_CORE_0_WORLD_TRIGGER_ADDR	
31 0	
0	Reset

WCL_CORE_0_WORLD_TRIGGER_ADDR Configures the entry address at which CPU switches from Secure World to Non-secure World. (RW)

Register 15.7. WCL_Core_0_World_PREPARE_REG (0x0144)

(reserved)	WCL_CORE_0_WORLD_PREPARE	
31 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

WCL_CORE_0_WORLD_PREPARE Configures the world to switch to.

0x1: reserved

0x2: Non-secure World

(R/W)

Register 15.8. WCL_Core_0_World_UPDATE_REG (0x0148)

WCL_CORE_0_UPDATE	
31 0	
0	Reset

WCL_CORE_0_UPDATE Write any value to this field to indicate the completion of CPU configuration for switching from Secure World to Non-Secure World. (WO)

Register 15.9. WCL_Core_0_World_Cancel_REG (0x014C)

WCL_CORE_0_WORLD_CANCEL	
31 0	
0	Reset

WCL_CORE_0_WORLD_CANCEL Write any value to this filed to cancel the CPU configuration for switching from Secure World to Non-Secure World. (WO)

Register 15.10. WCL_Core_0_World_IRam0_REG (0x0150)

(reserved)	WCL_CORE_0_WORLD_IRAM0	
31 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

WCL_CORE_0_WORLD_IRAM0 Stores the world info of CPU's instruction bus. Only used for debugging. (R/W)

Register 15.11. WCL_Core_0_World_DRam0_PIF_REG (0x0154)

(reserved)	WCL_CORE_0_WORLD_DRAM0_PIF	
31 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

WCL_CORE_0_WORLD_DRAM0_PIF Stores the world info of CPU's data bus and peripheral bus. Only used for debugging. (R/W)

Register 15.12. WCL_Core_0_World_Phase_REG (0x0158)

(reserved)	WCL_CORE_0_WORLD_PHASE	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

WCL_CORE_0_WORLD_PHASE Represents if the CPU is ready to switch from Non-secure World to Secure World.

1: ready

2: not ready

(RO)

16 System Registers (SYSREG)

16.1 Overview

The ESP32-C3 integrates a large number of peripherals, and enables the control of individual peripherals to achieve optimal characteristics in performance-vs-power-consumption scenarios. Specifically, ESP32-C3 has various system configuration registers that can be used for the chip's clock management (clock gating), power management, and the configuration of peripherals and core-system modules. This chapter lists all these system registers and their functions.

16.2 Features

ESP32-C3 system registers can be used to control the following peripheral blocks and core modules:

- System and memory
- Clock
- Software Interrupt
- Low-power management
- Peripheral clock gating and reset

16.3 Function Description

16.3.1 System and Memory Registers

16.3.1.1 Internal Memory

The following registers can be used to control ESP32-C3's internal memory:

- In register SYSCON_CLKGATE_FORCE_ON_REG:
  - Setting different bits of the SYSCON_ROM_CLKGATE_FORCE_ON field forces on the clock gates of different blocks of Internal ROM 0 and Internal ROM 1.
  - Setting different bits of the SYSCON_SRAM_CLKGATE_FORCE_ON field forces on the clock gates of different blocks of Internal SRAM.
  - This means when the respective bits of this register are set to 1, the clock gate of the corresponding ROM or SRAM blocks will always be on. Otherwise, the clock gate will turn on automatically when the corresponding ROM or SRAM blocks are accessed and turn off automatically when the corresponding ROM or SRAM blocks are not accessed. Therefore, it's recommended to configure these bits to 0 to lower power consumption.
- In register SYSCON_MEM_POWER_DOWN_REG:
  - Setting different bits of the SYSCON_ROM_POWER_DOWN field sends different blocks of Internal ROM 0 and Internal ROM 1 into retention state.
  - Setting different bits of the SYSCON_SRAM_POWER_DOWN field sends different blocks of Internal SRAM into retention state.

  - The “Retention” state is a low-power state of a memory block. In this state, the memory block still holds all the data stored but cannot be accessed, thus reducing the power consumption. Therefore, you can send a certain block of memory into the retention state to reduce power consumption if you know you are not going to use such memory block for some time.

- In register SYSCON_MEM_POWER_UP_REG:
  - By default, all memory enters low-power state when the chip enters the Light-sleep mode.
  - Setting different bits of the SYSCON_ROM_POWER_UP field forces different blocks of Internal ROM 0 and Internal ROM 1 to work as normal (do not enter the retention state) when the chip enters Light-sleep.
  - Setting different bits of the SYSCON_SRAM_POWER_UP field forces different blocks of Internal SRAM to work as normal (do not enter the retention state) when the chip enters Light-sleep.

For detailed information about the controlling bits of different blocks, please see Table 16-1 below.

Table 16-1. Memory Controlling Bit

Memory	Lowest Address1	Highest Address1	Lowest Address2	Highest Address2	Controlling Bit
ROM 0	0x4000_0000	0x4003_FFFF	-	-	Bit0
ROM 1	0x4004_0000	0x4005_FFFF	0x3FF0_0000	0x3FF1_FFFF	Bit1
SRAM Block 0	0x4037_C000	0x4037_FFFF	-	-	Bit0
SRAM Block 1	0x4038_0000	0x4039_FFFF	0x3FC8_0000	0x3FC9_FFFF	Bit1
SRAM Block 2	0x403A_0000	0x403B_FFFF	0x3FCA_0000	0x3FCB_FFFF	Bit2
SRAM Block 3	0x403C_0000	0x403D_FFFF	0x3FCC_0000	0x3FCD_FFFF	Bit3

For more information, please refer to Chapter 3 *System and Memory*.

16.3.1.2 External Memory

SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG configures encryption and decryption options of the external memory. For details, please refer to Chapter 23 *External Memory Encryption and Decryption (XTS_AES)*.

16.3.1.3 RSA Memory

SYSTEM_RSA_PD_CTRL_REG controls the SRAM memory in the RSA accelerator.

- Setting the SYSTEM_RSA_MEM_PD bit to send the RSA memory into retention state. This bit has the lowest priority, meaning it can be masked by the SYSTEM_RSA_MEM_FORCE_PU field. This bit is invalid when the *Digital Signature (DS)* occupies the RSA.
- Setting the SYSTEM_RSA_MEM_FORCE_PU bit to force the RSA memory to work as normal when the chip enters light sleep. This bit has the second highest priority, meaning it overrides the SYSTEM_RSA_MEM_PD field.
- Setting the SYSTEM_RSA_MEM_FORCE_PD bit to send the RSA memory into retention state. This bit has the highest priority, meaning it sends the RSA memory into retention state regardless of the SYSTEM_RSA_MEM_FORCE_PU field.

16.3.2 Clock Registers

The following registers are used to set clock sources and frequency. For more information, please refer to Chapter 6 *Reset and Clock*.

- SYSTEM_CPU_PER_CONF_REG
- SYSTEM_SYSCLK_CONF_REG
- SYSTEM_BT_LPCK_DIV_FRAC_REG

16.3.3 Interrupt Signal Registers

The following registers are used for generating the interrupt signals (software interrupt), which then can be routed to the CPU peripheral interrupts via the interrupt matrix. To be more specific, writing 1 to any of the following registers generates an interrupt signal. Therefore, these registers can be used by software to control interrupts. The following registers correspond to the interrupt source SW_INTR_0/1/2/3. For more information, please refer to Chapter 8 *Interrupt Matrix (INTERRUPT)*.

- SYSTEM_CPU_INTR_FROM_CPU_0_REG
- SYSTEM_CPU_INTR_FROM_CPU_1_REG
- SYSTEM_CPU_INTR_FROM_CPU_2_REG
- SYSTEM_CPU_INTR_FROM_CPU_3_REG

16.3.4 Low-power Management Registers

The following registers are used for low-power management. For more information, please refer to Chapter 9 *Low-power Management*.

- SYSTEM_RTC_FASTMEM_CONFIG_REG: configures the RTC CRC check.
- SYSTEM_RTC_FASTMEM_CRC_REG: configures the CRC check value.

16.3.5 Peripheral Clock Gating and Reset Registers

The following registers are used for controlling the clock gating and reset of different peripherals. Details can be seen in Table 16-2.

- SYSTEM_CACHE_CONTROL_REG
- SYSTEM_PERIP_CLK_EN0_REG
- SYSTEM_PERIP_RST_EN0_REG
- SYSTEM_PERIP_CLK_EN1_REG
- SYSTEM_PERIP_RST_EN1_REG

ESP32-C3 features low power consumption. This is why some peripheral clocks are gated (disabled) by default. Before using any of these peripherals, it is mandatory to enable the clock for the given peripheral and release the peripheral from reset state. For details, see the table below:

Table 16-2. Clock Gating and Reset Bits

Component	Clock Enabling Bit [1]	Reset Controlling Bit [2] [3]
CACHE Control	**SYSTEM_CACHE_CONTROL_REG**	
DCACHE	SYSTEM_DCACHE_CLK_ON	SYSTEM_DCACHE_RESET
ICACHE	SYSTEM_ICACHE_CLK_ON	SYSTEM_ICACHE_RESET
CPU	**SYSTEM_CPU_PERI_CLK_EN_REG**	**SYSTEM_CPU_PERI_RST_EN_REG**
DEBUG_ASSIST	SYSTEM_CLK_EN_ASSIST_DEBUG	SYSTEM_RST_EN_ASSIST_DEBUG
Peripherals	**SYSTEM_PERIP_CLK_EN0_REG**	**SYSTEM_PERIP_RST_EN0_REG**
TIMER	SYSTEM_TIMERS_CLK_EN	SYSTEM_TIMERS_RST
SPI0 / SPI1	SYSTEM_SPI01_CLK_EN	SYSTEM_SPI01_RST
UART0	SYSTEM_UART_CLK_EN	SYSTEM_UART_RST
UART1	SYSTEM_UART1_CLK_EN	SYSTEM_UART1_RST
SPI2	SYSTEM_SPI2_CLK_EN	SYSTEM_SPI2_RST
I2C0	SYSTEM_EXT0_CLK_EN	SYSTEM_EXT0_RST
UHCI0	SYSTEM_UHCI0_CLK_EN	SYSTEM_UHCI0_RST
RMT	SYSTEM_RMT_CLK_EN	SYSTEM_RMT_RST
LED PWM Controller	SYSTEM_LEDC_CLK_EN	SYSTEM_LEDC_RST
Timer Group0	SYSTEM_TIMERGROUP_CLK_EN	SYSTEM_TIMERGROUP_RST
Timer Group1	SYSTEM_TIMERGROUP1_CLK_EN	SYSTEM_TIMERGROUP1_RST
TWAI Controller	SYSTEM_CAN_CLK_EN	SYSTEM_CAN_RST
USB_DEVICE	SYSTEM_USB_DEVICE_CLK_EN	SYSTEM_USB_DEVICE_RST
UART MEM	SYSTEM_UART_MEM_CLK_EN [4]	SYSTEM_UART_MEM_RST
APB SARADC	SYSTEM_APB_SARADC_CLK_EN	SYSTEM_APB_SARADC_RST
ADC Controller	SYSTEM_ADC2_ARB_CLK_EN	SYSTEM_ADC2_ARB_RST
System Timer	SYSTEM_SYSTIMER_CLK_EN	SYSTEM_SYSTIMER_RST
Accelerators	**SYSTEM_PERIP_CLK_EN1_REG**	**SYSTEM_PERIP_RST_EN1_REG**
TSENS	SYSTEM_TSENS_CLK_EN	SYSTEM_TSENS_RST
DMA	SYSTEM_DMA_CLK_EN	SYSTEM_DMA_RST[5]
HMAC	SYSTEM_CRYPTO_HMAC_CLK_EN	SYSTEM_CRYPTO_HMAC_RST [6]
Digital Signature	SYSTEM_CRYPTO_DS_CLK_EN	SYSTEM_CRYPTO_DS_RST [7]
RSA Accelerator	SYSTEM_CRYPTO_RSA_CLK_EN	SYSTEM_CRYPTO_RSA_RST
SHA Accelerator	SYSTEM_CRYPTO_SHA_CLK_EN	SYSTEM_CRYPTO_SHA_RST
AES Accelerator	SYSTEM_CRYPTO_AES_CLK_EN	SYSTEM_CRYPTO_AES_RST

[1] Set the clock enable bit to 1 to enable the clock, and to 0 to disable the clock;

[2] Set the reset enabling bit to 1 to reset a peripheral, and to 0 to disable the reset.

[3] Reset registers cannot be cleared by hardware. Therefore, SW reset clear is required after setting the reset registers.

[4] UART memory is shared by all UART peripherals, meaning having any active UART peripherals will prevent the UART memory from entering the clock-gated state.

[5] When DMA is required for periphral communications, for example, UCHI0, SPI, I2S, LCD_CAM, AES, SHA and ADC, DMA clock should also be enabled.

[6] Resetting this bit also resets the SHA accelerator.

[7] Resetting this bit also resets the AES, SHA, and RSA accelerators.

16.4 Register Summary

The addresses in this section are relative to the base address of system registers provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Peripheral Clock Control Registers			
SYSTEM_CPU_PERI_CLK_EN_REG	CPU peripheral clock enable register	0x0000	R/W
SYSTEM_CPU_PERI_RST_EN_REG	CPU peripheral clock reset register	0x0004	R/W
SYSTEM_PERIP_CLK_EN0_REG	System peripheral clock enable register 0	0x0010	R/W
SYSTEM_PERIP_CLK_EN1_REG	System peripheral clock enable register 1	0x0014	R/W
SYSTEM_PERIP_RST_EN0_REG	System peripheral clock reset register 0	0x0018	R/W
SYSTEM_PERIP_RST_EN1_REG	System peripheral clock reset register 1	0x001C	R/W
SYSTEM_CACHE_CONTROL_REG	Cache clock control register	0x0040	R/W
Clock Configuration Registers			
SYSTEM_CPU_PER_CONF_REG	CPU clock configuration register	0x0008	R/W
SYSTEM_SYSCLK_CONF_REG	System clock configuration register	0x0058	varies
Low-power Management Registers			
SYSTEM_BT_LPCK_DIV_FRAC_REG	Low-power clock configuration register 1	0x0024	R/W
SYSTEM_RTC_FASTMEM_CONFIG_REG	Fast memory CRC configuration register	0x0048	varies
SYSTEM_RTC_FASTMEM_CRC_REG	Fast memory CRC result register	0x004C	RO
CPU Interrupt Control Registers			
SYSTEM_CPU_INTR_FROM_CPU_0_REG	CPU interrupt control register 0	0x0028	R/W
SYSTEM_CPU_INTR_FROM_CPU_1_REG	CPU interrupt control register 1	0x002C	R/W
SYSTEM_CPU_INTR_FROM_CPU_2_REG	CPU interrupt control register 2	0x0030	R/W
SYSTEM_CPU_INTR_FROM_CPU_3_REG	CPU interrupt control register 3	0x0034	R/W
System and Memory Control Registers			
SYSTEM_RSA_PD_CTRL_REG	RSA memory power control register	0x0038	R/W
SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG	External memory encryption and decryption control register	0x0044	R/W
Clock Gate Control Register			
SYSTEM_CLOCK_GATE_REG	Clock gate control register	0x0054	R/W
Date Register			
SYSTEM_DATE_REG	Version register	0x0FFC	R/W

The addresses below are relative to the base address of apb control provided in Table 3-3 in Chapter 3 *System and Memory*.

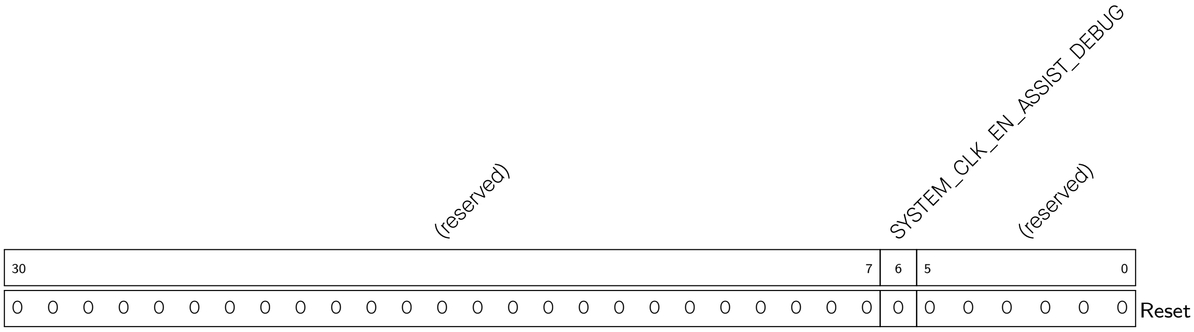
The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Register			
SYSCON_CLKGATE_FORCE_ON_REG	Internal memory clock gate enable register	0x00A4	R/W
SYSCON_MEM_POWER_DOWN_REG	Internal memory control register	0x00A8	R/W
SYSCON_MEM_POWER_UP_REG	Internal memory control register	0x00AC	R/W

16.5 Registers

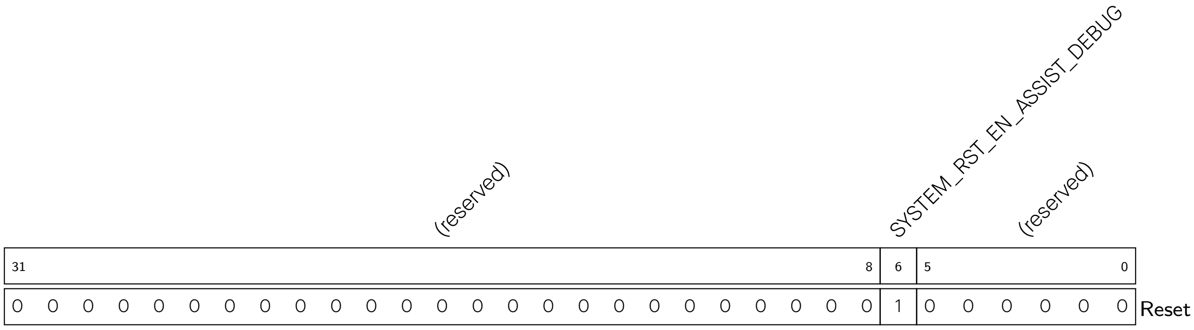
The addresses below are relative to the base address of system register provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 16.1. SYSTEM_CPU_PERI_CLK_EN_REG (0x0000)



SYSTEM_CLK_EN_ASSIST_DEBUG Set this bit to enable the ASSIST_DEBUG clock. Please see Chapter 17 *Debug Assistant (ASSIST_DEBUG)* for more information about ASSIST_DEBUG. (R/W)

Register 16.2. SYSTEM_CPU_PERI_RST_EN_REG (0x0004)



SYSTEM_RST_EN_ASSIST_DEBUG Set this bit to reset the ASSIST_DEBUG clock. Please see Chapter 17 *Debug Assistant (ASSIST_DEBUG)* for more information about ASSIST_DEBUG. (R/W)

Register 16.3. SYSTEM_PERIP_CLK_EN0_REG (0x0010)

(reserved)	SYSTEM_ADC2_ARB_CLK_EN	SYSTEM_SYSTIMER_CLK_EN	SYSTEM_APB_SARADC_CLK_EN	SYSTEM_SPI3_DMA_CLK_EN	(reserved)	SYSTEM_UART_MEM_CLK_EN	SYSTEM_USB_DEVICE_CLK_EN	(reserved)	SYSTEM_I2S1_CLK_EN	(reserved)	SYSTEM_CAN_CLK_EN	(reserved)	SYSTEM_TIMERGROUP1_CLK_EN	(reserved)	SYSTEM_TIMERGROUP_CLK_EN	(reserved)	SYSTEM_LEDC_CLK_EN	(reserved)	SYSTEM_RMT_CLK_EN	SYSTEM_UHCI0_CLK_EN	SYSTEM_EXT0_CLK_EN	SYSTEM_SPI2_CLK_EN	SYSTEM_UART1_CLK_EN	(reserved)	SYSTEM_UART_CLK_EN	SYSTEM_SPI01_CLK_EN	SYSTEM_TIMERS_CLK_EN	
31	30	29	28	27	26 25	24	23	22	21	20	19	18 16	15	14	13	12	11	10	9	8	7	6	5	4 3	2	1	0	
1	1	1	1	1	0 0	1	1	1	0	0	0	0 0 1	1	1	1	0	0	0	0	0	0	1	1	0 1	1	1	1	Reset

SYSTEM_TIMERS_CLK_EN Set this bit to enable TIMERS clock. (R/W)

SYSTEM_SPI01_CLK_EN Set this bit to enable SPI0 / SPI1 clock. (R/W)

SYSTEM_UART_CLK_EN Set this bit to enable UART clock. (R/W)

SYSTEM_UART1_CLK_EN Set this bit to enable UART1 clock. (R/W)

SYSTEM_SPI2_CLK_EN Set this bit to enable SPI2 clock. (R/W)

SYSTEM_EXT0_CLK_EN Set this bit to enable I2C_EXT0 clock. (R/W)

SYSTEM_UHCI0_CLK_EN Set this bit to enable UHCI0 clock. (R/W)

SYSTEM_RMT_CLK_EN Set this bit to enable RMT clock. (R/W)

SYSTEM_LEDC_CLK_EN Set this bit to enable LEDC clock. (R/W)

SYSTEM_TIMERGROUP_CLK_EN Set this bit to enable TIMER GROUP clock. (R/W)

SYSTEM_TIMERGROUP1_CLK_EN Set this bit to enable TIMERGROUP1 clock. (R/W)

SYSTEM_CAN_CLK_EN Set this bit to enable TWAI clock. (R/W)

SYSTEM_I2S1_CLK_EN Set this bit to enable I2S1 clock. (R/W)

SYSTEM_USB_DEVICE_CLK_EN Set this bit to enable USB DEVICE clock. (R/W)

SYSTEM_UART_MEM_CLK_EN Set this bit to enable UART_MEM clock. (R/W)

SYSTEM_SPI3_DMA_CLK_EN Set this bit to enable SPI3 DMA clock. (R/W)

SYSTEM_APB_SARADC_CLK_EN Set this bit to enable APB_SARADC clock. (R/W)

SYSTEM_SYSTIMER_CLK_EN Set this bit to enable SYSTEMTIMER clock. (R/W)

SYSTEM_ADC2_ARB_CLK_EN Set this bit to enable ADC2_ARB clock. (R/W)

Register 16.4. SYSTEM_PERIP_CLK_EN1_REG (0x0014)

(reserved)	SYSTEM_TSENS_CLK_EN	(reserved)	SYSTEM_DMA_CLK_EN	SYSTEM_CRYPTO_HMAC_CLK_EN	SYSTEM_CRYPTO_DS_CLK_EN	SYSTEM_CRYPTO_RSA_CLK_EN	SYSTEM_CRYPTO_SHA_CLK_EN	SYSTEM_CRYPTO_AES_CLK_EN	(reserved)	
31 11	10	9 7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	1 0 0	0	0	0	0	0	0	0	Reset

SYSTEM_CRYPTO_AES_CLK_EN Set this bit to enable AES clock. (R/W)

SYSTEM_CRYPTO_SHA_CLK_EN Set this bit to enable SHA clock. (R/W)

SYSTEM_CRYPTO_RSA_CLK_EN Set this bit to enable RSA clock. (R/W)

SYSTEM_CRYPTO_DS_CLK_EN Set this bit to enable DS clock. (R/W)

SYSTEM_CRYPTO_HMAC_CLK_EN Set this bit to enable HMAC clock. (R/W)

SYSTEM_DMA_CLK_EN Set this bit to enable DMA clock. (R/W)

SYSTEM_TSENS_CLK_EN Set this bit to enable TSENS clock. (R/W)

Register 16.5. SYSTEM_PERIP_RST_EN0_REG (0x0018)

(reserved)	SYSTEM_ADC2_ARB_RST	SYSTEM_SYSTIMER_RST	SYSTEM_APB_SARADC_RST	SYSTEM_SPI3_DMA_RST	(reserved)	SYSTEM_UART_MEM_RST	SYSTEM_USB_DEVICE_RST	(reserved)	SYSTEM_I2S1_RST	(reserved)	SYSTEM_CAN_RST	(reserved)	SYSTEM_TIMERGROUP1_RST	(reserved)	SYSTEM_TIMERGROUP_RST	(reserved)	SYSTEM_LEDC_RST	(reserved)	SYSTEM_RMT_RST	SYSTEM_UHCI0_RST	SYSTEM_EXT0_RST	SYSTEM_SPI2_RST	SYSTEM_UART1_RST	(reserved)	SYSTEM_UART_RST	SYSTEM_SPI01_RST	SYSTEM_TIMERS_RST	
31	30	29	28	27	26 25	24	23	22	21	20	19	18 16	15	14	13	12	11	10	9	8	7	6	5	4 3	2	1	0	
0	0	0	0	0	0 0	0	0	0	0	0	0	0 0 0	0	0	0	0	0	0	0	0	0	0	0	0 0	0	0	0	Reset

SYSTEM_TIMERS_RST Set this bit to reset TIMERS. (R/W)

SYSTEM_SPI01_RST Set this bit to reset SPI0 / SPI1. (R/W)

SYSTEM_UART_RST Set this bit to reset UART. (R/W)

SYSTEM_UART1_RST Set this bit to reset UART1. (R/W)

SYSTEM_SPI2_RST Set this bit to reset SPI2. (R/W)

SYSTEM_EXT0_RST Set this bit to reset I2C_EXT0. (R/W)

SYSTEM_UHCI0_RST Set this bit to reset UHCI0. (R/W)

SYSTEM_RMT_RST Set this bit to reset RMT. (R/W)

SYSTEM_LEDC_RST Set this bit to reset LEDC. (R/W)

SYSTEM_TIMERGROUP_RST Set this bit to reset TIMERGROUP. (R/W)

SYSTEM_TIMERGROUP1_RST Set this bit to reset TIMERGROUP1. (R/W)

SYSTEM_CAN_RST Set this bit to reset CAN. (R/W)

SYSTEM_I2S1_RST Set this bit to reset I2S1. (R/W)

SYSTEM_USB_DEVICE_RST Set this bit to reset USB DEVICE. (R/W)

SYSTEM_UART_MEM_RST Set this bit to reset UART_MEM. (R/W)

SYSTEM_SPI3_DMA_RST Set this bit to reset SPI3. (R/W)

SYSTEM_APB_SARADC_RST Set this bit to reset APB_SARADC. (R/W)

SYSTEM_SYSTIMER_RST Set this bit to reset SYSTIMER. (R/W)

SYSTEM_ADC2_ARB_RST Set this bit to reset ADC2_ARB. (R/W)

Register 16.6. SYSTEM_PERIP_RST_EN1_REG (0x001C)

	(reserved)	SYSTEM_TSENS_RST	(reserved)	SYSTEM_DMA_RST	SYSTEM_CRYPTO_HMAC_RST	SYSTEM_CRYPTO_DS_RST	SYSTEM_CRYPTO_RSA_RST	SYSTEM_CRYPTO_SHA_RST	SYSTEM_CRYPTO_AES_RST	(reserved)
	31 11	10	9 7	6	5	4	3	2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0 1 1	1	1	1	1	1	1	0

SYSTEM_CRYPTO_AES_RST Set this bit to reset CRYPTO_AES. (R/W)

SYSTEM_CRYPTO_SHA_RST Set this bit to reset CRYPTO_SHA. (R/W)

SYSTEM_CRYPTO_RSA_RST Set this bit to reset CRYPTO_RSA. (R/W)

SYSTEM_CRYPTO_DS_RST Set this bit to reset CRYPTO_DS. (R/W)

SYSTEM_CRYPTO_HMAC_RST Set this bit to reset CRYPTO_HMAC. (R/W)

SYSTEM_DMA_RST Set this bit to reset DMA. (R/W)

SYSTEM_TSENS_RST Set this bit to reset TSENS. (R/W)

Register 16.7. SYSTEM_CACHE_CONTROL_REG (0x0040)

	(reserved)	SYSTEM_DCACHE_RESET	SYSTEM_DCACHE_CLK_ON	SYSTEM_ICACHE_RESET	SYSTEM_ICACHE_CLK_ON
	31 4	3	2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	1	0	1

SYSTEM_ICACHE_CLK_ON Set this bit to enable i-cache clock. (R/W)

SYSTEM_ICACHE_RESET Set this bit to reset i-cache. (R/W)

SYSTEM_DCACHE_CLK_ON Set this bit to enable d-cache clock. (R/W)

SYSTEM_DCACHE_RESET Set this bit to reset d-cache. (R/W)

Register 16.8. SYSTEM_CPU_PER_CONF_REG (0x0008)

(reserved)	SYSTEM_CPU_WAITI_DELAY_NUM	SYSTEM_CPU_WAIT_MODE_FORCE_ON	SYSTEM_PLL_FREQ_SEL	SYSTEM_CPUPERIOD_SEL	
31 8	7 4	3	2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	1	1	0	Reset

SYSTEM_CPUPERIOD_SEL Set this field to select the CPU clock frequency. For details, please refer to Table 6-4 in Chapter 6 *Reset and Clock*.(R/W)

SYSTEM_PLL_FREQ_SEL Set this bit to select the PLL clock frequency. For details, please refer to Table 6-4 in Chapter 6 *Reset and Clock*. (R/W)

SYSTEM_CPU_WAIT_MODE_FORCE_ON Set this bit to force on the clock gate of CPU wait mode. Usually, after executing the WFI instruction, CPU enters the wait mode, during which the clock gate of CPU is turned off until any interrupts occur. In this way, power consumption is saved. However, if this bit is set, the clock gate of CPU is always on and will not be turned off by the WFI instruction. (R/W)

SYSTEM_CPU_WAITI_DELAY_NUM Sets the number of delay cycles to turn off the CPU clock gate after the CPU enters the wait mode because of a WFI instruction. (R/W)

Register 16.9. SYSTEM_BT_LPCK_DIV_FRAC_REG (0x0024)

(reserved)	SYSTEM_LPCLK_RTC_EN	SYSTEM_LPCLK_SEL_XTAL32K	SYSTEM_LPCLK_SEL_XTAL	SYSTEM_LPCLK_SEL_8M	SYSTEM_LPCLK_SEL_RTC_SLOW	(reserved)	
31 29	28	27	26	25	24	23 0	
0 0 0	0	0	0	1	0		Reset

SYSTEM_LPCLK_SEL_RTC_SLOW Set this bit to select RTC_SLOW_CLK as the low-power clock. (R/W)

SYSTEM_LPCLK_SEL_8M Set this bit to select RC_FAST_CLK div n clock as the low-power clock. (R/W)

SYSTEM_LPCLK_SEL_XTAL Set this bit to select XTAL clock as the low-power clock. (R/W)

SYSTEM_LPCLK_SEL_XTAL32K Set this bit to select xtal32k clock as the low-power clock. (R/W)

SYSTEM_LPCLK_RTC_EN Set this bit to enable the LOW_POWER_CLK clock. (R/W)

Register 16.10. SYSTEM_SYSCLK_CONF_REG (0x0058)

(reserved)	SYSTEM_CLK_XTAL_FREQ	SYSTEM_SOC_CLK_SEL	SYSTEM_PRE_DIV_CNT	
31 19	18 12	11 10	9 0	
0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0x1	Reset

SYSTEM_PRE_DIV_CNT This field is used to set the count of prescaler of XTAL_CLK. For details, please refer to Table 6-4 in Chapter 6 *Reset and Clock*. (R/W)

SYSTEM_SOC_CLK_SEL This field is used to select SOC clock. For details, please refer to Table 6-2 in Chapter 6 *Reset and Clock*. (R/W)

SYSTEM_CLK_XTAL_FREQ This field is used to read XTAL frequency in MHz. (RO)

Register 16.11. SYSTEM_RTC_FASTMEM_CONFIG_REG (0x0048)

SYSTEM_RTC_MEM_CRC_FINISH	SYSTEM_RTC_MEM_CRC_LEN	SYSTEM_RTC_MEM_CRC_ADDR	SYSTEM_RTC_MEM_CRC_START	(reserved)	
31	30 20	19 9	8	7 0	
0	0x7ff	0x0	0	0 0 0 0 0 0 0 0	Reset

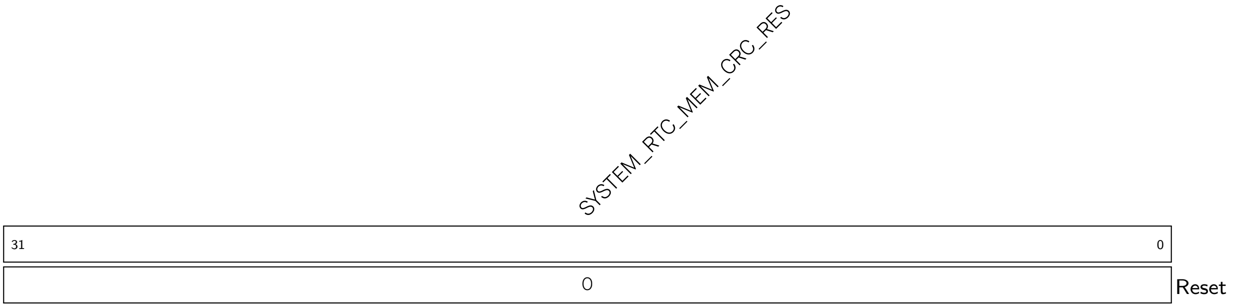
SYSTEM_RTC_MEM_CRC_START Set this bit to start the CRC of RTC memory. (R/W)

SYSTEM_RTC_MEM_CRC_ADDR This field is used to set address of RTC memory for CRC. (R/W)

SYSTEM_RTC_MEM_CRC_LEN This field is used to set length of RTC memory for CRC based on start address. (R/W)

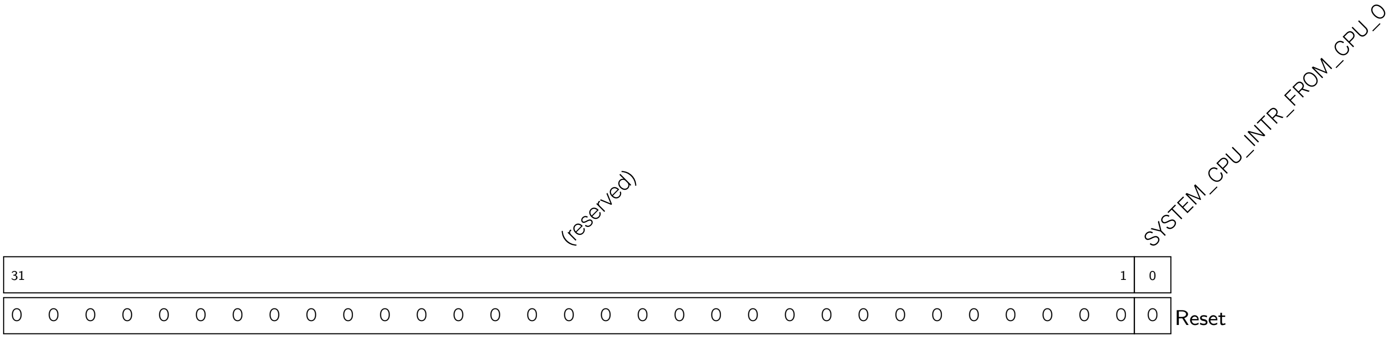
SYSTEM_RTC_MEM_CRC_FINISH This bit stores the status of RTC memory CRC. High level means finished while low level means not finished. (RO)

Register 16.12. SYSTEM_RTC_FASTMEM_CRC_REG (0x004C)



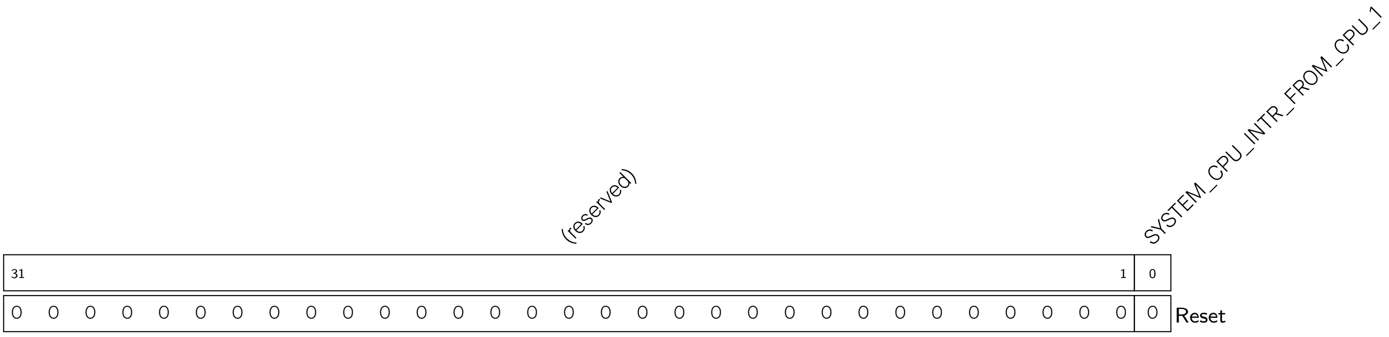
SYSTEM_RTC_MEM_CRC_RES This field stores the CRC result of RTC memory. (RO)

Register 16.13. SYSTEM_CPU_INTR_FROM_CPU_0_REG (0x0028)



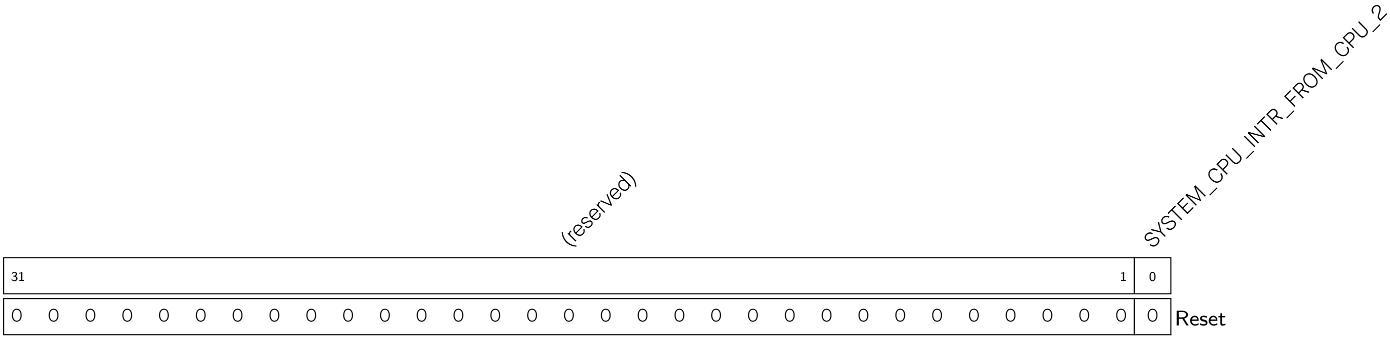
SYSTEM_CPU_INTR_FROM_CPU_0 Set this bit to generate CPU interrupt 0. This bit needs to be reset by software in the ISR process. (R/W)

Register 16.14. SYSTEM_CPU_INTR_FROM_CPU_1_REG (0x002C)



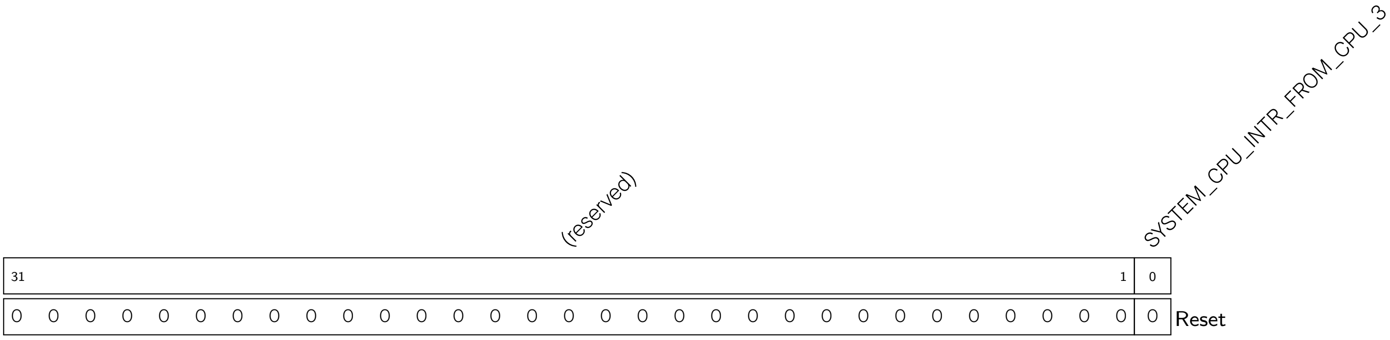
SYSTEM_CPU_INTR_FROM_CPU_1 Set this bit to generate CPU interrupt 1. This bit needs to be reset by software in the ISR process. (R/W)

Register 16.15. SYSTEM_CPU_INTR_FROM_CPU_2_REG (0x0030)



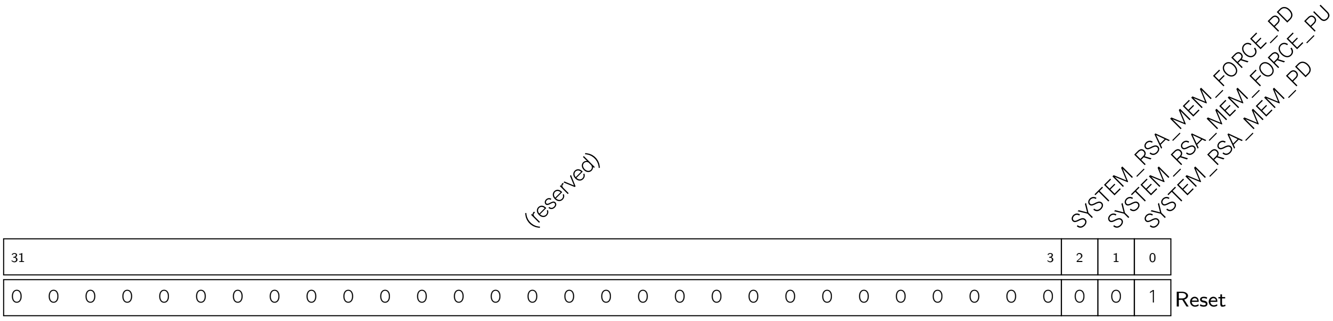
SYSTEM_CPU_INTR_FROM_CPU_2 Set this bit to generate CPU interrupt 2. This bit needs to be reset by software in the ISR process. (R/W)

Register 16.16. SYSTEM_CPU_INTR_FROM_CPU_3_REG (0x0034)



SYSTEM_CPU_INTR_FROM_CPU_3 Set this bit to generate CPU interrupt 3. This bit needs to be reset by software in the ISR process. (R/W)

Register 16.17. SYSTEM_RSA_PD_CTRL_REG (0x0038)

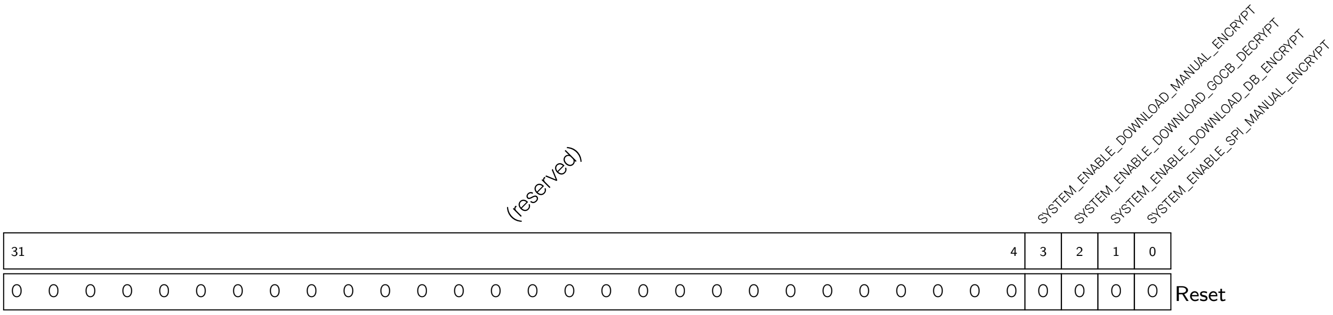


SYSTEM_RSA_MEM_PD Set this bit to send the RSA memory into retention state. This bit has the lowest priority, meaning it can be masked by the SYSTEM_RSA_MEM_FORCE_PU field. When Digital Signature occupies the RSA, this bit is invalid. (R/W)

SYSTEM_RSA_MEM_FORCE_PU Set this bit to force the RSA memory to work as normal when the chip enters light sleep. This bit has the second highest priority, meaning it overrides the SYSTEM_RSA_MEM_PD field. (R/W)

SYSTEM_RSA_MEM_FORCE_PD Set this bit to send the RSA memory into retention state. This bit has the highest priority, meaning it sends the RSA memory into retention state regardless of the SYSTEM_RSA_MEM_FORCE_PU field. (R/W)

Register 16.18. SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG (0x0044)



(reserved)
SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT
SYSTEM_ENABLE_DOWNLOAD_GOCB_DECRYPT

SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT Set this bit to enable Manual Encryption under SPI Boot mode. (R/W)

SYSTEM_ENABLE_DOWNLOAD_DB_ENCRYPT Set this bit to enable Auto Encryption under Download Boot mode. (R/W)

SYSTEM_ENABLE_DOWNLOAD_GOCB_DECRYPT Set this bit to enable Auto Decryption under Download Boot mode. (R/W)

SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT Set this bit to enable Manual Encryption under Download Boot mode. (R/W)

Register 16.19. SYSTEM_CLOCK_GATE_REG (0x0054)

(reserved)	SYSTEM_CLK_EN	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	Reset

SYSTEM_CLK_EN Set this bit to enable the system clock. (R/W)

Register 16.20. SYSTEM_DATE_REG (0x0FFC)

(reserved)	SYSTEM_DATE	
31 28	27 0	
0 0 0 0	0x2007150	Reset

SYSTEM_DATE Version control register. (R/W)

The addresses below are relative to the base address of apb control provided in Table 3-3 in Chapter 3 *System and Memory*.

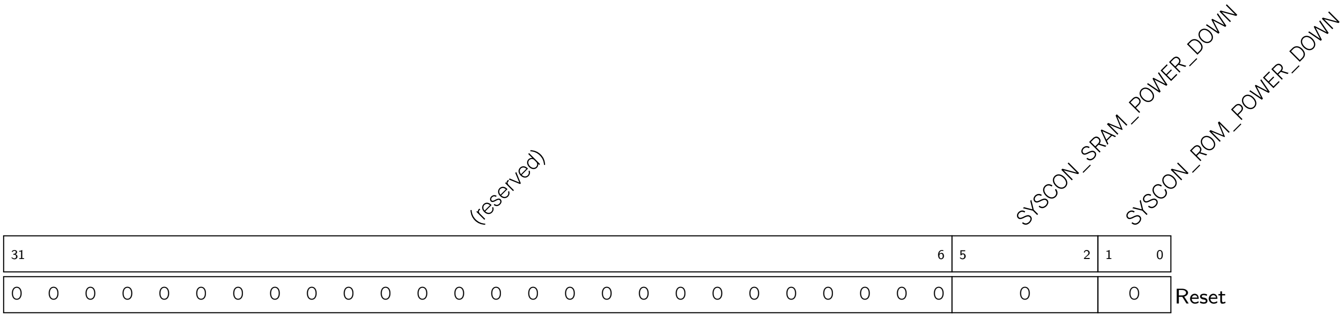
Register 16.21. SYSCON_CLKGATE_FORCE_ON_REG (0x00A4)

(reserved)	SYSCON_SRAM_CLKGATE_FORCE_ON	SYSCON_ROM_CLKGATE_FORCE_ON	
31 6	5 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0xf	3	Reset

SYSCON_ROM_CLKGATE_FORCE_ON Set 1 to configure the ROM clock gate to be always on; Set 0 to configure the clock gate to turn on automatically when ROM is accessed and turn off automatically when ROM is not accessed. (R/W)

SYSCON_SRAM_CLKGATE_FORCE_ON Set 1 to configure the SRAM clock gate to be always on; Set 0 to configure the clock gate to turn on automatically when SRAM is accessed and turn off automatically when SRAM is not accessed. (R/W)

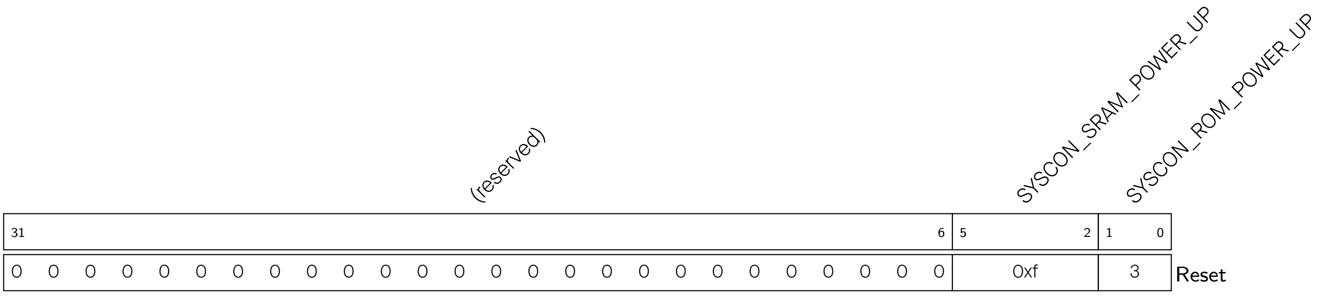
Register 16.22. SYSCON_MEM_POWER_DOWN_REG (0x00A8)



SYSCON_ROM_POWER_DOWN Set this field to send the internal ROM into retention state. (R/W)

SYSCON_SRAM_POWER_DOWN Set this field to send the internal SRAM into retention state. (R/W)

Register 16.23. SYSCON_MEM_POWER_UP_REG (0x00AC)



SYSCON_ROM_POWER_UP Set this field to force the internal ROM to work as normal (do not enter the retention state) when the chip enters light sleep. (R/W)

SYSCON_SRAM_POWER_UP Set this field to force the internal SRAM to work as normal (do not enter the retention state) when the chip enters light sleep. (R/W)

17 Debug Assistant (ASSIST_DEBUG)

17.1 Overview

Debug Assistant is an auxiliary module that features a set of functions to help locate bugs and issues during software debugging.

17.2 Features

- **Read/write monitoring**: Monitors whether the CPU bus has read from or written to a specified address space. A detected read or write will trigger an interrupt.
- **Stack pointer (SP) monitoring**: Monitors whether the SP exceeds the specified address space. A bounds violation will trigger an interrupt.
- **Program counter (PC) logging**: Records PC value. The developer can get the last PC value at the most recent CPU reset.
- **Bus access logging**: Records the information about bus access. When the CPU or DMA writes a specified value, the Debug Assistant module will record the address and PC value of this write operation, and push the data to the SRAM.

17.3 Functional Description

17.3.1 Region Read/Write Monitoring

The Debug Assistant module can monitor reads/writes performed by the CPU's Data bus and Peripheral bus in a certain address space, i.e., memory region. Whenever the Data bus reads or writes in the specified address space, an interrupt will be triggered. The Data bus can monitor two memory regions (assuming they are region 0 and region 1, defined by developer's needs) at the same time, so can the Peripheral bus.

17.3.2 SP Monitoring

The Debug Assistant module can monitor the SP so as to prevent stack overflow or erroneous push/pop. When the stack pointer exceeds the minimum or maximum threshold, Debug Assistant will record the PC pointer and generate an interrupt. The threshold is configured by software.

17.3.3 PC Logging

In some cases, software developers want to know the PC at the last CPU reset. For instance, when the program is stuck and can only be reset, the developer may want to know where the program got stuck in order to debug. The Debug Assistant module can record the PC at the last CPU reset, which can be then read for software debugging.

17.3.4 CPU/DMA Bus Access Logging

The Debug Assistant module can record the information about the CPU Data bus's and DMA bus's write behaviors in real time. When a write operation occurs in or a specific value is written to a specified address space, the Debug Assistant will record the bus type, PC, and the address, and then store the data in the SRAM in a certain format.

17.4 Recommended Operation

17.4.1 Region Monitoring and SP Monitoring Configuration Process

The Debug Assistant module can monitor reads and writes performed by the CPU's Data bus and Peripheral bus. Two memory regions on each bus can be monitored at the same time. All the monitoring modes supported by the Debug Assistant module are listed below:

- Monitoring of the read/write operations on Data bus
  - Data bus reads in region 0
  - Data bus writes in region 0
  - Data bus reads in region 1
  - Data bus writes in region 1
- Monitoring of the read/write operations on Peripheral bus
  - Peripheral bus reads in region 0
  - Peripheral bus writes in region 0
  - Peripheral bus reads in region 1
  - Peripheral bus writes in region 1
- Monitoring of exceeding the SP bounds
  - SP exceeds the upper bound address
  - SP exceeds the lower bound address

The configuration process for region monitoring and SP monitoring is as follows:

1. Configure monitored region and SP threshold.
   - Configure Data bus region 0 with ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MIN_REG and ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MAX_REG.
   - Configure Data bus region 1 with ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MIN_REG and ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MAX_REG.
   - Configure Peripheral bus region 0 with ASSIST_DEBUG_CORE_0_AREA_PIF_0_MIN_REG and ASSIST_DEBUG_CORE_0_AREA_PIF_0_MAX_REG.
   - Configure Peripheral bus region 1 with ASSIST_DEBUG_CORE_0_AREA_PIF_1_MIN_REG and ASSIST_DEBUG_CORE_0_AREA_PIF_1_MAX_REG.
   - Configure SP threshold with ASSIST_DEBUG_CORE_0_SP_MIN_REG and ASSIST_DEBUG_CORE_0_SP_MAX_REG.
2. Configure interrupts.
   - Configure ASSIST_DEBUG_CORE_0_INTR_ENA_REG to enable the interrupt of a monitoring mode.
   - Configure ASSIST_DEBUG_CORE_0_INTR_RAW_REG to get the interrupt status of a monitoring mode.
   - Configure ASSIST_DEBUG_CORE_0_INTR_CLR_REG to clear the interrupt of a monitoring mode.

3. Configure ASSIST_DEBUG_CORE_0_MONTR_ENA_REG to enable the monitoring mode(s). Various monitoring modes can be enabled at the same time.

Assuming that Debug Assistant needs to monitor whether Data bus has written to [A ~ B] address space, the user can enable monitoring in either Data bus region 0 or region 1. The following configuration process is based on region 0:

1. Configure ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MIN_REG to A.
2. Configure ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MAX_REG to B.
3. Configure ASSIST_DEBUG_CORE_0_INTR_ENA_REG bit[1] to enable the interrupt for write operations by Data bus in region 0.
4. Configure ASSIST_DEBUG_CORE_0_MONTR_ENA_REG bit[1] to enable monitoring write operations by Data bus in region 0.
5. Configure interrupt matrix to map ASSIST_DEBUG_INT into CPU interrupt (please refer to Chapter 8 *Interrupt Matrix (INTERRUPT)*).
6. After the interrupt is triggered:
    - Read ASSIST_DEBUG_CORE_0_INTR_RAW_REG to learn which operation triggered interrupt.
    - If the interrupt is triggered by region monitoring, read ASSIST_DEBUG_CORE_0_AREA_PC_REG for the PC value, and ASSIST_DEBUG_CORE_0_AREA_SP_REG for the SP.
    - If the interrupt is triggered by stack monitoring, read ASSIST_DEBUG_CORE_0_SP_PC_REG for the PC value.
    - Write '1' to the corresponding bits of ASSIST_DEBUG_CORE_0_INTR_RAW_REG to clear the interrupts.

17.4.2 PC Logging Configuration Process

The CPU sends PC signals to Debug Assistant. Only when ASSIST_DEBUG_CORE_0_RCD_PDEBUGEN is 1, the PC signal is valid, otherwise, it is always 0.

Only when ASSIST_DEBUG_CORE_0_RCD_RECORDEN is 1, ASSIST_DEBUG_CORE_0_RCD_PDEBUGPC_REG samples the CPU's PC signals, otherwise, it keeps the original value.

The description of ASSIST_DEBUG_CORE_0_RCD_EN_REG and ASSIST_DEBUG_CORE_0_RCD_PDEBUGPC_REG can be found in section 17.18 and 17.19.

When the CPU resets, ASSIST_DEBUG_CORE_0_RCD_EN_REG will reset, while ASSIST_DEBUG_CORE_0_RCD_PDEBUGPC_REG will not. Therefore, the latter will keep the PC value at the CPU reset.

17.4.3 CPU/DMA Bus Access Logging Configuration Process

The configuration process for CPU/DMA bus access logging is described below.

1. Configure monitored address space.
    - Configure ASSIST_DEBUG_LOG_MIN_REG and ASSIST_DEBUG_LOG_MAX_REG to specify monitored address space.

2. Configure monitoring mode with ASSIST_DEBUG_LOG_MODE:
   - write monitoring (whether the bus has write operations)
   - word monitoring (whether the bus writes a specific word)
   - halfword monitoring (whether the bus writes a specific halfword)
   - byte monitoring (whether the bus writes a specific byte)
3. Configure the specific values to be monitored.
   - In word monitoring mode, ASSIST_DEBUG_LOG_DATA_0_REG specifies the monitored word.
   - In halfword monitoring mode, ASSIST_DEBUG_LOG_DATA_0_REG[15:0] specifies the monitored halfword.
   - In byte monitoring mode, ASSIST_DEBUG_LOG_DATA_0_REG[7:0] specifies the monitored byte.
   - ASSIST_DEBUG_LOG_DATA_MASK_REG is used to mask the byte specified in ASSIST_DEBUG_LOG_DATA_0_REG. A masked byte can be any value. For example, in word monitoring, ASSIST_DEBUG_LOG_DATA_0_REG is configured to 0x01020304, and ASSIST_DEBUG_LOG_DATA_MASK_REG is configured to 0x1, then bus writes with data matching to 0x010203XX pattern will be recorded.
4. Configure the storage space for recorded data.
   - ASSIST_DEBUG_LOG_MEM_START_REG and ASSIST_DEBUG_LOG_MEM_END_REG specify the storage space for recorded data. The storage space must be in the range of 0x3FCC_0000 ~ 0x3FCD_FFFF.
   - Configure the permission for the Debug Assistant module to access the internal SRAM. Only if the access permission is enabled, the Debug Assistant module is able to access the internal SRAM. For more information please refer to Chapter 14 *Permission Control (PMS)*).
5. Configure the writing mode for recorded data: loop mode and non-loop mode.
   - In loop mode, writing to specified address space is performed in loops. When writing reaches the end address, it will return to the starting address and continue, overwriting the previously recorded data.
     For example, 10 writes (1 ~ 10) write to address space 0 ~ 4. After the 5th write writes to address 4, the 6th write will start writing from address 0. The 6th to 10th writes will overwrite the previous data written by 0 ~ 4 writes.
   - In non-loop mode, when writing reaches the end address, it will stop at the end address, not overwriting the previously recorded data.
     For example, 10 writes (1 ~ 10) write to address space 0 ~ 4. After the 5th write writes to address 4, the 6th to 10th writes will write at address 4. Only the data written by the last (10th) write will be retained at address 4.
6. Configure bus enable registers.
   - Enable CPU or DMA bus access logging with ASSIST_DEBUG_LOG_ENA. CPU and DMA bus access logging can be enabled at the same time.

When bus access logging is finished, the recorded data can be read from memory for decoding. The recorded data is in two packet formats, namely CPU packet (corresponding to CPU bus) and DMA packet (corresponding to DMA bus). The packet formats are shown in Table 17-1 and 17-2:

Table 17-1. CPU Packet Format

Bit[49:29]	Bit[28:2]	Bit[1:0]
addr_offset	pc_offset	format

Table 17-2. DMA Packet Format

Bit[24:6]	Bit[5:2]	Bit[1:0]
addr_offset	dma_source	format

It can be seen from the data packet formats that the CPU packet size is 50 bits and DMA packet size 25 bits. The packet formats contain the following fields:

- **format** – the packet type. 1: CPU packet; 3: DMA packet; other values: reserved.
- **pc_offset** – the offset of the PC register at time of access. Actual PC = pc_offset + 0x4000_0000.
- **addr_offset** – the address offset of a write operation. Actual adddress = addr_offset + ASSIST_DEBUG_LOG_MIN_REG.
- **dma_source** – the source of DMA access. Refer to Table 17-3.

Table 17-3. DMA Source

Value	Source
1	SPI2
2	reserved
3	reserved
4	AES
5	SHA
6	ADC
7	I2S0
8	reserved
9	LCD_CAM
10	reserved
11	UHCI0
12	reserved
13	LC
14	reserved
15	reserved

The packets are stored in the internal buffer first. When the buffered data reaches 125 bits, it will be expanded to 128 bits and written to the internal SRAM. The written data format is shown in Table 17-4.

Table 17-4. Written Data Format

Bit[127:3]	Bit[2:0]
Valid packets	START_FLAG

Since the CPU packet size is 50 bits and the DMA packet size 25 bits, the recorded data in each record is at least 25 bits and at most 75 bits. When the data stored in the internal buffer reaches 125 bits, it will be popped into memory. There are cases where a packet is divided into two portions: the first portion is written to memory, and the second portion is left in the buffer and will be popped into memory in the next write. The data left in the buffer is called residual data. The value of START_FLAG records the number of residual bits left from the last write to memory. The number of residual bits is START_FLAG * 25. START_FLAG also indicates the starting bit of the first valid packet in the current write. As an example: Assume that four DMA writes have generated four DMA packets to be stored in the buffer with a total of 100-bit data. Then, one CPU write occurs and generates one 50-bit CPU packet. The buffer will pop the previously-recorded 100-bit data plus the first 25 bits in the CPU packet into SRAM. The remaining 25 bits in the CPU packet is left in the buffer, waiting for the next write. START_FLAG in the next write will indicate that 25 bits in this write is from the last write.

In loop writing mode, if data is looped several times in the storage memory, the residual data will interfere with packet parsing. Therefore, users need to filter out the residual data in order to determine the starting position of the first valid packet with START_FLAG and ASSIST_DEBUG_LOG_MEM_CURRENT_ADDR_REG. Once the starting position of the packet is identified, the subsequent data is continuous and users do not need to care about the value of START_FLAG.

Note that if data in the buffer does not reach 125 bits, it will not be written to memory. All data should be written to memory for packet parsing. This can be done by disabling bus access logging. When ASSIST_DEBUG_LOG_ENA is set to 0, if there is data in the buffer, it will be padded with zeros from the left until it becomes 128 bits long and written to the memory.

The process of packet parsing is described below:

- Determine whether there is a data overflow with ASSIST_DEBUG_LOG_MEM_FULL_FLAG. If there is no overflow, ASSIST_DEBUG_LOG_MEM_START_REG is the starting address of the first packet. If there is an overflow and loop mode is enabled, ASSIST_DEBUG_LOG_MEM_CURRENT_ADDR_REG is the starting address of the first packet.
- Read and parse data from the starting address. Read 128 bits each time.
- Use START_FLAG to determine the starting bit of the first packet. Starting bit = START_FLAG * 25 + 3.

Note that START_FLAG is only used to locate the starting bit of the first packet. Once the starting bit is located, START_FLAG should be filtered out in the subsequent data.

After packet parsing is completed, clear the ASSIST_DEBUG_LOG_MEM_FULL_FLAG flag bit by setting ASSIST_DEBUG_CLR_LOG_MEM_FULL_FLAG.

17.5 Register Summary

The addresses in this section are relative to Debug Assistant base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Monitor configuration registers			
ASSIST_DEBUG_CORE_0_MONTR_ENA_REG	Monitoring enable register	0x0000	R/W
ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MIN_REG	Configures boundary address of region 0 monitored on Data bus	0x0010	R/W
ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MAX_REG	Configures boundary address of region 0 monitored on Data bus	0x0014	R/W
ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MIN_REG	Configures boundary address of region 1 monitored on Data bus	0x0018	R/W
ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MAX_REG	Configures boundary address of region 1 monitored on Data bus	0x001C	R/W
ASSIST_DEBUG_CORE_0_AREA_PIF_0_MIN_REG	Configures boundary address of region 0 monitored on Peripheral bus	0x0020	R/W
ASSIST_DEBUG_CORE_0_AREA_PIF_0_MAX_REG	Configures boundary address of region 0 monitored on Peripheral bus	0x0024	R/W
ASSIST_DEBUG_CORE_0_AREA_PIF_1_MIN_REG	Configures boundary address of region 1 monitored on Peripheral bus	0x0028	R/W
ASSIST_DEBUG_CORE_0_AREA_PIF_1_MAX_REG	Configures boundary address of region 1 monitored on Peripheral bus	0x002C	R/W
ASSIST_DEBUG_CORE_0_AREA_PC_REG	Region monitoring PC status register	0x0030	RO
ASSIST_DEBUG_CORE_0_AREA_SP_REG	Region monitoring SP status register	0x0034	RO
ASSIST_DEBUG_CORE_0_SP_MIN_REG	Configures stack monitoring boundary address	0x0038	R/W
ASSIST_DEBUG_CORE_0_SP_MAX_REG	Configures stack monitoring boundary address	0x003C	R/W
ASSIST_DEBUG_CORE_0_SP_PC_REG	Stack monitoring PC status register	0x0040	RO
Interrupt configuration registers			
ASSIST_DEBUG_CORE_0_INTR_RAW_REG	Interrupt status register	0x0004	RO

Name	Description	Address	Access
ASSIST_DEBUG_CORE_0_INTR_ENA_REG	Interrupt enable register	0x0008	R/W
ASSIST_DEBUG_CORE_0_INTR_CLR_REG	Interrupt clear register	0x000C	R/W
PC logging configuration register			
ASSIST_DEBUG_CORE_0_RCD_EN_REG	PC logging enable register	0x0044	R/W
PC logging status registers

ASSIST_DEBUG_CORE_0_RCD_PDEBUGSP_REG	PC logging register	0x004C	RO
Bus access logging configuration registers			
ASSIST_DEBUG_LOG_SETTING_REG	Bus access logging configuration register	0x0070	R/W
ASSIST_DEBUG_LOG_DATA_0_REG	Configures monitored data in Bus access logging	0x0074	R/W
ASSIST_DEBUG_LOG_DATA_MASK_REG	Configures masked data in Bus access logging	0x0078	R/W
ASSIST_DEBUG_LOG_MIN_REG	Configures monitored address space in Bus access logging	0x007C	R/W
ASSIST_DEBUG_LOG_MAX_REG	Configures monitored address space in Bus access logging	0x0080	R/W
ASSIST_DEBUG_LOG_MEM_START_REG	Configures the starting address of the storage memory for recorded data	0x0084	R/W
ASSIST_DEBUG_LOG_MEM_END_REG	Configures the end address of the storage memory for recorded data	0x0088	R/W
ASSIST_DEBUG_LOG_MEM_CURRENT_ADDR_REG	The current address of the storage memory for recorded data	0x008C	RO
ASSIST_DEBUG_LOG_MEM_FULL_FLAG_REG	Logging overflow status register	0x0090	varies
CPU status registers			
ASSIST_DEBUG_CORE_0_LASTPC_BEFORE_EXCEPTION_REG	PC of the last command before CPU enters exception	0x0094	RO
ASSIST_DEBUG_CORE_0_DEBUG_MODE_REG	CPU debug mode status register	0x0098	RO
Version register			
ASSIST_DEBUG_DATE_REG	Version control register	0x01FC	R/W

17.6 Registers

The addresses in this section are relative to Debug Assistant base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 17.1. ASSIST_DEBUG_CORE_0_MONTR_ENA_REG (0x0000)

	(reserved)	ASSIST_DEBUG_CORE_0_SP_SPILL_MAX_ENA	ASSIST_DEBUG_CORE_0_SP_SPILL_MIN_ENA	ASSIST_DEBUG_CORE_0_AREA_PIF_1_WR_ENA	ASSIST_DEBUG_CORE_0_AREA_PIF_1_RD_ENA	ASSIST_DEBUG_CORE_0_AREA_PIF_0_WR_ENA	ASSIST_DEBUG_CORE_0_AREA_PIF_0_RD_ENA	ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_WR_ENA	ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_RD_ENA	ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_WR_ENA	ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_RD_ENA
	31 … 10	9	8	7	6	5	4	3	2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0

ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_RD_ENA Monitoring enable bit for read operations in region 0 by the Data bus. (R/W)

ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_WR_ENA Monitoring enable bit for write operations in region 0 by the Data bus. (R/W)

ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_RD_ENA Monitoring enable bit for read operations in region 1 by the Data bus. (R/W)

ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_WR_ENA Monitoring enable bit for write operations in region 1 by the Data bus. (R/W)

ASSIST_DEBUG_CORE_0_AREA_PIF_0_RD_ENA Monitoring enable bit for read operations in region 0 by the Peripheral bus. (R/W)

ASSIST_DEBUG_CORE_0_AREA_PIF_0_WR_ENA Monitoring enable bit for write operations in region 0 by the Peripheral bus. (R/W)

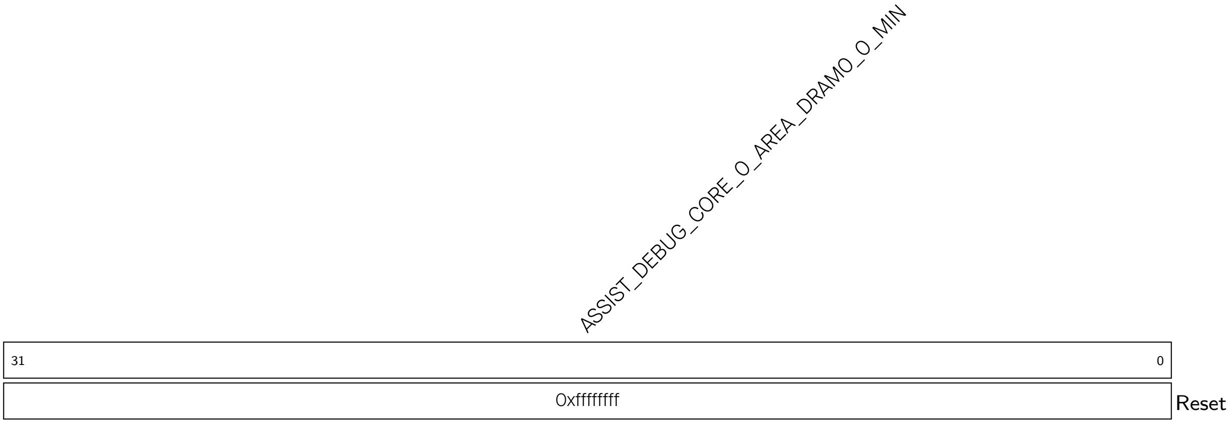
ASSIST_DEBUG_CORE_0_AREA_PIF_1_RD_ENA Monitoring enable bit for read operations in region 1 by the Peripheral bus. (R/W)

ASSIST_DEBUG_CORE_0_AREA_PIF_1_WR_ENA Monitoring enable bit for write operations in region 1 by the Peripheral bus. (R/W)

ASSIST_DEBUG_CORE_0_SP_SPILL_MIN_ENA Monitoring enable bit for SP exceeding the lower bound address of SP monitored region. (R/W)

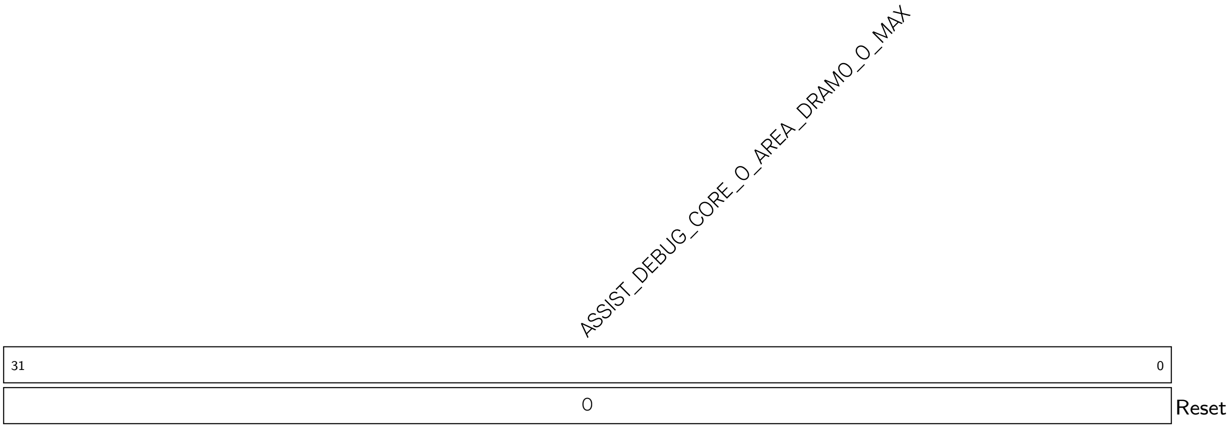
ASSIST_DEBUG_CORE_0_SP_SPILL_MAX_ENA Monitoring enable bit for SP exceeding the upper bound address of SP monitored region. (R/W)

Register 17.2. ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MIN_REG (0x0010)



ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MIN The lower bound address of Data bus region 0. (R/W)

Register 17.3. ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MAX_REG (0x0014)



ASSIST_DEBUG_CORE_0_AREA_DRAM0_0_MAX The upper bound address of Data bus region 0. (R/W)

Register 17.4. ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MIN_REG (0x0018)

ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MIN	
31 0	
0xffffffff	Reset

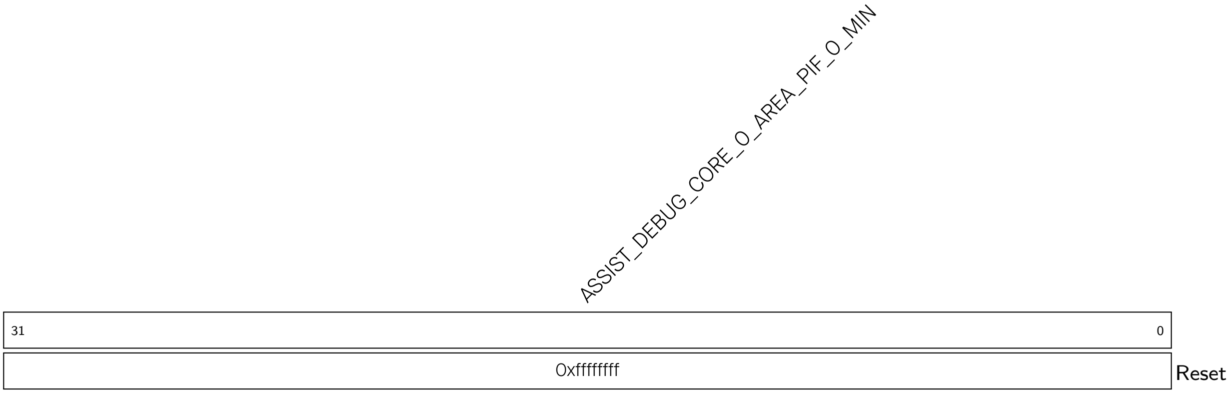
ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MIN The lower bound address of Data bus region 1. (R/W)

Register 17.5. ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MAX_REG (0x001C)

ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MAX	
31 0	
0	Reset

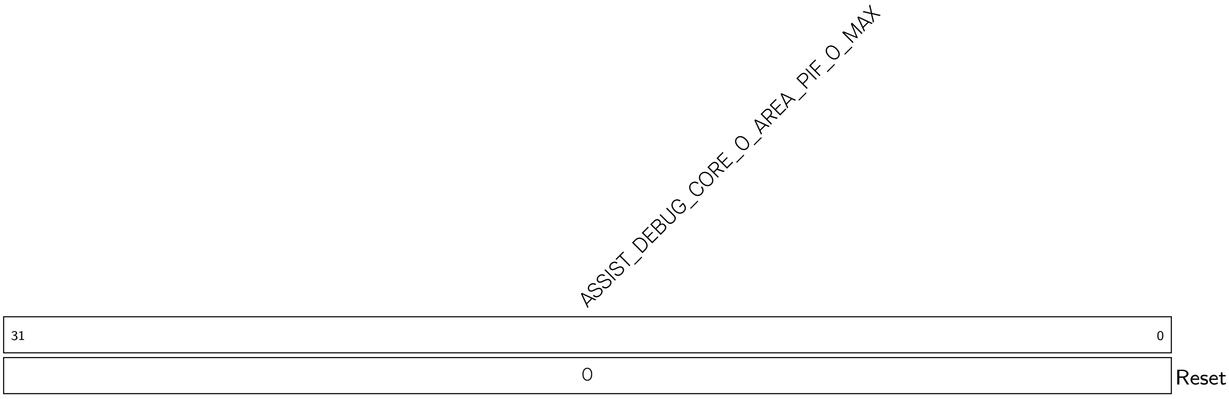
ASSIST_DEBUG_CORE_0_AREA_DRAM0_1_MAX The upper bound address of Data bus region 1. (R/W)

Register 17.6. ASSIST_DEBUG_CORE_0_AREA_PIF_0_MIN_REG (0x0020)



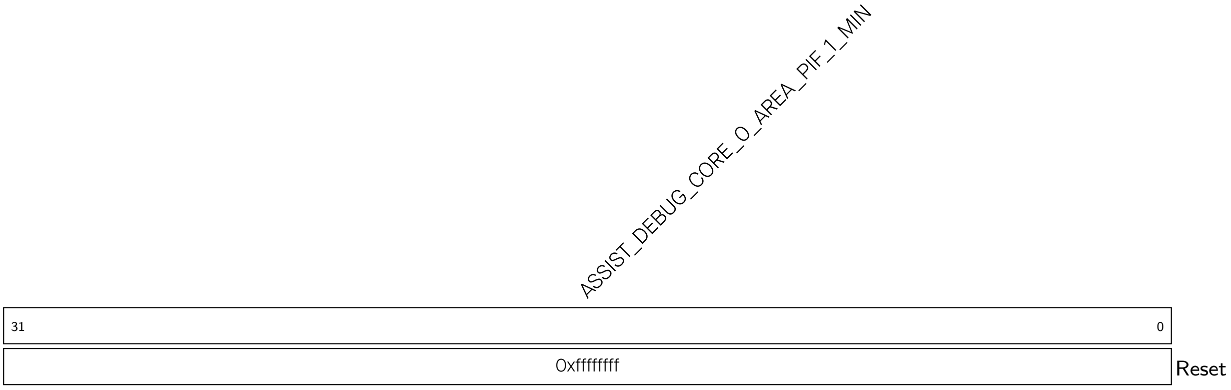
ASSIST_DEBUG_CORE_0_AREA_PIF_0_MIN The lower bound address of Peripheral bus region 0. (R/W)

Register 17.7. ASSIST_DEBUG_CORE_0_AREA_PIF_0_MAX_REG (0x0024)



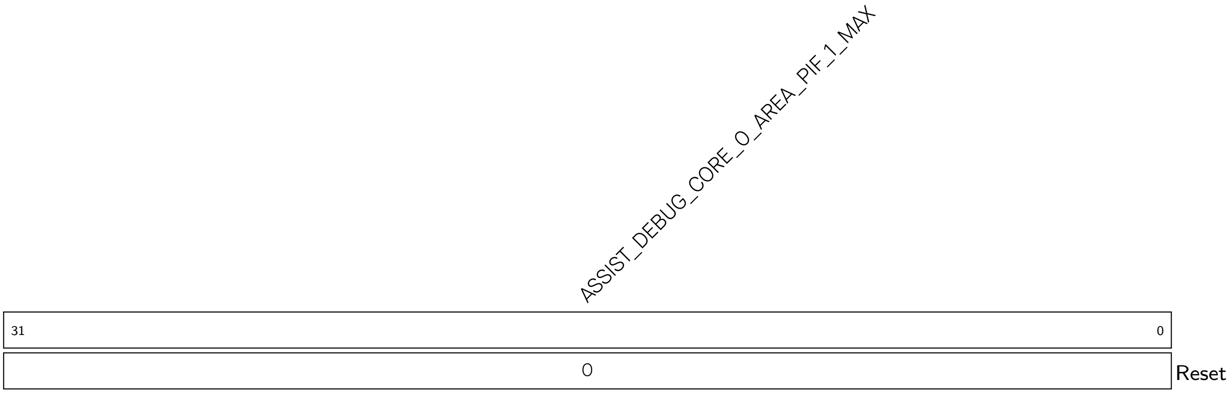
ASSIST_DEBUG_CORE_0_AREA_PIF_0_MAX The upper bound address of Peripheral bus region 0. (R/W)

Register 17.8. ASSIST_DEBUG_CORE_0_AREA_PIF_1_MIN_REG (0x0028)



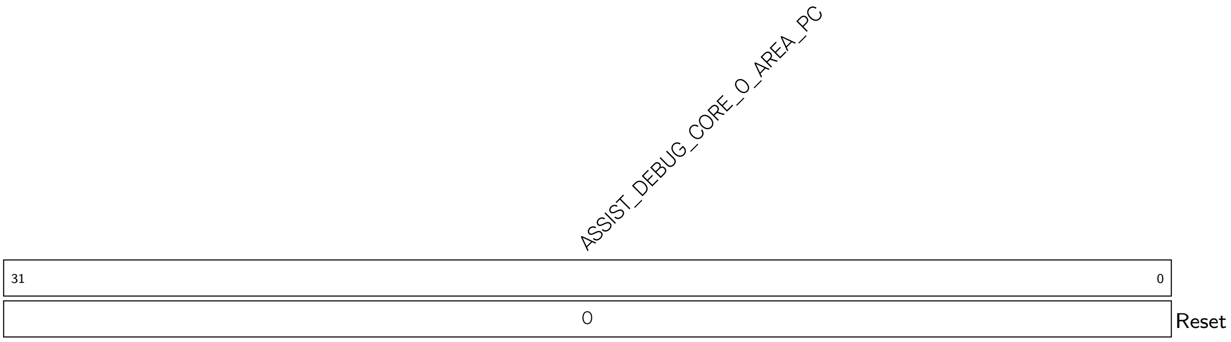
ASSIST_DEBUG_CORE_0_AREA_PIF_1_MIN The lower bound address of Peripheral bus region 1. (R/W)

Register 17.9. ASSIST_DEBUG_CORE_0_AREA_PIF_1_MAX_REG (0x002C)



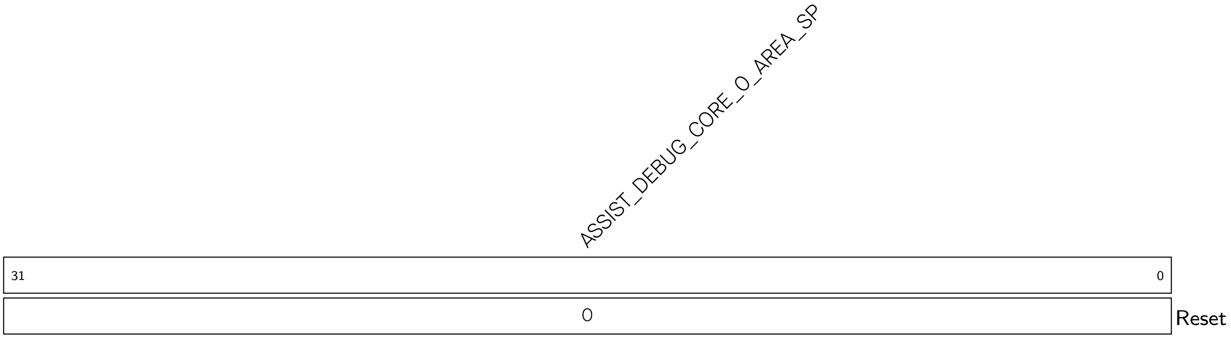
ASSIST_DEBUG_CORE_0_AREA_PIF_1_MAX The upper bound address of Peripheral bus region 1. (R/W)

Register 17.10. ASSIST_DEBUG_CORE_0_AREA_PC_REG (0x0030)



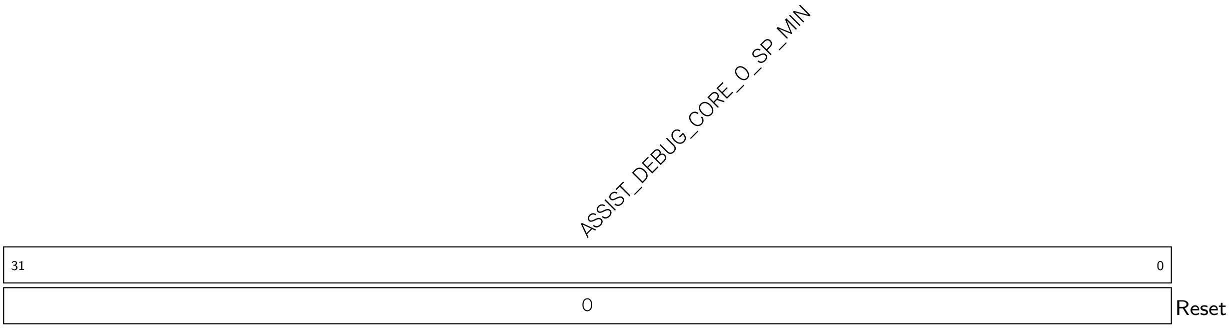
ASSIST_DEBUG_CORE_0_AREA_PC Records the PC value when interrupt triggers during region monitoring. (RO)

Register 17.11. ASSIST_DEBUG_CORE_0_AREA_SP_REG (0x0034)



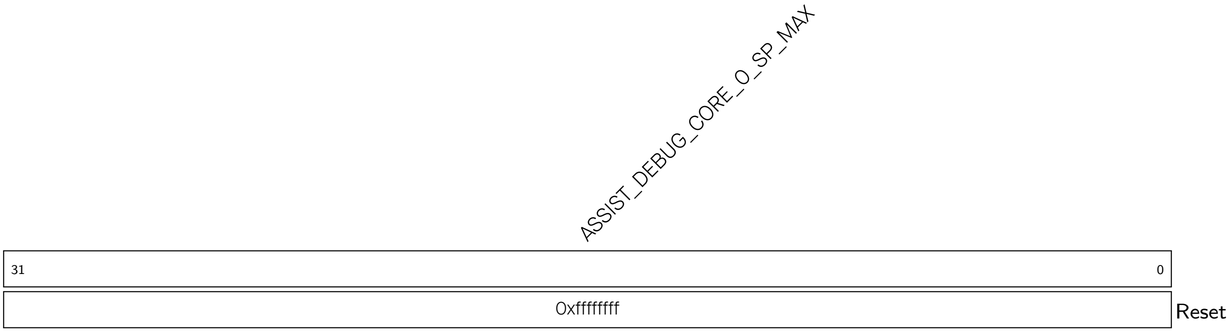
ASSIST_DEBUG_CORE_0_AREA_SP Records SP when interrupt triggers during region monitoring. (RO)

Register 17.12. ASSIST_DEBUG_CORE_0_SP_MIN_REG (0x0038)



ASSIST_DEBUG_CORE_0_SP_MIN The lower bound address of SP. (R/W)

Register 17.13. ASSIST_DEBUG_CORE_0_SP_MAX_REG (0x003C)



ASSIST_DEBUG_CORE_0_SP_MAX The upper bound address of SP. (R/W)

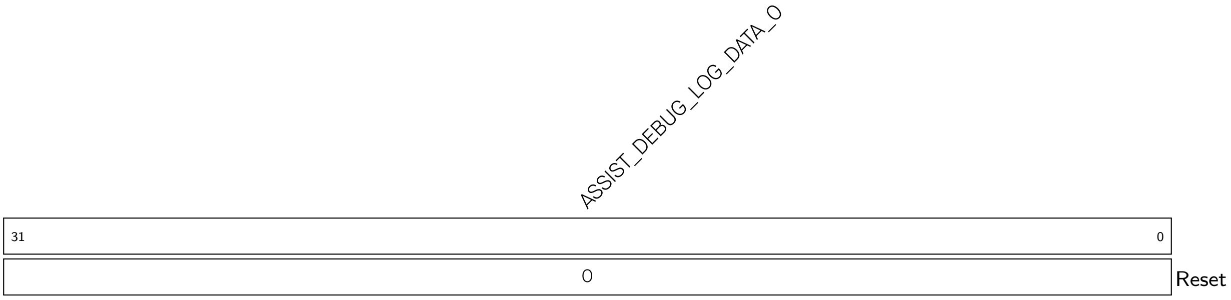
ASSIST_DEBUG_LOG_ENA Enables the CPU bus or DMA bus access logging. bit[0]: CPU bus access logging; bit[1]: reserved; bit[2]: DMA bus access logging. (R/W)

ASSIST_DEBUG_LOG_MODE Configures monitoring mode. bit[0]: write monitoring; bit[1]: word monitoring; bit[2]: halfword monitoring; bit[3]: byte monitoring. (R/W)

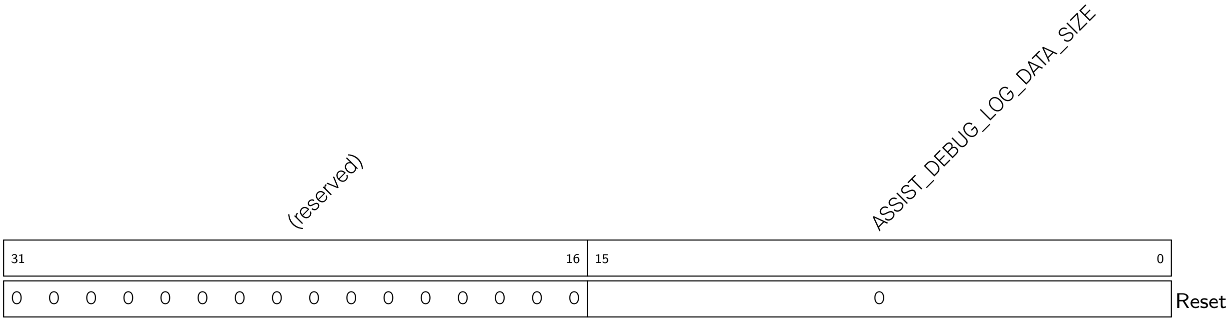
ASSIST_DEBUG_LOG_MEM_LOOP_ENABLE Configures the writing mode for recorded data. 1: loop mode; 0: non-loop mode. (R/W)

Register 17.22. ASSIST_DEBUG_LOG_DATA_0_REG (0x0074)



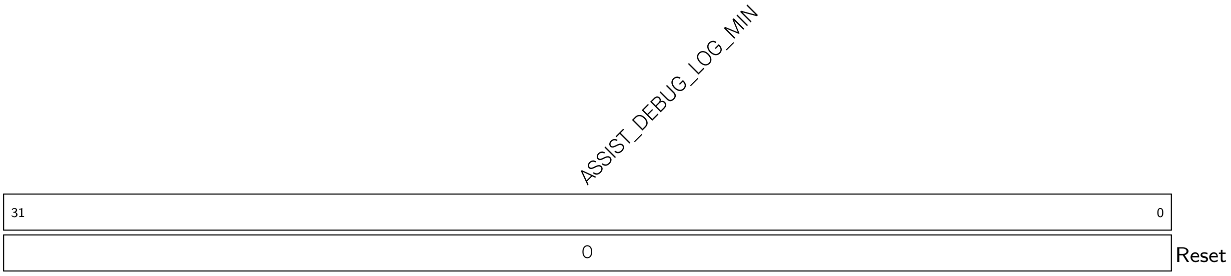
ASSIST_DEBUG_LOG_DATA_0 Specifies the monitored data. (R/W)

Register 17.23. ASSIST_DEBUG_LOG_DATA_MASK_REG (0x0078)



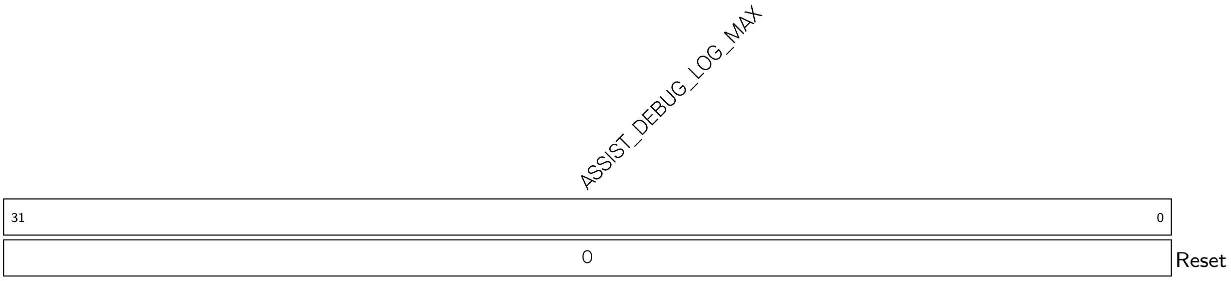
ASSIST_DEBUG_LOG_DATA_SIZE Masks the byte specified in ASSIST_DEBUG_LOG_DATA_0_REG. (R/W)

Register 17.24. ASSIST_DEBUG_LOG_MIN_REG (0x007C)



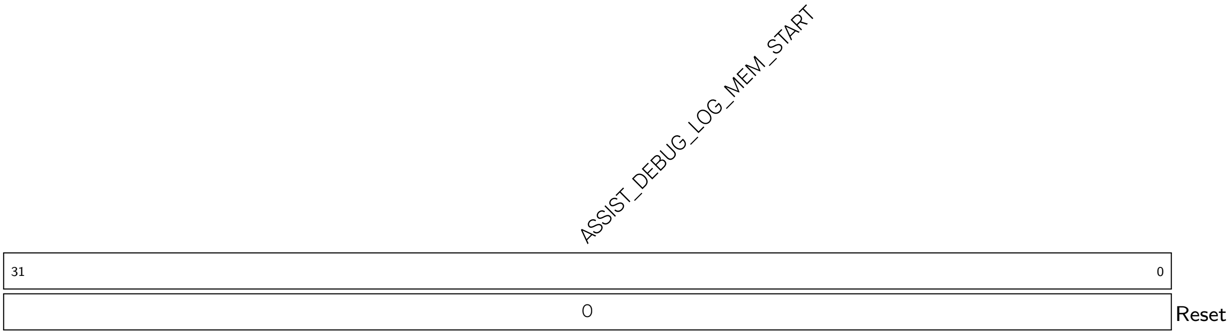
ASSIST_DEBUG_LOG_MIN Configures the lower bound address of monitored address space. (R/W)

Register 17.25. ASSIST_DEBUG_LOG_MAX_REG (0x0080)



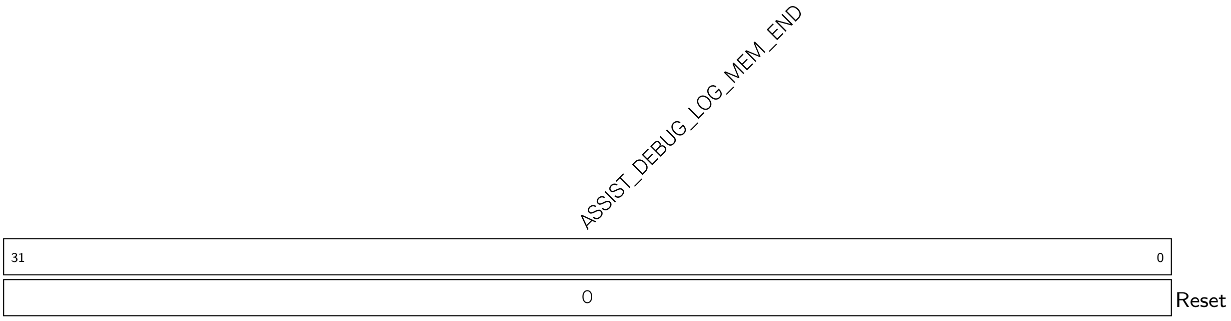
ASSIST_DEBUG_LOG_MAX Configures the upper bound address of monitored address space. (R/W)

Register 17.26. ASSIST_DEBUG_LOG_MEM_START_REG (0x0084)



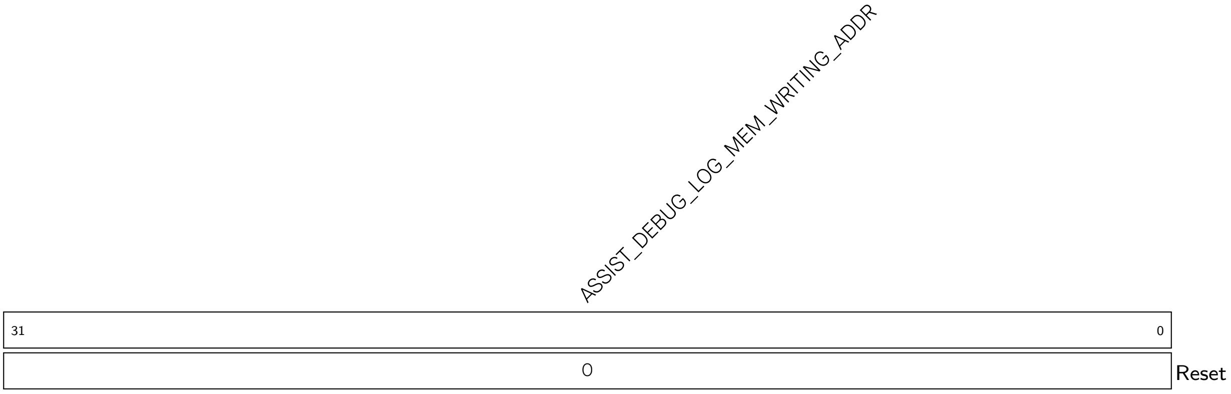
ASSIST_DEBUG_LOG_MEM_START Configures the starting address of the storage space for recorded data. (R/W)

Register 17.27. ASSIST_DEBUG_LOG_MEM_END_REG (0x0088)



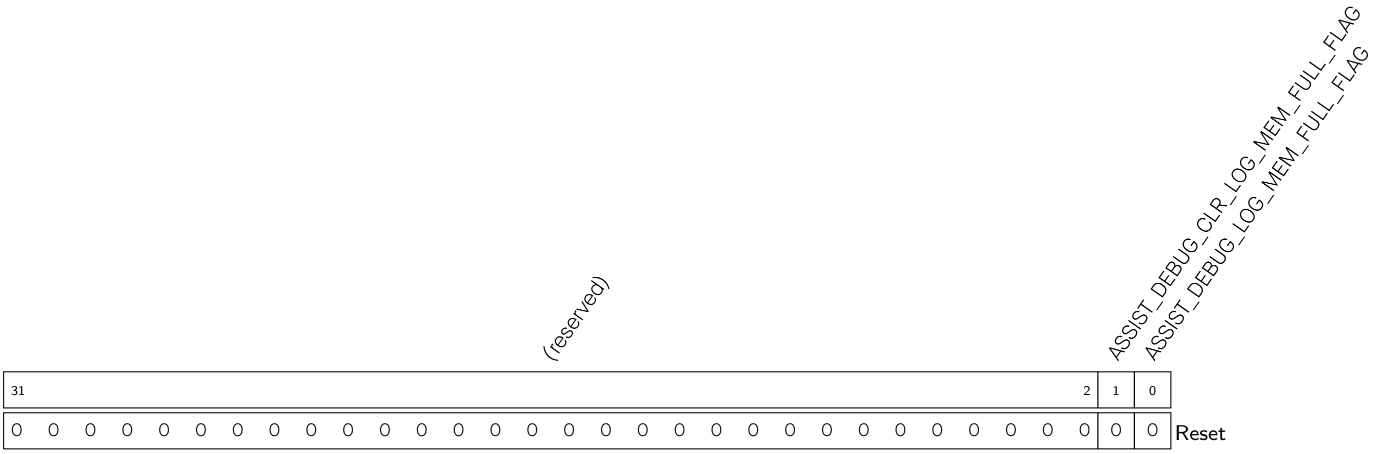
ASSIST_DEBUG_LOG_MEM_END Configures the end address of the storage space for recorded data. (R/W)

Register 17.28. ASSIST_DEBUG_LOG_MEM_CURRENT_ADDR_REG (0x008C)



ASSIST_DEBUG_LOG_MEM_WRITING_ADDR Indicates the address of the next write. (RO)

Register 17.29. ASSIST_DEBUG_LOG_MEM_FULL_FLAG_REG (0x0090)



ASSIST_DEBUG_LOG_MEM_FULL_FLAG The value "1" means there is a data overflow that exceeds the storage space. (RO)

ASSIST_DEBUG_CLR_LOG_MEM_FULL_FLAG Set to 1 to clear ASSIST_DEBUG_LOG_MEM_FULL_FLAG flag bit. Default value is "0". (R/W)

Register 17.30. ASSIST_DEBUG_CORE_0_LASTPC_BEFORE_EXCEPTION_REG (0x0094)

ASSIST_DEBUG_CORE_0_LASTPC_BEFORE_EXC	
31 0	
0	Reset

ASSIST_DEBUG_CORE_0_LASTPC_BEFORE_EXC Records the PC of the last command before the CPU enters exception. (RO)

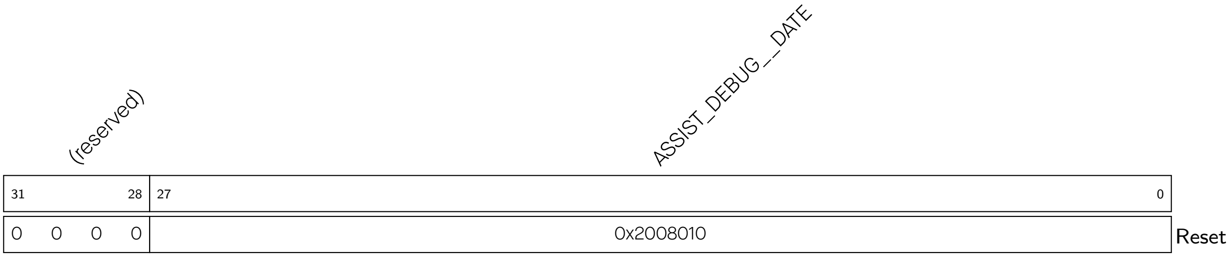
Register 17.31. ASSIST_DEBUG_CORE_0_DEBUG_MODE_REG (0x0098)

(reserved)	ASSIST_DEBUG_CORE_0_DEBUG_MODULE_ACTIVE	ASSIST_DEBUG_CORE_0_DEBUG_MODE	
31 2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

ASSIST_DEBUG_CORE_0_DEBUG_MODE Indicates whether the RISC-V CPU is in debug mode. 1: in debug mode; 0: not in debug mode. (RO)

ASSIST_DEBUG_CORE_0_DEBUG_MODULE_ACTIVE Indicates the status of the RISC-V CPU debug module. 1: active status; 0: inactive status. (RO)

Register 17.32. ASSIST_DEBUG_DATE_REG (0x01FC)



ASSIST_DEBUG__DATE Version control register. (R/W)

18 SHA Accelerator (SHA)

18.1 Introduction

ESP32-C3 integrates an SHA accelerator, which is a hardware device that speeds up SHA algorithm significantly, compared to SHA algorithm implemented solely in software. The SHA accelerator integrated in ESP32-C3 has two working modes, which are Typical SHA and DMA-SHA.

18.2 Features

The following functionality is supported:

- The following hash algorithms introduced in FIPS PUB 180-4 Spec.
  - SHA-1
  - SHA-224
  - SHA-256
- Two working modes
  - Typical SHA
  - DMA-SHA
- Interleaved function when working in Typical SHA working mode
- Interrupt function when working in DMA-SHA working mode

18.3 Working Modes

The SHA accelerator integrated in ESP32-C3 has two working modes.

- Typical SHA Working Mode: all the data is written and read via CPU directly.
- DMA-SHA Working Mode: all the data is read via DMA. That is, users can configure the DMA controller to read all the data needed for hash operation, thus releasing CPU for completing other tasks.

Users can start the SHA accelerator with different working modes by configuring registers SHA_START_REG and SHA_DMA_START_REG. For details, please see Table 18-1.

Table 18-1. SHA Accelerator Working Mode

Working Mode	Configuration Method
Typical SHA	Set SHA_START_REG to 1
DMA-SHA	Set SHA_DMA_START_REG to 1

Users can choose hash algorithms by configuring the SHA_MODE_REG register. For details, please see Table 18-2.

Table 18-2. SHA Hash Algorithm Selection

Hash Algorithm	SHA_MODE_REG Configuration
SHA-1	0
SHA-224	1
SHA-256	2

Notice:

ESP32-C3's Digital Signature (DS) and HMAC Accelerator (HMAC) modules also call the SHA accelerator. Therefore, users cannot access the SHA accelerator when these modules are working.

18.4 Function Description

SHA accelerator can generate the message digest via two steps: Preprocessing and Hash operation.

18.4.1 Preprocessing

Preprocessing consists of three steps: padding the message, parsing the message into message blocks and setting the initial hash value.

18.4.1.1 Padding the Message

The SHA accelerator can only process message blocks of 512 bits. Thus, all the messages should be padded to a multiple of 512 bits before the hash task.

Suppose that the length of the message M is m bits. Then M shall be padded as introduced below:

1. First, append the bit "1" to the end of the message;
2. Second, append k bits of zeros, where k is the smallest, non-negative solution to the equation $m + 1 + k \equiv 448\ mod$ 512;
3. Last, append the 64-bit block of value equal to the number m expressed using a binary representation.

For more details, please refer to Section "5.1 Padding the Message" in FIPS PUB 180-4 Spec.

18.4.1.2 Parsing the Message

The message and its padding must be parsed into N 512-bit blocks, $M^{(1)}$, $M^{(2)}$, …, $M^{(N)}$. Since the 512 bits of the input block may be expressed as sixteen 32-bit words, the first 32 bits of message block i are denoted $\mathrm{M}_0^{(i)}$, the next 32 bits are $\mathrm{M}_1^{(i)}$, and so on up to $\mathrm{M}_{15}^{(i)}$.

During the task, all the message blocks are written into the SHA_M_*n*_REG: $\mathrm{M}_0^{(i)}$ is stored in SHA_M_0_REG, $\mathrm{M}_1^{(i)}$ stored in SHA_M_1_REG, …, and $\mathrm{M}_{15}^{(i)}$ stored in SHA_M_15_REG.

Note:

For more information about "message block", please refer to Section "2.1 Glossary of Terms and Acronyms" in FIPS PUB 180-4 Spec.

18.4.1.3 Setting the Initial Hash Value

Before hash task begins for any secure hash algorithms, the initial Hash value H(0) must be set based on different algorithms. However, the SHA accelerator uses the initial Hash values (constant C) stored in the hardware for hash tasks.

18.4.2 Hash Operation

After the preprocessing, the ESP32-C3 SHA accelerator starts to hash a message M and generates message digest of different lengths, depending on different hash algorithms. As described above, the ESP32-C3 SHA accelerator supports two working modes, which are Typical SHA and DMA-SHA. The operation process for the SHA accelerator under two working modes is described in the following subsections.

18.4.2.1 Typical SHA Mode Process

Usually, the SHA accelerator will process all blocks of a message and produce a message digest before starting the computation of the next message digest.

However, ESP32-C3 SHA also supports optional "interleaved" message digest calculation. Users can insert new calculation (both Typical SHA and DMA-SHA) each time the SHA accelerator completes a sequence of operations.

- In Typical SHA mode, this can be done after each individual message block.
- In DMA-SHA mode, this can be done after a full sequence of DMA operations is complete.

Specifically, users can read out the message digest from registers SHA_H_*n*_REG after completing part of a message digest calculation, and use the SHA accelerator for a different calculation. After the different calculation completes, users can restore the previous message digest to registers SHA_H_*n*_REG, and resume the accelerator with the previously paused calculation.

Typical SHA Process

1. Select a hash algorithm.
    - Configure the SHA_MODE_REG register based on Table 18-2.
2. Process the current message block [1].
    - Write the message block in registers SHA_M_*n*_REG.
3. Start the SHA accelerator.
    - If this is the first time to execute this step, set the SHA_START_REG register to 1 to start the SHA accelerator. In this case, the accelerator uses the initial hash value stored in hardware for a given algorithm configured in Step 1 to start the calculation;

- If this is not the first time to execute this step[2], set the SHA_CONTINUE_REG register to 1 to start the SHA accelerator. In this case, the accelerator uses the hash value stored in the SHA_H_*n*_REG register to start calculation.

4. Check the progress of the current message block.
   - Poll register SHA_BUSY_REG until the content of this register becomes 0, indicating the accelerator has completed the calculation for the current message block and now is in the "idle" status [3].
5. Decide if you have more message blocks to process:
   - If yes, please go back to Step 2.
   - Otherwise, please continue.
6. Obtain the message digest.
   - Read the message digest from registers SHA_H_*n*_REG.

Note:

1. In this step, the software can also write the next message block (to be processed) in registers SHA_M_*n*_REG, if any, while the hardware starts SHA calculation, to save time.
2. You are resuming the SHA accelerator with the previously paused calculation.
3. Here you can decide if you want to insert other calculations. If yes, please go to the process for interleaved calculations for details.

As mentioned above, ESP32-C3 SHA accelerator supports **"interleaving" calculation under the Typical SHA working mode**.

The process to implement interleaved calculation is described below.

1. Prepare to hand the SHA accelerator over for an interleaved calculation by storing the following data of the previous calculation.
   - The selected hash algorithm stored in the SHA_MODE_REG register.
   - The message digest stored in registers SHA_H_*n*_REG.
2. Perform the interleaved calculation. For the detailed process of the interleaved calculation, please refer to Typical SHA process or DMA-SHA process, depending on the working mode of your interleaved calculation.
3. Prepare to hand the SHA accelerator back to the previously paused calculation by restoring the following data of the previous calculation.
   - Write the previously stored hash algorithm back to register SHA_MODE_REG.
   - Write the previously stored message digest back to registers SHA_H_*n*_REG.
4. Write the next message block from the previous paused calculation in registers SHA_M_*n*_REG, and set the SHA_CONTINUE_REG register to 1 to restart the SHA accelerator with the previously paused calculation.

18.4.2.2 DMA-SHA Mode Process

ESP32-C3 SHA accelerator does not support “interleaving” message digest calculation at the level of individual message blocks when using DMA, which means you cannot insert new calculation before a complete DMA-SHA process (of one or more message blocks) completes. In this case, users who need interleaved operation are recommended to divide the message blocks and perform several DMA-SHA calculations, instead of trying to compute all the messages in one go.

Single DMA-SHA calculation supports up to 63 data blocks.

In contrast to the Typical SHA working mode, when the SHA accelerator is working under the DMA-SHA mode, all data read are completed via DMA. Therefore, users are required to configure the DMA controller following the description in Chapter 2 *GDMA Controller (GDMA)*.

DMA-SHA process

1. Select a hash algorithm.
   - Select a hash algorithm by configuring the SHA_MODE_REG register. For details, please refer to Table 18-2.
2. Configure the SHA_INT_ENA_REG register to enable or disable interrupt (Set 1 to enable).
3. Configure the number of message blocks.
   - Write the number of message blocks M to the SHA_DMA_BLOCK_NUM_REG register.
4. Start the DMA-SHA calculation.
   - If the current DMA-SHA calculation follows a previous calculation, firstly write the message digest from the previous calculation to registers SHA_H_*n*_REG, then write 1 to register SHA_DMA_CONTINUE_REG to start SHA accelerator;
   - Otherwise, write 1 to register SHA_DMA_START_REG to start the accelerator.
5. Wait till the completion of the DMA-SHA calculation, which happens when:
   - The content of SHA_BUSY_REG register becomes 0, or
   - An SHA interrupt occurs. In this case, please clear interrupt by writing 1 to the SHA_INT_CLEAR_REG register.
6. Obtain the message digest:
   - Read the message digest from registers SHA_H_*n*_REG.

18.4.3 Message Digest

After the hash task completes, the SHA accelerator writes the message digest from the task to registers SHA_H_*n*_REG(*n*: 0~7). The lengths of the generated message digest are different depending on different hash algorithms. For details, see Table 18-3 below:

Table 18-3. The Storage and Length of Message Digest from Different Algorithms

Hash Algorithm	Length of Message Digest (in bits)	Storage[1]
SHA-1	160	SHA_H_0_REG ~ SHA_H_4_REG
SHA-224	224	SHA_H_0_REG ~ SHA_H_6_REG
SHA-256	256	SHA_H_0_REG ~ SHA_H_7_REG

[1] The message digest is stored in registers from most significant bits to the least significant bits, with the first word stored in register SHA_H_0_REG and the second word stored in register SHA_H_1_REG... For details, please see subsection 18.4.1.2.

18.4.4 Interrupt

SHA accelerator supports interrupt on the completion of message digest calculation when working in the DMA-SHA mode. To enable this function, write 1 to register SHA_INT_ENA_REG. Note that the interrupt should be cleared by software after use via setting the SHA_INT_CLEAR_REG register to 1.

18.5 Register Summary

The addresses in this section are relative to the SHA accelerator base address provided in Table 3-3 in Chapter *3 System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Control/Status registers			
SHA_CONTINUE_REG	Continues SHA operation (only effective in Typical SHA mode)	0x0014	WO
SHA_BUSY_REG	Indicates if SHA Accelerator is busy or not	0x0018	RO
SHA_DMA_START_REG	Starts the SHA accelerator for DMA-SHA operation	0x001C	WO
SHA_START_REG	Starts the SHA accelerator for Typical SHA operation	0x0010	WO
SHA_DMA_CONTINUE_REG	Continues SHA operation (only effective in DMA-SHA mode)	0x0020	WO
SHA_INT_CLEAR_REG	DMA-SHA interrupt clear register	0x0024	WO
SHA_INT_ENA_REG	DMA-SHA interrupt enable register	0x0028	R/W
Version Register			
SHA_DATE_REG	Version control register	0x002C	R/W
Configuration Registers			
SHA_MODE_REG	Defines the algorithm of SHA accelerator	0x0000	R/W

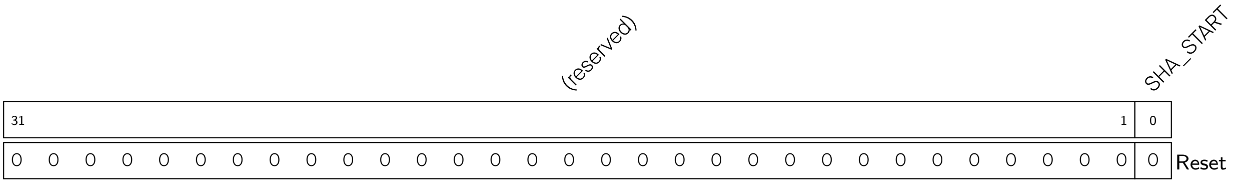
18.6 Registers

The addresses in this section are relative to the SHA accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 18.1. SHA_START_REG (0x0010)



SHA_START Write 1 to start Typical SHA calculation. (WO)

Register 18.2. SHA_CONTINUE_REG (0x0014)

(reserved)	SHA_CONTINUE	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SHA_CONTINUE Write 1 to continue Typical SHA calculation. (WO)

Register 18.3. SHA_BUSY_REG (0x0018)

(reserved)	SHA_BUSY_STATE	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SHA_BUSY_STATE Indicates the states of SHA accelerator. (RO) 1'h0: idle 1'h1: busy

Register 18.4. SHA_DMA_START_REG (0x001C)

(reserved)	SHA_DMA_START	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SHA_DMA_START Write 1 to start DMA-SHA calculation. (WO)

Register 18.5. SHA_DMA_CONTINUE_REG (0x0020)

(reserved)	SHA_DMA_CONTINUE	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SHA_DMA_CONTINUE Write 1 to continue DMA-SHA calculation. (WO)

Register 18.6. SHA_INT_CLEAR_REG (0x0024)

(reserved)	SHA_CLEAR_INTERRUPT	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SHA_CLEAR_INTERRUPT Clears DMA-SHA interrupt. (WO)

Register 18.7. SHA_INT_ENA_REG (0x0028)

(reserved)	SHA_INTERRUPT_ENA	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SHA_INTERRUPT_ENA Enables DMA-SHA interrupt. (R/W)

Register 18.8. SHA_DATE_REG (0x002C)

(reserved)	SHA_DATE	
31 30	29 0	
0 0	0x20190402	Reset

SHA_DATE Version control register. (R/W)

Register 18.9. SHA_MODE_REG (0x0000)

(reserved)	SHA_MODE	
31 3	2 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

SHA_MODE Defines the SHA algorithm. For details, please see Table 18-2. (R/W)

Register 18.10. SHA_DMA_BLOCK_NUM_REG (0x000C)

(reserved)	SHA_DMA_BLOCK_NUM	
31 6	5 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

SHA_DMA_BLOCK_NUM Defines the DMA-SHA block number. (R/W)

Register 18.11. SHA_H_*n*_REG (*n*: 0-7) (0x0040+4**n*)

SHA_H_*n*	
31 0	
0x000000	Reset

SHA_H_*n* Stores the *n*th 32-bit piece of the Hash value. (R/W)

Register 18.12. SHA_M_*n*_REG (*n*: 0-15) (0x0080+4**n*)

SHA_M_*n*	
31 0	
0x000000	Reset

SHA_M_*n* Stores the *n*th 32-bit piece of the message. (R/W)

19 AES Accelerator (AES)

19.1 Introduction

ESP32-C3 integrates an Advanced Encryption Standard (AES) Accelerator, which is a hardware device that speeds up AES Algorithm significantly, compared to AES algorithms implemented solely in software. The AES Accelerator integrated in ESP32-C3 has two working modes, which are Typical AES and DMA-AES.

19.2 Features

The following functionality is supported:

- Typical AES working mode
  - AES-128/AES-256 encryption and decryption
- DMA-AES working mode
  - AES-128/AES-256 encryption and decryption
  - Block cipher mode
    - ECB (Electronic Codebook)
    - CBC (Cipher Block Chaining)
    - OFB (Output Feedback)
    - CTR (Counter)
    - CFB8 (8-bit Cipher Feedback)
    - CFB128 (128-bit Cipher Feedback)
  - Interrupt on completion of computation

19.3 AES Working Modes

The AES Accelerator integrated in ESP32-C3 has two working modes, which are Typical AES and DMA-AES.

- Typical AES Working Mode:
  - Supports encryption and decryption using cryptographic keys of 128 and 256 bits, specified in NIST FIPS 197.

  In this working mode, the plaintext and ciphertext is written and read via CPU directly.
- DMA-AES Working Mode:
  - Supports encryption and decryption using cryptographic keys of 128 and 256 bits, specified in NIST FIPS 197;
  - Supports block cipher modes ECB/CBC/OFB/CTR/CFB8/CFB128 under NIST SP 800-38A.

  In this working mode, the plaintext and ciphertext are written and read via DMA. An interrupt will be generated when operation completes.

Users can choose the working mode for AES accelerator by configuring the AES_DMA_ENABLE_REG register according to Table 19-1 below.

Table 19-1. AES Accelerator Working Mode

AES_DMA_ENABLE_REG	Working Mode
0	Typical AES
1	DMA-AES

Users can choose the length of cryptographic keys and encryption / decryption by configuring the AES_MODE_REG register according to Table 19-2 below.

Table 19-2. Key Length and Encryption/Decryption

AES_MODE_REG[2:0]	Key Length and Encryption / Decryption
0	AES-128 encryption
1	reserved
2	AES-256 encryption
3	reserved
4	AES-128 decryption
5	reserved
6	AES-256 decryption
7	reserved

For detailed introduction on these two working modes, please refer to Section 19.4 and Section 19.5 below.

Notice:

ESP32-C3's Digital Signature (DS) module will call the AES accelerator. Therefore, users cannot access the AES accelerator when Digital Signature (DS) module is working.

19.4 Typical AES Working Mode

In the Typical AES working mode, users can check the working status of the AES accelerator by inquiring the AES_STATE_REG register and comparing the return value against the Table 19-3 below.

Table 19-3. Working Status under Typical AES Working Mode

AES_STATE_REG	Status	Description
0	IDLE	The AES accelerator is idle or completed operation.
1	WORK	The AES accelerator is in the middle of an operation.

19.4.1 Key, Plaintext, and Ciphertext

The encryption or decryption key is stored in AES_KEY_*n*_REG, which is a set of eight 32-bit registers.

- For AES-128 encryption/decryption, the 128-bit key is stored in AES_KEY_0_REG ~ AES_KEY_3_REG.
- For AES-256 encryption/decryption, the 256-bit key is stored in AES_KEY_0_REG ~ AES_KEY_7_REG.

The plaintext and ciphertext are stored in AES_TEXT_IN_*m*_REG and AES_TEXT_OUT_*m*_REG, which are two sets of four 32-bit registers.

- For AES-128/AES-256 encryption, the AES_TEXT_IN_*m*_REG registers are initialized with plaintext. Then, the AES Accelerator stores the ciphertext into AES_TEXT_OUT_*m*_REG after operation.
- For AES-128/AES-256 decryption, the AES_TEXT_IN_*m*_REG registers are initialized with ciphertext. Then, the AES Accelerator stores the plaintext into AES_TEXT_OUT_*m*_REG after operation.

19.4.2 Endianness

Text Endianness

In Typical AES working mode, the AES Accelerator uses cryptographic keys to encrypt and decrypt data in blocks of 128 bits. When filling data into AES_TEXT_IN_*m*_REG register or reading result from AES_TEXT_OUT_*m*_REG registers, users should follow the text endianness type specified in Table 19-4.

Table 19-4. Text Endianness Type for Typical AES

Plaintext/Ciphertext					
State[1]		c[2]			
		0	1	2	3
r	0	AES_TEXT_*x*_0_REG[7:0]	AES_TEXT_*x*_1_REG[7:0]	AES_TEXT_*x*_2_REG[7:0]	AES_TEXT_*x*_3_REG[7:0]
	1	AES_TEXT_*x*_0_REG[15:8]	AES_TEXT_*x*_1_REG[15:8]	AES_TEXT_*x*_2_REG[15:8]	AES_TEXT_*x*_3_REG[15:8]
	2	AES_TEXT_*x*_0_REG[23:16]	AES_TEXT_*x*_1_REG[23:16]	AES_TEXT_*x*_2_REG[23:16]	AES_TEXT_*x*_3_REG[23:16]
	3	AES_TEXT_*x*_0_REG[31:24]	AES_TEXT_*x*_1_REG[31:24]	AES_TEXT_*x*_2_REG[31:24]	AES_TEXT_*x*_3_REG[31:24]

[1] The definition of "State (including c and r)" is described in Section 3.4 The State in NIST FIPS 197.

[2] Where *x* = IN or OUT.

Key Endianness

In Typical AES working mode, when filling key into AES_KEY_*m*_REG registers, users should follow the key endianness type specified in Table 19-5 and Table 19-6.

Table 19-5. Key Endianness Type for AES-128 Encryption and Decryption

Bit[1]	w[0]	w[1]	w[2]	w[3][2]
[31:24]	AES_KEY_0_REG[7:0]	AES_KEY_1_REG[7:0]	AES_KEY_2_REG[7:0]	AES_KEY_3_REG[7:0]
[23:16]	AES_KEY_0_REG[15:8]	AES_KEY_1_REG[15:8]	AES_KEY_2_REG[15:8]	AES_KEY_3_REG[15:8]
[15:8]	AES_KEY_0_REG[23:16]	AES_KEY_1_REG[23:16]	AES_KEY_2_REG[23:16]	AES_KEY_3_REG[23:16]
[7:0]	AES_KEY_0_REG[31:24]	AES_KEY_1_REG[31:24]	AES_KEY_2_REG[31:24]	AES_KEY_3_REG[31:24]

[1] Column "Bit" specifies the bytes of each word stored in w[0] ~ w[3].

[2] w[0] ~ w[3] are "the first Nk words of the expanded key" as specified in Section 5.2 Key Expansion in NIST FIPS 197.

Table 19-6. Key Endianness Type for AES-256 Encryption and Decryption

Bit[1]	w[0]	w[1]	w[2]	w[3]	w[4]	w[5]	w[6]	w[7][2]
[31:24]	AES_KEY_0_REG[7:0]	AES_KEY_1_REG[7:0]	AES_KEY_2_REG[7:0]	AES_KEY_3_REG[7:0]	AES_KEY_4_REG[7:0]	AES_KEY_5_REG[7:0]	AES_KEY_6_REG[7:0]	AES_KEY_7_REG[7:0]
[23:16]	AES_KEY_0_REG[15:8]	AES_KEY_1_REG[15:8]	AES_KEY_2_REG[15:8]	AES_KEY_3_REG[15:8]	AES_KEY_4_REG[15:8]	AES_KEY_5_REG[15:8]	AES_KEY_6_REG[15:8]	AES_KEY_7_REG[15:8]
[15:8]	AES_KEY_0_REG[23:16]	AES_KEY_1_REG[23:16]	AES_KEY_2_REG[23:16]	AES_KEY_3_REG[23:16]	AES_KEY_4_REG[23:16]	AES_KEY_5_REG[23:16]	AES_KEY_6_REG[23:16]	AES_KEY_7_REG[23:16]
[7:0]	AES_KEY_0_REG[31:24]	AES_KEY_1_REG[31:24]	AES_KEY_2_REG[31:24]	AES_KEY_3_REG[31:24]	AES_KEY_4_REG[31:24]	AES_KEY_5_REG[31:24]	AES_KEY_6_REG[31:24]	AES_KEY_7_REG[31:24]

[1] Column "Bit" specifies the bytes of each word stored in w[0] ~ w[7].

[2] w[0] ~ w[7] are "the first Nk words of the expanded key" as specified in Chapter 5.2 Key Expansion in NIST FIPS 197.

19.4.3 Operation Process

Single Operation

1. Write 0 to the AES_DMA_ENABLE_REG register.
2. Initialize registers AES_MODE_REG, AES_KEY_*n*_REG, AES_TEXT_IN_*m*_REG.
3. Start operation by writing 1 to the AES_TRIGGER_REG register.
4. Wait till the content of the AES_STATE_REG register becomes 0, which indicates the operation is completed.
5. Read results from the AES_TEXT_OUT_*m*_REG register.

Consecutive Operations

In consecutive operations, primarily the input AES_TEXT_IN_*m*_REG and output AES_TEXT_OUT_*m*_REG registers are being written and read, while the content of AES_DMA_ENABLE_REG, AES_MODE_REG, AES_KEY_*n*_REG is kept unchanged. Therefore, the initialization can be simplified during the consecutive operation.

1. Write 0 to the AES_DMA_ENABLE_REG register before starting the first operation.
2. Initialize registers AES_MODE_REG and AES_KEY_*n*_REG before starting the first operation.
3. Update the content of AES_TEXT_IN_*m*_REG.
4. Start operation by writing 1 to the AES_TRIGGER_REG register.
5. Wait till the content of the AES_STATE_REG register becomes 0, which indicates the operation completes.
6. Read results from the AES_TEXT_OUT_*m*_REG register, and return to Step 3 to continue the next operation.

19.5 DMA-AES Working Mode

In the DMA-AES working mode, the AES accelerator supports six block cipher modes including ECB/CBC/OFB/CTR/CFB8/CFB128. Users can choose the block cipher mode by configuring the AES_BLOCK_MODE_REG register according to Table 19-7 below.

Table 19-7. Block Cipher Mode

AES_BLOCK_MODE_REG[2:0]	Block Cipher Mode
0	ECB (Electronic Codebook)
1	CBC (Cipher Block Chaining)
2	OFB (Output Feedback)
3	CTR (Counter)
4	CFB8 (8-bit Cipher Feedback)
5	CFB128 (128-bit Cipher Feedback)
6	reserved
7	reserved

Users can check the working status of the AES accelerator by inquiring the AES_STATE_REG register and comparing the return value against the Table 19-8 below.

Table 19-8. Working Status under DMA-AES Working mode

AES_STATE_REG[1:0]	Status	Description
0	IDLE	The AES accelerator is idle.
1	WORK	The AES accelerator is in the middle of an operation.
2	DONE	The AES accelerator completed operations.

When working in the DMA-AES working mode, the AES accelerator supports interrupt on the completion of computation. To enable this function, write 1 to the AES_INT_ENA_REG register. By default, the interrupt function is disabled. Also, note that the interrupt should be cleared by software after use.

19.5.1 Key, Plaintext, and Ciphertext

Block Operation

During the block operations, the AES Accelerator reads source data from DMA, and write result data to DMA after the computation.

- For encryption, DMA reads plaintext from memory, then passes it to AES as source data. After computation, AES passes ciphertext as result data back to DMA to write into memory.
- For decryption, DMA reads ciphertext from memory, then passes it to AES as source data. After computation, AES passes plaintext as result data back to DMA to write into memory.

During block operations, the lengths of the source data and result data are the same. The total computation time is reduced because the DMA data operation and AES computation can happen concurrently.

The length of source data for AES Accelerator under DMA-AES working mode must be 128 bits or the integral multiples of 128 bits. Otherwise, trailing zeros will be added to the original source data, so the length of source data equals to the nearest integral multiples of 128 bits. Please see details in Table 19-9 below.

Table 19-9. TEXT-PADDING

Function : TEXT-PADDING( )
Input : X, bit string. **Output** : Y = **TEXT-PADDING**(X), whose length is the nearest integral multiples of 128 bits.
Steps Let us assume that X is a data-stream that can be split into *n* parts as following: $X = X_1\|\|X_2\|\|\cdots\|\|X_{n-1}\|\|X_n$ Here, the lengths of $X_1, X_2, \cdots, X_{n-1}$ all equal to 128 bits, and the length of X_n is t (0<=*t*<=127). If $t = 0$, then **TEXT-PADDING**(X) = X; If $0 < t <= 127$, define a 128-bit block, X_n^*, and let $X_n^* = X_n\|\|0^{128-t}$, then **TEXT-PADDING**(X) = $X_1\|\|X_2\|\|\cdots\|\|X_{n-1}\|\|X_n^*$ = $X\|\|0^{128-t}$

19.5.2 Endianness

Under the DMA-AES working mode, the transmission of source data and result data for AES Accelerator is solely controlled by DMA. Therefore, the AES Accelerator cannot control the Endianness of the source data and result data, but does have requirement on how these data should be stored in memory and on the length of the data.

For example, let us assume DMA needs to write the following data into memory at address 0x0280.

- Data represented in hexadecimal:
  - 0102030405060708090A0B0C0D0E0F101112131415161718191A1B1C1D1E1F20
- Data Length:
  - Equals to 2 blocks.

Then, this data will be stored in memory as shown in Table 19-10 below.

Table 19-10. Text Endianness for DMA-AES

Address	Byte	Address	Byte	Address	Byte	Address	Byte
0x0280	0x01	0x0281	0x02	0x0282	0x03	0x0283	0x04
0x0284	0x05	0x0285	0x06	0x0286	0x07	0x0287	0x08
0x0288	0x09	0x0289	0x0A	0x028A	0x0B	0x028B	0x0C
0x028C	0x0D	0x028D	0x0E	0x028E	0x0F	0x028F	0x10
0x0290	0x11	0x0291	0x12	0x0292	0x13	0x0293	0x14
0x0294	0x15	0x0295	0x16	0x0296	0x17	0x0297	0x18
0x0298	0x19	0x0299	0x1A	0x029A	0x1B	0x029B	0x1C
0x029C	0x1D	0x029D	0x1E	0x029E	0x1F	0x029F	0x20

19.5.3 Standard Incrementing Function

AES accelerator provides two Standard Incrementing Functions for the CTR block operation, which are INC$_{32}$ and INC$_{128}$ Standard Incrementing Functions. By setting the AES_INC_SEL_REG register to 0 or 1, users can choose the INC$_{32}$ or INC$_{128}$ functions respectively. For details on the Standard Incrementing Function, please see Chapter B.1 The Standard Incrementing Function in NIST SP 800-38A.

19.5.4 Block Number

Register AES_BLOCK_NUM_REG stores the Block Number of plaintext P or ciphertext C. The length of this register equals to length(**TEXT-PADDING**(P))/128 or length(**TEXT-PADDING**(C))/128. The AES Accelerator only uses this register when working in the DMA-AES mode.

19.5.5 Initialization Vector

AES_IV_MEM is a 16-byte memory, which is only available for AES Accelerator working in block operations. For CBC/OFB/CFB8/CFB128 operations, the AES_IV_MEM memory stores the Initialization Vector (IV). For the CTR operation, the AES_IV_MEM memory stores the Initial Counter Block (ICB).

Both IV and ICB are 128-bit strings, which can be divided into Byte0, Byte1, Byte2 $\cdots$ Byte15 (from left to right). AES_IV_MEM stores data following the Endianness pattern presented in Table 19-10, i.e. the most significant (i.e., left-most) byte Byte0 is stored at the lowest address while the least significant (i.e., right-most) byte Byte15 at the highest address.

For more details on IV and ICB, please refer to NIST SP 800-38A.

19.5.6 Block Operation Process

1. Select one of DMA channels to connect with AES, configure the DMA chained list, and then start DMA. For details, please refer to Chapter 2 *GDMA Controller (GDMA)*.
2. Initialize the AES accelerator-related registers:
   - Write 1 to the AES_DMA_ENABLE_REG register.
   - Configure the AES_INT_ENA_REG register to enable or disable the interrupt function.
   - Initialize registers AES_MODE_REG and AES_KEY_*n*_REG.
   - Select block cipher mode by configuring the AES_BLOCK_MODE_REG register. For details, see Table 19-7.
   - Initialize the AES_BLOCK_NUM_REG register. For details, see Section 19.5.4.
   - Initialize the AES_INC_SEL_REG register (only needed when AES Accelerator is working under CTR block operation).
   - Initialize the AES_IV_MEM memory (This is always needed except for ECB block operation).
3. Start operation by writing 1 to the AES_TRIGGER_REG register.
4. Wait for the completion of computation, which happens when the content of AES_STATE_REG becomes 2 or the AES interrupt occurs.
5. Check if DMA completes data transmission from AES to memory. At this time, DMA had already written the result data in memory, which can be accessed directly. For details on DMA, please refer to Chapter 2 *GDMA Controller (GDMA)*.
6. Clear interrupt by writing 1 to the AES_INT_CLR_REG register, if any AES interrupt occurred during the computation.
7. Release the AES Accelerator by writing 0 to the AES_DMA_EXIT_REG register. After this, the content of the AES_STATE_REG register becomes 0. Note that, you can release DMA earlier, but only after Step 4 is completed.

19.6 Memory Summary

The addresses in this section are relative to the AES accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Size (byte)	Starting Address	Ending Address	Access
AES_IV_MEM	Memory IV	16 bytes	0x0050	0x005F	R/W

19.7 Register Summary

The addresses in this section are relative to the AES accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

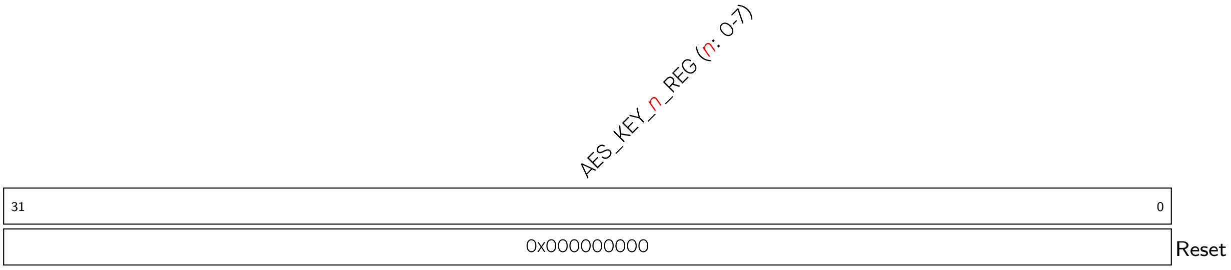
The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Key Registers			
AES_KEY_0_REG	AES key data register 0	0x0000	R/W
AES_KEY_1_REG	AES key data register 1	0x0004	R/W
AES_KEY_2_REG	AES key data register 2	0x0008	R/W
AES_KEY_3_REG	AES key data register 3	0x000C	R/W
AES_KEY_4_REG	AES key data register 4	0x0010	R/W
AES_KEY_5_REG	AES key data register 5	0x0014	R/W
AES_KEY_6_REG	AES key data register 6	0x0018	R/W
AES_KEY_7_REG	AES key data register 7	0x001C	R/W
TEXT_IN Registers			
AES_TEXT_IN_0_REG	Source text data register 0	0x0020	R/W
AES_TEXT_IN_1_REG	Source text data register 1	0x0024	R/W
AES_TEXT_IN_2_REG	Source text data register 2	0x0028	R/W
AES_TEXT_IN_3_REG	Source text data register 3	0x002C	R/W
TEXT_OUT Registers			
AES_TEXT_OUT_0_REG	Result text data register 0	0x0030	RO
AES_TEXT_OUT_1_REG	Result text data register 1	0x0034	RO
AES_TEXT_OUT_2_REG	Result text data register 2	0x0038	RO
AES_TEXT_OUT_3_REG	Result text data register 3	0x003C	RO
Configuration Registers			
AES_MODE_REG	Defines key length and encryption / decryption	0x0040	R/W
AES_DMA_ENABLE_REG	Selects the working mode of the AES accelerator	0x0090	R/W
AES_BLOCK_MODE_REG	Defines the block cipher mode	0x0094	R/W
AES_BLOCK_NUM_REG	Block number configuration register	0x0098	R/W
AES_INC_SEL_REG	Standard incrementing function register	0x009C	R/W
Controlling / Status Registers			
AES_TRIGGER_REG	Operation start controlling register	0x0048	WO
AES_STATE_REG	Operation status register	0x004C	RO
AES_DMA_EXIT_REG	Operation exit controlling register	0x00B8	WO
Interruption Registers			
AES_INT_CLR_REG	DMA-AES interrupt clear register	0x00AC	WO
AES_INT_ENA_REG	DMA-AES interrupt enable register	0x00B0	R/W

19.8 Registers

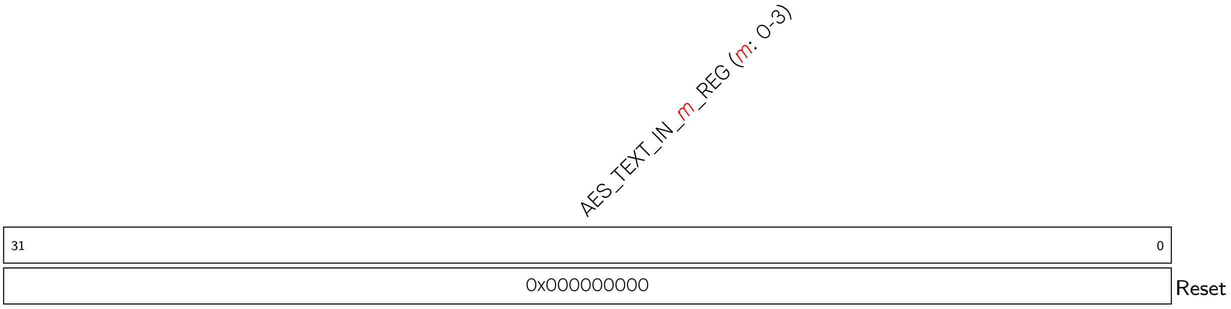
The addresses in this section are relative to the AES accelerator base address provided in Table 3-3 in Chapter *3 System and Memory*.

Register 19.1. AES_KEY_*n*_REG (*n*: 0-7) (0x0000+4n*)**



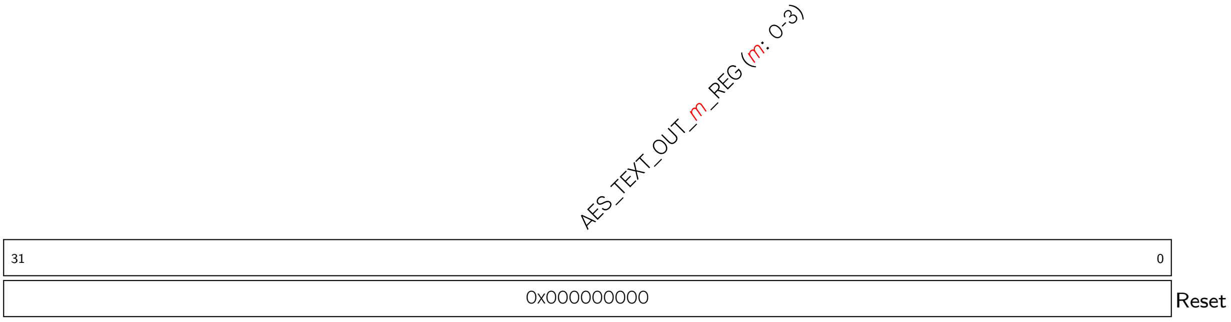
AES_KEY_*n*_REG (*n*: 0-7) Stores AES key data. (R/W)

Register 19.2. AES_TEXT_IN_*m*_REG (*m*: 0-3) (0x0020+4m*)**



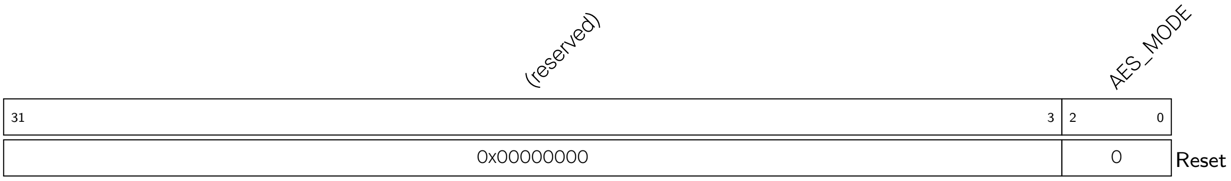
AES_TEXT_IN_*m*_REG (*m*: 0-3) Stores the source text data when the AES Accelerator operates in the Typical AES working mode. (R/W)

Register 19.3. AES_TEXT_OUT_*m*_REG (*m*: 0-3) (0x0030+4m*)**



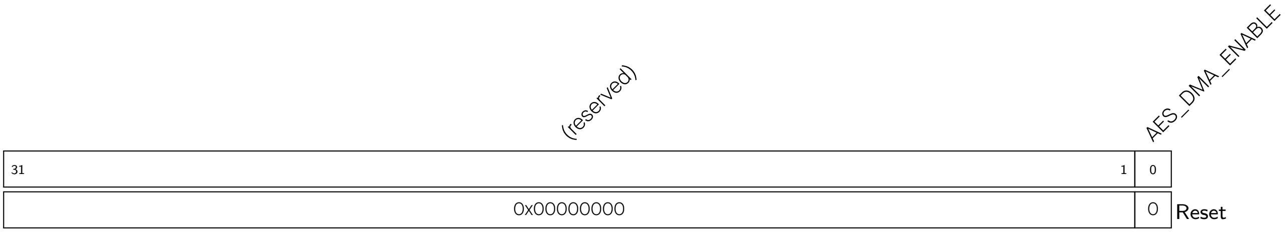
AES_TEXT_OUT_*m*_REG (*m*: 0-3) Stores the result text data when the AES Accelerator operates in the Typical AES working mode. (RO)

Register 19.4. AES_MODE_REG (0x0040)



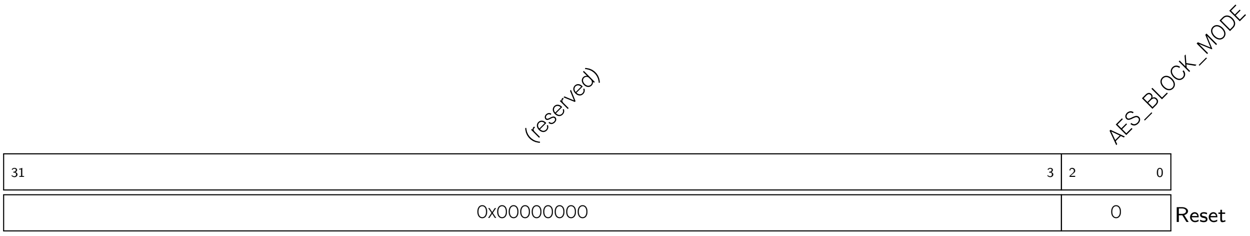
AES_MODE Defines the key length and encryption / decryption of the AES Accelerator. For details, see Table 19-2. (R/W)

Register 19.5. AES_DMA_ENABLE_REG (0x0090)



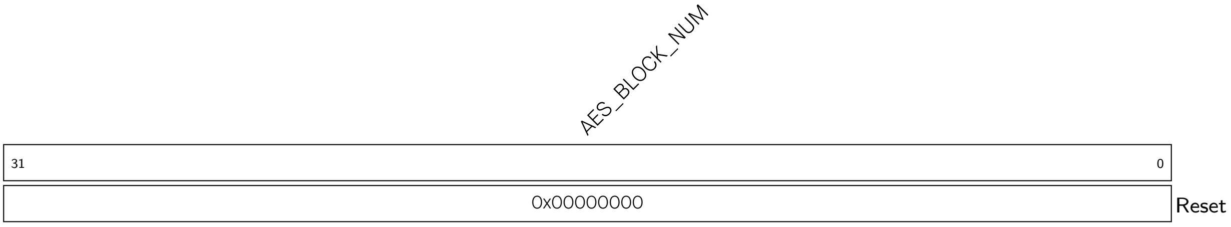
AES_DMA_ENABLE Defines the working mode of the AES Accelerator. 0: Typical AES, 1: DMA-AES. For details, see Table 19-1. (R/W)

Register 19.6. AES_BLOCK_MODE_REG (0x0094)



AES_BLOCK_MODE Defines the block cipher mode of the AES Accelerator operating under the DMA-AES working mode. For details, see Table 19-7. (R/W)

Register 19.7. AES_BLOCK_NUM_REG (0x0098)



AES_BLOCK_NUM Stores the Block Number of plaintext or ciphertext when the AES Accelerator operates under the DMA-AES working mode. For details, see Section 19.5.4. (R/W)

Register 19.8. AES_INC_SEL_REG (0x009C)

(reserved)	AES_INC_SEL	
31 1	0	
0x00000000	0	Reset

AES_INC_SEL Defines the Standard Incrementing Function for CTR block operation. Set this bit to 0 or 1 to choose INC_{32} or INC_{128}. (R/W)

Register 19.9. AES_TRIGGER_REG (0x0048)

(reserved)	AES_TRIGGER	
31 1	0	
0x00000000	x	Reset

AES_TRIGGER Set this bit to 1 to start AES operation. (WO)

Register 19.10. AES_STATE_REG (0x004C)

(reserved)	AES_STATE	
31 2	1 0	
0x00000000	0x0	Reset

AES_STATE Stores the working status of the AES Accelerator. For details, see Table 19-3 for Typical AES working mode and Table 19-8 for DMA AES working mode. (RO)

Register 19.11. AES_DMA_EXIT_REG (0x00B8)

(reserved)	AES_DMA_EXIT	
31 1	0	
0x00000000	x	Reset

AES_DMA_EXIT Set this bit to 1 to exit AES operation. This register is only effective for DMA-AES operation. (WO)

Register 19.12. AES_INT_CLR_REG (0x00AC)

(reserved)	AES_INT_CLR	
31 1	0	
0x00000000	x	Reset

AES_INT_CLR Set this bit to 1 to clear AES interrupt. (WO)

Register 19.13. AES_INT_ENA_REG (0x00B0)

(reserved)	AES_INT_ENA	
31 1	0	
0x00000000	0	Reset

AES_INT_ENA Set this bit to 1 to enable AES interrupt and 0 to disable interrupt. (R/W)

20 RSA Accelerator (RSA)

20.1 Introduction

The RSA Accelerator provides hardware support for high precision computation used in various RSA asymmetric cipher algorithms by significantly reducing their software complexity. Compared with RSA algorithms implemented solely in software, this hardware accelerator can speed up RSA algorithms significantly. Besides, the RSA Accelerator also supports operands of different lengths, which provides more flexibility during the computation.

20.2 Features

The following functionality is supported:

- Large-number modular exponentiation with two optional acceleration options
- Large-number modular multiplication
- Large-number multiplication
- Operands of different lengths
- Interrupt on completion of computation

20.3 Functional Description

The RSA Accelerator is activated by setting the SYSTEM_CRYPTO_RSA_CLK_EN bit in the SYSTEM_PERIP_CLK_EN1_REG register and clearing the SYSTEM_RSA_MEM_PD bit in the SYSTEM_RSA_PD_CTRL_REG register. This releases the RSA Accelerator from reset.

The RSA Accelerator is only available after the RSA-related memories are initialized. The content of the RSA_CLEAN_REG register is 0 during initialization and will become 1 after the initialization is done. Therefore, it is advised to wait until RSA_CLEAN_REG becomes 1 before using the RSA Accelerator.

The RSA_INTERRUPT_ENA_REG register is used to control the interrupt triggered on completion of computation. Write 1 or 0 to this register to enable or disable interrupt. By default, the interrupt function of the RSA Accelerator is enabled.

Notice:

ESP32-C3's Digital Signature (DS) module also calls the RSA accelerator. Therefore, users cannot access the RSA accelerator when Digital Signature (DS) is working.

20.3.1 Large Number Modular Exponentiation

Large-number modular exponentiation performs $Z = X^Y \bmod M$. The computation is based on Montgomery multiplication. Therefore, aside from the X, Y, and M arguments, two additional ones are needed — $\bar{r}$ and M', which need to be calculated in advance by software.

RSA Accelerator supports operands of length $N = 32 \times x$, where $x \in \{1, 2, 3, \ldots, 96\}$. The bit lengths of arguments Z, X, Y, M, and $\overline{r}$ can be arbitrary N, but all numbers in a calculation must be of the same length. The bit length of M' must be 32.

To represent the numbers used as operands, let us define a base-b positional notation, as follows:

$$b = 2^{32}$$

Using this notation, each number is represented by a sequence of base-b digits:

$$n = \frac{N}{32}$$
$$Z = (Z_{n-1}Z_{n-2} \cdots Z_0)_b$$
$$X = (X_{n-1}X_{n-2} \cdots X_0)_b$$
$$Y = (Y_{n-1}Y_{n-2} \cdots Y_0)_b$$
$$M = (M_{n-1}M_{n-2} \cdots M_0)_b$$
$$\overline{r} = (\overline{r}_{n-1}\overline{r}_{n-2} \cdots \overline{r}_0)_b$$

Each of the n values in $Z_{n-1} \cdots Z_0$, $X_{n-1} \cdots X_0$, $Y_{n-1} \cdots Y_0$, $M_{n-1} \cdots M_0$, $\overline{r}_{n-1} \cdots \overline{r}_0$ represents one base-b digit (a 32-bit word).

Z_{n-1}, X_{n-1}, Y_{n-1}, M_{n-1} and $\overline{r}_{n-1}$ are the most significant bits of Z, X, Y, M, while Z_0, X_0, Y_0, M_0 and $\overline{r}_0$ are the least significant bits.

If we define $R = b^n$, the additional arguments can be calculated as $\overline{r} = R^2 \bmod M$.

The following equation in the form compatible with the extended binary GCD algorithm can be written as

$$M^{-1} \times M + 1 = R \times R^{-1}$$
$$M' = M^{-1} \bmod b$$

Large-number modular exponentiation can be implemented as follows:

1. Write 1 or 0 to the RSA_INTERRUPT_ENA_REG register to enable or disable the interrupt function.
2. Configure relevant registers:
   (a) Write $(\frac{N}{32} - 1)$ to the RSA_MODE_REG register.
   (b) Write M' to the RSA_M_PRIME_REG register.
   (c) Configure registers related to the acceleration options, which are described later in Section 20.3.4.
3. Write X_i, Y_i, M_i and $\overline{r}_i$ for $i \in \{0, 1, \ldots, n-1\}$ to memory blocks RSA_X_MEM, RSA_Y_MEM, RSA_M_MEM and RSA_Z_MEM. The capacity of each memory block is 96 words. Each word of each memory block can store one base-b digit. The memory blocks use the little endian format for storage, i.e. the least significant digit of each number is in the lowest address.

   Users need to write data to each memory block only according to the length of the number; data beyond this length are ignored.

4. Write 1 to the RSA_MODEXP_START_REG register to start computation.
5. Wait for the completion of computation, which happens when the content of RSA_IDLE_REG becomes 1 or the RSA interrupt occurs.
6. Read the result Z_i for $i \in \{0, 1, \ldots, n-1\}$ from RSA_Z_MEM.
7. Write 1 to RSA_CLEAR_INTERRUPT_REG to clear the interrupt, if you have enabled the interrupt function.

After the computation, the RSA_MODE_REG register, memory blocks RSA_Y_MEM and RSA_M_MEM, as well as the RSA_M_PRIME_REG remain unchanged. However, X_i in RSA_X_MEM and $\bar{r}_i$ in RSA_Z_MEM computation are overwritten, and only these overwritten memory blocks need to be re-initialized before starting another computation.

20.3.2 Large Number Modular Multiplication

Large-number modular multiplication performs $Z = X \times Y \bmod M$. This computation is based on Montgomery multiplication. Therefore, similar to the large number modular exponentiation, two additional arguments are needed – $\bar{r}$ and M', which need to be calculated in advance by software.

The RSA Accelerator supports large-number modular multiplication with operands of 96 different lengths.

The computation can be executed as follows:

1. Write 1 or 0 to the RSA_INTERRUPT_ENA_REG register to enable or disable the interrupt function.
2. Configure relevant registers:
   (a) Write $(\frac{N}{32} - 1)$ to the RSA_MODE_REG register.
   (b) Write M' to the RSA_M_PRIME_REG register.
3. Write X_i, Y_i, M_i, and $\bar{r}_i$ for $i \in \{0, 1, \ldots, n-1\}$ to memory blocks RSA_X_MEM, RSA_Y_MEM, RSA_M_MEM and RSA_Z_MEM. The capacity of each memory block is 96 words. Each word of each memory block can store one base-b digit. The memory blocks use the little endian format for storage, i.e. the least significant digit of each number is in the lowest address.

   Users need to write data to each memory block only according to the length of the number; data beyond this length are ignored.
4. Write 1 to the RSA_MODMULT_START_REG register.
5. Wait for the completion of computation, which happens when the content of RSA_IDLE_REG becomes 1 or the RSA interrupt occurs.
6. Read the result Z_i for $i \in \{0, 1, \ldots, n-1\}$ from RSA_Z_MEM.
7. Write 1 to RSA_CLEAR_INTERRUPT_REG to clear the interrupt, if you have enabled the interrupt function.

After the computation, the length of operands in RSA_MODE_REG, the X_i in memory RSA_X_MEM, the Y_i in memory RSA_Y_MEM, the M_i in memory RSA_M_MEM, and the M' in memory RSA_M_PRIME_REG remain unchanged. However, the $\bar{r}_i$ in memory RSA_Z_MEM has already been overwritten, and only this overwritten memory block needs to be re-initialized before starting another computation.

20.3.3 Large Number Multiplication

Large-number multiplication performs $Z = X \times Y$. The length of result Z is twice that of operand X and operand Y. Therefore, the RSA Accelerator only supports Large Number Multiplication with operand length $N = 32 \times x$, where $x \in \{1, 2, 3, \ldots, 48\}$. The length $\hat{N}$ of result Z is $2 \times N$.

The computation can be executed as follows:

1. Write 1 or 0 to the RSA_INTERRUPT_ENA_REG register to enable or disable the interrupt function.
2. Write $(\frac{\hat{N}}{32} - 1)$, i.e. $(\frac{N}{16} - 1)$ to the RSA_MODE_REG register.
3. Write X_i and Y_i for $\in \{0, 1, \ldots, n-1\}$ to memory blocks RSA_X_MEM and RSA_Z_MEM. Each word of each memory block can store one base-b digit. The memory blocks use the little endian format for storage, i.e. the least significant digit of each number is in the lowest address. n is $\frac{N}{32}$.

   Write X_i for $i \in \{0, 1, \ldots, n-1\}$ to the address of the i words of the RSA_X_MEM memory block. Note that Y_i for $i \in \{0, 1, \ldots, n-1\}$ will not be written to the address of the i words of the RSA_Z_MEM register, but the address of the $n+i$ words, i.e. the base address of the RSA_Z_MEM memory plus the address offset $4 \times (n+i)$.

   Users need to write data to each memory block only according to the length of the number; data beyond this length are ignored.
4. Write 1 to the RSA_MULT_START_REG register.
5. Wait for the completion of computation, which happens when the content of RSA_IDLE_REG becomes 1 or the RSA interrupt occurs.
6. Read the result Z_i for $i \in \{0, 1, \ldots, \hat{n}-1\}$ from the RSA_Z_MEM register. $\hat{n}$ is $2 \times n$.
7. Write 1 to RSA_CLEAR_INTERRUPT_REG to clear the interrupt, if you have enabled the interrupt function.

After the computation, the length of operands in RSA_MODE_REG and the X_i in memory RSA_X_MEM remain unchanged. However, the Y_i in memory RSA_Z_MEM has already been overwritten, and only this overwritten memory block needs to be re-initialized before starting another computation.

20.3.4 Options for Acceleration

The ESP32-C3 RSA accelerator also provides SEARCH and CONSTANT_TIME options that can be configured to accelerate the large-number modular exponentiation. By default, both options are configured for no acceleration. Users can choose to use one or two of these options to accelerate the computation.

To be more specific, when neither of these two options are configured for acceleration, the time required to calculate $Z = X^Y \bmod M$ is solely determined by the lengths of operands. When either or both of these two options are configured for acceleration, the time required is also correlated with the 0/1 distribution of Y.

To better illustrate how these two options work, first assume Y is represented in binaries as

$$Y = (\widetilde{Y}_{N-1}\widetilde{Y}_{N-2} \cdots \widetilde{Y}_{t+1}\widetilde{Y}_t\widetilde{Y}_{t-1} \cdots \widetilde{Y}_0)_2$$

where,

- N is the length of Y,
- $\widetilde{Y}_t$ is 1,
- $\widetilde{Y}_{N-1}$, $\widetilde{Y}_{N-2}$, ..., $\widetilde{Y}_{t+1}$ are all equal to 0,
- and $\widetilde{Y}_{t-1}$, $\widetilde{Y}_{t-2}$, ..., $\widetilde{Y}_0$ are either 0 or 1 but exactly m bits should be equal to 0 and t-m bits 1, i.e. the Hamming weight of $\widetilde{Y}_{t-1}\widetilde{Y}_{t-2}, \cdots, \widetilde{Y}_0$ is $t - m$.

When either of these two options is configured for acceleration:

- SEARCH Option (Configuring RSA_SEARCH_ENABLE to 1 for acceleration)
  - The accelerator ignores the bit positions of $\widetilde{Y}_i$, where $i > \alpha$. Search position α is set by configuring the RSA_SEARCH_POS_REG register. The maximum value of α is N-1, which leads to the same result when this option is not used for acceleration. The best acceleration performance can be achieved by setting α to t, in which case, all the $\widetilde{Y}_{N-1}$, $\widetilde{Y}_{N-2}$, ..., $\widetilde{Y}_{t+1}$ of 0s are ignored during the calculation. Note that if you set α to be less than t, then the result of the modular exponentiation $Z = X^Y$ mod M will be incorrect.
- CONSTANT_TIME Option (Configuring RSA_CONSTANT_TIME_REG to 0 for acceleration)
  - The accelerator speeds up the calculation by simplifying the calculation concerning the 0 bits of Y. Therefore, the higher the proportion of bits 0 against bits 1, the better the acceleration performance is.

We provide an example to demonstrate the performance of the RSA Accelerator under different combinations of SEARCH and CONSTANT_TIME configuration. Here we perform $Z = X^Y$ mod M with N = 3072 and Y = 65537. Table 20-1 below demonstrates the time costs under different combinations of SEARCH and CONSTANT_TIME configuration. Here, we should also mention that, α is set to 16 when the SEARCH option is enabled.

Table 20-1. Acceleration Performance

SEARCH Option	CONSTANT_TIME Option	Time Cost (ms)
No acceleration	No acceleration	752.81
Accelerated	No acceleration	4.52
No acceleration	Acceleration	2.406
Acceleration	Acceleration	2.33

It's obvious that:

- The time cost is the biggest when none of these two options is configured for acceleration.
- The time cost is the smallest when both of these two options are configured for acceleration.
- The time cost can be dramatically reduced when either or both option(s) are configured for acceleration.

20.4 Memory Summary

The addresses in this section are relative to the RSA accelerator base address provided in Table 3-3 in Chapter *3 System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Table 20-2. RSA Accelerator Memory Blocks

Name	Description	Size (byte)	Starting Address	Ending Address	Access
RSA_M_MEM	Memory M	384	0x0000	0x017F	R/W
RSA_Z_MEM	Memory Z	384	0x0200	0x037F	R/W
RSA_Y_MEM	Memory Y	384	0x0400	0x057F	R/W
RSA_X_MEM	Memory X	384	0x0600	0x077F	R/W

20.5 Register Summary

The addresses in this section are relative to the RSA accelerator base address provided in Table 3-3 in Chapter *3 System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
RSA_M_PRIME_REG	Register to store M’	0x0800	R/W
RSA_MODE_REG	RSA length mode	0x0804	R/W
RSA_CONSTANT_TIME_REG	The constant_time option	0x0820	R/W
RSA_SEARCH_ENABLE_REG	The search option	0x0824	R/W
RSA_SEARCH_POS_REG	The search position	0x0828	R/W
Status/Control Registers			
RSA_CLEAN_REG	RSA clean register	0x0808	RO
RSA_MODEXP_START_REG	Modular exponentiation starting bit	0x080C	WO
RSA_MODMULT_START_REG	Modular multiplication starting bit	0x0810	WO
RSA_MULT_START_REG	Normal multiplication starting bit	0x0814	WO
RSA_IDLE_REG	RSA idle register	0x0818	RO
Interrupt Registers			
RSA_CLEAR_INTERRUPT_REG	RSA clear interrupt register	0x081C	WO
RSA_INTERRUPT_ENA_REG	RSA interrupt enable register	0x082C	R/W
Version Register			
RSA_DATE_REG	Version control register	0x0830	R/W

20.6 Registers

The addresses in this section are relative to the RSA accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 20.1. RSA_M_PRIME_REG (0x0800)

RSA_M_PRIME_REG	
31 … 0	
0x000000000	Reset

RSA_M_PRIME_REG Stores M'.(R/W)

Register 20.2. RSA_MODE_REG (0x0804)

(reserved)	RSA_MODE	
31 … 7	6 … 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0 0	Reset

RSA_MODE Stores the mode of modular exponentiation. (R/W)

Register 20.3. RSA_CLEAN_REG (0x0808)

(reserved)	RSA_CLEAN	
31 … 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RSA_CLEAN The content of this bit is 1 when memories complete initialization. (RO)

Register 20.4. RSA_MODEXP_START_REG (0x080C)

(reserved)	RSA_MODEXP_START	
31 … 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RSA_MODEXP_START Set this bit to 1 to start the modular exponentiation. (WO)

Register 20.5. RSA_MODMULT_START_REG (0x0810)

(reserved)	RSA_MODMULT_START	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RSA_MODMULT_START Set this bit to 1 to start the modular multiplication. (WO)

Register 20.6. RSA_MULT_START_REG (0x0814)

(reserved)	RSA_MULT_START	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RSA_MULT_START Set this bit to 1 to start the multiplication. (WO)

Register 20.7. RSA_IDLE_REG (0x0818)

(reserved)	RSA_IDLE	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RSA_IDLE The content of this bit is 1 when the RSA accelerator is idle. (RO)

Register 20.8. RSA_CLEAR_INTERRUPT_REG (0x081C)

(reserved)	RSA_CLEAR_INTERRUPT	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RSA_CLEAR_INTERRUPT Set this bit to 1 to clear the RSA interrupts. (WO)

Register 20.9. RSA_CONSTANT_TIME_REG (0x0820)

(reserved)	RSA_CONSTANT_TIME	
31 … 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	Reset

RSA_CONSTANT_TIME_REG Controls the constant_time option. 0: acceleration. 1: no acceleration (by default). (R/W)

Register 20.10. RSA_SEARCH_ENABLE_REG (0x0824)

(reserved)	RSA_SEARCH_ENABLE	
31 … 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

RSA_SEARCH_ENABLE Controls the search option. 0: no acceleration (by default). 1: acceleration. (R/W)

Register 20.11. RSA_SEARCH_POS_REG (0x0828)

(reserved)	RSA_SEARCH_POS	
31 … 12	11 … 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x000	Reset

RSA_SEARCH_POS Is used to configure the starting address when the acceleration option of search is used. (R/W)

Register 20.12. RSA_INTERRUPT_ENA_REG (0x082C)

(reserved)	RSA_INTERRUPT_ENA	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	Reset

RSA_INTERRUPT_ENA Set this bit to 1 to enable the RSA interrupt. This option is enabled by default. (R/W)

Register 20.13. RSA_DATE_REG (0x0830)

(reserved)	RSA_DATE	
31 30	29 0	
0 0	0x20200618	Reset

RSA_DATE Version control register. (R/W)

21 HMAC Accelerator (HMAC)

The Hash-based Message Authentication Code (HMAC) module computes Message Authentication Codes (MACs) using Hash algorithm and keys as described in RFC 2104. The hash algorithm is SHA-256, the 256-bit HMAC key is stored in an eFuse key block and can be set as read-protected, i. e., the key is not accessible from outside the HMAC accelerator itself.

21.1 Main Features

- Standard HMAC-SHA-256 algorithm
- Hash result only accessible by configurable hardware peripheral (in downstream mode)
- Compatible to challenge-response authentication algorithm
- Generates required keys for the Digital Signature (DS) peripheral (in downstream mode)
- Re-enables soft-disabled JTAG (in downstream mode)

21.2 Functional Description

The HMAC module operates in two modes: upstream mode and downstream mode. In upstream mode, the HMAC message is provided by users and the calculation result is read back by them; in downstream mode, the HMAC module is used as a Key Derivation Function (KDF) for other internal hardware. For instance, the JTAG can be temporarily disabled by burning odd number bits of EFUSE_SOFT_DIS_JTAG in eFuse. In this case, users can temporarily re-enable JTAG using the HMAC module in downstream mode.

After the reset signal being released, the HMAC module will check whether the DS key exists in the eFuse. If the key exists, the HMAC module will enter downstream digital signature mode and finish the DS key calculation automatically.

21.2.1 Upstream Mode

Common use cases for the upstream mode are challenge-response protocols supporting HMAC-SHA-256. Assume the two entities in the challenge-response protocol are A and B respectively, and the data message they expect to exchange is M. The general process of this protocol is as follows:

- A calculates a unique random number M
- A sends M to B
- B calculates the HMAC (through M and KEY) and sends the result to A
- A calculates the HMAC (through M and KEY) internally
- A compares the two results. If they are the same, then the identity of B is authenticated

To calculate the HMAC value (the following steps should be done by the user):

1. Initialize the HMAC module, and enter upstream mode.
2. Write the correctly padded message to the HMAC, one block at a time.
3. Read back the result from HMAC.

For details of this process, please see Section 21.2.5.

21.2.2 Downstream JTAG Enable Mode

JTAG debugging can be disabled in a way which allows later re-enabling using the HMAC module. The HMAC module will expect the user to supply the HMAC result for one of the eFuse keys. The HMAC module will check whether the supplied HMAC matches the one calculated from the chosen key. If both HMACs are the same, JTAG will be enabled until the user calls the HMAC module to clear the results and consequently disable JTAG again.

There are two parameters in eFuse memory to disable JTAG: EFUSE_HARD_DIS_JTAG and EFUSE_SOFT_DIS_JTAG. Write 1 to EFUSE_DIS_PAD_JTAG to disable JTAG permanently, and write odd numbers of 1 to EFUSE_SOFT_DIS_JTAG to disable JTAG temporarily. For more details, please see Chapter 4 *eFuse Controller (EFUSE)*. After bit EFUSE_SOFT_DIS_JTAG is set, the key to re-enable JTAG can be calculated in HMAC module's downstream mode. JTAG is re-enabled when the result configured by the user is the same as the HMAC result.

To re-enable JTAG:

1. Users enable the HMAC module by initializing clock and reset signals of HMAC, and enter downstream JTAG enable mode by configuring HMAC_SET_PARA_PURPOSE_REG, then Wait for the calculation to complete. Please see Section 21.2.5 for more details.
2. Users write 1 to the HMAC_SOFT_JTAG_CTRL_REG register to enter JTAG re-enable compare mode.
3. Users write the 256-bit HMAC value which is calculated locally from the 32-byte 0x00 using SHA-256 and the generated key to register HMAC_WR_JTAG_REG by writing 8 times and 32-bit each time in big-endian word order.
4. If the HMAC result matches the value that users calculated locally, then JTAG is re-enabled. Otherwise, JTAG remains disabled.
5. After writing 1 to HMAC_SET_INVALIDATE_JTAG_REG or resetting the chip, JTAG will be disabled. If users want to re-enable JTAG again, they need to repeat the above steps again.

21.2.3 Downstream Digital Signature Mode

The Digital Signature (DS) module encrypts its parameters using the AES-CBC algorithm. The HMAC module is used as a Key Derivation Function (KDF) to derive the AES key to decrypt these parameters (parameter decryption key). The key used for the HMAC as KDF is stored in one of the eFuse key blocks.

Before starting the DS module, users need to obtain the parameter decryption key for the DS module through HMAC calculation. For more information, please see Chapter 22 *Digital Signature (DS)*. After the chip is powered on, the HMAC module will check whether the key required to calculate the parameter decryption key has been burned in the eFuse block. If the key has been burned, HMAC module will automatically enter the downstream digital signature mode and complete the HMAC calculation based on the chosen key.

21.2.4 HMAC eFuse Configuration

Each HMAC key burned into an eFuse block has a key purpose, also burned into the eFuse section. This purpose specifies for which functionality the key can be used. The HMAC module will not accept a key with a non-matching purpose for any functionality. The HMAC module provides three different functionalities: re-enabling JTAG and serving as DS KDF in downstream mode as well as pure HMAC calculation in upstream mode. For each functionality, there exists a corresponding key purpose, listed in Table 21-1. Additionally, another purpose specifies a key which may be used for re-enabling JTAG as well as for serving as DS KDF.

Before enabling HMAC to do calculations, user should make sure the key to be used has been burned in eFuse by reading EFUSE_KEY_PURPOSE_x (We totally have 6 keys in eFuse, so x = 0,1,2,..,5), registers from *4 eFuse Controller (EFUSE)*. Take upstream as example, if there is no EFUSE_KEY_PURPOSE_HMAC_UP in EFUSE_KEY_PURPOSE_0~5, means there is no upstream used key in efuse. You can burn key to efuse as follows:

1. Prepare a secret 256-bit HMAC key and burn the key to an empty eFuse block y (there are six blocks for storing a key in eFuse. The numbers of those blocks range from 4 to 9, so y = 4,5,..,9. Hence, if we are talking about key0, we mean eFuse block4), and then program the purpose to EFUSE_KEY_PURPOSE_$(y-4)$. Take upstream mode as an example: after programming the key, the user should program EFUSE_KEY_PURPOSE_HMAC_UP (corresponding value is 6) to EFUSE_KEY_PURPOSE_$(y-4)$. Please see Chapter *4 eFuse Controller (EFUSE)* on how to program eFuse keys.
2. Configure this eFuse key block to be read protected, so that users cannot read its value. A copy of this key should be kept by any party who needs to verify this device.

Please note that the key whose purpose is EFUSE_KEY_PURPOSE_HMAC_DOWN_ALL can be used for both re-enabling JTAG or DS.

Table 21-1. HMAC Purposes and Configuration Value

Purpose	Mode	Value	Description
JTAG Re-enable	Downstream	6	EFUSE_KEY_PURPOSE_HMAC_DOWN_JTAG
DS Key Derivation	Downstream	7	EFUSE_KEY_PURPOSE_HMAC_DOWN_DIGITAL_SIGNATURE
HMAC Calculation	Upstream	8	EFUSE_KEY_PURPOSE_HMAC_UP
Both JTAG Re-enable and DS KDF	Downstream	5	EFUSE_KEY_PURPOSE_HMAC_DOWN_ALL

Configure HMAC Purposes

The correct purpose has to be written to register HMAC_SET_PARA_PURPOSE_REG (see Section 21.2.5). If there is no valid value in efuse purpose section, HMAC will terminate calculation.

Select eFuse Key Blocks

The eFuse controller provides six key blocks, i.e., KEY0 ~ 5. To select a particular KEYn for an HMAC calculation, write the key number n to register HMAC_SET_PARA_KEY_REG.

Note that the purpose of the key has also been programmed to eFuse memory. Only when the configured HMAC purpose matches the defined purpose of KEYn, will the HMAC module execute the configured calculation. Otherwise, it will return a matching error and stop the current calculation. For example, suppose a user selects KEY3 for HMAC calculation, and the value programmed to KEY_PURPOSE_3 is 6 (EFUSE_KEY_PURPOSE_HMAC_DOWN_JTAG). Based on Table 21-1, KEY3 can be used to re-enable JTAG. If the value written to register HMAC_SET_PARA_PURPOSE_REG is also 6, then the HMAC module will start the process to re-enable JTAG.

21.2.5 HMAC Process (Detailed)

The process to call HMAC is as follows:

1. Enable HMAC module

   (a) Set the peripheral clock bits for HMAC and SHA peripherals in register SYSTEM_PERIP_CLK_EN1_REG, and clear the corresponding peripheral reset bits in register SYSTEM_PERIP_RST_EN1_REG. For information on those registers, please see Chapter 3 *System and Memory*.

   (b) Write 1 to register HMAC_SET_START_REG.

2. Configure HMAC keys and key purposes

   (a) Write the key purpose m to register HMAC_SET_PARA_PURPOSE_REG. The possible key purpose values are shown in Table 21-1. For more information, please refer to Section 21.2.4.

   (b) Select KEYn in eFuse memory as the key by writing n (ranges from 0 to 5) to register HMAC_SET_PARA_KEY_REG. For more information, please refer to Section 21.2.4.

   (c) Write 1 to register HMAC_SET_PARA_FINISH_REG to complete the configuration.

   (d) Read register HMAC_QUERY_ERROR_REG. If its value is 1, it means the purpose of the selected block does not match the configured key purpose and the calculation will not proceed. If its value is 0, it means the purpose of the selected block matches the configured key purpose, and then the calculation can proceed.

   (e) When the value of HMAC_SET_PARA_PURPOSE_REG is not 8, it means the HMAC module is in downstream mode, proceed with step 3. When the value is 8, it means the HMAC module is in upstream mode, proceed with step 4.

3. Downstream mode

   (a) Poll Status register HMAC_QUERY_BUSY_REG until it reads 0.

   (b) To clear the result and make further usage of the dependent hardware (JTAG or DS) impossible, write 1 to either register HMAC_SET_INVALIDATE_JTAG_REG to clear the result generated by the JTAG key; or to register HMAC_SET_INVALIDATE_DS_REG to clear the result generated by DS key. Afterwards, the HMAC Process needs to be restarted to re-enable any of the dependent peripherals.

4. Transmit message block Block_n ($n >= 1$) in upstream mode

   (a) Poll Status register HMAC_QUERY_BUSY_REG until it reads 0.

   (b) Write the 512-bit Block_n to register HMAC_WDATA0~15_REG. Write 1 to register HMAC_SET_MESSAGE_ONE_REG, to trigger the processing of this message block.

   (c) Poll Status register HMAC_QUERY_BUSY_REG until it reads 0.

   (d) Different message blocks will be generated, depending on whether the size of the to-be-processed message is a multiple of 512 bits.

   - If the bit length of the message is a multiple of 512 bits, there are three possible options:

     i. If Block_n+1 exists, write 1 to register HMAC_SET_MESSAGE_ING_REG to make $n = n + 1$, and then jump to step 4.(b).

    ii. If Block_n is the last block of the message and users expects to apply SHA padding in hardware, write 1 to register HMAC_SET_MESSAGE_END_REG, and then jump to step 6.

    iii. If Block_n is the last block of the padded message and SHA padding has been applied by users, write 1 to register HMAC_SET_MESSAGE_PAD_REG, and then jump to step 5.

- If the bit length of the message is not a multiple of 512 bits, there are three possible options as follows. Note that in this case, the user is required to apply SHA padding to the message, after which the padded message length should be a multiple of 512 bits.

    i. If there is only one message block in total which has included all padding bits, write 1 to register HMAC_ONE_BLOCK_REG, and then jump to step 6.

    ii. If Block_n is the second last padded block, write 1 to register HMAC_SET_MESSAGE_PAD_REG, and then jump to step 5.

    iii. If Block_n is neither the last nor the second last message block, write 1 to register HMAC_SET_MESSAGE_ING_REG and define $n = n + 1$, and then jump to step 4.(b).

5. Apply SHA padding to message

    (a) Users apply SHA padding to the last message block as described in Section 21.3.1, write this block to register HMAC_WDATA0~15_REG, and then write 1 to register HMAC_SET_MESSAGE_ONE_REG. Then the HMAC module will process this message block.

    (b) Jump to step 6.

6. Read hash result in upstream mode

    (a) Poll Status register HMAC_QUERY_BUSY_REG until it reads 0.

    (b) Read hash result from register HMAC_RDATA0~7_REG.

    (c) Write 1 to register HMAC_SET_RESULT_FINISH_REG to finish calculation. The result will be cleared at the same time.

    (d) Upstream mode operation is completed.

Note:
The SHA accelerator can be called directly, or used internally by the DS module and the HMAC module. However, they can not share the hardware resources simultaneously. Therefore, the SHA module must not be called neither by the CPU nor by the DS module when the HMAC module is in use.

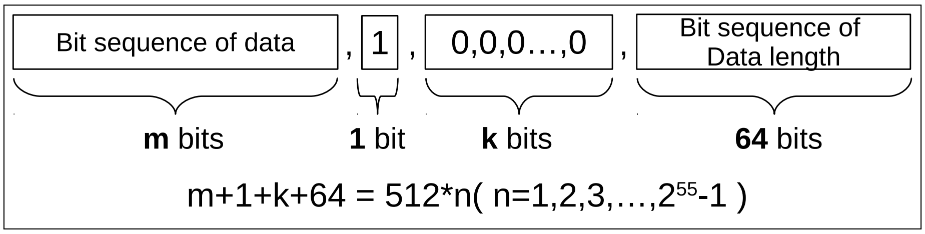
21.3 HMAC Algorithm Details

21.3.1 Padding Bits

The HMAC module uses SHA-256 as hash algorithm. If the input message is not a multiple of 512 bits, the user must apply a SHA-256 padding algorithm in software. The SHA-256 padding algorithm is the same as described in Section *Padding the Message* of FIPS PUB 180-4. In downstream mode, users do not need to input any message or apply padding. The HMAC module uses a default 32-byte pattern of 0x00 for re-enabling JTAG and a 32-byte pattern of 0xff for deriving the AES key for the DS module.

As shown in Figure 21-1, suppose the length of the unpadded message is m bits. Padding steps are as follows:

1. Append one bit of value "1" to the end of the unpadded message;
2. Append k bits of value "0", where k is the smallest non-negative number which satisfies $m + 1 + k \equiv 448 (mod 512)$;
3. Append a 64-bit integer value as a binary block. This block consists of the length of the unpadded message as a big-endian binary integer value m.



Bit sequence of data
1
0,0,0…,0
Bit sequence of Data length
m bits
1 bit
k bits
64 bits
m+1+k+64 = 512*n(n=1,2,3,…,2^55-1)

Figure 21-1. HMAC SHA-256 Padding Diagram

In upstream mode, if the length of the unpadded message is a multiple of 512 bits, users can configure hardware to apply SHA padding by writing 1 to HMAC_SET_MESSGAE_END_REG or do padding work themselves by writing 1 to HMAC_SET_MESSAGE_PAD_REG. If the length is not a multiple of 512 bits, SHA padding must be manually applied by the user. After the user prepared the padding data, they should complete the subsequent configuration according to the Section 21.2.5.

21.3.2 HMAC Algorithm Structure

The structure of the implemented algorithm in the HMAC module is shown in Figure 21-2. This is the standard HMAC algorithm as described in RFC 2104.

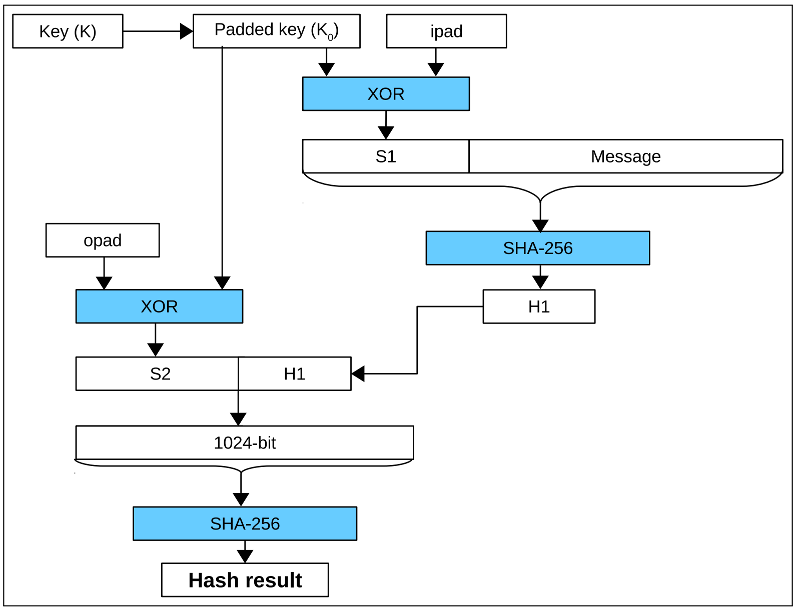


Figure 21-2. HMAC Structure Schematic Diagram

In Figure 21-2:

1. ipad is a 512-bit message block composed of 64 bytes of 0x36.
2. opad is a 512-bit message block composed of 64 bytes of 0x5c.

The HMAC module appends a 256-bit 0 sequence after the bit sequence of the 256-bit key k in order to get a 512-bit K_0. Then, the HMAC module XORs K_0 with ipad to get the 512-bit S1. Afterwards, the HMAC module appends the input message (multiple of 512 bits) after the 512-bit S1, and exercises the SHA-256 algorithm to get the 256-bit H1.

The HMAC module appends the 256-bit SHA-256 hash result H1 to the 512-bit S2 value, which is calculated using the XOR operation of K_0 and opad. A 768-bit sequence will be generated. Then, the HMAC module uses the SHA padding algorithm described in Section 21.3.1 to pad the 768-bit sequence to a 1024-bit sequence, and applies the SHA-256 algorithm to get the final hash result (256-bit).

21.4 Register Summary

The addresses in this section are relative to HMAC Accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

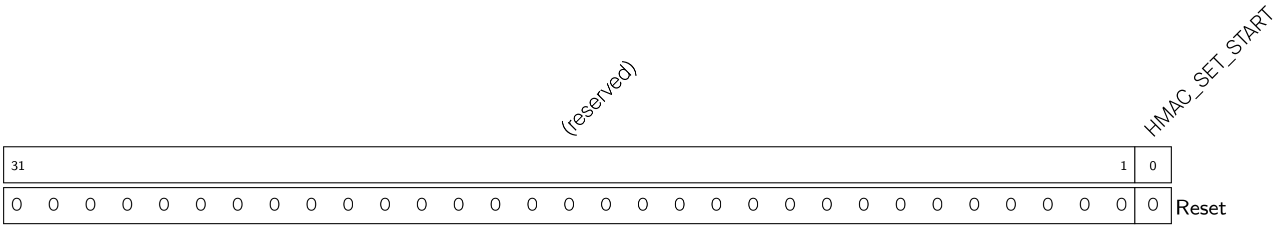
Name	Description	Address	Access
Control/Status Registers			
HMAC_SET_START_REG	HMAC start control register	0x0040	WO
HMAC_SET_PARA_FINISH_REG	HMAC configuration completion register	0x004C	WO
HMAC_SET_MESSAGE_ONE_REG	HMAC message control register	0x0050	WO
HMAC_SET_MESSAGE_ING_REG	HMAC message continue register	0x0054	WO
HMAC_SET_MESSAGE_END_REG	HMAC message end register	0x0058	WO
HMAC_SET_RESULT_FINISH_REG	HMAC result reading finish register	0x005C	WO
HMAC_SET_INVALIDATE_JTAG_REG	Invalidate JTAG result register	0x0060	WO
HMAC_SET_INVALIDATE_DS_REG	Invalidate digital signature result register	0x0064	WO
HMAC_QUERY_ERROR_REG	Stores matching results between keys generated by users and corresponding purposes	0x0068	RO
HMAC_QUERY_BUSY_REG	Busy state of HMAC module	0x006C	RO
configuration Registers			
HMAC_SET_PARA_PURPOSE_REG	HMAC parameter configuration register	0x0044	WO
HMAC_SET_PARA_KEY_REG	HMAC parameters configuration register	0x0048	WO
HMAC_SOFT_JTAG_CTRL_REG	Re-enable JTAG register 0	0x00F8	WO
HMAC_WR_JTAG_REG	Re-enable JTAG register 1	0x00FC	WO
HMAC Message Block			
HMAC_WR_MESSAGE_0_REG	Message register 0	0x0080	WO
HMAC_WR_MESSAGE_1_REG	Message register 1	0x0084	WO
HMAC_WR_MESSAGE_2_REG	Message register 2	0x0088	WO
HMAC_WR_MESSAGE_3_REG	Message register 3	0x008C	WO
HMAC_WR_MESSAGE_4_REG	Message register 4	0x0090	WO
HMAC_WR_MESSAGE_5_REG	Message register 5	0x0094	WO
HMAC_WR_MESSAGE_6_REG	Message register 6	0x0098	WO
HMAC_WR_MESSAGE_7_REG	Message register 7	0x009C	WO
HMAC_WR_MESSAGE_8_REG	Message register 8	0x00A0	WO
HMAC_WR_MESSAGE_9_REG	Message register 9	0x00A4	WO
HMAC_WR_MESSAGE_10_REG	Message register 10	0x00A8	WO
HMAC_WR_MESSAGE_11_REG	Message register 11	0x00AC	WO
HMAC_WR_MESSAGE_12_REG	Message register 12	0x00B0	WO
HMAC_WR_MESSAGE_13_REG	Message register 13	0x00B4	WO
HMAC_WR_MESSAGE_14_REG	Message register 14	0x00B8	WO
HMAC_WR_MESSAGE_15_REG	Message register 15	0x00BC	WO
HMAC Upstream Result			
HMAC_RD_RESULT_0_REG	Hash result register 0	0x00C0	RO
HMAC_RD_RESULT_1_REG	Hash result register 1	0x00C4	RO
HMAC_RD_RESULT_2_REG	Hash result register 2	0x00C8	RO

Name	Description	Address	Access
HMAC_RD_RESULT_3_REG	Hash result register 3	0x00CC	RO
HMAC_RD_RESULT_4_REG	Hash result register 4	0x00D0	RO
HMAC_RD_RESULT_5_REG	Hash result register 5	0x00D4	RO
HMAC_RD_RESULT_6_REG	Hash result register 6	0x00D8	RO
HMAC_RD_RESULT_7_REG	Hash result register 7	0x00DC	RO
Control/Status Registers			
HMAC_SET_MESSAGE_PAD_REG	Software padding register	0x00F0	WO
HMAC_ONE_BLOCK_REG	One block message register	0x00F4	WO
Version Register			
HMAC_DATE_REG	Version control register	0x00F8	R/W

21.5 Registers

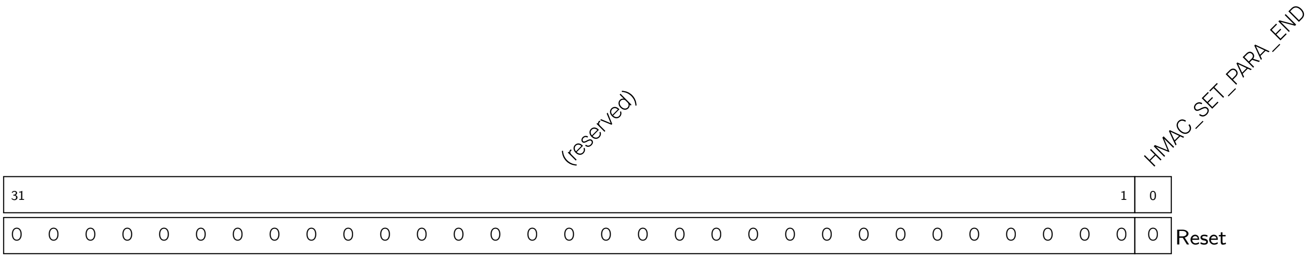
The addresses in this section are relative to HMAC Accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 21.1. HMAC_SET_START_REG (0x0040)



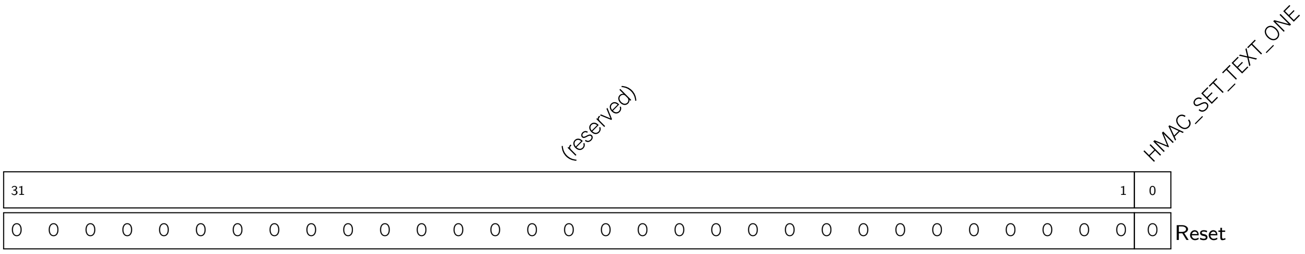
HMAC_SET_START Set this bit to enable HMAC. (WO)

Register 21.2. HMAC_SET_PARA_FINISH_REG (0x004C)



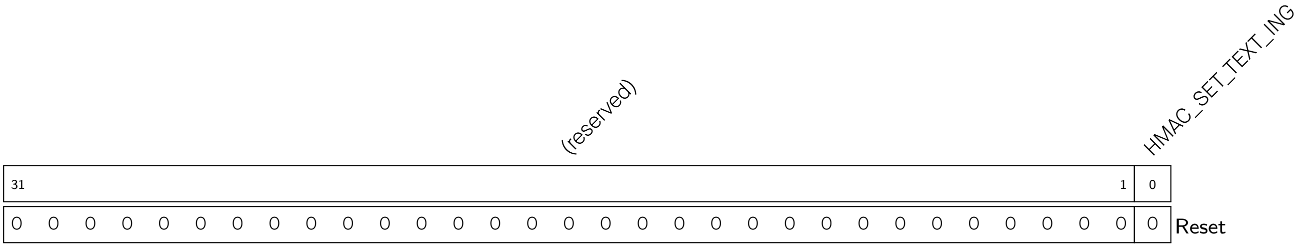
HMAC_SET_PARA_END Set this bit to finish HMAC configuration. (WO)

Register 21.3. HMAC_SET_MESSAGE_CALC_BLOCK_REG (0x0050)



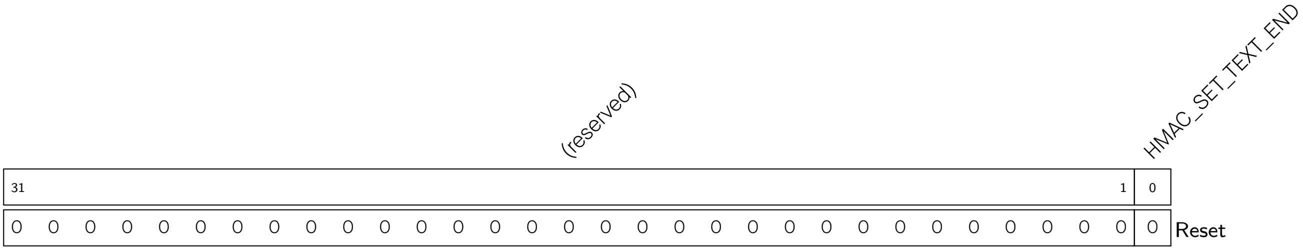
HMAC_SET_TEXT_ONE Call SHA to calculate one message block. (WO)

Register 21.4. HMAC_SET_MESSAGE_ING_REG (0x0054)



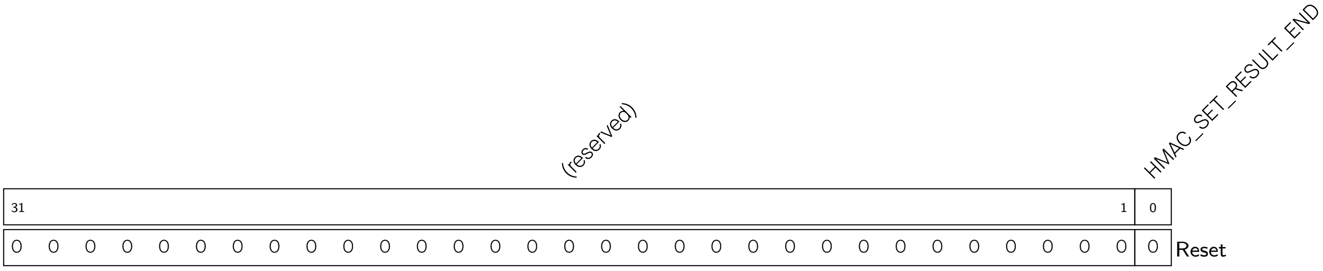
HMAC_SET_TEXT_ING Set this bit to show there are still some message blocks to be processed. (WO)

Register 21.5. HMAC_SET_MESSAGE_END_REG (0x0058)



HMAC_SET_TEXT_END Set this bit to start hardware padding. (WO)

Register 21.6. HMAC_SET_RESULT_FINISH_REG (0x005C)



HMAC_SET_RESULT_END Set this bit to exit upstream mode and clear calculation results. (WO)

Register 21.7. HMAC_SET_INVALIDATE_JTAG_REG (0x0060)

(reserved)	HMAC_SET_INVALIDATE_JTAG	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

HMAC_SET_INVALIDATE_JTAG Set this bit to clear calculation results when re-enabling JTAG in downstream mode. (WO)

Register 21.8. HMAC_SET_INVALIDATE_DS_REG (0x0064)

(reserved)	HMAC_SET_INVALIDATE_DS	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

HMAC_SET_INVALIDATE_DS Set this bit to clear calculation results of the DS module in downstream mode. (WO)

Register 21.9. HMAC_QUERY_ERROR_REG (0x0068)

(reserved)	HMAC_QUREY_CHECK	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

HMAC_QUREY_CHECK Indicates whether an HMAC key matches the purpose.(RO)

- 0: HMAC key and purpose match.
- 1: error.

Register 21.10. HMAC_QUERY_BUSY_REG (0x006C)

(reserved)	HMAC_BUSY_STATE	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

HMAC_BUSY_STATE Indicates whether HMAC is in busy state. Before configuring HMAC, please make sure HMAC is in IDLE state. (RO)

- 0: idle.
- 1: HMAC is still working on calculation.

Register 21.11. HMAC_SET_PARA_PURPOSE_REG (0x0044)

(reserved)	HMAC_PURPOSE_SET	
31 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

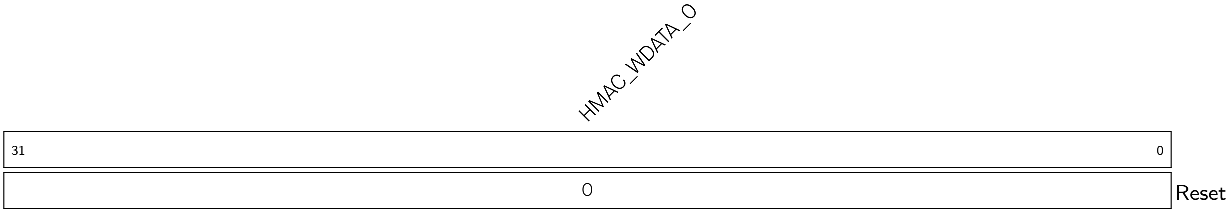
HMAC_PURPOSE_SET Determines the HMAC purpose, refer to the Table 21-1. (WO)

Register 21.12. HMAC_SET_PARA_KEY_REG (0x0048)

(reserved)	HMAC_KEY_SET	
31 3	2 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

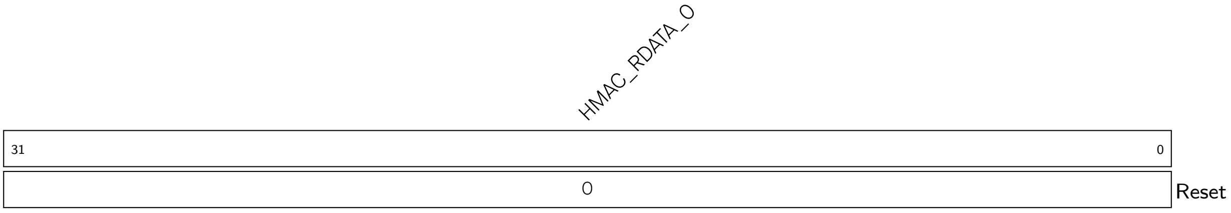
HMAC_KEY_SET Selects HMAC key. There are six keys with index 0~5. Write the index of the selected key to this field. (WO)

Register 21.13. HMAC_WR_MESSAGE_*n*_REG (*n*: 0-15) (0x0080+4**n*)



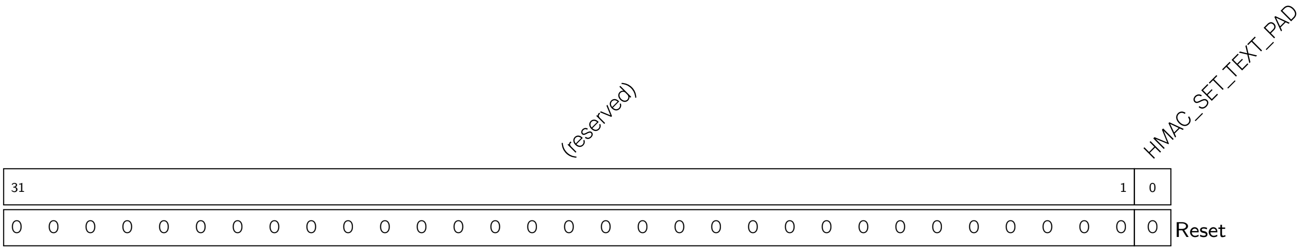
HMAC_WDATA_*n* Store the *n*th 32-bit of message. (WO)

Register 21.14. HMAC_RD_RESULT_*n*_REG (*n*: 0-7) (0x00C0+4**n*)



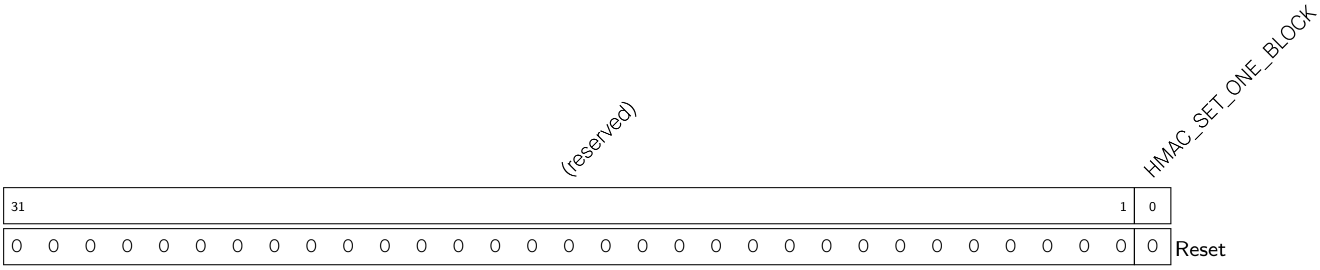
HMAC_RDATA_*n* Read the *n*th 32-bit of hash result. (RO)

Register 21.15. HMAC_SET_MESSAGE_PAD_REG (0x00F0)



HMAC_SET_TEXT_PAD Set this bit to indicate that padding is applied by software. (WO)

Register 21.16. HMAC_ONE_BLOCK_REG (0x00F4)



HMAC_SET_ONE_BLOCK Set this bit when there is only one block which already contins padding bits. (WO)

Register 21.17. HMAC_SOFT_JTAG_CTRL_REG (0x00F8)

(reserved)		HMAC_SOFT_JTAG_CTRL	
31	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0	Reset

HMAC_SOFT_JTAG_CTRL Set this bit to enable JTAG authentication mode. (WO)

Register 21.18. HMAC_WR_JTAG_REG (0x00FC)

HMAC_WR_JTAG		
31	0	
x		Reset

HMAC_WR_JTAG Set this field to re-enable the JTAG comparing input register. (WO)

Register 21.19. HMAC_DATE_REG (0x00F8)

(reserved)		HMAC_DATE		
31	30	29	0	
0	0	0x20200618		Reset

HMAC_DATE Version control register. (R/W)

22 Digital Signature (DS)

22.1 Overview

A Digital Signature is used to verify the authenticity and integrity of a message using a cryptographic algorithm. This can be used to validate a device's identity to a server, or to check the integrity of a message.

The ESP32-C3 includes a Digital Signature (DS) module providing hardware acceleration of messages' signatures based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as an input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by users while calculating the signature.

22.2 Features

- RSA digital signatures with key length up to 3072 bits
- Encrypted private key data, only decryptable by DS module
- SHA-256 digest to protect private key data against tampering by an attacker

22.3 Functional Description

22.3.1 Overview

The DS peripheral calculates RSA signature as $Z = X^Y \bmod M$ where Z is the signature, X is the input message, and Y and M are the RSA private key parameters.

Private key parameters are stored in flash as ciphertext. They are decrypted using a key (DS_KEY) which can only be calculated by the DS peripheral via the HMAC peripheral. The required inputs $(HMAC\_KEY)$ to generate the key are only stored in eFuse and can only be accessed by the HMAC peripheral. That is to say, the DS peripheral hardware can decrypt the private key, and the private key in plaintext is never accessed by the software. For more detailed information about eFuse and HMAC peripherals, please refer to Chapter 4 *eFuse Controller (EFUSE)* and 21 *HMAC Accelerator (HMAC)* peripheral.

The input message X will be sent directly to the DS peripheral by the software each time a signature is needed. After the RSA signature operation, the signature Z is read back by the software.

For better understanding, we define some symbols and functions here, which are only applicable to this chapter:

- 1^s A bit string consist of s bits with the value of "1".
- $[x]_s$ A bit string of s bits, in which s should be an integer multiple of 8 bits. If x is a number ($x < 2^s$), it is represented in little endian byte order in the bit string. x may be a variable such as $[Y]_{4096}$ or as a hexadecimal constant such as $[0x0C]_8$. If necessary, the value $[x]_t$ can be right-padded with $(s-t)$ number of 0 to reach s bits in length, and finally get $[x]_s$. For example, $[0x05]_8 = 00000101$, $[0x05]_{16} = 0000010100000000$, $[0x0005]_{16} = 0000000000000101$, $[0x13]_8 = 00010011$, $[0x13]_{16} = 0001001100000000$, $[0x0013]_{16} = 0000000000010011$.
- $||$ A bit string concatenation operator for joining multiple bit strings into a longer bit string.

22.3.2 Private Key Operands

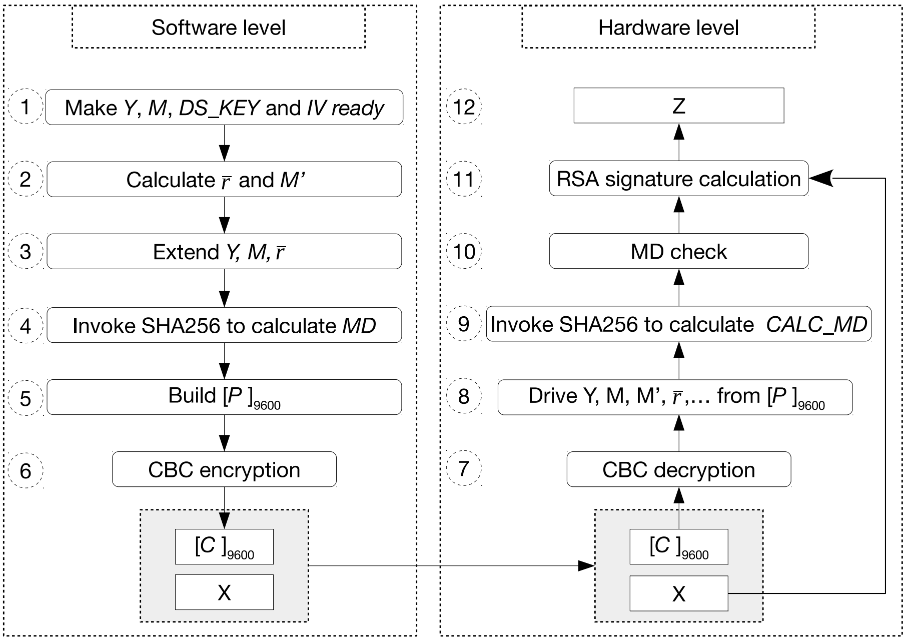
Private key operands Y (private key exponent) and M (key modulus) are generated by you. They have a particular RSA key length (up to 3072 bits). Two additional private key operands are needed: $\bar{r}$ and M'. These two operands are derived from Y and M.

Operands Y, M, $\bar{r}$ and M' are encrypted by you along with an authentication digest and stored as a single ciphertext C. C is input to the DS peripheral in this encrypted format, decrypted by the hardware, and then used for RSA signature calculation. Detailed description of how to generate C is provided in Section 22.3.3.

The DS peripheral supports RSA signature calculation $Z = X^Y \bmod M$, in which the length of operands should be $N = 32 \times x$ where $x \in \{1, 2, 3, \ldots, 96\}$. The bit lengths of arguments Z, X, Y, M and $\bar{r}$ should be an arbitrary value in N, and all of them in a calculation must be of the same length, while the bit length of M' should always be 32. For more detailed information about RSA calculation, please refer to Section 20.3.1 *Large Number Modular Exponentiation* in Chapter *20 RSA Accelerator (RSA)*.

22.3.3 Software Prerequisites

If users want to use the DS module for digital signature, the software and hardware must work closely to implement this successfully, and the software needs to do a series of preparations, as shown in Figure 22-1. The left side lists preparations required by the software before the hardware starts RSA signature calculation, while the right side lists the hardware workflow during the entire calculation procedure.



Software level
1
Make *Y*, *M*, *DS_KEY* and *IV ready*

Figure 22-1. Software Preparations and Hardware Working Process

Note:

1. The software preparation (left side in the Figure 22-1) is a one-time operation before any signature is calculated, while the hardware calculation (right side in the Figure 22-1) repeats for every signature calculation.

You need to follow the steps shown in the left part of Figure 22-1 to calculate C. Detailed instructions are as follows:

- **Step 1:** Prepare operands Y and M whose lengths should meet the requirements in Section 22.3.2. Define $[L]_{32} = \frac{N}{32}$ (i.e., for RSA 3072, $[L]_{32}$ == [0x60]$_{32}$). Prepare $[HMAC\_KEY]_{256}$ and calculate $[DS\_KEY]_{256}$ based on DS_KEY = HMAC-SHA256 ($[HMAC\_KEY]_{256}$, 1^{256}). Generate a random $[IV]_{128}$ which should meet the requirements of the AES-CBC block encryption algorithm. For more information on AES, please refer to Chapter 19 *AES Accelerator (AES)*.
- **Step 2:** Calculate $\overline{r}$ and M' based on M.
- **Step 3:** Extend Y, M and $\overline{r}$, in order to get $[Y]_{3072}$, $[M]_{3072}$ and $[\overline{r}]_{3072}$, respectively. This step is only required for Y, M and $\overline{r}$ whose length are less than 3072 bits, since their largest length are 3072 bits.
- **Step 4:** Calculate MD authentication code using the SHA-256:
  $[MD]_{256}$ = SHA256 ($[Y]_{3072}||[M]_{3072}||[\overline{r}]_{3072}||[M']_{32}||[L]_{32}||[IV]_{128}$)
- **Step 5:** Build $[P]_{9600}$ = ($[Y]_{3072}||[M]_{3072}||[\overline{r}]_{3072}||[Box]_{384}$), where $[Box]_{384}$ = ($[MD]_{256}||[M']_{32}||[L]_{32}||[\beta]_{64}$) and $[\beta]_{64}$ is a PKCS#7 padding value, i.e., a [0x0808080808080808]$_{64}$ string composed of 8 bytes (0x80). The purpose of $[\beta]_{64}$ is to make the bit length of P a multiple of 128.
- **Step 6:** Calculate C = $[C]_{9600}$ = AES-CBC-ENC ($[P]_{9600}$, $[DS\_KEY]_{256}$, $[IV]_{128}$), where C is the ciphertext with a length of 1200 bytes. C can also be calculated as C = $[C]_{9600}$ = ($[\widehat{Y}]_{3072}||[\widehat{M}]_{3072}||[\widehat{\overline{r}}]_{3072}||[\widehat{Box}]_{384}$), where $[\widehat{Y}]_{3072}$, $[\widehat{M}]_{3072}$, $[\widehat{\overline{r}}]_{3072}$, $[\widehat{Box}]_{384}$ are the four sub-parameters of C, and correspond to the ciphertext of $[Y]_{3072}$, $[M]_{3072}$, $[\overline{r}]_{3072}$, $[Box]_{384}$ respectively.

22.3.4 DS Operation at the Hardware Level

The hardware operation is triggered each time a digital signature needs to be calculated. The inputs are the pre-generated private key ciphertext C, a unique message X, and IV.

The DS operation at the hardware level can be divided into the following three stages:

1. **Decryption: Step 7 and 8 in Figure 22-1**

   The decryption process is the inverse of Step 6 in figure 22-1. The DS module will call AES accelerator to decrypt C in CBC block mode and get the resulted plaintext. The decryption process can be represented by P = AES-CBC-DEC (C, DS_KEY, IV), where IV (i.e., $[IV]_{128}$) is defined by you. $[DS\_KEY]_{256}$ is provided by HMAC module, derived from $HMAC\_KEY$ stored in eFuse. $[DS\_KEY]_{256}$, as well as $[HMAC\_KEY]_{256}$ are not readable by users.

   With P, the DS module can derive $[Y]_{3072}$, $[M]_{3072}$, $[\overline{r}]_{3072}$, $[M']_{32}$, $[L]_{32}$, MD authentication code, and the padding value $[\beta]_{64}$. This process is the inverse of Step 5.

2. **Check: Step 9 and 10 in Figure 22-1**

   The DS module will perform two checks: MD check and padding check. Padding check is not shown in Figure 22-1, as it happens at the same time with MD check.

   - MD check: The DS module calls SHA-256 to calculate the hash value $[CALC\_MD]_{256}$ (i.e., step 4). Then, $[CALC\_MD]_{256}$ is compared against the MD authentication code $[MD]_{256}$ from step 4. Only when the two match does the MD check pass.
   - Padding check: The DS module checks if $[\beta]_{64}$ complies with the aforementioned PKCS#7 format. Only when $[\beta]_{64}$ complies with the format does the padding check pass.

The DS module will only perform subsequent operations if MD check passes. If padding check fails, a warning message is generated, but it does not affect the subsequent operations.

3. **Calculation: Step 11 and 12 in Figure 22-1**

   The DS module treats X (input by you) and Y, M, $\overline{r}$ (compiled) as big numbers. With M', all operands to perform X^Y mod M are in place. The operand length is defined by L only. The DS module will get the signed result Z by calling RSA to perform $Z = X^Y$ mod M.

22.3.5 DS Operation at the Software Level

The software steps below should be followed each time a digital signature needs to be calculated. The inputs are the pre-generated private key ciphertext C, a unique message X, and IV. These software steps trigger the hardware steps described in Section 22.3.4.

We assume that the software has called the HMAC peripheral and HMAC on the hardware has calculated DS_KEY based on $HMAC\_KEY$.

1. **Prerequisites**: Prepare operands C, X, IV according to Section 22.3.3.
2. **Activate the DS peripheral**: Write 1 to DS_SET_START_REG.
3. **Check if DS_KEY is ready**: Poll DS_QUERY_BUSY_REG until the software reads 0.

   If the software does not read 0 in DS_QUERY_BUSY_REG after approximately 1 ms, it indicates a problem with HMAC initialization. In such a case, the software can read register DS_QUERY_KEY_WRONG_REG to get more information:

   - If the software reads 0 in DS_QUERY_KEY_WRONG_REG, it indicates that the HMAC peripheral has not been called.
   - If the software reads any value from 1 to 15 in DS_QUERY_KEY_WRONG_REG, it indicates that HMAC was called, but the DS module did not successfully get the DS_KEY value from the HMAC peripheral. This may indicate that the HMAC operation has been interrupted due to a software concurrency problem.

4. **Configure register**: Write IV block to register DS_IV_*m*_REG (*m*: 0 ~ 3). For more information on the IV block, please refer to Chapter 19 *AES Accelerator (AES)*.
5. **Write X to memory block DS_X_MEM**: Write X_i $(i \in \{0, 1, \ldots, n-1\})$, where $n = \frac{N}{32}$, to memory block DS_X_MEM whose capacity is 96 words. Each word can store one base-b digit. The memory block uses the little endian format for storage, i.e., the least significant digit of the operand is in the lowest address. Words in DS_X_MEM block after the configured length of X (N bits, as described in Section 22.3.2), are ignored.
6. **Write C to corresponding memory blocks**: Write the four sub-parameters of C to corresponding memory blocks:

   - Write $\widehat{Y_i}$ $(i \in \{0, 1, \ldots, 95\})$ to DS_Y_MEM.
   - Write $\widehat{M_i}$ $(i \in \{0, 1, \ldots, 95\})$ to DS_M_MEM.
   - Write $\widehat{\overline{r}_i}$ $(i \in \{0, 1, \ldots, 95\})$ to DS_RB_MEM.
   - write $\widehat{Box_i}$ $(i \in \{0, 1, \ldots, 11\})$ to DS_BOX_MEM.

The capacity of DS_Y_MEM, DS_M_MEM, and DS_RB_MEM is 96 words, whereas the capacity of DS_BOX_MEM is only 12 words. Each word can store one base-b digit. The memory blocks use the little endian format for storage, i.e., the least significant digit of the operand is in the lowest address.

7. **Start DS operation**: Write 1 to register DS_SET_ME_REG.
8. **Wait for the operation to be completed**: Poll register DS_QUERY_BUSY_REG until the software reads 0.
9. **Query check result**: Read register DS_QUERY_CHECK_REG and conduct subsequent operations as illustrated below based on the return value:
   - If the value is 0, it indicates that both padding check and MD check pass. You can continue to get the signed result Z.
   - If the value is 1, it indicates that the padding check passes but MD check fails. The signed result Z is invalid. The operation will resume directly from Step 11.
   - If the value is 2, it indicates that the padding check fails but MD check passes. You can continue to get the signed result Z. But please note that the data does not comply with the aforementioned PKCS#7 padding format, which may not be what you want.
   - If the value is 3, it indicates that both padding check and MD check fail. In this case, some fatal errors have occurred and the signed result Z is invalid. The operation will resume directly from Step 11.
10. **Read the signed result**: Read the signed result Z_i $(i \in \{0, 1, \ldots, n-1\})$, where $n = \frac{N}{32}$, from memory block DS_Z_MEM. The memory block stores Z in little-endian byte order.
11. **Exit the operation**: Write 1 to DS_SET_FINISH_REG, and then poll DS_QUERY_BUSY_REG until the software reads 0.

After the operation, all the input/output registers and memory blocks are cleared.

22.4 Memory Summary

The addresses in this section are relative to the Digital Signature base address provided in Table 3-3 in Chapter *3 System and Memory*.

Name	Description	Size (byte)	Starting Address	Ending Address	Access
DS_Y_MEM	Memory block Y	384	0x0000	0x017F	WO
DS_M_MEM	Memory block M	384	0x0200	0x037F	WO
DS_RB_MEM	Memory block $\overline{r}$	384	0x0400	0x057F	WO
DS_BOX_MEM	Memory block Box	48	0x0600	0x062F	WO
DS_X_MEM	Memory block X	384	0x0800	0x097F	WO
DS_Z_MEM	Memory block Z	384	0x0A00	0x0B7F	RO

22.5 Register Summary

The addresses in this section are relative to Digital Signature base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
DS_IV_0_REG	IV block data	0x0630	WO
DS_IV_1_REG	IV block data	0x0634	WO
DS_IV_2_REG	IV block data	0x0638	WO
DS_IV_3_REG	IV block data	0x063C	WO
Status/Control Registers			
DS_SET_START_REG	Activates the DS module	0x0E00	WO
DS_SET_ME_REG	Starts DS operation	0x0E04	WO
DS_SET_FINISH_REG	Ends DS operation	0x0E08	WO
DS_QUERY_BUSY_REG	Status of the DS module	0x0E0C	RO
DS_QUERY_KEY_WRONG_REG	Checks the reason why DS_KEY is not ready	0x0E10	RO
DS_QUERY_CHECK_REG	Queries DS check result	0x0814	RO
Version control register			
DS_DATE_REG	Version control register	0x0820	W/R

22.6 Registers

The addresses in this section are relative to Digital Signature base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 22.1. DS_IV_*m*_REG (*m*: 0-3) (0x0630+4**m*)

DS_IV_*m*_REG (*m*: 0-3)	
31 0	
0x000000000	Reset

DS_IV_*m*_REG (*m*: 0-3) IV block data. (WO)

Register 22.2. DS_SET_START_REG (0x0E00)

(reserved)	DS_SET_START	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

DS_SET_START Write 1 to this register to activate the DS peripheral. (WO)

Register 22.3. DS_SET_ME_REG (0x0E04)

(reserved)	DS_SET_ME	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

DS_SET_ME Write 1 to this register to start DS operation. (WO)

Register 22.4. DS_SET_FINISH_REG (0x0E08)

(reserved)	DS_SET_FINISH	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

DS_SET_FINISH Write 1 to this register to end DS operation. (WO)

Register 22.5. DS_QUERY_BUSY_REG (0x0E0C)

(reserved)	DS_QUERY_BUSY	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

DS_QUERY_BUSY 1: The DS module is busy; 0: The DS module is idle. (RO)

Register 22.6. DS_QUERY_KEY_WRONG_REG (0x0E10)

(reserved)	DS_QUERY_KEY_WRONG	
31 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

DS_QUERY_KEY_WRONG 1-15: HMAC was activated, but the DS peripheral did not successfully receive the DS_KEY from the HMAC peripheral. (The biggest value is 15); 0: HMAC is not called. (RO)

Register 22.7. DS_QUERY_CHECK_REG (0x0E14)

(reserved)	DS_PADDING_BAD	DS_MD_ERROR	
31 2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

DS_PADDING_BAD 1: The padding check fails; 0: The padding check passes. (RO)

DS_MD_ERROR 1: The MD check fails; 0: The MD check passes. (RO)

Register 22.8. DS_DATE_REG (0x0E20)

(reserved)	DS_DATE	
31 30	29 0	
0 0	0x20200618	Reset

DS_DATE Version control register. (R/W)

23 External Memory Encryption and Decryption (XTS_AES)

23.1 Overview

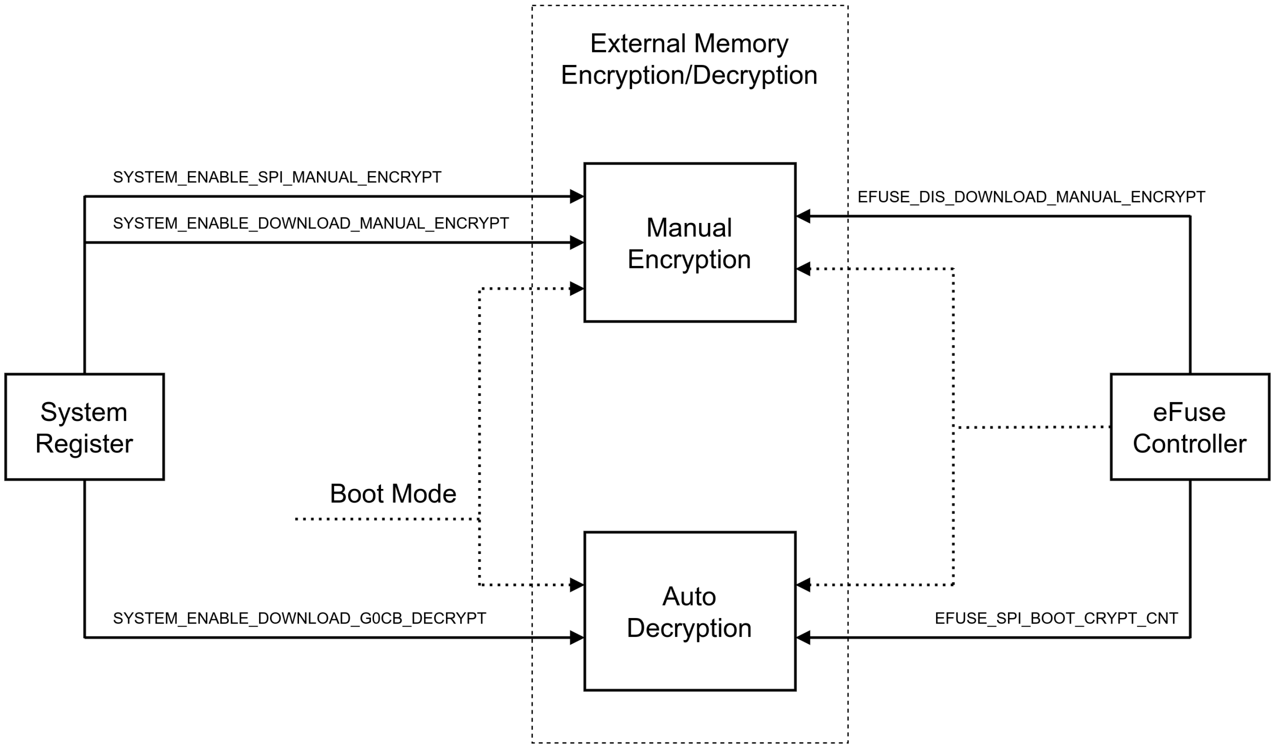
The ESP32-C3 integrates an External Memory Encryption and Decryption module that complies with the XTS_AES standard algorithm specified in IEEE Std 1619-2007, providing security for users' application code and data stored in the external memory (flash). Users can store proprietary firmware and sensitive data (e.g., credentials for gaining access to a private network) to the external flash.

23.2 Features

- General XTS_AES algorithm, compliant with IEEE Std 1619-2007
- Software-based manual encryption
- High-speed auto decryption, without software's participation
- Encryption and decryption functions jointly determined by registers configuration, eFuse parameters, and boot mode

23.3 Module Structure

The External Memory Encryption and Decryption module consists of two blocks, namely the Manual Encryption block and Auto Decryption block. The module architecture is shown in Figure 23-1.



External Memory
Encryption/Decryption
SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT
SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT
Manual
Encryption
EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT
System
Register
eFuse
Controller
Boot Mode
SYSTEM_ENABLE_DOWNLOAD_G0CB_DECRYPT
Auto
Decryption
EFUSE_SPI_BOOT_CRYPT_CNT

Figure 23-1. Architecture of the External Memory Encryption and Decryption

The Manual Encryption block can encrypt instructions/data which will then be written to the external flash as ciphertext via SPI1.

In the System Registers (SYSREG) peripheral (see 16 *System Registers (SYSREG)*), the following four bits in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG are relevant to the external memory encryption and decryption:

- SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT
- SYSTEM_ENABLE_DOWNLOAD_G0CB_DECRYPT
- SYSTEM_ENABLE_DOWNLOAD_DB_ENCRYPT
- SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT

The XTS_AES module also fetches two parameters from the peripheral eFuse Controller, which are: EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT and EFUSE_SPI_BOOT_CRYPT_CNT. For detailed information, please see 4 *eFuse Controller (EFUSE)*.

23.4 Functional Description

23.4.1 XTS Algorithm

The manual encryption and auto decryption use the XTS algorithm. During implementation, the XTS algorithm is characterized by a "data unit" of 1024 bits, defined in the Section *XTS-AES encryption procedure* of *XTS-AES Tweakable Block Cipher* Standard. For more information about XTS-AES algorithm, please refer to IEEE Std 1619-2007.

23.4.2 Key

The Manual Encryption block and Auto Decryption block share the same Key when implementing XTS algorithm. The Key is provided by the eFuse hardware and cannot be accessed by users.

The Key is 256-bit long. The value of the Key is determined by the content in one eFuse block from BLOCK4 ~ BLOCK9. For easier description, we define:

- Block$_A$: the block whose key purpose is EFUSE_KEY_PURPOSE_XTS_AES_128_KEY (please refer to Table 4-2 *Secure Key Purpose Values*). The 256-bit Key_A is stored in it.

There are two possibilities of how the Key is generated depending on whether Block$_A$ exists or not, as shown in Table 23-1. In each case, the Key can be uniquely determined by Block$_A$.

Table 23-1. Key generated based on Key_A

Block$_A$	Key	Key Length (bit)
Yes	Key_A	256
No	0^{256}	256

Notes:
"YES" indicates that the block exists; "NO" indicates that the block does not exist; "0^{256}" indicates a bit string that consists of 256-bit zeros. Note that using 0^{256} as Key is not secure. We strongly recommend to configure a valid key.

For more information of key purposes, please refer to Table 4-2 *Secure Key Purpose Values* in Chapter 4 *eFuse Controller (EFUSE)*.

23.4.3 Target Memory Space

The target memory space refers to a continuous address space in the external memory (flash) where the ciphertext is stored. The target memory space can be uniquely determined by two relevant parameters: size and base address, whose definitions are listed below.

- Size: the $size$ of the target memory space, indicating the number of bytes encrypted in one encryption operation, which supports 16 or 32 bytes.
- Base address: the $base\_addr$ of the target memory space. It is a 24-bit physical address, with range of 0x0000_0000 ~ 0x00FF_FFFF. It should be aligned to $size$, i.e., $base\_addr\%size == 0$.

For example, if there are 16 bytes of instruction data need to be encrypted and written to address 0x130 ~ 0x13F in the external flash, then the target space is 0x130 ~ 0x13F, size is 16 (bytes), and base address is 0x130.

The encryption of any length (must be multiples of 16 bytes) of plaintext instruction/data can be completed separately in multiple operations, and each operation has its individual target memory space and the relevant parameters.

For Auto Decryption blocks, these parameters are automatically determined by hardware. For Manual Encryption blocks, these parameters should be configured by users.

Note:

> The "tweak" defined in Section *Data units and tweaks* of IEEE Std 1619-2007 is a 128-bit non-negative integer ($tweak$), which can be generated according to $tweak$ = ($base\_addr$ & 0x00FFFF80). The lowest 7 bits and the highest 97 bits in $tweak$ are always zero.

23.4.4 Data Writing

For Auto Decryption blocks, data writing is automatically applied in hardware. For Manual Encryption blocks, data writing should be applied by users. The Manual Encryption block has a register block which consists of 8 registers, i.e., XTS_AES_PLAIN_*n*_REG (*n*: 0 ~ 7), that are dedicated to data writing and can store up to 256 bits of plaintext at a time.

Actually, the Manual Encryption block does not care where the plaintext comes from, but only where the ciphertext will be stored. Because of the strict correspondence between plaintext and ciphertext, in order to better describe how the plaintext is stored in the register block, we assume that the plaintext is stored in the target memory space in the first place and replaced by ciphertext after encryption. Therefore, the following description no longer has the concept of "plaintext", but uses "target memory space" instead. Please note that the plaintext can come from everywhere in actual use, but users should understand how the plaintext is stored in the register block.

How mapping between target memory space and registers works:

Assume a word in the target memory space is stored in $address$, define $offset = address\%32$, n = $\frac{offset}{4}$, then the word will be stored in register XTS_AES_PLAIN_n_REG.

The mapping between $offset$ and registers is shown in Table 23-2.

Table 23-2. Mapping Between Offsets and Registers

$offset$	Register	$offset$	Register
0x00	XTS_AES_PLAIN_0_REG	0x10	XTS_AES_PLAIN_4_REG
0x04	XTS_AES_PLAIN_1_REG	0x14	XTS_AES_PLAIN_5_REG
0x08	XTS_AES_PLAIN_2_REG	0x18	XTS_AES_PLAIN_6_REG
0x0C	XTS_AES_PLAIN_3_REG	0x1C	XTS_AES_PLAIN_7_REG

23.4.5 Manual Encryption Block

The Manual Encryption block is a peripheral module. It is equipped with registers and can be accessed by the CPU directly. Registers embedded in this block, the System Registers (SYSREG) peripheral, eFuse parameters, and boot mode jointly configure and use this module. Please note that the Manual Encryption block can only encrypt for storage in external flash.

The Manual Encryption block is operational only under certain conditions. The operating conditions are:

- In SPI Boot mode

  If bit SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG is 1, the Manual Encryption block can be enabled. Otherwise, it is not operational.

- In Download Boot mode

  If bit SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG is 1 and the eFuse parameter EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT is 0, the Manual Encryption block can be enabled. Otherwise, it is not operational.

Note:

- Even though the CPU can skip cache and get the encrypted instruction/data directly by reading the external memory, users can by no means access Key.

23.4.6 Auto Decryption Block

The Auto Decryption block is not a conventional peripheral, so it does not have any registers and cannot be accessed by the CPU directly. The System Registers (SYSREG) peripheral, eFuse parameters, and boot mode jointly configure and use this block.

The Auto Decryption block is operational only under certain conditions. The operating conditions are:

- In SPI Boot mode

  If the first bit or the third bit in parameter SPI_BOOT_CRYPT_CNT (3 bits) is set to 1, then the Auto Decryption block can be enabled. Otherwise, it is not operational.

- In Download Boot mode

  If bit SYSTEM_ENABLE_DOWNLOAD_G0CB_DECRYPT in register

SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG is 1, the Auto Decryption block can be enabled. Otherwise, it is not operational.

Note:

- When the Auto Decryption block is enabled, it will automatically decrypt the ciphertext if the CPU reads instructions/data from the external memory via cache to retrieve the instructions/data. The entire decryption process does not need software participation and is transparent to the cache. Users can by no means obtain the decryption Key during the process.
- When the Auto Decryption block is disabled, it does not have any effect on the contents stored in the external memory, no matter if they are encrypted or not. Therefore, what the CPU reads via cache is the original information stored in the external memory.

23.5 Software Process

When the Manual Encryption block operates, software needs to be involved in the process. The steps are as follows:

1. Configure XTS_AES:
   - Set register XTS_AES_PHYSICAL_ADDRESS_REG to $base\_addr$.
   - Set register XTS_AES_LINESIZE_REG to $\frac{size}{32}$.

   For definitions of $base\_addr$ and $size$, please refer to Section 23.4.3.
2. Write plaintext data to the registers block XTS_AES_PLAIN_*n*_REG (*n*: 0-7). For detailed information, please refer to Section 23.4.4.
   Please write data to registers according to your actual needs, and the unused ones could be set to arbitrary values.
3. Wait for Manual Encryption block to be idle. Poll register XTS_AES_STATE_REG until it reads 0 that indicates the Manual Encryption block is idle.
4. Trigger manual encryption by writing 1 to register XTS_AES_TRIGGER_REG.
5. Wait for the encryption process completion. Poll register XTS_AES_STATE_REG until it reads 2.
   Step 1 to 5 are the steps of encrypting plaintext instructions with the Manual Encryption block using the Key.
6. Write 1 to register XTS_AES_RELEASE_REG to grant SPI1 the access to the encrypted ciphertext. After this, the value of register XTS_AES_STATE_REG will become 3.
7. Call SPI1 to write the ciphertext in the external flash (see Chapter *27 SPI Controller (SPI)*).
8. Write 1 to register
   XTS_AES_DESTROY_REG to destroy the ciphertext. After this, the value of register XTS_AES_STATE_REG will become 0.

Repeat above steps according to the amount of plaintext instructions/data that need to be encrypted.

23.6 Register Summary

The addresses in this section are relative to External Memory Encryption and Decryption base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Plaintext Register Heap			
XTS_AES_PLAIN_0_REG	Plaintext register 0	0x0000	R/W
XTS_AES_PLAIN_1_REG	Plaintext register 1	0x0004	R/W
XTS_AES_PLAIN_2_REG	Plaintext register 2	0x0008	R/W
XTS_AES_PLAIN_3_REG	Plaintext register 3	0x000C	R/W
XTS_AES_PLAIN_4_REG	Plaintext register 4	0x0010	R/W
XTS_AES_PLAIN_5_REG	Plaintext register 5	0x0014	R/W
XTS_AES_PLAIN_6_REG	Plaintext register 6	0x0018	R/W
XTS_AES_PLAIN_7_REG	Plaintext register 7	0x001C	R/W
Configuration Registers			
XTS_AES_LINESIZE_REG	Configures the size of target memory space	0x0040	R/W
XTS_AES_DESTINATION_REG	Configures the type of the external memory	0x0044	R/W
XTS_AES_PHYSICAL_ADDRESS_REG	Physical address	0x0048	R/W
Control/Status Registers			
XTS_AES_TRIGGER_REG	Activates AES algorithm	0x004C	WO
XTS_AES_RELEASE_REG	Release control	0x0050	WO
XTS_AES_DESTROY_REG	Destroys control	0x0054	WO
XTS_AES_STATE_REG	Status register	0x0058	RO
Version Register			
XTS_AES_DATE_REG	Version control register	0x005C	RO

23.7 Registers

The addresses in this section are relative to External Memory Encryption and Decryption base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 23.1. XTS_AES_PLAIN_*n*_REG (*n*: 0-15) (0x0000+4**n*)

XTS_AES_PLAIN_*n*	
31 … 0	
0x000000	Reset

XTS_AES_PLAIN_*n* Stores *n*th 32-bit piece of plain text. (R/W)

Register 23.2. XTS_AES_LINESIZE_REG (0x0040)

(reserved)	XTS_AES_LINESIZE	
31 … 1	0	
0x00000000	0	Reset

XTS_AES_LINESIZE Configures the data size of one encryption operation.

- 0: 16 bytes;
- 1: 32 bytes. (R/W)

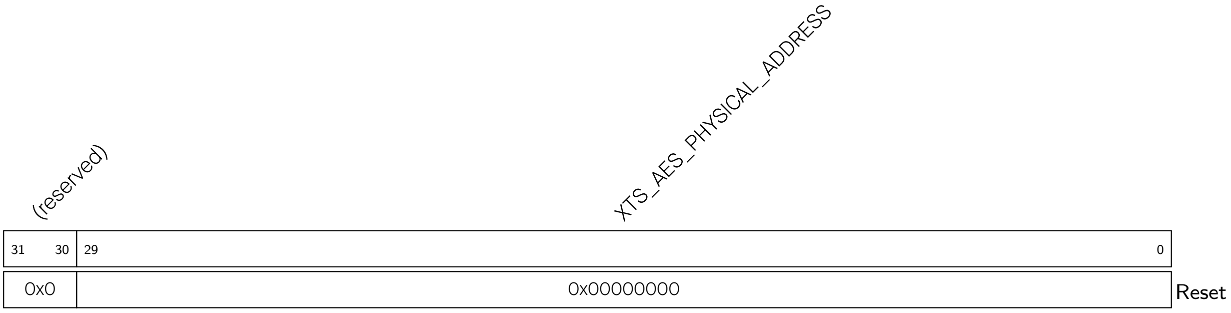
Register 23.3. XTS_AES_DESTINATION_REG (0x0044)

(reserved)	XTS_AES_DESTINATION	
31 … 1	0	
0x00000000	0	Reset

XTS_AES_DESTINATION Configures the type of the external memory. Currently, it must be set to 0, as the Manual Encryption block only supports flash encryption. Errors may occur if users write 1.

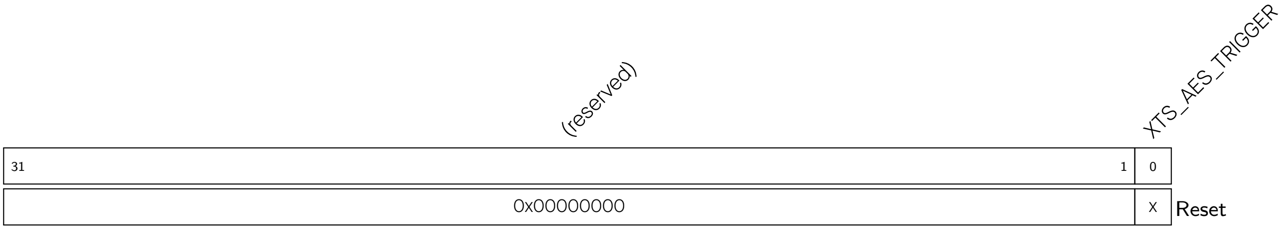
- 0: flash;
- 1: external RAM. (R/W)

Register 23.4. XTS_AES_PHYSICAL_ADDRESS_REG (0x0048)



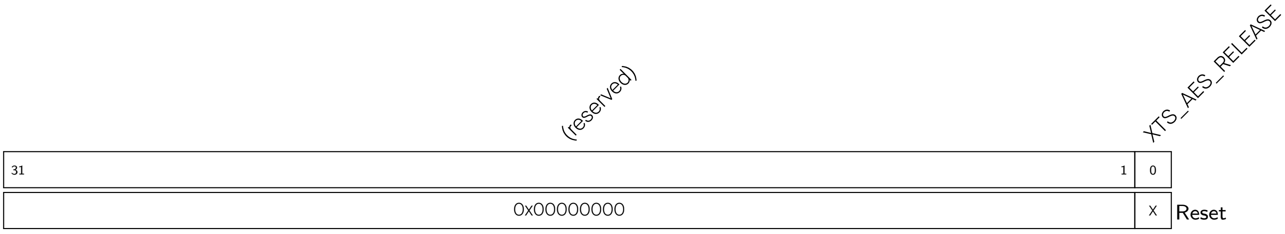
XTS_AES_PHYSICAL_ADDRESS Physical address. (Note that its value should be within the range between 0x0000_0000 and 0x00FF_FFFF). (R/W)

Register 23.5. XTS_AES_TRIGGER_REG (0x004C)



XTS_AES_TRIGGER Write 1 to enable manual encryption. (WO)

Register 23.6. XTS_AES_RELEASE_REG (0x0050)



XTS_AES_RELEASE Write 1 to grant SPI1 access to the encrypted result. (WO)

Register 23.7. XTS_AES_DESTROY_REG (0x0054)

(reserved)	XTS_AES_DESTROY	
31 1	0	
0x00000000	x	Reset

XTS_AES_DESTROY Write 1 to destroy encrypted result. (WO)

Register 23.8. XTS_AES_STATE_REG (0x0058)

(reserved)	XTS_AES_STATE	
31 2	1 0	
0x00000000	0x0	Reset

XTS_AES_STATE Indicates the status of the Manual Encryption block.

- 0x0 (XTS_AES_IDLE): idle;
- 0x1 (XTS_AES_BUSY): busy with encryption;
- 0x2 (XTS_AES_DONE): encryption is completed, but the encrypted result is not accessible to SPI;
- 0x3 (XTS_AES_RELEASE): encrypted result is accessible to SPI. (RO)

Register 23.9. XTS_AES_DATE_REG (0x005C)

(reserved)	XTS_AES_DATE	
31 30	29 0	
0 0	0x20200111	Reset

XTS_AES_DATE Version control register. (R/W)

24 Clock Glitch Detection

24.1 Overview

The Clock Glitch Detection module on ESP32-C3 detects glitches in external crystal XTAL_CLK signals, and generates a system reset signal when detecting glitches to reset the whole digital circuit including RTC. By doing so, it prevents attackers from injecting glitches on external crystal XTAL_CLK clock to compromise ESP32-C3 and thus strengthens chip security.

24.2 Functional Description

24.2.1 Clock Glitch Detection

The Clock Glitch Detection module on ESP32-C3 monitors input clock signals from XTAL_CLK. If it detects a glitch, namely a clock pulse (a or b in the figure below) with a width shorter than 3 ns, input clock signals from XTAL_CLK are blocked.

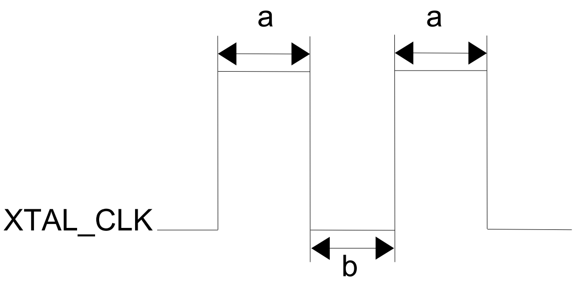


Figure 24-1. XTAL_CLK Pulse Width

24.2.2 Reset

Once detecting a glitch on XTAL_CLK that affects the circuit's normal operation, the Clock Glitch Detection module triggers a system reset if RTC_CNTL_GLITCH_RST_EN bit is enabled. By default, this bit is set to enable a reset.

25 Random Number Generator (RNG)

25.1 Introduction

The ESP32-C3 contains a true random number generator, which generates 32-bit random numbers that can be used for cryptographical operations, among other things.

25.2 Features

The random number generator in ESP32-C3 generates true random numbers, which means random number generated from a physical process, rather than by means of an algorithm. No number generated within the specified range is more or less likely to appear than any other number.

25.3 Functional Description

Every 32-bit value that the system reads from the RNG_DATA_REG register of the random number generator is a true random number. These true random numbers are generated based on the **thermal noise** in the system and the **asynchronous clock mismatch**.

- **Thermal noise** comes from the high-speed ADC or SAR ADC or both. Whenever the high-speed ADC or SAR ADC is enabled, bit streams will be generated and fed into the random number generator through an XOR logic gate as random seeds.
- RC_FAST_CLK is an **asynchronous clock** source and it increases the RNG entropy by introducing circuit metastability.

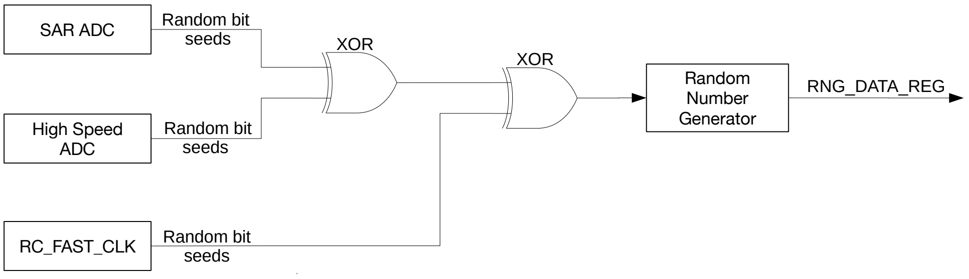

Figure 25-1. Noise Source

When there is noise coming from the SAR ADC, the random number generator is fed with a 2-bit entropy in one clock cycle of RC_FAST_CLK (20 MHz), which is generated from an internal RC oscillator (see Chapter 6 *Reset and Clock* for details). Thus, it is advisable to read the RNG_DATA_REG register at a maximum rate of 1 MHz to obtain the maximum entropy.

When there is noise coming from the high-speed ADC, the random number generator is fed with a 2-bit entropy in one APB clock cycle, which is normally 80 MHz. Thus, it is advisable to read the RNG_DATA_REG register at a maximum rate of 5 MHz to obtain the maximum entropy.

A data sample of 2 GB, which is read from the random number generator at a rate of 5 MHz with only the high-speed ADC being enabled, has been tested using the Dieharder Random Number Testsuite (version 3.31.1). The sample passed all tests.

25.4 Programming Procedure

When using the random number generator, make sure at least either the SAR ADC, high-speed ADC[1], or RC_FAST_CLK[2] is enabled. Otherwise, pseudo-random numbers will be returned.

- SAR ADC can be enabled by using the DIG ADC controller. For details, please refer to Chapter 34 *On-Chip Sensor and Analog Signal Processing*.
- High-speed ADC is enabled automatically when the Wi-Fi or Bluetooth modules is enabled.
- RC_FAST_CLK is enabled by setting the RTC_CNTL_DIG_FOSC_EN bit in the RTC_CNTL_CLK_CONF_REG register.

Note:

1. Note that, when the Wi-Fi module is enabled, the value read from the high-speed ADC can be saturated in some extreme cases, which lowers the entropy. Thus, it is advisable to also enable the SAR ADC as the noise source for the random number generator for such cases.
2. Enabling RC_FAST_CLK increases the RNG entropy. However, to ensure maximum entropy, it's recommended to always enable an ADC source as well.

When using the random number generator, read the RNG_DATA_REG register multiple times until sufficient random numbers have been generated. Ensure the rate at which the register is read does not exceed the frequencies described in section 25.3 above.

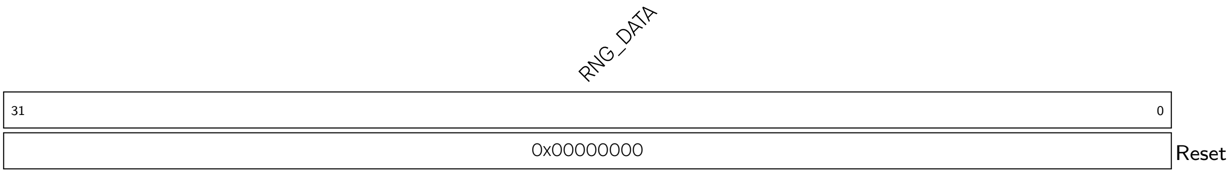
25.5 Register Summary

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
RNG_DATA_REG	Random number data	0x6002_60B0	RO

25.6 Register

Register 25.1. RNG_DATA_REG (0x6002_60B0)



RNG_DATA Random number source. (RO)

26 UART Controller (UART)

26.1 Overview

In embedded system applications, data is required to be transferred in a simple way with minimal system resources. This can be achieved by a Universal Asynchronous Receiver/Transmitter (UART), which flexibly exchanges data with other peripheral devices in full-duplex mode. ESP32-C3 has two UART controllers compatible with various UART devices. They support Infrared Data Association (IrDA) and RS485 transmission.

Each of the two UART controllers has a group of registers that function identically. In this chapter, the two UART controllers are referred to as UART*n*, in which *n* denotes 0 or 1.

A UART is a character-oriented data link for asynchronous communication between devices. Such communication does not add clock signals to the data sent. Therefore, in order to communicate successfully, the transmitter and the receiver must operate at the same baud rate with the same stop bit(s) and parity bit.

A UART data frame usually begins with one start bit, followed by data bits, one parity bit (optional) and one or more stop bits. UART controllers on ESP32-C3 support various lengths of data bits and stop bits. These controllers also support software and hardware flow control as well as GDMA for seamless high-speed data transfer. This allows developers to use multiple UART ports at minimal software cost.

26.2 Features

Each UART controller has the following features:

- Three clock sources that can be divided
- Programmable baud rate
- 512 x 8-bit RAM shared by TX FIFOs and RX FIFOs of the two UART controllers
- Full-duplex asynchronous communication
- Automatic baud rate detection of input signals
- Data bits ranging from 5 to 8
- Stop bits whose length can be 1, 1.5 or 2 bits
- Parity bit
- Special character AT_CMD detection
- RS485 protocol
- IrDA protocol
- High-speed data communication using GDMA
- UART as wake-up source
- Software and hardware flow control

26.3 UART Structure

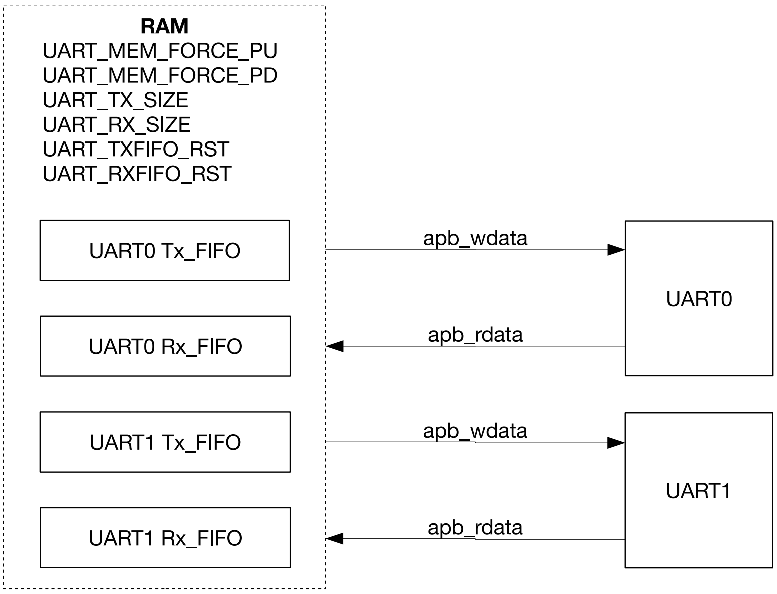


Figure 26-1. UART Architecture Overview

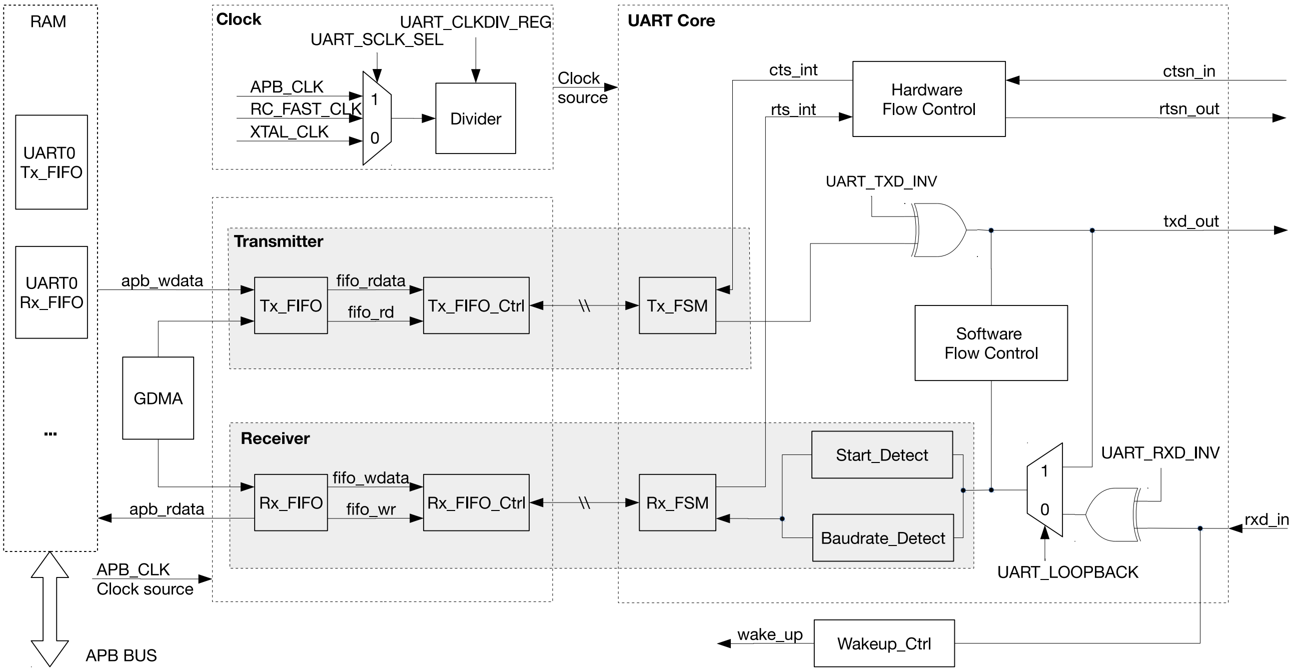

Figure 26-2. UART Structure

Figure 26-2 shows the basic structure of a UART controller. A UART controller works in two clock domains, namely APB_CLK domain and Core Clock domain (the UART Core's clock domain). The UART Core has three clock sources: a 80 MHz APB_CLK, RC_FAST_CLK and external crystal clock XTAL_CLK (for details, please refer to Chapter 6 *Reset and Clock*), which are selected by configuring UART_SCLK_SEL. The selected clock source is divided by a divider to generate clock signals that drive the UART Core. The divisor is configured by UART_CLKDIV_REG: UART_CLKDIV for the integral part, and UART_CLKDIV_FRAG for the fractional part.

A UART controller is broken down into two parts according to functions: a transmitter and a receiver.

The transmitter contains a TX FIFO, which buffers data to be sent. Software can write data to Tx_FIFO via the APB bus, or move data to Tx_FIFO using GDMA. Tx_FIFO_Ctrl controls writing and reading Tx_FIFO. When Tx_FIFO is not empty, Tx_FSM reads data bits in the data frame via Tx_FIFO_Ctrl, and converts them into a bitstream. The levels of output signal txd_out can be inverted by configuring the UART_TXD_INV field.

The receiver contains a RX FIFO, which buffers data to be processed. The levels of input signal rxd_in can be inverted by configuring UART_RXD_INV field. Baudrate_Detect measures the baud rate of input signal rxd_in by detecting its minimum pulse width. Start_Detect detects the start bit in a data frame. If the start bit is detected, Rx_FSM stores data bits in the data frame into Rx_FIFO by Rx_FIFO_Ctrl. Software can read data from Rx_FIFO via the APB bus, or receive data using GDMA.

HW_Flow_Ctrl controls rxd_in and txd_out data flows by standard UART RTS and CTS flow control signals (rtsn_out and ctsn_in). SW_Flow_Ctrl controls data flows by automatically adding special characters to outgoing data and detecting special characters in incoming data. When a UART controller is Light-sleep mode (see Chapter 9 *Low-power Management* for more details), Wakeup_Ctrl counts up rising edges of rxd_in. When the number is equal to or greater than (UART_ACTIVE_THRESHOLD + 3), a wake_up signal is generated and sent to RTC, which then wakes up the ESP32-C3 chip.

26.4 Functional Description

26.4.1 Clock and Reset

UART controllers are asynchronous. Their register configuration module, TX FIFO and RX FIFO are in APB_CLK domain, while the UART Core that controls transmission and reception is in Core Clock domain. The three clock sources of the UART core, namely APB_CLK, RC_FAST_CLK and external crystal clock XTAL_CLK, are selected by configuring UART_SCLK_SEL. The selected clock source is divided by a divider. This divider supports fractional frequency division: UART_SCLK_DIV_NUM field is the integral part, UART_SCLK_DIV_B field is the numerator of the fractional part, and UART_SCLK_DIV_A is the denominator of the fractional part. The divisor ranges from 1 ~ 256.

When the frequency of the UART Core's clock is higher than the frequency needed to generate the baud rate, the UART Core can be clocked at a lower frequency by the divider, in order to reduce power consumption. Usually, the UART Core's clock frequency is lower than the APB_CLK's frequency, and can be divided by the largest divisor value when higher than the frequency needed to generate the baud rate. The frequency of the UART Core's clock can also be at most twice higher than the APB_CLK. The clock for the UART transmitter and the UART receiver can be controlled independently. To enable the clock for the UART transmitter, UART_TX_SCLK_EN shall be set; to enable the clock for the UART receiver, UART_RX_SCLK_EN shall be set.

To ensure that the configured register values are synchronized from APB_CLK domain to Core Clock domain, please follow procedures in Section26.5.

To reset the whole UART, please:

- enable the clock for UART RAM by setting SYSTEM_UART_MEM_CLK_EN to 1;
- enable APB_CLK for UART*n* by setting SYSTEM_UART*n*_CLK_EN to 1
- clear SYSTEM_UART*n*_RST to 0;
- write 1 to UART_RST_CORE;

- write 1 to SYSTEM_UART*n*_RST;
- clear SYSTEM_UART*n*_RST to 0;
- clear UART_RST_CORE to 0.

Note that it is not recommended to reset the APB clock domain module or UART Core only.

26.4.2 UART RAM

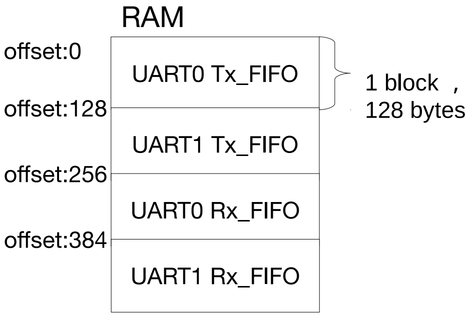

Figure 26-3. UART Controllers Sharing RAM

The two UART controllers on ESP32-C3 share 512 × 8 bits of FIFO RAM. As Figure 26-3 illustrates, RAM is divided into 4 blocks, each has 128 × 8 bits. Figure 26-3 shows how many RAM blocks are allocated to TX FIFOs and RX FIFOs of the two UART controllers by default. UART*n* Tx_FIFO can be expanded by configuring UART_TX_SIZE, while UART*n* Rx_FIFO can be expanded by configuring UART_RX_SIZE. Some limits are imposed:

- UART0 Tx_FIFO can be increased up to 4 blocks (the whole RAM);
- UART1 Tx_FIFO can be increased up to 3 blocks (from offset 128 to the end address);
- UART0 Rx_FIFO can be increased up to 2 blocks (from offset 256 to the end address);
- UART1 Rx_FIFO cannot be increased.

Please note that starting addresses of all FIFOs are fixed, so expanding one FIFO may take up the default space of other FIFOs. For example, by setting UART_TX_SIZE of UART0 to 2, the size of UART0 Tx_FIFO is increased by 128 bytes (from offset 0 to offset 255). In this case, UART0 Tx_FIFO takes up the default space for UART1 Tx_FIFO, and UART1's transmitting function cannot be used as a result.

When neither of the two UART controllers is active, RAM could enter low-power mode by setting UART_MEM_FORCE_PD.

UART0 Tx_FIFO and UART1 Tx_FIFO are reset by setting UART_TXFIFO_RST. UART0 Rx_FIFO and UART1 Rx_FIFO are reset by setting UART_RXFIFO_RST.

Data to be sent is written to TX FIFO via the APB bus or using GDMA, read automatically and converted from a frame into a bitstream by hardware Tx_FSM; data received is converted from a bitstream into a frame by hardware Rx_FSM, written into RX FIFO, and then stored into RAM via the APB bus or using GDMA. The two UART controllers share one GDMA channel.

The empty signal threshold for Tx_FIFO is configured by setting UART_TXFIFO_EMPTY_THRHD. When data stored in Tx_FIFO is less than UART_TXFIFO_EMPTY_THRHD, a UART_TXFIFO_EMPTY_INT interrupt is generated. The full signal threshold for Rx_FIFO is configured by setting UART_RXFIFO_FULL_THRHD. When data stored in Rx_FIFO is greater than UART_RXFIFO_FULL_THRHD, a UART_RXFIFO_FULL_INT interrupt is generated. In addition, when Rx_FIFO receives more data than its capacity, a UART_RXFIFO_OVF_INT interrupt is generated.

UART*n* can access FIFO via register UART_FIFO_REG. You can put data into TX FIFO by writing UART_RXFIFO_RD_BYTE, and get data in RX FIFO by reading UART_RXFIFO_RD_BYTE.

26.4.3 Baud Rate Generation and Detection

26.4.3.1 Baud Rate Generation

Before a UART controller sends or receives data, the baud rate should be configured by setting corresponding registers. The baud rate generator of a UART controller functions by dividing the input clock source. It can divide the clock source by a fractional amount. The divisor is configured by UART_CLKDIV_REG: UART_CLKDIV for the integral part, and UART_CLKDIV_FRAG for the fractional part. When using the 80 MHz input clock, the UART controller supports a maximum baud rate of 5 Mbaud.

The divisor of the baud rate divider is equal to

$$UART\_CLKDIV + \frac{UART\_CLKDIV\_FRAG}{16}$$

meaning that the final baud rate is equal to

$$\frac{INPUT\_FREQ}{UART\_CLKDIV + \frac{UART\_CLKDIV\_FRAG}{16}}$$

where INPUT_FREQ is the frequency of UART Core's source clock. For example, if UART_CLKDIV = 694 and UART_CLKDIV_FRAG = 7 then the divisor value is

$$694 + \frac{7}{16} = 694.4375$$

When UART_CLKDIV_FRAG is 0, the baud rate generator is an integer clock divider where an output pulse is generated every UART_CLKDIV input pulses.

When UART_CLKDIV_FRAG is not 0, the divider is fractional and the output baud rate clock pulses are not strictly uniform. As shown in Figure 26-4, for every 16 output pulses, the generator divides either (UART_CLKDIV + 1) input pulses or UART_CLKDIV input pulses per output pulse. A total of UART_CLKDIV_FRAG output pulses are generated by dividing (UART_CLKDIV + 1) input pulses, and the remaining (16 - UART_CLKDIV_FRAG) output pulses are generated by dividing UART_CLKDIV input pulses.

The output pulses are interleaved as shown in Figure 26-4 below, to make the output timing more uniform:

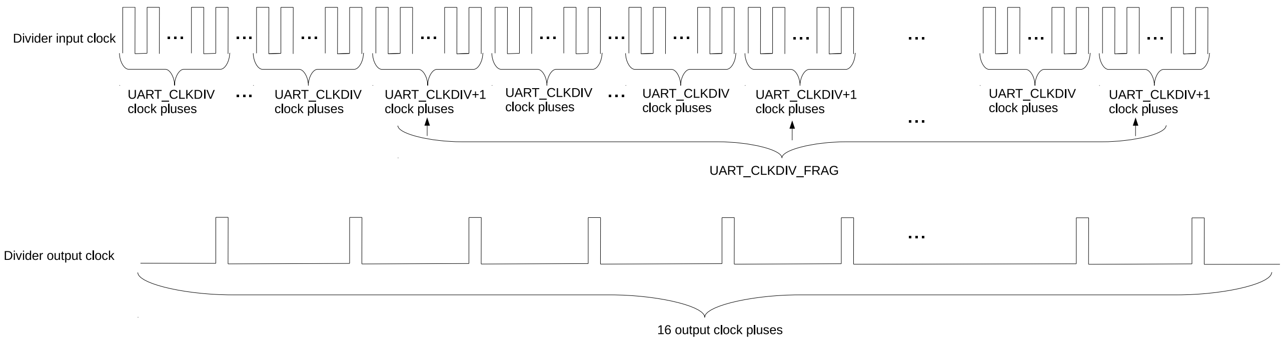

Figure 26-4. UART Controllers Division

To support IrDA (see Section 26.4.7 for details), the fractional clock divider for IrDA data transmission generates clock signals divided by 16 × UART_CLKDIV_REG. This divider works similarly as the one elaborated above: it takes UART_CLKDIV/16 as the integer value and the lowest four bits of UART_CLKDIV as the fractional value.

26.4.3.2 Baud Rate Detection

Automatic baud rate detection (Autobaud) on UARTs is enabled by setting UART_AUTOBAUD_EN. The Baudrate_Detect module shown in Figure 26-2 filters any noise whose pulse width is shorter than UART_GLITCH_FILT.

Before communication starts, the transmitter could send random data to the receiver for baud rate detection. UART_LOWPULSE_MIN_CNT stores the minimum low pulse width, UART_HIGHPULSE_MIN_CNT stores the minimum high pulse width, UART_POSEDGE_MIN_CNT stores the minimum pulse width between two rising edges, and UART_NEGEDGE_MIN_CNT stores the minimum pulse width between two falling edges. These four fields are read by software to determine the transmitter's baud rate.

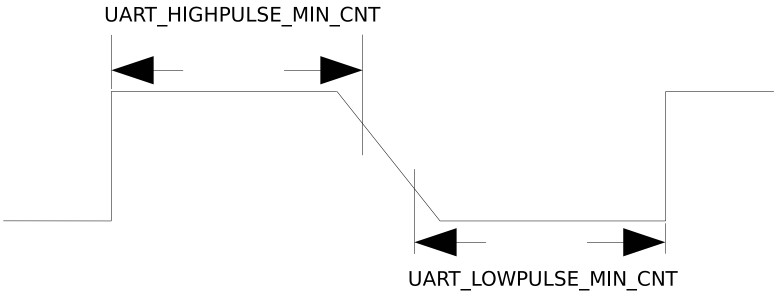

Figure 26-5. The Timing Diagram of Weak UART Signals Along Falling Edges

The baud rate can be determined in the following three ways:

1. Normally, to avoid sampling erroneous data along rising or falling edges in a metastable state, which results in the inaccuracy of UART_LOWPULSE_MIN_CNT or UART_HIGHPULSE_MIN_CNT, use a weighted average of these two values to eliminate errors. In this case, the baud rate is calculated as follows:

$$B_{\text{uart}} = \frac{f_{\text{clk}}}{(\text{UART\_LOWPULSE\_MIN\_CNT} + \text{UART\_HIGHPULSE\_MIN\_CNT} + 2)/2}$$

2. If UART signals are weak along falling edges as shown in Figure 26-5, which leads to an inaccurate average of UART_LOWPULSE_MIN_CNT and UART_HIGHPULSE_MIN_CNT, use UART_POSEDGE_MIN_CNT to determine the transmitter's baud rate as follows:

$$B_{\text{uart}} = \frac{f_{\text{clk}}}{(\text{UART\_POSEDGE\_MIN\_CNT} + 1)/2}$$

3. If UART signals are weak along rising edges, use UART_NEGEDGE_MIN_CNT to determine the transmitter's baud rate as follows:

$$B_{\text{uart}} = \frac{f_{\text{clk}}}{(\text{UART\_NEGEDGE\_MIN\_CNT} + 1)/2}$$

26.4.4 UART Data Frame

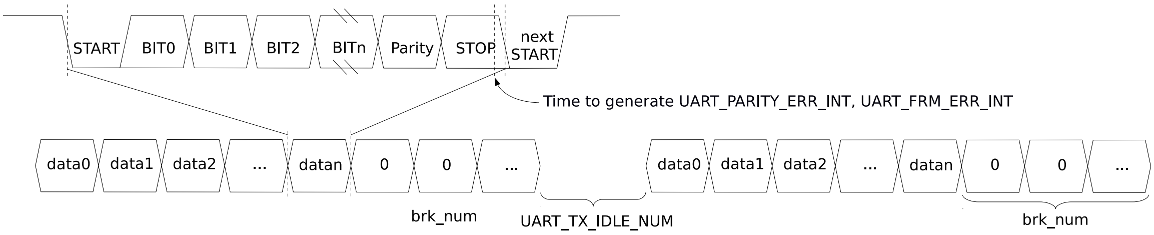

Figure 26-6. Structure of UART Data Frame

Figure 26-6 shows the basic structure of a data frame. A frame starts with one START bit, and ends with STOP bits which can be 1, 1.5, or 2 bits long, configured by UART_STOP_BIT_NUM (in RS485 mode turnaround delay may be added. See details in Section 26.4.6.2). The START bit is logical low, whereas STOP bits are logical high.

The actual data length can be anywhere between 5 ~ 8 bit, configured by UART_BIT_NUM. When UART_PARITY_EN is set, a parity bit is added after data bits. UART_PARITY is used to choose even parity or odd parity. When the receiver detects a parity bit error in the data received, a UART_PARITY_ERR_INT interrupt is generated, and the data received is still stored into RX FIFO. When the receiver detects a data frame error, a UART_FRM_ERR_INT interrupt is generated, and the data received by default is stored into RX FIFO.

If all data in Tx_FIFO has been sent, a UART_TX_DONE_INT interrupt is generated. After this, if the UART_TXD_BRK bit is set then the transmitter will enter the Break condition and send several NULL characters in which the TX data line is logical low. The number of NULL characters is configured by UART_TX_BRK_NUM. Once the transmitter has sent all NULL characters, a UART_TX_BRK_DONE_INT interrupt is generated. The minimum interval between data frames can be configured using UART_TX_IDLE_NUM. If the transmitter stays idle for UART_TX_IDLE_NUM or more time, a UART_TX_BRK_IDLE_DONE_INT interrupt is generated.

The receiver can also detect the Break conditions when the RX data line remains logical low for one NULL character transmission, and a UART_BRK_DET_INT interrupt will be triggered to detect that a Break condition has been completed.

The receiver can detect the current bus state through the timeout interrupt UART_RXFIFO_TOUT_INT. The UART_RXFIFO_TOUT_INT interrupt will be triggered when the bus is in the idle state for more than UART_RX_TOUT_THRHD bit time on current baud rate after the receiver has received at least one byte. You can use this interrupt to detect whether all the data from the transmitter has been sent.

26.4.5 AT_CMD Character Structure

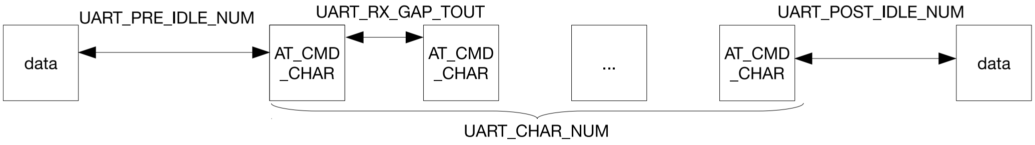

Figure 26-7. AT_CMD Character Structure

Figure 26-7 is the structure of a special character AT_CMD. If the receiver constantly receives AT_CMD_CHAR and the following conditions are met, a UART_AT_CMD_CHAR_DET_INT interrupt is generated.

- The interval between the first AT_CMD_CHAR and the last non-AT_CMD_CHAR character is at least UART _PRE_IDLE_NUM cycles.
- The interval between two AT_CMD_CHAR characters is less than UART_RX_GAP_TOUT cycles.
- The number of AT_CMD_CHAR characters is equal to or greater than UART_CHAR_NUM.
- The interval between the last AT_CMD_CHAR character and next non-AT_CMD_CHAR character is at least UART_POST_IDLE_NUM cycles.

26.4.6 RS485

The two UART controllers support RS485 protocol. This protocol uses differential signals to transmit data, so it can communicate over longer distances at higher bit rates than RS232. RS485 has two-wire half-duplex mode and four-wire full-duplex mode. UART controllers support two-wire half-duplex transmission and bus snooping. In a two-wire RS485 multidrop network, there can be 32 slaves at most.

26.4.6.1 Driver Control

As shown in Figure 26-8, in a two-wire multidrop network, an external RS485 transceiver is needed for differential to single-ended conversion. An RS485 transceiver contains a driver and a receiver. When a UART controller is not in transmitter mode, the connection to the differential line can be broken by disabling the driver. When DE is 1, the driver is enabled; when DE is 0, the driver is disabled.

The UART receiver converts differential signals to single-ended signals via an external receiver. RE is the enable control signal for the receiver. When RE is 0, the receiver is enabled; when RE is 1, the receiver is disabled. If RE is configured as 0, the UART controller is allowed to snoop data on the bus, including the data sent by itself.

DE can be controlled by either software or hardware. To reduce the cost of software, in our design DE is controlled by hardware. As shown in Figure 26-8, DE is connected to dtrn_out of UART (please refer to Section 26.4.9.1 for more details).

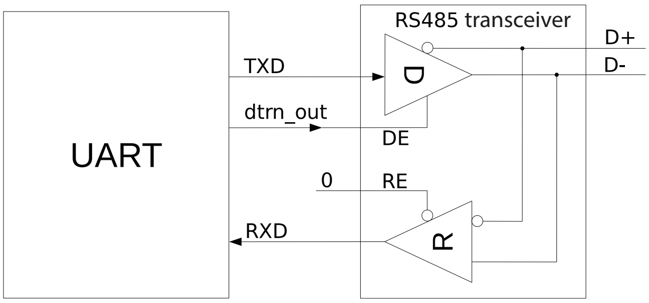

Figure 26-8. Driver Control Diagram in RS485 Mode

26.4.6.2 Turnaround Delay

By default, the two UART controllers work in receiver mode. When a UART controller is switched from transmitter mode to receiver mode, the RS485 protocol requires a turnaround delay of one cycle after the stop bit. The UART transmitter supports adding a turnaround delay of one cycle before the start bit or after the stop bit. When UART_DL0_EN is set, a turnaround delay of one cycle is added before the start bit; when UART_DL1_EN is set, a turnaround delay of one cycle is added after the stop bit.

26.4.6.3 Bus Snooping

In a two-wire multidrop network, UART controllers support bus snooping if RE of the external RS485 transceiver is 0. By default, a UART controller is not allowed to transmit and receive data simultaneously. If UART_RS485TX_RX_EN is set and the external RS485 transceiver is configured as in Figure 26-8, a UART controller may receive data in transmitter mode and snoop the bus. If UART_RS485RXBY_TX_EN is set, a UART controller may transmit data in receiver mode.

The two UART controllers can snoop the data sent by themselves. In transmitter mode, when a UART controller monitors a collision between the data sent and the data received, a UART_RS485_CLASH_INT is generated; when a UART controller monitors a data frame error, a UART_RS485_FRM_ERR_INT interrupt is generated; when a UART controller monitors a polarity error, a UART_RS485_PARITY_ERR_INT is generated.

26.4.7 IrDA

IrDA protocol consists of three layers, namely the physical layer, the link access protocol, and the link management protocol. The two UART controllers implement IrDA's physical layer. In IrDA encoding, a UART controller supports data rates up to 115.2 kbit/s (SIR, or serial infrared mode). As shown in Figure 26-9, the IrDA encoder converts a NRZ (non-return to zero code) signal to a RZI (return to zero inverted code) signal and sends it to the external driver and infrared LED. This encoder uses modulated signals whose pulse width is 3/16 bits to indicate logic "0", and low levels to indicate logic "1". The IrDA decoder receives signals from the infrared receiver and converts them to NRZ signals. In most cases, the receiver is high when it is idle, and the encoder output polarity is the opposite of the decoder input polarity. If a low pulse is detected, it indicates that a start bit has been received.

When IrDA function is enabled, one bit is divided into 16 clock cycles. If the bit to be sent is zero, then the 9th, 10th and 11th clock cycle are high.

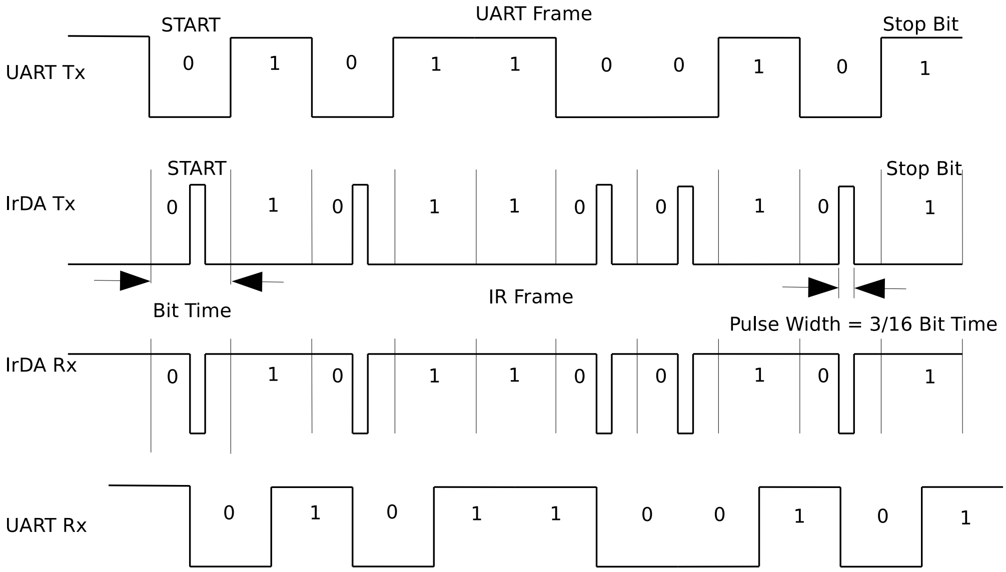

Figure 26-9. The Timing Diagram of Encoding and Decoding in SIR mode

The IrDA transceiver is half-duplex, meaning that it cannot send and receive data simultaneously. As shown in Figure 26-10, IrDA function is enabled by setting UART_IRDA_EN. When UART_IRDA_TX_EN is set (high), the IrDA transceiver is enabled to send data and not allowed to receive data; when UART_IRDA_TX_EN is reset (low), the IrDA transceiver is enabled to receive data and not allowed to send data.

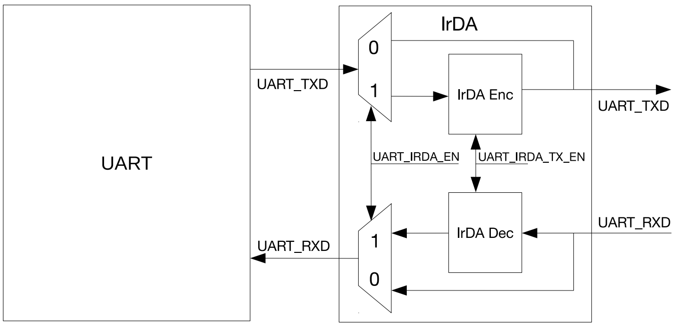

Figure 26-10. IrDA Encoding and Decoding Diagram

26.4.8 Wake-up

UART0 and UART1 can be set as wake-up source. When a UART controller is in Light-sleep mode, Wakeup_Ctrl counts up the rising edges of rxd_in. When the number of rising edges is is equal to or greater than (UART_ACTIVE_THRESHOLD + 3), a wake_up signal is generated and sent to RTC, which then wakes up ESP32-C3.

26.4.9 Flow Control

UART controllers have two ways to control data flow, namely hardware flow control and software flow control. Hardware flow control is achieved using output signal rtsn_out and input signal dsrn_in. Software flow control is achieved by inserting special characters in the data flow sent and detecting special characters in the data flow received.

26.4.9.1 Hardware Flow Control

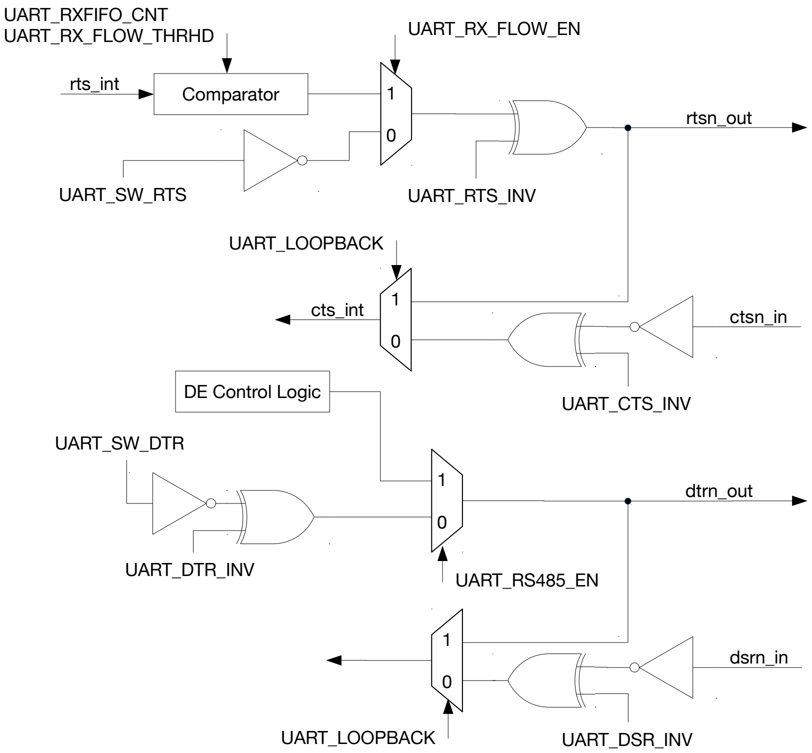

Figure 26-11. Hardware Flow Control Diagram

Figure 26-11 shows the hardware flow control of a UART controller. Hardware flow control uses output signal rtsn_out and input signal dsrn_in. Figure 26-12 illustrates how these signals are connected between UART on ESP32-C3 (hereinafter referred to as IU0) and the external UART (hereinafter referred to as EU0).

When rtsn_out of IU0 is low, EU0 is allowed to send data; when rtsn_out of IU0 is high, EU0 is notified to stop sending data until rtsn_out of IU0 returns to low. The output signal rtsn_out can be controlled in two ways.

- Software control: Enter this mode by clearing UART_RX_FLOW_EN to 0. In this mode, the level of rtsn_out is changed by configuring UART_SW_RTS.
- Hardware control: Enter this mode by setting UART_RX_FLOW_EN to 1. In this mode, rtsn_out is pulled high when data in Rx_FIFO exceeds UART_RX_FLOW_THRHD.

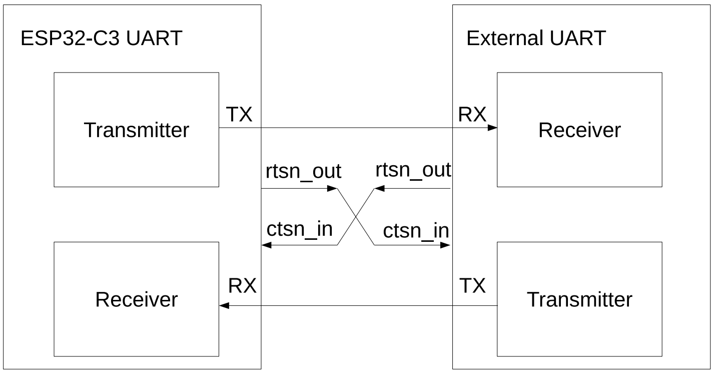

Figure 26-12. Connection between Hardware Flow Control Signals

When ctsn_in of IU0 is low, IU0 is allowed to send data; when ctsn_in is high, IU0 is not allowed to send data. When IU0 detects an edge change of ctsn_in, a UART_CTS_CHG_INT interrupt is generated.

If dtrn_out of IU0 is high, it indicates that IU0 is ready to transmit data. dtrn_out is generated by configuring the UART_SW_DTR field. When the IU0 transmitter detects a edge change of dsrn_in, a UART_DSR_CHG_INT interrupt is generated. After this interrupt is detected, software can obtain the level of input signal dsrn_in by reading UART_DSRN. If dsrn_in is high, it indicates that EU0 is ready to transmit data.

In a two-wire RS485 multidrop network enabled by setting UART_RS485_EN, dtrn_out is generated by hardware and used for transmit/receive turnaround. When data transmission starts, dtrn_out is pulled high and the external driver is enabled; when data transmission completes, dtrn_out is pulled low and the external driver is disabled. Please note that when there is a turnaround delay of one cycle added after the stop bit, dtrn_out is pulled low after the delay.

UART loopback test is enabled by setting UART_LOOPBACK. In the test, UART output signal txd_out is connected to its input signal rxd_in, rtsn_out is connected to ctsn_in, and dtrn_out is connected to dsrn_out. If the data sent matches the data received, it indicates that UART controllers are working properly.

26.4.9.2 Software Flow Control

Instead of CTS/RTS lines, software flow control uses XON/XOFF characters to start or stop data transmission. Such flow control is enabled by setting UART_SW_FLOW_CON_EN to 1.

When using software flow control, hardware automatically detects if there are XON/XOFF characters in the data flow received, and generate a UART_SW_XOFF_INT or a UART_SW_XON_INT interrupt accordingly. If an XOFF character is detected, the transmitter stops data transmission once the current byte has been transmitted; if an XON character is detected, the transmitter starts data transmission. In addition, software can force the transmitter to stop sending data by setting UART_FORCE_XOFF, or to start sending data by setting UART_FORCE_XON.

Software determines whether to insert flow control characters according to the remaining room in RX FIFO. When UART_SEND_XOFF is set, the transmitter sends an XOFF character configured by UART_XOFF_CHAR after the current byte in transmission; when UART_SEND_XON is set, the transmitter sends an XON character configured by UART_XON_CHAR after the current byte in transmission. If the RX FIFO of a UART controller stores more data than UART_XOFF_THRESHOLD, UART_SEND_XOFF is set by hardware. As a result, the transmitter sends an XOFF character configured by UART_XOFF_CHAR after the current byte in transmission. If the RX FIFO of a UART controller stores less data than UART_XON_THRESHOLD, UART_SEND_XON is set by hardware. As a result, the transmitter sends an XON character configured by UART_XON_CHAR after the current byte in transmission.

26.4.10 GDMA Mode

The two UART controllers on ESP32-C3 share one TX/RX GDMA (general direct memory access) channel via UHCI. In GDMA mode, UART controllers support the decoding and encoding of HCI data packets. The UHCI_UART*n*_CE field determines which UART controller occupies the GDMA TX/RX channel.

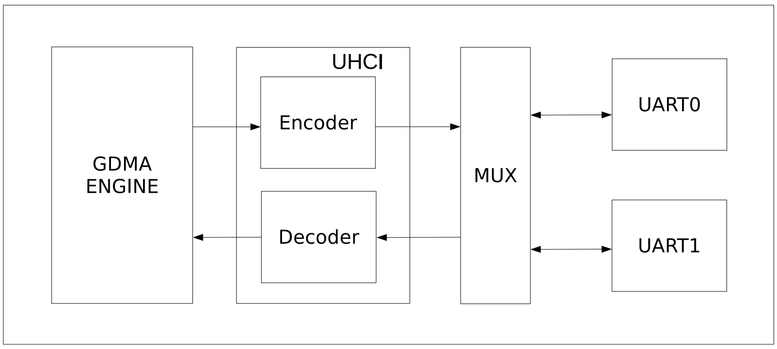

Figure 26-13. Data Transfer in GDMA Mode

Figure 26-13 shows how data is transferred using GDMA. Before GDMA receives data, software prepares an inlink. GDMA_INLINK_ADDR_CH*n* points to the first receive descriptor in the inlink. After GDMA_INLINK_START_CH*n* is set, UHCI sends data that UART has received to the decoder. The decoded data is then stored into the RAM pointed by the inlink under the control of GDMA.

Before GDMA sends data, software prepares an outlink and data to be sent. GDMA_OUTLINK_ADDR_CH*n* points to the first transmit descriptor in the outlink. After GDMA_OUTLINK_START_CH*n* is set, GDMA reads data from the RAM pointed by outlink. The data is then encoded by the encoder, and sent sequentially by the UART transmitter.

HCI data packets have separators at the beginning and the end, with data bits in the middle (separators + data bits + separators). The encoder inserts separators in front of and after data bits, and replaces data bits identical to separators with special characters. The decoder removes separators in front of and after data bits, and replaces special characters with separators. There can be more than one continuous separator at the beginning and the end of a data packet. The separator is configured by UHCI_SEPER_CHAR, 0xC0 by default. The special character is configured by UHCI_ESC_SEQ0_CHAR0 (0xDB by default) and UHCI_ESC_SEQ0_CHAR1 (0xDD by default). When all data has been sent, a GDMA_OUT_TOTAL_EOF_CH*n*_INT interrupt is generated. When all data has been received, a GDMA_IN_SUC_EOF_CH*n*_INT is generated.

26.4.11 UART Interrupts

- UART_AT_CMD_CHAR_DET_INT: Triggered when the receiver detects an AT_CMD character.
- UART_RS485_CLASH_INT: Triggered when a collision is detected between the transmitter and the receiver in RS485 mode.
- UART_RS485_FRM_ERR_INT: Triggered when an error is detected in the data frame sent by the transmitter in RS485 mode.

- UART_RS485_PARITY_ERR_INT: Triggered when an error is detected in the parity bit sent by the transmitter in RS485 mode.
- UART_TX_DONE_INT: Triggered when all data in the transmitter's TX FIFO has been sent.
- UART_TX_BRK_IDLE_DONE_INT: Triggered when the transmitter stays idle for the minimum interval (threshold) after sending the last data bit.
- UART_TX_BRK_DONE_INT: Triggered when the transmitter has sent all NULL characters after all data in TX FIFO had been sent.
- UART_GLITCH_DET_INT: Triggered when the receiver detects a glitch in the middle of the start bit.
- UART_SW_XOFF_INT: Triggered when UART_SW_FLOW_CON_EN is set and the receiver receives a XOFF character.
- UART_SW_XON_INT: Triggered when UART_SW_FLOW_CON_EN is set and the receiver receives a XON character.
- UART_RXFIFO_TOUT_INT: Triggered when the receiver takes more time than UART_RX_TOUT_THRHD to receive one byte.
- UART_BRK_DET_INT: Triggered when the receiver detects a NULL character (i.e. logic 0 for one NULL character transmission) after stop bits.
- UART_CTS_CHG_INT: Triggered when the receiver detects an edge change of CTSn signals.
- UART_DSR_CHG_INT: Triggered when the receiver detects an edge change of DSRn signals.
- UART_RXFIFO_OVF_INT: Triggered when the receiver receives more data than the capacity of RX FIFO.
- UART_FRM_ERR_INT: Triggered when the receiver detects a data frame error.
- UART_PARITY_ERR_INT: Triggered when the receiver detects a parity error.
- UART_TXFIFO_EMPTY_INT: Triggered when TX FIFO stores less data than what UART_TXFIFO_EMPTY_THRHD specifies.
- UART_RXFIFO_FULL_INT: Triggered when the receiver receives more data than what UART_RXFIFO_FULL_THRHD specifies.
- UART_WAKEUP_INT: Triggered when UART is woken up.

26.4.12 UHCI Interrupts

- UHCI_APP_CTRL1_INT: Triggered when software sets UHCI_APP_CTRL1_INT_RAW.
- UHCI_APP_CTRL0_INT: Triggered when software sets UHCI_APP_CTRL0_INT_RAW.
- UHCI_OUTLINK_EOF_ERR_INT: Triggered when an EOF error is detected in a transmit descriptor.
- UHCI_SEND_A_REG_Q_INT: Triggered when UHCI has sent a series of short packets using always_send.
- UHCI_SEND_S_REG_Q_INT: Triggered when UHCI has sent a series of short packets using single_send.
- UHCI_TX_HUNG_INT: Triggered when UHCI takes too long to read RAM using a GDMA transmit channel.
- UHCI_RX_HUNG_INT: Triggered when UHCI takes too long to receive data using a GDMA receive channel.
- UHCI_TX_START_INT: Triggered when GDMA detects a separator character.

- UHCI_RX_START_INT: Triggered when a separator character has been sent.

26.5 Programming Procedures

26.5.1 Register Type

All UART registers are in APB_CLK domain. According to whether clock domain crossing and synchronization are required, UART registers that can be configured by software are classified into three types, namely immediate registers, synchronous registers, and static registers. Immediate registers are read in APB_CLK domain, and take effect after configured via the APB bus. Synchronous registers are read in Core Clock domain, and take effect after synchronization. Static registers are also read in Core Clock domain, but would not change dynamically. Therefore, for static registers clock domain crossing is not required, and software can turn on and off the clock for the UART transmitter or receiver to ensure that the configuration sampled in Core Clock domain is correct.

26.5.1.1 Synchronous Registers

Read in Core Clock domain, synchronous registers implement the clock domain crossing design to ensure that their values sampled in Core Clock domain are correct. These registers as listed in Table 26-1 are configured as follows:

- Enable register synchronization by clearing UART_UPDATE_CTRL to 0;
- Wait for UART_REG_UPDATE to become 0, which indicates the completion of last synchronization;
- Configure synchronous registers;
- Synchronize the configured values to Core Clock domain by writting 1 to UART_REG_UPDATE.

Table 26-1. UART*n* Synchronous Registers

Register	Field
UART_CLKDIV_REG	UART_CLKDIV_FRAG[3:0]
	UART_CLKDIV[11:0]
UART_CONF0_REG	UART_AUTOBAUD_EN
	UART_ERR_WR_MASK
	UART_TXD_INV
	UART_RXD_INV
	UART_IRDA_EN
	UART_TX_FLOW_EN
	UART_LOOPBACK
	UART_IRDA_RX_INV

	UART_RS485TX_RX_EN
	UART_DL1_EN
	UART_DL0_EN
	UART_RS485_EN

26.5.1.2 Static Registers

Static registers, though also read in Core Clock domain, would not change dynamically when UART controllers are at work, so they do not implement the clock domain crossing design. These registers must be configured when the UART transmitter or receiver is not at work. In this case, software can turn off the clock for the UART transmitter or receiver, so that static registers are not sampled in their metastable state. When software turns on the clock, the configured values are stable to be correctly sampled. Static registers as listed in Table 26-2 are configured as follows:

- Turn off the clock for the UART transmitter by clearing UART_TX_SCLK_EN, or the clock for the UART receiver by clearing UART_RX_SCLK_EN, depending on which one (transmitter or receiver) is not at work;
- Configure static registers;
- Turn on the clock for the UART transmitter by writing 1 to UART_TX_SCLK_EN, or the clock for the UART receiver by writing 1 to UART_RX_SCLK_EN.

Table 26-2. UART*n* Static Registers

Register	Field

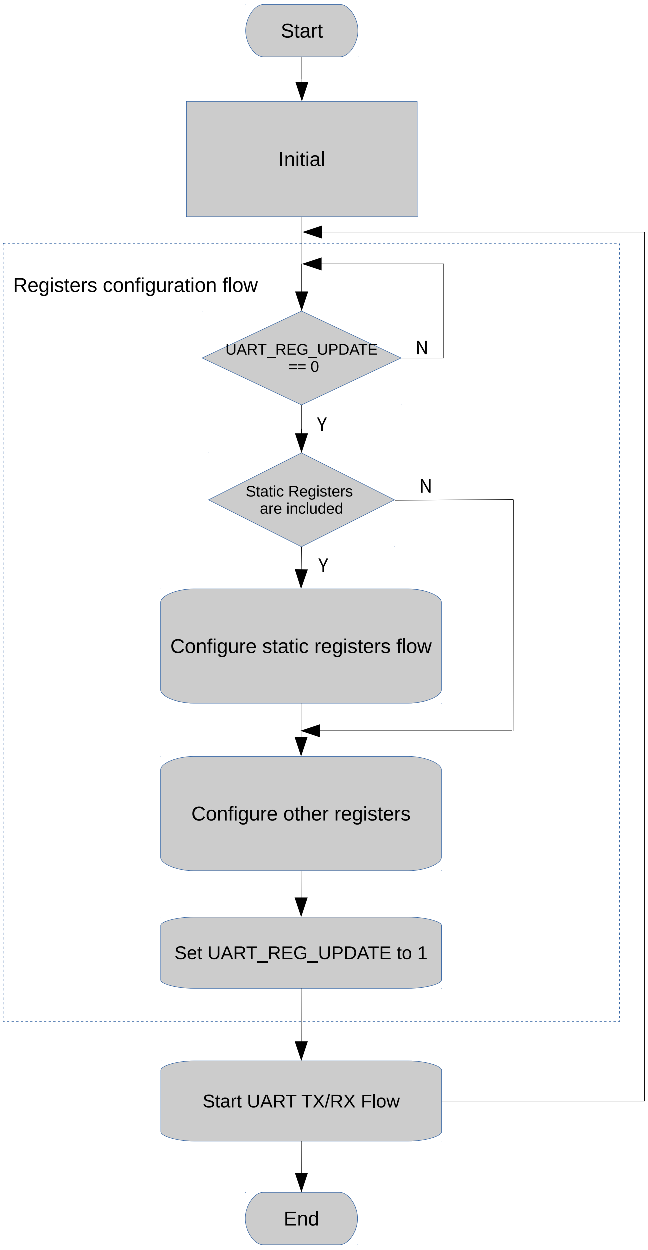
26.5.1.3 Immediate Registers

Except those listed in Table 26-1 and Table 26-2, registers that can be configured by software are immediate registers read in APB_CLK domain, such as interrupt and FIFO configuration registers.

26.5.2 Detailed Steps

Figure 26-14 illustrates the process to program UART controllers, namely initialize UART, configure registers, enable the UART transmitter or receiver, and finish data transmission.



Start

Configure static registers flow
Configure other registers
Set UART_REG_UPDATE to 1
Start UART TX/RX Flow
End

Figure 26-14. UART Programming Procedures

26.5.2.1 Initializing URAT*n*

To initialize URAT*n*:

- enable the clock for UART RAM by setting SYSTEM_UART_MEM_CLK_EN to 1;
- enable APB_CLK for UART*n* by setting SYSTEM_UART*n*_CLK_EN to 1;
- clear SYSTEM_UART*n*_RST;
- write 1 to UART_RST_CORE;
- write 1 to SYSTEM_UART*n*_RST;
- clear SYSTEM_UART*n*_RST;
- clear UART_RST_CORE;
- enable register synchronization by clearing UART_UPDATE_CTRL.

26.5.2.2 Configuring URAT*n* Communication

To configure URAT*n* communication:

- wait for UART_REG_UPDATE to become 0, which indicates the completion of the last synchronization;
- configure static registers (if any) following Section 26.5.1.2;
- select the clock source via UART_SCLK_SEL;
- configure divisor of the divider via UART_SCLK_DIV_NUM, UART_SCLK_DIV_A, and UART_SCLK_DIV_B;
- configure the baud rate for transmission via UART_CLKDIV and UART_CLKDIV_FRAG;
- configure data length via UART_BIT_NUM;
- configure odd or even parity check via UART_PARITY_EN and UART_PARITY;
- optional steps depending on application ...
- synchronize the configured values to the Core Clock domain by writing 1 to UART_REG_UPDATE.

26.5.2.3 Enabling UART*n*

To enable UART*n* transmitter:

- configure TX FIFO's empty threshold via UART_TXFIFO_EMPTY_THRHD;
- disable UART_TXFIFO_EMPTY_INT interrupt by clearing UART_TXFIFO_EMPTY_INT_ENA;
- write data to be sent to UART_RXFIFO_RD_BYTE;
- clear UART_TXFIFO_EMPTY_INT interrupt by setting UART_TXFIFO_EMPTY_INT_CLR;
- enable UART_TXFIFO_EMPTY_INT interrupt by setting UART_TXFIFO_EMPTY_INT_ENA;
- detect UART_TXFIFO_EMPTY_INT and wait for the completion of data transmission.

To enable UART*n* receiver:

- configure RX FIFO's full threshold via UART_RXFIFO_FULL_THRHD;
- enable UART_RXFIFO_FULL_INT interrupt by setting UART_RXFIFO_FULL_INT_ENA;

- detect UART_TXFIFO_FULL_INT and wait until the RX FIFO is full;
- read data from RX FIFO via UART_RXFIFO_RD_BYTE, and obtain the number of bytes received in RX FIFO via UART_RXFIFO_CNT.

26.6 Register Summary

The addresses in this section are relative to UART Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
FIFO Configuration			
UART_FIFO_REG	FIFO data register	0x0000	RO
UART_MEM_CONF_REG	UART threshold and allocation configuration	0x0060	R/W
UART Interrupt Register			
UART_INT_RAW_REG	Raw interrupt status	0x0004	R/WTC/SS
UART_INT_ST_REG	Masked interrupt status	0x0008	RO
UART_INT_ENA_REG	Interrupt enable bits	0x000C	R/W
UART_INT_CLR_REG	Interrupt clear bits	0x0010	WT
Configuration Register			
UART_CLKDIV_REG	Clock divider configuration	0x0014	R/W
UART_RX_FILT_REG	RX filter configuration	0x0018	R/W
UART_CONF0_REG	Configuration register 0	0x0020	R/W
UART_CONF1_REG	Configuration register 1	0x0024	R/W
UART_FLOW_CONF_REG	Software flow control configuration	0x0034	varies
UART_SLEEP_CONF_REG	Sleep mode configuration	0x0038	R/W
UART_SWFC_CONF0_REG	Software flow control character configuration	0x003C	R/W
UART_SWFC_CONF1_REG	Software flow control character configuration	0x0040	R/W
UART_TXBRK_CONF_REG	TX break character configuration	0x0044	R/W
UART_IDLE_CONF_REG	Frame end idle time configuration	0x0048	R/W
UART_RS485_CONF_REG	RS485 mode configuration	0x004C	R/W
UART_CLK_CONF_REG	UART core clock configuration	0x0078	R/W
Status Register			
UART_STATUS_REG	UART status register	0x001C	RO
UART_MEM_TX_STATUS_REG	TX FIFO write and read offset address	0x0064	RO
UART_MEM_RX_STATUS_REG	RX FIFO write and read offset address	0x0068	RO
UART_FSM_STATUS_REG	UART transmitter and receiver status	0x006C	RO
Autobaud Register			
UART_LOWPULSE_REG	Autobaud minimum low pulse duration register	0x0028	RO
UART_HIGHPULSE_REG	Autobaud minimum high pulse duration register	0x002C	RO
UART_RXD_CNT_REG	Autobaud edge change count register	0x0030	RO
UART_POSPULSE_REG	Autobaud high pulse register	0x0070	RO
UART_NEGPULSE_REG	Autobaud low pulse register	0x0074	RO
AT Escape Sequence Selection Configuration			
UART_AT_CMD_PRECNT_REG	Pre-sequence timing configuration	0x0050	R/W
UART_AT_CMD_POSTCNT_REG	Post-sequence timing configuration	0x0054	R/W
UART_AT_CMD_GAPTOUT_REG	Timeout configuration	0x0058	R/W

Name	Description	Address	Access
UART_AT_CMD_CHAR_REG	AT escape sequence detection configuration	0x005C	R/W
Version Register			
UART_DATE_REG	UART version control register	0x007C	R/W
UART_ID_REG	UART ID register	0x0080	varies

Name	Description	Address	Access
Configuration Register			
UHCI_CONF0_REG	UHCI configuration register	0x0000	R/W
UHCI_CONF1_REG	UHCI configuration register	0x0014	varies
UHCI_ESCAPE_CONF_REG	Escape character configuration	0x0020	R/W
UHCI_HUNG_CONF_REG	Timeout configuration	0x0024	R/W
UHCI_ACK_NUM_REG	UHCI ACK number configuration	0x0028	varies
UHCI_QUICK_SENT_REG	UHCI quick_sent configuration register	0x0030	varies
UHCI_REG_Q0_WORD0_REG	Q0_WORD0 quick_sent register	0x0034	R/W
UHCI_REG_Q0_WORD1_REG	Q0_WORD1 quick_sent register	0x0038	R/W
UHCI_REG_Q1_WORD0_REG	Q1_WORD0 quick_sent register	0x003C	R/W
UHCI_REG_Q1_WORD1_REG	Q1_WORD1 quick_sent register	0x0040	R/W
UHCI_REG_Q2_WORD0_REG	Q2_WORD0 quick_sent register	0x0044	R/W
UHCI_REG_Q2_WORD1_REG	Q2_WORD1 quick_sent register	0x0048	R/W
UHCI_REG_Q3_WORD0_REG	Q3_WORD0 quick_sent register	0x004C	R/W
UHCI_REG_Q3_WORD1_REG	Q3_WORD1 quick_sent register	0x0050	R/W
UHCI_REG_Q4_WORD0_REG	Q4_WORD0 quick_sent register	0x0054	R/W
UHCI_REG_Q4_WORD1_REG	Q4_WORD1 quick_sent register	0x0058	R/W
UHCI_REG_Q5_WORD0_REG	Q5_WORD0 quick_sent register	0x005C	R/W
UHCI_REG_Q5_WORD1_REG	Q5_WORD1 quick_sent register	0x0060	R/W
UHCI_REG_Q6_WORD0_REG	Q6_WORD0 quick_sent register	0x0064	R/W
UHCI_REG_Q6_WORD1_REG	Q6_WORD1 quick_sent register	0x0068	R/W
UHCI_ESC_CONF0_REG	Escape sequence configuration register 0	0x006C	R/W
UHCI_ESC_CONF1_REG	Escape sequence configuration register 1	0x0070	R/W
UHCI_ESC_CONF2_REG	Escape sequence configuration register 2	0x0074	R/W
UHCI_ESC_CONF3_REG	Escape sequence configuration register 3	0x0078	R/W
UHCI_PKT_THRES_REG	Configuration register for packet length	0x007C	R/W
UHCI Interrupt Register			
UHCI_INT_RAW_REG	Raw interrupt status	0x0004	varies
UHCI_INT_ST_REG	Masked interrupt status	0x0008	RO
UHCI_INT_ENA_REG	Interrupt enable bits	0x000C	R/W
UHCI_INT_CLR_REG	Interrupt clear bits	0x0010	WT
UHCI Status Register			
UHCI_STATE0_REG	UHCI receive status	0x0018	RO
UHCI_STATE1_REG	UHCI transmit status	0x001C	RO
UHCI_RX_HEAD_REG	UHCI packet header register	0x002C	RO
Version Register			
UHCI_DATE_REG	UHCI version control register	0x0080	R/W

26.7 Registers

The addresses in this section are relative to UART Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 26.1. UART_FIFO_REG (0x0000)

(reserved)	UART_RXFIFO_RD_BYTE	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

UART_RXFIFO_RD_BYTE UART*n* accesses FIFO via this field. (RO)

Register 26.2. UART_MEM_CONF_REG (0x0060)

(reserved)	UART_MEM_FORCE_PU	UART_MEM_FORCE_PD	UART_RX_TOUT_THRHD	UART_RX_FLOW_THRHD	UART_TX_SIZE	UART_RX_SIZE	(reserved)	
31 28	27	26	25 16	15 7	6 4	3 1	0	
0 0 0 0	0	0	0xa	0x0	0x1	1	0	Reset

UART_RX_SIZE This field is used to configure the amount of RAM allocated for RX FIFO. The default number is 128 bytes. (R/W)

UART_TX_SIZE This field is used to configure the amount of RAM allocated for TX FIFO. The default number is 128 bytes. (R/W)

UART_RX_FLOW_THRHD This field is used to configure the maximum amount of data bytes that can be received when hardware flow control works. (R/W)

UART_RX_TOUT_THRHD This field is used to configure the threshold time that the receiver takes to receive one byte, in the unit of bit time (the time it takes to transfer one bit). The UART_RXFIFO_TOUT_INT interrupt will be triggered when the receiver takes more time to receive one byte with UART RX_TOUT_EN set to 1. (R/W)

UART_MEM_FORCE_PD Set this bit to force power down UART RAM. (R/W)

UART_MEM_FORCE_PU Set this bit to force power up UART RAM. (R/W)

Register 26.3. UART_INT_RAW_REG (0x0004)

(reserved)	UART_WAKEUP_INT_RAW	UART_AT_CMD_CHAR_DET_INT_RAW	UART_RS485_CLASH_INT_RAW	UART_RS485_FRM_ERR_INT_RAW	UART_RS485_PARITY_ERR_INT_RAW	UART_TX_DONE_INT_RAW	UART_TX_BRK_IDLE_DONE_INT_RAW	UART_TX_BRK_DONE_INT_RAW	UART_GLITCH_DET_INT_RAW	UART_SW_XOFF_INT_RAW	UART_SW_XON_INT_RAW	UART_RXFIFO_TOUT_INT_RAW	UART_BRK_DET_INT_RAW	UART_CTS_CHG_INT_RAW	UART_DSR_CHG_INT_RAW	UART_RXFIFO_OVF_INT_RAW	UART_FRM_ERR_INT_RAW	UART_PARITY_ERR_INT_RAW	UART_TXFIFO_EMPTY_INT_RAW	UART_RXFIFO_FULL_INT_RAW	
31 20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	Reset

UART_RXFIFO_FULL_INT_RAW This interrupt raw bit turns to high level when the receiver receives more data than what UART_RXFIFO_FULL_THRHD specifies. (R/WTC/SS)

UART_TXFIFO_EMPTY_INT_RAW This interrupt raw bit turns to high level when the amount of data in TX FIFO is less than what UART_TXFIFO_EMPTY_THRHD specifies. (R/WTC/SS)

UART_PARITY_ERR_INT_RAW This interrupt raw bit turns to high level when the receiver detects a parity error in the data. (R/WTC/SS)

UART_FRM_ERR_INT_RAW This interrupt raw bit turns to high level when the receiver detects a data frame error. (R/WTC/SS)

UART_RXFIFO_OVF_INT_RAW This interrupt raw bit turns to high level when the receiver receives more data than the capacity of RX FIFO. (R/WTC/SS)

UART_DSR_CHG_INT_RAW This interrupt raw bit turns to high level when the receiver detects the edge change of DSRn signal. (R/WTC/SS)

UART_CTS_CHG_INT_RAW This interrupt raw bit turns to high level when the receiver detects the edge change of CTSn signal. (R/WTC/SS)

UART_BRK_DET_INT_RAW This interrupt raw bit turns to high level when the receiver detects a 0 after the stop bit. (R/WTC/SS)

UART_RXFIFO_TOUT_INT_RAW This interrupt raw bit turns to high level when the receiver takes more time than UART_RX_TOUT_THRHD to receive a byte. (R/WTC/SS)

UART_SW_XON_INT_RAW This interrupt raw bit turns to high level when the receiver receives an XON character and UART_SW_FLOW_CON_EN is set to 1. (R/WTC/SS)

UART_SW_XOFF_INT_RAW This interrupt raw bit turns to high level when the receiver receives an XOFF character and UART_SW_FLOW_CON_EN is set to 1. (R/WTC/SS)

UART_GLITCH_DET_INT_RAW This interrupt raw bit turns to high level when the receiver detects a glitch in the middle of a start bit. (R/WTC/SS)

Continued on the next page...

Register 26.3. UART_INT_RAW_REG (0x0004)

Continued from the previous page...

UART_TX_BRK_DONE_INT_RAW This interrupt raw bit turns to high level when the transmitter completes sending NULL characters, after all data in TX FIFO are sent. (R/WTC/SS)

UART_TX_BRK_IDLE_DONE_INT_RAW This interrupt raw bit turns to high level when the transmitter has kept the shortest duration after sending the last data. (R/WTC/SS)

UART_TX_DONE_INT_RAW This interrupt raw bit turns to high level when the transmitter has sent out all data in FIFO. (R/WTC/SS)

UART_RS485_PARITY_ERR_INT_RAW This interrupt raw bit turns to high level when the receiver detects a parity error from the echo of the transmitter in RS485 mode. (R/WTC/SS)

UART_RS485_FRM_ERR_INT_RAW This interrupt raw bit turns to high level when the receiver detects a data frame error from the echo of the transmitter in RS485 mode. (R/WTC/SS)

UART_RS485_CLASH_INT_RAW This interrupt raw bit turns to high level when a collision is detected between the transmitter and the receiver in RS485 mode. (R/WTC/SS)

UART_AT_CMD_CHAR_DET_INT_RAW This interrupt raw bit turns to high level when the receiver detects the configured UART_AT_CMD_CHAR. (R/WTC/SS)

UART_WAKEUP_INT_RAW This interrupt raw bit turns to high level when the input RXD edge changes more times than what (UART_ACTIVE_THRESHOLD + 3）specifies in Light-sleep mode. (R/WTC/SS)

Register 26.4. UART_INT_ST_REG (0x0008)

	(reserved)	UART_WAKEUP_INT_ST	UART_AT_CMD_CHAR_DET_INT_ST	UART_RS485_CLASH_INT_ST	UART_RS485_FRM_ERR_INT_ST	UART_RS485_PARITY_ERR_INT_ST	UART_TX_DONE_INT_ST	UART_TX_BRK_IDLE_DONE_INT_ST	UART_TX_BRK_DONE_INT_ST	UART_GLITCH_DET_INT_ST	UART_SW_XOFF_INT_ST	UART_SW_XON_INT_ST	UART_RXFIFO_TOUT_INT_ST	UART_BRK_DET_INT_ST	UART_CTS_CHG_INT_ST	UART_DSR_CHG_INT_ST	UART_RXFIFO_OVF_INT_ST	UART_FRM_ERR_INT_ST	UART_PARITY_ERR_INT_ST	UART_TXFIFO_EMPTY_INT_ST	UART_RXFIFO_FULL_INT_ST
	31 20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

UART_RXFIFO_FULL_INT_ST This is the status bit for UART_RXFIFO_FULL_INT when UART_RXFIFO_FULL_INT_ENA is set to 1. (RO)

UART_TXFIFO_EMPTY_INT_ST This is the status bit for UART_TXFIFO_EMPTY_INT when UART_TXFIFO_EMPTY_INT_ENA is set to 1. (RO)

UART_PARITY_ERR_INT_ST This is the status bit for UART_PARITY_ERR_INT when UART_PARITY_ERR_INT_ENA is set to 1. (RO)

UART_FRM_ERR_INT_ST This is the status bit for UART_FRM_ERR_INT when UART_FRM_ERR_INT_ENA is set to 1. (RO)

UART_RXFIFO_OVF_INT_ST This is the status bit for UART_RXFIFO_OVF_INT when UART_RXFIFO_OVF_INT_ENA is set to 1. (RO)

UART_DSR_CHG_INT_ST This is the status bit for UART_DSR_CHG_INT when UART_DSR_CHG_INT_ENA is set to 1. (RO)

UART_CTS_CHG_INT_ST This is the status bit for UART_CTS_CHG_INT when UART_CTS_CHG_INT_ENA is set to 1. (RO)

UART_BRK_DET_INT_ST This is the status bit for UART_BRK_DET_INT when UART_BRK_DET_INT_ENA is set to 1. (RO)

UART_RXFIFO_TOUT_INT_ST This is the status bit for UART_RXFIFO_TOUT_INT when UART_RXFIFO_TOUT_INT_ENA is set to 1. (RO)

UART_SW_XON_INT_ST This is the status bit for UART_SW_XON_INT when UART_SW_XON_INT_ENA is set to 1. (RO)

UART_SW_XOFF_INT_ST This is the status bit for UART_SW_XOFF_INT when UART_SW_XOFF_INT_ENA is set to 1. (RO)

UART_GLITCH_DET_INT_ST This is the status bit for UART_GLITCH_DET_INT when UART_GLITCH_DET_INT_ENA is set to 1. (RO)

UART_TX_BRK_DONE_INT_ST This is the status bit for UART_TX_BRK_DONE_INT when UART_TX_BRK_DONE_INT_ENA is set to 1. (RO)

Continued on the next page...

UART_RXFIFO_FULL_INT_CLR Set this bit to clear the UART_THE RXFIFO_FULL_INT interrupt. (WT)

UART_TXFIFO_EMPTY_INT_CLR Set this bit to clear the UART_TXFIFO_EMPTY_INT interrupt. (WT)

UART_PARITY_ERR_INT_CLR Set this bit to clear the UART_PARITY_ERR_INT interrupt. (WT)

UART_FRM_ERR_INT_CLR Set this bit to clear the UART_FRM_ERR_INT interrupt. (WT)

UART_RXFIFO_OVF_INT_CLR Set this bit to clear the UART_UART_RXFIFO_OVF_INT interrupt. (WT)

UART_DSR_CHG_INT_CLR Set this bit to clear the UART_DSR_CHG_INT interrupt. (WT)

UART_CTS_CHG_INT_CLR Set this bit to clear the UART_CTS_CHG_INT interrupt. (WT)

UART_BRK_DET_INT_CLR Set this bit to clear the UART_BRK_DET_INT interrupt. (WT)

UART_RXFIFO_TOUT_INT_CLR Set this bit to clear the UART_RXFIFO_TOUT_INT interrupt. (WT)

UART_SW_XON_INT_CLR Set this bit to clear the UART_SW_XON_INT interrupt. (WT)

UART_SW_XOFF_INT_CLR Set this bit to clear the UART_SW_XOFF_INT interrupt. (WT)

UART_GLITCH_DET_INT_CLR Set this bit to clear the UART_GLITCH_DET_INT interrupt. (WT)

UART_TX_BRK_DONE_INT_CLR Set this bit to clear the UART_TX_BRK_DONE_INT interrupt. (WT)

UART_TX_BRK_IDLE_DONE_INT_CLR Set this bit to clear the UART_TX_BRK_IDLE_DONE_INT interrupt. (WT)

UART_TX_DONE_INT_CLR Set this bit to clear the UART_TX_DONE_INT interrupt. (WT)

UART_RS485_PARITY_ERR_INT_CLR Set this bit to clear the UART_RS485_PARITY_ERR_INT interrupt. (WT)

Continued on the next page...

Register 26.6. UART_INT_CLR_REG (0x0010)

Continued from the previous page...

UART_RS485_FRM_ERR_INT_CLR Set this bit to clear the UART_RS485_FRM_ERR_INT interrupt. (WT)

UART_RS485_CLASH_INT_CLR Set this bit to clear the UART_RS485_CLASH_INT interrupt. (WT)

UART_AT_CMD_CHAR_DET_INT_CLR Set this bit to clear the UART_AT_CMD_CHAR_DET_INT interrupt. (WT)

UART_WAKEUP_INT_CLR Set this bit to clear the UART_WAKEUP_INT interrupt. (WT)

Register 26.7. UART_CLKDIV_REG (0x0014)

(reserved)	UART_CLKDIV_FRAG	(reserved)	UART_CLKDIV	
31 24	23 20	19 12	11 0	
0 0 0 0 0 0 0 0	0x0	0 0 0 0 0 0 0 0	0x2b6	Reset

UART_CLKDIV The integral part of the frequency divisor. (R/W)

UART_CLKDIV_FRAG The fractional part of the frequency divisor. (R/W)

Register 26.8. UART_RX_FILT_REG (0x0018)

(reserved)	UART_GLITCH_FILT_EN	UART_GLITCH_FILT	
31 9	8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x8	Reset

UART_GLITCH_FILT When input pulse width is lower than this value, the pulse is ignored. (R/W)

UART_GLITCH_FILT_EN Set this bit to enable RX signal filter. (R/W)

Register 26.9. UART_CONF0_REG (0x0020)

(reserved)	UART_MEM_CLK_EN	UART_AUTOBAUD_EN	UART_ERR_WR_MASK	UART_CLK_EN	UART_DTR_INV	UART_RTS_INV	UART_TXD_INV	UART_DSR_INV	UART_CTS_INV	UART_RXD_INV	UART_TXFIFO_RST	UART_RXFIFO_RST	UART_IRDA_EN	UART_TX_FLOW_EN	UART_LOOPBACK	UART_IRDA_RX_INV	UART_IRDA_TX_INV	UART_IRDA_WCTL	UART_IRDA_TX_EN	UART_IRDA_DPLX	UART_TXD_BRK	UART_SW_DTR	UART_SW_RTS	UART_STOP_BIT_NUM	UART_BIT_NUM	UART_PARITY_EN	UART_PARITY	
31 29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5 4	3 2	1	0	
0 0 0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	3	0	0	Reset

UART_PARITY This bit is used to configure the parity check mode. (R/W)

UART_PARITY_EN Set this bit to enable UART parity check. (R/W)

UART_BIT_NUM This field is used to set the length of data. (R/W)

UART_STOP_BIT_NUM This field is used to set the length of stop bit. (R/W)

UART_SW_RTS This bit is used to configure the software RTS signal which is used in software flow control. (R/W)

UART_SW_DTR This bit is used to configure the software DTR signal which is used in software flow control. (R/W)

UART_TXD_BRK Set this bit to enable the transmitter to send NULL characters when the process of sending data is done. (R/W)

UART_IRDA_DPLX Set this bit to enable IrDA loopback mode. (R/W)

UART_IRDA_TX_EN This is the start enable bit for IrDA transmitter. (R/W)

UART_IRDA_WCTL 1: The IrDA transmitter's 11th bit is the same as 10th bit; 0: Set IrDA transmitter's 11th bit to 0. (R/W)

UART_IRDA_TX_INV Set this bit to invert the level of IrDA transmitter. (R/W)

UART_IRDA_RX_INV Set this bit to invert the level of IrDA receiver. (R/W)

UART_LOOPBACK Set this bit to enable UART loopback test mode. (R/W)

UART_TX_FLOW_EN Set this bit to enable flow control function for the transmitter. (R/W)

UART_IRDA_EN Set this bit to enable IrDA protocol. (R/W)

UART_RXFIFO_RST Set this bit to reset the UART RX FIFO. (R/W)

UART_TXFIFO_RST Set this bit to reset the UART TX FIFO. (R/W)

UART_RXD_INV Set this bit to invert the level value of UART RXD signal. (R/W)

UART_CTS_INV Set this bit to invert the level value of UART CTS signal. (R/W)

UART_DSR_INV Set this bit to invert the level value of UART DSR signal. (R/W)

Continued on the next page...

Register 26.9. UART_CONF0_REG (0x0020)

Continued from the previous page...

UART_TXD_INV Set this bit to invert the level value of UART TXD signal. (R/W)

UART_RTS_INV Set this bit to invert the level value of UART RTS signal. (R/W)

UART_DTR_INV Set this bit to invert the level value of UART DTR signal. (R/W)

UART_CLK_EN 1: Force clock on for register; 0: Support clock only when application writes registers. (R/W)

UART_ERR_WR_MASK 1: The receiver stops storing data into FIFO when data is wrong; 0: The receiver stores the data even if the received data is wrong. (R/W)

UART_AUTOBAUD_EN This is the enable bit for baud rate detection. (R/W)

UART_MEM_CLK_EN The signal to enable UART RAM clock gating. (R/W)

Register 26.10. UART_CONF1_REG (0x0024)

(reserved)	UART_RX_TOUT_EN	UART_RX_FLOW_EN	UART_RX_TOUT_FLOW_DIS	UART_DIS_RX_DAT_OVF	UART_TXFIFO_EMPTY_THRHD	UART_RXFIFO_FULL_THRHD	
31 22	21	20	19	18	17 9	8 0	
0 0 0 0 0 0 0 0 0 0	0	0	0	0	0x60	0x60	Reset

UART_RXFIFO_FULL_THRHD An UART_RXFIFO_FULL_INT interrupt is generated when the receiver receives more data than the value of this field. (R/W)

UART_TXFIFO_EMPTY_THRHD An UART_TXFIFO_EMPTY_INT interrupt is generated when the number of data bytes in TX FIFO is less than the value of this field. (R/W)

UART_DIS_RX_DAT_OVF Disable UART RX data overflow detection. (R/W)

UART_RX_TOUT_FLOW_DIS Set this bit to stop accumulating idle_cnt when hardware flow control works. (R/W)

UART_RX_FLOW_EN This is the flow enable bit for UART receiver. (R/W)

UART_RX_TOUT_EN This is the enable bit for UART receiver's timeout function. (R/W)

Register 26.11. UART_FLOW_CONF_REG (0x0034)

(reserved)	UART_SEND_XOFF	UART_SEND_XON	UART_FORCE_XOFF	UART_FORCE_XON	UART_XONOFF_DEL	UART_SW_FLOW_CON_EN	
31 6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	Reset

UART_SW_FLOW_CON_EN Set this bit to enable software flow control. When UART receives flow control characters XON or XOFF, which can be configured by UART_XON_CHAR or UART_XOFF_CHAR respectively, UART_SW_XON_INT or UART_SW_XOFF_INT interrupts can be triggered if enabled. (R/W)

UART_XONOFF_DEL Set this bit to remove flow control characters from the received data. (R/W)

UART_FORCE_XON Set this bit to force the transmitter to send data. (R/W)

UART_FORCE_XOFF Set this bit to stop the transmitter from sending data. (R/W)

UART_SEND_XON Set this bit to send an XON character. This bit is cleared by hardware automatically. (R/W/SS/SC)

UART_SEND_XOFF Set this bit to send an XOFF character. This bit is cleared by hardware automatically. (R/W/SS/SC)

Register 26.12. UART_SLEEP_CONF_REG (0x0038)

(reserved)	UART_ACTIVE_THRESHOLD	
31 10	9 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0xf0	Reset

UART_ACTIVE_THRESHOLD UART is activated from Light-sleep mode when the input RXD edge changes more times than the value of this field plus 3. (R/W)

Register 26.13. UART_SWFC_CONF0_REG (0x003C)

(reserved)	UART_XOFF_CHAR	UART_XOFF_THRESHOLD	
31 17	16 9	8 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x13	0xe0	Reset

UART_XOFF_THRESHOLD When the number of data bytes in RX FIFO is more than the value of this field with UART_SW_FLOW_CON_EN set to 1, the transmitter sends an XOFF character. (R/W)

UART_XOFF_CHAR This field stores the XOFF flow control character. (R/W)

Register 26.14. UART_SWFC_CONF1_REG (0x0040)

(reserved)	UART_XON_CHAR	UART_XON_THRESHOLD	
31 17	16 9	8 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x11	0x0	Reset

UART_XON_THRESHOLD When the number of data bytes in RX FIFO is less than the value of this field with UART_SW_FLOW_CON_EN set to 1, the transmitter sends an XON character. (R/W)

UART_XON_CHAR This field stores the XON flow control character. (R/W)

Register 26.15. UART_TXBRK_CONF_REG (0x0044)

(reserved)	UART_TX_BRK_NUM	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0xa	Reset

UART_TX_BRK_NUM This field is used to configure the number of 0 to be sent after the process of sending data is done. It is active when UART_TXD_BRK is set to 1. (R/W)

Register 26.16. UART_IDLE_CONF_REG (0x0048)

(reserved)	UART_TX_IDLE_NUM	UART_RX_IDLE_THRHD	
31 20	19 10	9 0	
0 0 0 0 0 0 0 0 0 0 0 0	0x100	0x100	Reset

UART_RX_IDLE_THRHD A frame end signal is generated when the receiver takes more time to receive one byte data than the value of this field, in the unit of bit time (the time it takes to transfer one bit). (R/W)

UART_TX_IDLE_NUM This field is used to configure the duration time between transfers, in the unit of bit time (the time it takes to transfer one bit). (R/W)

Register 26.17. UART_RS485_CONF_REG (0x004C)

(reserved)	UART_RS485_TX_DLY_NUM	UART_RS485_RX_DLY_NUM	UART_RS485RXBY_TX_EN	UART_RS485TX_RX_EN	UART_DL1_EN	UART_DL0_EN	UART_RS485_EN	
31 10	9 6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	Reset

UART_RS485_EN Set this bit to choose RS485 mode. (R/W)

UART_DL0_EN Configures whether or not to add a turnaround delay of 1 bit before the start bit.

0: Not add

1: Add

(R/W)

UART_DL1_EN Configures whether or not to add a turnaround delay of 1 bit after the stop bit.

0: Not add

1: Add

(R/W)

UART_RS485TX_RX_EN Set this bit to enable the receiver could receive data when the transmitter is transmitting data in RS485 mode. (R/W)

UART_RS485RXBY_TX_EN 1: enable RS485 transmitter to send data when RS485 receiver line is busy. (R/W)

UART_RS485_RX_DLY_NUM This bit is used to delay the receiver's internal data signal. (R/W)

UART_RS485_TX_DLY_NUM This field is used to delay the transmitter's internal data signal. (R/W)

Register 26.18. UART_CLK_CONF_REG (0x0078)

	(reserved)	UART_RX_SCLK_EN	UART_TX_SCLK_EN	UART_RST_CORE	UART_SCLK_EN	UART_SCLK_SEL	UART_SCLK_DIV_NUM	UART_SCLK_DIV_A	UART_SCLK_DIV_B
	31 26	25	24	23	22	21 20	19 12	11 6	5 0
Reset	0 0 0 0 0 0	1	1	0	1	3	0x1	0x0	0x0

UART_SCLK_DIV_B The denominator of the frequency divisor. (R/W)

UART_SCLK_DIV_A The numerator of the frequency divisor. (R/W)

UART_SCLK_DIV_NUM The integral part of the frequency divisor. (R/W)

UART_SCLK_SEL Selects UART clock source. 1: APB_CLK; 2: RC_FAST_CLK; 3: XTAL_CLK. (R/W)

UART_SCLK_EN Set this bit to enable UART TX/RX clock. (R/W)

UART_RST_CORE Write 1 and then write 0 to this bit, to reset UART TX/RX. (R/W)

UART_TX_SCLK_EN Set this bit to enable UART TX clock. (R/W)

UART_RX_SCLK_EN Set this bit to enable UART RX clock. (R/W)

Register 26.19. UART_STATUS_REG (0x001C)

	UART_TXD	UART_RTSN	UART_DTRN	(reserved)	UART_TXFIFO_CNT	UART_RXD	UART_CTSN	UART_DSRN	(reserved)	UART_RXFIFO_CNT
	31	30	29	28 26	25 16	15	14	13	12 10	9 0
Reset	1	1	1	0 0 0	0	1	1	0	0 0 0	0

UART_RXFIFO_CNT Stores the number of valid data bytes in RX FIFO. (RO)

UART_DSRN This bit represents the level of the internal UART DSR signal. (RO)

UART_CTSN This bit represents the level of the internal UART CTS signal. (RO)

UART_RXD This bit represents the level of the internal UART RXD signal. (RO)

UART_TXFIFO_CNT Stores the number of data bytes in TX FIFO. (RO)

UART_DTRN This bit represents the level of the internal UART DTR signal. (RO)

UART_RTSN This bit represents the level of the internal UART RTS signal. (RO)

UART_TXD This bit represents the level of the internal UART TXD signal. (RO)

Register 26.20. UART_MEM_TX_STATUS_REG (0x0064)

(reserved)	UART_TX_RADDR	(reserved)	UART_APB_TX_WADDR	
31 21	20 11	10	9 0	
0 0 0 0 0 0 0 0 0 0 0	0x0	0	0x0	Reset

UART_APB_TX_WADDR This field stores the offset address in TX FIFO when software writes TX FIFO via APB. (RO)

UART_TX_RADDR This field stores the offset address in TX FIFO when TX FSM reads data via Tx_FIFO_Ctrl. (RO)

Register 26.21. UART_MEM_RX_STATUS_REG (0x0068)

(reserved)	UART_RX_WADDR	(reserved)	UART_APB_RX_RADDR	
31 21	20 11	10	9 0	
0 0 0 0 0 0 0 0 0 0 0	0x100	0	0x100	Reset

UART_APB_RX_RADDR This field stores the offset address in RX FIFO when software reads data from RX FIFO via APB. UART0 is 0x200. UART1 is 0x280. (RO)

UART_RX_WADDR This field stores the offset address in RX FIFO when Rx_FIFO_Ctrl writes RX FIFO. (RO)

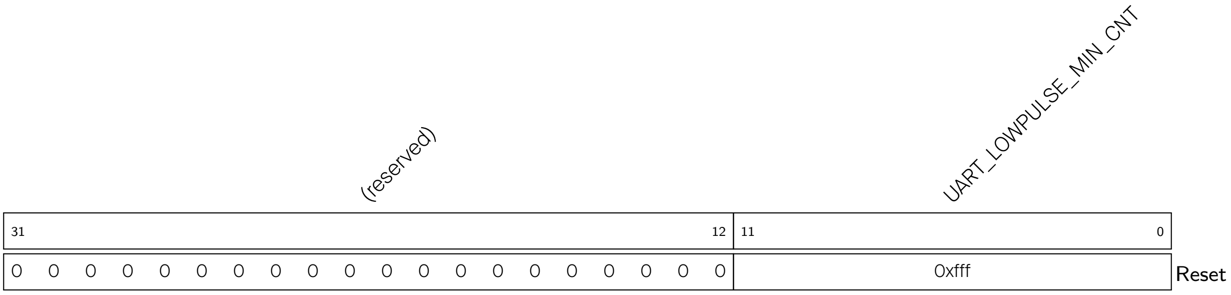
Register 26.22. UART_FSM_STATUS_REG (0x006C)

(reserved)	UART_ST_UTX_OUT	UART_ST_URX_OUT	
31 8	7 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

UART_ST_URX_OUT This is the status field of the receiver. (RO)

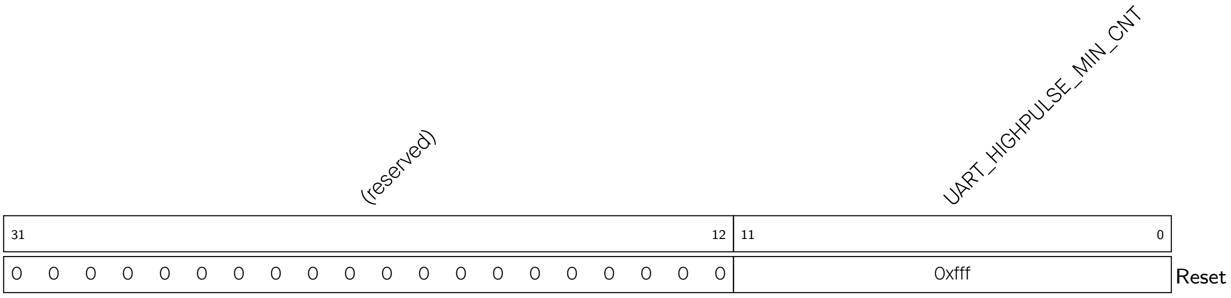
UART_ST_UTX_OUT This is the status field of the transmitter. (RO)

Register 26.23. UART_LOWPULSE_REG (0x0028)



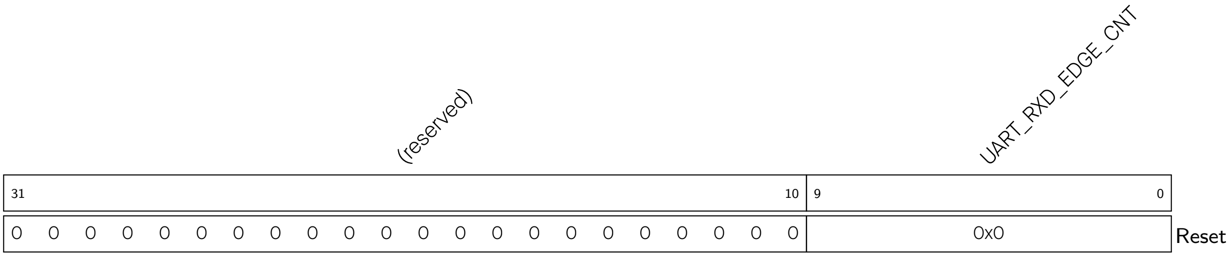
UART_LOWPULSE_MIN_CNT This field stores the value of the minimum duration time of the low level pulse, in the unit of APB_CLK cycles. It is used in baud rate detection. (RO)

Register 26.24. UART_HIGHPULSE_REG (0x002C)



UART_HIGHPULSE_MIN_CNT This field stores the value of the maximum duration time for the high level pulse, in the unit of APB_CLK cycles. It is used in baud rate detection. (RO)

Register 26.25. UART_RXD_CNT_REG (0x0030)



UART_RXD_EDGE_CNT This field stores the count of RXD edge change. It is used in baud rate detection. (RO)

Register 26.26. UART_POSPULSE_REG (0x0070)

(reserved)		UART_POSEDGE_MIN_CNT		
31	12	11	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0xfff		Reset

UART_POSEDGE_MIN_CNT This field stores the minimal input clock count between two positive edges. It is used in baud rate detection. (RO)

Register 26.27. UART_NEGPULSE_REG (0x0074)

(reserved)		UART_NEGEDGE_MIN_CNT		
31	12	11	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0xfff		Reset

UART_NEGEDGE_MIN_CNT This field stores the minimal input clock count between two negative edges. It is used in baud rate detection. (RO)

Register 26.28. UART_AT_CMD_PRECNT_REG (0x0050)

(reserved)		UART_PRE_IDLE_NUM		
31	16	15	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0x901		Reset

UART_PRE_IDLE_NUM This field is used to configure the idle duration time before the first AT_CMD is received by the receiver, in the unit of bit time (the time it takes to transfer one bit). (R/W)

Register 26.29. UART_AT_CMD_POSTCNT_REG (0x0054)

(reserved)	UART_POST_IDLE_NUM	
31 16	15 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x901	Reset

UART_POST_IDLE_NUM This field is used to configure the duration time between the last AT_CMD and the next data byte, in the unit of bit time (the time it takes to transfer one bit). (R/W)

Register 26.30. UART_AT_CMD_GAPTOUT_REG (0x0058)

(reserved)	UART_RX_GAP_TOUT	
31 16	15 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	11	Reset

UART_RX_GAP_TOUT This field is used to configure the duration time between the AT_CMD characters, in the unit of bit time (the time it takes to transfer one bit). (R/W)

Register 26.31. UART_AT_CMD_CHAR_REG (0x005C)

(reserved)	UART_CHAR_NUM	UART_AT_CMD_CHAR	
31 16	15 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x3	0x2b	Reset

UART_AT_CMD_CHAR This field is used to configure the content of AT_CMD character. (R/W)

UART_CHAR_NUM This field is used to configure the number of continuous AT_CMD charactersss received by the receiver. (R/W)

Register 26.32. UART_DATE_REG (0x007C)

UART_DATE		
31	0	
0x2008270		Reset

UART_DATE This is the version control register. (R/W)

Register 26.33. UART_ID_REG (0x0080)

UART_REG_UPDATE	UART_UPDATE_CTRL	UART_ID		
31	30	29	0	
0	1	0x000500		Reset

UART_ID This field is used to configure the UART_ID. (R/W)

UART_UPDATE_CTRL This bit is used to control register synchronization mode. This bit must be cleared before writing 1 to UART_REG_UPDATE to synchronize configured values to UART Core's clock domain. (R/W)

UART_REG_UPDATE When this bit is set to 1 by software, registers are synchronized to UART Core's clock domain. This bit is cleared by hardware after synchronization is done. (R/W/SC)

Register 26.34. UHCI_CONF0_REG (0x0000)

(reserved)	UHCI_UART_RX_BRK_EOF_EN	UHCI_CLK_EN	UHCI_ENCODE_CRC_EN	UHCI_LEN_EOF_EN	UHCI_UART_IDLE_EOF_EN	UHCI_CRC_REC_EN	UHCI_HEAD_EN	UHCI_SEPER_EN	(reserved)	UHCI_UART1_CE	UHCI_UART0_CE	UHCI_RX_RST	UHCI_TX_RST	
31 13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	1	1	0	1	1	1	0	0	0	0	0	Reset

UHCI_TX_RST Write 1, then write 0 to this bit to reset decode state machine. (R/W)

UHCI_RX_RST Write 1, then write 0 to this bit to reset encode state machine. (R/W)

UHCI_UART0_CE Set this bit to link up UHCI and UART0. (R/W)

UHCI_UART1_CE Set this bit to link up UHCI and UART1. (R/W)

UHCI_SEPER_EN Set this bit to separate the data frame using a special character. (R/W)

UHCI_HEAD_EN Set this bit to encode the data packet with a formatting header. (R/W)

UHCI_CRC_REC_EN Set this bit to enable UHCI to receive the 16 bit CRC. (R/W)

UHCI_UART_IDLE_EOF_EN If this bit is set to 1, UHCI will end the payload receiving process when UART has been in idle state. (R/W)

UHCI_LEN_EOF_EN If this bit is set to 1, UHCI decoder stops receiving payload data when the number of received data bytes has reached the specified value. The value is payload length indicated by UHCI packet header when UHCI_HEAD_EN is 1 or the value is configuration value when UHCI_HEAD_EN is 0. If this bit is set to 0, UHCI decoder stops receiving payload data when 0xC0 has been received. (R/W)

UHCI_ENCODE_CRC_EN Set this bit to enable data integrity check by appending a 16 bit CCITT-CRC to end of the payload. (R/W)

UHCI_CLK_EN 1: Force clock on for register; 0: Support clock only when application writes registers. (R/W)

UHCI_UART_RX_BRK_EOF_EN If this bit is set to 1, UHCI will end payload receive process when NULL frame is received by UART. (R/W)

Register 26.35. UHCI_CONF1_REG (0x0014)

(reserved)	UHCI_SW_START	UHCI_WAIT_SW_START	(reserved)	UHCI_TX_ACK_NUM_RE	UHCI_TX_CHECK_SUM_RE	UHCI_SAVE_HEAD	UHCI_CRC_DISABLE	UHCI_CHECK_SEQ_EN	UHCI_CHECK_SUM_EN	
31 9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	1	1	0	0	1	1	Reset

UHCI_CHECK_SUM_EN This is the enable bit to check header checksum when UHCI receives a data packet. (R/W)

UHCI_CHECK_SEQ_EN This is the enable bit to check sequence number when UHCI receives a data packet. (R/W)

UHCI_CRC_DISABLE Set this bit to support CRC calculation. Data Integrity Check Present bit in UHCI packet frame should be 1. (R/W)

UHCI_SAVE_HEAD Set this bit to save the packet header when UHCI receives a data packet. (R/W)

UHCI_TX_CHECK_SUM_RE Set this bit to encode the data packet with a checksum. (R/W)

UHCI_TX_ACK_NUM_RE Set this bit to encode the data packet with an acknowledgment when a reliable packet is to be transmitted. (R/W)

UHCI_WAIT_SW_START The UHCI der will jump to ST_SW_WAIT status if this bit is set to 1. (R/W)

UHCI_SW_START If current UHCI_ENCODE_STATE is ST_SW_WAIT, the UHCI will start to send data packet out when this bit is set to 1. (R/W/SC)

Register 26.36. UHCI_ESCAPE_CONF_REG (0x0020)

(reserved)	UHCI_RX_13_ESC_EN	UHCI_RX_11_ESC_EN	UHCI_RX_DB_ESC_EN	UHCI_RX_C0_ESC_EN	UHCI_TX_13_ESC_EN	UHCI_TX_11_ESC_EN	UHCI_TX_DB_ESC_EN	UHCI_TX_C0_ESC_EN	
31 8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	1	1	0	0	1	1	Reset

UHCI_TX_C0_ESC_EN Set this bit to decode character 0xC0 when DMA receives data. (R/W)

UHCI_TX_DB_ESC_EN Set this bit to decode character 0xDB when DMA receives data. (R/W)

UHCI_TX_11_ESC_EN Set this bit to decode flow control character 0x11 when DMA receives data. (R/W)

UHCI_TX_13_ESC_EN Set this bit to decode flow control character 0x13 when DMA receives data. (R/W)

UHCI_RX_C0_ESC_EN Set this bit to replace 0xC0 by special characters when DMA sends data. (R/W)

UHCI_RX_DB_ESC_EN Set this bit to replace 0xDB by special characters when DMA sends data. (R/W)

UHCI_RX_11_ESC_EN Set this bit to replace flow control character 0x11 by special characters when DMA sends data. (R/W)

UHCI_RX_13_ESC_EN Set this bit to replace flow control character 0x13 by special characters when DMA sends data. (R/W)

Register 26.37. UHCI_HUNG_CONF_REG (0x0024)

(reserved)	UHCI_RXFIFO_TIMEOUT_ENA	UHCI_RXFIFO_TIMEOUT_SHIFT	UHCI_RXFIFO_TIMEOUT	UHCI_TXFIFO_TIMEOUT_ENA	UHCI_TXFIFO_TIMEOUT_SHIFT	UHCI_TXFIFO_TIMEOUT	
31 24	23	22 20	19 12	11	10 8	7 0	
0 0 0 0 0 0 0 0	1	0	0x10	1	0	0x10	Reset

UHCI_TXFIFO_TIMEOUT This field stores the timeout value. UHCI will produce the UHCI_TX_HUNG_INT interrupt when DMA takes more time to receive data. (R/W)

UHCI_TXFIFO_TIMEOUT_SHIFT This field is used to configure the maximum tick count. (R/W)

UHCI_TXFIFO_TIMEOUT_ENA This is the enable bit for TX FIFO receive timeout. (R/W)

UHCI_RXFIFO_TIMEOUT This field stores the timeout value. UHCI will produce the UHCI_RX_HUNG_INT interrupt when DMA takes more time to read data from RAM. (R/W)

UHCI_RXFIFO_TIMEOUT_SHIFT This field is used to configure the maximum tick count. (R/W)

UHCI_RXFIFO_TIMEOUT_ENA This is the enable bit for DMA send timeout. (R/W)

Register 26.38. UHCI_ACK_NUM_REG (0x0028)

(reserved)	UHCI_ACK_NUM_LOAD	UHCI_ACK_NUM	
31 4	3	2 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	0x0	Reset

UHCI_ACK_NUM This is the ACK number used in software flow control. (R/W)

UHCI_ACK_NUM_LOAD Set this bit to 1, and the value configured by UHCI_ACK_NUM would be loaded. (WT)

Register 26.39. UHCI_QUICK_SENT_REG (0x0030)

(reserved)	UHCI_ALWAYS_SEND_EN	UHCI_ALWAYS_SEND_NUM	UHCI_SINGLE_SEND_EN	UHCI_SINGLE_SEND_NUM	
31 8	7	6 4	3	2 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x0	0	0x0	Reset

UHCI_SINGLE_SEND_NUM This field is used to specify the single_send mode. (R/W)

UHCI_SINGLE_SEND_EN Set this bit to enable single_send mode to send short packets. (R/W/SC)

UHCI_ALWAYS_SEND_NUM This field is used to specify the always_send mode. (R/W)

UHCI_ALWAYS_SEND_EN Set this bit to enable always_send mode to send short packets. (R/W)

Register 26.40. UHCI_REG_Q0_WORD0_REG (0x0034)

UHCI_SEND_Q0_WORD0	
31 0	
0x000000	Reset

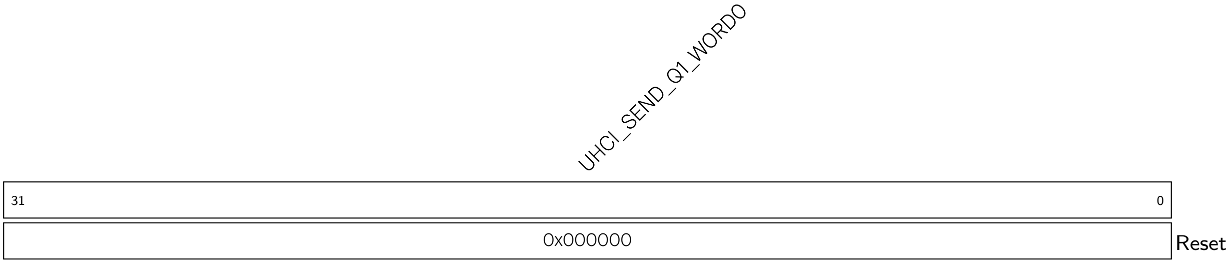
UHCI_SEND_Q0_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.41. UHCI_REG_Q0_WORD1_REG (0x0038)

UHCI_SEND_Q0_WORD1	
31 0	
0x000000	Reset

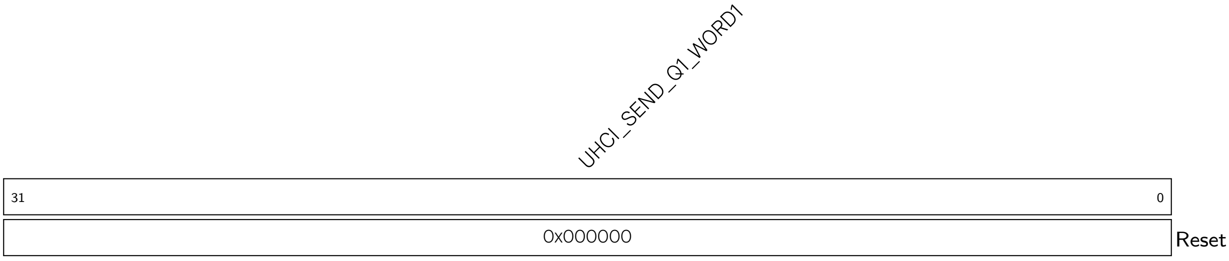
UHCI_SEND_Q0_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.42. UHCI_REG_Q1_WORD0_REG (0x003C)



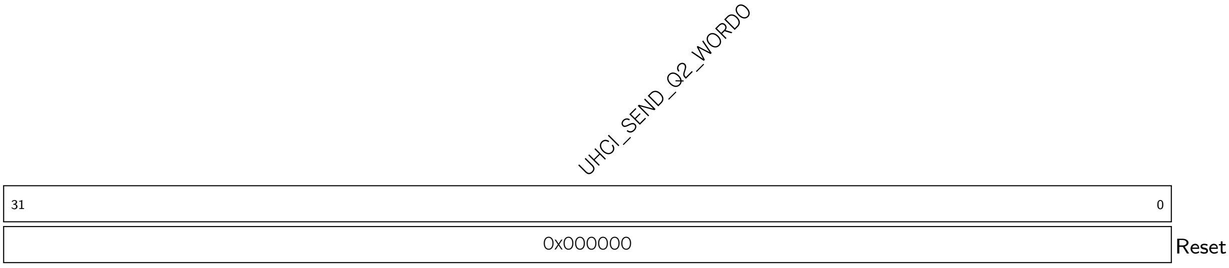
UHCI_SEND_Q1_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.43. UHCI_REG_Q1_WORD1_REG (0x0040)



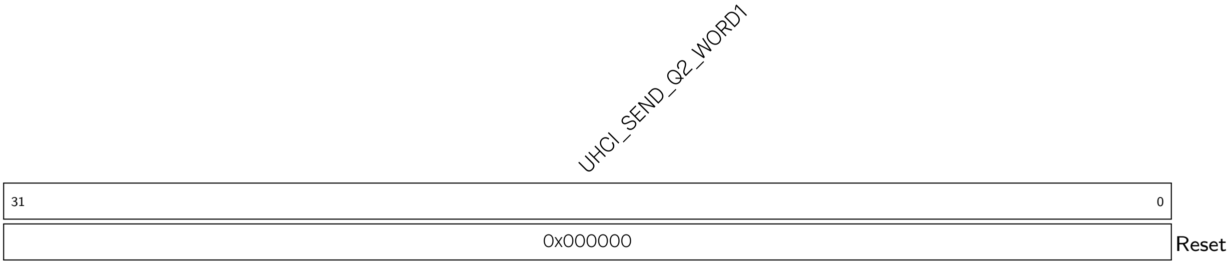
UHCI_SEND_Q1_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.44. UHCI_REG_Q2_WORD0_REG (0x0044)



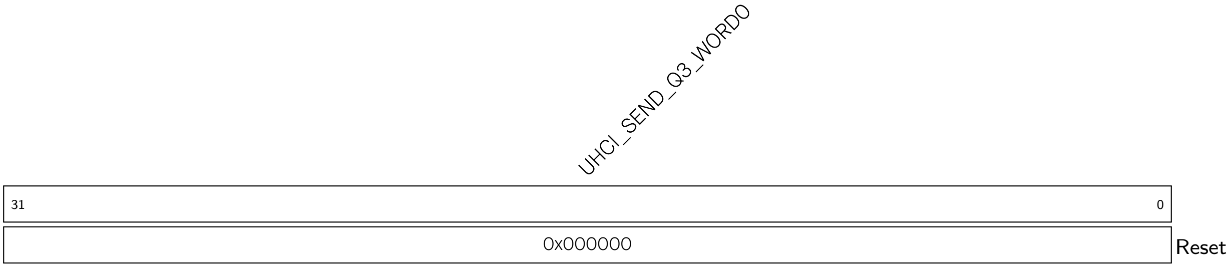
UHCI_SEND_Q2_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.45. UHCI_REG_Q2_WORD1_REG (0x0048)



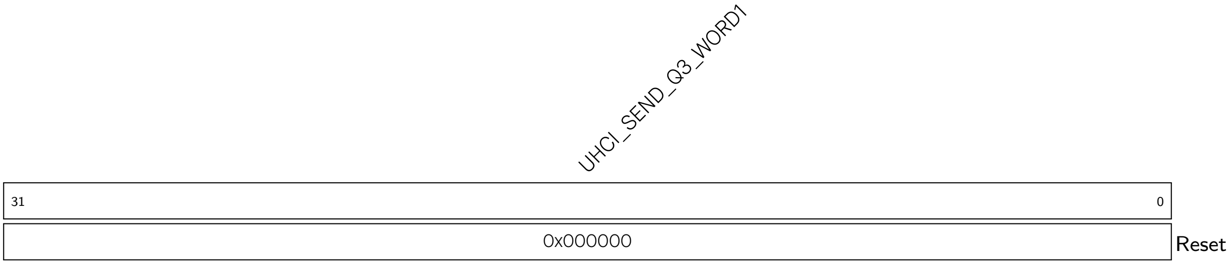
UHCI_SEND_Q2_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.46. UHCI_REG_Q3_WORD0_REG (0x004C)



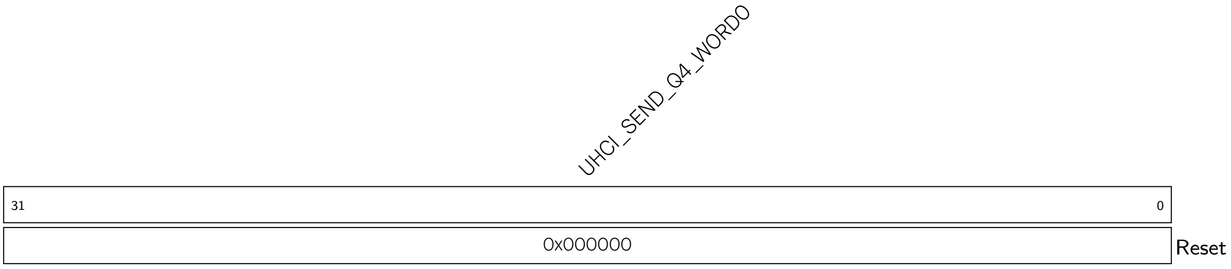
UHCI_SEND_Q3_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.47. UHCI_REG_Q3_WORD1_REG (0x0050)



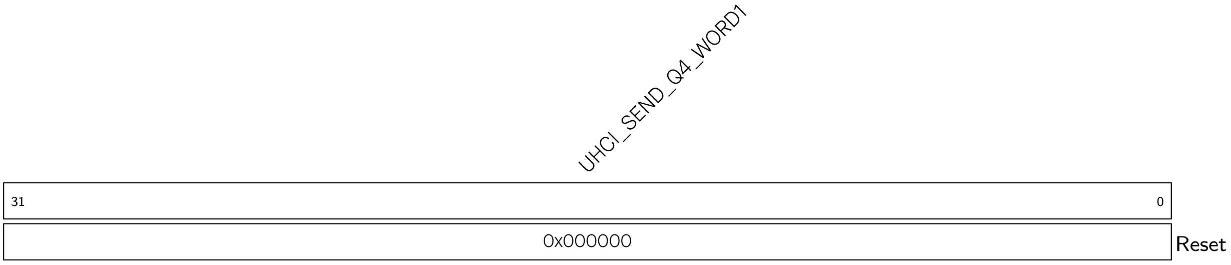
UHCI_SEND_Q3_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.48. UHCI_REG_Q4_WORD0_REG (0x0054)



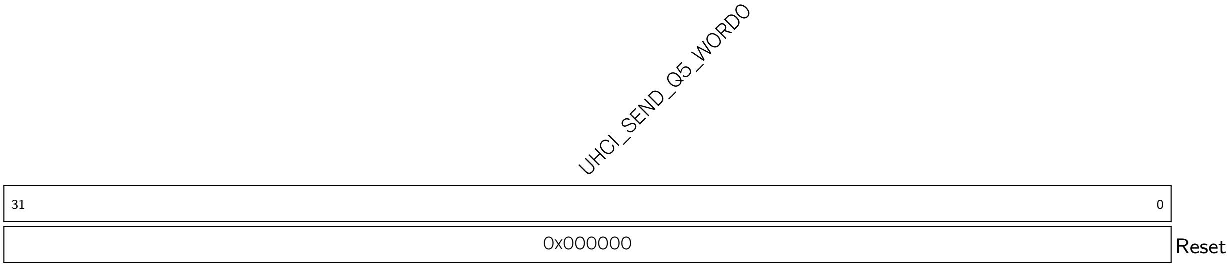
UHCI_SEND_Q4_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.49. UHCI_REG_Q4_WORD1_REG (0x0058)



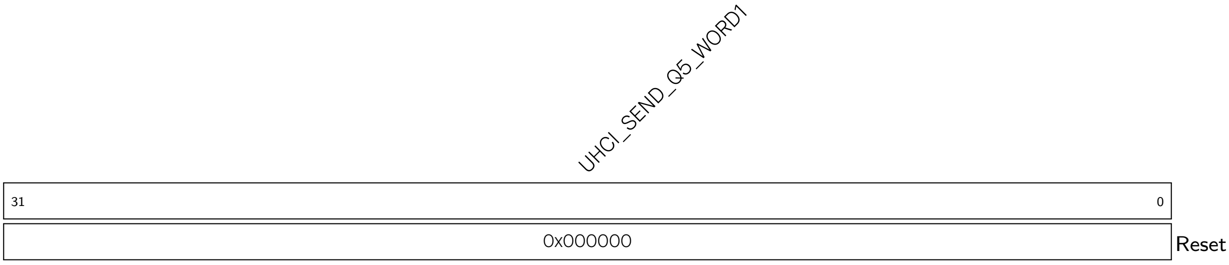
UHCI_SEND_Q4_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.50. UHCI_REG_Q5_WORD0_REG (0x005C)



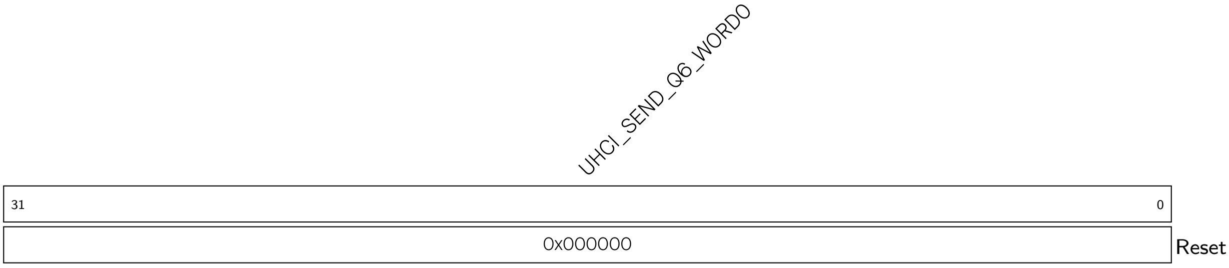
UHCI_SEND_Q5_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.51. UHCI_REG_Q5_WORD1_REG (0x0060)



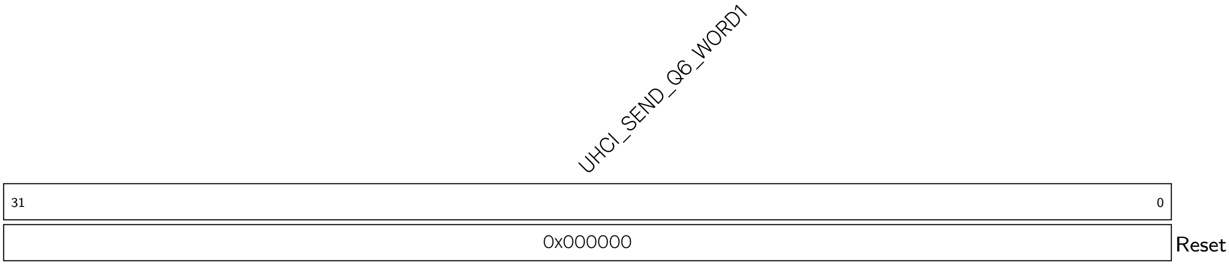
UHCI_SEND_Q5_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.52. UHCI_REG_Q6_WORD0_REG (0x0064)



UHCI_SEND_Q6_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.53. UHCI_REG_Q6_WORD1_REG (0x0068)



UHCI_SEND_Q6_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 26.54. UHCI_ESC_CONF0_REG (0x006C)

(reserved)	UHCI_SEPER_ESC_CHAR1	UHCI_SEPER_ESC_CHAR0	UHCI_SEPER_CHAR	
31 24	23 16	15 8	7 0	
0 0 0 0 0 0 0 0	0xdc	0xdb	0xc0	Reset

UHCI_SEPER_CHAR This field is used to define separators to encode data packets. The default value is 0xC0. (R/W)

UHCI_SEPER_ESC_CHAR0 This field is used to define the first character of SLIP escape sequence. The default value is 0xDB. (R/W)

UHCI_SEPER_ESC_CHAR1 This field is used to define the second character of SLIP escape sequence. The default value is 0xDC. (R/W)

Register 26.55. UHCI_ESC_CONF1_REG (0x0070)

(reserved)	UHCI_ESC_SEQ0_CHAR1	UHCI_ESC_SEQ0_CHAR0	UHCI_ESC_SEQ0	
31 24	23 16	15 8	7 0	
0 0 0 0 0 0 0 0	0xdd	0xdb	0xdb	Reset

UHCI_ESC_SEQ0 This field is used to define a character that need to be encoded. The default value is 0xDB that used as the first character of SLIP escape sequence. (R/W)

UHCI_ESC_SEQ0_CHAR0 This field is used to define the first character of SLIP escape sequence. The default value is 0xDB. (R/W)

UHCI_ESC_SEQ0_CHAR1 This field is used to define the second character of SLIP escape sequence. The default value is 0xDD. (R/W)

Register 26.56. UHCI_ESC_CONF2_REG (0x0074)

(reserved)	UHCI_ESC_SEQ1_CHAR1	UHCI_ESC_SEQ1_CHAR0	UHCI_ESC_SEQ1	
31 24	23 16	15 8	7 0	
0 0 0 0 0 0 0 0	0xde	0xdb	0x11	Reset

UHCI_ESC_SEQ1 This field is used to define a character that need to be encoded. The default value is 0x11 that used as a flow control character. (R/W)

UHCI_ESC_SEQ1_CHAR0 This field is used to define the first character of SLIP escape sequence. The default value is 0xDB. (R/W)

UHCI_ESC_SEQ1_CHAR1 This field is used to define the second character of SLIP escape sequence. The default value is 0xDE. (R/W)

Register 26.57. UHCI_ESC_CONF3_REG (0x0078)

(reserved)	UHCI_ESC_SEQ2_CHAR1	UHCI_ESC_SEQ2_CHAR0	UHCI_ESC_SEQ2	
31 24	23 16	15 8	7 0	
0 0 0 0 0 0 0 0	0xdf	0xdb	0x13	Reset

UHCI_ESC_SEQ2 This field is used to define a character that need to be decoded. The default value is 0x13 that used as a flow control character. (R/W)

UHCI_ESC_SEQ2_CHAR0 This field is used to define the first character of SLIP escape sequence. The default value is 0xDB. (R/W)

UHCI_ESC_SEQ2_CHAR1 This field is used to define the second character of SLIP escape sequence. The default value is 0xDF. (R/W)

Register 26.58. UHCI_PKT_THRES_REG (0x007C)

(reserved)	UHCI_PKT_THRS	
31 13	12 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x80	Reset

UHCI_PKT_THRS This field is used to configure the maximum value of the packet length when UHCI_HEAD_EN is 0. (R/W)

Register 26.59. UHCI_INT_RAW_REG (0x0004)

(reserved)	UHCI_APP_CTRL1_INT_RAW	UHCI_APP_CTRL0_INT_RAW	UHCI_OUT_EOF_INT_RAW	UHCI_SEND_A_REG_Q_INT_RAW	UHCI_SEND_S_REG_Q_INT_RAW	UHCI_TX_HUNG_INT_RAW	UHCI_RX_HUNG_INT_RAW	UHCI_TX_START_INT_RAW	UHCI_RX_START_INT_RAW	
31 9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	Reset

UHCI_RX_START_INT_RAW This is the interrupt raw bit for UHCI_RX_START_INT interrupt. The interrupt is triggered when a separator has been sent. (R/WTC/SS)

UHCI_TX_START_INT_RAW This is the interrupt raw bit for UHCI_TX_START_INT interrupt. The interrupt is triggered when UHCI detects a separator. (R/WTC/SS)

UHCI_RX_HUNG_INT_RAW This is the interrupt raw bit for UHCI_RX_HUNG_INT interrupt. The interrupt is triggered when UHCI takes more time to receive data than configure value. (R/WTC/SS)

UHCI_TX_HUNG_INT_RAW This is the interrupt raw bit for UHCI_TX_HUNG_INT interrupt. The interrupt is triggered when UHCI takes more time to read data from RAM than the configured value. (R/WTC/SS)

UHCI_SEND_S_REG_Q_INT_RAW This is the interrupt raw bit for UHCI_SEND_S_REG_Q_INT interrupt. The interrupt is triggered when UHCI has sent out a short packet using single_send mode. (R/WTC/SS)

UHCI_SEND_A_REG_Q_INT_RAW This is the interrupt raw bit for UHCI_SEND_A_REG_Q_INT interrupt. The interrupt is triggered when UHCI has sent out a short packet using always_send mode. (R/WTC/SS)

UHCI_OUT_EOF_INT_RAW This is the interrupt raw bit for UHCI_OUT_EOF_INT interrupt. The interrupt is triggered when there are some errors in EOF in the transmit descriptors. (R/WTC/SS)

UHCI_APP_CTRL0_INT_RAW This is the interrupt raw bit for UHCI_APP_CTRL0_INT interrupt. The interrupt is triggered when UHCI_APP_CTRL0_IN_SET is set. (R/W)

UHCI_APP_CTRL1_INT_RAW This is the interrupt raw bit for UHCI_APP_CTRL1_INT interrupt. The interrupt is triggered when UHCI_APP_CTRL1_IN_SET is set. (R/W)

Register 26.60. UHCI_INT_ST_REG (0x0008)

(reserved)	UHCI_APP_CTRL1_INT_ST	UHCI_APP_CTRL0_INT_ST	UHCI_OUTLINK_EOF_ERR_INT_ST	UHCI_SEND_A_REG_Q_INT_ST	UHCI_SEND_S_REG_Q_INT_ST	UHCI_TX_HUNG_INT_ST	UHCI_RX_HUNG_INT_ST	UHCI_TX_START_INT_ST	UHCI_RX_START_INT_ST

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	Reset

UHCI_RX_START_INT_ST This is the masked interrupt bit for UHCI_RX_START_INT interrupt when UHCI_RX_START_INT_ENA is set to 1. (RO)

UHCI_TX_START_INT_ST This is the masked interrupt bit for UHCI_TX_START_INT interrupt when UHCI_TX_START_INT_ENA is set to 1. (RO)

UHCI_RX_HUNG_INT_ST This is the masked interrupt bit for UHCI_RX_HUNG_INT interrupt when UHCI_RX_HUNG_INT_ENA is set to 1. (RO)

UHCI_TX_HUNG_INT_ST This is the masked interrupt bit for UHCI_TX_HUNG_INT interrupt when UHCI_TX_HUNG_INT_ENA is set to 1. (RO)

UHCI_SEND_S_REG_Q_INT_ST This is the masked interrupt bit for UHCI_SEND_S_REG_Q_INT interrupt when UHCI_SEND_S_REG_Q_INT_ENA is set to 1. (RO)

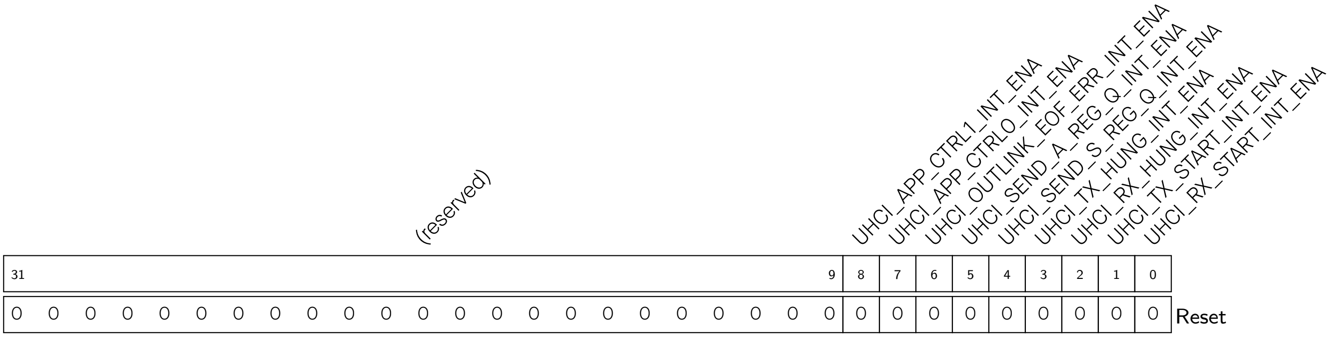
UHCI_SEND_A_REG_Q_INT_ST This is the masked interrupt bit for UHCI_SEND_A_REG_Q_INT interrupt when UHCI_SEND_A_REG_Q_INT_ENA is set to 1. (RO)

UHCI_OUTLINK_EOF_ERR_INT_ST This is the masked interrupt bit for UHCI_OUTLINK_EOF_ERR_INT interrupt when UHCI_OUTLINK_EOF_ERR_INT_ENA is set to 1. (RO)

UHCI_APP_CTRL0_INT_ST This is the masked interrupt bit for UHCI_APP_CTRL0_INT interrupt when UHCI_APP_CTRL0_INT_ENA is set to 1. (RO)

UHCI_APP_CTRL1_INT_ST This is the masked interrupt bit for UHCI_APP_CTRL1_INT interrupt when UHCI_APP_CTRL1_INT_ENA is set to 1. (RO)

Register 26.61. UHCI_INT_ENA_REG (0x000C)



UHCI_RX_START_INT_ENA This is the interrupt enable bit for UHCI_RX_START_INT interrupt. (R/W)

UHCI_TX_START_INT_ENA This is the interrupt enable bit for UHCI_TX_START_INT interrupt. (R/W)

UHCI_RX_HUNG_INT_ENA This is the interrupt enable bit for UHCI_RX_HUNG_INT interrupt. (R/W)

UHCI_TX_HUNG_INT_ENA This is the interrupt enable bit for UHCI_TX_HUNG_INT interrupt. (R/W)

UHCI_SEND_S_REG_Q_INT_ENA This is the interrupt enable bit for UHCI_SEND_S_REG_Q_INT interrupt. (R/W)

UHCI_SEND_A_REG_Q_INT_ENA This is the interrupt enable bit for UHCI_SEND_A_REG_Q_INT interrupt. (R/W)

UHCI_OUTLINK_EOF_ERR_INT_ENA This is the interrupt enable bit for UHCI_OUTLINK_EOF_ERR_INT interrupt. (R/W)

UHCI_APP_CTRL0_INT_ENA This is the interrupt enable bit for UHCI_APP_CTRL0_INT interrupt. (R/W)

UHCI_APP_CTRL1_INT_ENA This is the interrupt enable bit for UHCI_APP_CTRL1_INT interrupt. (R/W)

Register 26.62. UHCI_INT_CLR_REG (0x0010)

(reserved)	UHCI_APP_CTRL1_INT_CLR	UHCI_APP_CTRL0_INT_CLR	UHCI_OUTLINK_EOF_ERR_INT_CLR	UHCI_SEND_A_REG_Q_INT_CLR	UHCI_SEND_S_REG_Q_INT_CLR	UHCI_TX_HUNG_INT_CLR	UHCI_RX_HUNG_INT_CLR	UHCI_TX_START_INT_CLR	UHCI_RX_START_INT_CLR

UHCI_RX_START_INT_CLR Set this bit to clear UHCI_RX_START_INT interrupt. (WT)

UHCI_TX_START_INT_CLR Set this bit to clear UHCI_TX_START_INT interrupt. (WT)

UHCI_RX_HUNG_INT_CLR Set this bit to clear UHCI_RX_HUNG_INT interrupt. (WT)

UHCI_TX_HUNG_INT_CLR Set this bit to clear UHCI_TX_HUNG_INT interrupt. (WT)

UHCI_SEND_S_REG_Q_INT_CLR Set this bit to clear UHCI_SEND_S_REG_Q_INT interrupt. (WT)

UHCI_SEND_A_REG_Q_INT_CLR Set this bit to clear UHCI_SEND_A_REG_Q_INT interrupt. (WT)

UHCI_OUTLINK_EOF_ERR_INT_CLR Set this bit to clear UHCI_OUTLINK_EOF_ERR_INT interrupt. (WT)

UHCI_APP_CTRL0_INT_CLR Set this bit to clear UHCI_APP_CTRL0_INT interrupt. (WT)

UHCI_APP_CTRL1_INT_CLR Set this bit to clear UHCI_APP_CTRL1_INT interrupt. (WT)

Register 26.63. UHCI_STATE0_REG (0x0018)

(reserved)	UHCI_DECODE_STATE	UHCI_RX_ERR_CAUSE	
31 6	5 3	2 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	Reset

UHCI_RX_ERR_CAUSE This field indicates the error type when DMA has received a packet with error. 3'b001: Checksum error in the HCI packet; 3'b010: Sequence number error in the HCI packet; 3'b011: CRC bit error in the HCI packet; 3'b100: 0xC0 is found but the received the HCI packet is not end; 3'b101: 0xC0 is not found when the HCI packet has been received; 3'b110: CRC check error. (RO)

UHCI_DECODE_STATE UHCI decoder status. (RO)

Register 26.64. UHCI_STATE1_REG (0x001C)

(reserved)	UHCI_ENCODE_STATE	
31 3	2 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

UHCI_ENCODE_STATE UHCI encoder status. (RO)

Register 26.65. UHCI_RX_HEAD_REG (0x002C)

UHCI_RX_HEAD	
31 0	
0x000000	Reset

UHCI_RX_HEAD This register stores the header of the current received packet. (RO)

Register 26.66. UHCI_DATE_REG (0x0080)

UHCI_DATE	
31 0	
0x2007170	Reset

UHCI_DATE This is the version control register. (R/W)

27 SPI Controller (SPI)

27.1 Overview

The Serial Peripheral Interface (SPI) is a synchronous serial interface useful for communication with external peripherals. The ESP32-C3 chip integrates three SPI controllers:

- SPI0,
- SPI1,
- General Purpose SPI2 (GP-SPI2).

SPI0 and SPI1 controllers are primarily reserved for internal use. This chapter mainly focuses on the GP-SPI2 controller.

27.2 Glossary

To better illustrate the functions of GP-SPI2, the following terms are used in this chapter.

Master Mode GP-SPI2 acts as an SPI master and initiates SPI transactions.

Slave Mode GP-SPI2 acts as an SPI slave and transfers data with its master when its CS is asserted.

MISO Master in, slave out, data transmission from a slave to a master.

MOSI Master out, slave in, data transmission from a master to a slave

Transaction One instance of a master asserting a CS line, transferring data to and from a slave, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.

SPI Transfer The whole process of an SPI master exchanges data with a slave. One SPI transfer consists of one or more SPI transactions.

Single Transfer An SPI transfer consists of only one transaction.

CPU-Controlled Transfer A data transfer happens between CPU buffer SPI_W0_REG ~ SPI_W15_REG and SPI peripheral.

DMA-Controlled Transfer A data transfer happens between DMA and SPI peripheral, controlled by DMA engine.

Configurable Segmented Transfer A data transfer controlled by DMA in SPI master mode. Such transfer consists of multiple transactions (segments), and each of transactions can be configured independently.

Slave Segmented Transfer A data transfer controlled by DMA in SPI slave mode. Such transfer consists of multiple transactions (segments).

Full-duplex The sending line and receiving line between the master and the slave are independent. Sending data and receiving data happen at the same time.

Half-duplex Only one side, the master or the slave, sends data first, and the other side receives data. Sending data and receiving data can not happen at the same time.

4-line full-duplex 4-line here means: clock line, CS line, and two data lines. The two data lines can be used to send or receive data simultaneously.

4-line half-duplex 4-line here means: clock line, CS line, and two data lines. The two data lines can not be used simultaneously.

3-line half-duplex 3-line here means: clock line, CS line, and one data line. The data line is used to transmit or receive data.

1-bit SPI In one clock cycle, one bit can be transferred.

(2-bit) Dual SPI In one clock cycle, two bits can be transferred.

Dual Output Read A data mode of Dual SPI. In one clock cycle, one bit of a command, or one bit of an address, or two bits of data can be transferred.

Dual I/O Read Another data mode of Dual SPI. In one clock cycle, one bit of a command, or two bits of an address, or two bits of data can be transferred.

(4-bit) Quad SPI In one clock cycle, four bits can be transferred.

Quad Output Read A data mode of Quad SPI. In one clock cycle, one bit of a command, or one bit of an address, or four bits of data can be transferred.

Quad I/O Read Another data mode of Quad SPI. In one clock cycle, one bit of a command, or four bits of an address, or four bits of data can be transferred.

QPI In one clock cycle, four bits of a command, or four bits of an address, or four bits of data can be transferred.

27.3 Features

Some of the key features of GP-SPI2 are:

- Master and slave modes
- Half- and full-duplex communications
- CPU- and DMA-controlled transfers
- Various data modes:
  - 1-bit SPI mode
  - 2-bit Dual SPI mode
  - 4-bit Quad SPI mode
  - QPI mode
- Configurable module clock frequency:
  - Master: up to 80 MHz
  - Slave: up to 60 MHz
- Configurable data length:
  - CPU-controlled transfer in master mode or in slave mode: 1 ~ 64 B
  - DMA-controlled single transfer in master mode: 1 ~ 32 KB
  - DMA-controlled configurable segmented transfer in master mode: data length is unlimited

  - DMA-controlled single transfer or segmented transfer in slave mode: data length is unlimited

- Configurable bit read/write order
- Independent interrupts for CPU-controlled transfer and DMA-controlled transfer
- Configurable clock polarity and phase
- Four SPI clock modes: mode 0 ~ mode 3
- Six CS lines in master mode: CS0 ~ CS5
- Able to communicate with SPI devices, such as a sensor, a screen controller, as well as a flash or RAM chip

27.4 Architectural Overview

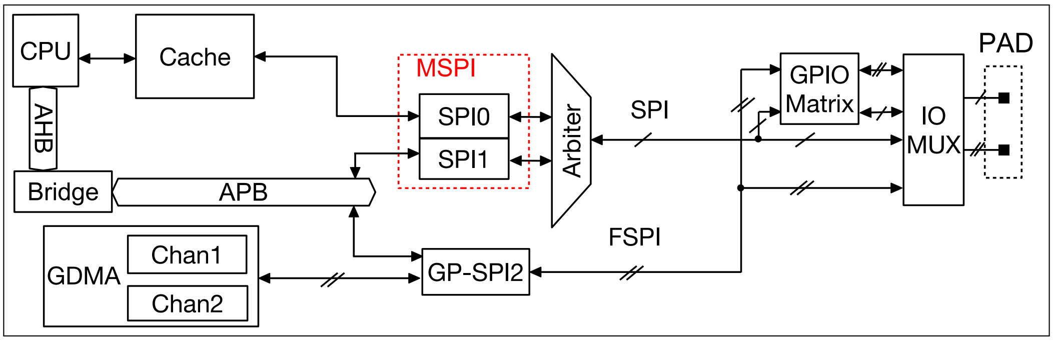

Figure 27-1. SPI Module Overview

Figure 27-1 shows an overview of SPI module. GP-SPI2 exchanges data with SPI devices by the following ways:

- CPU-controlled transfer: CPU <-> GP-SPI2 <-> SPI devices
- DMA-controlled transfer: GDMA <-> GP-SPI2 <-> SPI devices

The signals for GP-SPI2 are prefixed with "FSPI" (Fast SPI). FSPI bus signals are routed to GPIO pins via either GPIO matrix or IO MUX. For more information, see Chapter *5 IO MUX and GPIO Matrix (GPIO, IO MUX)*.

27.5 Functional Description

27.5.1 Data Modes

GP-SPI2 can be configured as either a master or a slave to communicate with other SPI devices in the following data modes, see Table 27-2.

Table 27-2. Data Modes Supported by GP-SPI2

Supported Mode		CMD State	Address State	Data State
1-bit SPI		1-bit	1-bit	1-bit
Dual SPI	Dual Output Read	1-bit	1-bit	2-bit
	Dual I/O Read	1-bit	2-bit	2-bit

Table 27-2. Data Modes Supported by GP-SPI2

Supported Mode		CMD State	Address State	Data State
Quad SPI	Quad Output Read	1-bit	1-bit	4-bit
	Quad I/O Read	1-bit	4-bit	4-bit
QPI		4-bit	4-bit	4-bit

For the states can be used in

- master mode, see Section 27.5.8.
- slave mode, see Section 27.5.9.

27.5.2 FSPI Bus Signal Mapping

The mapping of FSPI bus signals and the functional description of the signals are shown in Table 27-3 and in Table 27-4, respectively. The signals in one line in Table 27-3 corresponds to each other. For example, the signal FSPID is connected to MOSI in GP-SPI2 full-duplex communication, and FSPIQ to MISO. You can take Figure 27-7 as an example.

Table 27-3. Mapping of FSPI Bus Signals

Standard SPI Protocol		Extended SPI Protocol
Full-Duplex SPI Signal	Half-Duplex SPI Signal	FSPI Bus Signal
MOSI	MOSI	FSPID
MISO	(MISO)	FSPIQ
CS	CS	FSPICS0 ~ 5
CLK	CLK	FSPICLK
—	—	FSPIWP
—	—	FSPIHD

Table 27-4. Functional Description of FSPI Bus Signals

FSPI Bus Signal	Function
FSPID	MOSI/SIO0 (serial data input and output, bit0)
FSPIQ	MISO/SIO1 (serial data input and output, bit1)
FSPIWP	SIO2 (serial data input and output, bit2)
FSPIHD	SIO3 (serial data input and output, bit3)
FSPICLK	Input and output clock in master/slave mode
FSPICS0	Input and output CS signal in master/slave mode
FSPICS1 ~ 5	Output CS signal in master mode

Figure 27-5 shows the signals used in various SPI modes.

Table 27-5. Signals Used in Various SPI Modes

FSPI Signal	Master Mode						Slave Mode					
	1-bit SPI			2-bit Dual SPI	4-bit Quad SPI	QPI	1-bit SPI			2-bit Dual SPI	4-bit Quad SPI	QPI
	FD[1]	3-line HD[2]	4-line HD				FD	3-line HD	4-line HD			
FSPICLK	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
FSPICS0	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
FSPICS1	Y	Y	Y	Y	Y	Y						
FSPICS2	Y	Y	Y	Y	Y	Y						
FSPICS3	Y	Y	Y	Y	Y	Y						
FSPICS4	Y	Y	Y	Y	Y	Y						
FSPICS5	Y	Y	Y	Y	Y	Y						
FSPID	Y	Y	(Y)[3]	Y[4]	Y[5]	Y	Y	Y	(Y)[6]	Y[7]	Y[8]	Y
FSPIQ	Y		(Y)[3]	Y[4]	Y[5]	Y	Y		(Y)[6]	Y[7]	Y[8]	Y
FSPIWP					Y[5]	Y					Y[8]	Y
FSPIHD					Y[5]	Y					Y[8]	Y

[1] FD: full-duplex

[2] HD: half-duplex

[3] Only one of the two signals is used at a time.

[4] The two signals are used in parallel.

[5] The four signals are used in parallel.

[6] Only one of the two signals is used at a time.

[7] The two signals are used in parallel.

[8] The four signals are used in parallel.

27.5.3 Bit Read/Write Order Control

In master mode:

- The bit order of the command, address and data sent by the GP-SPI2 master is controlled by SPI_WR_BIT_ORDER.
- The bit order of the data received by the master is controlled by SPI_RD_BIT_ORDER.

In slave mode:

- The bit order of the data sent by the GP-SPI2 slave is controlled by SPI_WR_BIT_ORDER.
- The bit order of the command, address and data received by the slave is controlled by SPI_RD_BIT_ORDER.

Table 27-6 shows the function of SPI_RD/WR_BIT_ORDER.

Table 27-6. Bit Order Control in GP-SPI2 Master and Slave Modes

Bit Mode	FSPI Bus Data	SPI_RD/WR_BIT_ORDER = 0 (MSB)	SPI_RD/WR_BIT_ORDER = 1 (LSB)
1-bit mode	FSPID or FSPIQ	B7→B6→B5→B4→B3→B2→B1→B0	B0→B1→B2→B3→B4→B5→B6→B7
2-bit mode	FSPIQ	B7→B5→B3→B1	B1→B3→B5→B7
	FSPID	B6→B4→B2→B0	B0→B2→B4→B6
4-bit mode	FSPIHD	B7→B3	B3→B7
	FSPIWP	B6→B2	B2→B6
	FSPIQ	B5→B1	B1→B5
	FSPID	B4→B0	B0→B4

27.5.4 Transfer Modes

GP-SPI2 supports the following transfers when working as a master or a slave.

Table 27-7. Supported Transfers in Master and Slave Modes

Mode		CPU-Controlled Single Transfer	DMA-Controlled Single Transfer	DMA-Controlled Configurable Segmented Transfer	DMA-Controlled Slave Segmented Transfer
Master	Full-Duplex	Y	Y	Y	–
	Half-Duplex	Y	Y	Y	–
Slave	Full-Duplex	Y	Y	–	Y
	Half-Duplex	Y	Y	–	Y

The following sections provide detailed information about the transfer modes listed in the table above.

27.5.5 CPU-Controlled Data Transfer

GP-SPI2 provides 16 x 32-bit data buffers, i.e., SPI_W0_REG ~ SPI_W15_REG, see Figure 27-2. CPU-controlled transfer indicates the transfer, in which the data to send is from GP-SPI2 data buffer and the received data is stored to GP-SPI2 data buffer. In such transfer, every single transaction needs to be triggered by the CPU, after its related registers are configured. For such reason, the CPU-controlled transfer is always single transfers (consisting of only one transaction). CPU-controlled mode supports full-duplex communication and half-duplex communication.

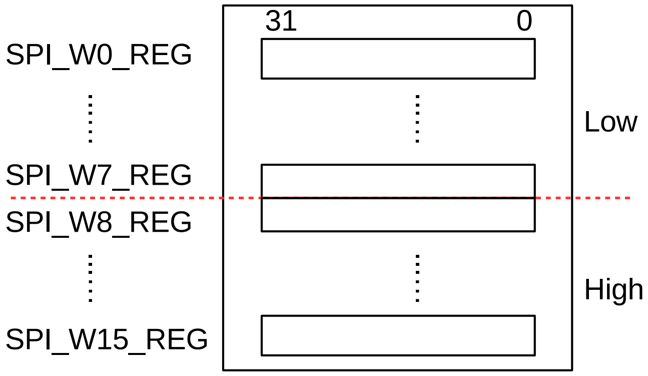

Figure 27-2. Data Buffer Used in CPU-Controlled Transfer

27.5.5.1 CPU-Controlled Master Mode

In a CPU-controlled master full-duplex or half-duplex transfer, the RX or TX data is saved to or sent from SPI_W0_REG ~ SPI_W15_REG. The bits SPI_USR_MOSI_HIGHPART and SPI_USR_MISO_HIGHPART control which buffers are used, see the list below.

- TX data
  - When SPI_USR_MOSI_HIGHPART is cleared, i.e. high part mode is disabled, TX data is from SPI_W0_ REG ~ SPI_W15_REG and the data address is incremented by 1 on each byte transferred. If the data byte length is larger than 64, the data in SPI_W8_REG[7:0] ~ SPI_W15_REG[31:24] may be sent more than once. For instance, 66 bytes (byte0 ~ byte65) need to send out, the address of byte65 is the result of (65 % 64 = 1), i.e. byte65 is from SPI_W0_REG[15:8], and byte64 is from SPI_W0_REG[7:0]. For this case, the content of SPI_W0_REG[15:0] may be sent more than once.
  - When SPI_USR_MOSI_HIGHPART is set, i.e. high part mode is enabled, TX data is from SPI_W8_REG ~ SPI_W15_REG and the data address is incremented by 1 on each byte transferred. If the data byte length is larger than 32, the data in SPI_W8_REG[7:0] ~ SPI_W15_REG[31:24] may be sent more than once.
- RX data
  - When SPI_USR_MISO_HIGHPART is cleared, i.e. high part mode is disabled, RX data is saved to SPI_W0_REG ~ SPI_W15_REG, and the data address is incremented by 1 on each byte transferred. If the data byte length is larger than 64, the data in SPI_W8_REG[7:0] ~ SPI_W15_REG[31:24] may be overwritten. For instance, 66 bytes (byte0 ~ byte65) are received, byte65 and byte64 will be stored to the addresses of (65 % 64 = 1) and (64 % 64 = 0), i.e. SPI_W0_REG[15:8] and SPI_W0_REG[7:0]. For this case, the content of SPI_W0_REG[15:0] may be overwritten.
  - When SPI_USR_MISO_HIGHPART is set, i.e. high part mode is enabled, the RX data is saved to SPI_W8_REG ~ SPI_W15_REG, and the data address is incremented by 1 on each byte transferred. If the data byte length is larger than 32, the content of SPI_W8_REG ~ SPI_W15_REG may be overwritten.

Note:

- TX/RX data address mentioned above both are byte-addressable. Address 0 stands for SPI_W0_REG[7:0], and Address 1 for SPI_W0_REG[15:8], and so on. The largest address is SPI_W15_REG[31:24].
- To avoid any possible error in TX/RX data, such as TX data being sent more than once or RX data being overwritten, please make sure the registers are configured correctly.

27.5.5.2 CPU-Controlled Slave Mode

In a CPU-controlled slave full-duplex or half-duplex transfer, the RX data or TX data is saved to or sent from SPI_W0_REG ~ SPI_W15_REG, which are byte-addressable.

- In full-duplex communication, the address of SPI_W0_REG ~ SPI_W15_REG starts from 0 and is incremented by 1 on each byte transferred. If the data address is larger than 63, the content of SPI_W15_REG[31:24] is overwritten.
- In half-duplex communication, the ADDR value in transmission format is the start address of the RX or TX data, corresponding to the registers SPI_W0_REG ~ SPI_W15_REG. The RX or TX address is incremented by 1 on each byte transferred. If the address is larger than 63 (the highest byte address, i.e. SPI_W15_REG[31:24]), the address of overflowing data is always 63 and only the content of SPI_W15_REG[31:24] is overwritten.

According to your applications, the registers SPI_W0_REG ~ SPI_W15_REG can be used as:

- data buffers only
- data buffers and status buffers
- status buffers only

27.5.6 DMA-Controlled Data Transfer

DMA-controlled transfer refers to the transfer, in which GDMA RX module receives data and GDMA TX module sends data. This transfer is supported both in master mode and in slave mode.

A DMA-controlled transfer can be

- a single transfer, consisting of only one transaction. GP-SPI2 supports this transfer both in master and slave modes.
- a configurable segmented transfer, consisting of several transactions (segments). GP-SPI2 supports this transfer only in master mode. For more information, see Section 27.5.8.5.
- a slave segmented transfer, consisting of several transactions (segments). GP-SPI2 supports this transfer only in slave mode. For more information, see Section 27.5.9.3.

A DMA-controlled transfer only needs to be triggered once by CPU. When such transfer is triggered, data is transferred by the GDMA engine from or to the DMA-linked memory, without CPU operation.

DMA-controlled mode supports full-duplex communication, half-duplex communication and functions described in Section 27.5.8 and Section 27.5.9. Meanwhile, the GDMA RX module is independent from the GDMA TX module, which means that there are four kinds of full-duplex communications:

- Data is received in DMA-controlled mode and sent in DMA-controlled mode.

- Data is received in DMA-controlled mode but sent in CPU-controlled mode.
- Data is received in CPU-controlled mode but sent in DMA-controlled mode.
- Data is received in CPU-controlled mode and sent in CPU-controlled mode.

27.5.6.1 GDMA Configuration

- Select a GDMA channel*n*, and configure a GDMA TX/RX descriptor, see Chapter 2 *GDMA Controller (GDMA)*.
- Set the bit GDMA_INLINK_START_CH*n* or GDMA_OUTLINK_START_CH*n* to start GDMA RX/TX engine.
- Before all the GDMA TX buffer is used or the GDMA TX engine is reset, if GDMA_OUTLINK_RESTART_CH*n* is set, a new TX buffer will be added to the end of the last TX buffer in use.
- GDMA RX buffer is linked in the same way as the GDMA TX buffer, by setting GDMA_INLINK_START_CH*n* or GDMA_INLINK_RESTART_CH*n*.
- The TX and RX data lengths are determined by the configured GDMA TX and RX buffer respectively, both of which are 0 ~ 32 KB.
- Initialize GDMA inlink and outlink before GDMA starts. The bits SPI_DMA_RX_ENA and SPI_DMA_TX_ENA in register SPI_DMA_CONF_REG should be set, otherwise the read/write data will be stored to/sent from the registers SPI_W0_REG ~ SPI_W15_REG.

In master mode, if GDMA_IN_SUC_EOF_CH*n*_INT_ENA is set, then the interrupt GDMA_IN_SUC_EOF_CH*n*_INT will be triggered when one single transfer or one configurable segmented transfer is finished.

The only difference between DMA-controlled transfers in master mode and in slave mode is on the GDMA RX control:

- When the bit SPI_RX_EOF_EN is cleared, a GDMA_IN_SUC_EOF_CH*n*_INT interrupt may be generated after the CS is pulled high once:
  - In a slave single transfer, if SPI_DMA_SLV_SEG_TRANS_EN is cleared and GDMA_IN_SUC_EOF_CH*n*_INT _ENA is set, a GDMA_IN_SUC_EOF_CH*n*_INT interrupt will be triggered once the single transfer is done.
  - In a slave segmented transfer, if both SPI_DMA_SLV_SEG_TRANS_EN and GDMA_IN_SUC_EOF_CH*n*_ INT_ENA are set, a GDMA_IN_SUC_EOF_CH*n*_INT interrupt also is triggered once the command (CMD7 or End_SEG_TRANS) is received correctly.
- When the bit SPI_RX_EOF_EN is set, the generation of GDMA_IN_SUC_EOF_CH*n*_INT also depends on the length of transferred data.
  - In a slave single transfer, if SPI_DMA_SLV_SEG_TRANS_EN is cleared and GDMA_IN_SUC_EOF_CH*n*_ INT_ENA is set, a GDMA_IN_SUC_EOF_CH*n*_INT interrupt will be generated once the single transfer is done or the length of GDMA RX received data is equal to (SPI_MS_DATA_BITLEN + 1).
  - In a slave segmented transfer, if SPI_DMA_SLV_SEG_TRANS_EN is set, a GDMA_IN_SUC_EOF_CH*n*_INT interrupt will be generated once the command (CMD7 or

End_SEG_TRANS) is received correctly or the length of GDMA RX received data is equal to (SPI_MS_DATA_BITLEN + 1).

27.5.6.2 GDMA TX/RX Buffer Length Control

It is recommended that the length of configured GDMA TX/RX buffer is equal to the length of real transferred data.

- If the length of configured GDMA TX buffer is shorter than that of real transferred data, the extra data will be the same as the last transferred data. SPI_OUTFIFO_EMPTY_ERR_INT and GDMA_OUT_EOF_CH*n*_INT are triggered.
- If the length of configured GDMA TX buffer is longer than the that of real transferred data, the TX buffer is not fully used, and the remaining buffer is available for following transaction even if a new TX buffer is linked later. Please keep it in mind. Or save the unused data and reset DMA.
- If the length of configured GDMA RX buffer is shorter than that of real transferred data, the extra data will be lost. The interrupts SPI_INFIFO_FULL_ERR_INT and SPI_TRANS_DONE_INT are triggered. But GDMA_IN_SUC_EOF_CH*n*_INT interrupt is not generated.
- If the length of configured GDMA RX buffer is longer than that of real transferred data, the RX buffer is not fully used, and the remaining buffer is discarded. In the following transaction, a new linked buffer will be used directly.

27.5.7 Data Flow Control in GP-SPI2 Master and Slave Modes

CPU-controlled and DMA-controlled transfers are supported in GP-SPI2 master and slave modes. CPU-controlled transfer means that data transfers between registers SPI_W0_REG ~ SPI_W15_REG and the SPI device. DMA-controlled transfer means that data transfers between the configured GDMA TX/RX buffer and the SPI device. To select between the two transfer modes, configure SPI_DMA_RX_ENA and SPI_DMA_TX_ENA before the transfer starts.

27.5.7.1 GP-SPI2 Functional Blocks

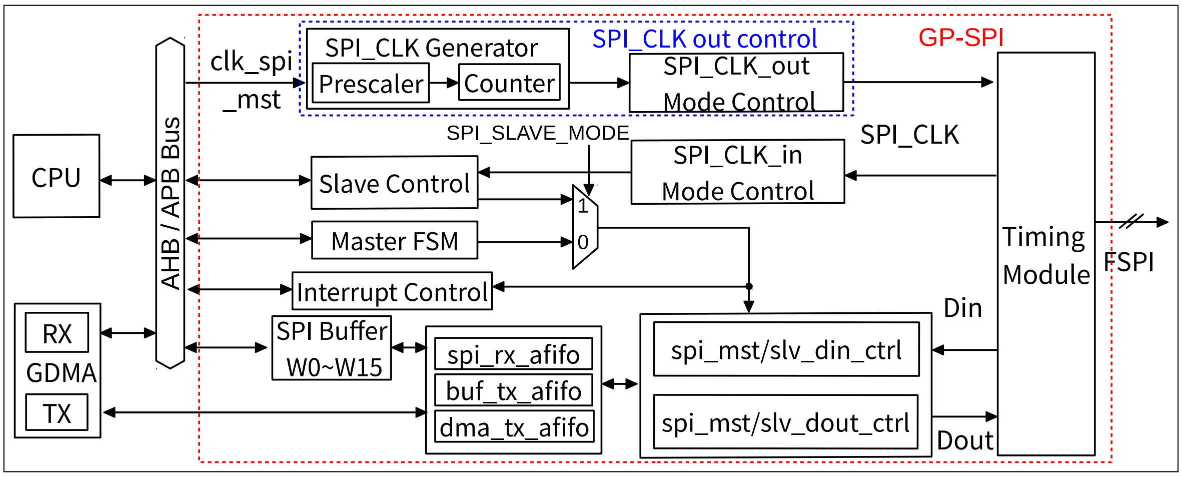

Figure 27-3. GP-SPI2 Block Diagram

Figure 27-3 shows main functional blocks in GP-SPI2, including:

- Master FSM: all the features, supported in GP-SPI2 master mode, are controlled by this state machine together with register configuration.
- SPI Buffer: SPI_W0_REG ~ SPI_W15_REG, see Figure 27-2. The data transferred in CPU-controlled mode is prepared in this buffer.
- Timing Module: capture data on FSPI bus.
- spi_mst/slv_din/dout_ctrl: convert the TX/RX data into bytes.
- spi_rx_afifo: store the received data.
- buf_tx_afifo: store the data to send.
- dma_tx_afifo: store the data from GDMA.
- clk_spi_mst: this clock is the module clock of GP-SPI2 and derived from PLL_CLK. It is used in GP-SPI2 master mode, to generate SPI_CLK signal for data transfer and for slaves.
- SPI_CLK Generator: generate SPI_CLK by dividing clk_spi_mst. The divider is determined by SPI_CLKCNT_N and SPI_CLKDIV_PRE.
- SPI_CLK_out Mode Control: output the SPI_CLK signal for data transfer and for slaves.
- SPI_CLK_in Mode Control: capture the SPI_CLK signal from SPI master when GP-SPI2 works as a slave.

27.5.7.2 Data Flow Control in Master Mode

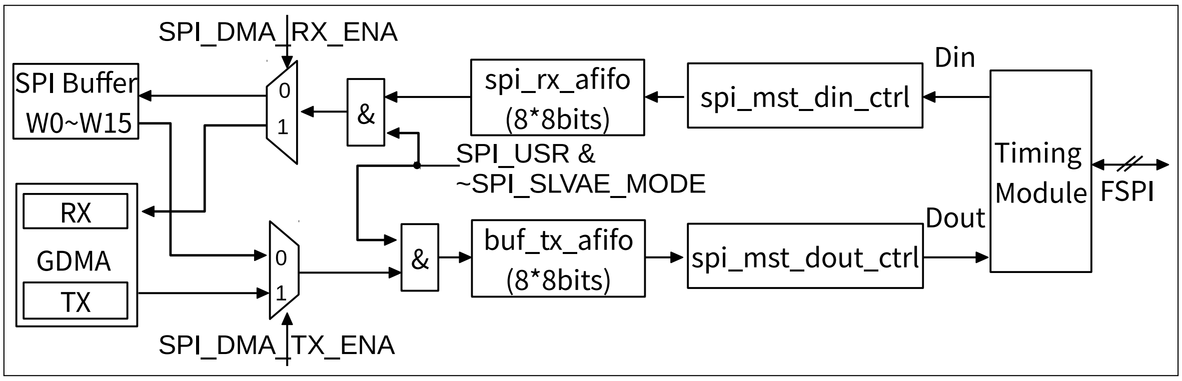

Figure 27-4. Data Flow Control in GP-SPI2 Master Mode

Figure 27-4 shows the data flow of GP-SPI2 in master mode. Its control logic is as follows:

- RX data: data in FSPI bus is captured by Timing Module, converted in units of bytes by spi_mst_din_ctrl module, and then stored in corresponding addresses according to the transfer modes.
  - CPU-controlled transfer: the data is stored to registers SPI_W0_REG ~ SPI_W15_REG.
  - DMA-controlled transfer: the data is stored to GDMA RX buffer.
- TX data: the TX data is from corresponding addresses according to transfer modes and is saved to buf_tx_afifo.
  - CPU-controlled transfer: TX data is from SPI_W0_REG ~ SPI_W15_REG.
  - DMA-controlled transfer: TX data is from GDMA TX buffer.

The data in buf_tx_afifo is sent out to Timing Module in 1/2/4-bit modes, controlled by GP-SPI2 state machine. The Timing Module can be used for timing compensation. For more information, see Section 27.8.

27.5.7.3 Data Flow Control in Slave Mode

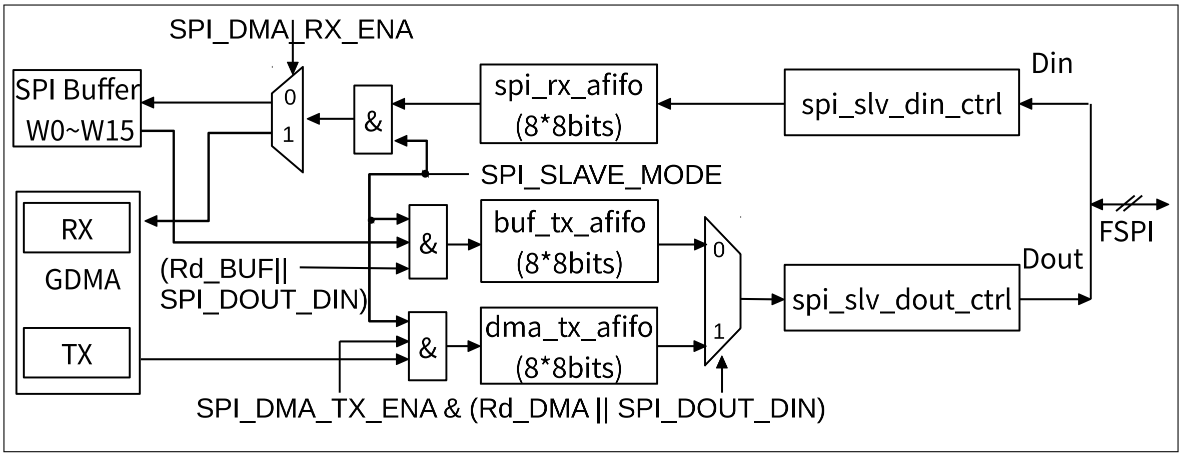

Figure 27-5. Data Flow Control in GP-SPI2 Slave Mode

Figure 27-5 shows the data flow in GP-SPI2 slave mode. Its control logic is as follows:

- In CPU/DMA-controlled full-duplex/half-duplex modes, when an external SPI master starts the SPI transfer, data on the FSPI bus is captured, converted into unit of bytes by spi_slv_din_ctrl module, and then is stored in spi_rx_afifo.
  - In CPU-controlled full-duplex transfer, the received data in spi_rx_afifo will be later stored into registers SPI_W0_REG ~ SPI_W15_REG, successively.
  - In half-duplex Wr_BUF transfer, when the value of address (SLV_ADDR[7:0]) is received, the received data in spi_rx_afifo will be stored in the related address of registers SPI_W0_REG ~ SPI_W15_REG
  - In DMA-controlled full-duplex transfer or in half-duplex Wr_DMA transfer, the received data in spi_rx_afifo will be stored in the configured GDMA RX buffer.
- In CPU-controlled full-/half-duplex transfer, the data to send is stored in buf_tx_afifo. In DMA-controlled full-/half-duplex transfer, the data to send is stored in dma_tx_afifo. Therefore, Rd_BUF transaction controlled by CPU and Rd_DMA transaction controlled by DMA can be done in one slave segmented transfer. TX data comes from corresponding addresses according the transfer modes.
  - In CPU-controlled full-duplex transfer, when SPI_SLAVE_MODE and SPI_DOUTDIN are set and SPI_DMA
    _TX_ENA is cleared, the data in SPI_W0_REG ~ SPI_W15_REG will be stored into buf_tx_afifo;
  - In CPU-controlled half-duplex transfer, when SPI_SLAVE_MODE is set, SPI_DOUTDIN is cleared, Rd_BUF command and SLV_ADDR[7:0] are received, the data started from the related address of SPI_W0_REG ~ SPI_W15_REG will be stored into buf_tx_afifo;
  - In DMA-controlled full-duplex transfer, when SPI_SLAVE_MODE, SPI_DOUTDIN and SPI_DMA_TX_ENA are set, the data in the configured GDMA TX buffer will be stored into dma_tx_afifo;

   - In DMA-controlled half-duplex transfer, when SPI_SLAVE_MODE is set, SPI_DOUTDIN is cleared, and Rd_DMA command is received, the data in the configured GDMA TX buffer will be stored into dma_tx_afifo.

The data in buf_tx_afifo or dma_tx_afifo is sent out by spi_slv_dout_ctrl module in 1/2/4-bit modes.

27.5.8 GP-SPI2 Works as a Master

GP-SPI2 can be configured as a SPI master by clearing the bit SPI_SLAVE_MODE in SPI_SLAVE_REG. In this operation mode, GP-SPI2 provides clock signal (the divided clock from GP-SPI2 module clock) and six CS lines (CS0 ~ CS5).

Note:

- The length of transferred data must be in unit of bytes, otherwise the extra bits will be lost. The extra bits here means the result of total data bits % 8.
- To transfer bits not in unit of bytes, consider implementing it in CMD state or ADDR state.

27.5.8.1 State Machine

When GP-SPI2 works as a master, the state machine controls its various states during data transfer, including configuration (CONF), preparation (PREP), command (CMD), address (ADDR), dummy (DUMMY), data out (DOUT), and data in (DIN) states. GP-SPI2 is mainly used to access 1/2/4-bit SPI devices, such as flash and external RAM, thus the naming of GP-SPI2 states keeps consistent with the sequence naming of flash and external RAM. The meaning of each state is described as follows and Figure 27-6 shows the workflow of GP-SPI2 state machine.

1. IDLE: GP-SPI2 is not active or is in slave mode.
2. CONF: only used in DMA-controlled configurable segmented transfer. Set SPI_USR and SPI_USR_CONF to enable this state. If this state is not enabled, it means the current transfer is a single transfer.
3. PREP: prepare an SPI transaction and control SPI CS setup time. Set SPI_USR and SPI_CS_SETUP to enable this state.
4. CMD: send command sequence. Set SPI_USR and SPI_USR_COMMAND to enable this state.
5. ADDR: send address sequence. Set SPI_USR and SPI_USR_ADDR to enable this state.
6. DUMMY (wait cycle): send dummy sequence. Set SPI_USR and SPI_USR_DUMMY to enable this state.
7. DATA: transfer data.
   - DOUT: send data sequence. Set SPI_USR and SPI_USR_MOSI to enable this state.
   - DIN: receive data sequence. Set SPI_USR and SPI_USR_MISO to enable this state.
8. DONE: control SPI CS hold time. Set SPI_USR to enable this state.

Figure 27-6. GP-SPI2 State Machine in Master Mode

Legend to state flow:

- —: indicates corresponding state condition is not satisfied; repeats current state.
- —: corresponding registers are set and conditions are satisfied; goes to next state.
- —: state registers are not set; skips one or more following states, depending on the registers of the following states are set or not.

Explanation to the conditions listed in the figure above:

- CONF condition: gpc[17:0] >= SPI_CONF_BITLEN[17:0]
- PREP condition: gpc[4:0] >= SPI_CS_SETUP_TIME[4:0]
- CMD condition: gpc[3:0] >= SPI_USR_COMMAND_BITLEN[3:0]
- ADDR condition: gpc[4:0] >= SPI_USR_ADDR_BITLEN[4:0]
- DUMMY condition: gpc[7:0] >= SPI_USR_DUMMY_CYCLELEN[7:0]
- DOUT condition: gpc[17:0] >= SPI_MS_DATA_BITLEN[17:0]
- DIN condition: gpc[17:0] >= SPI_MS_DATA_BITLEN[17:0]
- DONE condition: (gpc[4:0] >= SPI_CS_HOLD_TIME[4:0] || SPI_CS_HOLD == 1'b0)

A counter (gpc[17:0]) is used in the state machine to control the cycle length of each state. The states CONF, PREP, CMD, ADDR, DUMMY, DOUT, and DIN can be enabled or disabled independently. The cycle length of each state can also be configured independently.

27.5.8.2 Register Configuration for State and Bit Mode Control

Introduction

The registers, related to GP-SPI2 state control, are listed in Table 27-8. Users can enable QPI mode for GP-SPI2 by setting the bit SPI_QPI_MODE in register SPI_USER_REG.

Table 27-8. Registers Used for State Control in 1/2/4-bit Modes

State	Control Registers for 1-bit Mode FSPI Bus	Control Registers for 2-bit Mode FSPI Bus	Control Registers for 4-bit Mode FSPI Bus
CMD	SPI_USR_COMMAND_VALUE SPI_USR_COMMAND_BITLEN SPI_USR_COMMAND	SPI_USR_COMMAND_VALUE SPI_USR_COMMAND_BITLEN SPI_FCMD_DUAL SPI_USR_COMMAND	SPI_USR_COMMAND_VALUE SPI_USR_COMMAND_BITLEN SPI_FCMD_QUAD SPI_USR_COMMAND
ADDR	SPI_USR_ADDR_VALUE SPI_USR_ADDR_BITLEN SPI_USR_ADDR	SPI_USR_ADDR_VALUE SPI_USR_ADDR_BITLEN SPI_USR_ADDR SPI_FADDR_DUAL	SPI_USR_ADDR_VALUE SPI_USR_ADDR_BITLEN SPI_USR_ADDR SPI_FADDR_QUAD
DUMMY	SPI_USR_DUMMY_CYCLELEN SPI_USR_DUMMY	SPI_USR_DUMMY_CYCLELEN SPI_USR_DUMMY	SPI_USR_DUMMY_CYCLELEN SPI_USR_DUMMY
DIN	SPI_USR_MISO SPI_MS_DATA_BITLEN	SPI_USR_MISO SPI_MS_DATA_BITLEN SPI_FREAD_DUAL	SPI_USR_MISO SPI_MS_DATA_BITLEN SPI_FREAD_QUAD

Table 27-8. Registers Used for State Control in 1/2/4-bit Modes

State	Control Registers for 1-bit Mode FSPI Bus	Control Registers for 2-bit Mode FSPI Bus	Control Registers for 4-bit Mode FSPI Bus
DOUT	SPI_USR_MOSI SPI_MS_DATA_BITLEN	SPI_USR_MOSI SPI_MS_DATA_BITLEN SPI_FWRITE_DUAL	SPI_USR_MOSI SPI_MS_DATA_BITLEN SPI_FWRITE_QUAD

As shown in Table 27-8, the registers in each cell should be configured to set the FSPI bus to corresponding bit mode, i.e. the mode shown in the table header, at a specific state (corresponding to the first column).

Configuration

For instance, when GP-SPI2 reads data, and

- CMD is in 1-bit mode
- ADDR is in 2-bit mode
- DUMMY is 8 clock cycles
- DIN is in 4-bit mode

The register configuration can be as follows:

1. Configure CMD state related registers.
   - Configure the required command value in SPI_USR_COMMAND_VALUE.
   - Configure command bit length in SPI_USR_COMMAND_BITLEN. SPI_USR_COMMAND_BITLEN = expected bit length - 1.
   - Set SPI_USR_COMMAND.
   - Clear SPI_FCMD_DUAL and SPI_FCMD_QUAD.
2. Configure ADDR state related registers.
   - Configure the required address value in SPI_USR_ADDR_VALUE.
   - Configure address bit length in SPI_USR_ADDR_BITLEN. SPI_USR_ADDR_BITLEN = expected bit length - 1.
   - Set SPI_USR_ADDR and SPI_FADDR_DUAL.
   - Clear SPI_FADDR_QUAD.
3. Configure DUMMY state related registers.
   - Configure DUMMY cycles in SPI_USR_DUMMY_CYCLELEN. SPI_USR_DUMMY_CYCLELEN = expected clock cycles - 1.
   - Set SPI_USR_DUMMY.
4. Configure DIN state related registers.
   - Configure read data bit length in SPI_MS_DATA_BITLEN. SPI_MS_DATA_BITLEN = bit length expected - 1.
   - Set SPI_FREAD_QUAD and SPI_USR_MISO.

- Clear SPI_FREAD_DUAL.
- Configure GDMA in DMA-controlled mode. In CPU controlled mode, no action is needed.

5. Clear SPI_USR_MOSI.
6. Set SPI_DMA_AFIFO_RST, SPI_BUF_AFIFO_RST, and SPI_RX_AFIFO_RST to reset these buffers.
7. Set SPI_USR to start GP-SPI2 transfer.

When writing data (DOUT state), SPI_USR_MOSI should be configured instead, while SPI_USR_MISO should be cleared. The output data bit length is the value of SPI_MS_DATA_BITLEN + 1. Output data should be configured in GP-SPI2 data buffer (SPI_W0_REG ~ SPI_W15_REG) in CPU-controlled mode, or GDMA TX buffer in DMA-controlled mode. The data byte order is incremented from LSB (byte 0) to MSB.

Pay special attention to the command value in SPI_USR_COMMAND_VALUE and to address value in SPI_USR_
ADDR_VALUE.

The configuration of command value is as follows:

- If SPI_USR_COMMAND_BITLEN < 8, the command value is written to SPI_USR_COMMAND_VALUE[7:0]. Command value is sent as follows.
  - If SPI_WR_BIT_ORDER is set, the lower part of SPI_USR_COMMAND_VALUE[7:0], i.e. SPI_USR_COMMAND_VALUE[SPI_USR_COMMAND_BITLEN:0], is sent first.
  - If SPI_WR_BIT_ORDER is cleared, the higher part of SPI_USR_COMMAND_VALUE[7:0], i.e. SPI_USR_COM
    MAND_VALUE[7:7 - SPI_USR_COMMAND_BITLEN], is sent first.
- If 7 < SPI_USR_COMMAND_BITLEN < 16, the command value is written to SPI_USR_COMMAND_VALUE[15:
  0]. Command value is sent as follows.
  - If SPI_WR_BIT_ORDER is set, SPI_USR_COMMAND_VALUE[7:0] is sent first, and then the lower part of SPI_USR_COMMAND_VALUE[15:8], i.e. SPI_USR_COMMAND_VALUE[SPI_USR_COMMAND _BITLEN:8], is sent.
  - If SPI_WR_BIT_ORDER is cleared, SPI_USR_COMMAND_VALUE[7:0] is sent first, and then the higher part of SPI_USR_COMMAND_VALUE[15:8], i.e. SPI_USR_COMMAND_VALUE[15:15 - SPI_USR_COMMAN
    D_BITLEN], is sent.

The configuration of address value is as follows:

- If SPI_USR_ADDR_BITLEN < 8, the address value is written to SPI_USR_ADDR_VALUE[31:24]. Address value is sent as follows.
  - If SPI_WR_BIT_ORDER is set, the lower part of SPI_USR_ADDR_VALUE[31:24], i.e. SPI_USR_ADDR_VALUE[SPI_USR_ADDR_BITLEN + 24:24], is sent first.
  - If SPI_WR_BIT_ORDER is cleared, the higher part of SPI_USR_ADDR_VALUE[31:24], i.e. SPI_USR_ADDR_
    VALUE[31:31 - SPI_USR_ADDR_BITLEN], is sent first.

- If 7 < SPI_USR_ADDR_BITLEN < 16, the ADDR value is written to SPI_USR_ADDR_VALUE[31:16]. Address value is sent as follows.
    - If SPI_WR_BIT_ORDER is set, SPI_USR_ADDR_VALUE[31:24] is sent first, and then the lower part of SPI_USR_ADDR_VALUE[23:16], i.e. SPI_USR_ADDR_VALUE[SPI_USR_ADDR_BITLEN + 8:16], is sent.
    - If SPI_WR_BIT_ORDER is cleared, SPI_USR_ADDR_VALUE[31:24] is sent first, and then the higher part of SPI_USR_ADDR_VALUE[23:16], i.e. SPI_USR_ADDR_VALUE[23:31 - SPI_USR_ADDR_BITLEN], is sent.
- If 15 < SPI_USR_ADDR_BITLEN < 24, the ADDR value is written to SPI_USR_ADDR_VALUE[31:8]. Address value is sent as follows.
    - If SPI_WR_BIT_ORDER is set, SPI_USR_ADDR_VALUE[31:16] is sent first, and then the lower part of SPI_USR_ADDR_VALUE[15:8], i.e. SPI_USR_ADDR_VALUE[SPI_USR_ADDR_BITLEN - 8:8], is sent.
    - If SPI_WR_BIT_ORDER is cleared, SPI_USR_ADDR_VALUE[31:16] is sent first, and then the higher part of SPI_USR_ADDR_VALUE[15:8], i.e. SPI_USR_ADDR_VALUE[15:31 - SPI_USR_ADDR_BITLEN], is sent.
- If 23 < SPI_USR_ADDR_BITLEN < 32, the ADDR value is written to SPI_USR_ADDR_VALUE[31:0]. Address value is sent as follows.
    - If SPI_WR_BIT_ORDER is set, SPI_USR_ADDR_VALUE[31:8] is sent first, and then the lower part of SPI_USR_ADDR_VALUE[7:0], i.e. SPI_USR_ADDR_VALUE[SPI_USR_ADDR_BITLEN - 24:0], is sent.
    - If SPI_WR_BIT_ORDER is cleared, SPI_USR_ADDR_VALUE[31:8] is sent first, and then the higher part of SPI_USR_ADDR_VALUE[7:0], i.e. SPI_USR_ADDR_VALUE[7:31 - SPI_USR_ADDR_BITLEN], is sent.

27.5.8.3 Full-Duplex Communication (1-bit Mode Only)

Introduction

GP-SPI2 supports SPI full-duplex communication. In this mode, SPI master provides CLK and CS signals, exchanging data with SPI slave in 1-bit mode via MOSI (FSPID, sending) and MISO (FSPIQ, receiving) at the same time. To enable this communication mode, set the bit SPI_DOUTDIN in register SPI_USER_REG. Figure 27-7 illustrates the connection of GP-SPI2 with its slave in full-duplex communication.

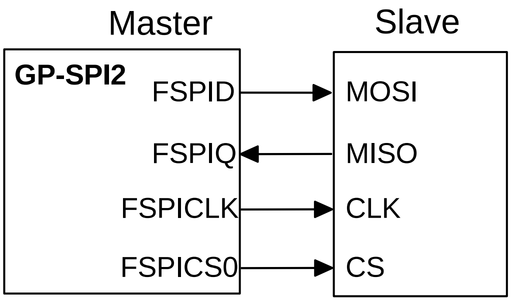

Figure 27-7. Full-Duplex Communication Between GP-SPI2 Master and a Slave

In full-duplex communication, the behavior of states CMD, ADDR, DUMMY, DOUT and DIN are configurable. Usually, the states CMD, ADDR and DUMMY are not used in this communication. The bit length of transferred data is configured in SPI_MS_DATA_BITLEN. The actual bit length used in communication equals to (SPI_MS_DATA_BITLEN + 1).

Configuration

To start a data transfer, follow the steps below:

- Configure the IO path via IO MUX or GPIO matrix between GP-SPI2 and an external SPI device.
- Configure APB clock (APB_CLK, see Chapter 6 *Reset and Clock*) and module clock (clk_spi_mst) for the GP-SPI2 module.
- Set SPI_DOUTDIN and clear SPI_SLAVE_MODE, to enable full-duplex communication in master mode.
- Configure GP-SPI2 registers listed in Table 27-8.
- Configure SPI CS setup time and hold time according to Section 27.6.
- Set the property of FSPICLK according to Section 27.7.
- Prepare data according to the selected transfer mode:
  - In CPU-controlled MOSI mode, prepare data in registers SPI_W0_REG ~ SPI_W15_REG.
  - In DMA-controlled mode,
    - configure SPI_DMA_TX_ENA/SPI_DMA_RX_ENA
    - configure GDMA TX/RX link
    - start GDMA TX/RX engine, as described in Section 27.5.6 and Section 27.5.7.
- Configure interrupts and wait for SPI slave to get ready for transfer.
- Set SPI_DMA_AFIFO_RST, SPI_BUF_AFIFO_RST, and SPI_RX_AFIFO_RST to reset these buffers.
- Set SPI_USR in register SPI_CMD_REG to start the transfer and wait for the configured interrupts.

27.5.8.4 Half-Duplex Communication (1/2/4-bit Mode)

Introduction

In this mode, GP-SPI2 provides CLK and CS signals. Only one side (SPI master or slave) can send data at a time, while the other side receives the data. To enable this communication mode, clear the bit SPI_DOUTDIN in register SPI_USER_REG. The standard format of SPI half-duplex communication is CMD + [ADDR +] [DUMMY +] [DOUT or DIN]. The states ADDR, DUMMY, DOUT, and DIN are optional, and can be disabled or enabled independently.

As described in Section 27.5.8.2, the properties of GP-SPI2 states: CMD, ADDR, DUMMY, DOUT and DIN, such as cycle length, value, and parallel bus bit mode, can be set independently. For the register configuration, see Table 27-8.

The detailed properties of half-duplex GP-SPI2 are as follows:

1. CMD: 0 ~ 16 bits, master output, slave input.
2. ADDR: 0 ~ 32 bits, master output, slave input.
3. DUMMY: 0 ~ 256 FSPICLK cycles, master output, slave input.
4. DOUT: 0 ~ 512 bits (64 B) in CPU-controlled mode and 0 ~ 256 Kbits (32 KB) in DMA-controlled mode, master output, slave input.

5. DIN: 0 ~ 512 bits (64 B) in CPU-controlled mode and 0 ~ 256 Kbits (32 KB) in DMA-controlled mode, master input, slave output.

Configuration

The register configuration is as follows:

1. Configure the IO path via IO MUX or GPIO matrix between GP-SPI2 and an external SPI device.
2. Configure APB clock (APB_CLK) and module clock (clk_spi_mst) for the GP-SPI2 module.
3. Clear SPI_DOUTDIN and SPI_SLAVE_MODE, to enable half-duplex communication in master mode.
4. Configure GP-SPI2 registers listed in Table 27-8.
5. Configure SPI CS setup time and hold time according to Section 27.6.
6. Set the property of FSPICLK according to Section 27.7.
7. Prepare data according to the selected transfer mode:
   - In CPU-controlled MOSI mode, prepare data in registers SPI_W0_REG ~ SPI_W15_REG.
   - In DMA-controlled mode,
     - configure SPI_DMA_TX_ENA/SPI_DMA_RX_ENA
     - configure GDMA TX/RX link
     - start GDMA TX/RX engine, as described in Section 27.5.6 and Section 27.5.7.
8. Configure interrupts and wait for SPI slave to get ready for transfer.
9. Set SPI_DMA_AFIFO_RST, SPI_BUF_AFIFO_RST, and SPI_RX_AFIFO_RST to reset these buffers.
10. Set SPI_USR in register SPI_CMD_REG to start the transfer and wait for the configured interrupts.

Application Example

The following example shows how GP-SPI2 to access flash and external RAM in master half-duplex mode.

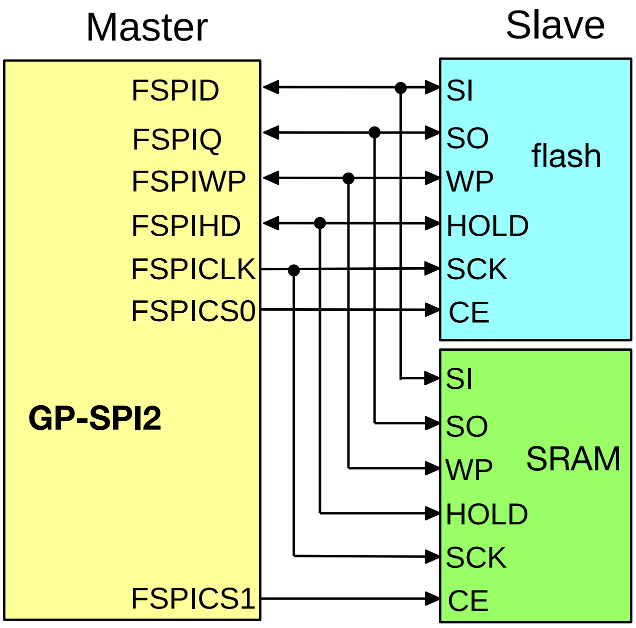

Figure 27-8. Connection of GP-SPI2 to Flash and External RAM in 4-bit Mode

Figure 27-9 indicates GP-SPI2 Quad I/O Read sequence according to standard flash specification. Other GP-SPI2 command sequences are implemented in accordance with the requirements of SPI slaves.

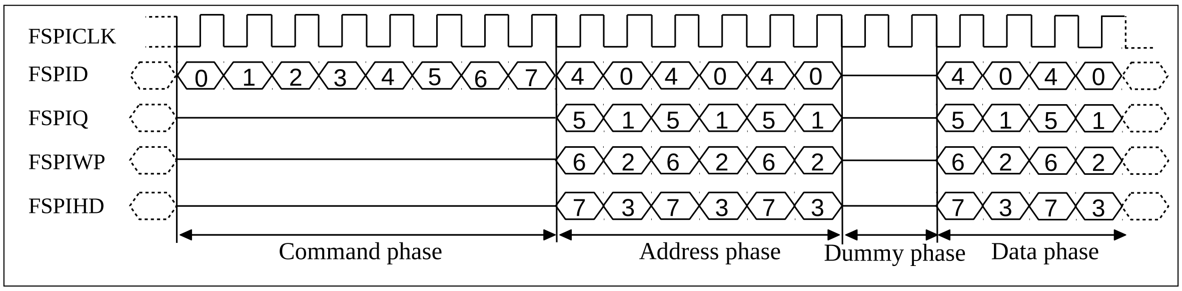

Figure 27-9. SPI Quad I/O Read Command Sequence Sent by GP-SPI2 to Flash

27.5.8.5 DMA-Controlled Configurable Segmented Transfer

Note:
Note that there is no separate section on how to configure a single transfer in master mode, since the CONF state of a configurable segmented transfer can be skipped to implement a single transfer.

Introduction

When GP-SPI2 works as a master, it provides a feature named: configurable segmented transfer controlled by DMA.

A DMA-controlled transfer in master mode can be

- a single transfer, consisting of only one transaction;
- or a configurable segmented transfer, consisting of several transactions (segments).

In a configurable segmented transfer, the registers of its each single transaction (segment) are configurable.

This feature enables GP-SPI2 to do as many as transactions (segments) as configured when such transfer is triggered once by CPU. Figure 27-10 shows how this feature works.

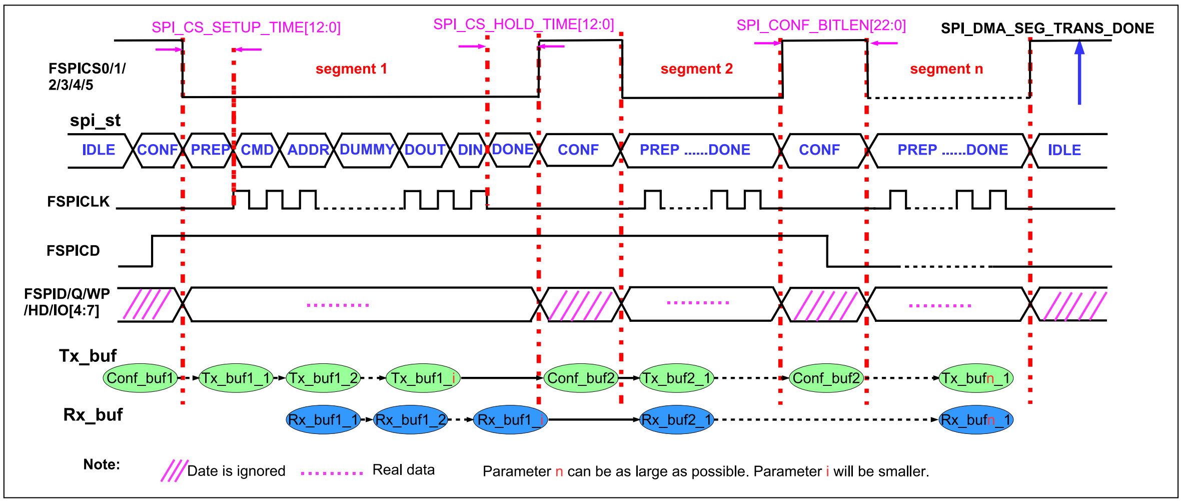

Figure 27-10. Configurable Segmented Transfer in DMA-Controlled Master Mode

As shown in Figure 27-10, the registers for one transaction (segment *n*) can be reconfigured by GP-SPI2 hardware according to the content in its Conf_buf*n* during a CONF state, before this segment starts.

It's recommended to provide separate GDMA CONF links and CONF buffers (Conf_buf*i* in Figure 27-10) for each CONF state. A GDMA TX link is used to connect all the CONF buffers and TX data buffers (Tx_buf*i* in Figure 27-10) into a chain. Hence, the behavior of the FSPI bus in each segment can be controlled independently.

For example, in a configurable segmentent transfer, its segment*i*, segment*j*, and segment*k* can be configured to full-duplex, half-duplex MISO, and half-duplex MOSI, respectively. *i*, *j*, and *k* are integer variables, which can be any segment number.

Meanwhile, the state of GP-SPI2, the data length and cycle length of the FSPI bus, and the behavior of the GDMA, can be configured independently for each segment. When this whole DMA-controlled transfer (consisting of several segments) has finished, a GP-SPI2 interrupt, SPI_DMA_SEG_TRANS_DONE_INT, is triggered.

Configuration

1. Configure the IO path via IO MUX or GPIO matrix between GP-SPI2 and an external SPI device.
2. Configure APB clock (APB_CLK) and module clock (clk_spi_mst) for GP-SPI2 module.
3. Clear SPI_DOUTDIN and SPI_SLAVE_MODE, to enable half-duplex communication in master mode.
4. Configure GP-SPI2 registers listed in Table 27-8.
5. Configure SPI CS setup time and hold time according to Section 27.6.
6. Set the property of FSPICLK according to Section 27.7.
7. Prepare descriptors for GDMA CONF buffer and TX data (optional) for each segment. Chain the descriptors of CONF buffer and TX buffers of several segments into one linked list.
8. Similarly, prepare descriptors for RX buffers for each segment and chain them into one linked list.

9. Configure all the needed CONF buffers, TX buffers and RX buffers, respectively for each segment before this DMA-controlled transfer begins.
10. Point GDMA_OUTLINK_ADDR_CH*n* to the head address of the CONF and TX buffer descriptor linked list, and then set GDMA_OUTLINK_START_CH*n* to start the TX GDMA.
11. Clear the bit SPI_RX_EOF_EN in register SPI_DMA_CONF_REG. Point GDMA_INLINK_ADDR_CH*n* to the head address of the RX buffer descriptor linked list, and then set GDMA_INLINK_START_CH*n* to start the RX GDMA.
12. Set SPI_USR_CONF to enable CONF state.
13. Set SPI_DMA_SEG_TRANS_DONE_INT_ENA to enable the SPI_DMA_SEG_TRANS_DONE_INT interrupt. Configure other interrupts if needed according to Section 27.9.
14. Wait for all the slaves to get ready for transfer.
15. Set SPI_DMA_AFIFO_RST, SPI_BUF_AFIFO_RST and SPI_RX_AFIFO_RST, to reset these buffers.
16. Set SPI_USR to start this DMA-controlled transfer.
17. Wait for SPI_DMA_SEG_TRANS_DONE_INT interrupt, which means this transfer has finished and the data has been stored into corresponding memory.

Configuration of CONF Buffer and Magic Value

On GP-SPI2, only registers which will change from the last transaction (segment) need to be re-configured to new values in CONF state. The configuration of other registers can be skipped (i.e. kept the same) to save time and chip resources.

The first word in GDMA CONF buffer*i*, called SPI_BIT_MAP_WORD, defines whether each GP-SPI2 register is to be updated or not in segment*i*. The relation of SPI_BIT_MAP_WORD and GP-SPI2 registers to update can be seen in Table 27-9 Bitmap (BM) Table. If a bit in the BM table is set to 1, its corresponding register value will be updated in this segment. Otherwise, if some registers should be kept from being changed, the related bits should be set to 0.

Table 27-9. GP-SPI2 Master BM Table for CONF State

BM Bit	Register Name	BM Bit	Register Name
0	SPI_ADDR_REG	7	SPI_MISC_REG
1	SPI_CTRL_REG	8	SPI_DIN_MODE_REG
2	SPI_CLOCK_REG	9	SPI_DIN_NUM_REG
3	SPI_USER_REG	10	SPI_DOUT_MODE_REG
4	SPI_USER1_REG	11	SPI_DMA_CONF_REG
5	SPI_USER2_REG	12	SPI_DMA_INT_ENA_REG
6	SPI_MS_DLEN_REG	13	SPI_DMA_INT_CLR_REG

Then new values of all the registers to be modified should be placed right after SPI_BIT_MAP_WORD, in consecutive words in the CONF buffer.

To ensure the correctness of the content in each CONF buffer, the value in SPI_BIT_MAP_WORD[31:28] is used as "magic value", and will be compared with SPI_DMA_SEG_MAGIC_VALUE in the register SPI_SLAVE_REG. The value of SPI_DMA_SEG_MAGIC_VALUE should be configured before this DMA-controlled transfer starts, and can not be changed during these segments.

- If SPI_BIT_MAP_WORD[31:28] == SPI_DMA_SEG_MAGIC_VALUE, this DMA-controlled transfer continues normally; the interrupt SPI_DMA_SEG_TRANS_DONE_INT is triggered at the end of this DMA-controlled transfer.
- If SPI_BIT_MAP_WORD[31:28] != SPI_DMA_SEG_MAGIC_VALUE, GP-SPI2 state (spi_st) goes back to IDLE and the transfer is ended immediately. The interrupt SPI_DMA_SEG_TRANS_DONE_INT is still triggered, with SPI_SEG_MAGIC_ERR_INT_RAW bit set to 1.

CONF Buffer Configuration Example

Table 27-10 and Table 27-11 provide an example to show how to configure a CONF buffer for a transaction (segment *i*) whose SPI_ADDR_REG, SPI_CTRL_REG, SPI_CLOCK_REG, SPI_USER_REG, SPI_USER1_REG need to be updated.

Table 27-10. An Example of CONF buffer*i* in Segment*i*

CONF buffer*i*	Note
SPI_BIT_MAP_WORD	The first word in this buffer. Its value is 0xA000001F in this example when the SPI_DMA_SEG_MAGIC_VALUE is set to 0xA. As shown in Table 27-11, bits 0, 1, 2, 3, and 4 are set, indicating the following registers will be updated.
SPI_ADDR_REG	The second word, stores the new value to SPI_ADDR_REG.
SPI_CTRL_REG	The third word, stores the new value to SPI_CTRL_REG.
SPI_CLOCK_REG	The fourth word, stores the new value to SPI_CLOCK_REG.
SPI_USER_REG	The fifth word, stores the new value to SPI_USER_REG.
SPI_USER1_REG	The sixth word, stores the new value to SPI_USER1_REG.

Table 27-11. BM Bit Value v.s. Register to Be Updated in This Example

BM Bit	Value	Register Name	BM Bit	Value	Register Name
0	1	SPI_ADDR_REG	7	0	SPI_MISC_REG
1	1	SPI_CTRL_REG	8	0	SPI_DIN_MODE_REG
2	1	SPI_CLOCK_REG	9	0	SPI_DIN_NUM_REG
3	1	SPI_USER_REG	10	0	SPI_DOUT_MODE_REG
4	1	SPI_USER1_REG	11	0	SPI_DMA_CONF_REG
5	0	SPI_USER2_REG	12	0	SPI_DMA_INT_ENA_REG
6	0	SPI_MS_DLEN_REG	13	0	SPI_DMA_INT_CLR_REG

Notes:

In a DMA-controlled configurable segmented transfer, please pay special attention to the following bits:

- SPI_USR_CONF: set SPI_USR_CONF before SPI_USR is set, to enable this transfer.
- SPI_USR_CONF_NXT: if segment*i* is not the final transaction of this whole DMA-controlled transfer, its SPI_USR_CONF_NXT should be set to 1.
- SPI_CONF_BITLEN: GP-SPI2 CS setup time and hold time are programmable independently in each segment, see Section 27.6 for detailed configuration. The CS high time in each segment is about:

$$(SPI\_CONF\_BITLEN + 5) \times T_{APB\_CLK}$$

The CS high time in CONF state can be set from 62.5 μs to 3.2768 ms when $f_{\text{APB\_CLK}}$ is 80 MHz. (SPI_CONF_
BITLEN + 5) will overflow from (0x40000 - SPI_CONF_BITLEN - 5) if SPI_CONF_BITLEN is larger than 0x3FFFA.

27.5.9 GP-SPI2 Works as a Slave

GP-SPI2 can be used as a slave to communicate with an SPI master. As a slave, GP-SPI2 supports 1-bit SPI, 2-bit dual SPI, 4-bit quad SPI, and QPI modes, with specific communication formats. To enable this mode, set SPI_SLAVE_MODE in register SPI_SLAVE_REG.

The CS signal must be held low during the transmission, and its falling/rising edges indicate the start/end of a single or segmented transmission. The length of transferred data must be in unit of bytes, otherwise the extra bits will be lost. The extra bits here means the result of total bits % 8.

27.5.9.1 Communication Formats

In GP-SPI2 slave mode, SPI full-duplex and half-duplex communications are available. To select from the two communications, configure SPI_DOUTDIN in register SPI_USER_REG.

Full-duplex communication means that input data and output data are transmitted simultaneously throughout the entire transaction. All bits are treated as input or output data, which means no command, address or dummy states are expected. The interrupt SPI_TRANS_DONE_INT is triggered once the transaction
ends.

In half-duplex communication, the format is CMD+ADDR+DUMMY+DATA (DIN or DOUT).

- "DIN" means that an SPI master reads data from GP-SPI2.
- "DOUT" means that an SPI master writes data to GP-SPI2.

The detailed properties of each state are as follows:

1. CMD:
   - Indicate the function of SPI slave;
   - One byte from master to slave;
   - Only the values in Table 27-12 and Table 27-13 are valid;
   - Can be sent in 1-bit SPI mode or 4-bit QPI mode.
2. ADDR:
   - The address for Wr_BUF and Rd_BUF commands in CPU-controlled transfer, or placeholder bits in other transfers and can be defined by application;
   - One byte from master to slave;
   - Can be sent in 1-bit, 2-bit or 4-bit modes (according to the command).
3. DUMMY:
   - It's value is meaningless. SPI slave prepares data in this state;
   - Bit mode of FSPI bus is also meaningless here;

- Last for eight SPI_CLK cycles.

4. DIN or DOUT:
    - Data length can be 0 ~ 64 B in CPU-controlled mode and unlimited in DMA-controlled mode;
    - Can be sent in 1-bit, 2-bit or 4-bit modes according to the CMD value.

> **Note:**
> The states of ADDR and DUMMY can never be omitted in any half-duplex communications.

When a half-duplex transaction is complete, the transferred CMD and ADDR values are latched into SPI_SLV_
LAST_COMMAND and SPI_SLV_LAST_ADDR respectively. The SPI_SLV_CMD_ERR_INT_RAW will be set if the transferred CMD value is not supported by GP-SPI2 slave mode. The SPI_SLV_CMD_ERR_INT_RAW can only be cleared by software.

27.5.9.2 Supported CMD Values in Half-Duplex Communication

In half-duplex communication, the defined values of CMD determine the transfer types. Unsupported CMD values are disregarded, meanwhile the related transfer is ignored and SPI_SLV_CMD_ERR_INT_RAW is set. The transfer format is CMD (8 bits) + ADDR (8 bits) + DUMMY (8 SPI_CLK cycles) + DATA (unit in bytes). The detailed description of CMD[3:0] is as follows:

1. 0x1 (Wr_BUF): CPU-controlled write mode. Master sends data and GP-SPI2 receives data. The data is stored in the related address of SPI_W0_REG ~ SPI_W15_REG.
2. 0x2 (Rd_BUF): CPU-controlled read mode. Master receives the data sent by GP-SPI2. The data comes from the related address of SPI_W0_REG ~ SPI_W15_REG.
3. 0x3 (Wr_DMA): DMA-controlled write mode. Master sends data and GP-SPI2 receives data. The data is stored in GP-SPI2 GDMA RX buffer.
4. 0x4 (Rd_DMA): DMA-controlled read mode. Master receives the data sent by GP-SPI2. The data comes from GP-SPI2 GDMA TX buffer.
5. 0x7 (CMD7): used to generate an SPI_SLV_CMD7_INT interrupt. It can also generate a GDMA_IN_SUC_EOF
_CH*n*_INT interrupt in a slave segmented transfer when GDMA RX link is used. But it will not end GP-SPI2's slave segmented transfer.
6. 0x8 (CMD8): only used to generate an SPI_SLV_CMD8_INT interrupt, which will not end GP-SPI2's slave segmented transfer.
7. 0x9 (CMD9): only used to generate an SPI_SLV_CMD9_INT interrupt, which will not end GP-SPI2's slave segmented transfer.
8. 0xA (CMDA): only used to generate an SPI_SLV_CMDA_INT interrupt, which will not end GP-SPI2's slave segmented transfer.

The detail function of CMD7, CMD8, CMD9, and CMDA commands is reserved for user definition. These commands can be used as handshake signals, the passwords of some specific functions, the triggers of some user defined actions, and so on.

1/2/4-bit modes in states of CMD, ADDR, DATA are supported, which are determined by value of CMD[7:4]. The DUMMY state is always in 1-bit mode and lasts for eight SPI_CLK cycles. The definition of CMD[7:4] is as follows:

1. 0x0: CMD, ADDR, and DATA states all are in 1-bit mode.
2. 0x1: CMD and ADDR are in 1-bit mode. DATA is in 2-bit mode.
3. 0x2: CMD and ADDR are in 1-bit mode. DATA is in 4-bit mode.
4. 0x5: CMD is in 1-bit mode. ADDR and DATA are in 2-bit mode.
5. 0xA: CMD is in 1-bit mode, ADDR and DATA are in 4-bit mode. Or in QPI mode.

In addition, if the value of CMD[7:0] is 0x05, 0xA5, 0x06, or 0xDD, DUMMY and DATA states are omitted. The definition of CMD[7:0] is as follows:

1. 0x05 (End_SEG_TRANS): master sends 0x05 command to end slave segmented transfer in SPI mode.
2. 0xA5 (End_SEG_TRANS): master sends 0xA5 command to end slave segmented transfer in QPI mode.
3. 0x06 (En_QPI): GP-SPI2 enters QPI mode when receiving the 0x06 command and the bit SPI_QPI_MODE in register SPI_USER_REG is set.
4. 0xDD (Ex_QPI): GP-SPI2 exits QPI mode when receiving the 0xDD command and the bit SPI_QPI_MODE is cleared.

All the GP-SPI2 supported CMD values are listed in Table 27-12 and Table 27-13. Note that DUMMY state is always in 1-bit mode and lasts for eight SPI_CLK cycles.

Table 27-12. Supported CMD Values in SPI Mode

Transfer Type	CMD[7:0]	CMD State	ADDR State	DATA State
Wr_BUF	0x01	1-bit mode	1-bit mode	1-bit mode
	0x11	1-bit mode	1-bit mode	2-bit mode
	0x21	1-bit mode	1-bit mode	4-bit mode
	0x51	1-bit mode	2-bit mode	2-bit mode
	0xA1	1-bit mode	4-bit mode	4-bit mode
Rd_BUF	0x02	1-bit mode	1-bit mode	1-bit mode
	0x12	1-bit mode	1-bit mode	2-bit mode
	0x22	1-bit mode	1-bit mode	4-bit mode
	0x52	1-bit mode	2-bit mode	2-bit mode
	0xA2	1-bit mode	4-bit mode	4-bit mode
Wr_DMA	0x03	1-bit mode	1-bit mode	1-bit mode
	0x13	1-bit mode	1-bit mode	2-bit mode
	0x23	1-bit mode	1-bit mode	4-bit mode
	0x53	1-bit mode	2-bit mode	2-bit mode
	0xA3	1-bit mode	4-bit mode	4-bit mode
Rd_DMA	0x04	1-bit mode	1-bit mode	1-bit mode
	0x14	1-bit mode	1-bit mode	2-bit mode
	0x24	1-bit mode	1-bit mode	4-bit mode
	0x54	1-bit mode	2-bit mode	2-bit mode
	0xA4	1-bit mode	4-bit mode	4-bit mode

Table 27-12. Supported CMD Values in SPI Mode

Transfer Type	CMD[7:0]	CMD State	ADDR State	DATA State
CMD7	0x07	1-bit mode	1-bit mode	-
	0x17	1-bit mode	1-bit mode	-
	0x27	1-bit mode	1-bit mode	-
	0x57	1-bit mode	2-bit mode	-
	0xA7	1-bit mode	4-bit mode	-

	0x18	1-bit mode	1-bit mode	-
	0x28	1-bit mode	1-bit mode	-
	0x58	1-bit mode	2-bit mode	-
	0xA8	1-bit mode	4-bit mode	-
CMD9	0x09	1-bit mode	1-bit mode	-
	0x19	1-bit mode	1-bit mode	-
	0x29	1-bit mode	1-bit mode	-
	0x59	1-bit mode	2-bit mode	-
	0xA9	1-bit mode	4-bit mode	-
CMDA	0x0A	1-bit mode	1-bit mode	-
	0x1A	1-bit mode	1-bit mode	-
	0x2A	1-bit mode	1-bit mode	-
	0x5A	1-bit mode	2-bit mode	-
	0xAA	1-bit mode	4-bit mode	-
End_SEG_TRANS	0x05	1-bit mode	-	-
En_QPI	0x06	1-bit mode	-	-

Table 27-13. Supported CMD Values in QPI Mode

Transfer Type	CMD[7:0]	CMD State	ADDR State	DATA State
Wr_BUF	0xA1	4-bit mode	4-bit mode	4-bit mode
Rd_BUF	0xA2	4-bit mode	4-bit mode	4-bit mode
Wr_DMA	0xA3	4-bit mode	4-bit mode	4-bit mode
Rd_DMA	0xA4	4-bit mode	4-bit mode	4-bit mode
CMD7	0xA7	4-bit mode	4-bit mode	-
CMD8	0xA8	4-bit mode	4-bit mode	-
CMD9	0xA9	4-bit mode	4-bit mode	-
CMDA	0xAA	4-bit mode	4-bit mode	-
End_SEG_TRANS	0xA5	4-bit mode	4-bit mode	-
Ex_QPI	0xDD	4-bit mode	4-bit mode	-

Master sends 0x06 CMD (En_QPI) to set GP-SPI2 slave to QPI mode and all the states of supported transfer will be in 4-bit mode afterwards. If 0xDD CMD (Ex_QPI) is received, GP-SPI2 slave will be back to SPI mode.

Other transfer types than described in Table 27-12 and Table 27-13 are ignored. If the transferred data is not in unit of byte, GP-SPI2 can send or receive these extra bits (total bits % 8), however, the correctness of the data is not guaranteed. But if the CS low time is longer than 2 APB clock (APB_CLK) cycles, SPI_TRANS_DONE_INT will be triggered. For more information on interrupts triggered at the end of transmissions, please refer to Section 27.9.

27.5.9.3 Slave Single Transfer and Slave Segmented Transfer

When GP-SPI2 works as a slave, it supports full-duplex and half-duplex communications controlled by DMA and by CPU. DMA-controlled transfer can be a single transfer, or a slave segmented transfer consisting of several transactions (segments). The CPU-controlled transfer can only be one single transfer, since each CPU-controlled transaction needs to be triggered by CPU.

In a slave segmented transfer, all transfer types listed in Table 27-12 and Table 27-13 are supported in a single transaction (segment). It means that CPU-controlled transaction and DMA-controlled transaction can be mixed in one slave segmented transfer.

It is recommended that in a slave segmented transfer:

- CPU-controlled transaction is used for handshake communication and short data transfers.
- DMA-controlled transaction is used for large data transfers.

27.5.9.4 Configuration of Slave Single Transfer

In slave mode, GP-SPI2 supports CPU/DMA-controlled full-duplex/half-duplex single transfers. The register configuration procedure is as follows:

1. Configure the IO path via IO MUX or GPIO matrix between GP-SPI2 and an external SPI device.
2. Configure APB clock (APB_CLK).
3. Set the bit SPI_SLAVE_MODE, to enable slave mode.
4. Configure SPI_DOUTDIN:
    - 1: enable full-duplex communication.
    - 0: enable half-duplex communication.
5. Prepare data:
    - if CPU-controlled transfer mode is selected and GP-SPI2 is used to send data, then prepare data in registers SPI_W0_REG ~ SPI_W15_REG.
    - if DMA-controlled transfer mode is selected,
        - configure SPI_DMA_TX_ENA/SPI_DMA_RX_ENA and SPI_RX_EOF_EN.
        - configure GDMA TX/RX link.
        - start GDMA TX/RX engine, as described in Section 27.5.6 and Section 27.5.7.
6. Set SPI_DMA_AFIFO_RST, SPI_BUF_AFIFO_RST, and SPI_RX_AFIFO_RST to reset these buffers.
7. Clear SPI_DMA_SLV_SEG_TRANS_EN in register SPI_DMA_CONF_REG to enable slave single transfer mode.
8. Set SPI_TRANS_DONE_INT_ENA in SPI_DMA_INT_ENA_REG and wait for the interrupt SPI_TRANS_DONE_INT. In DMA-controlled mode, it is recommended to wait for the interrupt

GDMA_IN_SUC_EOF_CH*n*_INT when GDMA RX buffer is used, which means that data has been stored in the related memory. Other interrupts described in Section 27.9 are optional.

27.5.9.5 Configuration of Slave Segmented Transfer in Half-Duplex

GDMA must be used in this mode. The register configuration procedure is as follows:

1. Configure the IO path via IO MUX or GPIO matrix between GP-SPI2 and an external SPI device.
2. Configure APB clock (APB_CLK).
3. Set SPI_SLAVE_MODE to enable slave mode.
4. Clear SPI_DOUTDIN to enable half-duplex communication.
5. Prepare data in registers SPI_W0_REG ~ SPI_W15_REG, if needed.
6. Set SPI_DMA_AFIFO_RST, SPI_BUF_AFIFO_RST and SPI_RX_AFIFO_RST to reset these buffers.
7. Set bits SPI_DMA_RX_ENA and SPI_DMA_TX_ENA. Clear the bit SPI_RX_EOF_EN. Configure GDMA TX/RX link and start GDMA TX/RX engine, as shown in Section 27.5.6 and Section 27.5.7.
8. Set SPI_DMA_SLV_SEG_TRANS_EN in SPI_DMA_CONF_REG to enable slave segmented transfer.
9. Set SPI_DMA_SEG_TRANS_DONE_INT_ENA in SPI_DMA_INT_ENA_REG and wait for the interrupt SPI_DMA_SEG_TRANS_DONE_INT, which means that the segmented transfer has finished and data has been put into the related memory. Other interrupts described in Section 27.9 are optional.

When End_SEG_TRANS (0x05 in SPI mode, 0xA5 in QPI mode) is received by GP-SPI2, this slave segmented transfer is ended and the interrupt SPI_DMA_SEG_TRANS_DONE_INT is triggered.

27.5.9.6 Configuration of Slave Segmented Transfer in Full-Duplex

GDMA must be used in this mode. In such transfer, the data is transferred from and to the GDMA buffer. The interrupt GDMA_IN_SUC_EOF_CH*n*
_INT is triggered when the transfer ends. The configuration procedure is as follows:

1. Configure the IO path via IO MUX or GPIO matrix between GP-SPI2 and an external SPI device.
2. Configure APB clock (APB_CLK).
3. Set SPI_SLAVE_MODE and SPI_DOUTDIN, to enable full-duplex communication in slave mode.
4. Set SPI_DMA_AFIFO_RST, SPI_BUF_AFIFO_RST, and SPI_RX_AFIFO_RST bit, to reset these buffers.
5. Set SPI_DMA_TX_ENA/SPI_DMA_RX_ENA. Configure GDMA TX/RX link and start GDMA TX/RX engine, as shown in Section 27.5.6 and Section 27.5.7.
6. Set the bit SPI_RX_EOF_EN in register SPI_DMA_CONF_REG. Configure SPI_MS_DATA_BITLEN[17:0] in register SPI_MS_DLEN_REG to the byte length of the received DMA data.
7. Set SPI_DMA_SLV_SEG_TRANS_EN in SPI_DMA_CONF_REG to enable slave segmented transfer mode.
8. Set GDMA_IN_SUC_EOF_CH*n*_INT_ENA and wait for the interrupt GDMA_IN_SUC_EOF_CH*n*_INT.

27.6 CS Setup Time and Hold Time Control

SPI bus CS (SPI_CS) setup time and hold time are very important to meet the timing requirements of various SPI devices (e.g. flash or PSRAM).

CS setup time is the time between the CS falling edge and the first latch edge of SPI bus CLK (SPI_CLK). The first latch edge for mode 0 and mode 3 is rising edge, and falling edge for mode 2 and mode 4.

CS hold time is the time between the last latch edge of SPI_CLK and the CS rising edge.

In slave mode, the CS setup time and hold time should be longer than 0.5 x T_SPI_CLK, otherwise the SPI transfer may be incorrect. T_SPI_CLK: one cycle of SPI_CLK.

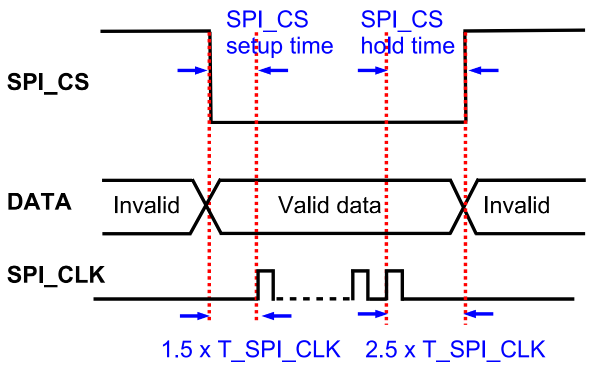
In master mode, set the CS setup time by specifying SPI_CS_SETUP in SPI_USER_REG and SPI_CS_SETUP_TIME in SPI_USER1_REG:

- If SPI_CS_SETUP is cleared, the SPI CS setup time is 0.5 x T_SPI_CLK.
- If SPI_CS_SETUP is set, the SPI CS setup time is (SPI_CS_SETUP_TIME + 1.5) x T_SPI_CLK.

Set the CS hold time by specifying SPI_CS_HOLD in SPI_USER_REG and SPI_CS_HOLD_TIME in SPI_USER1_REG:

- If SPI_CS_HOLD is cleared, the SPI CS hold time is 0.5 x T_SPI_CLK;
- If SPI_CS_HOLD is set, the SPI CS hold time is (SPI_CS_HOLD_TIME + 1.5) x T_SPI_CLK.

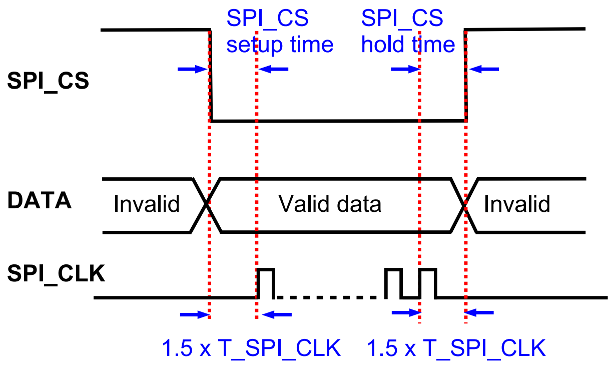
Figure 27-11 and Figure 27-12 show the recommended CS timing and register configuration to access external RAM and flash.



Register Configurations:

SPI_CS_SETUP = 1; SPI_CS_SETUP_TIME = 0;
SPI_CS_HOLD = 1; SPI_CS_HOLD_TIME = 1.

Figure 27-11. Recommended CS Timing and Settings When Accessing External RAM



Register Configurations:

SPI_CS_SETUP = 1; SPI_CS_SETUP_TIME = 0;
SPI_CS_HOLD = 1; SPI_CS_HOLD_TIME = 0.

Figure 27-12. Recommended CS Timing and Settings When Accessing Flash

27.7 GP-SPI2 Clock Control

GP-SPI2 has the following clocks:

- clk_spi_mst: module clock of GP-SPI2, derived from PLL_CLK. Used in GP-SPI2 master mode, to generate SPI_CLK signal for data transfer and for slaves.
- SPI_CLK: output clock in master mode.
- APB_CLK: clock for register configuration.

In master mode, the maximum output clock frequency of GP-SPI2 is $f_{\text{clk\_spi\_mst}}$. To have slower frequencies, the output clock frequency can be divided as follows:

$$f_{\text{SPI\_CLK}} = \frac{f_{\text{clk\_spi\_mst}}}{(\text{SPI\_CLKCNT\_N} + 1)(\text{SPI\_CLKDIV\_PRE} + 1)}$$

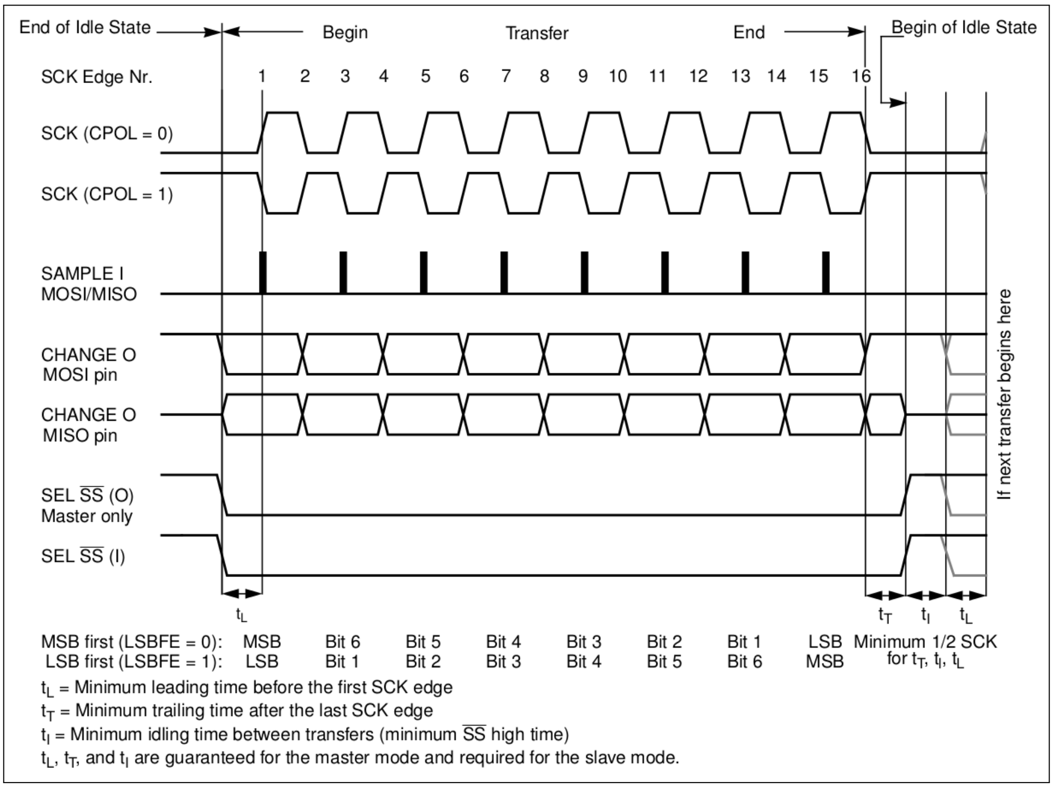
The divider is configured by SPI_CLKCNT_N and SPI_CLKDIV_PRE in register SPI_CLOCK_REG. When the bit SPI_CLK_EQU_SYSCLK in register SPI_CLOCK_REG is set to 1, the output clock frequency of GP-SPI2 will be $f_{\text{clk\_spi\_mst}}$. And for other integral clock divisions, SPI_CLK_EQU_SYSCLK should be set to 0.

In slave mode, the supported input clock frequency ($f_{\text{SPI\_CLK}}$) of GP-SPI2 is:

- If $f_{\text{APB\_CLK}}$ >= 60 MHz, $f_{\text{SPI\_CLK}}$ <= 60 MHz;
- If $f_{\text{APB\_CLK}}$ < 60 MHz, $f_{\text{SPI\_CLK}}$ <= $f_{\text{APB\_CLK}}$.

27.7.1 Clock Phase and Polarity

There are four clock modes in SPI protocol, modes 0 ~ 3, see Figure 27-13 and Figure 27-14 (excerpted from SPI protocol):



End of Idle State
Begin
Transfer
End
Begin of Idle State

Figure 27-14. SPI Clock Mode 1 or 3

1. Mode 0: CPOL = 0, CPHA = 0; SCK is 0 when the SPI is in idle state; data is changed on the negative edge of SCK and sampled on the positive edge. The first data is shifted out before the first negative edge of SCK.

2. Mode 1: CPOL = 0, CPHA = 1; SCK is 0 when the SPI is in idle state; data is changed on the positive edge of SCK and sampled on the negative edge.
3. Mode 2: CPOL = 1, CPHA = 0; SCK is 1 when the SPI is in idle state; data is changed on the positive edge of SCK and sampled on the negative edge. The first data is shifted out before the first positive edge of SCK.
4. Mode 3: CPOL = 1, CPHA = 1; SCK is 1 when the SPI is in idle state; data is changed on the negative edge of SCK and sampled on the positive edge.

27.7.2 Clock Control in Master Mode

The four clock modes 0 ~ 3 are supported in GP-SPI2 master mode. The polarity and phase of GP-SPI2 clock are controlled by the bit SPI_CK_IDLE_EDGE in register SPI_MISC_REG and the bit SPI_CK_OUT_EDGE in register SPI_USER_REG. The register configuration for SPI clock modes 0 ~ 3 is provided in Table 27-14, and can be changed according to the path delay in the application.

Table 27-14. Clock Phase and Polarity Configuration in Master Mode

Control Bit	Mode 0	Mode 1	Mode 2	Mode 3
SPI_CK_IDLE_EDGE	0	0	1	1
SPI_CK_OUT_EDGE	0	1	1	0

SPI_CLK_MODE is used to select the number of rising edges of SPI_CLK, when SPI_CS raises high, to be 0, 1, 2 or SPI_CLK always on.

Note:
When SPI_CLK_MODE is configured to 1 or 2, the bit SPI_CS_HOLD must be set and the value of SPI_CS_HOLD_TIME should be larger than 1.

27.7.3 Clock Control in Slave Mode

GP-SPI2 slave mode also supports clock modes 0 ~ 3. The polarity and phase are configured by the bits SPI_TSCK_I_EDGE and SPI_RSCK_I_EDGE in register SPI_USER_REG. The output edge of data is controlled by SPI_CLK_MODE_13 in register SPI_SLAVE_REG. The detailed register configuration is shown in Table 27-15:

Table 27-15. Clock Phase and Polarity Configuration in Slave Mode

Control Bit	Mode 0	Mode 1	Mode 2	Mode 3
SPI_TSCK_I_EDGE	0	1	1	0
SPI_RSCK_I_EDGE	0	1	1	0
SPI_CLK_MODE_13	0	1	0	1

27.8 GP-SPI2 Timing Compensation

Introduction

The I/O lines are mapped via GPIO Matrix or IO MUX. But there is no timing adjustment in IO MUX. The input data and output data can be delayed for 1 or 2 APB_CLK cycles at the rising or falling edge in GPIO matrix. For detailed register configuration, see Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)*.

Figure 27-15 shows the timing compensation control for GP-SPI2 master mode, including the following paths:

- "CLK": the output path of GP-SPI2 bus clock. The clock is sent out by SPI_CLK out control module, passes through GPIO Matrix or IO MUX and then goes to an external SPI device.
- "IN": data input path of GP-SPI2. The input data from an external SPI device passes through GPIO Matrix or IO MUX, then is adjusted by the Timing Module and finally is stored into spi_rx_afifo.
- "OUT": data output path of GP-SPI2. The output data is sent out to the Timing Module, passes through GPIO Matrix or IO MUX and is then captured by an external SPI device.

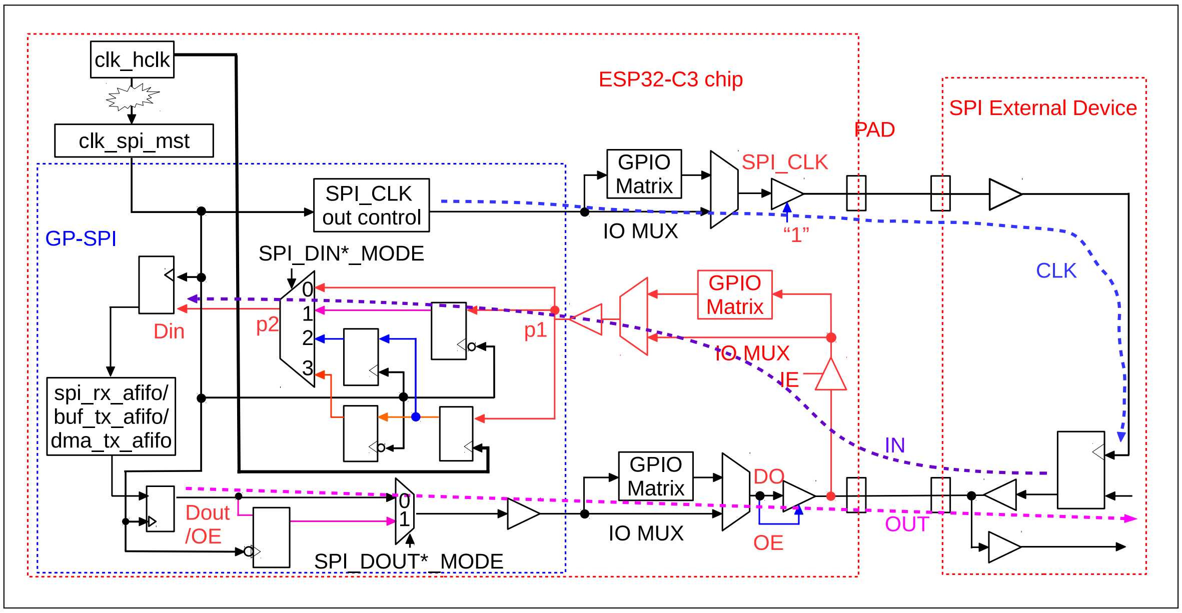

Figure 27-15. Timing Compensation Control Diagram in GP-SPI2 Master Mode

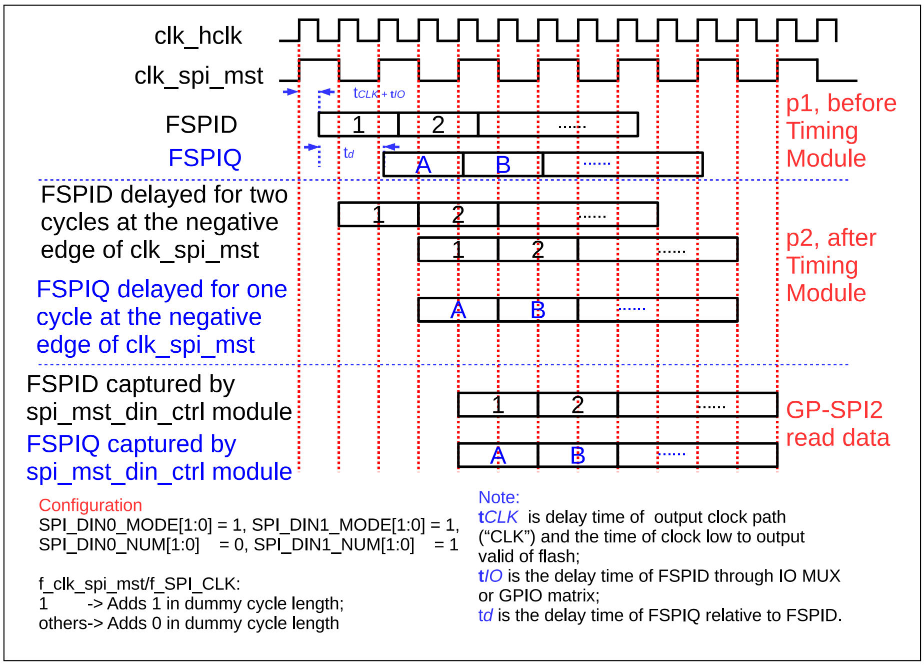
Every input and output data is passing through the Timing Module and the module can be used to apply delay in units of $T_{\text{clk\_spi\_mst}}$ (one cycle of clk_spi_mst) on rising or falling edge.

Key Registers

- SPI_DIN_MODE_REG: select the latch edge of input data
- SPI_DIN_NUM_REG: select the delay cycles of input data
- SPI_DOUT_MODE_REG: select the latch edge of output data

Timing Compensation Example

Figure 27-16 shows a timing compensation example in GP-SPI2 master mode. Note that DUMMY cycle length is configurable to compensate the delay in I/O lines, so as to enhance the performance of GP-SPI2.



clk_hclk
clk_spi_mst

FSPIQ
tCLK+ tIO
td
1
2
......
A
B
p1, before Timing Module
FSPID delayed for two cycles at the negative edge of clk_spi_mst
FSPIQ delayed for one cycle at the negative edge of clk_spi_mst
p2, after Timing Module
FSPID captured by spi_mst_din_ctrl module
FSPIQ captured by spi_mst_din_ctrl module
GP-SPI2 read data

Configuration
SPI_DIN0_MODE[1:0] = 1, SPI_DIN1_MODE[1:0] = 1,
SPI_DIN0_NUM[1:0] = 0, SPI_DIN1_NUM[1:0] = 1

f_clk_spi_mst/f_SPI_CLK:
1 -> Adds 1 in dummy cycle length;
others-> Adds 0 in dummy cycle length

Note:
t*CLK* is delay time of output clock path ("CLK") and the time of clock low to output valid of flash;
t*IO* is the delay time of FSPID through IO MUX or GPIO matrix;
td is the delay time of FSPIQ relative to FSPID.

Figure 27-16. Timing Compensation Example in GP-SPI2 Master Mode

In Figure 27-16, "p1" is the point of input data of Timing Module, "p2" is the point of output data of Timing Module. Since the input data FSPIQ is unaligned to FSPID, the read data of GP-SPI2 will be wrong without the timing compensation.

To get correct read data, follow the the settings below, assuing $f_{clk\_spi\_mst}$ equals to f_{SPI_CLK}:

- Delay FSPID for two cycles at the falling edge of clk_spi_mst.
- Delay FSPIQ for one cycle at the falling edge of clk_spi_mst.
- Add one extra dummy cycle.

In GP-SPI2 slave mode, if the bit SPI_RSCK_DATA_OUT in register SPI_SLAVE_REG is set to 1, the output data is sent at latch edge, which is half an SPI clock cycle earlier. This can be used for slave mode timing compensation.

27.9 Interrupts

Interrupt Summary

GP-SPI2 provides an SPI interface interrupt SPI_INT. When an SPI transfer ends, an interrupt is generated in GP-SPI2. The interrupt may be one or more of the following ones:

- SPI_DMA_INFIFO_FULL_ERR_INT: triggered when GDMA RX FIFO length is shorter than the real transferred data length.
- SPI_DMA_OUTFIFO_EMPTY_ERR_INT: triggered when GDMA TX FIFO length is shorter than the real transferred data length.
- SPI_SLV_EX_QPI_INT: triggered when Ex_QPI is received correctly in GP-SPI2 slave mode and the SPI transfer ends.

- SPI_SLV_EN_QPI_INT: triggered when En_QPI is received correctly in GP-SPI2 slave mode and the SPI transfer ends.
- SPI_SLV_CMD7_INT: triggered when CMD7 is received correctly in GP-SPI2 slave mode and the SPI transfer ends.
- SPI_SLV_CMD8_INT: triggered when CMD8 is received correctly in GP-SPI2 slave mode and the SPI transfer ends.
- SPI_SLV_CMD9_INT: triggered when CMD9 is received correctly in GP-SPI2 slave mode and the SPI transfer ends.
- SPI_SLV_CMDA_INT: triggered when CMDA is received correctly in GP-SPI2 slave mode and the SPI transfer ends.
- SPI_SLV_RD_DMA_DONE_INT: triggered at the end of Rd_DMA transfer in slave mode.
- SPI_SLV_WR_DMA_DONE_INT: triggered at the end of Wr_DMA transfer in slave mode.
- SPI_SLV_RD_BUF_DONE_INT: triggered at the end of Rd_BUF transfer in slave mode.
- SPI_SLV_WR_BUF_DONE_INT: triggered at the end of Wr_BUF transfer in slave mode.
- SPI_TRANS_DONE_INT: triggered at the end of SPI bus transfer in both master and slave modes.
- SPI_DMA_SEG_TRANS_DONE_INT: triggered at the end of End_SEG_TRANS transfer in GP-SPI2 slave segmented transfer mode or at the end of configurable segmented transfer in master mode.
- SPI_SEG_MAGIC_ERR_INT: triggered when a Magic error occurs in CONF buffer during configurable segmented transfer in master mode.
- SPI_MST_RX_AFIFO_WFULL_ERR_INT: triggered by RX AFIFO write-full error in GP-SPI2 master mode.
- SPI_MST_TX_AFIFO_REMPTY_ERR_INT: triggered by TX AFIFO read-empty error in GP-SPI2 master mode.
- SPI_SLV_CMD_ERR_INT: triggered when a received command value is not supported in GP-SPI2 slave mode.
- SPI_APP2_INT: used and triggered by software. It is only used for user defined function.
- SPI_APP1_INT: used and triggered by software. It is only used for user defined function.

Interrupts Used in Master and Slave Modes

Table 27-16 and Table 27-17 show the interrupts used in GP-SPI2 master and slave modes. Set the interrupt enable bit SPI_*_INT_ENA in SPI_DMA_INT_ENA_REG and wait for the SPI_INT interrupt. When the transfer ends, the related interrupt is triggered and should be cleared by software before the next transfer.

Table 27-16. GP-SPI2 Master Mode Interrupts

Transfer Type	Communication Mode	Controlled by	Interrupt
Single Transfer	Full-duplex	DMA	GDMA_IN_SUC_EOF_CH*n*_INT [1]
		CPU	SPI_TRANS_DONE_INT [2]
	Half-duplex MOSI Mode	DMA	SPI_TRANS_DONE_INT
		CPU	SPI_TRANS_DONE_INT
	Half-duplex MISO Mode	DMA	GDMA_IN_SUC_EOF_CH*n*_INT

Table 27-16. GP-SPI2 Master Mode Interrupts

Transfer Type	Communication Mode	Controlled by	Interrupt
		CPU	SPI_TRANS_DONE_INT
Configurable Segmented Transfer	Full-duplex	DMA	SPI_DMA_SEG_TRANS_DONE_INT [3]
		CPU	Not supported
	Half-duplex MOSI Mode	DMA	SPI_DMA_SEG_TRANS_DONE_INT
		CPU	Not supported
	Half-duplex MISO	DMA	SPI_DMA_SEG_TRANS_DONE_INT
		CPU	Not supported

Note:

1. If GDMA_IN_SUC_EOF_CHn_INT is triggered, it means all the RX data of GP-SPI2 has been stored in the RX buffer, and the TX data has been transferred to the slave.
2. SPI_TRANS_DONE_INT is triggered when CS is high, which indicates that master has completed the data exchange in SPI_W0_REG ~ SPI_W15_REG with slave in this mode.
3. If SPI_DMA_SEG_TRANS_DONE_INT is triggered, it means that the whole configurable segmented transfer (consisting of several segments) has finished, i.e. the RX data has been stored in the RX buffer completely and all the TX data has been sent out.

Table 27-17. GP-SPI2 Slave Mode Interrupts

Transfer Type	Communication Mode	Controlled by	Interrupt
Single Transfer	Full-duplex	DMA	GDMA_IN_SUC_EOF_CHn_INT [1]
		CPU	SPI_TRANS_DONE_INT [2]
	Half-duplex MOSI Mode	DMA (Wr_DMA)	GDMA_IN_SUC_EOF_CHn_INT[3]
		CPU (Wr_BUF)	SPI_TRANS_DONE_INT[4]
	Half-duplex MISO Mode	DMA (Rd_DMA)	SPI_TRANS_DONE_INT[5]
		CPU (Rd_BUF)	SPI_TRANS_DONE_INT[6]
Slave Segmented Transfer	Full-duplex	DMA	GDMA_IN_SUC_EOF_CHn_INT[7]
		CPU	Not supported[8]
	Half-duplex MOSI Mode	DMA (Wr_DMA)	SPI_DMA_SEG_TRANS_DONE_INT[9]
		CPU (Wr_BUF)	Not supported[10]
	Half-duplex MISO Mode	DMA (Rd_DMA)	SPI_DMA_SEG_TRANS_DONE_INT[11]
		CPU (Rd_BUF)	Not supported[12]

Note:

1. If GDMA_IN_SUC_EOF_CHn_INT is triggered, it means all the RX data has been stored in the RX buffer, and the TX data has been sent to the slave.
2. SPI_TRANS_DONE_INT is triggered when CS is high, which indicates that master has completed the data exchange in SPI_W0_REG ~ SPI_W15_REG with slave in this mode.
3. SPI_SLV_WR_DMA_DONE_INT just means that the transmission on the SPI bus is done, but can not ensure that all the push data has been stored in the RX buffer. For this reason, GDMA_IN_SUC_EOF_CHn_INT is recommended.
4. Or wait for SPI_SLV_WR_BUF_DONE_INT.

5. Or wait for SPI_SLV_RD_DMA_DONE_INT.
6. Or wait for SPI_SLV_RD_BUF_DONE_INT.
7. Slave should set the total read data byte length in SPI_MS_DATA_BITLEN before the transfer begins. And set SPI_RX_EOF_EN 0→1 before the end of the interrupt program.
8. Master and slave should define a method to end the segmented transfer, such as via GPIO interrupt and so on.
9. Master sends End_SEG_TRAN to end the segmented transfer or slave sets the total read data byte length in SPI_MS_DATA_BITLEN and waits for GDMA_IN_SUC_EOF_CH*n*_INT.
10. Half-duplex Wr_BUF single transfer can be used in a DMA-controlled segmented transfer.
11. Master sends End_SEG_TRAN to end the segmented transfer.
12. Half-duplex Rd_BUF single transfer can be used in a DMA-controlled segmented transfer.

27.10 Register Summary

The addresses in this section are relative to SPI base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

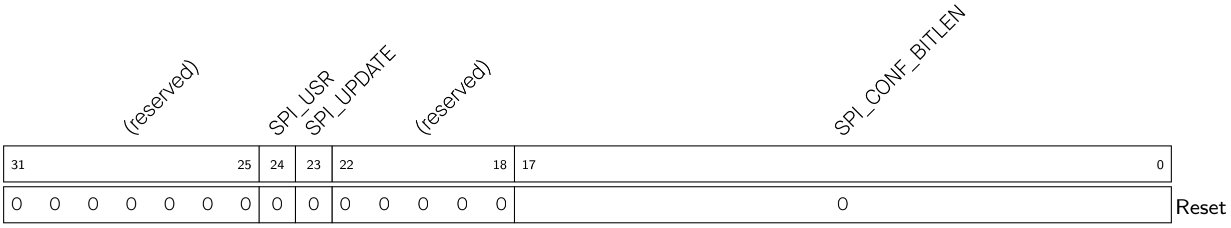
Name	Description	Address	Access
User-defined control registers			
SPI_CMD_REG	Command control register	0x0000	varies
SPI_ADDR_REG	Address value register	0x0004	R/W
SPI_USER_REG	SPI USER control register	0x0010	varies
SPI_USER1_REG	SPI USER control register 1	0x0014	R/W
SPI_USER2_REG	SPI USER control register 2	0x0018	R/W
Control and configuration registers			
SPI_CTRL_REG	SPI control register	0x0008	R/W
SPI_MS_DLEN_REG	SPI data bit length control register	0x001C	R/W
SPI_MISC_REG	SPI MISC register	0x0020	R/W
SPI_DMA_CONF_REG	SPI DMA control register	0x0030	varies
SPI_SLAVE_REG	SPI slave control register	0x00E0	varies
SPI_SLAVE1_REG	SPI slave control register 1	0x00E4	R/W/SS
Clock control registers			
SPI_CLOCK_REG	SPI clock control register	0x000C	R/W
SPI_CLK_GATE_REG	SPI module clock and register clock control	0x00E8	R/W
Timing registers			
SPI_DIN_MODE_REG	SPI input delay mode configuration	0x0024	R/W
SPI_DIN_NUM_REG	SPI input delay number configuration	0x0028	R/W
SPI_DOUT_MODE_REG	SPI output delay mode configuration	0x002C	R/W
Interrupt registers			
SPI_DMA_INT_ENA_REG	SPI DMA interrupt enable register	0x0034	R/W
SPI_DMA_INT_CLR_REG	SPI DMA interrupt clear register	0x0038	WT
SPI_DMA_INT_RAW_REG	SPI DMA interrupt raw register	0x003C	varies
SPI_DMA_INT_ST_REG	SPI DMA interrupt status register	0x0040	RO

Name	Description	Address	Access
CPU-controlled data buffer			
SPI_W0_REG	SPI CPU-controlled buffer 0	0x0098	R/W/SS
SPI_W1_REG	SPI CPU-controlled buffer 1	0x009C	R/W/SS
SPI_W2_REG	SPI CPU-controlled buffer 2	0x00A0	R/W/SS
SPI_W3_REG	SPI CPU-controlled buffer 3	0x00A4	R/W/SS
SPI_W4_REG	SPI CPU-controlled buffer 4	0x00A8	R/W/SS
SPI_W5_REG	SPI CPU-controlled buffer 5	0x00AC	R/W/SS
SPI_W6_REG	SPI CPU-controlled buffer 6	0x00B0	R/W/SS
SPI_W7_REG	SPI CPU-controlled buffer 7	0x00B4	R/W/SS
SPI_W8_REG	SPI CPU-controlled buffer 8	0x00B8	R/W/SS
SPI_W9_REG	SPI CPU-controlled buffer 9	0x00BC	R/W/SS
SPI_W10_REG	SPI CPU-controlled buffer 10	0x00C0	R/W/SS
SPI_W11_REG	SPI CPU-controlled buffer 11	0x00C4	R/W/SS
SPI_W12_REG	SPI CPU-controlled buffer 12	0x00C8	R/W/SS
SPI_W13_REG	SPI CPU-controlled buffer 13	0x00CC	R/W/SS
SPI_W14_REG	SPI CPU-controlled buffer 14	0x00D0	R/W/SS
SPI_W15_REG	SPI CPU-controlled buffer 15	0x00D4	R/W/SS
Version register			
SPI_DATE_REG	Version control	0x00F0	R/W

27.11 Registers

The addresses in this section are relative to SPI base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 27.1. SPI_CMD_REG (0x0000)



SPI_CONF_BITLEN Define the SPI CLK cycles of SPI CONF state. Can be configured in CONF state. (R/W)

SPI_UPDATE Set this bit to synchronize SPI registers from APB clock domain into SPI module clock domain. This bit is only used in SPI master mode. (WT)

SPI_USR User-defined command enable. An SPI operation will be triggered when the bit is set. The bit will be cleared once the operation is done. 1: enable; 0: disable. Can not be changed by CONF_buf. (R/W/SC)

Register 27.2. SPI_ADDR_REG (0x0004)

SPI_USR_ADDR_VALUE	
31 0	
0	Reset

SPI_USR_ADDR_VALUE Address to slave. Can be configured in CONF state. (R/W)

Register 27.3. SPI_USER_REG (0x0010)

31	SPI_USR_COMMAND	1
30	SPI_USR_ADDR	0
29	SPI_USR_DUMMY	0
28	SPI_USR_MISO	0
27	SPI_USR_MOSI	0
26	SPI_USR_DUMMY_IDLE	0
25	SPI_USR_MOSI_HIGHPART	0
24	SPI_USR_MISO_HIGHPART	0
23 … 18	(reserved)	0 0 0 0 0 0
17	SPI_SIO	0
16	(reserved)	0
15	SPI_USR_CONF_NXT	0
14	(reserved)	0
13	SPI_FWRITE_QUAD	0
12	SPI_FWRITE_DUAL	0
11 … 10	(reserved)	0 0
9	SPI_CK_OUT_EDGE	0
8	SPI_RSCK_I_EDGE	0
7	SPI_CS_SETUP	1
6	SPI_CS_HOLD	1
5	SPI_TSCK_I_EDGE	0
4	(reserved)	0
3	SPI_QPI_MODE	0
2 … 1	(reserved)	0 0
0	SPI_DOUTDIN	0
		Reset

SPI_DOUTDIN Set the bit to enable full-duplex communication. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_QPI_MODE 1: Enable QPI mode. 0: Disable QPI mode. This configuration is applicable when the SPI controller works as master or slave. Can be configured in CONF state. (R/W/SS/SC)

SPI_TSCK_I_EDGE In slave mode, this bit can be used to change the polarity of TSCK. 0: TSCK = SPI_CK_I. 1: TSCK = !SPI_CK_I. (R/W)

SPI_CS_HOLD Keep SPI CS low when SPI is in DONE state. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_CS_SETUP Enable SPI CS when SPI is in prepare (PREP) state. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_RSCK_I_EDGE In slave mode, this bit can be used to change the polarity of RSCK. 0: RSCK = !SPI_CK_I. 1: RSCK = SPI_CK_I. (R/W)

SPI_CK_OUT_EDGE This bit together with SPI_CK_IDLE_EDGE is used to control SPI clock mode. Can be configured in CONF state. For more information, see Section 27.7.2. (R/W)

SPI_FWRITE_DUAL In write operations, read-data phase is in 2-bit mode. Can be configured in CONF state. (R/W)

SPI_FWRITE_QUAD In write operations, read-data phase is in 4-bit mode. Can be configured in CONF state. (R/W)

SPI_USR_CONF_NXT Enable the CONF state for the next transaction (segment) in a configurable segmented transfer. Can be configured in CONF state. (R/W)

- If this bit is set, it means this configurable segmented transfer will continue its next transaction (segment).
- If this bit is cleared, it means this transfer will end after the current transaction (segment) is finished. Or this is not a configurable segmented transfer.

SPI_SIO Set the bit to enable 3-line half-duplex communication, where MOSI and MISO signals share the same pin. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_USR_MISO_HIGHPART In read-data phase, only access to high-part of the buffers: SPI_W8_REG ~ SPI_W15_REG. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

Continued on the next page...

Register 27.3. SPI_USER_REG (0x0010)

Continued from the previous page...

SPI_USR_MOSI_HIGHPART In write-data phase, only access to high-part of the buffers: SPI_W8_REG ~ SPI_W15_REG. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_USR_DUMMY_IDLE If this bit is set, SPI clock is disabled in DUMMY state. Can be configured in CONF state. (R/W)

SPI_USR_MOSI Set this bit to enable the write-data (DOUT) state of an operation. Can be configured in CONF state. (R/W)

SPI_USR_MISO Set this bit to enable the read-data (DIN) state of an operation. Can be configured in CONF state. (R/W)

SPI_USR_DUMMY Set this bit to enable the DUMMY state of an operation. Can be configured in CONF state. (R/W)

SPI_USR_ADDR Set this bit to enable the address (ADDR) state of an operation. Can be configured in CONF state. (R/W)

SPI_USR_COMMAND Set this bit to enable the command (CMD) state of an operation. Can be configured in CONF state. (R/W)

Register 27.4. SPI_USER1_REG (0x0014)

SPI_USR_ADDR_BITLEN	SPI_CS_HOLD_TIME	SPI_CS_SETUP_TIME	SPI_MST_WFULL_ERR_END_EN	(reserved)	SPI_USR_DUMMY_CYCLELEN	
31 27	26 22	21 17	16	15 8	7 0	
23	0x1	0	1	0 0 0 0 0 0 0 0	7	Reset

SPI_USR_DUMMY_CYCLELEN The length of DUMMY state, in unit of SPI_CLK cycles. This value is (the expected cycle number - 1). Can be configured in CONF state. (R/W)

SPI_MST_WFULL_ERR_END_EN 1: SPI transfer is ended when SPI RX AFIFO wfull error occurs in GP-SPI master full-/half-duplex modes. 0: SPI transfer is not ended when SPI RX AFIFO wfull error occurs in GP-SPI master full-/half-duplex modes. (R/W)

SPI_CS_SETUP_TIME The length of prepare (PREP) state, in unit of SPI_CLK cycles. This value is equal to the expected cycles - 1. This field is used together with SPI_CS_SETUP. Can be configured in CONF state. (R/W)

SPI_CS_HOLD_TIME Delay cycles of CS pin, in units of SPI_CLK cycles. This field is used together with SPI_CS_HOLD. Can be configured in CONF state. (R/W)

SPI_USR_ADDR_BITLEN The bit length in address state. This value is (expected bit number - 1). Can be configured in CONF state. (R/W)

Register 27.5. SPI_USER2_REG (0x0018)

SPI_USR_COMMAND_BITLEN	SPI_MST_REMPTY_ERR_END_EN	(reserved)	SPI_USR_COMMAND_VALUE	
31 28	27	26 16	15 0	
7	1	0 0 0 0 0 0 0 0 0 0 0	0	Reset

SPI_USR_COMMAND_VALUE The value of command. Can be configured in CONF state. (R/W)

SPI_MST_REMPTY_ERR_END_EN 1: SPI transfer is ended when SPI TX AFIFO read empty error occurs in GP-SPI master full-/half-duplex modes. 0: SPI transfer is not ended when SPI TX AFIFO read empty error occurs in GP-SPI master full-/half-duplex modes. (R/W)

SPI_USR_COMMAND_BITLEN The bit length of command state. This value is (expected bit number - 1). Can be configured in CONF state. (R/W)

Register 27.6. SPI_CTRL_REG (0x0008)

(reserved)	SPI_WR_BIT_ORDER	SPI_RD_BIT_ORDER	(reserved)	SPI_WP_POL	SPI_HOLD_POL	SPI_D_POL	SPI_Q_POL	(reserved)	SPI_FREAD_QUAD	SPI_FREAD_DUAL	(reserved)	SPI_FCMD_QUAD	SPI_FCMD_DUAL	(reserved)	SPI_FADDR_QUAD	SPI_FADDR_DUAL	(reserved)	SPI_DUMMY_OUT	(reserved)	
31 27	26	25	24 22	21	20	19	18	17 16	15	14	13 10	9	8	7	6	5	4	3	2 0	
0 0 0 0 0	0	0	0 0 0	1	1	1	1	0 0	0	0	0 0 0 0	0	0	0	0	0	0	0	0 0 0	Reset

SPI_DUMMY_OUT Configure the output signal level in DUMMY state. Can be configured in CONF state. (R/W)

SPI_FADDR_DUAL Apply 2-bit mode during address (ADDR) state. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_FADDR_QUAD Apply 4-bit mode during address (ADDR) state. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_FCMD_DUAL Apply 2-bit mode during command (CMD) state. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_FCMD_QUAD Apply 4-bit mode during command (CMD) state. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_FREAD_DUAL In read operations, read-data (DIN) state is in 2-bit mode. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_FREAD_QUAD In read operations, read-data (DIN) state is in 4-bit mode. 1: enable; 0: disable. Can be configured in CONF state. (R/W)

SPI_Q_POL This bit is used to set MISO line polarity. 1: high; 0: low. Can be configured in CONF state. (R/W)

SPI_D_POL This bit is used to set MOSI line polarity. 1: high; 0: low. Can be configured in CONF state. (R/W)

SPI_HOLD_POL This bit is used to set SPI_HOLD output value when SPI is in idle. 1: output high; 0: output low. Can be configured in CONF state. (R/W)

SPI_WP_POL This bit is to set the output value of write-protect signal when SPI is in idle. 1: output high; 0: output low. Can be configured in CONF state. (R/W)

SPI_RD_BIT_ORDER In read-data (MISO) state, 1: LSB first; 0: MSB first. Can be configured in CONF state. (R/W)

SPI_WR_BIT_ORDER In command (CMD), address (ADDR), and write-data (MOSI) states, 1: LSB first; 0: MSB first. Can be configured in CONF state. (R/W)

Register 27.7. SPI_MS_DLEN_REG (0x001C)

(reserved)	SPI_MS_DATA_BITLEN	
31 18	17 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

SPI_MS_DATA_BITLEN The value of this field is the configured SPI transmission data bit length in master mode DMA-controlled transfer or CPU-controlled transfer. The value is also the configured bit length in slave mode DMA RX controlled transfer. The register value shall be (bit_num - 1). Can be configured in CONF state. (R/W)

Register 27.8. SPI_MISC_REG (0x0020)

SPI_QUAD_DIN_PIN_SWAP	SPI_CS_KEEP_ACTIVE	SPI_CK_IDLE_EDGE	(reserved)	SPI_SLAVE_CS_POL	(reserved)	SPI_MASTER_CS_POL	SPI_CK_DIS	SPI_CS5_DIS	SPI_CS4_DIS	SPI_CS3_DIS	SPI_CS2_DIS	SPI_CS1_DIS	SPI_CS0_DIS	
31	30	29	28 24	23	22 13	12 7	6	5	4	3	2	1	0	
0	0	0	0 0 0 0 0	0	0 0 0 0 0 0 0 0 0 0	0	0	1	1	1	1	1	0	Reset

SPI_CS0_DIS SPI CS0 pin enable bit. 1: disable CS0, 0: SPI_CS0 signal is from/to CS0 pin. Can be configured in CONF state. (R/W)

SPI_CS1_DIS SPI CS1 pin enable bit. 1: disable CS1, 0: SPI_CS1 signal is from/to CS1 pin. Can be configured in CONF state. (R/W)

SPI_CS2_DIS SPI CS2 pin enable bit. 1: disable CS2, 0: SPI_CS2 signal is from/to CS2 pin. Can be configured in CONF state. (R/W)

SPI_CS3_DIS SPI CS3 pin enable bit. 1: disable CS3, 0: SPI_CS3 signal is from/to CS3 pin. Can be configured in CONF state. (R/W)

SPI_CS4_DIS SPI CS4 pin enable bit. 1: disable CS4, 0: SPI_CS4 signal is from/to CS4 pin. Can be configured in CONF state. (R/W)

SPI_CS5_DIS SPI CS5 pin enable bit. 1: disable CS5, 0: SPI_CS5 signal is from/to CS5 pin. Can be configured in CONF state. (R/W)

SPI_CK_DIS 1: disable SPI_CLK output. 0: enable SPI_CLK output. Can be configured in CONF state. (R/W)

SPI_MASTER_CS_POL In master mode, the bits are the polarity of SPI CS line, the value is equivalent to SPI_CS ^ SPI_MASTER_CS_POL. Can be configured in CONF state. (R/W)

SPI_SLAVE_CS_POL Configure SPI slave input CS polarity. 1: invert. 0: not change. Can be configured in CONF state. (R/W)

SPI_CK_IDLE_EDGE 1: SPI_CLK line is high when GP-SPI2 is in idle. 0: SPI_CLK line is low when GP-SPI2 is in idle. Can be configured in CONF state. (R/W)

SPI_CS_KEEP_ACTIVE SPI CS line keeps low when the bit is set. Can be configured in CONF state. (R/W)

SPI_QUAD_DIN_PIN_SWAP 1: SPI quad input swap enable. 0: SPI quad input swap disable. Can be configured in CONF state. (R/W)

Register 27.9. SPI_DMA_CONF_REG (0x0030)

SPI_DMA_AFIFO_RST	SPI_BUF_AFIFO_RST	SPI_RX_AFIFO_RST	SPI_DMA_TX_ENA	SPI_DMA_RX_ENA	(reserved)	SPI_RX_EOF_EN	SPI_SLV_TX_SEG_TRANS_CLR_EN	SPI_SLV_RX_SEG_TRANS_CLR_EN	SPI_DMA_SLV_SEG_TRANS_EN	(reserved)	
31	30	29	28	27	26 22	21	20	19	18	17 0	
0	0	0	0	0	0 0 0 0 0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

SPI_DMA_SLV_SEG_TRANS_EN 1: enable DAM-controlled segmented transfer in slave half-duplex mode. 0: disable. (R/W)

SPI_SLV_RX_SEG_TRANS_CLR_EN In DMA-controlled half-duplex slave mode, if the size of DMA RX buffer is smaller than the size of the received data, 1: the data in following transfers will not be received. 0: the data in this transfer will not be received, but in the following transfers, if the size of DMA RX buffer is not 0, the data in following transfers will be received, otherwise not. (R/W)

SPI_SLV_TX_SEG_TRANS_CLR_EN In DMA-controlled half-duplex slave mode, if the size of DMA TX buffer is smaller than the size of the transmitted data, 1: the data in the following transfers will not be updated, i.e. the old data is transmitted repeatedly. 0: the data in this transfer will not be updated. But in the following transfers, if new data is filled in DMA TX FIFO, new data will be transmitted, otherwise not. (R/W)

SPI_RX_EOF_EN 1: In a DAM-controlled transfer, if the bit number of transferred data is equal to (SPI_MS_DATA_BITLEN + 1), then GDMA_IN_SUC_EOF_CH*n*_INT_RAW will be set by hardware. 0: GDMA_IN_SUC_EOF_CH*n*_INT_RAW is set by SPI_TRANS_DONE_INT event in a non-segmented transfer, or by in a SPI_DMA_SEG_TRANS_DONE_INT event in a segmented transfer. (R/W)

SPI_DMA_RX_ENA Set this bit to enable SPI DMA controlled receive data mode. (R/W)

SPI_DMA_TX_ENA Set this bit to enable SPI DMA controlled send data mode. (R/W)

SPI_RX_AFIFO_RST Set this bit to reset spi_rx_afifo as shown in Figure 27-4 and in Figure 27-5. spi_rx_afifo is used to receive data in SPI master and slave transfer. (WT)

SPI_BUF_AFIFO_RST Set this bit to reset buf_tx_afifo as shown in Figure 27-4 and in Figure 27-5. buf_tx_afifo is used to send data out in CPU-controlled master and slave transfer. (WT)

SPI_DMA_AFIFO_RST Set this bit to reset dma_tx_afifo as shown in Figure 27-4 and in Figure 27-5. dma_tx_afifo is used to send data out in DMA-controlled slave transfer. (WT)

Register 27.10. SPI_SLAVE_REG (0x00E0)

(reserved)	SPI_USR_CONF	SPI_SOFT_RESET	SPI_SLAVE_MODE	SPI_DMA_SEG_MAGIC_VALUE	(reserved)	SPI_SLV_WRBUF_BITLEN_EN	SPI_SLV_RDBUF_BITLEN_EN	SPI_SLV_WRDMA_BITLEN_EN	SPI_SLV_RDDMA_BITLEN_EN	(reserved)	SPI_RSCK_DATA_OUT	SPI_CLK_MODE_13	SPI_CLK_MODE	
31 29	28	27	26	25 22	21 12	11	10	9	8	7 4	3	2	1 0	
0 0 0	0	0	0	10	0 0 0 0 0 0 0 0 0 0	0	0	0	0	0 0 0 0	0	0	0	Reset

SPI_CLK_MODE SPI clock mode control bits. Can be configured in CONF state. (R/W)

- 0: SPI clock is off when CS becomes inactive.
- 1: SPI clock is delayed one cycle after CS becomes inactive.
- 2: SPI clock is delayed two cycles after CS becomes inactive.
- 3: SPI clock is always on.

SPI_CLK_MODE_13 Configure clock mode. (R/W)

- 1: support SPI clock mode 1 and 3. Output data B[0]/B[7] at the first edge.
- 0: support SPI clock mode 0 and 2. Output data B[1]/B[6] at the first edge.

SPI_RSCK_DATA_OUT Save half a cycle when TSCK is the same as RSCK. 1: output data at RSCK posedge. 0: output data at TSCK posedge. (R/W)

SPI_SLV_RDDMA_BITLEN_EN If this bit is set, SPI_SLV_DATA_BITLEN is used to store the data bit length of Rd_DMA transfer. (R/W)

SPI_SLV_WRDMA_BITLEN_EN If this bit is set, SPI_SLV_DATA_BITLEN is used to store the data bit length of Wr_DMA transfer. (R/W)

SPI_SLV_RDBUF_BITLEN_EN If this bit is set, SPI_SLV_DATA_BITLEN is used to store data bit length of Rd_BUF transfer. (R/W)

SPI_SLV_WRBUF_BITLEN_EN If this bit is set, SPI_SLV_DATA_BITLEN is used to store data bit length of Wr_BUF transfer. (R/W)

SPI_DMA_SEG_MAGIC_VALUE Configure the magic value of BM table in DMA-controlled configurable segmented transfer. (R/W)

SPI_SLAVE_MODE Set SPI work mode. 1: slave mode. 0: master mode. (R/W)

SPI_SOFT_RESET Software reset enable bit. If this bit is set, the SPI clock line, CS line, and data line are reset. Can be configured in CONF state. (WT)

SPI_USR_CONF 1: enable the CONF state of current DMA-controlled configurable segmented transfer, which means the configurable segmented transfer is started. 0: This is not a configurable segmented transfer. (R/W)

Register 27.11. SPI_SLAVE1_REG (0x00E4)

SPI_SLV_LAST_ADDR	SPI_SLV_LAST_COMMAND	SPI_SLV_DATA_BITLEN	
31 26	25 18	17 0	
0	0	0	Reset

SPI_SLV_DATA_BITLEN Configure the transferred data bit length in SPI slave full-/half-duplex modes. (R/W/SS)

SPI_SLV_LAST_COMMAND In slave mode, it is the value of command. (R/W/SS)

SPI_SLV_LAST_ADDR In slave mode, it is the value of address. (R/W/SS)

Register 27.12. SPI_CLOCK_REG (0x000C)

SPI_CLK_EQU_SYSCLK	(reserved)	SPI_CLKDIV_PRE	SPI_CLKCNT_N	SPI_CLKCNT_H	SPI_CLKCNT_L	
31	30 22	21 18	17 12	11 6	5 0	
1	0 0 0 0 0 0 0 0 0	0	0x3	0x1	0x3	Reset

SPI_CLKCNT_L In master mode, this field must be equal to SPI_CLKCNT_N. In slave mode, it must be 0. Can be configured in CONF state. (R/W)

SPI_CLKCNT_H In master mode, this field must be floor((SPI_CLKCNT_N + 1)/2 - 1). floor() here is to down round a number, floor(2.2) = 2. In slave mode, it must be 0. Can be configured in CONF state. (R/W)

SPI_CLKCNT_N In master mode, this is the divider of SPI_CLK. So SPI_CLK frequency is $f_{\text{apb\_clk}}$/(SPI_CLKDIV_PRE + 1)/(SPI_CLKCNT_N + 1). Can be configured in CONF state. (R/W)

SPI_CLKDIV_PRE In master mode, this is pre-divider of SPI_CLK. Can be configured in CONF state. (R/W)

SPI_CLK_EQU_SYSCLK In master mode, 1: SPI_CLK is eqaul to APB_CLK. 0: SPI_CLK is divided from APB_CLK. Can be configured in CONF state. (R/W)

Register 27.13. SPI_CLK_GATE_REG (0x00E8)

(reserved)		SPI_MST_CLK_SEL	SPI_MST_CLK_ACTIVE	SPI_CLK_EN	
31	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0	0	0	Reset

SPI_CLK_EN Set this bit to enable clock gate. (R/W)

SPI_MST_CLK_ACTIVE Set this bit to power on the SPI module clock. (R/W)

SPI_MST_CLK_SEL This bit is used to select SPI module clock source in master mode. 1: PLL_F80M_CLK. 0: XTAL_CLK. (R/W)

Register 27.14. SPI_DIN_MODE_REG (0x0024)

(reserved)	SPI_TIMING_HCLK_ACTIVE	(reserved)	SPI_DIN3_MODE	SPI_DIN2_MODE	SPI_DIN1_MODE	SPI_DIN0_MODE	
31 17	16	15 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0 0	0	0	0	0	Reset

SPI_DIN0_MODE Configure the input mode for FSPID signal. Can be configured in CONF state. (R/W)

- 0: input without delay
- 1: input at the rising edge of APB_CLK
- 2: input at the falling edge of APB_CLK
- 3: input at the edge of SPI_CLK

SPI_DIN1_MODE Configure the input mode for FSPIQ signal. Can be configured in CONF state. (R/W)

- 0: input without delay
- 1: input at the rising edge of APB_CLK
- 2: input at the falling edge of APB_CLK
- 3: input at the edge of SPI_CLK

SPI_DIN2_MODE Configure the input mode for FSPIWP signal. Can be configured in CONF state. (R/W)

- 0: input without delay
- 1: input at the rising edge of APB_CLK
- 2: input at the falling edge of APB_CLK
- 3: input at the edge of SPI_CLK

SPI_DIN3_MODE Configure the input mode for FSPIHD signal. Can be configured in CONF state. (R/W)

- 0: input without delay
- 1: input at the rising edge of APB_CLK
- 2: input at the falling edge of APB_CLK
- 3: input at the edge of SPI_CLK

SPI_TIMING_HCLK_ACTIVE 1: enable HCLK (high-frequency clock) in SPI input timing module. 0: disable HCLK. Can be configured in CONF state. (R/W)

Register 27.15. SPI_DIN_NUM_REG (0x0028)

(reserved)	SPI_DIN3_NUM	SPI_DIN2_NUM	SPI_DIN1_NUM	SPI_DIN0_NUM	
31 8	7 6	5 4	3 2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	Reset

SPI_DIN0_NUM Configure the delays to input signal FSPID based on the setting of SPI_DIN0_MODE. Can be configured in CONF state. (R/W)

- 0: delayed by 1 clock cycle
- 1: delayed by 2 clock cycles
- 2: delayed by 3 clock cycles
- 3: delayed by 4 clock cycles

SPI_DIN1_NUM Configure the delays to input signal FSPIQ based on the setting of SPI_DIN1_MODE. Can be configured in CONF state. (R/W)

- 0: delayed by 1 clock cycle
- 1: delayed by 2 clock cycles
- 2: delayed by 3 clock cycles
- 3: delayed by 4 clock cycles

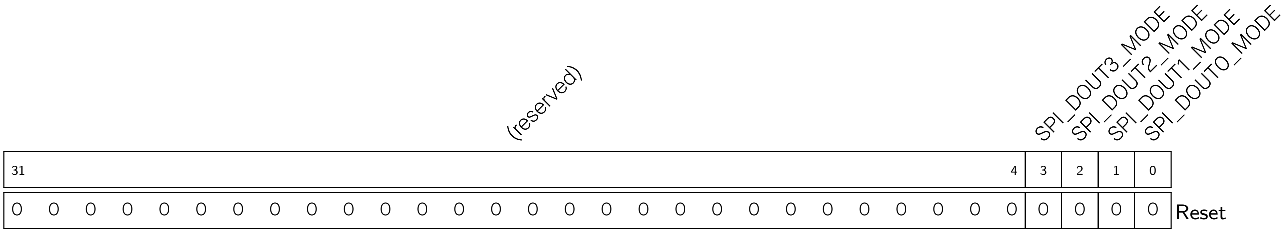
SPI_DIN2_NUM Configure the delays to input signal FSPIWP based on the setting of SPI_DIN2_MODE. Can be configured in CONF state. (R/W)

- 0: delayed by 1 clock cycle
- 1: delayed by 2 clock cycles
- 2: delayed by 3 clock cycles
- 3: delayed by 4 clock cycles

SPI_DIN3_NUM Configure the delays to input signal FSPIHD based on the setting of SPI_DIN3_MODE. Can be configured in CONF state. (R/W)

- 0: delayed by 1 clock cycle
- 1: delayed by 2 clock cycles
- 2: delayed by 3 clock cycles
- 3: delayed by 4 clock cycles

Register 27.16. SPI_DOUT_MODE_REG (0x002C)



SPI_DOUT0_MODE Configure the output mode for FSPID signal. Can be configured in CONF state. (R/W)

- 0: output without delay
- 1: output with a delay of a SPI module clock cycle at its falling edge

SPI_DOUT1_MODE Configure the output mode for FSPIQ signal. Can be configured in CONF state. (R/W)

- 0: output without delay
- 1: output with a delay of a SPI module clock cycle at its falling edge

SPI_DOUT2_MODE Configure the output mode for FSPIWP signal. Can be configured in CONF state. (R/W)

- 0: output without delay
- 1: output with a delay of a SPI module clock cycle at its falling edge

SPI_DOUT3_MODE Configure the output mode for FSPIHD signal. Can be configured in CONF state. (R/W)

- 0: output without delay
- 1: output with a delay of a SPI module clock cycle at its falling edge

Register 27.17. SPI_DMA_INT_ENA_REG (0x0034)

(reserved)	SPI_APP1_INT_ENA	SPI_APP2_INT_ENA	SPI_MST_TX_AFIFO_REMPTY_ERR_INT_ENA	SPI_MST_RX_AFIFO_WFULL_ERR_INT_ENA	SPI_SLV_CMD_ERR_INT_ENA	(reserved)	SPI_SEG_MAGIC_ERR_INT_ENA	SPI_DMA_SEG_TRANS_DONE_INT_ENA	SPI_TRANS_DONE_INT_ENA	SPI_SLV_WR_BUF_DONE_INT_ENA	SPI_SLV_RD_BUF_DONE_INT_ENA	SPI_SLV_WR_DMA_DONE_INT_ENA	SPI_SLV_RD_DMA_DONE_INT_ENA	SPI_SLV_CMDA_INT_ENA	SPI_SLV_CMD9_INT_ENA	SPI_SLV_CMD8_INT_ENA	SPI_SLV_CMD7_INT_ENA	SPI_SLV_EN_QPI_INT_ENA	SPI_SLV_EX_QPI_INT_ENA	SPI_DMA_OUTFIFO_EMPTY_ERR_INT_ENA	SPI_DMA_INFIFO_FULL_ERR_INT_ENA	
31 21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

SPI_DMA_INFIFO_FULL_ERR_INT_ENA The enable bit for SPI_DMA_INFIFO_FULL_ERR_INT interrupt. (R/W)

SPI_DMA_OUTFIFO_EMPTY_ERR_INT_ENA The enable bit for SPI_DMA_OUTFIFO_EMPTY_ERR_INT interrupt. (R/W)

SPI_SLV_EX_QPI_INT_ENA The enable bit for SPI_SLV_EX_QPI_INT interrupt. (R/W)

SPI_SLV_EN_QPI_INT_ENA The enable bit for SPI_SLV_EN_QPI_INT interrupt. (R/W)

SPI_SLV_CMD7_INT_ENA The enable bit for SPI_SLV_CMD7_INT interrupt. (R/W)

SPI_SLV_CMD8_INT_ENA The enable bit for SPI_SLV_CMD8_INT interrupt. (R/W)

SPI_SLV_CMD9_INT_ENA The enable bit for SPI_SLV_CMD9_INT interrupt. (R/W)

SPI_SLV_CMDA_INT_ENA The enable bit for SPI_SLV_CMDA_INT interrupt. (R/W)

SPI_SLV_RD_DMA_DONE_INT_ENA The enable bit for SPI_SLV_RD_DMA_DONE_INT interrupt. (R/W)

SPI_SLV_WR_DMA_DONE_INT_ENA The enable bit for SPI_SLV_WR_DMA_DONE_INT interrupt. (R/W)

SPI_SLV_RD_BUF_DONE_INT_ENA The enable bit for SPI_SLV_RD_BUF_DONE_INT interrupt. (R/W)

SPI_SLV_WR_BUF_DONE_INT_ENA The enable bit for SPI_SLV_WR_BUF_DONE_INT interrupt. (R/W)

SPI_TRANS_DONE_INT_ENA The enable bit for SPI_TRANS_DONE_INT interrupt. (R/W)

SPI_DMA_SEG_TRANS_DONE_INT_ENA The enable bit for SPI_DMA_SEG_TRANS_DONE_INT interrupt. (R/W)

SPI_SEG_MAGIC_ERR_INT_ENA The enable bit for SPI_SEG_MAGIC_ERR_INT interrupt. (R/W)

Continued on the next page...

Register 27.17. SPI_DMA_INT_ENA_REG (0x0034)

Continued from the previous page...

SPI_SLV_CMD_ERR_INT_ENA The enable bit for SPI_SLV_CMD_ERR_INT interrupt. (R/W)

SPI_MST_RX_AFIFO_WFULL_ERR_INT_ENA The enable bit for SPI_MST_RX_AFIFO_WFULL_ERR_INT interrupt. (R/W)

SPI_MST_TX_AFIFO_REMPTY_ERR_INT_ENA The enable bit for SPI_MST_TX_AFIFO_REMPTY_ERR_INT interrupt. (R/W)

SPI_APP2_INT_ENA The enable bit for SPI_APP2_INT interrupt. (R/W)

SPI_APP1_INT_ENA The enable bit for SPI_APP1_INT interrupt. (R/W)

28 I2C Controller (I2C)

The I2C (Inter-Integrated Circuit) bus allows ESP32-C3 to communicate with multiple external devices. These external devices can share one bus.

28.1 Overview

The I2C bus has two lines, namely a serial data line (SDA) and a serial clock line (SCL). Both SDA and SCL lines are open-drain. The I2C bus can be connected to a single or multiple master devices and a single or multiple slave devices. However, only one master device can access a slave at a time via the bus.

The master initiates communication by generating a START condition: pulling the SDA line low while SCL is high, and sending nine clock pulses via SCL. The first eight pulses are used to transmit a 7-bit address followed by a read/write $(R/\overline{W})$ bit. If the address of an I2C slave matches the 7-bit address transmitted, this matching slave can respond by pulling SDA low on the ninth clock pulse. The master and the slave can send or receive data according to the $R/\overline{W}$ bit. Whether to terminate the data transfer or not is determined by the logic level of the acknowledge (ACK) bit. During data transfer, SDA changes only when SCL is low. Once finishing communication, the master sends a STOP condition: pulling SDA up while SCL is high. If a master both reads and writes data in one transfer, then it should send a RSTART condition, a slave address and a $R/\overline{W}$ bit before changing its operation. The RSTART condition is used to change the transfer direction and the mode of the devices (master mode or slave mode).

28.2 Features

The I2C controller has the following features:

- Master mode and slave mode
- Communication between multiple slaves
- Standard mode (100 Kbit/s)
- Fast mode (400 Kbit/s)
- 7-bit addressing and 10-bit addressing
- Continuous data transfer achieved by pulling SCL low
- Programmable digital noise filtering
- Double addressing mode, which uses slave address and slave memory or register address

28.3 I2C Architecture

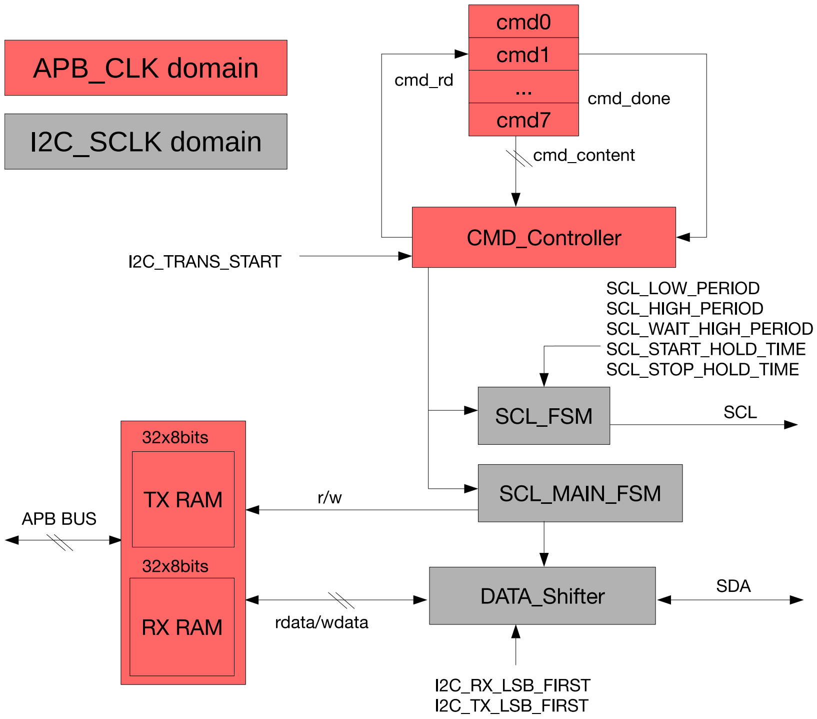

Figure 28-1. I2C Master Architecture

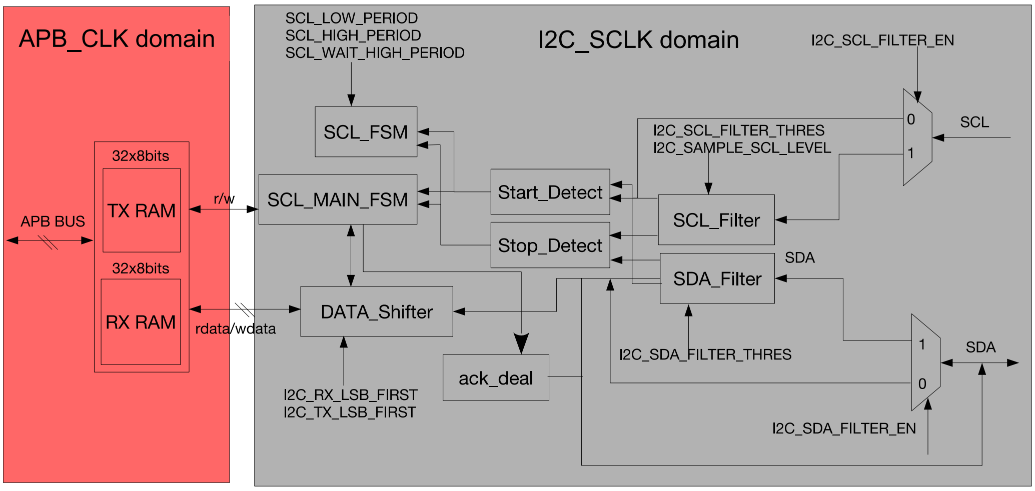

Figure 28-2. I2C Slave Architecture

The I2C controller runs either in master mode or slave mode, which is determined by I2C_MS_MODE. Figure 28-1 shows the architecture of a master, while Figure 28-2 shows that of a slave. The I2C controller has the following main parts:

- transmit and receive memory (TX/RX RAM)
- command controller (CMD_Controller)
- SCL clock controller (SCL_FSM)
- SDA data controller (SCL_MAIN_FSM)

- serial/parallel data converter (DATA_Shifter)
- filter for SCL (SCL_Filter)
- filter for SDA (SDA_Filter)

Besides, the I2C controller also has a clock module which generates I2C clocks, and a synchronization module which synchronizes the APB bus and the I2C controller.

The clock module is used to select clock sources, turn on and off clocks, and divide clocks. SCL_Filter and SDA_Filter remove noises on SCL input signals and SDA input signals respectively. The synchronization module synchronizes signal transfer between different clock domains.

Figure 28-3 and Figure 28-4 are the timing diagram and corresponding parameters of the I2C protocol. SCL_FSM generates the timing sequence conforming to the I2C protocol.

SCL_MAIN_FSM controls the execution of I2C commands and the sequence of the SDA line. CMD_Controller is used for an I2C master to generate (R)START, STOP, WRITE, READ and END commands. TX RAM and RX RAM store data to be transmitted and data received respectively. DATA_Shifter shifts data between serial and parallel form.

28.4 Functional Description

Note that operations may differ between the I2C controller in ESP32-C3 and other masters or slaves on the bus. Please refer to datasheets of individual I2C devices for specific information.

28.4.1 Clock Configuration

Registers, TX RAM, and RX RAM are configured and accessed in the APB_CLK clock domain, whose frequency is 1 ~ 80 MHz. The main logic of the I2C controller, including SCL_FSM, SCL_MAIN_FSM, SCL_FILTER, SDA_FILTER, and DATA_SHIFTER, are in the I2C_SCLK clock domain.

You can choose the clock source for I2C_SCLK from XTAL_CLK or RC_FAST_CLK via I2C_SCLK_SEL. When I2C_SCLK_SEL is cleared, the clock source is XTAL_CLK. When I2C_SCLK_SEL is set, the clock source is RC_FAST_CLK. The clock source is enabled by configuring I2C_SCLK_ACTIVE as high level, and then passes through a fractional divider to generate I2C_SCLK according to the following equation:

$$Divisor = I2C\_SCLK\_DIV\_NUM + 1 + \frac{I2C\_SCLK\_DIV\_A}{I2C\_SCLK\_DIV\_B}$$

The frequency of XTAL_CLK is 40 MHz, while the frequency of RC_FAST_CLK is 17.5 MHz. Limited by timing parameters, the derived clock I2C_SCLK should operate at a frequency 20 timers larger than SCL's frequency.

28.4.2 SCL and SDA Noise Filtering

SCL_Filter and SDA_Filter modules are identical and are used to filter signal noises on SCL and SDA, respectively. These filters can be enabled or disabled by configuring I2C_SCL_FILTER_EN and I2C_SDA_FILTER_EN.

Take SCL_Filter as an example. When enabled, SCL_Filter samples input signals on the SCL line continuously. These input signals are valid only if they remain unchanged for consecutive I2C_SCL_FILTER_THRES

I2C_SCLK clock cycles. Given that only valid input signals can pass through the filter, SCL_Filter can remove glitches whose pulse width is shorter than I2C_SCL_FILTER_THRES I2C_SCLK clock cycles, while SDA_Filter can remove glitches whose pulse width is shorter than I2C_SDA_FILTER_THRES I2C_SCLK clock cycles.

28.4.3 SCL Clock Stretching

The I2C controller in slave mode (i.e. slave) can hold the SCL line low in exchange for more time to process data. This function called clock stretching is enabled by setting the I2C_SLAVE_SCL_STRETCH_EN bit. The time period to release the SCL line from stretching is configured by setting the I2C_STRETCH_PROTECT_NUM field, in order to avoid timing sequence errors. The slave will hold the SCL line low when one of the following four events occurs:

1. Address match: The address of the slave matches the address sent by the master via the SDA line, and the $R/\overline{W}$ bit is 1.
2. RAM being full: RX RAM of the slave is full. Note that when the slave receives less than 32 bytes, it is not necessary to enable clock stretching; when the slave receives 32 bytes or more, you may interrupt data transmission to wrapped around RAM via the FIFO threshold, or enable clock stretching for more time to process data. When clock stretching is enabled, I2C_RX_FULL_ACK_LEVEL must be cleared, otherwise there will be unpredictable consequences.
3. RAM being empty: The slave is sending data, but its TX RAM is empty.
4. Sending an ACK: If I2C_SLAVE_BYTE_ACK_CTL_EN is set, the slave pulls SCL low when sending an ACK bit. At this stage, software validates data and configures I2C_SLAVE_BYTE_ACK_LVL to control the level of the ACK bit. Note that when RX RAM of the slave is full, the level of the ACK bit to be sent is determined by I2C_RX_FULL_ACK_LEVEL, instead of I2C_SLAVE_BYTE_ACK_LVL. In this case, I2C_RX_FULL_ACK_LEVEL should also be cleared to ensure proper functioning of clock stretching.

After SCL has been stretched low, the cause of stretching can be read from the I2C_STRETCH_CAUSE bit. Clock stretching is disabled by setting the I2C_SLAVE_SCL_STRETCH_CLR bit.

28.4.4 Generating SCL Pulses in Idle State

Usually when the I2C bus is idle, the SCL line is held high. The I2C controller in ESP32-C3 can be programmed to generate SCL pulses in idle state. This function only works when the I2C controller is configured as master. If the I2C_SCL_RST_SLV_EN bit is set, hardware will send I2C_SCL_RST_SLV_NUM SCL pulses. When software reads 0 in I2C_SCL_RST_SLV_EN, set I2C_CONF_UPGATE to stop this function.

28.4.5 Synchronization

I2C registers are configured in APB_CLK domain, whereas the I2C controller is configured in asynchronous I2C_SCLK domain. Therefore, before being used by the I2C controller, register values should be synchronized by first writing configuration registers and then writing 1 to I2C_CONF_UPGATE. Registers that need synchronization are listed in Table 28-1.

Table 28-1. I2C Synchronous Registers

Register	Parameter	Address

I2C_CTR_REG	I2C_SLV_TX_AUTO_START_EN	0x0004
	I2C_ADDR_10BIT_RW_CHECK_EN	
	I2C_ADDR_BROADCASTING_EN	
	I2C_SDA_FORCE_OUT

	I2C_HIGH_PERIOD	
I2C_SDA_HOLD_REG	I2C_SDA_HOLD_TIME	0x0030
I2C_SDA_SAMPLE_REG	I2C_SDA_SAMPLE_TIME	0x0034
I2C_SCL_START_HOLD_REG	I2C_SCL_START_HOLD_TIME	0x0040
I2C_SCL_RSTART_SETUP_REG	I2C_SCL_RSTART_SETUP_TIME	0x0044
I2C_SCL_STOP_HOLD_REG	I2C_SCL_STOP_HOLD_TIME	0x0048
I2C_SCL_STOP_SETUP_REG	I2C_SCL_STOP_SETUP_TIME	0x004C
I2C_SCL_ST_TIME_OUT_REG	I2C_SCL_ST_TO_I2C	0x0078
I2C_SCL_MAIN_ST_TIME_OUT_REG	I2C_SCL_MAIN_ST_TO_I2C	0x007C
I2C_FILTER_CFG_REG	I2C_SCL_FILTER_EN	0x0050
	I2C_SCL_FILTER_THRES	
	I2C_SDA_FILTER_EN	
	I2C_SDA_FILTER_THRES	

28.4.6 Open-Drain Output

SCL and SDA output drivers must be configured as open drain. There are two ways to achieve this:

1. Set I2C_SCL_FORCE_OUT and I2C_SDA_FORCE_OUT, and configure GPIO_PIN*n*_PAD_DRIVER for corresponding SCL and SDA pads as open-drain.

2. Clear I2C_SCL_FORCE_OUT and I2C_SDA_FORCE_OUT.

Because these lines are configured as open-drain, the low-to-high transition time of each line is longer, determined together by the pull-up resistor and the line capacitance. The output duty cycle of I2C is limited by the SDA and SCL line's pull-up speed, mainly SCL's speed.

In addition, when I2C_SCL_FORCE_OUT and I2C_SCL_PD_EN are set to 1, SCL can be forced low; when I2C_SDA_FORCE_OUT and I2C_SDA_PD_EN are set to 1, SDA can be forced low.

28.4.7 Timing Parameter Configuration

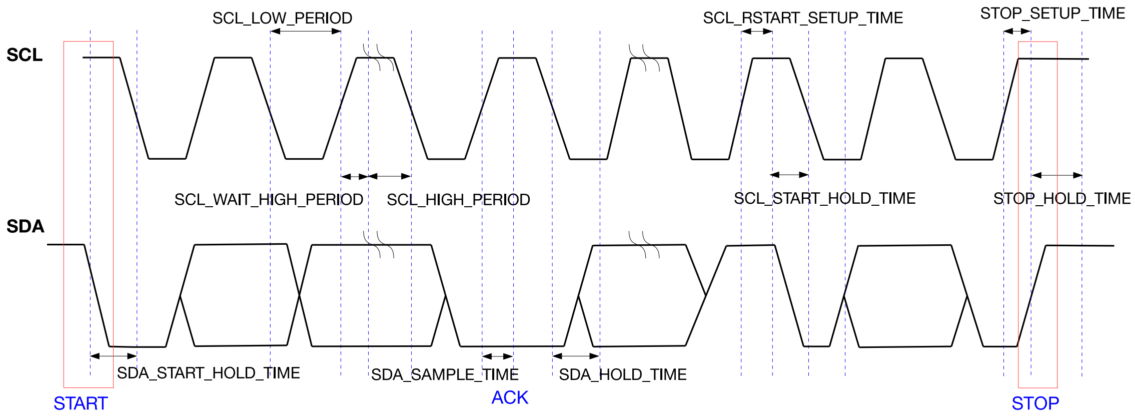

Figure 28-5. I2C Timing Diagram

Figure 28-5 shows the timing diagram of an I2C master. This figure also specifies registers used to configure the START bit, STOP bit, data hold time, data sample time, waiting time on the rising SCL edge, etc. Timing parameters are calculated as follows in I2C_SCLK clock cycles:

1. $t_{LOW} = (I2C\_SCL\_LOW\_PERIOD + 1) \cdot T_{I2C\_SCLK}$
2. $t_{HIGH} = (I2C\_SCL\_HIGH\_PERIOD + 1) \cdot T_{I2C\_SCLK}$
3. $t_{SU:STA} = (I2C\_SCL\_RSTART\_SETUP\_TIME + 1) \cdot T_{I2C\_SCLK}$
4. $t_{HD:STA} = (I2C\_SCL\_START\_HOLD\_TIME + 1) \cdot T_{I2C\_SCLK}$
5. $t_r = (I2C\_SCL\_WAIT\_HIGH\_PERIOD + 1) \cdot T_{I2C\_SCLK}$
6. $t_{SU:STO} = (I2C\_SCL\_STOP\_SETUP\_TIME + 1) \cdot T_{I2C\_SCLK}$
7. $t_{BUF} = (I2C\_SCL\_STOP\_HOLD\_TIME + 1) \cdot T_{I2C\_SCLK}$
8. $t_{HD:DAT} = (I2C\_SDA\_HOLD\_TIME + 1) \cdot T_{I2C\_SCLK}$
9. $t_{SU:DAT} = (I2C\_SCL\_LOW\_PERIOD - I2C\_SDA\_HOLD\_TIME) \cdot T_{I2C\_SCLK}$

Timing registers below are divided into two groups, depending on the mode in which these registers are active:

- Master mode only:

   1. I2C_SCL_START_HOLD_TIME: Specifies the interval between pulling SDA low and pulling SCL low when the master generates a START condition. This interval is (I2C_SCL_START_HOLD_TIME +1) in I2C_SCLK cycles. This register is active only when the I2C controller works in master mode.

2. I2C_SCL_LOW_PERIOD: Specifies the low period of SCL. This period lasts (I2C_SCL_LOW_PERIOD + 1) in I2C_SCLK cycles. However, it could be extended when SCL is pulled low by peripheral devices or by an END command executed by the I2C controller, or when the clock is stretched. This register is active only when the I2C controller works in master mode.

3. I2C_SCL_WAIT_HIGH_PERIOD: Specifies time for SCL to go high in I2C_SCLK cycles. Please make sure that SCL could be pulled high within this time period. Otherwise, the high period of SCL may be incorrect. This register is active only when the I2C controller works in master mode.

4. I2C_SCL_HIGH_PERIOD: Specifies the high period of SCL in I2C_SCLK cycles. This register is active only when the I2C controller works in master mode. When SCL goes high within (I2C_SCL_WAIT_HIGH_PERIOD + 1) in I2C_SCLK cycles, its frequency is:

$$f_{scl} = \frac{f_{\text{I2C\_SCLK}}}{\text{I2C\_SCL\_LOW\_PERIOD + I2C\_SCL\_HIGH\_PERIOD + I2C\_SCL\_WAIT\_HIGH\_PERIOD+3}}$$

- Master mode and slave mode:

1. I2C_SDA_SAMPLE_TIME: Specifies the interval between the rising edge of SCL and the level sampling time of SDA. It is advised to set a value in the middle of SCL's high period, so as to correctly sample the level of SCL. This register is active both in master mode and slave mode.

2. I2C_SDA_HOLD_TIME: Specifies the interval between changing the SDA output level and the falling edge of SCL. This register is active both in master mode and slave mode.

Timing parameters limits corresponding register configuration.

1. $\frac{f_{I2C\_SCLK}}{f_{SCL}} > 20$
2. $3 \times f_{I2C\_SCLK} \leq (I2C\_SDA\_HOLD\_TIME - 4) \times f_{APB\_CLK}$
3. I2C_SDA_HOLD_TIME + I2C_SCL_START_HOLD_TIME > SDA_FILTER_THRES + 3
4. I2C_SCL_WAIT_HIGH_PERIOD < I2C_SDA_SAMPLE_TIME < I2C_SCL_HIGH_PERIOD
5. I2C_SDA_SAMPLE_TIME < I2C_SCL_WAIT_HIGH_PERIOD + I2C_SCL_START_HOLD_TIME + I2C_SCL_RSTART_SETUP_TIME
6. I2C_STRETCH_PROTECT_NUM + I2C_SDA_HOLD_TIME > I2C_SCL_LOW_PERIOD

28.4.8 Timeout Control

The I2C controller has three types of timeout control, namely timeout control for SCL_FSM, for SCL_MAIN_FSM, and for the SCL line. The first two are always enabled, while the third is configurable.

When SCL_FSM remains unchanged for more than $2^{I2C\_SCL\_ST\_TO\_I2C}$ clock cycles, an I2C_SCL_ST_TO_INT interrupt is triggered, and then SCL_FSM goes to idle state. The value of I2C_SCL_ST_TO_I2C should be less than or equal to 22, which means SCL_FSM could remain unchanged for 2^{22} I2C_SCLK clock cycles at most before the interrupt is generated.

When SCL_MAIN_FSM remains unchanged for more than $2^{I2C\_SCL\_MAIN\_ST\_TO\_I2C}$ clock cycles, an I2C_SCL_MAIN_ST_TO_INT interrupt is triggered, and then SCL_MAIN_FSM goes to idle state. The value of I2C_SCL_MAIN_ST_TO_I2C should be less than or equal to 22, which means SCL_MAIN_FSM could remain unchanged for 2^{22} I2C_SCLK clock cycles at most before the interrupt is generated.

Timeout control for SCL is enabled by setting I2C_TIME_OUT_EN. When the level of SCL remains unchanged for more than $2^{I2C\_TIME\_OUT\_VALUE}$ clock cycles, an I2C_TIME_OUT_INT interrupt is triggered, and then the I2C bus goes to idle state.

28.4.9 Command Configuration

When the I2C controller works in master mode, CMD_Controller reads commands from 8 sequential command registers and controls SCL_FSM and SCL_MAIN_FSM accordingly.

	31	30:14	13:11	10	9	8	7:0
cmd0	CMD_DONE	reserved	op_code	ack_value	ack_exp	ack_check_en	byte_num

	31	30:14	13:11	10	9	8	7:0
cmd7	CMD_DONE	reserved	op_code	ack_value	ack_exp	ack_check_en	byte_num

Figure 28-6. Structure of I2C Command Registers

Command registers, whose structure is illustrated in Figure 28-6, are active only when the I2C controller works in master mode. Fields of command registers are:

1. CMD_DONE: Indicates that a command has been executed. After each command has been executed, the CMD_DONE bit in the corresponding command register is set to 1 by hardware. By reading this bit, software can tell if the command has been executed. When writing new commands, this bit must be cleared by software.

2. op_code: Indicates the command. The I2C controller supports five commands:

   - RSTART: op_code = 6. The I2C controller sends a START bit or a RSTART bit defined by the I2C protocol.

   - WRITE: op_code = 1. The I2C controller sends a slave address, a register address (only in double addressing mode) and data to the slave.

   - READ: op_code = 3. The I2C controller reads data from the slave.

   - STOP: op_code = 2. The I2C controller sends a STOP bit defined by the I2C protocol. This code also indicates that the command sequence has been executed, and the CMD_Controller stops reading commands. After restarted by software, the CMD_Controller resumes reading commands from command register 0.

   - END: op_code = 4. The I2C controller pulls the SCL line down and suspends I2C communication. This code also indicates that the command sequence has completed, and the CMD_Controller stops executing commands. Once software refreshes data in command registers and the RAM, the CMD_Controller can be restarted to execute commands from command register 0 again.

3. ack_value: Used to configure the level of the ACK bit sent by the I2C controller during a read operation. This bit is ignored in RSTART, STOP, END and WRITE conditions.

4. ack_exp: Used to configure the level of the ACK bit expected by the I2C controller during a write operation. This bit is ignored during RSTART, STOP, END and READ conditions.

5. ack_check_en: Used to enable the I2C controller during a write operation to check whether the ACK level sent by the slave matches ack_exp in the command. If this bit is set and the level received does not match ack_exp in the WRITE command, the master will generate an I2C_NACK_INT interrupt and a STOP condition for data transfer. If this bit is cleared, the controller will not check the ACK level sent by the slave. This bit is ignored during RSTART, STOP, END and READ conditions.
6. byte_num: Specifies the length of data (in bytes) to be read or written. Can range from 1 to 255 bytes. This bit is ignored during RSTART, STOP and END conditions.

Each command sequence is executed starting from command register 0 and terminated by a STOP or an END. Therefore, there must be a STOP or an END command in one command sequence.

A complete data transfer on the I2C bus should be initiated by a START and terminated by a STOP. The transfer process may be completed using multiple sequences, separated by END commands. Each sequence may differ in the direction of data transfer, clock frequency, slave addresses, data length, etc. This allows efficient use of available peripheral RAM and also achieves more flexible I2C communication.

28.4.10 TX/RX RAM Data Storage

Both TX RAM and RX RAM are 32 × 8 bits, and can be accessed in FIFO or non-FIFO mode. If I2C_NONFIFO_EN bit is cleared, both RAMs are accessed in FIFO mode; if I2C_NONFIFO_EN bit is set, both RAMs are accessed in non-FIFO mode.

TX RAM stores data that the I2C controller needs to send. During communication, when the I2C controller needs to send data (except acknowledgement bits), it reads data from TX RAM and sends them sequentially via SDA. When the I2C controller works in master mode, all data must be stored in TX RAM in the order they will be sent to slaves. The data stored in TX RAM include slave addresses, read/write bits, register addresses (only in double addressing mode) and data to be sent. When the I2C controller works in slave mode, TX RAM only stores data to be sent.

TX RAM can be read and written by the CPU. The CPU writes to TX RAM either in FIFO mode or in non-FIFO mode (direct address). In FIFO mode, the CPU writes to TX RAM via the fixed address I2C_DATA_REG, with addresses for writing in TX RAM incremented automatically by hardware. In non-FIFO mode, the CPU accesses TX RAM directly via address fields (I2C Base Address + 0x100) ~(I2C Base Address + 0x17C). Each byte in TX RAM occupies an entire word in the address space. Therefore, the address of the first byte is I2C Base Address + 0x100, the second byte is I2C Base Address + 0x104, the third byte is I2C Base Address + 0x108, and so on. The CPU can only read TX RAM via direct addresses. Addresses for reading TX RAM are the same with addresses for writing TX RAM.

RX RAM stores data the I2C controller receives during communication. When the I2C controller works in slave mode, neither slave addresses sent by the master nor register addresses (only in double addressing mode) will be stored into RX RAM. Values of RX RAM can be read by software after I2C communication completes.

RX RAM can only be read by the CPU. The CPU reads RX RAM either in FIFO mode or in non-FIFO mode (direct address). In FIFO mode, the CPU reads RX RAM via the fixed address I2C_DATA_REG, with addresses for reading RX RAM incremented automatically by hardware. In non-FIFO mode, the CPU accesses TX RAM directly via address fields (I2C Base Address + 0x180) ~(I2C Base Address + 0x1FC). Each byte in RX RAM occupies an entire word in the address space. Therefore, the address of the first byte is I2C Base Address + 0x180, the second byte is I2C Base Address + 0x184, the third byte is I2C Base Address + 0x188 and so on.

In FIFO mode, TX RAM of a master may wrap around to send data larger than 32 bytes. Set I2C_FIFO_PRT_EN.

If the size of data to be sent is smaller than I2C_TXFIFO_WM_THRHD (master), an I2C_TXFIFO_WM_INT (master) interrupt is generated. After receiving the interrupt, software continues writing to I2C_DATA_REG (master). Please ensure that software writes to or refreshes TX RAM before the master sends data, otherwise it may result in unpredictable consequences.

In FIFO mode, RX RAM of a slave may also wrap around to receive data larger than 32 bytes. Set I2C_FIFO_PRT_EN and clear I2C_RX_FULL_ACK_LEVEL. If data already received (to be overwritten) is larger than I2C_RXFIFO_WM_THRHD (slave), an I2C_RXFIFO_WM_INT (slave) interrupt is generated. After receiving the interrupt, software continues reading from I2C_DATA_REG (slave).

28.4.11 Data Conversion

DATA_Shifter is used for serial/parallel conversion, converting byte data in TX RAM to an outgoing serial bitstream or an incoming serial bitstream to byte data in RX RAM. I2C_RX_LSB_FIRST and I2C_TX_LSB_FIRST can be used to select LSB- or MSB-first storage and transmission of data.

28.4.12 Addressing Mode

Besides 7-bit addressing, the ESP32-C3 I2C controller also supports 10-bit addressing and double addressing. 10-bit addressing can be mixed with 7-bit addressing.

Define the slave address as SLV_ADDR. In 7-bit addressing mode, the slave address is SLV_ADDR[6:0]; in 10-bit addressing mode, the slave address is SLV_ADDR[9:0].

In 7-bit addressing mode, the master only needs to send one byte of address, which comprises SLV_ADDR[6:0] and a $R/\overline{W}$ bit. In 7-bit addressing mode, there is a special case called general call addressing (broadcast). It is enabled by setting I2C_ADDR_BROADCASTING_EN in a slave. When the slave receives the general call address (0x00) from the master and the $R/\overline{W}$ bit followed is 0, it responds to the master regardless of its own address.

In 10-bit addressing mode, the master needs to send two bytes of address. The first byte is slave_addr_first_7bits followed by a $R/\overline{W}$ bit, and slave_addr_first_7bits should be configured as (0x78 | SLV_ADDR[9:8]). The second byte is slave_addr_second_byte, which should be configured as SLV_ADDR[7:0]. The slave can enable 10-bit addressing by configuring I2C_ADDR_10BIT_EN. I2C_SLAVE_ADDR is used to configure I2C slave address. Specifically, I2C_SLAVE_ADDR[14:7] should be configured as SLV_ADDR[7:0], and I2C_SLAVE_ADDR[6:0] should be configured as (0x78 | SLV_ADDR[9:8]). Since a 10-bit slave address has one more byte than a 7-bit address, byte_num of the WRITE command and the number of bytes in the RAM increase by one.

When working in slave mode, the I2C controller supports double addressing, where the first address is the address of an I2C slave, and the second one is the slave's memory address. When using double addressing, RAM must be accessed in non-FIFO mode. Double addressing is enabled by setting I2C_FIFO_ADDR_CFG_EN.

28.4.13 $R/\overline{W}$ Bit Check in 10-bit Addressing Mode

In 10-bit addressing mode, when I2C_ADDR_10BIT_RW_CHECK_EN is set to 1, the I2C controller performs a check on the first byte, which consists of slave_addr_first_7bits and a $R/\overline{W}$ bit. When the $R/\overline{W}$ bit does not indicate a WRITE operation, i.e. not in line with the I2C protocol, the data transfer ends. If the check feature is not enabled, when the $R/\overline{W}$ bit does not indicate a WRITE, the data transfer still continues, but transfer failure may occur.

28.4.14 To Start the I2C Controller

To start the I2C controller in master mode, after configuring the controller to master mode and command registers, write 1 to I2C_TRANS_START in order that the master starts to parse and execute command sequences. The master always executes a command sequence starting from command register 0 to a STOP or an END at the end. To execute another command sequence starting from command register 0, refresh commands by writing 1 again to I2C_TRANS_START.

To start the I2C controller in slave mode, there are two ways:

- Set I2C_SLV_TX_AUTO_START_EN, and the slave starts automatic transfer upon an address match;
- Clear I2C_SLV_TX_AUTO_START_EN, and always set I2C_TRANS_START before transfer.

28.5 Programming Example

This sections provides programming examples for typical communication scenarios. ESP32-C3 has one I2C controller. For the convenience of description, I2C masters and slaves in all subsequent figures are ESP32-C3 I2C controllers. I2C master is referred to as I2C$_{master}$, and I2C slave is referred to as I2C$_{slave}$.

28.5.1 I2C$_{master}$ Writes to I2C$_{slave}$ with a 7-bit Address in One Command Sequence

28.5.1.1 Introduction

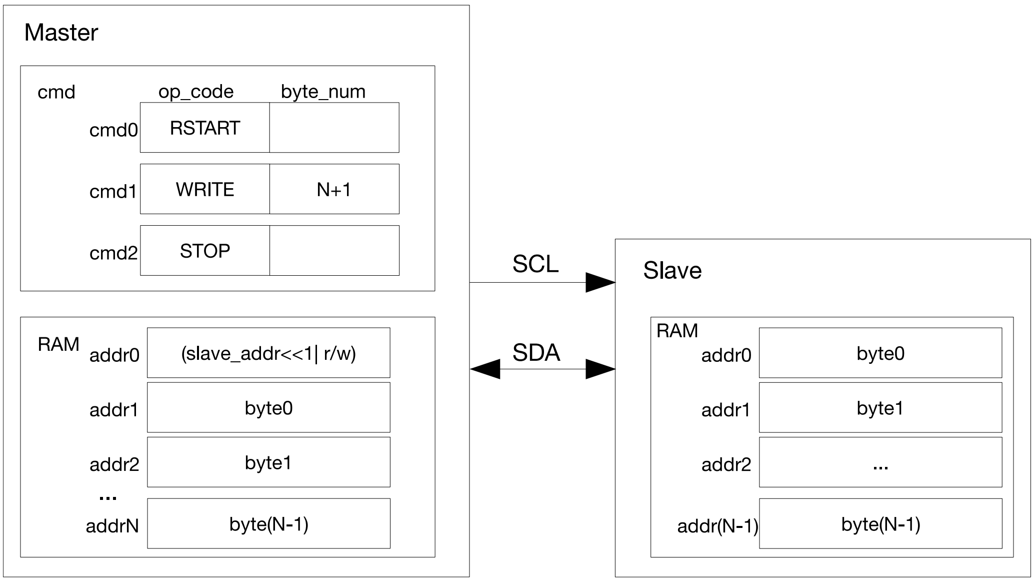

Figure 28-7. I2C$_{master}$ Writing to I2C$_{slave}$ with a 7-bit Address

Figure 28-7 shows how I2C$_{master}$ writes N bytes of data to I2C$_{slave}$'s RAM using 7-bit addressing. As shown in figure 28-7 , the first byte in the RAM of I2C$_{master}$ is a 7-bit I2C$_{slave}$ address followed by a $R/\overline{W}$ bit. When the $R/\overline{W}$ bit is 0, it indicates a WRITE operation. The remaining bytes are used to store data ready for transfer. The cmd box contains related command sequences.

After the command sequence is configured and data in RAM is ready, I2C$_{master}$ enables the controller and initiates data transfer by setting the I2C_TRANS_START bit. The controller has four steps to take:

1. Wait for SCL to go high, to avoid SCL being used by other masters or slaves.

2. Execute a RSTART command and send a START bit.
3. Execute a WRITE command by taking N+1 bytes from the RAM in order and send them to I2C$_{\text{slave}}$ in the same order. The first byte is the address of I2C$_{\text{slave}}$.
4. Send a STOP. Once the I2C$_{\text{master}}$ transfers a STOP bit, an I2C_TRANS_COMPLETE_INT interrupt is generated.

28.5.1.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
3. Configure command registers of I2C$_{\text{master}}$.

Command register	op_code	ack_value	ack_exp	ack_check_er	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	ack_value	ack_exp	1	N+1
I2C_COMMAND2 (master)	STOP	—	—	—	—

4. Write I2C$_{\text{slave}}$ address and data to be sent to TX RAM of I2C$_{\text{master}}$ in either FIFO mode or non-FIFO mode according to Section 28.4.10.
5. Write address of I2C$_{\text{slave}}$ to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register.
6. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
7. Write 1 to I2C_TRANS_START (master) and I2C_TRANS_START (slave) to start transfer.
8. I2C$_{\text{slave}}$ compares the slave address sent by I2C$_{\text{master}}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{\text{master}}$'s WRITE command is 1, I2C$_{\text{master}}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{\text{master}}$ does not check ACK value and take I2C$_{\text{slave}}$ as a matching slave by default.
    - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{\text{master}}$ continues data transfer.
    - Not match: If the received ACK value does not match ack_exp, I2C$_{\text{master}}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.
9. I2C$_{\text{master}}$ sends data, and checks ACK value or not according to ack_check_en (master).
10. If data to be sent (N) is larger than 32 bytes, TX RAM of I2C$_{\text{master}}$ may wrap around in FIFO mode. For details, please refer to Section 28.4.10.
11. If data to be received (N) is larger than 32 bytes, RX RAM of I2C$_{\text{slave}}$ may wrap around in FIFO mode. For details, please refer to Section 28.4.10.

    If data to be received (N) is larger than 32 bytes, the other way is to enable clock stretching by setting the I2C_SLAVE_SCL_STRETCH_EN (slave), and clearing I2C_RX_FULL_ACK_LEVEL. When RX RAM is full, an I2C_SLAVE_STRETCH_INT (slave) interrupt is generated. In this way, I2C$_{\text{slave}}$ can hold SCL low, in exchange for more time to read data. After software has finished reading, you can set

I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.

12. After data transfer completes, I2C$_{master}$ executes the STOP command, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.5.2 I2C$_{master}$ Writes to I2C$_{slave}$ with a 10-bit Address in One Command Sequence

28.5.2.1 Introduction

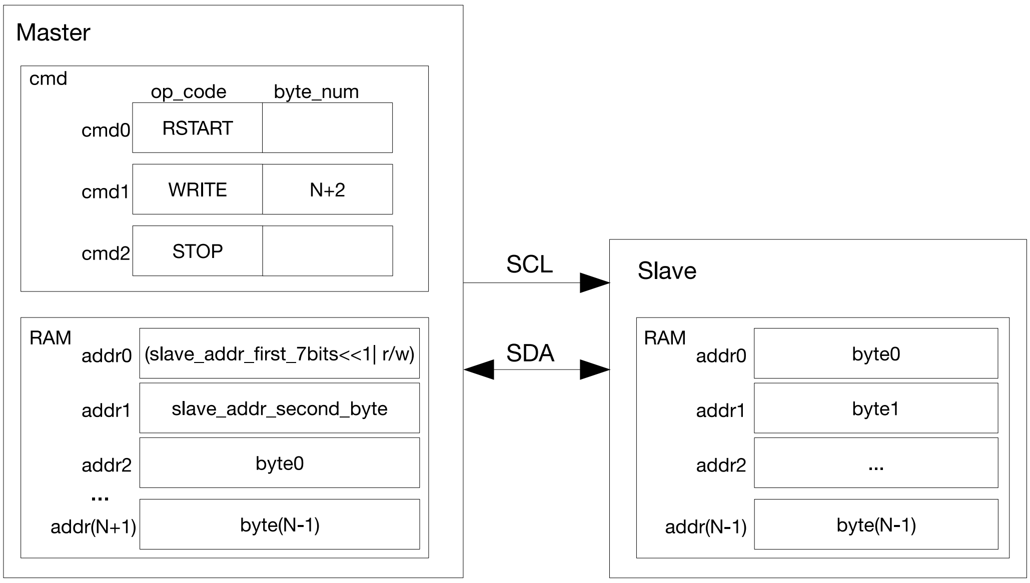

Figure 28-8. I2C$_{master}$ Writing to a Slave with a 10-bit Address

Figure 28-8 shows how I2C$_{master}$ writes N bytes of data using 10-bit addressing to an I2C slave. The configuration and transfer process is similar to what is described in 28.5.1, except that a 10-bit I2C$_{slave}$ address is formed from two bytes. Since a 10-bit I2C$_{slave}$ address has one more byte than a 7-bit I2C$_{slave}$ address, byte_num and length of data in TX RAM increase by 1 accordingly.

28.5.2.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.

2. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.

3. Configure command registers of I2C$_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_er	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	ack_value	ack_exp	1	N+2
I2C_COMMAND2 (master)	STOP	—	—	—	—

4. Configure I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) as I2C$_{slave}$'s 10-bit address, and

set I2C_ADDR_10BIT_EN (slave) to 1 to enable 10-bit addressing.

5. Write I2C$_{slave}$ address and data to be sent to TX RAM of I2C$_{master}$. The first byte of I2C$_{slave}$ address comprises ((0x78 | I2C_SLAVE_ADDR[9:8])«1) and a $R/\overline{W}$ bit. The second byte of I2C$_{slave}$ address is I2C_SLAVE_ADDR[7:0]. These two bytes are followed by data to be sent in FIFO or non-FIFO mode.
6. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
7. Write 1 to I2C_TRANS_START (master) and I2C_TRANS_START (slave) to start transfer.
8. I2C$_{slave}$ compares the slave address sent by I2C$_{master}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{master}$'s WRITE command is 1, I2C$_{master}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{master}$ does not check ACK value and take I2C$_{slave}$ as matching slave by default.
   - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{master}$ continues data transfer.
   - Not match: If the received ACK value does not match ack_exp, I2C$_{master}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.
9. I2C$_{master}$ sends data, and checks ACK value or not according to ack_check_en (master).
10. If data to be sent is larger than 32 bytes, TX RAM of I2C$_{master}$ may wrap around in FIFO mode. For details, please refer to Section 28.4.10.
11. If data to be received is larger than 32 bytes, RX RAM of I2C$_{slave}$ may wrap around in FIFO mode. For details, please refer to Section 28.4.10.

    If data to be received is larger than 32 bytes, the other way is to enable clock stretching by setting I2C_SLAVE_SCL_STRETCH_EN (slave), and clearing I2C_RX_FULL_ACK_LEVEL to 0. When RX RAM is full, an I2C_SLAVE_STRETCH_INT (slave) interrupt is generated. In this way, I2C$_{slave}$ can hold SCL low, in exchange for more time to read data. After software has finished reading, you can set I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.
12. After data transfer completes, I2C$_{master}$ executes the STOP command, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.5.3 I2C$_{master}$ Writes to I2C$_{slave}$ with Two 7-bit Addresses in One Command Sequence

28.5.3.1 Introduction

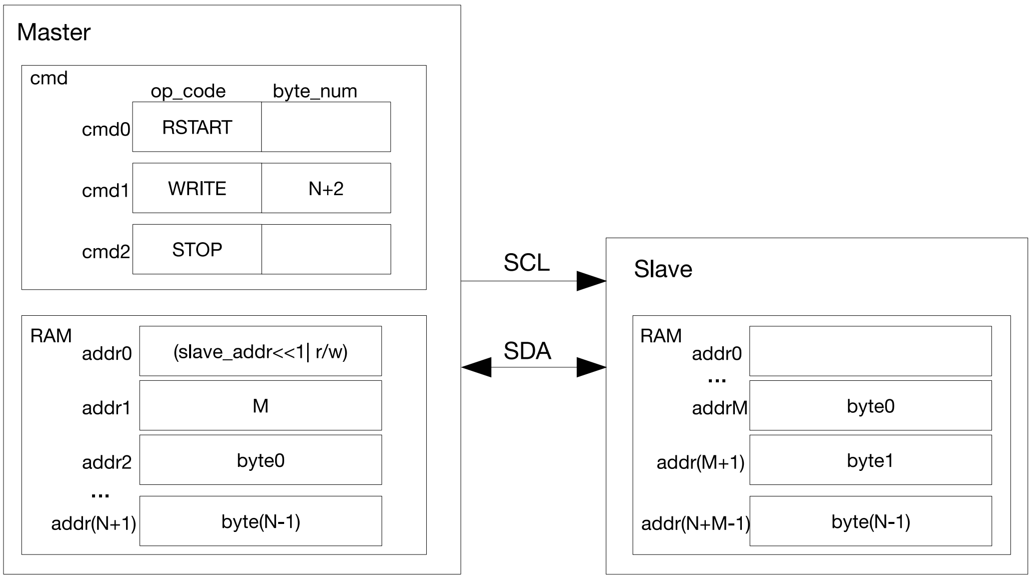

Figure 28-9. I2C$_{master}$ Writing to I2C$_{slave}$ with Two 7-bit Addresses

Figure 28-9 shows how I2C$_{master}$ writes N bytes of data to I2C$_{slave}$'s RAM using 7-bit double addressing. The configuration and transfer process is similar to what is described in Section 28.5.1, except that in 7-bit double addressing mode I2C$_{master}$ sends two 7-bit addresses. The first address is the address of an I2C slave, and the second one is I2C$_{slave}$'s memory address (i.e. addrM in Figure 28-9). When using double addressing, RAM must be accessed in non-FIFO mode. The I2C slave put received byte0 ~ byte(N-1) into its RAM in an order staring from addrM. The RAM is overwritten every 32 bytes.

28.5.3.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. Set I2C_FIFO_ADDR_CFG_EN (slave) to 1 to enable double addressing mode.
3. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
4. Configure command registers of I2C$_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_er	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	ack_value	ack_exp	1	N+2
I2C_COMMAND2 (master)	STOP	—	—	—	—

5. Write I2C$_{slave}$ address and data to be sent to TX RAM of I2C$_{master}$ in FIFO or non-FIFO mode.
6. Write address of I2C$_{slave}$ to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register.
7. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.

8. Write 1 to I2C_TRANS_START (master) and I2C_TRANS_START (slave) to start transfer.

9. I2C$_{slave}$ compares the slave address sent by I2C$_{master}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{master}$'s WRITE command is 1, I2C$_{master}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{master}$ does not check ACK value and take I2C$_{slave}$ as matching slave by default.

   - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{master}$ continues data transfer.

   - Not match: If the received ACK value does not match ack_exp, I2C$_{master}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.

10. I2C$_{slave}$ receives the RX RAM address sent by I2C$_{master}$ and adds the offset.

11. I2C$_{master}$ sends data, and checks ACK value or not according to ack_check_en (master).

12. If data to be sent is larger than 32 bytes, TX RAM of I2C$_{master}$ may wrap around in FIFO mode. For details, please refer to Section 28.4.10.

13. If data to be received is larger than 32 bytes, you may enable clock stretching by setting I2C_SLAVE_SCL_STRETCH_EN (slave), and clearing I2C_RX_FULL_ACK_LEVEL to 0. When RX RAM is full, an I2C_SLAVE_STRETCH_INT (slave) interrupt is generated. In this way, I2C$_{slave}$ can hold SCL low, in exchange for more time to read data. After software has finished reading, you can set I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.

14. After data transfer completes, I2C$_{master}$ executes the STOP command, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.5.4 I2C$_{master}$ Writes to I2C$_{slave}$ with a 7-bit Address in Multiple Command Sequences

28.5.4.1 Introduction

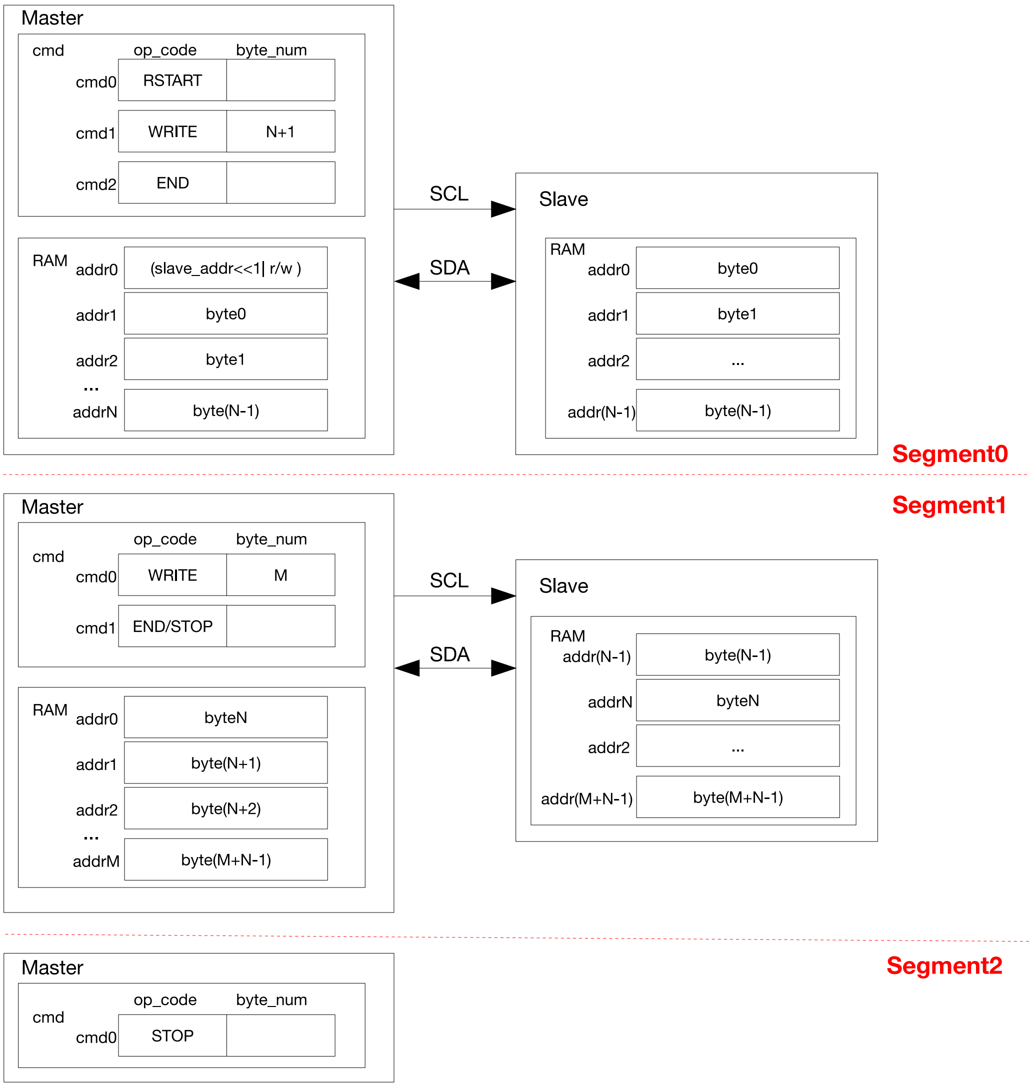

Figure 28-10. I2C$_{master}$ Writing to I2C$_{slave}$ with a 7-bit Address in Multiple Sequences

Given that the I2C Controller RAM holds only 32 bytes, when data are too large to be processed even by the wrapped RAM, it is advised to transmit them in multiple command sequences. At the end of every command sequence is an END command. When the controller executes this END command to pull SCL low, software refreshes command sequence registers and the RAM for next the transfer.

Figure 28-10 shows how I2C$_{master}$ writes to an I2C slave in two or three segments as an example. For the first segment, the CMD_Controller registers are configured as shown in Segment0. Once data in I2C$_{master}$'s RAM is ready and I2C_TRANS_START is set, I2C$_{master}$ initiates data transfer. After executing the END command, I2C$_{master}$ turns off the SCL clock and pulls SCL low to reserve the bus. Meanwhile, the controller generates an I2C_END_DETECT_INT interrupt.

For the second segment, after detecting the I2C_END_DETECT_INT interrupt, software refreshes the CMD_Controller registers, reloads the RAM and clears this interrupt, as shown in Segment1. If cmd1 in the second segment is a STOP, then data is transmitted to I2C$_{slave}$ in two segments. I2C$_{master}$ resumes data transfer after I2C_TRANS_START is set, and terminates the transfer by sending a STOP bit.

For the third segment, after the second data transfer finishes and an I2C_END_DETECT_INT is detected, the CMD_Controller registers of I2C$_{master}$ are configured as shown in Segment2. Once I2C_TRANS_START is set, I2C$_{master}$ generates a STOP bit and terminates the transfer.

Note that other I2C$_{master}$s will not transact on the bus between two segments. The bus is only released after a STOP signal is sent. The I2C controller can be reset by setting I2C_FSM_RST field at any time. This field will later be cleared automatically by hardware.

28.5.4.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
3. Configure command registers of I2C$_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	ack_value	ack_exp	1	N+1
I2C_COMMAND2 (master)	END	—	—	—	—

4. Write I2C$_{slave}$ address and data to be sent to TX RAM of I2C$_{master}$ in either FIFO mode or non-FIFO mode according to Section 28.4.10.
5. Write address of I2C$_{slave}$ to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register
6. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
7. Write 1 to I2C_TRANS_START (master) and I2C_TRANS_START (slave) to start transfer.
8. I2C$_{slave}$ compares the slave address sent by I2C$_{master}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{master}$'s WRITE command is 1, I2C$_{master}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{master}$ does not check ACK value and take I2C$_{slave}$ as matching slave by default.
    - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{master}$ continues data transfer.
    - Not match: If the received ACK value does not match ack_exp, I2C$_{master}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.
9. I2C$_{master}$ sends data, and checks ACK value or not according to ack_check_en (master).
10. After the I2C_END_DETECT_INT (master) interrupt is generated, set I2C_END_DETECT_INT_CLR (master) to 1 to clear this interrupt.
11. Update I2C$_{master}$'s command registers.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	WRITE	ack_value	ack_exp	1	M

I2C_COMMAND1 (master)	END/STOP	—	—	—	—

12. Write M bytes of data to be sent to TX RAM of I2C$_{master}$ in FIFO or non-FIFO mode.
13. Write 1 to I2C_TRANS_START (master) bit to start transfer and repeat step 9.
14. If the command is a STOP, I2C stops transfer and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.
15. If the command is an END, repeat step 10.
16. Update I2C$_{master}$'s command registers.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND1 (master)	STOP	—	—	—	—

17. Write 1 to I2C_TRANS_START (master) bit to start transfer.
18. I2C$_{master}$ executes the STOP command and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.5.5 I2C$_{master}$ Reads I2C$_{slave}$ with a 7-bit Address in One Command Sequence

28.5.5.1 Introduction

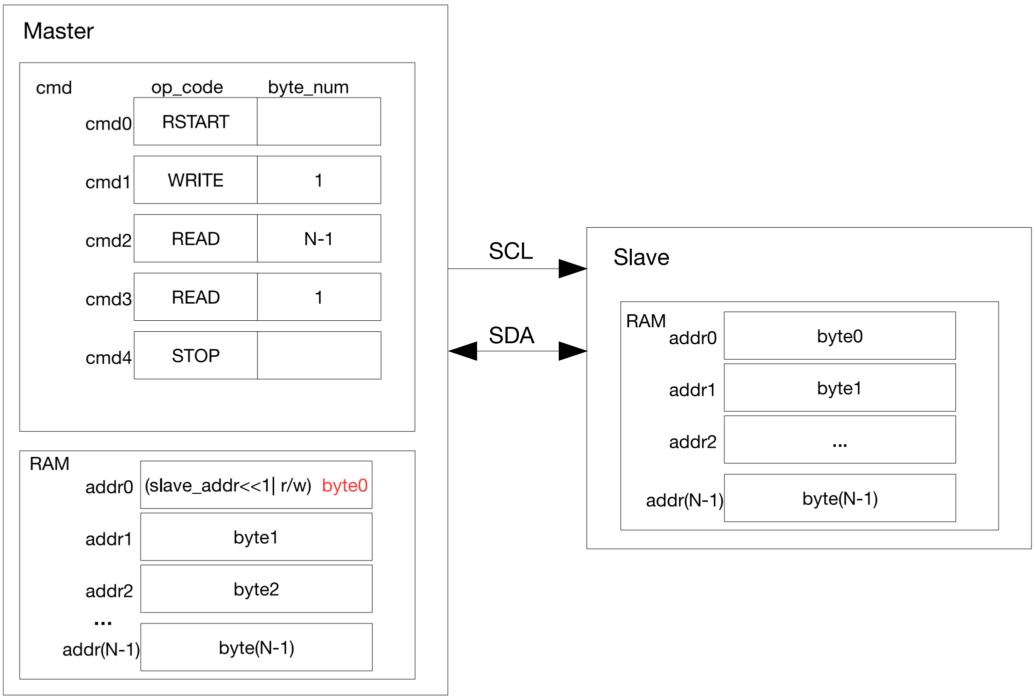

Figure 28-11. I2C$_{master}$ Reading I2C$_{slave}$ with a 7-bit Address

Figure 28-11 shows how I2C$_{master}$ reads N bytes of data from an I2C slave using 7-bit addressing. cmd1 is a WRITE command, and when this command is executed I2C$_{master}$ sends I2C$_{slave}$ address. The byte sent comprises a 7-bit I2C$_{slave}$ address and a $R/\overline{W}$ bit. When the $R/\overline{W}$ bit is 1, it indicates a READ operation. If the address of an I2C slave matches the sent address, this matching slave starts sending data to I2C$_{master}$.

I2C$_{master}$ generates acknowledgements according to ack_value defined in the READ command upon receiving a byte.

As illustrated in Figure 28-11, I2C$_{master}$ executes two READ commands: it generates ACKs for (N-1) bytes of data in cmd2, and a NACK for the last byte of data in cmd 3. This configuration may be changed as required. I2C$_{master}$ writes received data into the controller RAM from addr0, whose original content (a I2C$_{slave}$ address and a $R/\overline{W}$ bit) is overwritten by byte0 marked red in Figure 28-11.

28.5.5.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. We recommend setting I2C_SLAVE_SCL_STRETCH_EN (slave) to 1, so that SCL can be held low for more processing time when I2C$_{slave}$ needs to send data. If this bit is not set, software should write data to be sent to I2C$_{slave}$'s TX RAM before I2C$_{master}$ initiates transfer. Configuration below is applicable to scenario where I2C_SLAVE_SCL_STRETCH_EN (slave) is 1.
3. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
4. Configure command registers of I2C$_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_er	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	0	0	1	1
I2C_COMMAND2 (master)	READ	0	0	1	N-1
I2C_COMMAND3 (master)	READ	1	0	1	1
I2C_COMMAND4 (master)	STOP	—	—	—	—

5. Write I2C$_{slave}$ address to TX RAM of I2C$_{master}$ in either FIFO mode or non-FIFO mode according to Section 28.4.10.
6. Write address of I2C$_{slave}$ to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register.
7. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
8. Write 1 to I2C_TRANS_START (master) bit to start I2C$_{master}$'s transfer.
9. Start I2C$_{slave}$'s transfer according to Section 28.4.14.
10. I2C$_{slave}$ compares the slave address sent by I2C$_{master}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{master}$'s WRITE command is 1, I2C$_{master}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{master}$ does not check ACK value and take I2C$_{slave}$ as matching slave by default.
    - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{master}$ continues data transfer.
    - Not match: If the received ACK value does not match ack_exp, I2C$_{master}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.

11. After I2C_SLAVE_STRETCH_INT (slave) is generated, the I2C_STRETCH_CAUSE bit is 0. The I2C$_{slave}$ address matches the address sent over SDA, and I2C$_{slave}$ needs to send data.
12. Write data to be sent to TX RAM of I2C$_{slave}$ according to Section 28.4.10.
13. Set I2C_SLAVE_SCL_STRETCH_CLR (slave) to 1 to release SCL.
14. I2C$_{slave}$ sends data, and I2C$_{master}$ checks ACK value or not according to ack_check_en (master) in the READ command.
15. If data to be read by I2C$_{master}$ is larger than 32 bytes, an I2C_SLAVE_STRETCH_INT (slave) interrupt will be generated when TX RAM of I2C$_{slave}$ becomes empty. In this way, I2C$_{slave}$ can hold SCL low, so that software has more time to pad data in TX RAM of I2C$_{slave}$ and read data in RX RAM of I2C$_{master}$. After software has finished reading, you can set I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.
16. After I2C$_{master}$ has received the last byte of data, set ack_value (master) to 1. I2C$_{slave}$ will stop transfer once receiving the I2C_NACK_INT interrupt.
17. After data transfer completes, I2C$_{master}$ executes the STOP command, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.5.6 I2C$_{master}$ Reads I2C$_{slave}$ with a 10-bit Address in One Command Sequence

28.5.6.1 Introduction

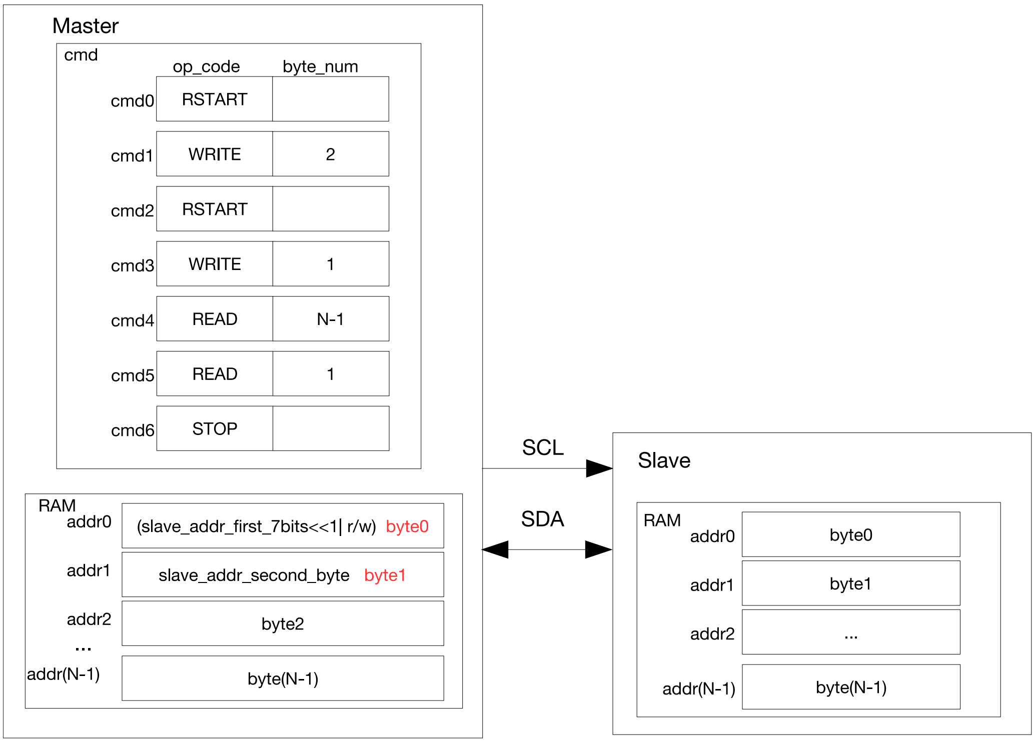

Figure 28-12. I2C$_{master}$ Reading I2C$_{slave}$ with a 10-bit Address

Figure 28-12 shows how I2C$_{master}$ reads data from an I2C slave using 10-bit addressing. Unlike 7-bit addressing, in 10-bit addressing the WRITE command of the I2C$_{master}$ is formed from two bytes, and correspondingly TX RAM of this master stores a 10-bit address of two bytes. The $R/\overline{W}$ bit in the first byte is 0, which indicates a

WRITE operation. After a RSTART condition, I2C$_{master}$ sends the first byte of address again to read data from I2C$_{slave}$, but the $R/\overline{W}$ bit is 1, which indicates a READ operation. The two address bytes can be configured as described in Section 28.5.2.

28.5.6.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. We recommend setting I2C_SLAVE_SCL_STRETCH_EN (slave) to 1, so that SCL can be held low for more processing time when I2C$_{slave}$ needs to send data. If this bit is not set, software should write data to be sent to I2C$_{slave}$'s TX RAM before I2C$_{master}$ initiates transfer. Configuration below is applicable to scenario where I2C_SLAVE_SCL_STRETCH_EN (slave) is 1.
3. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
4. Configure command registers of I2C$_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	0	0	1	2
I2C_COMMAND2 (master)	RSTART	—	—	—	—
I2C_COMMAND3 (master)	WRITE	0	0	1	1
I2C_COMMAND4 (master)	READ	0	0	1	N-1
I2C_COMMAND5 (master)	READ	1	0	1	1
I2C_COMMAND6 (master)	STOP	—	—	—	—

5. Configure I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) as I2C$_{slave}$'s 10-bit address, and set
   I2C_ADDR_10BIT_EN (slave) to 1 to enable 10-bit addressing.
6. Write I2C$_{slave}$ address and data to be sent to TX RAM of I2C$_{master}$ in either FIFO or non-FIFO mode. The first byte of address comprises ((0x78 | I2C_SLAVE_ADDR[9:8])«1) and a $R/\overline{W}$ bit, which is 1 and indicates a WRITE operation. The second byte of address is I2C_SLAVE_ADDR[7:0]. The third byte is ((0x78 | I2C_SLAVE_ADDR[9:8])«1) and a $R/\overline{W}$ bit, which is 1 and indicates a READ operation.
7. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
8. Write 1 to I2C_TRANS_START (master) to start I2C$_{master}$'s transfer.
9. Start I2C$_{slave}$'s transfer according to Section 28.4.14.
10. I2C$_{slave}$ compares the slave address sent by I2C$_{master}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{master}$'s WRITE command is 1, I2C$_{master}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{master}$ does not check ACK value and take I2C$_{slave}$ as matching slave by default.

- Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{\text{master}}$ continues data transfer.
- Not match: If the received ACK value does not match ack_exp, I2C$_{\text{master}}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.

11. I2C$_{\text{master}}$ sends a RSTART and the third byte in TX RAM, which is ((0x78 | I2C_SLAVE_ADDR[9:8])«1) and a $R/\overline{W}$ bit that indicates READ.
12. I2C$_{\text{slave}}$ repeats step 10. If its address matches the address sent by I2C$_{\text{master}}$, I2C$_{\text{slave}}$ proceed on to the next steps.
13. After I2C_SLAVE_STRETCH_INT (slave) is generated, the I2C_STRETCH_CAUSE bit is 0. The I2C$_{\text{slave}}$ address matches the address sent over SDA, and I2C$_{\text{slave}}$ needs to send data.
14. Write data to be sent to TX RAM of I2C$_{\text{slave}}$ in either FIFO mode or non-FIFO mode according to Section 28.4.10.
15. Set I2C_SLAVE_SCL_STRETCH_CLR (slave) to 1 to release SCL.
16. I2C$_{\text{slave}}$ sends data, and I2C$_{\text{master}}$ checks ACK value or not according to ack_check_en (master) in the READ command.
17. If data to be read by I2C$_{\text{master}}$ is larger than 32 bytes, an I2C_SLAVE_STRETCH_INT (slave) interrupt will be generated when TX RAM of I2C$_{\text{slave}}$ becomes empty. In this way, I2C$_{\text{slave}}$ can hold SCL low, so that software has more time to pad data in TX RAM of I2C$_{\text{slave}}$ and read data in RX RAM of I2C$_{\text{master}}$. After software has finished reading, you can set I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.
18. After I2C$_{\text{master}}$ has received the last byte of data, set ack_value (master) to 1. I2C$_{\text{slave}}$ will stop transfer once receiving the I2C_NACK_INT interrupt.
19. After data transfer completes, I2C$_{\text{master}}$ executes the STOP command, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.5.7 I2C$_{\text{master}}$ Reads I2C$_{\text{slave}}$ with Two 7-bit Addresses in One Command Sequence

28.5.7.1 Introduction

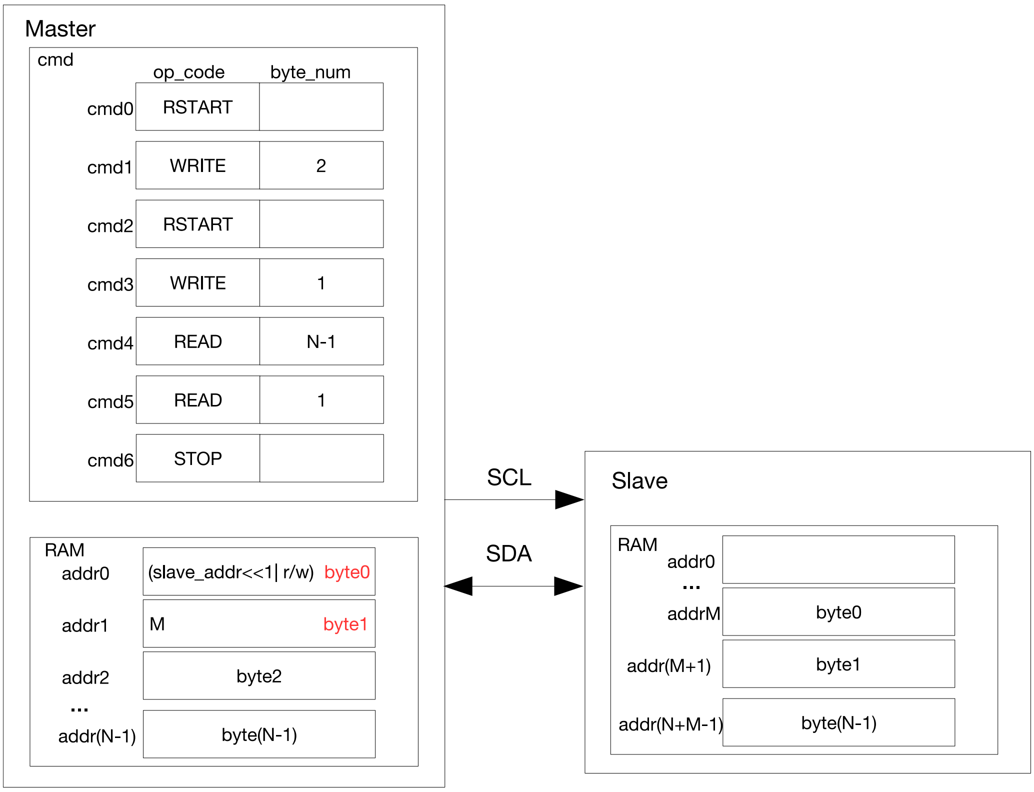

Figure 28-13. $I2C_{master}$ Reading N Bytes of Data from addrM of $I2C_{slave}$ with a 7-bit Address

Figure 28-13 shows how $I2C_{master}$ reads data from specified addresses in an I2C slave. $I2C_{master}$ sends two bytes of addresses: the first byte is a 7-bit $I2C_{slave}$ address followed by a $R/\overline{W}$ bit, which is 0 and indicates a WRITE; the second byte is $I2C_{slave}$'s memory address. After a RSTART condition, $I2C_{master}$ sends the first byte of address again, but the $R/\overline{W}$ bit is 1 which indicates a READ. Then, $I2C_{master}$ reads data starting from addrM.

28.5.7.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. We recommend setting I2C_SLAVE_SCL_STRETCH_EN (slave) to 1, so that SCL can be held low for more processing time when $I2C_{slave}$ needs to send data. If this bit is not set, software should write data to be sent to $I2C_{slave}$'s TX RAM before $I2C_{master}$ initiates transfer. Configuration below is applicable to scenario where I2C_SLAVE_SCL_STRETCH_EN (slave) is 1.
3. Set I2C_FIFO_ADDR_CFG_EN (slave) to 1 to enable double addressing mode.
4. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
5. Configure command registers of $I2C_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	0	0	1	2

I2C_COMMAND2 (master)	RSTART	—	—	—	—
I2C_COMMAND3 (master)	WRITE	0	0	1	1
I2C_COMMAND4 (master)	READ	0	0	1	N-1
I2C_COMMAND5 (master)	READ	1	0	1	1
I2C_COMMAND6 (master)	STOP	—	—	—	—

6. Configure I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register as I2C$_{\text{slave}}$'s 7-bit address, and set I2C_ADDR_10BIT_EN (slave) to 0 to enable 7-bit addressing.
7. Write I2C$_{\text{slave}}$ address and data to be sent to TX RAM of I2C$_{\text{master}}$ in either FIFO or non-FIFO mode according to Section 28.4.10. The first byte of address comprises (I2C_SLAVE_ADDR[6:0])«1) and a $R/\overline{W}$ bit, which is 0 and indicates a WRITE. The second byte of address is memory address M of I2C$_{\text{slave}}$. The third byte is (I2C_SLAVE_ADDR[6:0])«1) and a $R/\overline{W}$ bit, which is 1 and indicates a READ.
8. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
9. Write 1 to I2C_TRANS_START (master) and I2C_TRANS_START (slave) to start I2C$_{\text{master}}$'s transfer.
10. Start I2C$_{\text{slave}}$'s transfer according to Section 28.4.14.
11. I2C$_{\text{slave}}$ compares the slave address sent by I2C$_{\text{master}}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{\text{master}}$'s WRITE command is 1, I2C$_{\text{master}}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{\text{master}}$ does not check ACK value and take I2C$_{\text{slave}}$ as matching slave by default.
    - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{\text{master}}$ continues data transfer.
    - Not match: If the received ACK value does not match ack_exp, I2C$_{\text{master}}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.
12. I2C$_{\text{slave}}$ receives memory address sent by I2C$_{\text{master}}$ and adds the offset.
13. I2C$_{\text{master}}$ sends a RSTART and the third byte in TX RAM, which is ((0x78 | I2C_SLAVE_ADDR[9:8])«1) and a R bit.
14. I2C$_{\text{slave}}$ repeats step 11. If its address matches the address sent by I2C$_{\text{master}}$, I2C$_{\text{slave}}$ proceed on to the next steps.
15. After I2C_SLAVE_STRETCH_INT (slave) is generated, the I2C_STRETCH_CAUSE bit is 0. The I2C$_{\text{slave}}$ address matches the address sent over SDA, and I2C$_{\text{slave}}$ needs to send data.
16. Write data to be sent to TX RAM of I2C$_{\text{slave}}$ in either FIFO mode or non-FIFO mode according to Section 28.4.10.
17. Set I2C_SLAVE_SCL_STRETCH_CLR (slave) to 1 to release SCL.
18. I2C$_{\text{slave}}$ sends data, and I2C$_{\text{master}}$ checks ACK value or not according to ack_check_en (master) in the READ command.

19. If data to be read by I2C$_{master}$ is larger than 32 bytes, an I2C_SLAVE_STRETCH_INT (slave) interrupt will be generated when TX RAM of I2C$_{slave}$ becomes empty. In this way, I2C$_{slave}$ can hold SCL low, so that software has more time to pad data in TX RAM of I2C$_{slave}$ and read data in RX RAM of I2C$_{master}$. After software has finished reading, you can set I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.

20. After I2C$_{master}$ has received the last byte of data, set ack_value (master) to 1. I2C$_{slave}$ will stop transfer once receiving the I2C_NACK_INT interrupt.

21. After data transfer completes, I2C$_{master}$ executes the STOP command, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.5.8 I2C$_{master}$ Reads I2C$_{slave}$ with a 7-bit Address in Multiple Command Sequences

28.5.8.1 Introduction

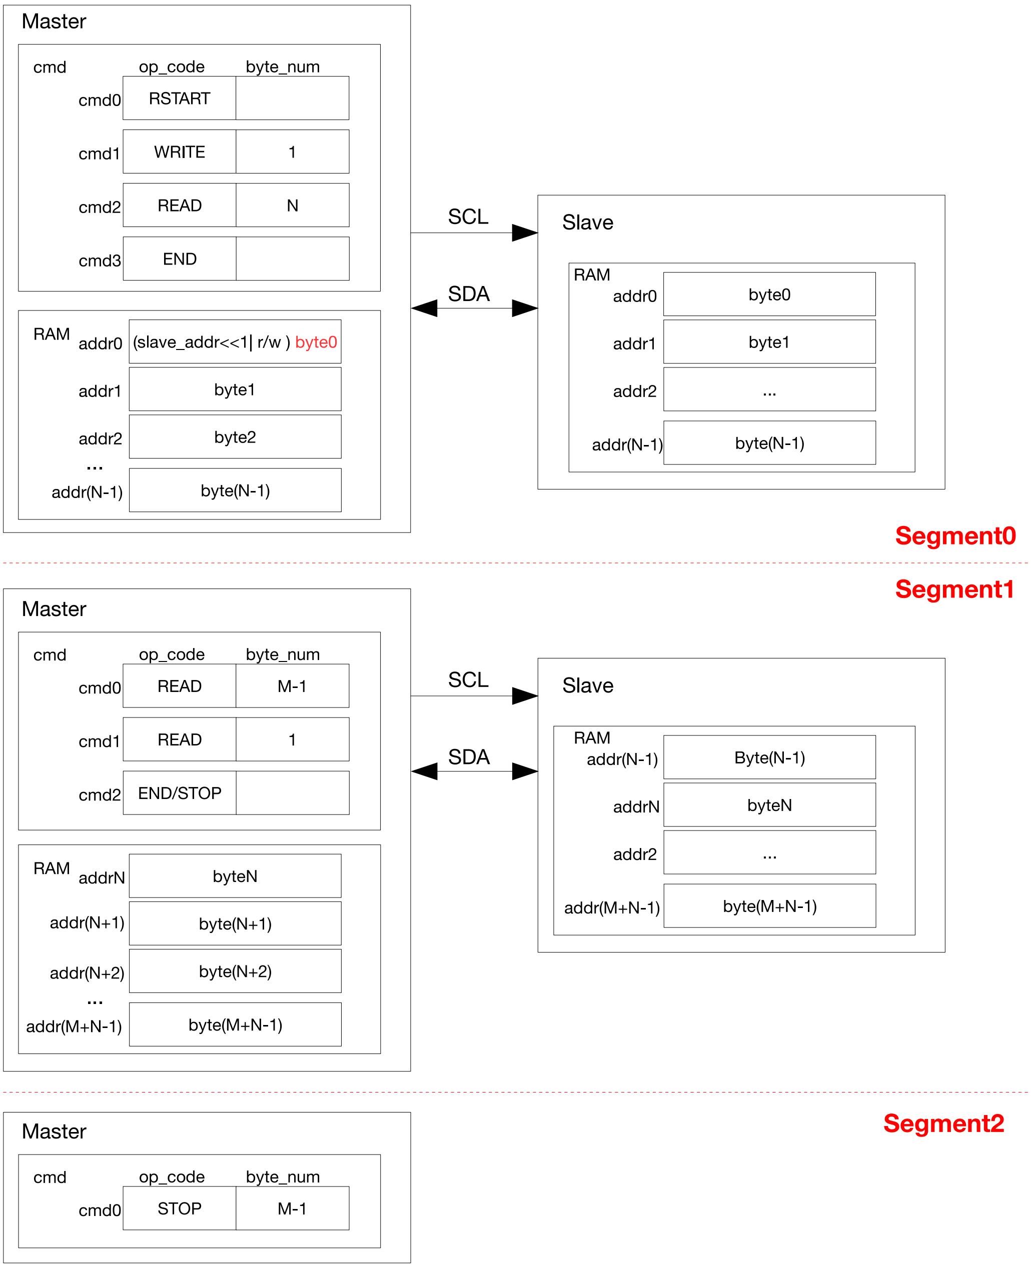

Figure 28-14. I2C$_{master}$ Reading I2C$_{slave}$ with a 7-bit Address in Segments

Figure 28-14 shows how I2C$_{master}$ reads (N+M) bytes of data from an I2C slave in two/three segments separated by END commands. Configuration procedures are described as follows:

1. The procedures for Segment0 is similar to Figure 28-11, except that the last command is an END.
2. Prepare data in the TX RAM of I2C$_{slave}$, and set I2C_TRANS_START to start data transfer. After executing the END command, I2C$_{master}$ refreshes command registers and the RAM as shown in Segment1, and clears the corresponding I2C_END_DETECT_INT interrupt. If cmd2 in Segment1 is a STOP, then data is read from I2C$_{slave}$ in two segments. I2C$_{master}$ resumes data transfer by setting I2C_TRANS_START and terminates the transfer by sending a STOP bit.

3. If cmd2 in Segment1 is an END, then data is read from I2C$_{slave}$ in three segments. After the second data transfer finishes and an I2C_END_DETECT_INT interrupt is detected, the cmd box is configured as shown in Segment2. Once I2C_TRANS_START is set, I2C$_{master}$ terminates the transfer by sending a STOP bit.

28.5.8.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. We recommend setting I2C_SLAVE_SCL_STRETCH_EN (slave) to 1, so that SCL can be held low for more processing time when I2C$_{slave}$ needs to send data. If this bit is not set, software should write data to be sent to I2C$_{slave}$'s TX RAM before I2C$_{master}$ initiates transfer. Configuration below is applicable to scenario where I2C_SLAVE_SCL_STRETCH_EN (slave) is 1.
3. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
4. Configure command registers of I2C$_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	0	0	1	1
I2C_COMMAND2 (master)	READ	0	0	1	N
I2C_COMMAND3 (master)	END	—	—	—	—

5. Write I2C$_{slave}$ address to TX RAM of I2C$_{master}$ in FIFO or non-FIFO mode.
6. Write address of I2C$_{slave}$ to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register.
7. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
8. Write 1 to I2C_TRANS_START (master) to start I2C$_{master}$'s transfer.
9. Start I2C$_{slave}$'s transfer according to Section 28.4.14.
10. I2C$_{slave}$ compares the slave address sent by I2C$_{master}$ with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C$_{master}$'s WRITE command is 1, I2C$_{master}$ checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C$_{master}$ does not check ACK value and take I2C$_{slave}$ as matching slave by default.
    - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C$_{master}$ continues data transfer.
    - Not match: If the received ACK value does not match ack_exp, I2C$_{master}$ generates an I2C_NACK_INT (master) interrupt and stops data transfer.
11. After I2C_SLAVE_STRETCH_INT (slave) is generated, the I2C_STRETCH_CAUSE bit is 0. The I2C$_{slave}$ address matches the address sent over SDA, and I2C$_{slave}$ needs to send data.
12. Write data to be sent to TX RAM of I2C$_{slave}$ in either FIFO mode or non-FIFO mode according to Section 28.4.10.
13. Set I2C_SLAVE_SCL_STRETCH_CLR (slave) to 1 to release SCL.

14. I2C$_{slave}$ sends data, and I2C$_{master}$ checks ACK value or not according to ack_check_en (master) in the READ command.

15. If data to be read by I2C$_{master}$ in one READ command (N or M) is larger than 32 bytes, an I2C_SLAVE_STRETCH_INT (slave) interrupt will be generated when TX RAM of I2C$_{slave}$ becomes empty. In this way, I2C$_{slave}$ can hold SCL low, so that software has more time to pad data in TX RAM of I2C$_{slave}$ and read data in RX RAM of I2C$_{master}$. After software has finished reading, you can set I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.

16. Once finishing reading data in the first READ command, I2C$_{master}$ executes the END command and triggers an I2C_END_DETECT_INT (master) interrupt, which is cleared by setting I2C_END_DETECT_INT_CLR (master) to 1.

17. Update I2C$_{master}$'s command registers using one of the following two methods:

Command registers	op_code	ack_value	ack_exp	ack_check_er	byte_num
I2C_COMMAND0 (master)	READ	ack_value	ack_exp	1	M
I2C_COMMAND1 (master)	END	—	—	—	—

Or

Command registers	op_code	ack_value	ack_exp	ack_check_er	byte_num
I2C_COMMAND0 (master)	READ	0	0	1	M-1
I2C_COMMAND0 (master)	READ	1	0	1	1
I2C_COMMAND1 (master)	STOP	—	—	—	—

18. Write M bytes of data to be sent to TX RAM of I2C$_{slave}$. If M is larger than 32, then repeat step 14 in FIFO or non-FIFO mode.

19. Write 1 to I2C_TRANS_START (master) bit to start transfer and repeat step 14.

20. If the last command is a STOP, then set ack_value (master) to 1 after I2C$_{master}$ has received the last byte of data. I2C$_{slave}$ stops transfer upon the I2C_NACK_INT interrupt. I2C$_{master}$ executes the STOP command to stop transfer and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

21. If the last command is an END, then repeat step 16 and proceed on to the next steps.

22. Update I2C$_{master}$'s command registers.

Command registers	op_code	ack_value	ack_exp	ack_check_er	byte_num
I2C_COMMAND1 (master)	STOP	—	—	—	—

23. Write 1 to I2C_TRANS_START (master) bit to start transfer.

24. I2C$_{master}$ executes the STOP command to stop transfer, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

28.6 Interrupts

- I2C_SLAVE_STRETCH_INT: Generated when one of the four stretching events occurs in slave mode.
- I2C_DET_START_INT: Triggered when the master or the slave detects a START bit.
- I2C_SCL_MAIN_ST_TO_INT: Triggered when the main state machine SCL_MAIN_FSM remains unchanged for over I2C_SCL_MAIN_ST_TO_I2C[23:0] clock cycles.
- I2C_SCL_ST_TO_INT: Triggered when the state machine SCL_FSM remains unchanged for over I2C_SCL_ST_TO_I2C[23:0] clock cycles.
- I2C_RXFIFO_UDF_INT: Triggered when the I2C controller reads RX FIFO via the APB bus, but RX FIFO is empty.
- I2C_TXFIFO_OVF_INT: Triggered when the I2C controller writes TX FIFO via the APB bus, but TX FIFO is full.
- I2C_NACK_INT: Triggered when the ACK value received by the master is not as expected, or when the ACK value received by the slave is 1.
- I2C_TRANS_START_INT: Triggered when the I2C controller sends a START bit.
- I2C_TIME_OUT_INT: Triggered when SCL stays high or low for more than $2^{I2C\_TIME\_OUT\_VALUE}$ clock cycles during data transfer.
- I2C_TRANS_COMPLETE_INT: Triggered when the I2C controller detects a STOP bit.
- I2C_MST_TXFIFO_UDF_INT: Triggered when TX FIFO of the master underflows.
- I2C_ARBITRATION_LOST_INT: Triggered when the SDA's output value does not match its input value while the master's SCL is high.
- I2C_BYTE_TRANS_DONE_INT: Triggered when the I2C controller sends or receives a byte.
- I2C_END_DETECT_INT: Triggered when op_code of the master indicates an END command and an END condition is detected.
- I2C_RXFIFO_OVF_INT: Triggered when RX FIFO of the I2C controller overflows.
- I2C_TXFIFO_WM_INT: I2C TX FIFO watermark interrupt. Triggered when I2C_FIFO_PRT_EN is 1 and the pointers of TX FIFO are less than I2C_TXFIFO_WM_THRHD[4:0].
- I2C_RXFIFO_WM_INT: I2C RX FIFO watermark interrupt. Triggered when I2C_FIFO_PRT_EN is 1 and the pointers of RX FIFO are greater than I2C_RXFIFO_WM_THRHD[4:0].

28.7 Register Summary

The addresses in this section are relative to I2C Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Timing registers			
I2C_SCL_LOW_PERIOD_REG	Configures the low level width of SCL	0x0000	R/W
I2C_SDA_HOLD_REG	Configures the hold time after a negative SCL edge	0x0030	R/W
I2C_SDA_SAMPLE_REG	Configures the sample time after a positive SCL edge	0x0034	R/W
I2C_SCL_HIGH_PERIOD_REG	Configures the high level width of SCL	0x0038	R/W
I2C_SCL_START_HOLD_REG	Configures the delay between the SDA and SCL negative edge for a START condition	0x0040	R/W
I2C_SCL_RSTART_SETUP_REG	Configures the delay between the positive edge of SCL and the negative edge of SDA	0x0044	R/W
I2C_SCL_STOP_HOLD_REG	Configures the delay after the SCL clock edge for a STOP condition	0x0048	R/W
I2C_SCL_STOP_SETUP_REG	Configures the delay between the SDA and SCL positive edge for a STOP condition	0x004C	R/W
I2C_SCL_ST_TIME_OUT_REG	SCL status timeout register	0x0078	R/W
I2C_SCL_MAIN_ST_TIME_OUT_REG	SCL main status timeout register	0x007C	R/W
Configuration registers			
I2C_CTR_REG	Transmission configuration register	0x0004	varies
I2C_TO_REG	Timeout control register	0x000C	R/W
I2C_SLAVE_ADDR_REG	Slave address configuration register	0x0010	R/W
I2C_FIFO_CONF_REG	FIFO configuration register	0x0018	R/W
I2C_FILTER_CFG_REG	SCL and SDA filter configuration register	0x0050	R/W
I2C_CLK_CONF_REG	I2C clock configuration register	0x0054	R/W
I2C_SCL_SP_CONF_REG	Power configuration register	0x0080	varies
I2C_SCL_STRETCH_CONF_REG	Configures SCL clock stretching	0x0084	varies
Status registers			
I2C_SR_REG	Describes I2C work status	0x0008	RO
I2C_FIFO_ST_REG	FIFO status register	0x0014	RO
I2C_DATA_REG	Read/write FIFO register	0x001C	R/W
Interrupt registers			
I2C_INT_RAW_REG	Raw interrupt status	0x0020	R/SS/WTC
I2C_INT_CLR_REG	Interrupt clear bits	0x0024	WT
I2C_INT_ENA_REG	Interrupt enable bits	0x0028	R/W
I2C_INT_STATUS_REG	Status of captured I2C communication events	0x002C	RO
Command registers			
I2C_COMD0_REG	I2C command register 0	0x0058	varies
I2C_COMD1_REG	I2C command register 1	0x005C	varies

Name	Description	Address	Access
I2C_COMD2_REG	I2C command register 2	0x0060	varies
I2C_COMD3_REG	I2C command register 3	0x0064	varies
I2C_COMD4_REG	I2C command register 4	0x0068	varies
I2C_COMD5_REG	I2C command register 5	0x006C	varies
I2C_COMD6_REG	I2C command register 6	0x0070	varies
I2C_COMD7_REG	I2C command register 7	0x0074	varies
Version register			
I2C_DATE_REG	Version control register	0x00F8	R/W

28.8 Registers

The addresses in this section are relative to I2C Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 28.1. I2C_SCL_LOW_PERIOD_REG (0x0000)

(reserved)	I2C_SCL_LOW_PERIOD	
31 9	8 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_SCL_LOW_PERIOD This field is used to configure how long SCL remains low in master mode, in I2C module clock cycles. (R/W)

Register 28.2. I2C_SDA_HOLD_REG (0x0030)

(reserved)	I2C_SDA_HOLD_TIME	
31 9	8 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

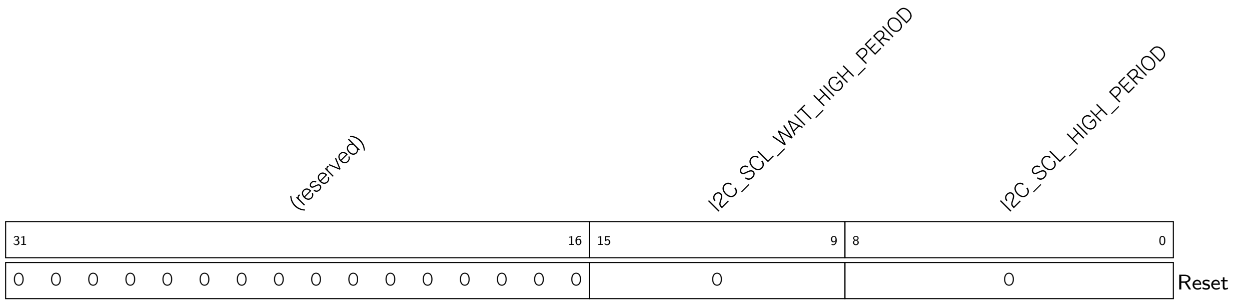
I2C_SDA_HOLD_TIME This field is used to configure the time to hold the data after the falling edge of SCL, in I2C module clock cycles. (R/W)

Register 28.3. I2C_SDA_SAMPLE_REG (0x0034)

(reserved)	I2C_SDA_SAMPLE_TIME	
31 9	8 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_SDA_SAMPLE_TIME This field is used to configure how long SDA is sampled, in I2C module clock cycles. (R/W)

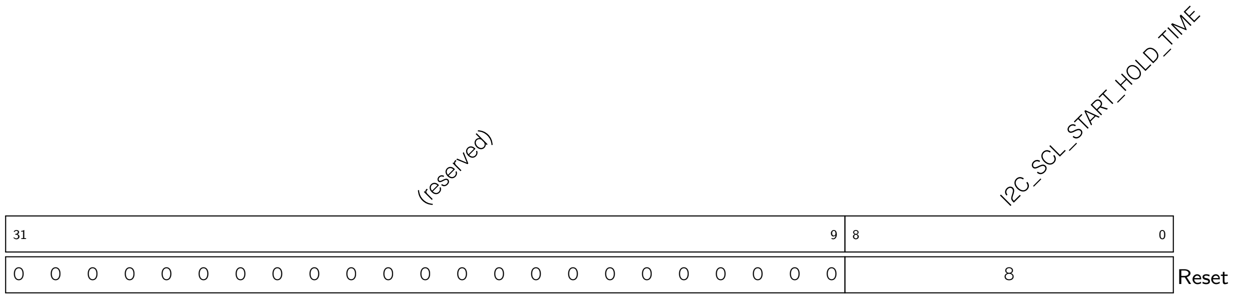
Register 28.4. I2C_SCL_HIGH_PERIOD_REG (0x0038)



I2C_SCL_HIGH_PERIOD This field is used to configure how long SCL remains high in master mode, in I2C module clock cycles. (R/W)

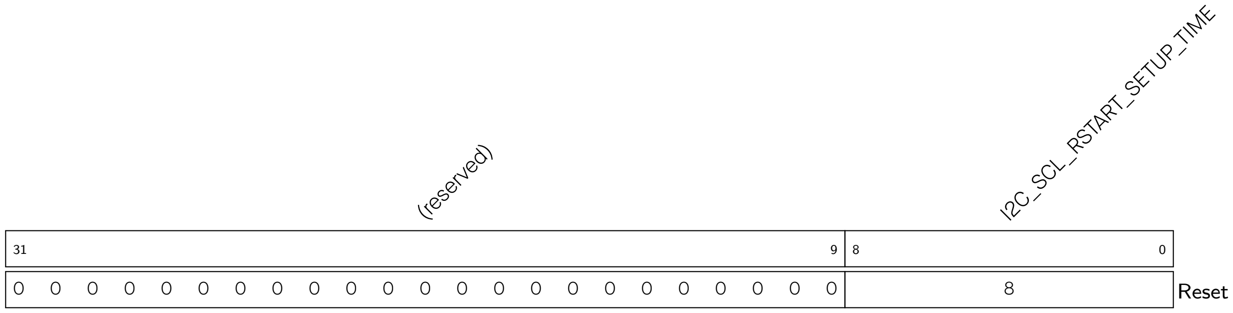
I2C_SCL_WAIT_HIGH_PERIOD This field is used to configure the SCL_FSM's waiting period for SCL high level in master mode, in I2C module clock cycles. (R/W)

Register 28.5. I2C_SCL_START_HOLD_REG (0x0040)



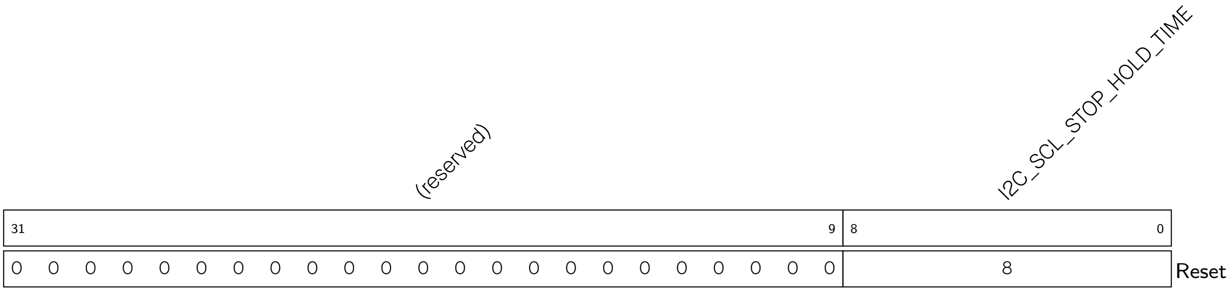
I2C_SCL_START_HOLD_TIME This field is used to configure the time between the falling edge of SDA and the falling edge of SCL for a START condition, in I2C module clock cycles. (R/W)

Register 28.6. I2C_SCL_RSTART_SETUP_REG (0x0044)



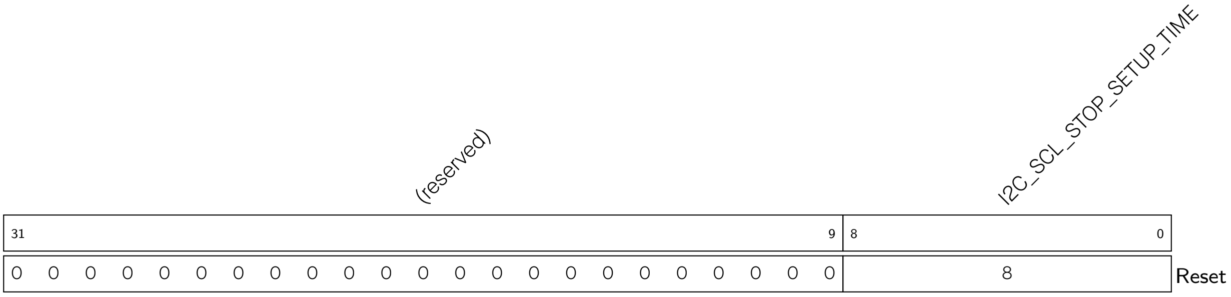
I2C_SCL_RSTART_SETUP_TIME This field is used to configure the time between the rising edge of SCL and the falling edge of SDA for a RSTART condition, in I2C module clock cycles. (R/W)

Register 28.7. I2C_SCL_STOP_HOLD_REG (0x0048)



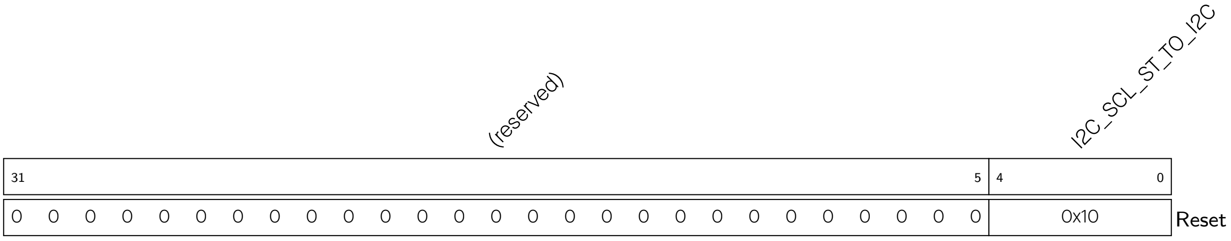
I2C_SCL_STOP_HOLD_TIME This field is used to configure the delay after the STOP condition, in I2C module clock cycles. (R/W)

Register 28.8. I2C_SCL_STOP_SETUP_REG (0x004C)



I2C_SCL_STOP_SETUP_TIME This field is used to configure the time between the rising edge of SCL and the rising edge of SDA, in I2C module clock cycles. (R/W)

Register 28.9. I2C_SCL_ST_TIME_OUT_REG (0x0078)



I2C_SCL_ST_TO_I2C The maximum time that SCL_FSM remains unchanged. It should be no more than 23. (R/W)

Register 28.10. I2C_SCL_MAIN_ST_TIME_OUT_REG (0x007C)

(reserved)	I2C_SCL_MAIN_ST_TO_I2C	
31 5	4 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x10	Reset

I2C_SCL_MAIN_ST_TO_I2C The maximum time that SCL_MAIN_FSM remains unchanged. It should be no more than 23. (R/W)

Register 28.11. I2C_CTR_REG (0x0004)

(reserved)	I2C_ADDR_BROADCASTING_EN	I2C_ADDR_10BIT_RW_CHECK_EN	I2C_SLV_TX_AUTO_START_EN	I2C_CONF_UPGATE	I2C_FSM_RST	I2C_ARBITRATION_EN	I2C_CLK_EN	I2C_RX_LSB_FIRST	I2C_TX_LSB_FIRST	I2C_TRANS_START	I2C_MS_MODE	I2C_RX_FULL_ACK_LEVEL	I2C_SAMPLE_SCL_LEVEL	I2C_SCL_FORCE_OUT	I2C_SDA_FORCE_OUT	
31 15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	1	0	0	0	0	0	1	0	1	1	Reset

I2C_SDA_FORCE_OUT Configures the SDA output mode.

0: Open drain output

1: Direct output

(R/W)

I2C_SCL_FORCE_OUT Configures the SCL output mode.

0: Open drain output

1: Direct output

(R/W)

I2C_SAMPLE_SCL_LEVEL This bit is used to select the sampling mode. 0: samples SDA data on the SCL high level; 1: samples SDA data on the SCL low level. (R/W)

I2C_RX_FULL_ACK_LEVEL This bit is used to configure the ACK value that need to be sent by master when I2C_RXFIFO_CNT has reached the threshold. (R/W)

I2C_MS_MODE Set this bit to configure the I2C controller as an I2C Master. Clear this bit to configure the I2C controller as a slave. (R/W)

I2C_TRANS_START Set this bit to start sending the data in TX FIFO. (WT)

I2C_TX_LSB_FIRST This bit is used to control the order to send data. 0: sends data from the most significant bit; 1: sends data from the least significant bit. (R/W)

I2C_RX_LSB_FIRST This bit is used to control the order to receive data. 0: receives data from the most significant bit; 1: receives data from the least significant bit. (R/W)

I2C_CLK_EN This field controls APB_CLK clock gating. 0: APB_CLK is gated to save power; 1: APB_CLK is always on. (R/W)

I2C_ARBITRATION_EN This is the enable bit for I2C bus arbitration function. (R/W)

I2C_FSM_RST This bit is used to reset the SCL_FSM. (WT)

I2C_CONF_UPGATE Synchronization bit. (WT)

I2C_SLV_TX_AUTO_START_EN This is the enable bit for slave to send data automatically. (R/W)

I2C_ADDR_10BIT_RW_CHECK_EN This is the enable bit to check if the R/W bit of 10-bit addressing is consistent with the I2C protocol. (R/W)

I2C_ADDR_BROADCASTING_EN This is the enable bit for 7-bit general call addressing. (R/W)

Register 28.12. I2C_TO_REG (0x000C)

(reserved)	I2C_TIME_OUT_EN	I2C_TIME_OUT_VALUE	
31 6	5	4 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x10	Reset

I2C_TIME_OUT_VALUE This field is used to configure the timeout value for receiving a data bit in I2C_SCLK clock cycles. The configured timeout value equals $2^{I2C\_TIME\_OUT\_VALUE}$ clock cycles. (R/W)

I2C_TIME_OUT_EN This is the enable bit for timeout control. (R/W)

Register 28.13. I2C_SLAVE_ADDR_REG (0x0010)

I2C_ADDR_10BIT_EN	(reserved)	I2C_SLAVE_ADDR	
31	30 15	14 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_SLAVE_ADDR When the I2C controller is in slave mode, this field is used to configure the slave address. (R/W)

I2C_ADDR_10BIT_EN This field is used to enable the 10-bit addressing mode in master mode. (R/W)

Register 28.14. I2C_FIFO_CONF_REG (0x0018)

(reserved)	I2C_FIFO_PRT_EN	I2C_TX_FIFO_RST	I2C_RX_FIFO_RST	I2C_FIFO_ADDR_CFG_EN	I2C_NONFIFO_EN	I2C_TXFIFO_WM_THRHD	I2C_RXFIFO_WM_THRHD	
31 15	14	13	12	11	10	9 5	4 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	0	0	0	0	0x4	0xb	Reset

I2C_RXFIFO_WM_THRHD The watermark threshold of RX FIFO in non-FIFO mode. When I2C_FIFO_PRT_EN is 1 and RX FIFO counter is bigger than I2C_RXFIFO_WM_THRHD[4:0], I2C_RXFIFO_WM_INT_RAW bit is valid. (R/W)

I2C_TXFIFO_WM_THRHD The watermark threshold of TX FIFO in non-FIFO mode. When I2C_FIFO_PRT_EN is 1 and TX FIFO counter is smaller than I2C_TXFIFO_WM_THRHD[4:0], I2C_TXFIFO_WM_INT_RAW bit is valid. (R/W)

I2C_NONFIFO_EN Set this bit to enable APB non-FIFO mode. (R/W)

I2C_FIFO_ADDR_CFG_EN When this bit is set to 1, the byte received after the I2C address byte represents the offset address in the I2C Slave RAM. (R/W)

I2C_RX_FIFO_RST Set this bit to reset RX FIFO. (R/W)

I2C_TX_FIFO_RST Set this bit to reset TX FIFO. (R/W)

I2C_FIFO_PRT_EN The control enable bit of FIFO pointer in non-FIFO mode. This bit controls the valid bits and TX/RX FIFO overflow, underflow, full and empty interrupts. (R/W)

Register 28.15. I2C_FILTER_CFG_REG (0x0050)

(reserved)	I2C_SDA_FILTER_EN	I2C_SCL_FILTER_EN	I2C_SDA_FILTER_THRES	I2C_SCL_FILTER_THRES	
31 10	9	8	7 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	1	0	0	Reset

I2C_SCL_FILTER_THRES When a pulse on the SCL input has smaller width than the value of this field in I2C module clock cycles, the I2C controller ignores that pulse. (R/W)

I2C_SDA_FILTER_THRES When a pulse on the SDA input has smaller width than the value of this field in I2C module clock cycles, the I2C controller ignores that pulse. (R/W)

I2C_SCL_FILTER_EN This is the filter enable bit for SCL. (R/W)

I2C_SDA_FILTER_EN This is the filter enable bit for SDA. (R/W)

Register 28.16. I2C_CLK_CONF_REG (0x0054)

(reserved)	I2C_SCLK_ACTIVE	I2C_SCLK_SEL	I2C_SCLK_DIV_B	I2C_SCLK_DIV_A	I2C_SCLK_DIV_NUM	
31 22	21	20	19 14	13 8	7 0	
0 0 0 0 0 0 0 0 0 0	1	0	0	0	0	Reset

I2C_SCLK_DIV_NUM The integral part of the divisor. (R/W)

I2C_SCLK_DIV_A The numerator of the divisor's fractional part. (R/W)

I2C_SCLK_DIV_B The denominator of the divisor's fractional part. (R/W)

I2C_SCLK_SEL The clock selection bit for the I2C controller. 0: XTAL_CLK; 1: RC_FAST_CLK. (R/W)

I2C_SCLK_ACTIVE The clock switch bit for the I2C controller. (R/W)

Register 28.17. I2C_SCL_SP_CONF_REG (0x0080)

(reserved)	I2C_SDA_PD_EN	I2C_SCL_PD_EN	I2C_SCL_RST_SLV_NUM	I2C_SCL_RST_SLV_EN	
31 8	7	6	5 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	Reset

I2C_SCL_RST_SLV_EN When the master is idle, set this bit to send out SCL pulses. The number of pulses equals to I2C_SCL_RST_SLV_NUM[4:0]. (R/W/SC)

I2C_SCL_RST_SLV_NUM Configures the pulses of SCL generated in master mode. Valid when I2C_SCL_RST_SLV_EN is 1. (R/W)

I2C_SCL_PD_EN The power down enable bit for the I2C output SCL line. 0: Not power down; 1: Power down. Set I2C_SCL_FORCE_OUT and I2C_SCL_PD_EN to 1 to stretch SCL low. (R/W)

I2C_SDA_PD_EN The power down enable bit for the I2C output SDA line. 0: Not power down; 1: Power down. Set I2C_SDA_FORCE_OUT and I2C_SDA_PD_EN to 1 to stretch SDA low. (R/W)

Register 28.18. I2C_SCL_STRETCH_CONF_REG (0x0084)

(reserved)	I2C_SLAVE_BYTE_ACK_LVL	I2C_SLAVE_BYTE_ACK_CTL_EN	I2C_SLAVE_SCL_STRETCH_CLR	I2C_SLAVE_SCL_STRETCH_EN	I2C_STRETCH_PROTECT_NUM	
31 14	13	12	11	10	9 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	Reset

I2C_STRETCH_PROTECT_NUM Configures the time period to release the SCL line from stretching to avoid timing violation. Usually it should be larger than the SDA steup time. (R/W)

I2C_SLAVE_SCL_STRETCH_EN The enable bit for SCL clock stretching. 0: Disable; 1: Enable. The SCL output line will be stretched low when I2C_SLAVE_SCL_STRETCH_EN is 1 and one of the four stretching events occurs. The cause of stretching can be seen in I2C_STRETCH_CAUSE. (R/W)

I2C_SLAVE_SCL_STRETCH_CLR Set this bit to clear SCL clock stretching. (WT)

I2C_SLAVE_BYTE_ACK_CTL_EN The enable bit for slave to control the level of the ACK bit. (R/W)

I2C_SLAVE_BYTE_ACK_LVL Set the level of the ACK bit when I2C_SLAVE_BYTE_ACK_CTL_EN is set. (R/W)

Register 28.19. I2C_SR_REG (0x0008)

(reserved)	I2C_SCL_STATE_LAST	(reserved)	I2C_SCL_MAIN_STATE_LAST	I2C_TXFIFO_CNT	(reserved)	I2C_STRETCH_CAUSE	I2C_RXFIFO_CNT	(reserved)	I2C_SLAVE_ADDRESSED	I2C_BUS_BUSY	I2C_ARB_LOST	(reserved)	I2C_SLAVE_RW	I2C_RESP_REC	
31	30 28	27	26 24	23 18	17 16	15 14	13 8	7 6	5	4	3	2	1	0	
0	0	0	0	0	0 0	0x3	0	0 0	0	0	0	0	0	0	Reset

I2C_RESP_REC The received ACK value in master mode or slave mode. 0: ACK; 1: NACK. (RO)

I2C_SLAVE_RW When in slave mode, 0: master writes to slave; 1: master reads from slave. (RO)

I2C_ARB_LOST When the I2C controller loses control of the SCL line, this bit changes to 1. (RO)

I2C_BUS_BUSY 0: The I2C bus is in idle state; 1: The I2C bus is busy transferring data. (RO)

I2C_SLAVE_ADDRESSED When the I2C controller is in slave mode, and the address sent by the master matches the address of the slave, this bit is at high level. (RO)

I2C_RXFIFO_CNT This field represents the number of data bytes to be sent. (RO)

I2C_STRETCH_CAUSE The cause of SCL clock stretching in slave mode. 0: stretching SCL low when the master starts to read data; 1: stretching SCL low when TX FIFO is empty in slave mode; 2: stretching SCL low when RX FIFO is full in slave mode. (RO)

I2C_TXFIFO_CNT This field stores the number of data bytes received in RAM. (RO)

I2C_SCL_MAIN_STATE_LAST This field indicates the status of the state machine. 0: idle; 1: address shift; 2: ACK address; 3: receive data; 4: transmit data; 5: send ACK; 6: wait for ACK. (RO)

I2C_SCL_STATE_LAST This field indicates the status of the state machine used to produce SCL. 0: idle; 1: start; 2: falling edge; 3: low; 4: rising edge; 5: high; 6: stop. (RO)

Register 28.20. I2C_FIFO_ST_REG (0x0014)

(reserved)	I2C_SLAVE_RW_POINT	(reserved)	I2C_TXFIFO_WADDR	I2C_TXFIFO_RADDR	I2C_RXFIFO_WADDR	I2C_RXFIFO_RADDR	
31 30	29 22	21 20	19 15	14 10	9 5	4 0	
0 0	0	0 0	0	0	0	0	Reset

I2C_RXFIFO_RADDR This is the offset address of the APB reading from RX FIFO. (RO)

I2C_RXFIFO_WADDR This is the offset address of the I2C controller receiving data and writing to RX FIFO. (RO)

I2C_TXFIFO_RADDR This is the offset address of the I2C controller reading from TX FIFO. (RO)

I2C_TXFIFO_WADDR This is the offset address of APB bus writing to TX FIFO. (RO)

I2C_SLAVE_RW_POINT The received data in I2C slave mode. (RO)

Register 28.21. I2C_DATA_REG (0x001C)

(reserved)	I2C_FIFO_RDATA	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_FIFO_RDATA This field is used to read data from RX FIFO, or write data to TX FIFO. (R/W)

Register 28.22. I2C_INT_RAW_REG (0x0020)

(reserved)	I2C_GENERAL_CALL_INT_RAW	I2C_SLAVE_STRETCH_INT_RAW	I2C_DET_START_INT_RAW	I2C_SCL_MAIN_ST_TO_INT_RAW	I2C_SCL_ST_TO_INT_RAW	I2C_RXFIFO_UDF_INT_RAW	I2C_TXFIFO_OVF_INT_RAW	I2C_NACK_INT_RAW	I2C_TRANS_START_INT_RAW	I2C_TIME_OUT_INT_RAW	I2C_TRANS_COMPLETE_INT_RAW	I2C_MST_TXFIFO_UDF_INT_RAW	I2C_ARBITRATION_LOST_INT_RAW	I2C_BYTE_TRANS_DONE_INT_RAW	I2C_END_DETECT_INT_RAW	I2C_RXFIFO_OVF_INT_RAW	I2C_TXFIFO_WM_INT_RAW	I2C_RXFIFO_WM_INT_RAW	
31 18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	Reset

I2C_RXFIFO_WM_INT_RAW The raw interrupt bit for the I2C_RXFIFO_WM_INT interrupt. (R/SS/WTC)

I2C_TXFIFO_WM_INT_RAW The raw interrupt bit for the I2C_TXFIFO_WM_INT interrupt. (R/SS/WTC)

I2C_RXFIFO_OVF_INT_RAW The raw interrupt bit for the I2C_RXFIFO_OVF_INT interrupt. (R/SS/WTC)

I2C_END_DETECT_INT_RAW The raw interrupt bit for the I2C_END_DETECT_INT interrupt. (R/SS/WTC)

I2C_BYTE_TRANS_DONE_INT_RAW The raw interrupt bit for the I2C_BYTE_TRANS_DONE_INT interrupt. (R/SS/WTC)

I2C_ARBITRATION_LOST_INT_RAW The raw interrupt bit for the I2C_ARBITRATION_LOST_INT interrupt. (R/SS/WTC)

I2C_MST_TXFIFO_UDF_INT_RAW The raw interrupt bit for the I2C_MST_TXFIFO_UDF_INT interrupt. (R/SS/WTC)

I2C_TRANS_COMPLETE_INT_RAW The raw interrupt bit for the I2C_TRANS_COMPLETE_INT interrupt. (R/SS/WTC)

I2C_TIME_OUT_INT_RAW The raw interrupt bit for the I2C_TIME_OUT_INT interrupt. (R/SS/WTC)

I2C_TRANS_START_INT_RAW The raw interrupt bit for the I2C_TRANS_START_INT interrupt. (R/SS/WTC)

I2C_NACK_INT_RAW The raw interrupt bit for the I2C_NACK_INT interrupt. (R/SS/WTC)

I2C_TXFIFO_OVF_INT_RAW The raw interrupt bit for the I2C_TXFIFO_OVF_INT interrupt. (R/SS/WTC)

I2C_RXFIFO_UDF_INT_RAW The raw interrupt bit for the I2C_RXFIFO_UDF_INT interrupt. (R/SS/WTC)

Continued on the next page...

Register 28.22. I2C_INT_RAW_REG (0x0020)

Continued from the previous page...

I2C_SCL_ST_TO_INT_RAW The raw interrupt bit for the I2C_SCL_ST_TO_INT interrupt. (R/SS/WTC)

I2C_SCL_MAIN_ST_TO_INT_RAW The raw interrupt bit for the I2C_SCL_MAIN_ST_TO_INT interrupt. (R/SS/WTC)

I2C_DET_START_INT_RAW The raw interrupt bit for the I2C_DET_START_INT interrupt. (R/SS/WTC)

I2C_SLAVE_STRETCH_INT_RAW The raw interrupt bit for the I2C_SLAVE_STRETCH_INT interrupt. (R/SS/WTC)

I2C_GENERAL_CALL_INT_RAW The raw interrupt bit for the I2C_GENARAL_CALL_INT interrupt. (R/SS/WTC)

Register 28.23. I2C_INT_CLR_REG (0x0024)

Register 28.25. I2C_INT_STATUS_REG (0x002C)

Continued from the previous page...

I2C_SCL_ST_TO_INT_ST The masked interrupt status bit for the I2C_SCL_ST_TO_INT interrupt. (RO)

I2C_SCL_MAIN_ST_TO_INT_ST The masked interrupt status bit for the I2C_SCL_MAIN_ST_TO_INT interrupt. (RO)

I2C_DET_START_INT_ST The masked interrupt status bit for the I2C_DET_START_INT interrupt. (RO)

I2C_SLAVE_STRETCH_INT_ST The masked interrupt status bit for the I2C_SLAVE_STRETCH_INT interrupt. (RO)

I2C_GENERAL_CALL_INT_ST The masked interrupt status bit for the I2C_GENARAL_CALL_INT interrupt. (RO)

Register 28.26. I2C_COMD0_REG (0x0058)

I2C_COMMAND0_DONE	(reserved)	I2C_COMMAND0	
31	30 ... 14	13 ... 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND0 This is the content of command register 0. It consists of three parts:

- op_code is the command. 1: WRITE; 2: STOP; 3: READ; 4: END; 6: RSTART.
- Byte_num represents the number of bytes that need to be sent or received.
- ack_check_en, ack_exp and ack are used to control the ACK bit. For more information, see Section 28.4.9.

(R/W)

I2C_COMMAND0_DONE When command 0 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 28.27. I2C_COMD1_REG (0x005C)

I2C_COMMAND1_DONE	(reserved)	I2C_COMMAND1	
31	30 14	13 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND1 This is the content of command register 1. It is the same as that of I2C_COMMAND0. (R/W)

I2C_COMMAND1_DONE When command 1 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 28.28. I2C_COMD2_REG (0x0060)

I2C_COMMAND2_DONE	(reserved)	I2C_COMMAND2	
31	30 14	13 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND2 This is the content of command register 2. It is the same as that of I2C_COMMAND0. (R/W)

I2C_COMMAND2_DONE When command 2 has been executed in master mode, this bit changes to high Level. (R/W/SS)

Register 28.29. I2C_COMD3_REG (0x0064)

I2C_COMMAND3_DONE	(reserved)	I2C_COMMAND3	
31	30 14	13 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND3 This is the content of command register 3. It is the same as that of I2C_COMMAND0. (R/W)

I2C_COMMAND3_DONE When command 3 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 28.30. I2C_COMD4_REG (0x0068)

I2C_COMMAND4_DONE	(reserved)	I2C_COMMAND4	
31	30 14	13 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND4 This is the content of command register 4. It is the same as that of I2C_COMMAND0. (R/W)

I2C_COMMAND4_DONE When command 4 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 28.31. I2C_COMD5_REG (0x006C)

I2C_COMMAND5_DONE	(reserved)	I2C_COMMAND5	
31	30 14	13 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND5 This is the content of command register 5. It is the same as that of I2C_COMMAND0. (R/W)

I2C_COMMAND5_DONE When command 5 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 28.32. I2C_COMD6_REG (0x0070)

I2C_COMMAND6_DONE	(reserved)	I2C_COMMAND6	
31	30 14	13 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND6 This is the content of command register 6. It is the same as that of I2C_COMMAND0. (R/W)

I2C_COMMAND6_DONE When command 6 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 28.33. I2C_COMD7_REG (0x0074)

I2C_COMMAND7_DONE	(reserved)	I2C_COMMAND7	
31	30 14	13 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

I2C_COMMAND7 This is the content of command register 7. It is the same as that of I2C_COMMAND0. (R/W)

I2C_COMMAND7_DONE When command 7 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 28.34. I2C_DATE_REG (0x00F8)

I2C_DATE	
31 0	
0x20070201	Reset

I2C_DATE This is the version control register. (R/W)

29 I2S Controller (I2S)

29.1 Overview

ESP32-C3 has a built-in I2S interface, which provides a flexible communication interface for streaming digital data in multimedia applications, especially digital audio applications.

The I2S standard bus defines three signals: a bit clock signal (BCK), a channel/word select signal (WS), and a serial data signal (SD). A basic I2S data bus has one master and one slave. The roles remain unchanged throughout the communication. The I2S module on ESP32-C3 provides separate transmit (TX) and receive (RX) units for high performance.

29.2 Terminology

To better illustrate the functionality of I2S, the following terms are used in this chapter.

Master mode As a master, I2S drives BCK/WS signals, and sends data to or receives data from a slave.

Slave mode As a slave, I2S is driven by BCK/WS signals, and receives data from or sends data to a master.

Full-duplex There are two separate data lines. Transmitted and received data are carried simultaneously.

Half-duplex Only one side, the master or the slave, sends data first, and the other side receives data. Sending data and receiving data can not happen at the same time.

A-law and μ-law A-law and μ-law are compression/decompression algorithms in digital pulse code modulated (PCM) non-uniform quantization, which can effectively improve the signal-to-quantization noise ratio.

TDM RX mode In this mode, pulse code modulated (PCM) data is received and stored into memory via direct memory access (DMA), utilizing time division multiplexing (TDM). The signal lines include: BCK, WS, and SD. Data from 16 channels at most can be received. TDM Philips standard, TDM MSB alignment standard, and TDM PCM standard are supported in this mode, depending on user configuration.

Normal PDM RX mode In this mode, pulse density modulation (PDM) data is received and stored into memory via DMA. Used signals: WS and DATA. PDM standard is supported in this mode by user configuration.

TDM TX mode In this mode, pulse code modulated (PCM) data is sent from memory via DMA, in a way of time division multiplexing (TDM). The signal lines include: BCK, WS, and DATA. Data up to 16 channels can be sent. TDM Philips standard, TDM MSB alignment standard, and TDM PCM standard are supported in this mode, depending on user configuration.

Normal PDM TX mode In this mode, pulse density modulation (PDM) data is sent from memory via DMA. The signal lines include: WS and DATA. PDM standard is supported in this mode by user configuration.

PCM-to-PDM TX mode In this mode, I2S as a **master**, converts the pulse code modulated (PCM) data from memory via DMA into pulse density modulation (PDM) data, and then sends the data out. Used signals: WS and DATA. PDM standard is supported in this mode by user configuration.

29.3 Features

- Supports master mode and slave mode
- Supports full-duplex and half-duplex communications
- Provides separate TX unit and RX unit, independent of each other
- Supports TX unit and RX unit to work independently and simultaneously
- Supports a variety of audio standards:
  - TDM Philips standard
  - TDM MSB alignment standard
  - TDM PCM standard
  - PDM standard
- Configurable high-precision sample clock
- Supports the following frequencies: 8 kHz, 16 kHz, 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, 128 kHz, and 192 kHz (192 kHz is not supported in 32-bit slave mode).
- Supports 8-/16-/24-/32-bit data communication
- Supports DMA access
- Supports standard I2S interface interrupts

29.4 System Architecture

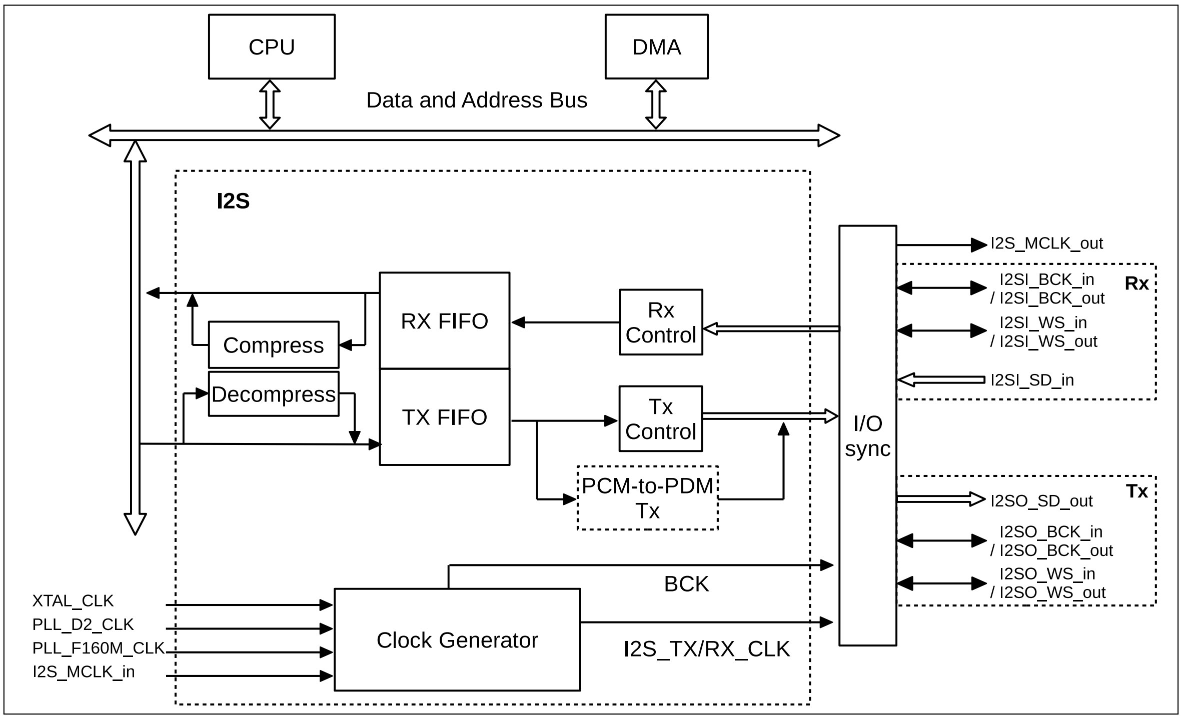

Figure 29-1. ESP32-C3 I2S System Diagram

Figure 29-1 shows the structure of ESP32-C3 I2S module, consisting of:

- TX unit (TX control)
- RX unit (RX control)
- input and output timing unit (I/O sync)
- clock divider (Clock Generator)
- 64 x 32-bit TX FIFO
- 64 x 32-bit RX FIFO
- Compress/Decompress units

I2S module supports direct access (DMA) to internal memory, see Chapter 2 *GDMA Controller (GDMA)*.

Both the TX unit and the RX unit have a three-line interface that includes a bit clock line (BCK), a word select line (WS), and a serial data line (SD). The SD line of the TX unit is fixed as output, and the SD line of the RX unit as input. BCK and WS signal lines for TX unit and RX unit can be configured as master output mode or slave input mode.

The signal bus of I2S module is shown at the right part of Figure 29-1. The naming of these signals in RX and TX units follows the pattern: I2SA_B_C, such as I2SI_BCK_in.

- "A": direction of data bus
  - "I": input, receiving
  - "O": output, transmitting

- “B”: signal function
  - BCK
  - WS
  - SD
- “C”: signal direction
  - “in”: input signal into I2S module
  - “out”: output signal from I2S module

Table 29-2 provides a detailed description of I2S signals.

Table 29-2. I2S Signal Description

Signal	Direction	Function
I2SI_BCK_in	Input	In I2S slave mode, inputs BCK signal for RX unit.
I2SI_BCK_out	Output	In I2S master mode, outputs BCK signal for RX unit.
I2SI_WS_in	Input	In I2S slave mode, inputs WS signal for RX unit.
I2SI_WS_out	Output	In I2S master mode, outputs WS signal for RX unit.
I2SI_Data_in	Input	Works as the serial input data bus for I2S RX unit.
I2SO_Data_out	Output	Works as the serial output data bus for I2S TX unit.
I2SO_BCK_in	Input	In I2S slave mode, inputs BCK signal for TX unit.
I2SO_BCK_out	Output	In I2S master mode, outputs BCK signal for TX unit.
I2SO_WS_in	Input	In I2S slave mode, inputs WS signal for TX unit.
I2SO_WS_out	Output	In I2S master mode, outputs WS signal for TX unit.
I2S_MCLK_in	Input	In I2S slave mode, works as a clock source from the external master.
I2S_MCLK_out	Output	In I2S master mode, works as a clock source for the external slave.

Note:
Any required signals of I2S must be mapped to the chip’s pins via GPIO matrix, see Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)*.

29.5 Supported Audio Standards

ESP32-C3 I2S supports multiple audio standards, including TDM Philips standard, TDM MSB alignment standard, TDM PCM standard, and PDM standard.

Select the needed standard by configuring the following bits:

- I2S_TX/RX_TDM_EN
  - 0: disable TDM mode.
  - 1: enable TDM mode.
- I2S_TX/RX_PDM_EN
  - 0: disable PDM mode.

  - 1: enable PDM mode.

- I2S_TX/RX_MSB_SHIFT
  - 0: WS and SD signals change simultaneously, i.e. enable MSB alignment standard.
  - 1: WS signal changes one BCK clock cycle earlier than SD signal, i.e. enable Philips standard or select PCM standard.

- I2S_TX/RX_PCM_BYPASS
  - 0: enable PCM standard.
  - 1: disable PCM standard.

29.5.1 TDM Philips Standard

Philips specifications require that WS signal changes one BCK clock cycle earlier than SD signal on BCK falling edge, which means that WS signal is valid from one clock cycle before transmitting the first bit of channel data and changes one clock before the end of channel data transfer. SD signal line transmits the most significant bit of audio data first.

Compared with Philips standard, TDM Philips standard supports multiple channels, see Figure 29-2.

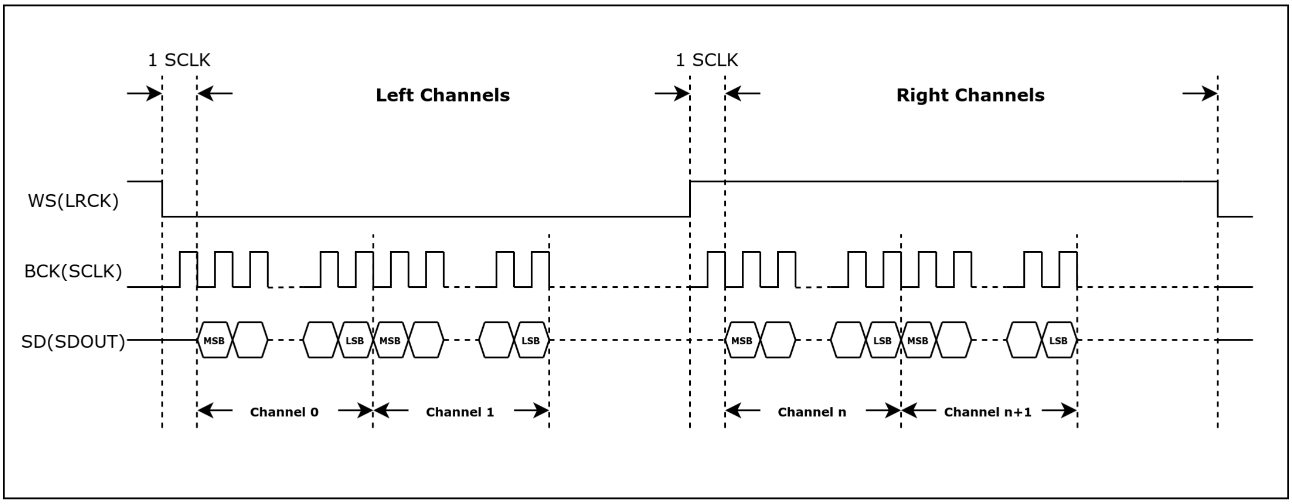

Figure 29-2. TDM Philips Standard Timing Diagram

29.5.2 TDM MSB Alignment Standard

MSB alignment specifications require WS and SD signals change simultaneously on the falling edge of BCK. The WS signal is valid until the end of channel data transfer. The SD signal line transmits the most significant bit of audio data first.

Compared with MSB alignment standard, TDM MSB alignment standard supports multiple channels, see Figure 29-3.

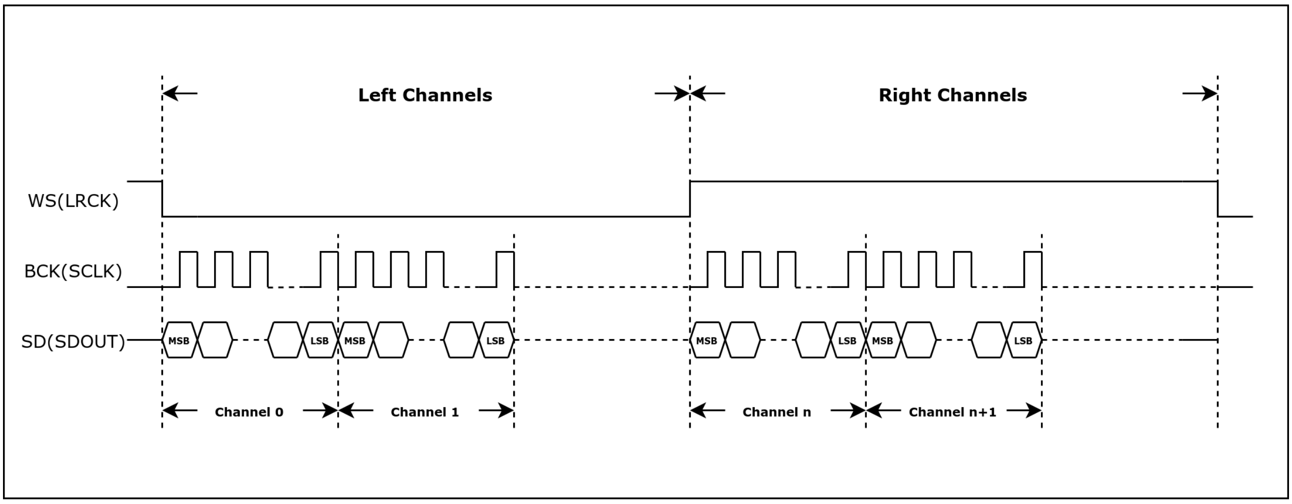

Figure 29-3. TDM MSB Alignment Standard Timing Diagram

29.5.3 TDM PCM Standard

Short frame synchronization under PCM standard requires WS signal changes one BCK clock cycle earlier than SD signal on the falling edge of BCK, which means that the WS signal becomes valid one clock cycle before transferring the first bit of channel data and remains unchanged in this BCK clock cycle. SD signal line transmits the most significant bit of audio data first.

Compared with PCM standard, TDM PCM standard supports multiple channels, see Figure 29-4.

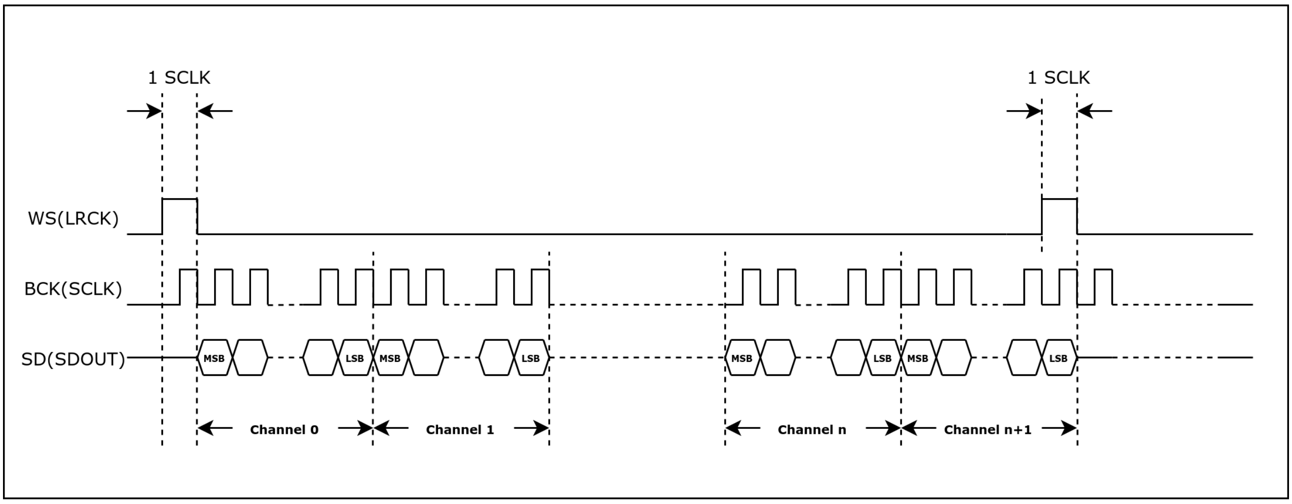

Figure 29-4. TDM PCM Standard Timing Diagram

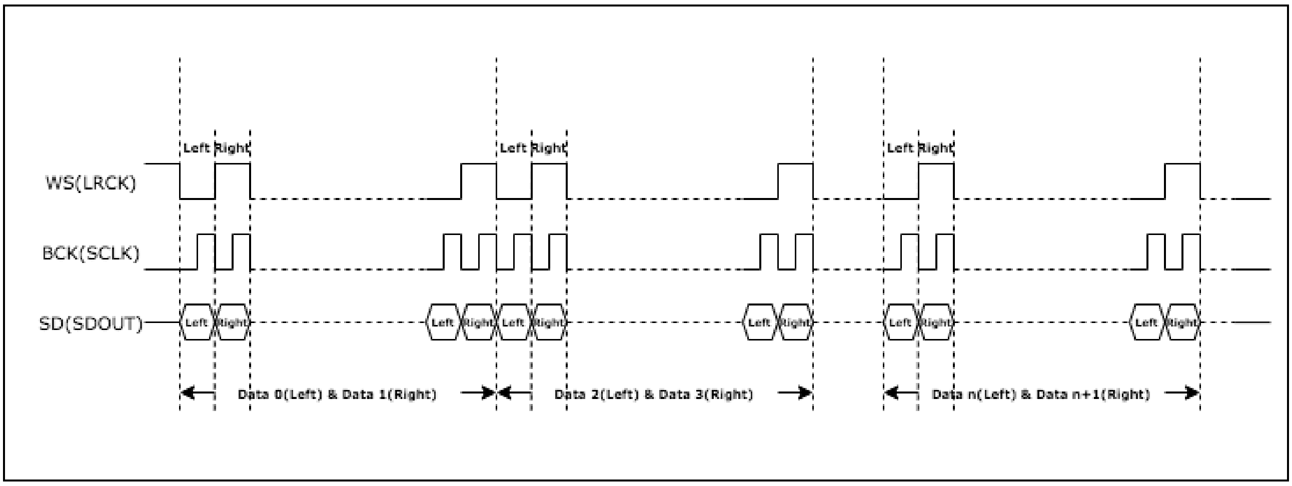
29.5.4 PDM Standard

Under PDM standard, WS signal changes continuously during data transmission. The low-level and high-level of this signal indicates the left channel and right channel, respectively. WS and SD signals change simultaneously on the falling edge of BCK, see Figure 29-5.



WS(LRCK)
BCK(SCLK)
SD(SDOUT)
Left
Right
Data 0(Left) & Data 1(Right)
Data 2(Left) & Data 3(Right)
Data n(Left) & Data n+1(Right)

Figure 29-5. PDM Standard Timing Diagram

29.6 I2S TX/RX Clock

I2S_TX/RX_CLK is the master clock of I2S TX/RX unit, divided from:

- 40 MHz XTAL_CLK
- 160 MHz PLL_F160M_CLK
- 240 MHz PLL_D2_CLK
- or external input clock: I2S_MCLK_in

The serial clock (BCK) of the I2S TX/RX unit is divided from I2S_TX/RX_CLK, as shown in Figure 29-6. I2S_TX/RX_CLK_SEL is used to select clock source for TX/RX unit, and I2S_TX/RX_CLK_ACTIVE to enable or disable the clock source.

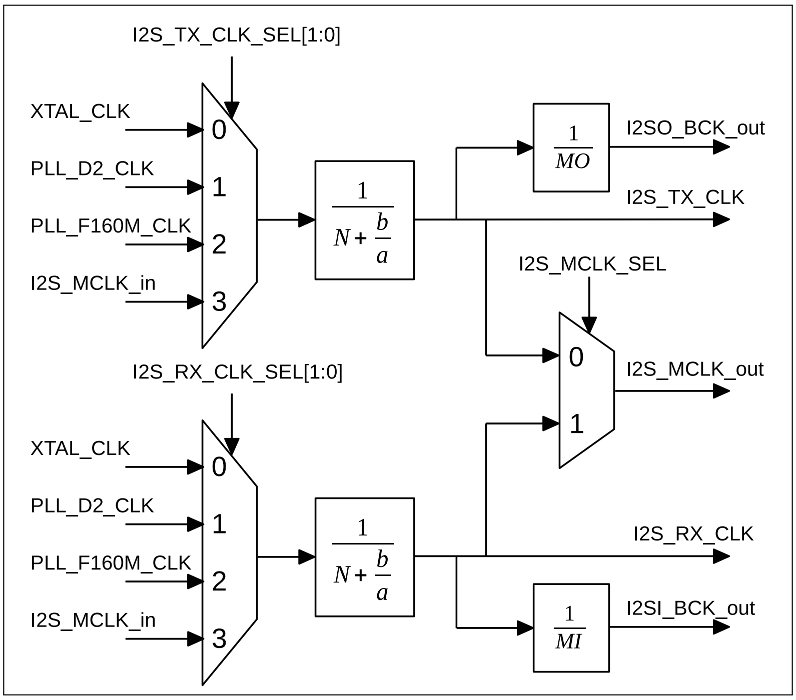


Figure 29-6. I2S Clock

The following formula shows the relation between I2S_TX/RX_CLK frequency $f_{\text{I2S\_TX/RX\_CLK}}$ and the divider clock source frequency $f_{\text{I2S\_CLK\_S}}$:

$$f_{\text{I2S\_TX/RX\_CLK}} = \frac{f_{\text{I2S\_CLK\_S}}}{\text{N} + \frac{\text{b}}{\text{a}}}$$

N is an integer value between 2 and 256. The value of N corresponds to the value of I2S_TX/RX_CLKM_DIV_NUM in register I2S_TX/RX_CLKM_CONF_REG as follows:

- When I2S_TX/RX_CLKM_DIV_NUM = 0, N = 256.
- When I2S_TX/RX_CLKM_DIV_NUM = 1, N = 2.
- When I2S_TX/RX_CLKM_DIV_NUM has any other value, N = I2S_TX/RX_CLKM_DIV_NUM.

The values of “a” and “b” in fractional divider depend only on x, y, z, and yn1. The corresponding formulas are as follows:

- When b $<= \frac{\text{a}}{2}$, yn1 $= 0$, x $= floor([\frac{\text{a}}{\text{b}}]) - 1$, y $=$ a%b, z $=$ b;
- When b $> \frac{\text{a}}{2}$, yn1 $= 1$, x $= floor([\frac{\text{a}}{\text{a - b}}]) - 1$, y $=$ a%(a - b), z $=$ a - b.

The values of x, y, z, and yn1 are configured in I2S_TX/RX_CLKM_DIV_X, I2S_TX/RX_CLKM_DIV_Y, I2S_TX/RX_CLKM_DIV_Z, and I2S_TX/RXCLKM_DIV_YN1. To configure the integer divider, clear I2S_TX/RX_CLKM_DIV_X and I2S_TX/RX_CLKM_DIV_Z, then set I2S_TX/RX_CLKM_DIV_Y to 1.

Note:
Using fractional divider may introduce some clock jitter.

In master TX mode, the serial clock BCK for I2S TX unit is I2SO_BCK_out, divided from I2S_TX_CLK. That is:

$$f_{\text{I2SO\_BCK\_out}} = \frac{f_{\text{I2S\_TX\_CLK}}}{\text{MO}}$$

“MO” is an integer value:

$$\text{MO} = \text{I2S\_TX\_BCK\_DIV\_NUM} + 1$$

Note:
I2S_TX_BCK_DIV_NUM must not be configured as 1.

In master RX mode, the serial clock BCK for I2S RX unit is I2SI_BCK_out, divided from I2S_RX_CLK. That is:

$$f_{\text{I2SI\_BCK\_out}} = \frac{f_{\text{I2S\_RX\_CLK}}}{\text{MI}}$$

“MI” is an integer value:

$$\text{MI} = \text{I2S\_RX\_BCK\_DIV\_NUM} + 1$$

Note:

- I2S_RX_BCK_DIV_NUM must not be configured as 1.
- In I2S slave mode, make sure $f_{\text{I2S\_TX/RX\_CLK}}$ >= 8 * f_{BCK}. I2S module can output I2S_MCLK_out as the master clock for peripherals.

29.7 I2S Reset

The units and FIFOs in I2S module are reset by the following bits.

- I2S TX/RX units: reset by the bits I2S_TX_RESET and I2S_RX_RESET.
- I2S TX/RX FIFO: reset by the bits I2S_TX_FIFO_RESET and I2S_RX_FIFO_RESET.

Note:
I2S module clock must be configured first before the module and FIFO are reset.

29.8 I2S Master/Slave Mode

The ESP32-C3 I2S module can operate as a master or a slave in half-duplex and full-duplex communication modes, depending on the configuration of I2S_RX_SLAVE_MOD and I2S_TX_SLAVE_MOD.

- I2S_TX_SLAVE_MOD
  - 0: master TX mode
  - 1: slave TX mode
- I2S_RX_SLAVE_MOD
  - 0: master RX mode
  - 1: slave RX mode

29.8.1 Master/Slave TX Mode

- I2S works as a master transmitter:
  - Set the bit I2S_TX_START to start transmitting data.
  - TX unit keeps driving the clock signal and serial data.
  - If I2S_TX_STOP_EN is set and all the data in FIFO is transmitted, the master stops transmitting data.
  - If I2S_TX_STOP_EN is cleared and all the data in FIFO is transmitted, meanwhile no new data is filled into FIFO, then the TX unit keeps sending the last data frame.
  - Master stops sending data when the bit I2S_TX_START is cleared.
- I2S works as a slave transmitter:
  - Set the bit I2S_TX_START.
  - Wait for the master BCK clock to enable a transmit operation.

  - If I2S_TX_STOP_EN is set and all the data in FIFO is transmitted, then the slave keeps sending zeros, till the master stops providing BCK signal.
  - If I2S_TX_STOP_EN is cleared and all the data in FIFO is transmitted, meanwhile no new data is filled into FIFO, then the TX unit keeps sending the last data frame.
  - If I2S_TX_START is cleared, slave keeps sending zeros till the master stops providing BCK clock signal.

29.8.2 Master/Slave RX Mode

- I2S works as a master receiver:
  - Set the bit I2S_RX_START to start receiving data.
  - RX unit keeps outputting clock signal and sampling input data.
  - RX unit stops receiving data when the bit I2S_RX_START is cleared.
- I2S works as a slave receiver:
  - Set the bit I2S_RX_START.
  - Wait for master BCK signal to start receiving data.
  - RX unit stops receiving data when the bit I2S_RX_START is cleared.

29.9 Transmitting Data

Note:
Updating the configuration described in this and subsequent sections requires to set I2S_TX_UPDATE accordingly, to synchronize registers from APB clock domain to TX clock domain. For more detailed configuration, see Section 29.11.1.

In TX mode, I2S first reads data from DMA and sends these data out via output signals according to the configured data mode and channel mode.

29.9.1 Data Format Control

Data format is controlled in the following phases:

- Phase I: read data from memory and write it to TX FIFO.
- Phase II: read the data to send (TX data) from TX FIFO and convert the data according to output data mode.
- Phase III: clock out the TX data serially.

29.9.1.1 Bit Width Control of Channel Valid Data

The bit width of valid data in each channel is determined by I2S_TX_BITS_MOD and I2S_TX_24_FILL_EN, see the table below.

Table 29-3. Bit Width of Channel Valid Data

Channel Valid Data Width	I2S_TX_BITS_MOD	I2S_TX_24_FILL_EN
32	31	x[1]
	23	1
24	23	0
16	15	x
8	7	x

[1] This value is ignored.

29.9.1.2 Endian Control of Channel Valid Data

When I2S reads data from DMA, the data endian under various data width is controlled by I2S_TX_BIG_ENDIAN, see the table below.

Table 29-4. Endian of Channel Valid Data

Channel Valid Data Width	Origin Data	Endian of Processed Data	I2S_TX_BIG_ENDIAN
32	{B3, B2, B1, B0}	{B3, B2, B1, B0}	0
		{B0, B1, B2, B3}	1
24	{B2, B1, B0}	{B2, B1, B0}	0
		{B0, B1, B2}	1
16	{B1, B0}	{B1, B0}	0
		{B0, B1}	1
8	{B0}	{B0}	x

29.9.1.3 A-law/μ-law Compression and Decompression

ESP32-C3 I2S compresses/decompresses the valid data into 32-bit by A-law or by μ-law. If the bit width of valid data is smaller than 32, zeros are filled to the extra high bits of the data to be compressed/decompressed by default.

Note:
Extra high bits here mean the bits[31: channel valid data width] of the data to be compressed/decompressed.

Configure I2S_TX_PCM_BYPASS to:

- 0, do not compress or decompress the data.
- 1, compress or decompress the data.

Configure I2S_TX_PCM_CONF to:

- 0, decompress the data using A-law.
- 1, compress the data using A-law.
- 2, decompress the data using μ-law.
- 3, compress the data using μ-law.

At this point, the first phase of data format control is complete.

29.9.1.4 Bit Width Control of Channel TX Data

The TX data width in each channel is determined by I2S_TX_TDM_CHAN_BITS.

- If TX data width in each channel is larger than the valid data width, zeros will be filled to these extra bits. Configure I2S_TX_LEFT_ALIGN to:
  - 0, the valid data is at the lower bits of TX data. Zeros are filled into higher bits of TX data.
  - 1, the valid data is at the higher bits of TX data. Zeros are filled into lower bits of TX data.
- If the TX data width in each channel is smaller than the valid data width, only the lower bits of valid data are sent out, and the higher bits are discarded.

At this point, the second phase of data format control is complete.

29.9.1.5 Bit Order Control of Channel Data

The data bit order in each channel is controlled by I2S_TX_BIT_ORDER:

- 1, data is sent out from low bits to high bits.
- 0, data is sent out from high bits to low bits.

At this point, the data format control is complete. Figure 29-7 shows a complete process of TX data format control.

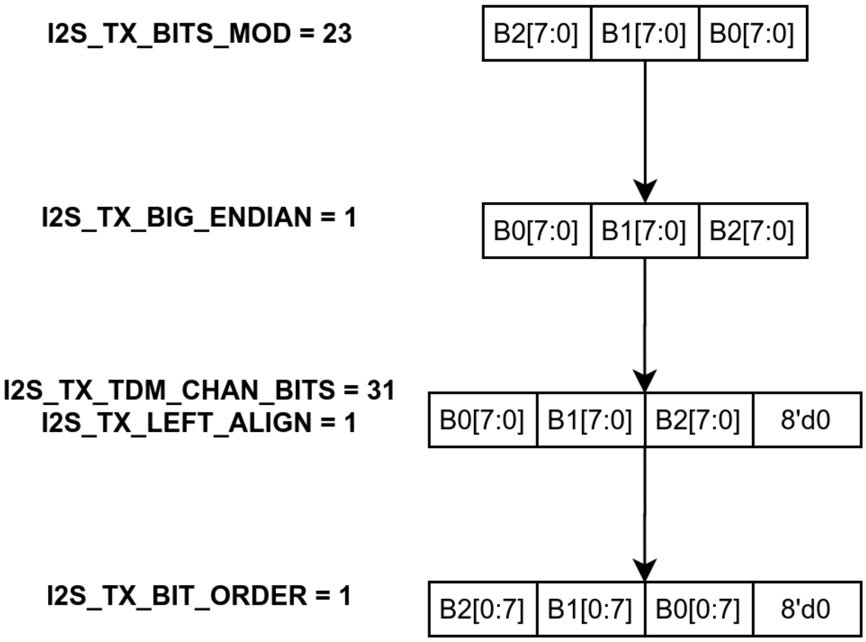

Figure 29-7. TX Data Format Control

29.9.2 Channel Mode Control

ESP32-C3 I2S supports both TDM TX mode and PDM TX mode. Set I2S_TX_TDM_EN to enable TDM TX mode, or set I2S_TX_PDM_EN to enable PDM TX mode.

Note:

- I2S_TX_TDM_EN and I2S_TX_PDM_EN must not be cleared or set simultaneously.
- Most stereo I2S codecs can be controlled by setting the I2S module into 2-channel mode under TDM standard.

29.9.2.1 I2S Channel Control in TDM TX Mode

In TDM TX mode, I2S supports up to 16 channels to output data. The total number of TX channels in use is controlled by I2S_TX_TDM_TOT_CHAN_NUM. For example, if I2S_TX_TDM_TOT_CHAN_NUM is set to 5, six channels in total (channel 0 ~ 5) will be used to transmit data, see Figure 29-8.

In these TX channels, if I2S_TX_TDM_CHANn_EN is set to:

- 1, this channel sends the channel data out.
- 0, the TX data to be sent by this channel is controlled by I2S_TX_CHAN_EQUAL:
  - 1, the data of previous channel is sent out.
  - 0, the data stored in I2S_SINGLE_DATA is sent out.

In TDM TX master mode, WS signal is controlled by I2S_TX_WS_IDLE_POL and I2S_TX_TDM_WS_WIDTH:

- I2S_TX_WS_IDLE_POL: the default level of WS signal
- I2S_TX_TDM_WS_WIDTH: the cycles the WS default level lasts for when transmitting all channel data

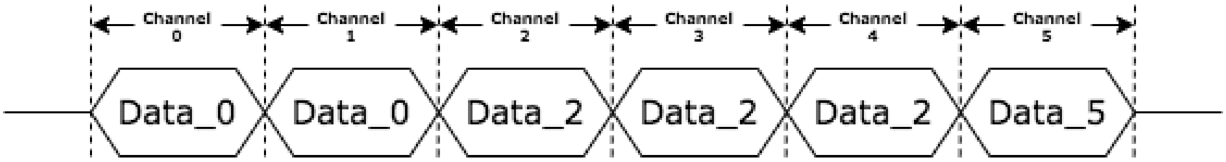
I2S_TX_HALF_SAMPLE_BITS x 2 is equal to the BCK cycles in one WS period.

TDM Channel Configuration Example

In this example, register configuration is as follows:

- I2S_TX_TDM_CHAN_NUM = 5, i.e. channel 0 ~ 5 are used to transmit data.
- I2S_TX_CHAN_EQUAL = 1, i.e. that data of previous channel will be transmitted if the bit I2S_TX_TDM_CHAN*n*
  _EN is cleared. *n* = 0 ~ 5.
- I2S_TX_TDM_CHAN0/2/5_EN = 1, i.e. these channels send their channel data out.
- I2S_TX_TDM_CHAN1/3/4_EN = 0, i.e. these channels send the previous channel data out.

Once the configuration is done, data is transmitted as follows.



I2S_TX_TDM_CHAN_NUM = 5; I2S_TX_CHAN_EQUAL = 1;
I2S_TX_TDM_CHAN0_EN = 1; I2S_TX_TDM_CHAN1_EN = 0; I2S_TX_TDM_CHAN2_EN = 1;
I2S_TX_TDM_CHAN3_EN = 0; I2S_TX_TDM_CHAN4_EN = 0; I2S_TX_TDM_CHAN5_EN = 1;

Figure 29-8. TDM Channel Control

29.9.2.2 I2S Channel Control in PDM TX Mode

ESP32-C3 I2S supports two PDM TX modes, namely, normal PDM TX mode and PCM-to-PDM TX mode.

In PDM TX mode, fetching data from DMA is controlled by I2S_TX_MONO and I2S_TX_MONO_FST_VLD, see Table 29-5. Please configure the two bits according to the data stored in memory, be it the single-channel or dual-channel data.

Table 29-5. Data-Fetching Control in PDM TX Mode

Data-Fetching Control Option	Mode	I2S_TX_MONO	I2S_TX_MONO_FST_VLD
Post data-fetching request to DMA at any edge of WS signal	Stereo mode	0	x
Post data-fetching request to DMA only at the second half period of WS signal	Mono mode	1	0
Post data-fetching request to DMA only at the first half period of WS signal	Mono mode	1	1

In **normal PDM TX mode**, I2S channel mode is controlled by I2S_TX_CHAN_MOD and I2S_TX_WS_IDLE_POL, see the table below.

Table 29-6. I2S Channel Control in Normal PDM TX Mode

Channel Control Option	Left Channel	Right Channel	Mode Control Field[1]	Channel Select Bit[2]
Stereo mode	Transmit the left channel data	Transmit the right channel data	0	x
Mono mode	Transmit the left channel data	Transmit the left channel data	1	0
	Transmit the right channel data	Transmit the right channel data	1	1
	Transmit the right channel data	Transmit the right channel data	2	0
	Transmit the left channel data	Transmit the left channel data	2	1
	Transmit the value of "single"[3]	Transmit the right channel data	3	0
	Transmit the left channel data	Transmit the value of "single"	3	1
	Transmit the left channel data	Transmit the value of "single"	4	0
	Transmit the value of "single"	Transmit the right channel data	4	1

[1] I2S_TX_CHAN_MOD

[2] I2S_TX_WS_IDLE_POL

[3] The "single" value is equal to the value of I2S_SINGLE_DATA.

In PDM TX aster mode, the WS level of I2S module is controlled by I2S_TX_WS_IDLE_POL. The frequency of WS signal is half of BCK frequency. The configuration of WS signal is similar to that of BCK signal, see Section 29.6 and Figure 29-9.

In **PCM-to-PDM TX mode**, the PCM data from DMA is converted to PDM data and then output in PDM signal format. Configure I2S_PCM2PDM_CONV_EN to enable this mode.

The register configuration for PCM-to-PDM TX mode is as follows:

- Configure 1-line PDM output format or 1-/2-line DAC output mode as the table below:

Table 29-7. PCM-to-PDM TX Mode

Channel Output Format	I2S_TX_PDM_DAC_MODE_EN	I2S_TX_PDM_DAC_2OUT_EN
1-line PDM output format[1]	0	x
1-line DAC output format[2]	1	0
2-line DAC output format	1	1

Note:

1. In PDM output format, SD data of two channels is sent out in one WS period.
2. In DAC output format, SD data of one channel is sent out in one WS period.

- Configure sampling frequency and upsampling rate

  In PCM-to-PDM TX mode, PDM clock frequency is equal to BCK frequency. The relation of sampling frequency (f_{Sampling}) and BCK frequency is as follows:

$$f_{\text{Sampling}} = \frac{f_{\text{BCK}}}{\text{OSR}}$$

Upsampling rate (OSR) is related to I2S_TX_PDM_SINC_OSR2 as follows:

$$\text{OSR} = \text{I2S\_TX\_PDM\_SINC\_OSR2} \times 64$$

Sampling frequency f_{Sampling} is related to I2S_TX_PDM_FS as follows:

$$f_{\text{Sampling}} = \text{I2S\_TX\_PDM\_FS} \times 100$$

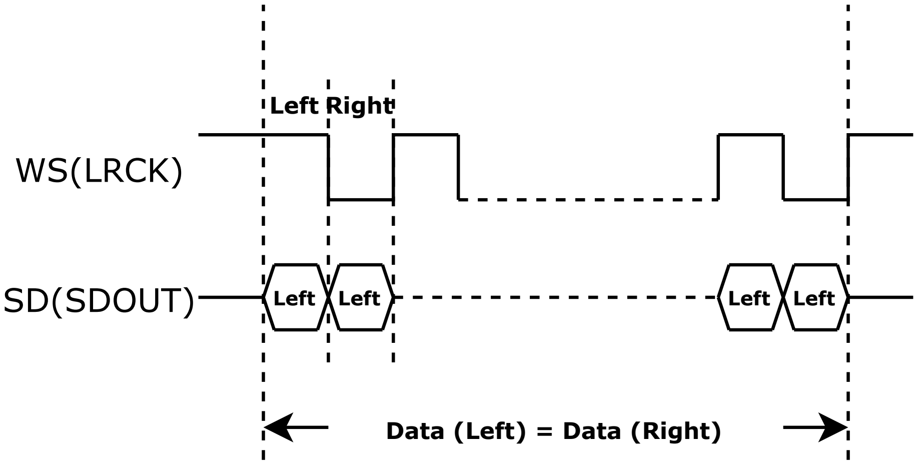
Configure the registers according to needed sampling frequency, upsampling rate, and PDM clock frequency.

PDM Channel Configuration Example

In this example, the register configuration is as follows.

- I2S_TX_CHAN_MOD = 2, i.e. mono mode is selected.
- I2S_TX_WS_IDLE_POL = 1, i.e. both the left channel and right channel transmit the left channel data.

Once the configuration is done, the channel data is transmitted as follows.



I2S_TX_CHAN_MOD = 2; I2S_TX_WS_IDLE_POL = 1;

Figure 29-9. PDM Channel Control Example

29.10 Receiving Data

Note:

Updating the configuration described in this and subsequent sections requires setting I2S_RX_UPDATE, to synchronize registers from APB clock domain to RX clock domain. For more detailed configuration, see Section 29.11.2.

In RX mode, I2S first reads data from peripheral interface, and then stores the data into memory via DMA, according to the configured channel mode and data mode.

29.10.1 Channel Mode Control

ESP32-C3 I2S supports both TDM RX mode and PDM RX mode. Set I2S_RX_TDM_EN to enable TDM RX mode, or set I2S_RX_PDM_EN to enable PDM RX mode.

Note:
I2S_RX_TDM_EN and I2S_RX_PDM_EN must not be cleared or set simultaneously.

29.10.1.1 I2S Channel Control in TDM RX Mode

In TDM RX mode, I2S supports up to 16 channels to input data. The total number of RX channels in use is controlled by I2S_RX_TDM_TOT_CHAN_NUM. For example, if I2S_RX_TDM_TOT_CHAN_NUM is set to 5, channel 0 ~ 5 will be used to receive data.

In these RX channels, if I2S_RX_TDM_CHANn_EN is set to:

- 1, this channel data is valid and will be stored into RX FIFO.
- 0, this channel data is invalid and will not be stored into RX FIFO.

In TDM RX master mode, WS signal is controlled by I2S_RX_WS_IDLE_POL and I2S_RX_TDM_WS_WIDTH.

- I2S_RX_WS_IDLE_POL: the default level of WS signal
- I2S_RX_TDM_WS_WIDTH: the cycles the WS default level lasts for when receiving all channel data

I2S_RX_HALF_SAMPLE_BITS x 2 is equal to the BCK cycles in one WS period.

29.10.1.2 I2S Channel Control in PDM RX Mode

In PDM RX mode, I2S converts the serial data from channels to the data to be entered into memory.

In PDM RX master mode, the default level of WS signal is controlled by I2S_RX_WS_IDLE_POL. WS frequency is half of BCK frequency. The configuration of BCK signal is similar to that of WS signal as described in Section 29.6. Note, in PDM RX mode, the value of I2S_RX_HALF_SAMPLE_BITS must be same as that of I2S_RX_BITS_MOD.

29.10.2 Data Format Control

Data format is controlled in the following phases:

- Phase I: serial input data is converted into the data to be saved to RX FIFO.
- Phase II: the data is read from RX FIFO and converted according to input data mode.

29.10.2.1 Bit Order Control of Channel Data

The data bit order in each channel is controlled by I2S_RX_BIT_ORDER:

- 1, serial data is entered from low bits to high bits.
- 0, serial data is entered from high bits to low bits.

At this point, the first phase of data format control is complete.

29.10.2.2 Bit Width Control of Channel Storage (Valid) Data

The storage data width in each channel is controlled by I2S_RX_BITS_MOD and I2S_RX_24_FILL_EN, see the table below.

Table 29-8. Channel Storage Data Width

Channel Storage Data Width	I2S_RX_BITS_MOD	I2S_RX_24_FILL_EN
32	31	x
	23	1
24	23	0
16	15	x
8	7	x

29.10.2.3 Bit Width Control of Channel RX Data

The RX data width in each channel is determined by I2S_RX_TDM_CHAN_BITS.

- If the storage data width in each channel is smaller than the received (RX) data width, then only the bits within the storage data width is saved into memory. Configure I2S_RX_LEFT_ALIGN to:
  - 0, only the lower bits of the received data within the storage data width is stored to memory.
  - 1, only the higher bits of the received data within the storage data width is stored to memory.
- If the received data width is smaller than the storage data width in each channel, the higher bits of the received data will be filled with zeros and then the data is saved to memory.

29.10.2.4 Endian Control of Channel Storage Data

The received data is then converted into storage data (to be stored to memory) after some processing, such as discarding extra bits or filling zeros in missing bits. The endian of the storage data is controlled by I2S_RX_BIG_ENDIAN under various data width, see the table below.

Table 29-9. Channel Storage Data Endian

Channel Storage Data Width	Origin Data	Endian of Processed Data	I2S_RX_BIG_ENDIAN
32	{B3, B2, B1, B0}	{B3, B2, B1, B0}	0
		{B0, B1, B2, B3}	1
24	{B2, B1, B0}	{B2, B1, B0}	0
		{B0, B1, B2}	1
16	{B1, B0}	{B1, B0}	0
		{B0, B1}	1
8	{B0}	{B0}	x

29.10.2.5 A-law/μ-law Compression and Decompression

ESP32-C3 I2S compresses/decompresses the storage data in 32-bit by A-law or by μ-law. By default, zeros are filled into high bits.

Configure I2S_RX_PCM_BYPASS to:

- 0, do not compress or decompress the data.

- 1, compress or decompress the data.

Configure I2S_RX_PCM_CONF to:

- 0, decompress the data using A-law.
- 1, compress the data using A-law.
- 2, decompress the data using μ-law.
- 3, compress the data using μ-law.

At this point, the data format control is complete. Data then is stored into memory via DMA.

29.11 Software Configuration Process

29.11.1 Configure I2S as TX Mode

Follow the steps below to configure I2S as TX mode via software:

1. Configure the clock as described in Section 29.6.
2. Configure signal pins according to Table 29-2.
3. Select the mode needed by configuring the bit I2S_TX_SLAVE_MOD.
   - 0: master TX mode
   - 1: slave TX mode
4. Set needed TX data mode and TX channel mode as described in Section 29.9, and then set the bit I2S_TX_UPDATE.
5. Reset TX unit and TX FIFO as described in Section 29.7.
6. Enable corresponding interrupts, see Section 29.12.
7. Configure DMA outlink.
8. Set I2S_TX_STOP_EN if needed. For more information, please refer to Section 29.8.1.
9. Start transmitting data:
   - In master mode, wait till I2S slave gets ready, then set I2S_TX_START to start transmitting data.
   - In slave mode, set the bit I2S_TX_START. When the I2S master supplies BCK and WS signals, I2S slave starts transmitting data.
10. Wait for the interrupt signals set in Step 6, or check whether the transfer is completed by querying I2S_TX_IDLE:
    - 0: transmitter is working.
    - 1: transmitter is in idle.
11. Clear I2S_TX_START to stop data transfer.

29.11.2 Configure I2S as RX Mode

Follow the steps below to configure I2S as RX mode via software:

1. Configure the clock as described in Section 29.6.

2. Configure signal pins according to Table 29-2.
3. Select the mode needed by configuring the bit I2S_RX_SLAVE_MOD.
    - 0: master RX mode
    - 1: slave RX mode
4. Set needed RX data mode and RX channel mode as described in Section 29.10, and then set the bit I2S_RX_UPDATE.
5. Reset RX unit and its FIFO according to Section 29.7.
6. Enable corresponding interrupts, see Section 29.12.
7. Configure DMA inlink, and set the length of RX data in I2S_RXEOF_NUM_REG.
8. Start receiving data:
    - In master mode, when the slave is ready, set I2S_RX_START to start receiving data.
    - In slave mode, set I2S_RX_START to start receiving data when get BCK and WS signals from the master.
9. The received data is then stored to the specified address of ESP32-C3 memory according the configuration of DMA. Then the corresponding interrupt set in Step 6 is generated.

29.12 I2S Interrupts

- I2S_TX_HUNG_INT: triggered when transmitting data is timed out. For example, if module is configured as TX slave mode, but the master does not provide BCK or WS signal for a long time (specified in I2S_LC_HUNG_CO NF_REG), then this interrupt will be triggered.
- I2S_RX_HUNG_INT: triggered when receiving data is timed out. For example, if I2S module is configured as RX slave mode, but the master does not send data for a long time (specified in I2S_LC_HUNG_CONF_REG), then this interrupt will be triggered.
- I2S_TX_DONE_INT: triggered when transmitting data is completed.
- I2S_RX_DONE_INT: triggered when receiving data is completed.

29.13 Register Summary

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Interrupt registers			
I2S_INT_RAW_REG	I2S interrupt raw register	0x000C	RO/WTC/SS
I2S_INT_ST_REG	I2S interrupt status register	0x0010	RO
I2S_INT_ENA_REG	I2S interrupt enable register	0x0014	R/W
I2S_INT_CLR_REG	I2S interrupt clear register	0x0018	WT
RX control and configuration registers			
I2S_RX_CONF_REG	I2S RX configuration register	0x0020	varies
I2S_RX_CONF1_REG	I2S RX configuration register 1	0x0028	R/W

Name	Description	Address	Access
I2S_RX_CLKM_CONF_REG	I2S RX clock configuration register	0x0030	R/W
I2S_TX_PCM2PDM_CONF_REG	I2S TX PCM-to-PDM configuration register	0x0040	R/W
I2S_TX_PCM2PDM_CONF1_REG	I2S TX PCM-to-PDM configuration register 1	0x0044	R/W
I2S_RX_TDM_CTRL_REG	I2S TX TDM mode control register	0x0050	R/W
I2S_RXEOF_NUM_REG	I2S RX data number control register	0x0064	R/W
TX control and configuration registers			
I2S_TX_CONF_REG	I2S TX configuration register	0x0024	varies
I2S_TX_CONF1_REG	I2S TX configuration register 1	0x002C	R/W
I2S_TX_CLKM_CONF_REG	I2S TX clock configuration register	0x0034	R/W
I2S_TX_TDM_CTRL_REG	I2S TX TDM mode control register	0x0054	R/W
RX clock and timing registers			
I2S_RX_CLKM_DIV_CONF_REG	I2S RX unit clock divider configuration register	0x0038	R/W
I2S_RX_TIMING_REG	I2S RX timing control register	0x0058	R/W
TX clock and timing registers			
I2S_TX_CLKM_DIV_CONF_REG	I2S TX unit clock divider configuration register	0x003C	R/W
I2S_TX_TIMING_REG	I2S TX timing control register	0x005C	R/W
Control and configuration registers			
I2S_LC_HUNG_CONF_REG	I2S timeout configuration register	0x0060	R/W
I2S_CONF_SIGLE_DATA_REG	I2S single data register	0x0068	R/W
TX status register			
I2S_STATE_REG	I2S TX status register	0x006C	RO
Version register			
I2S_DATE_REG	Version control register	0x0080	R/W

29.14 Registers

Register 29.1. I2S_INT_RAW_REG (0x000C)

(reserved)		I2S_TX_HUNG_INT_RAW	I2S_RX_HUNG_INT_RAW	I2S_TX_DONE_INT_RAW	I2S_RX_DONE_INT_RAW	
31	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	Reset

I2S_RX_DONE_INT_RAW The raw interrupt status bit for I2S_RX_DONE_INT interrupt. (RO/WTC/SS)

I2S_TX_DONE_INT_RAW The raw interrupt status bit for I2S_TX_DONE_INT interrupt. (RO/WTC/SS)

I2S_RX_HUNG_INT_RAW The raw interrupt status bit for I2S_RX_HUNG_INT interrupt. (RO/WTC/SS)

I2S_TX_HUNG_INT_RAW The raw interrupt status bit for I2S_TX_HUNG_INT interrupt. (RO/WTC/SS)

Register 29.2. I2S_INT_ST_REG (0x0010)

(reserved)		I2S_TX_HUNG_INT_ST	I2S_RX_HUNG_INT_ST	I2S_TX_DONE_INT_ST	I2S_RX_DONE_INT_ST	
31	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	Reset

I2S_RX_DONE_INT_ST The masked interrupt status bit for I2S_RX_DONE_INT interrupt. (RO)

I2S_TX_DONE_INT_ST The masked interrupt status bit for I2S_TX_DONE_INT interrupt. (RO)

I2S_RX_HUNG_INT_ST The masked interrupt status bit for I2S_RX_HUNG_INT interrupt. (RO)

I2S_TX_HUNG_INT_ST The masked interrupt status bit for I2S_TX_HUNG_INT interrupt. (RO)

Register 29.3. I2S_INT_ENA_REG (0x0014)

(reserved)	I2S_TX_HUNG_INT_ENA	I2S_RX_HUNG_INT_ENA	I2S_TX_DONE_INT_ENA	I2S_RX_DONE_INT_ENA	
31 4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	Reset

I2S_RX_DONE_INT_ENA The interrupt enable bit for I2S_RX_DONE_INT interrupt. (R/W)

I2S_TX_DONE_INT_ENA The interrupt enable bit for I2S_TX_DONE_INT interrupt. (R/W)

I2S_RX_HUNG_INT_ENA The interrupt enable bit for I2S_RX_HUNG_INT interrupt. (R/W)

I2S_TX_HUNG_INT_ENA The interrupt enable bit for I2S_TX_HUNG_INT interrupt. (R/W)

Register 29.4. I2S_INT_CLR_REG (0x0018)

(reserved)	I2S_TX_HUNG_INT_CLR	I2S_RX_HUNG_INT_CLR	I2S_TX_DONE_INT_CLR	I2S_RX_DONE_INT_CLR	
31 4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	Reset

I2S_RX_DONE_INT_CLR Set this bit to clear I2S_RX_DONE_INT interrupt. (WT)

I2S_TX_DONE_INT_CLR Set this bit to clear I2S_TX_DONE_INT interrupt. (WT)

I2S_RX_HUNG_INT_CLR Set this bit to clear I2S_RX_HUNG_INT interrupt. (WT)

I2S_TX_HUNG_INT_CLR Set this bit to clear I2S_TX_HUNG_INT interrupt. (WT)

Register 29.5. I2S_RX_CONF_REG (0x0020)

	(reserved)	I2S_RX_PDM_EN	I2S_RX_TDM_EN	I2S_RX_BIT_ORDER	I2S_RX_WS_IDLE_POL	I2S_RX_24_FILL_EN	I2S_RX_LEFT_ALIGN	I2S_RX_STOP_MODE	I2S_RX_PCM_BYPASS	I2S_RX_PCM_CONF	I2S_RX_MONO_FST_VLD	I2S_RX_UPDATE	I2S_RX_BIG_ENDIAN	(reserved)	I2S_RX_MONO	(reserved)	I2S_RX_SLAVE_MOD	I2S_RX_START	I2S_RX_FIFO_RESET	I2S_RX_RESET
	31 21	20	19	18	17	16	15	14 13	12	11 10	9	8	7	6	5	4	3	2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	1	0	1	0x1	1	0	0	0	0	0	0	0	0	0

I2S_RX_RESET Set this bit to reset RX unit. (WT)

I2S_RX_FIFO_RESET Set this bit to reset RX FIFO. (WT)

I2S_RX_START Set this bit to start receiving data. (R/W)

I2S_RX_SLAVE_MOD Set this bit to enable slave RX mode. (R/W)

I2S_RX_MONO Set this bit to enable RX unit in mono mode. (R/W)

I2S_RX_BIG_ENDIAN I2S RX byte endian. 1: low address data is saved to high address. 0: low address data is saved to low address. (R/W)

I2S_RX_UPDATE Set 1 to update I2S RX registers from APB clock domain to I2S RX clock domain. This bit will be cleared by hardware after register update is done. (R/W/SC)

I2S_RX_MONO_FST_VLD 1: The first channel data is valid in I2S RX mono mode. 0: The second channel data is valid in I2S RX mono mode. (R/W)

I2S_RX_PCM_CONF I2S RX compress/decompress configuration bit. 0 (atol): A-law decompress, 1 (ltoa): A-law compress, 2 (utol): μ-law decompress, 3 (ltou): μ-law compress. (R/W)

I2S_RX_PCM_BYPASS Set this bit to bypass Compress/Decompress module for received data. (R/W)

I2S_RX_STOP_MODE 0: I2S RX stops only when I2S_RX_START is cleared. 1: I2S RX stops when I2S_RX_START is 0 or in_suc_eof is 1. 2: I2S RX stops when I2S_RX_START is 0 or RX FIFO is full. (R/W)

I2S_RX_LEFT_ALIGN 1: I2S RX left alignment mode. 0: I2S RX right alignment mode. (R/W)

I2S_RX_24_FILL_EN 1: store 24-bit channel data to 32 bits (Extra bits are filled with zeros). 0: store 24-bit channel data to 24 bits. (R/W)

I2S_RX_WS_IDLE_POL 0: WS remains low when receiving left channel data, and remains high when receiving right channel data. 1: WS remains high when receiving left channel data, and remains low when receiving right channel data. (R/W)

I2S_RX_BIT_ORDER I2S RX bit order. 1: the lowest bit is received first. 0: the highest bit is received first. (R/W)

I2S_RX_TDM_EN 1: Enable I2S TDM RX mode. 0: Disable I2S TDM RX mode. (R/W)

I2S_RX_PDM_EN 1: Enable I2S PDM RX mode. 0: Disable I2S PDM RX mode. (R/W)

Register 29.6. I2S_RX_CONF1_REG (0x0028)

(reserved)	I2S_RX_MSB_SHIFT	I2S_RX_TDM_CHAN_BITS	I2S_RX_HALF_SAMPLE_BITS	I2S_RX_BITS_MOD	I2S_RX_BCK_DIV_NUM	I2S_RX_TDM_WS_WIDTH	
31 30	29	28 24	23 18	17 13	12 7	6 0	
0 0	1	0xf	0xf	0xf	6	0x0	Reset

I2S_RX_TDM_WS_WIDTH The width of rx_ws_out (WS default level) in TDM mode is (I2S_RX_TDM_WS_WIDTH + 1) * T_BCK. (R/W)

I2S_RX_BCK_DIV_NUM Configure the divider of BCK in RX mode. Note this divider must not be configured to 1. (R/W)

I2S_RX_BITS_MOD Configure the valid data bit length of I2S RX channel. 7: all the valid channel data is in 8-bit mode. 15: all the valid channel data is in 16-bit mode. 23: all the valid channel data is in 24-bit mode. 31: all the valid channel data is in 32-bit mode. (R/W)

I2S_RX_HALF_SAMPLE_BITS I2S RX half sample bits. This value x 2 is equal to the BCK cycles in one WS period. (R/W)

I2S_RX_TDM_CHAN_BITS Configure RX bit number for each channel in TDM mode. Bit number expected = this value + 1. (R/W)

I2S_RX_MSB_SHIFT Control the timing between WS signal and the MSB of data. 1: WS signal changes one BCK clock earlier. 0: Align at rising edge. (R/W)

Register 29.7. I2S_RX_CLKM_CONF_REG (0x0030)

(reserved)	I2S_MCLK_SEL	I2S_RX_CLK_SEL	I2S_RX_CLK_ACTIVE	(reserved)	I2S_RX_CLKM_DIV_NUM	
31 30	29	28 27	26	25 8	7 0	
0 0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	2	Reset

I2S_RX_CLKM_DIV_NUM Integral I2S clock divider value. (R/W)

I2S_RX_CLK_ACTIVE Clock enable signal of I2S RX unit. (R/W)

I2S_RX_CLK_SEL Select clock source for I2S RX unit. 0: XTAL_CLK. 1: PLL_D2_CLK. 2: PLL_F160M_CLK. 3: I2S_MCLK_in. (R/W)

I2S_MCLK_SEL 0: Use I2S TX unit clock as I2S_MCLK_OUT. 1: Use I2S RX unit clock as I2S_MCLK_OUT. (R/W)

Register 29.8. I2S_TX_PCM2PDM_CONF_REG (0x0040)

(reserved)	I2S_PCM2PDM_CONV_EN	I2S_TX_PDM_DAC_MODE_EN	I2S_TX_PDM_DAC_2OUT_EN	(reserved)	I2S_TX_PDM_SINC_OSR2	(reserved)	
31 26	25	24	23	22 5	4 1	0	
0 0 0 0 0 0	0	0	0	0x0	0x2	0	Reset

I2S_TX_PDM_SINC_OSR2 I2S TX PDM OSR value. (R/W)

I2S_TX_PDM_DAC_2OUT_EN 0: 1-line DAC output mode. 1: 2-line DAC output mode. Only valid when I2S_TX_PDM_DAC_MODE_EN is set. (R/W)

I2S_TX_PDM_DAC_MODE_EN 0: 1-line PDM output mode. 1: DAC output mode. (R/W)

I2S_PCM2PDM_CONV_EN Enable bit for I2S TX PCM-to-PDM conversion. (R/W)

Register 29.9. I2S_TX_PCM2PDM_CONF1_REG (0x0044)

(reserved)	I2S_TX_PDM_FS	(reserved)	
31 20	19 10	9 0

I2S_DATE Version control register. (R/W)

30 USB Serial/JTAG Controller (USB_SERIAL_JTAG)

The ESP32-C3 contains an USB Serial/JTAG Controller. This unit can be used to program the SoC's flash, read program output, as well as attach a debugger to the running program. All of these are possible for any computer with a USB host ('host' in the rest of this text) without any active external components.

30.1 Overview

While programming and debugging an ESP32-C3 project using the UART and JTAG functionality is certainly possible, it has a few downsides. First of all, both UART and JTAG take up IO pins and as such, fewer pins are left usable for controlling external signals in software. Additionally, an external chip or adapter is needed for both UART and JTAG to interface with a host computer, which means it will be necessary to integrate these two functionalities in the form of external chips or debugging adapters.

In order to alleviate these issues,, as well as to negate the need for external devices, the ESP32-C3 contains an USB Serial/JTAG Controller, which integrates the functionality of both an USB-to-serial converter as well as those of an USB-to-JTAG adapter. As this device directly interfaces to an external USB host using only the two data lines required by USB2.0, debugging the ESP32-C3 only requires two pins to be dedicated to this functionality.

30.2 Features

- USB Full-speed device.
- Fixed function device, hardwired for CDC-ACM (Communication Device Class - Abstract Control Model) and JTAG adapter functionality.
- 2 OUT Endpoints, 3 IN Endpoints in addition to Control Endpoint 0; Up to 64-byte data payload size.
- Internal PHY, so no or very few external components needed to connect to a host computer.
- CDC-ACM adherent serial port emulation is plug-and-play on most modern OSes.
- JTAG interface allows fast communication with CPU debug core using a compact representation of JTAG instructions.
- CDC-ACM supports host controllable chip reset and entry into download mode.

As shown in Figure 30-1, the USB Serial/JTAG Controller consists of an USB PHY, a USB device interface, a JTAG command processor and a response capture unit, as well as the CDC-ACM registers. The PHY and part of the device interface are clocked from a 48 MHz clock derived from the main PLL, the rest of the logic is clocked from APB_CLK. The JTAG command processor is connected to the JTAG debug unit of the main processor; the CDC-ACM registers are connected to the APB bus and as such can be read from and written to by software running on the main CPU.

Note that while the USB Serial/JTAG device is a USB 2.0 device, it only supports Full-speed (12 Mbps) and not the High-speed (480 Mbps) mode the USB2.0 standard introduced.

Figure 30-2 shows the internal details of the USB Serial/JTAG controller on the USB side. The USB Serial/JTAG Controller consists of an USB 2.0 Full Speed device. It contains a control endpoint, a dummy interrupt endpoint, two bulk input endpoints as well as two bulk output endpoints. Together, these form an USB Composite device, which consists of an CDC-ACM USB class device as well as a vendor-specific device

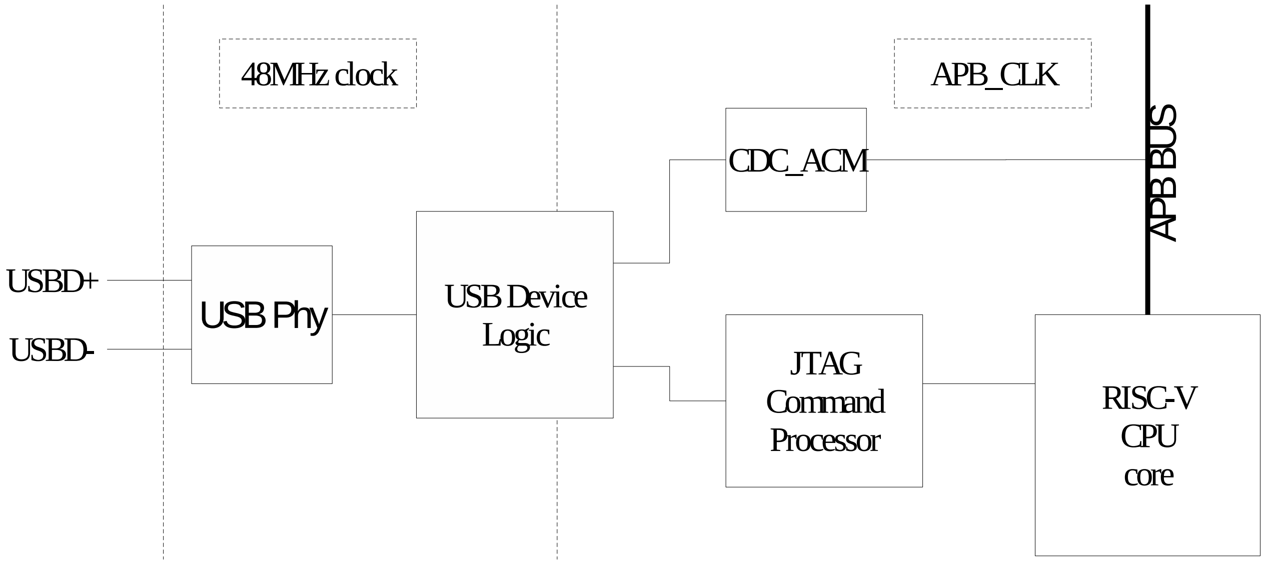

Figure 30-1. USB Serial/JTAG High Level Diagram

implementing the JTAG interface. On the SoC side, the JTAG interface is directly connected to the RISC-V CPU's debugging interface, allowing debugging of programs running on that core. Meanwhile, the CDC-ACM device is exposed as a set of registers, allowing a program on the CPU to read and write from this. Additionally, the ROM startup code of the SoC contains code allowing the user to reprogram attached flash memory using this interface.

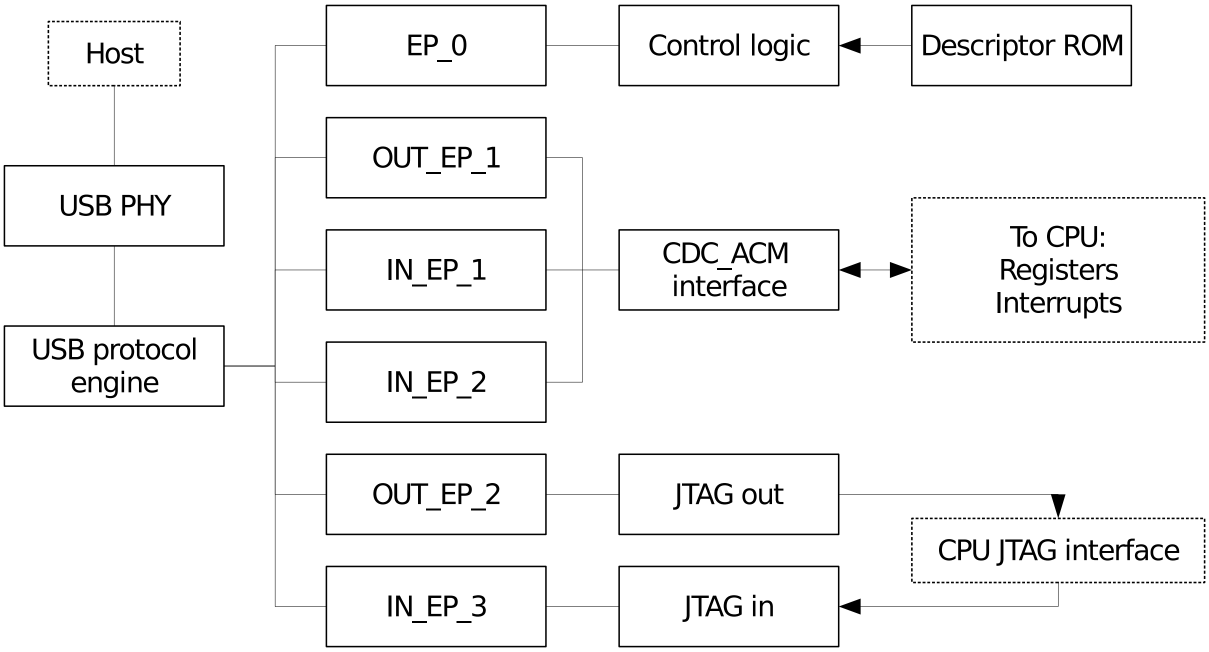

Figure 30-2. USB Serial/JTAG Block Diagram

30.3 Functional Description

The USB Serial/JTAG Controller interfaces with an USB host processor on one side, and the CPU debug hardware as well as the software running on the USB port on the other side.

30.3.1 CDC-ACM USB Interface Functional Description

The CDC-ACM interface adheres to the standard USB CDC-ACM class for serial port emulation. It contains a dummy interrupt endpoint (which will never send any events, as they are not implemented nor needed) and a Bulk IN as well as a Bulk OUT endpoint for the host's received and sent serial data respectively. These endpoints can handle 64-byte packets at a time, allowing for high throughput. As CDC-ACM is a standard USB device class, a host generally does not need any special installation procedures for it to function: when the USB debugging device is properly connected to a host, the operating system should show a new serial port moments later.

The CDC-ACM interface accepts the following standard CDC-ACM control requests:

Table 30-1. Standard CDC-ACM Control Requests

Command	Action
SEND_BREAK	Accepted but ignored (dummy)
SET_LINE_CODING	Accepted but ignored (dummy)
GET_LINE_CODING	Always returns 9600 baud, no parity, 8 databits, 1 stopbit
SET_CONTROL_LINE_STATE	Set the state of the RTS/DTR lines, see Table 30-2

Aside from general-purpose communication, the CDC-ACM interface also can be used to reset the ESP32-C3 and optionally make it go into download mode in order to flash new firmware. This is done by setting the RTS and DTR lines on the virtual serial port.

Table 30-2. CDC-ACM Settings with RTS and DTR

RTS	DTR	Action
0	0	Clear download mode flag
0	1	Set download mode flag
1	0	Reset ESP32-C3
1	1	No action

Note that if the download mode flag is set when the ESP32-C3 is reset, the ESP32-C3 will reboot into download mode. When this flag is cleared and the chip is reset, the ESP32-C3 will boot from flash. For specific sequences, please refer to Section 30.4. All these functions can also be disabled by programming various eFuses, please refer to Chapter 4 *eFuse Controller (EFUSE)* for more details.

30.3.2 CDC-ACM Firmware Interface Functional Description

As the USB Serial/JTAG Controller is connected to the internal APB bus of the ESP32-C3, the CPU can interact with it. This is mainly used to read and write data from and to the virtual serial port on the attached host.

USB CDC-ACM serial data is sent to and received from the host in packets of 0 to 64 bytes in size. When enough CDC-ACM data has accumulated in the host, the host will send a packet to the CDC-ACM receive endpoint, and when the USB Serial/JTAG Controller has a free buffer, it will accept this packet. Conversely, the host will check periodically if the USB Serial/JTAG Controller has a packet ready to be sent to the host, and if so, receive this packet.

Firmware can get notified of new data from the host in one of two ways. First of all, the USB_SERIAL_JTAG_SERIAL_OUT_EP_DATA_AVAIL bit will remain set to one as long as there still is unread host data in the buffer. Secondly, the availability of data will trigger the USB_SERIAL_JTAG_SERIAL_OUT_RECV_PKT_INT interrupt as well.

When data is available, it can be read by firmware by repeatedly reading bytes from USB_SERIAL_JTAG_EP1_REG. The amount of bytes to read can be determined by checking the USB_SERIAL_JTAG_SERIAL_OUT_EP_DATA_AVAIL bit after reading each byte to see if there is more data to read. After all data is read, the USB debug device is automatically readied to receive a new data packet from the host.

When the firmware has data to send, it can do so by putting it in the send buffer and triggering a flush, allowing the host to receive the data in a USB packet. In order to do so, there needs to be space available in the send buffer. Firmware can check this by reading USB_REG_SERIAL_IN_EP_DATA_FREE; a one in this register field indicates there is still free room in the buffer. While this is the case, firmware can fill the buffer by writing bytes to the USB_SERIAL_JTAG_EP1_REG register.

Writing the buffer doesn't immediately trigger sending data to the host. This does not happen until the buffer is flushed; a flush causes the entire buffer to be readied for reception by the USB host at once. A flush can be triggered in two ways: after the 64th byte is written to the buffer, the USB hardware will automatically flush the buffer to the host. Alternatively, firmware can trigger a flush by writing a one to USB_REG_SERIAL_WR_DONE.

Regardless of how a flush is triggered, the send buffer will be unavailable for firmware to write into until it has been fully read by the host. As soon as this happens, the USB_SERIAL_JTAG_SERIAL_IN_EMPTY_INT interrupt will be triggered, indicating the send buffer can receive another 64 bytes.

30.3.3 USB-to-JTAG Interface

The USB-to-JTAG interface uses a vendor-specific class for its implementation. It consists of two endpoints, one to receive commands and one to send responses. Additionally, some less time-sensitive commands can be given as control requests.

30.3.4 JTAG Command Processor

Commands from the host to the JTAG interface are interpreted by the JTAG command processor. Internally, the JTAG command processor implements a full four-wire JTAG bus, consisting of the TCK, TMS and TDI output lines to the RISC-V CPU, as well as the TDO line signalling back from the CPU to the JTAG response capture unit. These signals adhere to the IEEE 1149.1 JTAG standards. Additionally, there is a SRST line to reset the SoC.

The JTAG command processor parses each received nibble (4-bit value) as a command. As USB data is received in 8-bit bytes, this means each byte contains two commands. The USB command processor will execute high-nibble first and low-nibble second. The commands are used to control the TCK, TMS, TDI, and SRST lines of the internal JTAG bus, as well as signal the JTAG response capture unit that the state of the TDO line (which is driven by the CPU debug logic) needs to be captured.

Of this internal JTAG bus, TCK, TMS, TDI and TDO are connected directly to the JTAG debugging logic of the RISC-V CPU. SRST is connected to the reset logic of the digital circuitry in the SoC and a high level on this line will cause a digital system reset. Note that the USB Serial/JTAG Controller itself is not affected by SRST.

A nibble can contain the following commands:

Table 30-3. Commands of a Nibble

bit	3	2	1	0
CMD_CLK	0	cap	tms	tdi
CMD_RST	1	0	0	srst
CMD_FLUSH	1	0	1	0
CMD_RSV	1	0	1	1
CMD_REP	1	1	R1	R0

- CMD_CLK will set the TDI and TMS to the indicated values and emit one clock pulse on TCK. If the CAP bit is 1, it will also instruct the JTAG response capture unit to capture the state of the TDO line. This instruction forms the basis of JTAG communication.
- CMD_RST will set the state of the SRST line to the indicated value. This can be used to reset the ESP32-C3.
- CMD_FLUSH will instruct the JTAG response capture unit to flush the buffer of all bits it collected so the host is able to read them. Note that in some cases, a JTAG transaction will end in an odd number of commands and as such an odd number of nibbles. In this case, it is allowable to repeat the CMD_FLUSH to get an even number of nibbles fitting an integer number of bytes.
- CMD_RSV is reserved in the current implementation. The ESP32-C3 will ignore this command when it receives it.
- CMD_REP repeats the last (non-CMD_REP) command a certain number of times. It's intended goal is to compress command streams which repeat the same CMD_CLK instruction multiple times. A command like CMD_CLK can be followed by multiple CMD_REP commands. The number of repetitions done by one CMD_REP can be expressed as $no\_repetitions = (R1 \times 2 + R0) \times (4^{cmd\_rep\_count})$, where cmd_rep_count is how many CMD_REP instructions went directly before it. Note that the CMD_REP is only intended to repeat a CMD_CLK command. Specifically, using it on a CMD_FLUSH command may lead to an unresponsive USB device, needing an USB reset to recover.

30.3.5 USB-to-JTAG Interface: CMD_REP usage example

Here is a list of commands as an illustration of the use of CMD_REP. Note each command is a nibble; in this example the bytewise command stream would be 0x0D 0x5E 0xCF.

1. 0x0 (CMD_CLK: cap=0, tdi=0, tms=0)
2. 0xD (CMD_REP: R1=0, R0=1)
3. 0x5 (CMD_CLK: cap=1, tdi=0, tms=1)
4. 0xE (CMD_REP: R1=1, R0=0)
5. 0xC (CMD_REP: R1=0, R0=0)
6. 0xF (CMD_REP: R1=1, R0=1)

This is what happens at every step:

1. TCK is clocked with the TDI and TMS lines set to 0. No data is captured.
2. TCK is clocked another $(0 \times 2 + 1) \times (4^0) = 1$ time with the same settings as step 1.
3. TCK is clocked with the TDI line set to 0 and TMS set to 1. Data on the TDO line is captured.
4. TCK is clocked another $(1 \times 2 + 0) \times (4^0) = 2$ times with the same settings as step 3.
5. Nothing happens: $(0 \times 2 + 0) \times (4^1) = 0$. Note that this does increase cmd_rep_count for the next step.
6. TCK is clocked another $(1 \times 2 + 1) \times (4^2) = 48$ times with the same settings as step 3.

In other words: This example stream has the same net effect as command 1 twice, then repeating command 3 for 51 times.

30.3.6 USB-to-JTAG Interface: Response Capture Unit

The response capture unit reads the TDO line of the internal JTAG bus and captures its value when the command parser executes a CMD_CLK with cap=1. It puts this bit into an internal shift register, and writes a byte into the USB buffer when 8 bits have been collected. Of these 8 bits, the least significant one is the one that is read from TDO the earliest.

As soon as either 64 bytes (512 bits) have been collected or a CMD_FLUSH command is executed, the response capture unit will make the buffer available for the host to receive. Note that the interface to the USB logic is double-buffered. This way, as long as USB throughput is sufficient, the response capture unit can always receive more data: while one of the buffers is waiting to be sent to the host, the other one can receive more data. When the host has received data from its buffer and the response capture unit flushes its buffer, the two buffers change position.

This also means that a command stream can cause at most 128 bytes of capture data to be generated (less if there are flush commands in the stream) without the host acting to receive the generated data. If more data is generated anyway, the command stream is paused and the device will not accept more commands before the generated capture data is read out.

Note that in general, the logic of the response capture unit tries not to send zero-byte responses: for instance, sending a series of CMD_FLUSH commands will not cause a series of zero-byte USB responses to be sent. However, in the current implementation, some zero-byte responses may be generated in extraordinary circumstances. It's recommended to ignore these responses.

30.3.7 USB-to-JTAG Interface: Control Transfer Requests

Aside from the command processor and the response capture unit, the USB-to-JTAG interface also understands some control requests, as documented in the table below:

Table 30-4. USB-to-JTAG Control Requests

bmRequestType	bRequest	wValue	wIndex	wLength	Data
01000000b	0 (VEND_JTAG_SETDIV)	[divider]	interface	0	None
01000000b	1 (VEND_JTAG_SETIO)	[iobits]	interface	0	None
11000000b	2 (VEND_JTAG_GETTDO)	0	interface	1	[iostate]
10000000b	6 (GET_DESCRIPTOR)	0x2000	0	256	[jtag cap desc]

- VEND_JTAG_SETDIV sets the divider used. This directly affects the duration of a TCK clock pulse. The TCK clock pulses are derived from APB_CLK, which is divided down using an internal divider. This control request allows the host to set this divider. Note that on startup, the divider is set to 2, meaning the TCK clock rate will generally be 40 MHz.
- VEND_JTAG_SETIO can bypass the JTAG command processor to set the internal TDI, TDO, TMS and SRST lines to given values. These values are encoded in the wValue field in the format of 11'b0, srst, trst, tck, tms, tdi.
- VEND_JTAG_GETTDO can bypass the JTAG response capture unit to read the internal TDO signal directly. This request returns one byte of data, of which the least significant bit represents the status of the TDO line.
- GET_DESCRIPTOR is a standard USB request, however it can also be used with a vendor-specific wValue of 0x2000 to get the JTAG capabilities descriptor. This returns a certain amount of bytes representing the following fixed structure, which describes the capabilities of the USB-to-JTAG adapter. This structure allows host software to automatically support future revisions of the hardware without needing an update.

The JTAG capabilities descriptor of the ESP32-C3 is as follows. Note that all 16-bit values are little-endian.

Table 30-5. JTAG Capabilities Descriptor

Byte	Value	Description
0	1	JTAG protocol capabilities structure version
1	10	Total length of JTAG protocol capabilities
2	1	Type of this struct: 1 for speed capabilities struct
3	8	Length of this speed capabilities struct
4 ~ 5	8000	APB_CLK speed in 10 kHz increments. Note that the maximal TCK speed is half of this
6 ~ 7	1	Minimum divisor settable by the VEND_JTAG_SETDIV request
8 ~ 9	255	Maximum divisor settable by the VEND_JTAG_SETDIV request

30.4 Recommended Operation

There is very little setup needed in order to use the USB Serial/JTAG Device. The USB-to-JTAG hardware itself does not need any setup aside from the standard USB initialization the host operating system already does. The CDC-ACM emulation, on the host side, also is plug-and-play.

On the firmware side, very little initialization should be needed either: the USB hardware is self-initializing and after boot-up, if a host is connected and listening on the CDC-ACM interface, data can be exchanged as described above without any specific setup aside from the firmware optionally setting up an interrupt service handler.

One thing to note is that there may be situations where the host is either not attached or the CDC-ACM virtual port is not opened. In this case, the packets that are flushed to the host will never be picked up and the transmit buffer will never be empty. It is important to detect this and time out, as this is the only way to reliably detect that the port on the host side is closed.

Another thing to note is that the USB device is dependent on both the PLL for the 48 MHz USB PHY clock, as well as APB_CLK. Specifically, an APB_CLK of 40 MHz or more is required for proper USB compliant operation, although the USB device will still function with most hosts with an APB_CLK as low as 10 MHz. Behaviour shown when this happens is dependent on the host USB hardware and drivers, and can include the device being unresponsive and it disappearing when first accessed.

More specifically, the APB_CLK will be affected by clock gating the USB Serial/JTAG Controller, which may happen in Light Sleep. Additionally, the USB serial/JTAG Controller (as well as the attached RISC-V CPU) will be entirely powered down in Deep Sleep mode. If a device needs to be debugged in either of these two modes, it may be preferable to use an external JTAG debugger and serial interface instead.

The CDC-ACM interface can also be used to reset the SoC and take it into or out of download mode. Generating the correct sequence of handshake signals can be a bit complicated: Most operating systems only allow setting or resetting DTR and RTS separately, and not in tandem. Additionally, some drivers (e.g. the standard CDC-ACM driver on Windows) do not set DTR until RTS is set and the user needs to explicitly set RTS in order to 'propagate' the DTR value. These are the recommended procedures:

To reset the SoC into download mode:

Table 30-6. Reset SoC into Download Mode

Action	Internal state	Note
Clear DTR	RTS=?, DTR=0	Initialize to known values
Clear RTS	RTS=0, DTR=0	-
Set DTR	RTS=0, DTR=1	Set download mode flag
Clear RTS	RTS=0, DTR=1	Propagate DTR
Set RTS	RTS=1, DTR=1	-
Clear DTR	RTS=1, DTR=0	Reset SoC
Set RTS	RTS=1, DTR=0	Propagate DTR
Clear RTS	RTS=0, DTR=0	Clear download flag

To reset the SoC into booting from flash:

Table 30-7. Reset SoC into Booting

Action	Internal state	Note
Clear DTR	RTS=?, DTR=0	-
Clear RTS	RTS=0, DTR=0	Clear download flag
Set RTS	RTS=1, DTR=0	Reset SoC
Clear RTS	RTS=0, DTR=0	Exit reset

30.5 Register Summary

The addresses in this section are relative to USB Serial/JTAG Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
USB_SERIAL_JTAG_EP1_REG	FIFO access for the CDC-ACM data IN and OUT endpoints	0x0000	R/W
USB_SERIAL_JTAG_CONF0_REG	PHY hardware configuration	0x0018	R/W
USB_SERIAL_JTAG_TEST_REG	Registers used for debugging the PHY	0x001C	R/W
USB_SERIAL_JTAG_MISC_CONF_REG	Clock enable control	0x0044	R/W
USB_SERIAL_JTAG_MEM_CONF_REG	Memory power control	0x0048	R/W
Status Registers			
USB_SERIAL_JTAG_EP1_CONF_REG	Configuration and control registers for the CDC-ACM FIFOs	0x0004	varies
USB_SERIAL_JTAG_JFIFO_ST_REG	JTAG FIFO status and control registers	0x0020	varies
USB_SERIAL_JTAG_FRAM_NUM_REG	Last received SOF frame index register	0x0024	RO
USB_SERIAL_JTAG_IN_EP0_ST_REG	Control IN endpoint status information	0x0028	RO
USB_SERIAL_JTAG_IN_EP1_ST_REG	CDC-ACM IN endpoint status information	0x002C	RO
USB_SERIAL_JTAG_IN_EP2_ST_REG	CDC-ACM interrupt IN endpoint status information	0x0030	RO
USB_SERIAL_JTAG_IN_EP3_ST_REG	JTAG IN endpoint status information	0x0034	RO
USB_SERIAL_JTAG_OUT_EP0_ST_REG	Control OUT endpoint status information	0x0038	RO
USB_SERIAL_JTAG_OUT_EP1_ST_REG	CDC-ACM OUT endpoint status information	0x003C	RO
USB_SERIAL_JTAG_OUT_EP2_ST_REG	JTAG OUT endpoint status information	0x0040	RO
Interrupt Registers			
USB_SERIAL_JTAG_INT_RAW_REG	Interrupt raw status register	0x0008	R/WTC/SS
USB_SERIAL_JTAG_INT_ST_REG	Interrupt status register	0x000C	RO
USB_SERIAL_JTAG_INT_ENA_REG	Interrupt enable status register	0x0010	R/W
USB_SERIAL_JTAG_INT_CLR_REG	Interrupt clear status register	0x0014	WT
Version Registers			
USB_SERIAL_JTAG_DATE_REG	Version register	0x0080	R/W

30.6 Registers

The addresses in this section are relative to USB Serial/JTAG Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 30.1. USB_SERIAL_JTAG_EP1_REG (0x0000)

(reserved)		USB_SERIAL_JTAG_RDWR_BYTE		
31	8	7	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		0x0		Reset

USB_SERIAL_JTAG_RDWR_BYTE Write and read byte data to/from UART Tx/Rx FIFO through this field. When USB_SERIAL_JTAG_SERIAL_IN_EMPTY_INT is set then user can write data (up to 64 bytes) into UART Tx FIFO. When USB_SERIAL_JTAG_SERIAL_OUT_RECV_PKT_INT is set, user can check USB_SERIAL_JTAG_OUT_EP1_WR_ADDR and USB_SERIAL_JTAG_OUT_EP1_RD_ADDR to know how many data is received, then read that amount of data from UART Rx FIFO. (R/W)

Register 30.2. USB_SERIAL_JTAG_CONF0_REG (0x0018)

(reserved)	USB_SERIAL_JTAG_USB_PAD_ENABLE	USB_SERIAL_JTAG_PULLUP_VALUE	USB_SERIAL_JTAG_DM_PULLDOWN	USB_SERIAL_JTAG_DM_PULLUP	USB_SERIAL_JTAG_DP_PULLDOWN	USB_SERIAL_JTAG_DP_PULLUP	USB_SERIAL_JTAG_PAD_PULL_OVERRIDE	USB_SERIAL_JTAG_VREF_OVERRIDE	USB_SERIAL_JTAG_VREFH	USB_SERIAL_JTAG_VREFL	USB_SERIAL_JTAG_EXCHG_PINS	USB_SERIAL_JTAG_EXCHG_PINS_OVERRIDE	USB_SERIAL_JTAG_PHY_SEL	
31 15	14	13	12	11	10	9	8	7	6 5	4 3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1	0	0	0	0	1	0	0	0	0	0	0	0	Reset

USB_SERIAL_JTAG_PHY_SEL Select internal/external PHY. 1’b0: internal PHY, 1’b1: external PHY. (R/W)

USB_SERIAL_JTAG_EXCHG_PINS_OVERRIDE Enable software control USB D+ D- exchange. (R/W)

USB_SERIAL_JTAG_EXCHG_PINS USB D+ D- exchange (R/W)

USB_SERIAL_JTAG_VREFL Control single-end input high threshold. 1.76 V to 2 V, step 80 mV. (R/W)

USB_SERIAL_JTAG_VREFH Control single-end input low threshold. 0.8 V to 1.04 V, step 80 mV. (R/W)

USB_SERIAL_JTAG_VREF_OVERRIDE Enable software control input threshold. (R/W)

USB_SERIAL_JTAG_PAD_PULL_OVERRIDE Enable software control USB D+ D- pull-up pull-down. (R/W)

USB_SERIAL_JTAG_DP_PULLUP Control USB D+ pull-up. (R/W)

USB_SERIAL_JTAG_DP_PULLDOWN Control USB D+ pull-down. (R/W)

USB_SERIAL_JTAG_DM_PULLUP Control USB D- pull-up. (R/W)

USB_SERIAL_JTAG_DM_PULLDOWN Control USB D- pull-down. (R/W)

USB_SERIAL_JTAG_PULLUP_VALUE Control pull-up value. 0: 2.2 K; 1: 1.1 K. (R/W)

USB_SERIAL_JTAG_USB_PAD_ENABLE Enable USB pad function. (R/W)

Register 30.3. USB_SERIAL_JTAG_TEST_REG (0x001C)

(reserved)	USB_SERIAL_JTAG_TEST_TX_DM	USB_SERIAL_JTAG_TEST_TX_DP	USB_SERIAL_JTAG_TEST_USB_OE	USB_SERIAL_JTAG_TEST_ENABLE	
31 4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	Reset

USB_SERIAL_JTAG_TEST_ENABLE Enable test of the USB pad. (R/W)

USB_SERIAL_JTAG_TEST_USB_OE USB pad output enable in test. (R/W)

USB_SERIAL_JTAG_TEST_TX_DP USB D+ tx value in test. (R/W)

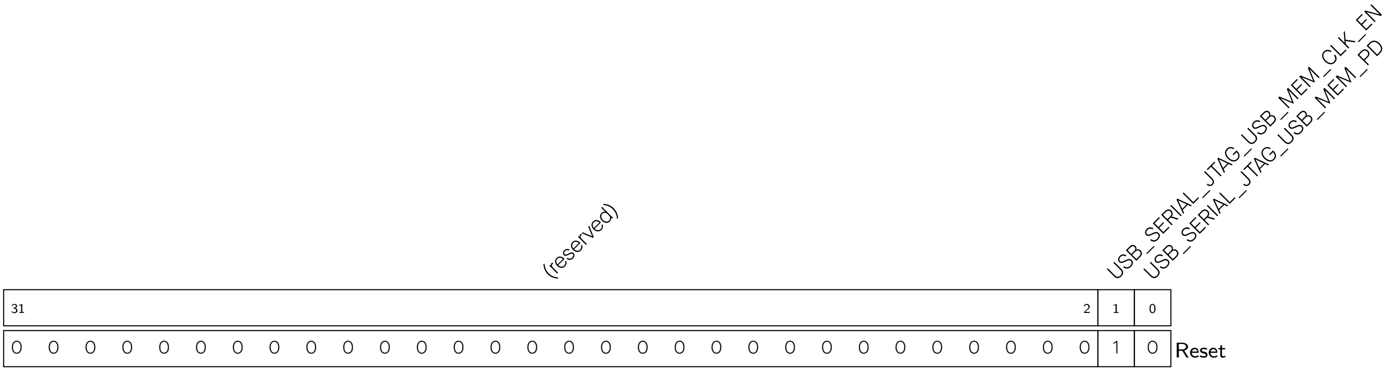
USB_SERIAL_JTAG_TEST_TX_DM USB D- tx value in test. (R/W)

Register 30.4. USB_SERIAL_JTAG_MISC_CONF_REG (0x0044)

(reserved)	USB_SERIAL_JTAG_CLK_EN	
31 1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

USB_SERIAL_JTAG_CLK_EN 1’h1: Force clock on for register. 1’h0: Support clock only when application writes registers. (R/W)

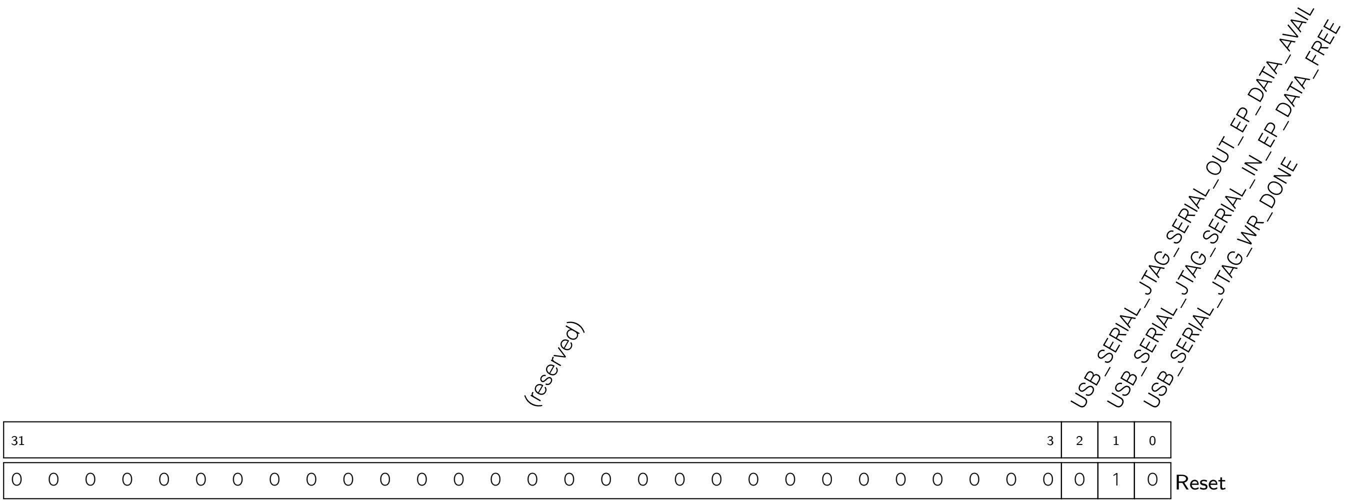
Register 30.5. USB_SERIAL_JTAG_MEM_CONF_REG (0x0048)



USB_SERIAL_JTAG_USB_MEM_PD Set to power down USB memory. (R/W)

USB_SERIAL_JTAG_USB_MEM_CLK_EN Set to force clock-on for USB memory. (R/W)

Register 30.6. USB_SERIAL_JTAG_EP1_CONF_REG (0x0004)



USB_SERIAL_JTAG_WR_DONE Set this bit to indicate writing byte data to UART Tx FIFO is done. This bit then stays 0 until data in UART Tx FIFO is read by the USB Host. (WT)

USB_SERIAL_JTAG_SERIAL_IN_EP_DATA_FREE 1'b1: Indicate UART Tx FIFO is not full and data can be written into in. After writing USB_SERIAL_JTAG_WR_DONE, this will be 1'b0 until the data is sent to the USB Host. (RO)

USB_SERIAL_JTAG_SERIAL_OUT_EP_DATA_AVAIL 1'b1: Indicate there is data in UART Rx FIFO. (RO)

Register 30.7. USB_SERIAL_JTAG_JFIFO_ST_REG (0x0020)

(reserved)	USB_SERIAL_JTAG_OUT_FIFO_RESET	USB_SERIAL_JTAG_IN_FIFO_RESET	USB_SERIAL_JTAG_OUT_FIFO_FULL	USB_SERIAL_JTAG_OUT_FIFO_EMPTY	USB_SERIAL_JTAG_OUT_FIFO_CNT	USB_SERIAL_JTAG_IN_FIFO_FULL	USB_SERIAL_JTAG_IN_FIFO_EMPTY	USB_SERIAL_JTAG_IN_FIFO_CNT	
31 10	9	8	7	6	5 4	3	2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	1	0	0	1	0	Reset

USB_SERIAL_JTAG_IN_FIFO_CNT JTAG in FIFO counter. (RO)

USB_SERIAL_JTAG_IN_FIFO_EMPTY Set to indicate JTAG in FIFO is empty. (RO)

USB_SERIAL_JTAG_IN_FIFO_FULL Set to indicate JTAG in FIFO is full. (RO)

USB_SERIAL_JTAG_OUT_FIFO_CNT JTAT out FIFO counter. (RO)

USB_SERIAL_JTAG_OUT_FIFO_EMPTY Set to indicate JTAG out FIFO is empty. (RO)

USB_SERIAL_JTAG_OUT_FIFO_FULL Set to indicate JTAG out FIFO is full. (RO)

USB_SERIAL_JTAG_IN_FIFO_RESET Write 1 to reset JTAG in FIFO. (R/W)

USB_SERIAL_JTAG_OUT_FIFO_RESET Write 1 to reset JTAG out FIFO. (R/W)

Register 30.8. USB_SERIAL_JTAG_FRAM_NUM_REG (0x0024)

(reserved)	USB_SERIAL_JTAG_SOF_FRAME_INDEX	
31 11	10 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

USB_SERIAL_JTAG_SOF_FRAME_INDEX Frame index of received SOF frame. (RO)

Register 30.9. USB_SERIAL_JTAG_IN_EP0_ST_REG (0x0028)

31 Two-wire Automotive Interface (TWAI)

The Two-wire Automotive Interface (TWAI®) is a multi-master, multi-cast communication protocol with functions such as error detection and signaling and inbuilt message priorities and arbitration. The TWAI protocol is suited for automotive and industrial applications (see Section 31.2 for more details).

ESP32-C3 contains a TWAI controller that can be connected to the TWAI bus via an external transceiver. The TWAI controller contains numerous advanced features, and can be utilized in a wide range of use cases such as automotive products, industrial automation controls, building automation, etc.

31.1 Features

The TWAI controller on ESP32-C3 supports the following features:

- Compatible with ISO 11898-1 protocol (CAN Specification 2.0)
- Supports Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID)
- Bit rates from 1 Kbit/s to 1 Mbit/s
- Multiple modes of operation
  - Normal
  - Listen-only (no influence on bus)
  - Self-test (no acknowledgment required during data transmission)
- 64-byte Receive FIFO
- Special transmissions
  - Single-shot transmissions (does not automatically re-transmit upon error)
  - Self Reception (the TWAI controller transmits and receives messages simultaneously)
- Acceptance Filter (supports single and dual filter modes)
- Error detection and handling
  - Error Counters
  - Configurable Error Warning Limit
  - Error Code Capture
  - Arbitration Lost Capture

31.2 Functional Protocol

31.2.1 TWAI Properties

The TWAI protocol connects two or more nodes in a bus network, and allows nodes to exchange messages in a latency bounded manner. A TWAI bus has the following properties.

Single Channel and Non-Return-to-Zero: The bus consists of a single channel to carry bits, and thus communication is half-duplex. Synchronization is also implemented in this channel, so extra channels (e.g., clock or enable) are not required. The bit stream of a TWAI message is encoded using the Non-Return-to-Zero (NRZ) method.

Bit Values: The single channel can either be in a dominant or recessive state, representing a logical 0 and a logical 1 respectively. A node transmitting data in a dominant state always overrides the other node transmitting data in a recessive state. The physical implementation on the bus is left to the application level to decide (e.g., differential pair or a single wire).

Bit Stuffing: Certain fields of TWAI messages are bit-stuffed. A transmitter that transmits five consecutive bits of the same value (e.g., dominant value or recessive value) should automatically insert a complementary bit. Likewise, a receiver that receives five consecutive bits should treat the next bit as a stuffed bit. Bit stuffing is applied to the following fields: SOF, arbitration field, control field, data field, and CRC sequence (see Section 31.2.2 for more details).

Multi-cast: All nodes receive the same bits as they are connected to the same bus. Data is consistent across all nodes unless there is a bus error (see Section 31.2.3 for more details).

Multi-master: Any node can initiate a transmission. If a transmission is already ongoing, a node will wait until the current transmission is over before initiating a new transmission.

Message Priority and Arbitration: If two or more nodes simultaneously initiate a transmission, the TWAI protocol ensures that one node will win arbitration of the bus. The arbitration field of the message transmitted by each node is used to determine which node will win arbitration.

Error Detection and Signaling: Each node actively monitors the bus for errors, and signals the detected errors by transmitting an error frame.

Fault Confinement: Each node maintains a set of error counters that are incremented/decremented according to a set of rules. When the error counters surpass a certain threshold, the node will automatically eliminate itself from the network by switching itself off.

Configurable Bit Rate: The bit rate for a single TWAI bus is configurable. However, all nodes on the same bus must operate at the same bit rate.

Transmitters and Receivers: At any point in time, a TWAI node can either be a transmitter or a receiver.

- A node generating a message is a transmitter. The node remains a transmitter until the bus is idle or until the node loses arbitration. Please note that nodes that have not lost arbitration can all be transmitters.
- All nodes that are not transmitters are receivers.

31.2.2 TWAI Messages

TWAI nodes use messages to transmit data, and signal errors to other nodes when detecting errors on the bus. Messages are split into various frame types, and some frame types will have different frame formats.

The TWAI protocol has of the following frame types:

- Data frame
- Remote frame
- Error frame
- Overload frame
- Interframe space

The TWAI protocol has the following frame formats:

- Standard Frame Format (SFF) that uses a 11-bit identifier
- Extended Frame Format (EFF) that uses a 29-bit identifier

31.2.2.1 Data Frames and Remote Frames

Data frames are used by nodes to send data to other nodes, and can have a payload of 0 to 8 data bytes. Remote frames are used for nodes to request a data frame with the same identifier from other nodes, and thus they do not contain any data bytes. However, data frames and remote frames share many fields. Figure 31-1 illustrates the fields and sub-fields of different frames and formats.

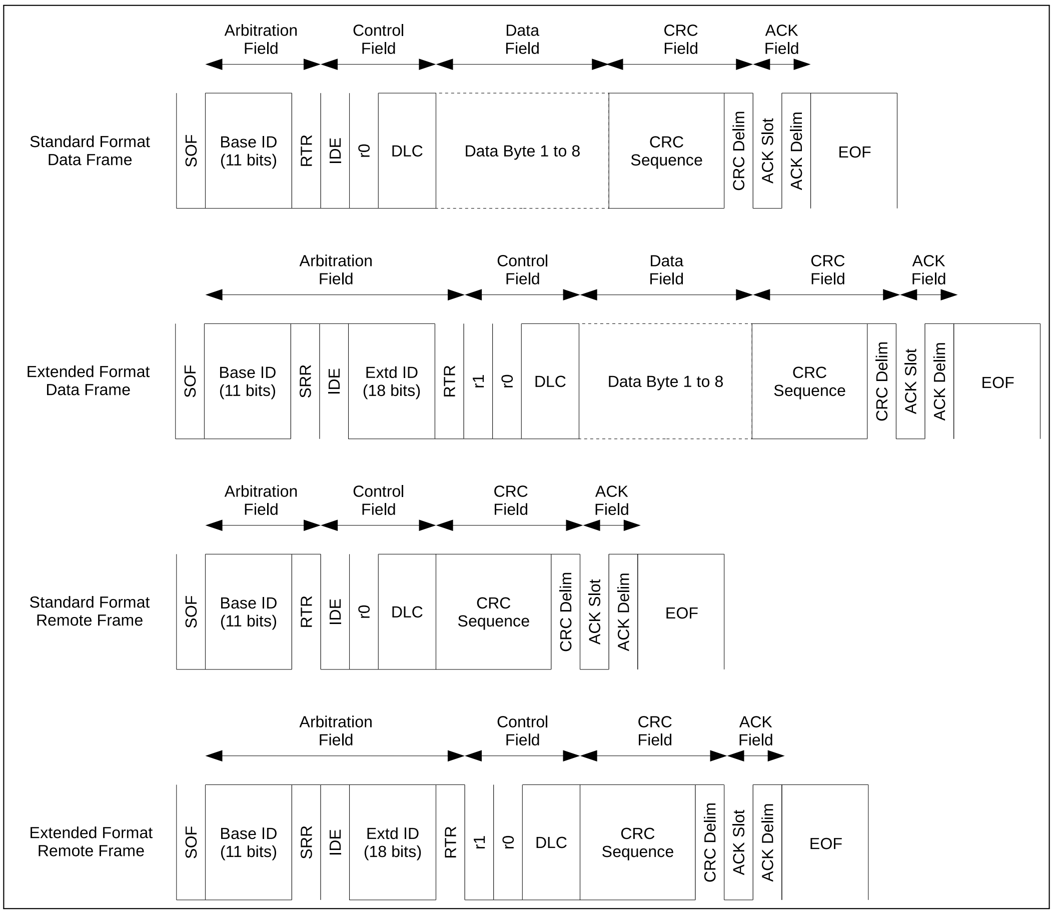

Figure 31-1. Bit Fields in Data Frames and Remote Frames

Arbitration Field

When two or more nodes transmits a data or remote frame simultaneously, the arbitration field is used to determine which node will win arbitration of the bus. In the arbitration field, if a node transmits a recessive bit while detects a dominant bit, this indicates that another node has overridden its recessive bit. Therefore, the node transmitting the recessive bit has lost arbitration of the bus and should immediately switch to be a receiver.

The arbitration field primarily consists of a frame identifier that is transmitted from the most significant bit first. Given that a dominant bit represents a logical 0, and a recessive bit represents a logical 1:

- A frame with the smallest ID value always wins arbitration.

- Given the same ID and format, data frames always prevail over remote frames due to their RTR bits being dominant.
- Given the same first 11 bits of ID, a Standard Format Data Frame always prevails over an Extended Format Data Frame due to its SRR bits being recessive.

Control Field

The control field primarily consists of the DLC (Data Length Code) which indicates the number of payload data bytes for a data frame, or the number of requested data bytes for a remote frame. The DLC is transmitted from the most significant bit first.

Data Field

The data field contains the actual payload data bytes of a data frame. Remote frames do not contain any data field.

CRC Field

The CRC field primarily consists of a CRC sequence. The CRC sequence is a 15-bit cyclic redundancy code calculated form the de-stuffed contents (everything from the SOF to the end of the data field) of a data or remote frame.

ACK Field

The ACK field primarily consists of an ACK Slot and an ACK Delim. The ACK field indicates that the receiver has received an effective message from the transmitter.

Table 31-1. Data Frames and Remote Frames in SFF and EFF

Data/Remote Frames	Description
SOF	The SOF (Start of Frame) is a single dominant bit used to synchronize nodes on the bus.
Base ID	The Base ID (ID.28 to ID.18) is the 11-bit identifier for SFF, or the first 11 bits of the 29-bit identifier for EFF.
RTR	The RTR (Remote Transmission Request) bit indicates whether the message is a data frame (dominant) or a remote frame (recessive). This means that a remote frame will always lose arbitration to a data frame if they have the same ID.
SRR	The SRR (Substitute Remote Request) bit is transmitted in EFF to substitute for the RTR bit at the same position in SFF.
IDE	The IDE (Identifier Extension) bit indicates whether the message is SFF (dominant) or EFF (recessive). This means that a SFF frame will always win arbitration over an EFF frame if they have the same Base ID.
Extd ID	The Extended ID (ID.17 to ID.0) is the remaining 18 bits of the 29-bit identifier for EFF.
r1	The r1 bit (reserved bit 1) is always dominant.
r0	The r0 bit (reserved bit 0) is always dominant.
DLC	The DLC (Data Length Code) is 4-bit long and should contain any value from 0 to 8. Data frames use the DLC to indicate the number of data bytes in the data frame. Remote frames used the DLC to indicate the number of data bytes to request from another node.

Cont'd on next page

Table 31-1 – cont'd from previous page

Data/Remote Frames	Description
Data Bytes	The data payload of data frames. The number of bytes should match the value of DLC. Data byte 0 is transmitted first, and each data byte is transmitted from the most significant bit first.
CRC Sequence	The CRC sequence is a 15-bit cyclic redundancy code.
CRC Delim	The CRC Delim (CRC Delimiter) is a single recessive bit that follows the CRC sequence.
ACK Slot	The ACK Slot (Acknowledgment Slot) is intended for receiver nodes to indicate that the data or remote frame was received without any issue. The transmitter node will send a recessive bit in the ACK Slot and receiver nodes should override the ACK Slot with a dominant bit if the frame was received without errors.
ACK Delim	The ACK Delim (Acknowledgment Delimiter) is a single recessive bit.
EOF	The EOF (End of Frame) marks the end of a data or remote frame, and consists of seven recessive bits.

31.2.2.2 Error and Overload Frames

Error Frames

Error frames are transmitted when a node detects a bus error. Error frames notably consist of an Error Flag which is made up of six consecutive bits of the same value, thus violating the bit-stuffing rule. Therefore, when a particular node detects a bus error and transmits an error frame, all other nodes will then detect a stuff error and transmit their own error frames in response. This has the effect of propagating the detection of a bus error across all nodes on the bus.

When a node detects a bus error, it will transmit an error frame starting from the next bit. However, if the type of bus error was a CRC error, then the error frame will start at the bit following the ACK Delim (see Section 31.2.3 for more details). The following Figure 31-2 shows different fields of an error frame:

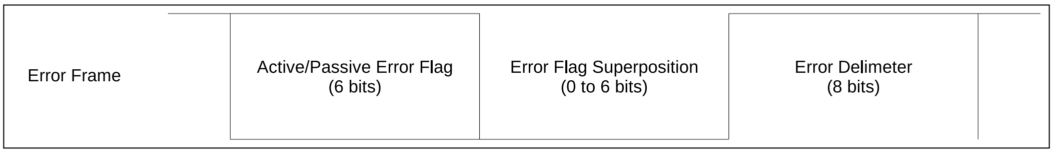

Figure 31-2. Fields of an Error Frame

Table 31-2. Error Frame

Error Frame	Description
Error Flag	The Error Flag has two forms, the Active Error Flag consisting of 6 dominant bits and the Passive Error Flag consisting of 6 recessive bits (unless overridden by dominant bits of other nodes). Active Error Flags are sent by error active nodes, whilst Passive Error Flags are sent by error passive nodes.

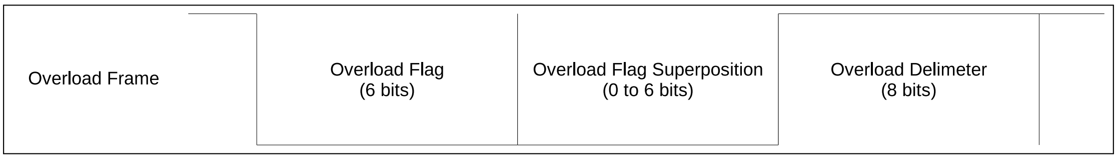
Cont'd on next page

Table 31-2 – cont'd from previous page

Error Frame	Description
Error Flag Superposition	The Error Flag Superposition field meant to allow for other nodes on the bus to transmit their respective Active Error Flags. The superposition field can range from 0 to 6 bits, and ends when the first recessive bit is detected (i.e., the first it of the Delimiter).
Error Delimeter	The Delimiter field marks the end of the error/overload frame, and consists of 8 recessive bits.

Overload Frames

An overload frame has the same bit fields as an error frame containing an Active Error Flag. The key difference is in the cases that can trigger the transmission of an overload frame. Figure 31-3 below shows the bit fields of an overload frame.



Overload Frame
Overload Flag (6 bits)
Overload Flag Superposition (0 to 6 bits)
Overload Delimeter (8 bits)

Figure 31-3. Fields of an Overload Frame

Table 31-3. Overload Frame

Overload Flag	Description
Overload Flag	Consists of 6 dominant bits. Same as an Active Error Flag.
Overload Flag Superposition	Allows for the superposition of Overload Flags from other nodes, similar to an Error Flag Superposition.
Overload Delimiter	Consists of 8 recessive bits. Same as an Error Delimiter.

Overload frames will be transmitted under the following cases:

1. A receiver requires a delay of the next data or remote frame.
2. A dominant bit is detected at the first and second bit of intermission.
3. A dominant bit is detected at the eighth (last) bit of an Error Delimiter. Note that in this case, TEC and REC will not be incremented (see Section 31.2.3 for more details).

Transmitting an overload frame due to one of the above cases must also satisfy the following rules:

- The start of an overload frame due to case 1 is only allowed to be started at the first bit time of an expected intermission.
- The start of an overload frame due to case 2 and 3 is only allowed to be started one bit after detecting the dominant bit.
- A maximum of two overload frames may be generated in order to delay the transmission of the next data or remote frame.

31.2.2.3 Interframe Space

The Interframe Space acts as a separator between frames. Data frames and remote frames must be separated from preceding frames by an Interframe Space, regardless of the preceding frame's type (data frame, remote frame, error frame, or overload frame). However, error frames and overload frames do not need to be separated from preceding frames.

Figure 31-4 shows the fields within an Interframe Space:

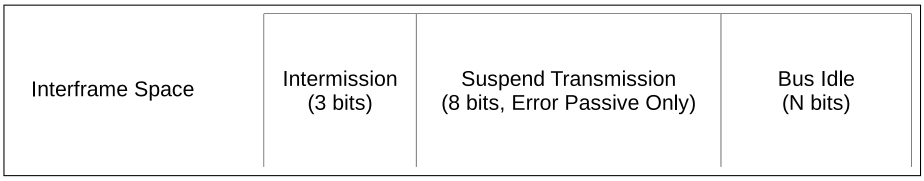


Figure 31-4. The Fields within an Interframe Space

Table 31-4. Interframe Space

Interframe Space	Description
Intermission	The Intermission consists of 3 recessive bits.
Suspend Transmission	An Error Passive node that has just transmitted a message must include a Suspend Transmission field. This field consists of 8 recessive bits. Error Active nodes should not include this field.
Bus Idle	The Bus Idle field is of arbitrary length. Bus Idle ends when an SOF is transmitted. If a node has a pending transmission, the SOF should be transmitted at the first bit following Intermission.

31.2.3 TWAI Errors

31.2.3.1 Error Types

Bus Errors in TWAI are categorized into the following types:

Bit Error
A Bit Error occurs when a node transmits a bit value (i.e., dominant or recessive) but the opposite bit is detected (e.g., a dominant bit is transmitted but a recessive is detected). However, if the transmitted bit is recessive and is located in the Arbitration Field or ACK Slot or Passive Error Flag, then detecting a dominant bit will not be considered a Bit Error.

Stuff Error
A stuff error is detected when six consecutive bits of the same value are detected (which violats the bit-stuffing encoding rules).

CRC Error
A receiver of a data or remote frame will calculate CRC based on the bits it has received. A CRC error occurs when the CRC calculated by the receiver does not match the CRC sequence in the received data or remote Frame.

Format Error
A Format Error is detected when a format-fixed bit field of a message contains an illegal bit. For example, the r1 and r0 fields must be dominant.

ACK Error
An ACK Error occurs when a transmitter does not detect a dominant bit at the ACK Slot.

31.2.3.2 Error States

TWAI nodes implement fault confinement by each maintaining two error counters, where the counter values determine the error state. The two error counters are known as the Transmit Error Counter (TEC) and Receive Error Counter (REC). TWAI has the following error states.

Error Active

An Error Active node is able to participate in bus communication and transmit an Active Error Flag when it detects an error.

Error Passive

An Error Passive node is able to participate in bus communication, but can only transmit an Passive Error Flag when it detects an error. Error Passive nodes that have transmitted a data or remote frame must also include the Suspend Transmission field in the subsequent Interframe Space.

Bus Off

A Bus Off node is not permitted to influence the bus in any way (i.e., is not allowed to transmit data).

31.2.3.3 Error Counters

The TEC and REC are incremented/decremented according to the following rules. **Note that more than one rule can apply to a given message transfer.**

1. When a receiver detects an error, the REC is increased by 1, except when the detected error was a Bit Error during the transmission of an Active Error Flag or an Overload Flag.
2. When a receiver detects a dominant bit as the first bit after sending an Error Flag, the REC is increased by 8.
3. When a transmitter sends an Error Flag, the TEC is increased by 8. However, the following scenarios are exempt from this rule:
   - A transmitter is Error Passive since the transmitter generates an Acknowledgment Error because of not detecting a dominant bit in the ACK Slot, while detecting a dominant bit when sending a passive error flag. In this case, the TEC should not be increased.
   - A transmitter transmits an Error Flag due to a Stuff Error during Arbitration. If the stuffed bit should have been recessive but was monitored as dominant, then the TEC should not be increased.
4. If a transmitter detects a Bit Error whilst sending an Active Error Flag or Overload Flag, the TEC is increased by 8.
5. If a receiver detects a Bit Error while sending an Active Error Flag or Overload Flag, the REC is increased by 8.
6. A node can tolerate up to 7 consecutive dominant bits after sending an Active/Passive Error Flag, or Overload Flag. After detecting the 14th consecutive dominant bit (when sending an Active Error Flag or Overload Flag), or the 8th consecutive dominant bit following a Passive Error Flag, a transmitter will increase its TEC by 8 and a receiver will increase its REC by 8. Every additional 8 consecutive dominant bits will also increase the TEC (for transmitters) or REC (for receivers) by 8 as well.
7. When a transmitter has transmitted a message (getting ACK and no errors until the EOF is complete), the TEC is decremented by 1, unless the TEC is already at 0.
8. When a receiver successfully receives a message (no errors before ACK Slot, and successful sending of ACK), the REC is decremented.
   - If the REC is between 1 and 127, the REC will be decremented by 1.
   - If the REC is greater than 127, the REC will be set to 127.

- If the REC is 0, the REC will remain 0.

9. A node becomes Error Passive when its TEC and/or REC is greater than or equal to 128. Though the node becomes Error Passive, it still sends an Active Error Flag. Note that once the REC has reached to 128, any further increases to its value are invalid until the REC returns to a value less than 128.

10. A node becomes Bus Off when its TEC is greater than or equal to 256.

11. An Error Passive node becomes Error Active when both the TEC and REC are less than or equal to 127.

12. A Bus Off node can become Error Active (with both its TEC and REC reset to 0) after it monitors 128 occurrences of 11 consecutive recessive bits on the bus.

31.2.4 TWAI Bit Timing

31.2.4.1 Nominal Bit

The TWAI protocol allows a TWAI bus to operate at a particular bit rate. However, all nodes within a TWAI bus must operate at the same bit rate.

- **The Nominal Bit Rate** is defined as the number of bits transmitted per second.
- **The Nominal Bit Time** is defined as **1/Nominal Bit Rate.**

A single Nominal Bit Time is divided into multiple segments, and each segment is made up of multiple Time Quanta. A **Time Quantum** is a minimum unit of time, and is implemented as some form of prescaled clock signal in each node. Figure 31-5 illustrates the segments within a single Nominal Bit Time.

TWAI controllers will operate in time steps of one Time Quanta where the state of the TWAI bus is analyzed. If the bus states in two consecutive Time Quantas are different (i.e., recessive to dominant or vice versa), it means an edge is generated. The intersection of PBS1 and PBS2 is considered the Sample Point and the sampled bus value is considered the value of that bit.

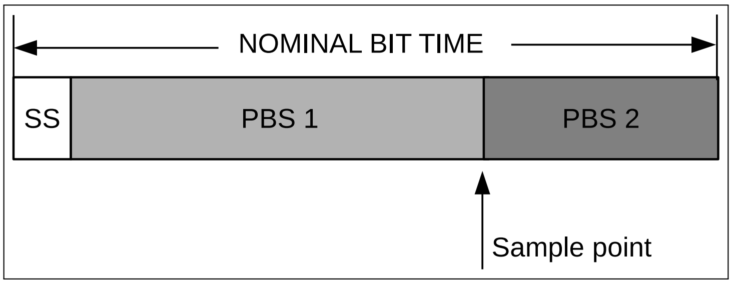

Figure 31-5. Layout of a Bit

Table 31-5. Segments of a Nominal Bit Time

Segment	Description
SS	The SS (Synchronization Segment) is 1 Time Quantum long. If all nodes are perfectly synchronized, the edge of a bit will lie in the SS.
PBS1	PBS1 (Phase Buffer Segment 1) can be 1 to 16 Time Quanta long. PBS1 is meant to compensate for the physical delay times within the network. PBS1 can also be lengthened for synchronization purposes.

Cont'd on next page

Table 31-5 – cont'd from previous page

Segment	Description
PBS2	PBS2 (Phase Buffer Segment 2) can be 1 to 8 Time Quanta long. PBS2 is meant to compensate for the information processing time of nodes. PBS2 can also be shortened for synchronization purposes.

31.2.4.2 Hard Synchronization and Resynchronization

Due to clock skew and jitter, the bit timing of nodes on the same bus may become out of phase. Therefore, a bit edge may come before or after the SS. To ensure that the internal bit timing clocks of each node are kept in phase, TWAI has various methods of synchronization. The **Phase Error "e"** is measured in the number of Time Quanta and relative to the SS.

- A positive Phase Error (e > 0) is when the edge lies after the SS and before the Sample Point (i.e., the edge is late).
- A negative Phase Error (e < 0) is when the edge lies after the Sample Point of the previous bit and before SS (i.e., the edge is early).

To correct for Phase Errors, there are two forms of synchronization, known as **Hard Synchronization** and **Resynchronization. Hard Synchronization** and **Resynchronization** obey the following rules:

- Only one synchronization may occur in a single bit time.
- Synchronizations only occurs on recessive to dominant edges.

Hard Synchronization
Hard Synchronization occurs on the recessive to dominant (i.e., the first SOF bit after Bus Idle) edges when the bus is idle. All nodes will restart their internal bit timings so that the recessive to dominant edge lies within the SS of the restarted bit timing.

Resynchronization
Resynchronization occurs on recessive to dominant edges when the bus is not idel. If the edge has a positive Phase Error (e > 0), PBS1 is lengthened by a certain number of Time Quanta. If the edge has a negative Phase Error (e < 0), PBS2 will be shortened by a certain number of Time Quanta.

The number of Time Quanta to lengthen or shorten depends on the magnitude of the Phase Error, and is also limited by the Synchronization Jump Width (SJW) value which is programmable.

- When the magnitude of the Phase Error (**e**) is less than or equal to the SJW, PBS1/PBS2 are lengthened/shortened by the **e** number of Time Quanta. This has a same effect as Hard Synchronization.
- When the magnitude of the Phase Error is greater to the SJW, PBS1/PBS2 are lengthened/shortened by the SJW number of Time Quanta. This means it may take multiple bits of synchronization before the Phase Error is entirely corrected.

31.3 Architectural Overview

The major functional blocks of the TWAI controller are shown in Figure 31-6.

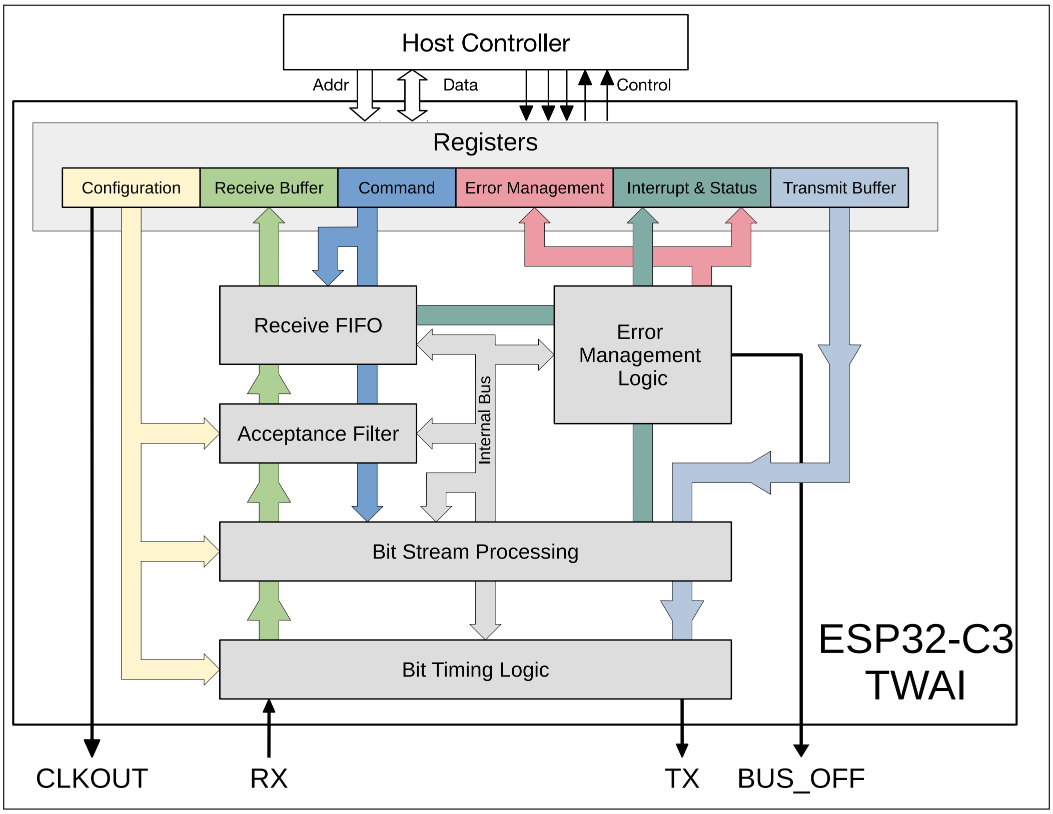

Figure 31-6. TWAI Overview Diagram

31.3.1 Registers Block

The ESP32-C3 CPU accesses peripherals using 32-bit aligned words. However, the majority of registers in the TWAI controller only contain useful data at the least significant byte (bits [7:0]). Therefore, in these registers, bits [31:8] are ignored on writes, and return 0 on reads.

Configuration Registers

The configuration registers store various configuration items for the TWAI controller such as bit rates, operation mode, Acceptance Filter, etc. Configuration registers can only be modified whilst the TWAI controller is in Reset Mode (See Section 31.4.1).

Command Registers

The command register is used by the CPU to drive the TWAI controller to initiate certain actions such as transmitting a message or clearing the Receive Buffer. The command register can only be modified when the TWAI controller is in Operation Mode (see section 31.4.1).

Interrupt & Status Registers

The interrupt register indicates what events have occurred in the TWAI controller (each event is represented by a separate bit). The status register indicates the current status of the TWAI controller.

Error Management Registers

The error management registers include error counters and capture registers. The error counter registers represent TEC and REC values. The capture registers will record information about instances where TWAI controller detects a bus error, or when it loses arbitration.

Transmit Buffer Registers

The transmit buffer is a 13-byte buffer used to store a TWAI message to be transmitted.

Receive Buffer Registers

The Receive Buffer is a 13-byte buffer which stores a single message. The Receive Buffer acts as a window of Receive FIFO, whose first message will be mapped into the Receive Buffer.

Note that the Transmit Buffer registers, Receive Buffer registers, and the Acceptance Filter registers share the same address range (offset 0x0040 to 0x0070). Their access is governed by the following rules:

- When the TWAI controller is in Reset Mode, all reads and writes to the address range maps to the Acceptance Filter registers.
- When the TWAI controller is in Operation Mode:
  - All reads to the address range maps to the Receive Buffer registers.
  - All writes to the address range maps to the Transmit Buffer registers.

31.3.2 Bit Stream Processor

The Bit Stream Processing (BSP) module frames data from the Transmit Buffer (e.g. bit stuffing and additional CRC fields) and generates a bit stream for the Bit Timing Logic (BTL) module. At the same time, the BSP module is also responsible for processing the received bit stream (e.g., de-stuffing and verifying CRC) from the BTL module and placing the message into the Receive FIFO. The BSP will also detect errors on the TWAI bus and report them to the Error Management Logic (EML).

31.3.3 Error Management Logic

The Error Management Logic (EML) module updates the TEC and REC, records error information like error types and positions, and updates the error state of the TWAI controller such that the BSP module generates the correct Error Flags. Furthermore, this module also records the bit position when the TWAI controller loses arbitration.

31.3.4 Bit Timing Logic

The Bit Timing Logic (BTL) module transmits and receives messages at the configured bit rate. The BTL module also handles bit timing synchronization so that communication remains stable. A single bit time consists of multiple programmable segments that allows users to set the length of each segment to account for factors such as propagation delay and controller processing time, etc.

31.3.5 Acceptance Filter

The Acceptance Filter is a programmable message filtering unit that allows the TWAI controller to accept or reject a received message based on the message's ID field. Only accepted messages will be stored in the Receive FIFO. The Acceptance Filter's registers can be programmed to specify a single filter, or two separate filters (dual filter mode).

31.3.6 Receive FIFO

The Receive FIFO is a 64-byte buffer (inside the TWAI controller) that stores received messages accepted by the Acceptance Filter. Messages in the Receive FIFO can vary in size (between 3 to 13-bytes). When the Receive FIFO is full (or does not have enough space to store the next received message in its entirety), the Overrun Interrupt will be triggered, and any subsequent received messages will be lost until adequate space is cleared in the Receive FIFO. The first message in the Receive FIFO will be mapped to the 13-byte Receive

Buffer until that message is cleared (using the Release Receive Buffer command bit). After being cleared, the Receive Buffer will map to the next message in the Receive FIFO, and the space occupied by the previous message in the Receive FIFO can be used to receive new messages.

31.4 Functional Description

31.4.1 Modes

The ESP32-C3 TWAI controller has two working modes: Reset Mode and Operation Mode. Reset Mode and Operation Mode are entered by setting or clearing the TWAI_RESET_MODE bit.

31.4.1.1 Reset Mode

Entering Reset Mode is required in order to modify the various configuration registers of the TWAI controller. When entering Reset Mode, the TWAI controller is essentially disconnected from the TWAI bus. When in Reset Mode, the TWAI controller will not be able to transmit any messages (including error signals). Any transmission in progress is immediately terminated. Likewise, the TWAI controller will not be able to receive any messages either.

31.4.1.2 Operation Mode

In operation mode, the TWAI controller connects to the bus and write-protect all configuration registers to ensure consistency during operation. When in Operation Mode, the TWAI controller can transmit and receive messages (including error signaling) depending on which operation sub-mode the TWAI controller was configured with. The TWAI controller supports the following operation sub-modes:

- **Normal Mode:** The TWAI controller can transmit and receive messages including error signals (such as error and overload Frames).
- **Self-test Mode:** Self-test mode is similar to normal Mode, but the TWAI controller will consider the transmission of a data or RTR frame successful and do not generate an ACK error even if it was not acknowledged. This is commonly used when the TWAI controller does self-test.
- **Listen-only Mode:** The TWAI controller will be able to receive messages, but will remain completely passive on the TWAI bus. Thus, the TWAI controller will not be able to transmit any messages, acknowledgments, or error signals. The error counters will remain frozen. This mode is useful for TWAI bus monitoring.

Note that when exiting Reset Mode (i.e., entering Operation Mode), the TWAI controller must wait for 11 consecutive recessive bits to occur before being able to fully connect the TWAI bus (i.e., be able to transmit or receive).

31.4.2 Bit Timing

The operating bit rate of the TWAI controller must be configured whilst the TWAI controller is in Reset Mode. The bit rate is configured using TWAI_BUS_TIMING_0_REG and TWAI_BUS_TIMING_1_REG, and the two registers contain the following fields:

The following Table 31-6 illustrates the bit fields of TWAI_BUS_TIMING_0_REG.

Table 31-6. Bit Information of TWAI_BUS_TIMING_0_REG (0x18)

Bit 31-16	Bit 15	Bit 14	Bit 13	Bit 12	......	Bit 1	Bit 0
Reserved	SJW.1	SJW.0	Reserved	BRP.12	......	BRP.1	BRP.0

Notes:

- BRP: The TWAI Time Quanta clock is derived from the APB clock that is usually 80 MHz. The Baud Rate Prescaler (BRP) field is used to define the prescaler according to the equation below, where t_{Tq} is the Time Quanta clock cycle and t_{CLK} is APB clock cycle:
  $t_{Tq} = 2 \times t_{CLK} \times (2^{12} \times BRP.12 + 2^{11} \times BRP.11 + ... + 2^{1} \times BRP.1 + 2^{0} \times BRP.0 + 1)$
- SJW: Synchronization Jump Width (SJW) is configured in SJW.0 and SJW.1 where SJW = (2 x SJW.1 + SJW.0 + 1)□

The following Table 31-7 illustrates the bit fields of TWAI_BUS_TIMING_1_REG.

Table 31-7. Bit Information of TWAI_BUS_TIMING_1_REG (0x1c)

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	SAM	PBS2.2	PBS2.1	PBS2.0	PBS1.3	PBS1.2	PBS1.1	PBS1.0

Notes:

- PBS1: The number of Time Quanta in Phase Buffer Segment 1 is defined according to the following equation: (8 x PBS1.3 + 4 x PBS1.2 + 2 x PBS1.1 + PBS1.0 + 1)□
- PBS2: The number of Time Quanta in Phase Buffer Segment 2 is defined according to the following equation: (4 x PBS2.2 + 2 x PBS2.1 + PBS2.0 + 1)□
- SAM: Enables triple sampling if set to 1. This is useful for low/medium speed buses to filter spikes on the bus line.

31.4.3 Interrupt Management

The ESP32-C3 TWAI controller provides eight interrupts, each represented by a single bit in the TWAI_INT_RAW_REG. For a particular interrupt to be triggered, the corresponding enable bit in TWAI_INT ENA_REG must be set.

The TWAI controller provides the following interrupts:

- Receive Interrupt
- Transmit Interrupt
- Error Warning Interrupt
- Data Overrun Interrupt
- Error Passive Interrupt
- Arbitration Lost Interrupt
- Bus Error Interrupt
- Bus Status Interrupt

The TWAI controller's interrupt signal to the interrupt matrix will be asserted whenever one or more interrupt bits are set in the TWAI_INT_RAW_REG, and deasserted when all bits in TWAI_INT_RAW_REG are cleared. The majority of interrupt bits in TWAI_INT_RAW_REG are automatically cleared when the register is read, except for the Receive Interrupt which can only be cleared when all the messages are released by setting the TWAI_RELEASE_BUF bit.

31.4.3.1 Receive Interrupt (RXI)

The Receive Interrupt (RXI) is asserted whenever the TWAI controller has received messages that are pending to be read from the Receive Buffer (i.e., when TWAI_RX_MESSAGE_CNT_REG > 0). Pending received messages includes valid messages in the Receive FIFO and also overrun messages. The RXI will not be deasserted until all pending received messages are cleared using the TWAI_RELEASE_BUF command bit.

31.4.3.2 Transmit Interrupt (TXI)

The Transmit Interrupt (TXI) is triggered whenever Transmit Buffer becomes free, indicating another message can be loaded into the Transmit Buffer to be transmitted. The Transmit Buffer becomes free under the following scenarios:

- A message transmission has completed successfully, i.e., acknowledged without any errors. (Any failed messages will automatically be resent.)
- A single shot transmission has completed (successfully or unsuccessfully, indicated by the TWAI_TX_COMPLETE bit).
- A message transmission was aborted using the TWAI_ABORT_TX command bit.

31.4.3.3 Error Warning Interrupt (EWI)

The Error Warning Interrupt (EWI) is triggered whenever there is a change to the TWAI_ERR_ST and TWAI_BUS_OFF_ST bits of the TWAI_STATUS_REG (i.e., transition from 0 to 1 or vice versa). Thus, an EWI could indicate one of the following events, depending on the values TWAI_ERR_ST and TWAI_BUS_OFF_ST at the moment when the EWI is triggered.

- If TWAI_ERR_ST = 0 and TWAI_BUS_OFF_ST = 0:
  - If the TWAI controller was in the Error Active state, it indicates both the TEC and REC have returned below the threshold value set by TWAI_ERR_WARNING_LIMIT_REG.
  - If the TWAI controller was previously in the Bus Off Recovery state, it indicates that Bus Recovery has completed successfully.
- If TWAI_ERR_ST = 1 and TWAI_BUS_OFF_ST = 0: The TEC or REC error counters have exceeded the threshold value set by TWAI_ERR_WARNING_LIMIT_REG.
- If TWAI_ERR_ST = 1 and TWAI_BUS_OFF_ST = 1: The TWAI controller has entered the BUS_OFF state (due to the TEC >= 256).
- If TWAI_ERR_ST = 0 and TWAI_BUS_OFF_ST = 1: The TWAI controller's TEC has dropped below the threshold value set by TWAI_ERR_WARNING_LIMIT_REG during BUS_OFF recovery.

31.4.3.4 Data Overrun Interrupt (DOI)

The Data Overrun Interrupt (DOI) is triggered whenever the Receive FIFO has overrun. The DOI indicates that the Receive FIFO is full and should be cleared immediately to prevent any further overrun messages.

The DOI is only triggered by the first message that causes the Receive FIFO to overrun (i.e., the transition from the Receive FIFO not being full to the Receive FIFO overrunning). Any subsequent overrun messages will not trigger the DOI again. The DOI could be triggered again when all received messages (valid or overrun) have been cleared.

31.4.3.5 Error Passive Interrupt (TXI)

The Error Passive Interrupt (EPI) is triggered whenever the TWAI controller switches from Error Active to Error Passive, or vice versa.

31.4.3.6 Arbitration Lost Interrupt (ALI)

The Arbitration Lost Interrupt (ALI) is triggered whenever the TWAI controller is attempting to transmit a message and loses arbitration. The bit position where the TWAI controller lost arbitration is automatically recorded in Arbitration Lost Capture register (TWAI_ARB LOST CAP_REG). When the ALI occurs again, the Arbitration Lost Capture register will no longer record new bit location until it is cleared (via CPU reading this register).

31.4.3.7 Bus Error Interrupt (BEI)

The Bus Error Interrupt (BEI) is triggered whenever TWAI controller detects an error on the TWAI bus. When a bus error occurs, the Bus Error type and its bit position are automatically recorded in the Error Code Capture register (TWAI_ERR_CODE_CAP_REG). When the BEI occurs again, the Error Code Capture register will no longer record new error information until it is cleared (via a read from the CPU).

31.4.3.8 Bus Status Interrupt (BSI)

The Bus Status Interrupt (BSI) is triggered whenever TWAI controller is switching between receive/transmit status and idle status. When a BSI occurs, the current status of TWAI controller can be measured by reading TWAI_RX_ST and TWAI_TX_ST in TWAI_STATUS_REG register.

31.4.4 Transmit and Receive Buffers

31.4.4.1 Overview of Buffers

Table 31-8. Buffer Layout for Standard Frame Format and Extended Frame Format

Standard Frame Format (SFF)		Extended Frame Format (EFF)	
TWAI Address	Content	TWAI Address	Content
0x40	TX/RX frame information	0x40	TX/RX frame information
0x44	TX/RX identifier 1	0x44	TX/RX identifier 1
0x48	TX/RX identifier 2	0x48	TX/RX identifier 2
0x4c	TX/RX data byte 1	0x4c	TX/RX identifier 3

Cont'd on next page

Table 31-8 – cont'd from previous page

Standard Frame Format (SFF)		Extended Frame Format (EFF)	
TWAI Address	Content	TWAI Address	Content
0x50	TX/RX data byte 2	0x50	TX/RX identifier 4
0x54	TX/RX data byte 3	0x54	TX/RX data byte 1
0x58	TX/RX data byte 4	0x58	TX/RX data byte 2
0x5c	TX/RX data byte 5	0x5c	TX/RX data byte 3
0x60	TX/RX data byte 6	0x60	TX/RX data byte 4
0x64	TX/RX data byte 7	0x64	TX/RX data byte 5
0x68	TX/RX data byte 8	0x68	TX/RX data byte 6
0x6c	reserved	0x6c	TX/RX data byte 7
0x70	reserved	0x70	TX/RX data byte 8

Table 31-8 illustrates the layout of the Transmit Buffer and Receive Buffer registers. Both the Transmit and Receive Buffer registers share the same address space and are only accessible when the TWAI controller is in Operation Mode. The CPU accesses Transmit Buffer registers for write operations, and Receive Buffer registers for read operations . Both buffers share the exact same register layout and fields to represent a message (received or to be transmitted). The Transmit Buffer registers are used to configure a TWAI message to be transmitted. The CPU would write to the Transmit Buffer registers specifying the message's frame type, frame format, frame ID, and frame data (payload). Once the Transmit Buffer is configured, the CPU would then initiate the transmission by setting the TWAI_TX_REQ bit in TWAI_CMD_REG.

- For a self-reception request, set the TWAI_SELF_RX_REQ bit instead.
- For a single-shot transmission, set both the TWAI_TX_REQ and the TWAI_ABORT_TX simultaneously.

The Receive Buffer registers map the first message in the Receive FIFO. The CPU would read the Receive Buffer registers to obtain the first message's frame type, frame format, frame ID, and frame data (payload). Once the message has been read from the Receive Buffer registers, the CPU can set the TWAI_RELEASE_BUF bit in TWAI_CMD_REG to clear the Receive Buffer registers. If there are still messages in the Receive FIFO, the Receive Buffer registers will map the first message again.

31.4.4.2 Frame Information

The frame information is one byte long and specifies a message's frame type, frame format, and length of data. The frame information fields are shown in Table 31-9.

Table 31-9. TX/RX Frame Information (SFF/EFF)□TWAI Address 0x40

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	FF[1]	RTR[2]	X[3]	X[3]	DLC.3[4]	DLC.2[4]	DLC.1[4]	DLC.0[4]

Notes:

1. FF: The Frame Format (FF) bit specifies whether the message is Extended Frame Format (EFF) or Standard Frame Format (SFF). The message is EFF when FF bit is 1, and SFF when FF bit is 0.
2. RTR: The Remote Transmission Request (RTR) bit specifies whether the message is a data frame or a remote frame. The message is a remote frame when the RTR bit is 1, and a data frame when the RTR bit is 0.

3. X: Don't care, can be any value.
4. DLC: The Data Length Code (DLC) field specifies the number of data bytes for a data frame, or the number of data bytes to request in a remote frame. TWAI data frames are limited to a maximum payload of 8 data bytes, and thus the DLC should range anywhere from 0 to 8.

31.4.4.3 Frame Identifier

The Frame Identifier fields is two-byte (11-bit) long if the message is SFF, and four-byte (29-bit) long if the message is EFF.

The Frame Identifier fields for an SFF (11-bit) message is shown in Table 31-10 ~ 31-11.

Table 31-10. TX/RX Identifier 1 (SFF); TWAI Address 0x44

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.10	ID.9	ID.8	ID.7	ID.6	ID.5	ID.4	ID.3

Table 31-11. TX/RX Identifier 2 (SFF); TWAI Address 0x48

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.2	ID.1	ID.0	X[1]	X[2]	X[2]	X[2]	X[2]

Notes:

1. Don't care. Recommended to be compatible with receive buffer (i.e., set to RTR) in case of using the self reception functionality (or together with self-test functionality).
2. Don't care. Recommended to be compatible with receive buffer (i.e., set to 0) in case of using the self reception functionality (or together with self-test functionality).

The Frame Identifier fields for an EFF (29-bits) message is shown in Table 31-12 ~ 31-15.

Table 31-12. TX/RX Identifier 1 (EFF); TWAI Address 0x44

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.28	ID.27	ID.26	ID.25	ID.24	ID.23	ID.22	ID.21

Table 31-13. TX/RX Identifier 2 (EFF); TWAI Address 0x48

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.20	ID.19	ID.18	ID.17	ID.16	ID.15	ID.14	ID.13

Table 31-14. TX/RX Identifier 3 (EFF); TWAI Address 0x4c

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.12	ID.11	ID.10	ID.9	ID.8	ID.7	ID.6	ID.5

Table 31-15. TX/RX Identifier 4 (EFF); TWAI Address 0x50

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.4	ID.3	ID.2	ID.1	ID.0	X[1]	X[2]	X[2]

Notes:

1. Don't care. Recommended to be compatible with receive buffer (i.e., set to RTR) in case of using the self reception functionality (or together with self-test functionality).
2. Don't care. Recommended to be compatible with receive buffer (i.e., set to 0) in case of using the self reception functionality (or together with self-test functionality).

31.4.4.4 Frame Data

The Frame Data field contains the payloads of transmitted or received data frame, and can range from 0 to eight bytes. The number of valid bytes should be equal to the DLC. However, if the DLC is larger than eight bytes, the number of valid bytes would still be limited to eight. Remote frames do not have data payloads, so their Frame Data fields will be unused.

For example, when transmitting a data frame with five bytes, the CPU should write five to the DLC field, and then write data to the corresponding register of the first to the fifth data field. Likewise, when the CPU receives a data frame with a DLC of five data bytes, only the first to the fifth data byte will contain valid payload data for the CPU to read.

31.4.5 Receive FIFO and Data Overruns

The Receive FIFO is a 64-byte internal buffer used to store received messages in First In First Out order. A single received message can occupy between 3 to 13 bytes of space in the Receive FIFO, and their endianness is identical to the register layout of the Receive Buffer registers. The Receive Buffer registers are mapped to the bytes of the first message in the Receive FIFO.

When the TWAI controller receives a message, it will increment the value of TWAI_RX_MESSAGE_COUNTER up to a maximum of 64. If there is adequate space in the Receive FIFO, the message contents will be written into the Receive FIFO. Once a message has been read from the Receive Buffer, the TWAI_RELEASE_BUF bit should be set. This will decrement TWAI_RX_MESSAGE_COUNTER and free the space occupied by the first message in the Receive FIFO. The Receive Buffer will then map to the next message in the Receive FIFO.

A data overrun occurs when the TWAI controller receives a message, but the Receive FIFO lacks the adequate free space to store the received message in its entirety (either due to the message contents being larger than the free space in the Receive FIFO, or the Receive FIFO being completely full).

When a data overrun occurs:

- The free space left in the Receive FIFO is filled with the partial contents of the overrun message. If the Receive FIFO is already full, then none of the overrun message's contents will be stored.
- When data in the Receive FIFO overruns for the first time, a Data Overrun Interrupt will be triggered.
- Each overrun message will still increment the TWAI_RX_MESSAGE_COUNTER up to a maximum of 64.
- The Receive FIFO will internally mark overrun messages as invalid. The TWAI_MISS_ST bit can be used to determine whether the message currently mapped to by the Receive Buffer is valid or overrun.

To clear an overrun Receive FIFO, the TWAI_RELEASE_BUF must be called repeatedly until

TWAI_RX_MESSAGE_COUNTER is 0. This has the effect of reading all valid messages in the Receive FIFO and clearing all overrun messages.

31.4.6 Acceptance Filter

The Acceptance Filter allows the TWAI controller to filter out received messages based on their ID (and optionally their first data byte and frame type). Only accepted messages are passed on to the Receive FIFO. The use of Acceptance Filters allows a more lightweight operation of the TWAI controller (e.g., less use of Receive FIFO, fewer Receive Interrupts) since the TWAI Controller only need to handle a subset of messages.

The Acceptance Filter configuration registers can only be accessed whilst the TWAI controller is in Reset Mode, since they share the same address spaces with the Transmit Buffer and Receive Buffer registers.

The configuration registers consist of a 32-bit Acceptance Code Value and a 32-bit Acceptance Mask Value. The Acceptance Code value specifies a bit pattern which each filtered bit of the message must match in order for the message to be accepted. The Acceptance Mask Value is able to mask out certain bits of the Code value (i.e., set as “Don’t Care” bits). Each filtered bit of the message must either match the acceptance code or be masked in order for the message to be accepted, as demonstrated in Figure 31-7.

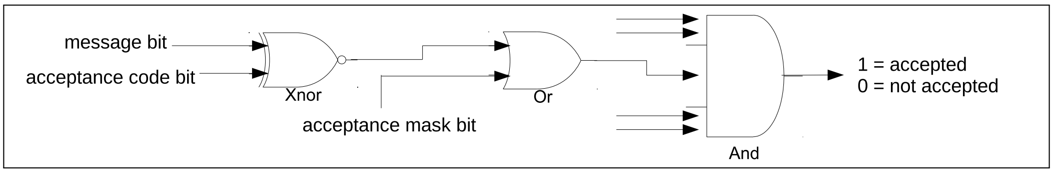

Figure 31-7. Acceptance Filter

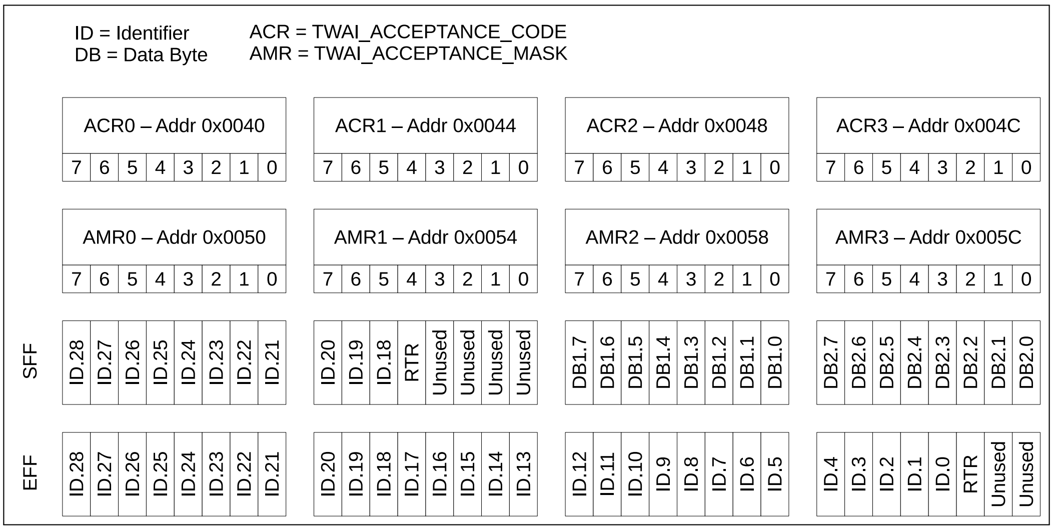
The TWAI controller Acceptance Filter allows the 32-bit Acceptance Code and Mask Values to either define a single filter (i.e., Single Filter Mode), or two filters (i.e., Dual Filter Mode). How the Acceptance Filter interprets the 32-bit code and mask values is dependent on filter mode and the format of received messages (i.e., SFF or EFF).

31.4.6.1 Single Filter Mode

Single Filter Mode is enabled by setting the TWAI_RX_FILTER_MODE bit to 1. This will cause the 32-bit code and mask values to define a single filter. The single filter can filter the following bits of a data or remote frame:

- SFF
  - The entire 11-bit ID
  - RTR bit
  - Data byte 1 and Data byte 2
- EFF
  - The entire 29-bit ID
  - RTR bit

The following Figure 31-8 illustrates how the 32-bit code and mask values will be interpreted under Single Filter Mode.



ID = Identifier
DB = Data Byte

ACR = TWAI_ACCEPTANCE_CODE
AMR = TWAI_ACCEPTANCE_MASK

	ACR0 – Addr 0x0040	ACR1 – Addr 0x0044	ACR2 – Addr 0x0048	ACR3 – Addr 0x004C
	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0
	AMR0 – Addr 0x0050	AMR1 – Addr 0x0054	AMR2 – Addr 0x0058	AMR3 – Addr 0x005C
	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0	7 6 5 4 3 2 1 0
SFF	ID.28 ID.27 ID.26 ID.25 ID.24 ID.23 ID.22 ID.21	ID.20 ID.19 ID.18 RTR Unused Unused Unused Unused	DB1.7 DB1.6 DB1.5 DB1.4 DB1.3 DB1.2 DB1.1 DB1.0	DB2.7 DB2.6 DB2.5 DB2.4 DB2.3 DB2.2 DB2.1 DB2.0
EFF	ID.28 ID.27 ID.26 ID.25 ID.24 ID.23 ID.22 ID.21	ID.20 ID.19 ID.18 ID.17 ID.16 ID.15 ID.14 ID.13	ID.12 ID.11 ID.10 ID.9 ID.8 ID.7 ID.6 ID.5	ID.4 ID.3 ID.2 ID.1 ID.0 RTR Unused Unused

Figure 31-8. Single Filter Mode

31.4.6.2 Dual Filter Mode

Dual Filter Mode is enabled by clearing the TWAI_RX_FILTER_MODE bit to 0. This will cause the 32-bit code and mask values to define a two separate filters referred to as filter 1 or filter 2. Under Dual Filter Mode, a message will be accepted if it is accepted by one of the two filters.

The two filters can filter the following bits of a data or remote frame:

- SFF
  - The entire 11-bit ID
  - RTR bit
  - Data byte 1 (for filter 1 only)
- EFF
  - The first 16 bits of the 29-bit ID

The following Figure 31-9 illustrates how the 32-bit code and mask values will be interpreted in Dual Filter Mode.

31.4.7 Error Management

The TWAI protocol requires that each TWAI node maintains the Transmit Error Counter (TEC) and Receive Error Counter (REC). The value of both error counters determines the current error state of the TWAI controller (i.e., Error Active, Error Passive, Bus-Off). The TWAI controller stores the TEC and REC values in TWAI_TX_ERR_CNT_REG and TWAI_RX_ERR_CNT_REG respectively, and they can be read by the CPU anytime. In addition to the error states, the TWAI controller also offers an Error Warning Limit (EWL) feature that can warn users of the occurrence of severe bus errors before the TWAI controller enters the Error Passive state.

The current error state of the TWAI controller is indicated via a combination of the following values and status bits: TEC, REC, TWAI_ERR_ST, and TWAI_BUS_OFF_ST. Certain changes to these values and bits will also trigger interrupts, thus allowing the users to be notified of error state transitions (see section 31.4.3). The following figure 31-10 shows the relation between the error states, values and bits, and error state related interrupts.

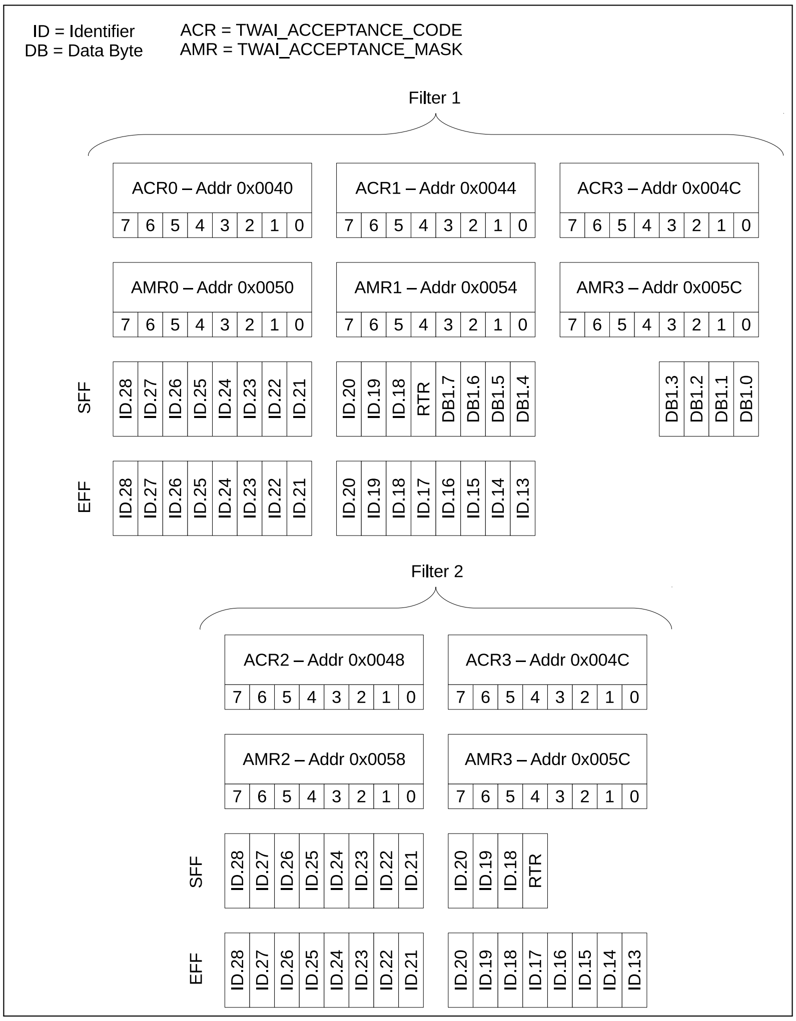


Figure 31-9. Dual Filter Mode

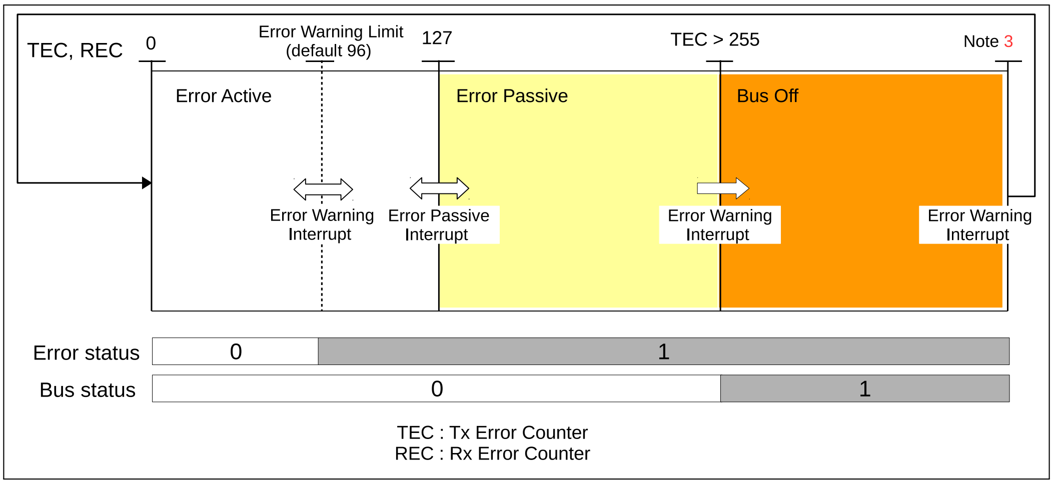

Figure 31-10. Error State Transition

31.4.7.1 Error Warning Limit

The Error Warning Limit (EWL) is a configurable threshold value for the TEC and REC, which will trigger an interrupt when exceeded. The EWL is intended to serve as a warning about severe TWAI bus errors, and is triggered before the TWAI controller enters the Error Passive state. The EWL is configured in

TWAI_ERR_WARNING_LIMIT_REG and can only be configured whilst the TWAI controller is in Reset Mode. The TWAI_ERR_WARNING_LIMIT_REG has a default value of 96. When the values of TEC and/or REC are larger than or equal to the EWL value, the TWAI_ERR_ST bit is immediately set to 1. Likewise, when the values of both the TEC and REC are smaller than the EWL value, the TWAI_ERR_ST bit is immediately reset to 0. The Error Warning Interrupt is triggered whenever the value of the TWAI_ERR_ST bit (or the TWAI_BUS_OFF_ST) changes.

31.4.7.2 Error Passive

The TWAI controller is in the Error Passive state when the TEC or REC value exceeds 127. Likewise, when both the TEC and REC are less than or equal to 127, the TWAI controller enters the Error Active state. The Error Passive Interrupt is triggered whenever the TWAI controller transitions from the Error Active state to the Error Passive state or vice versa.

31.4.7.3 Bus-Off and Bus-Off Recovery

The TWAI controller enters the Bus-Off state when the TEC value exceeds 255. On entering the Bus-Off state, the TWAI controller will automatically do the following:

- Set REC to 0
- Set TEC to 127
- Set the TWAI_BUS_OFF_ST bit to 1
- Enter Reset Mode

The Error Warning Interrupt is triggered whenever the value of the TWAI_BUS_OFF_ST bit (or the TWAI_ERR_ST bit) changes.

To return to the Error Active state, the TWAI controller must undergo Bus-Off Recovery. Bus-Off Recovery requires the TWAI controller to observe 128 occurrences of 11 consecutive recessive bits on the bus. To initiate Bus-Off Recovery (after entering the Bus-Off state), the TWAI controller should enter Operation Mode by setting the TWAI_RESET_MODE bit to 0. The TEC tracks the progress of Bus-Off Recovery by decrementing the TEC each time when the TWAI controller observes 11 consecutive recessive bits. When Bus-Off Recovery has completed (i.e., TEC has decremented from 127 to 0), the TWAI_BUS_OFF_ST bit will automatically be reset to 0, thus triggering the Error Warning Interrupt.

31.4.8 Error Code Capture

The Error Code Capture (ECC) feature allows the TWAI controller to record the error type and bit position of a TWAI bus error in the form of an error code. Upon detecting a TWAI bus error, the Bus Error Interrupt is triggered and the error code is recorded in TWAI_ERR_CODE_CAP_REG. Subsequent bus errors will trigger the Bus Error Interrupt, but their error codes will not be recorded until the current error code is read from the TWAI_ERR_CODE_CAP_REG.

The following Table 31-16 shows the fields of the TWAI_ERR_CODE_CAP_REG:

Table 31-16. Bit Information of TWAI_ERR_CODE_CAP_REG (0x30)

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ERRC.1[1]	ERRC.0[1]	DIR[2]	SEG.4[3]	SEG.3[3]	SEG.2[3]	SEG.1[3]	SEG.0[3]

Notes:

- ERRC: The Error Code (ERRC) indicates the type of bus error: 00 for bit error, 01 for format error, 10 for stuff error, and 11 for other types of error.
- DIR: The Direction (DIR) indicates whether the TWAI controller was transmitting or receiving when the bus error occurred: 0 for transmitter, 1 for receiver.
- SEG: The Error Segment (SEG) indicates which segment of the TWAI message (i.e., bit position) the bus error occurred at.

The following Table 31-17 shows how to interpret the SEG.0 to SEG.4 bits.

Table 31-17. Bit Information of Bits SEG.4 - SEG.0

Bit SEG.4	Bit SEG.3	Bit SEG.2	Bit SEG.1	Bit SEG.0	Description
0	0	0	1	1	start of frame
0	0	0	1	0	ID.28 ~ ID.21
0	0	1	1	0	ID.20 ~ ID.18
0	0	1	0	0	bit SRTR
0	0	1	0	1	bit IDE
0	0	1	1	1	ID.17 ~ ID.13
0	1	1	1	1	ID.12 ~ ID.5
0	1	1	1	0	ID.4 ~ ID.0
0	1	1	0	0	bit RTR
0	1	1	0	1	reserved bit 1
0	1	0	0	1	reserved bit 0
0	1	0	1	1	data length code
0	1	0	1	0	data field
0	1	0	0	0	CRC sequence
1	1	0	0	0	CRC delimiter
1	1	0	0	1	ACK slot
1	1	0	1	1	ACK delimiter
1	1	0	1	0	end of frame
1	0	0	1	0	intermission
1	0	0	0	1	active error flag
1	0	1	1	0	passive error flag
1	0	0	1	1	tolerate dominant bits
1	0	1	1	1	error delimiter
1	1	1	0	0	overload flag

Notes:

- Bit SRTR: under Standard Frame Format.
- Bit IDE: Identifier Extension Bit, 0 for Standard Frame Format.

31.4.9 Arbitration Lost Capture

The Arbitration Lost Capture (ALC) feature allows the TWAI controller to record the bit position where it loses arbitration. When the TWAI controller loses arbitration, the bit position is recorded in TWAI_ARB LOST CAP_REG and the Arbitration Lost Interrupt is triggered.

Subsequent losses in arbitration will trigger the Arbitration Lost Interrupt, but will not be recorded in TWAI_ARB LOST CAP_REG until the current Arbitration Lost Capture is read from the TWAI_ERR_CODE_CAP_REG.

Table 31-18 illustrates bits and fields of TWAI_ERR_CODE_CAP_REG whilst Figure 31-11 illustrates the bit positions of a TWAI message.

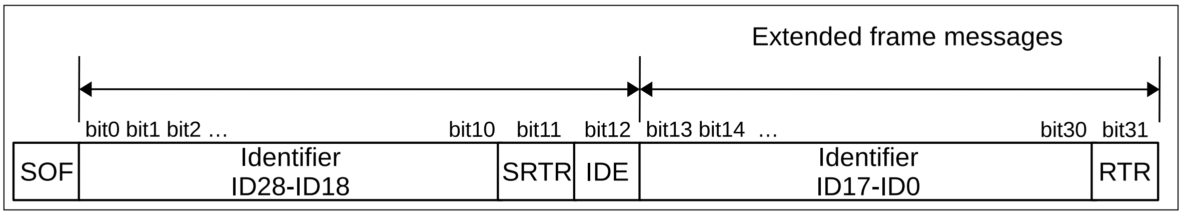

Figure 31-11. Positions of Arbitration Lost Bits

Table 31-18. Bit Information of TWAI_ARB LOST CAP_REG (0x2c)

Bit 31-5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	BITNO.4[1]	BITNO.3[1]	BITNO.2[1]	BITNO.1[1]	BITNO.0[1]

Notes:

- BITNO: Bit Number (BITNO) indicates the nth bit of a TWAI message where arbitration was lost.

31.5 Register Summary

'|' here means separate line to distinguish between TWAI working modes discussed in Section 31.4.1 *Modes*. The left describes the access in Operation Mode. The right belongs to Reset Mode and is marked in red. The addresses in this section are relative to Two-wire Automotive Interface base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
TWAI_MODE_REG	Mode Register	0x0000	R/W
TWAI_BUS_TIMING_0_REG	Bus Timing Register 0	0x0018	RO | R/W
TWAI_BUS_TIMING_1_REG	Bus Timing Register 1	0x001C	RO | R/W
TWAI_ERR_WARNING_LIMIT_REG	Error Warning Limit Register	0x0034	RO | R/W
TWAI_DATA_0_REG	Data Register 0	0x0040	WO | R/W
TWAI_DATA_1_REG	Data Register 1	0x0044	WO | R/W
TWAI_DATA_2_REG	Data Register 2	0x0048	WO | R/W
TWAI_DATA_3_REG	Data Register 3	0x004C	WO | R/W
TWAI_DATA_4_REG	Data Register 4	0x0050	WO | R/W
TWAI_DATA_5_REG	Data Register 5	0x0054	WO | R/W
TWAI_DATA_6_REG	Data Register 6	0x0058	WO | R/W
TWAI_DATA_7_REG	Data Register 7	0x005C	WO | R/W
TWAI_DATA_8_REG	Data Register 8	0x0060	WO | RO
TWAI_DATA_9_REG	Data Register 9	0x0064	WO | RO
TWAI_DATA_10_REG	Data Register 10	0x0068	WO | RO

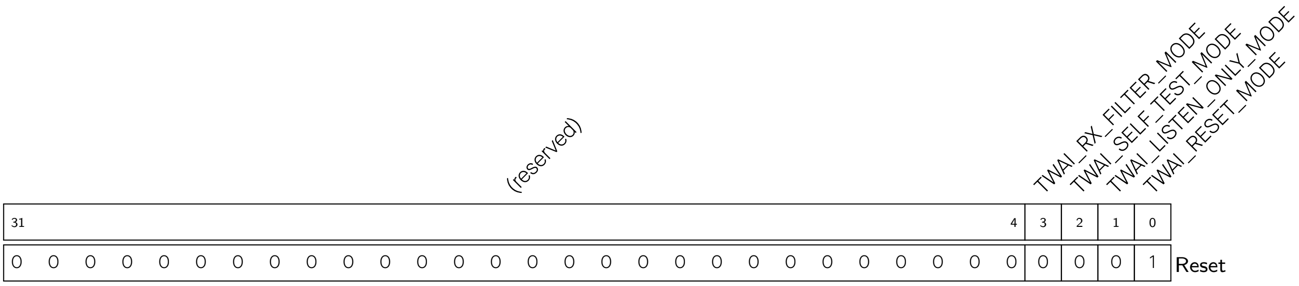
TWAI_INT ENA_REG	Interrupt Enable Register	0x0010	R/W

31.6 Registers

'|' here means separate line. The left describes the access in Operation Mode. The right belongs to Reset Mode with red color. The addresses in this section are relative to Two-wire Automotive Interface base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 31.1. TWAI_MODE_REG (0x0000)



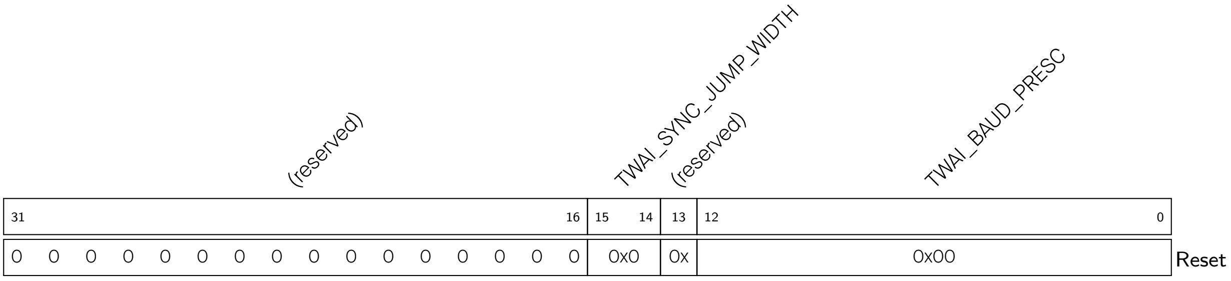
TWAI_RESET_MODE This bit is used to configure the operation mode of the TWAI Controller. 1: Reset mode; 0: Operation mode (R/W)

TWAI_LISTEN_ONLY_MODE 1: Listen only mode. In this mode the nodes will only receive messages from the bus, without generating the acknowledge signal nor updating the RX error counter. (R/W)

TWAI_SELF_TEST_MODE 1: Self test mode. In this mode the TX nodes can perform a successful transmission without receiving the acknowledge signal. This mode is often used to test a single node with the self reception request command. (R/W)

TWAI_RX_FILTER_MODE This bit is used to configure the filter mode. 0: Dual filter mode; 1: Single filter mode (R/W)

Register 31.2. TWAI_BUS_TIMING_0_REG (0x0018)



TWAI_BAUD_PRESC Baud Rate Prescaler value, determines the frequency dividing ratio. (RO | R/W)

TWAI_SYNC_JUMP_WIDTH Synchronization Jump Width (SJW), 1 ~ 14 Tq wide. (RO | R/W)

Register 31.3. TWAI_BUS_TIMING_1_REG (0x001C)

(reserved)	TWAI_TIME_SAMP	TWAI_TIME_SEG2	TWAI_TIME_SEG1	
31 8	7	6 4	3 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0x0	0x0	Reset

TWAI_TIME_SEG1 The width of PBS1. (RO | R/W)

TWAI_TIME_SEG2 The width of PBS2. (RO | R/W)

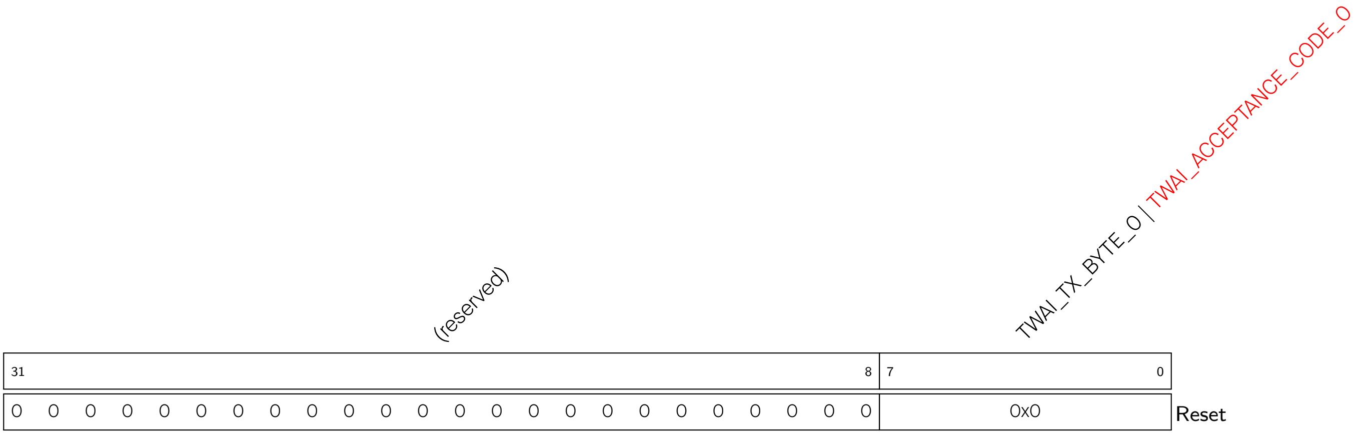
TWAI_TIME_SAMP The number of sample points. 0: the bus is sampled once; 1: the bus is sampled three times (RO | R/W)

Register 31.4. TWAI_ERR_WARNING_LIMIT_REG (0x0034)

(reserved)	TWAI_ERR_WARNING_LIMIT	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x60	Reset

TWAI_ERR_WARNING_LIMIT Error warning threshold. In the case when any of an error counter value exceeds the threshold, or all the error counter values are below the threshold, an error warning interrupt will be triggered (given the enable signal is valid). (RO | R/W)

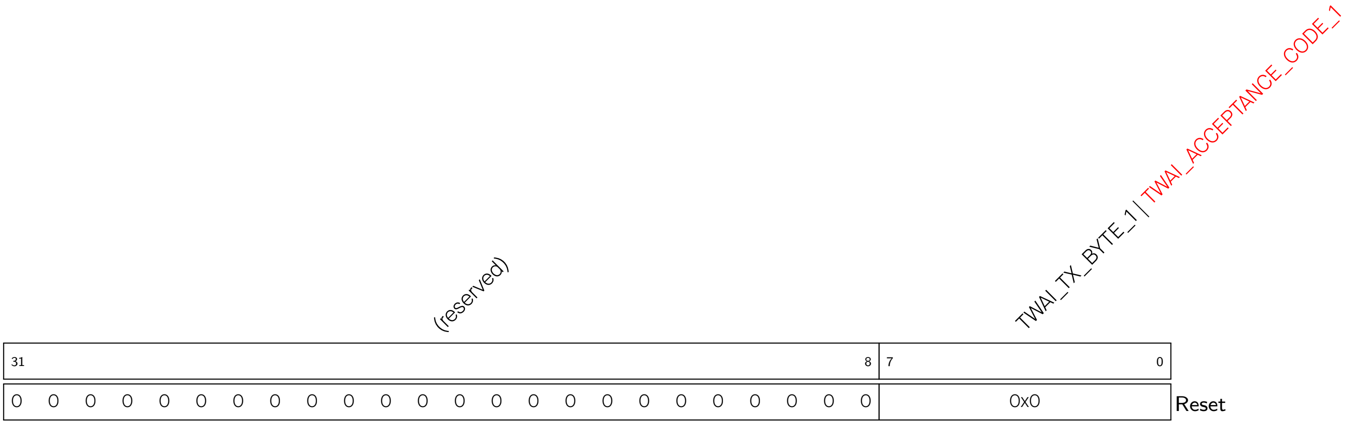
Register 31.5. TWAI_DATA_0_REG (0x0040)



TWAI_TX_BYTE_0 Stored the 0th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_0 Stored the 0th byte of the filter code in reset mode. (R/W)

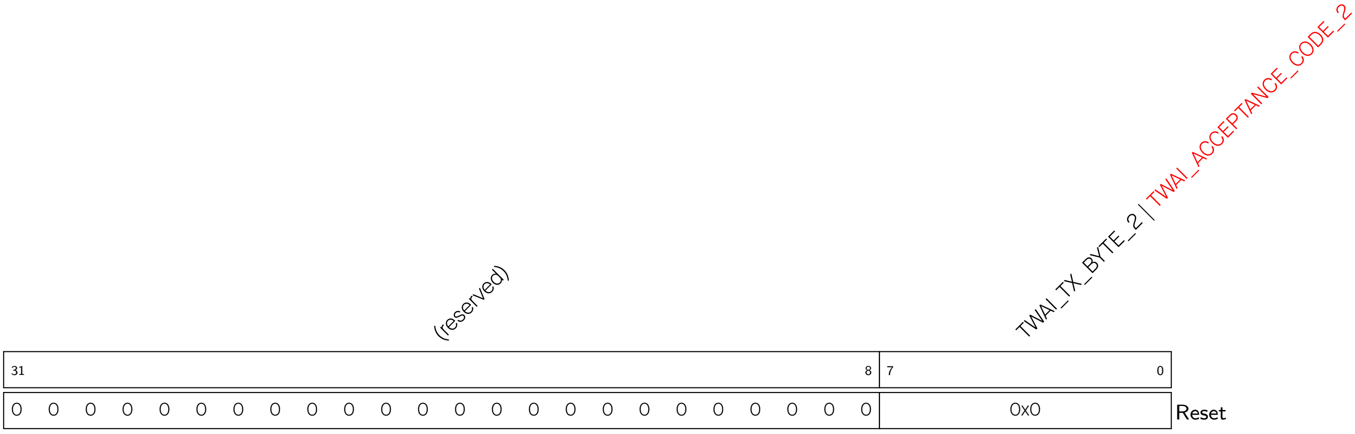
Register 31.6. TWAI_DATA_1_REG (0x0044)



TWAI_TX_BYTE_1 Stored the 1st byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_1 Stored the 1st byte of the filter code in reset mode. (R/W)

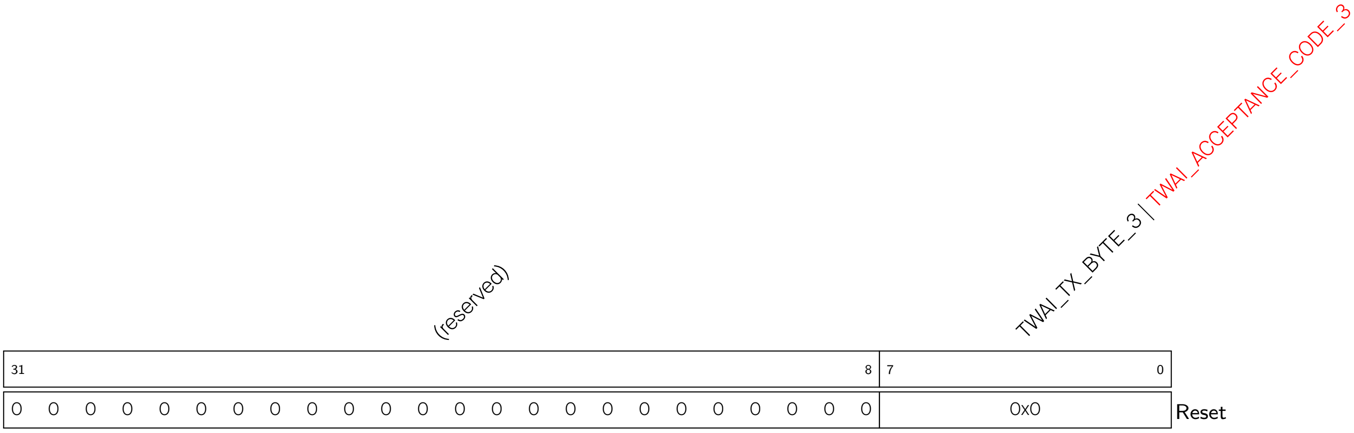
Register 31.7. TWAI_DATA_2_REG (0x0048)



TWAI_TX_BYTE_2 Stored the 2nd byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_2 Stored the 2nd byte of the filter code in reset mode. (R/W)

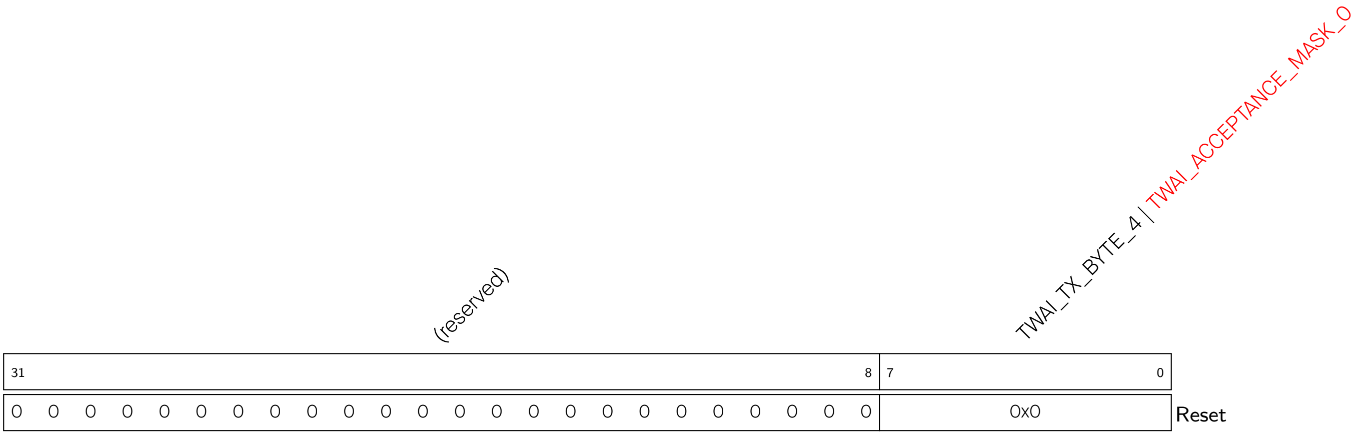
Register 31.8. TWAI_DATA_3_REG (0x004C)



TWAI_TX_BYTE_3 Stored the 3rd byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_3 Stored the 3rd byte of the filter code in reset mode. (R/W)

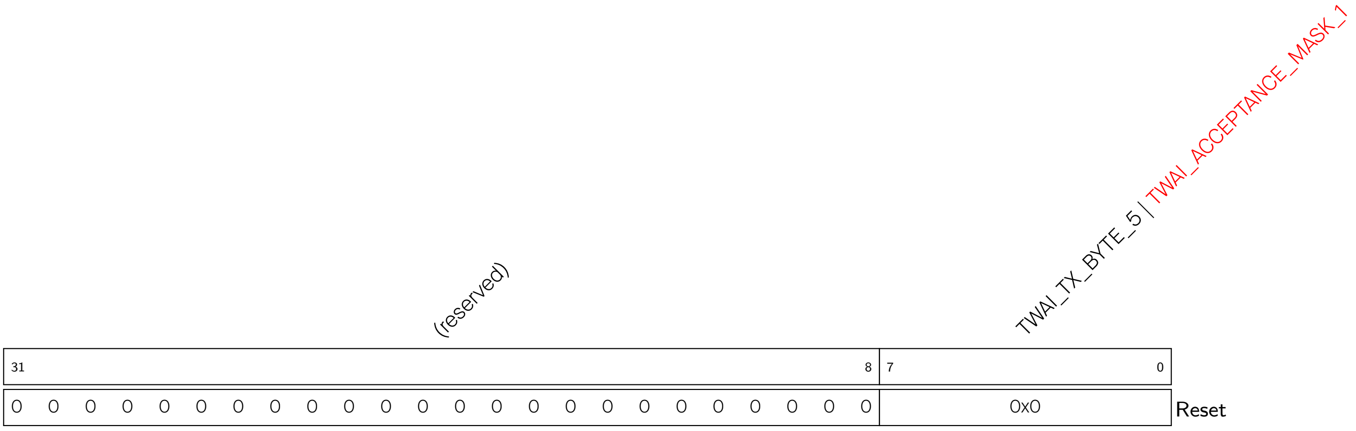
Register 31.9. TWAI_DATA_4_REG (0x0050)



TWAI_TX_BYTE_4 Stored the 4th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_0 Stored the 0th byte of the filter code in reset mode. (R/W)

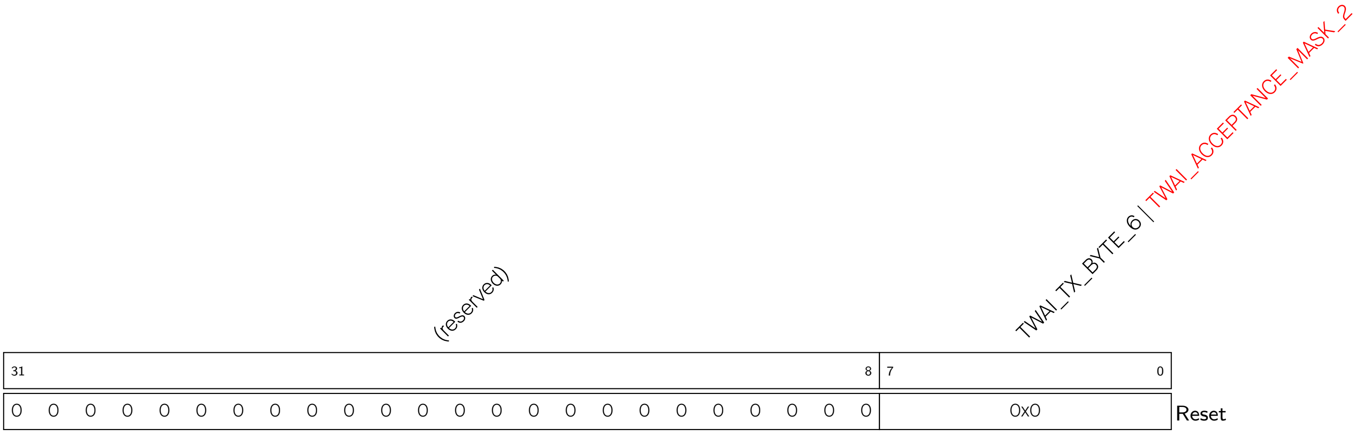
Register 31.10. TWAI_DATA_5_REG (0x0054)



TWAI_TX_BYTE_5 Stored the 5th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_1 Stored the 1st byte of the filter code in reset mode. (R/W)

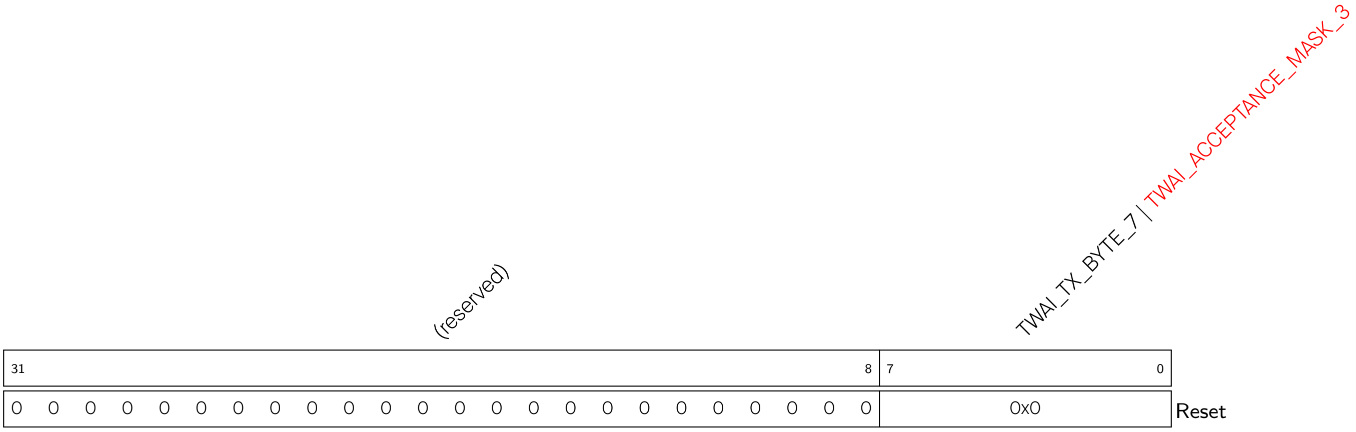
Register 31.11. TWAI_DATA_6_REG (0x0058)



TWAI_TX_BYTE_6 Stored the 6th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_2 Stored the 2nd byte of the filter code in reset mode. (R/W)

Register 31.12. TWAI_DATA_7_REG (0x005C)



TWAI_TX_BYTE_7 Stored the 7th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_3 Stored the 3rd byte of the filter code in reset mode. (R/W)

Register 31.13. TWAI_DATA_8_REG (0x0060)

(reserved)	TWAI_TX_BYTE_8	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

TWAI_TX_BYTE_8 Stored the 8th byte information of the data to be transmitted in operation mode. (WO)

Register 31.14. TWAI_DATA_9_REG (0x0064)

(reserved)	TWAI_TX_BYTE_9	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

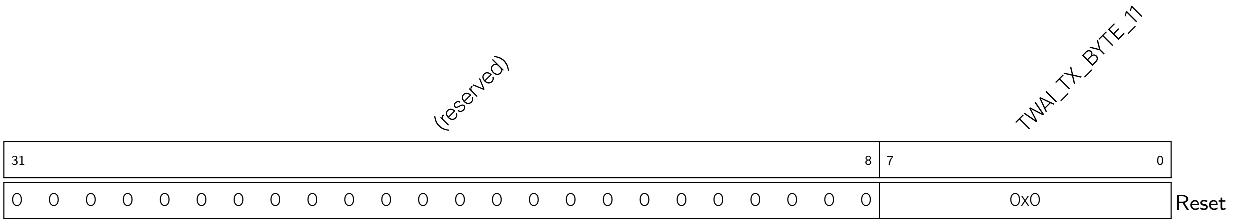
TWAI_TX_BYTE_9 Stored the 9th byte information of the data to be transmitted in operation mode. (WO)

Register 31.15. TWAI_DATA_10_REG (0x0068)

(reserved)	TWAI_TX_BYTE_10	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

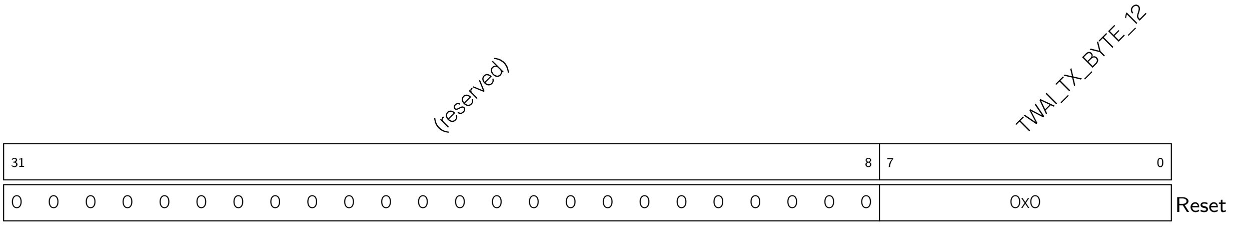
TWAI_TX_BYTE_10 Stored the 10th byte information of the data to be transmitted in operation mode. (WO)

Register 31.16. TWAI_DATA_11_REG (0x006C)



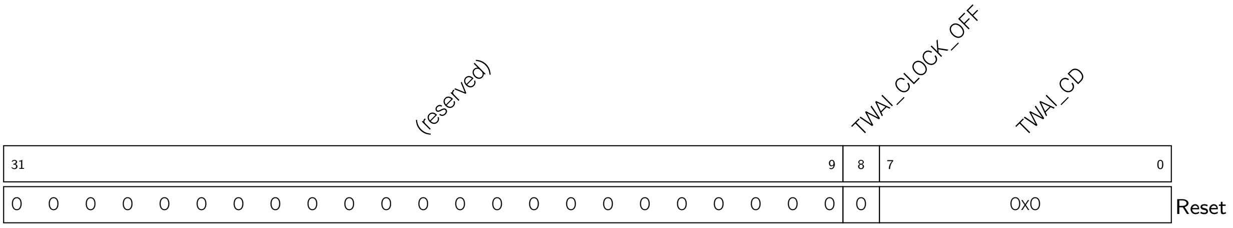
TWAI_TX_BYTE_11 Stored the 11th byte information of the data to be transmitted in operation mode. (WO)

Register 31.17. TWAI_DATA_12_REG (0x0070)



TWAI_TX_BYTE_12 Stored the 12th byte information of the data to be transmitted in operation mode. (WO)

Register 31.18. TWAI_CLOCK_DIVIDER_REG (0x007C)



TWAI_CD These bits are used to configure the divisor of the external CLKOUT pin. (R/W)

TWAI_CLOCK_OFF This bit can be configured in reset mode. 1: Disable the external CLKOUT pin; 0: Enable the external CLKOUT pin (RO | R/W)

Register 31.19. TWAI_CMD_REG (0x0004)

(reserved)	TWAI_SELF_RX_REQ	TWAI_CLR_OVERRUN	TWAI_RELEASE_BUF	TWAI_ABORT_TX	TWAI_TX_REQ	
31 5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	Reset

TWAI_TX_REQ Set the bit to 1 to drive nodes to start transmission. (WO)

TWAI_ABORT_TX Set the bit to 1 to cancel a pending transmission request. (WO)

TWAI_RELEASE_BUF Set the bit to 1 to release the RX buffer. (WO)

TWAI_CLR_OVERRUN Set the bit to 1 to clear the data overrun status bit. (WO)

TWAI_SELF_RX_REQ Self reception request command. Set the bit to 1 to allow a message be transmitted and received simultaneously. (WO)

Register 31.20. TWAI_STATUS_REG (0x0008)

(reserved)	TWAI_MISS_ST	TWAI_BUS_OFF_ST	TWAI_ERR_ST	TWAI_TX_ST	TWAI_RX_ST	TWAI_TX_COMPLETE	TWAI_TX_BUF_ST	TWAI_OVERRUN_ST	TWAI_RX_BUF_ST	
31 9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	1	1	0	0	Reset

TWAI_RX_BUF_ST 1: The data in the RX buffer is not empty, with at least one received data packet. (RO)

TWAI_OVERRUN_ST 1: The RX FIFO is full and data overrun has occurred. (RO)

TWAI_TX_BUF_ST 1: The TX buffer is empty, the CPU may write a message into it. (RO)

TWAI_TX_COMPLETE 1: The TWAI controller has successfully received a packet from the bus. (RO)

TWAI_RX_ST 1: The TWAI Controller is receiving a message from the bus. (RO)

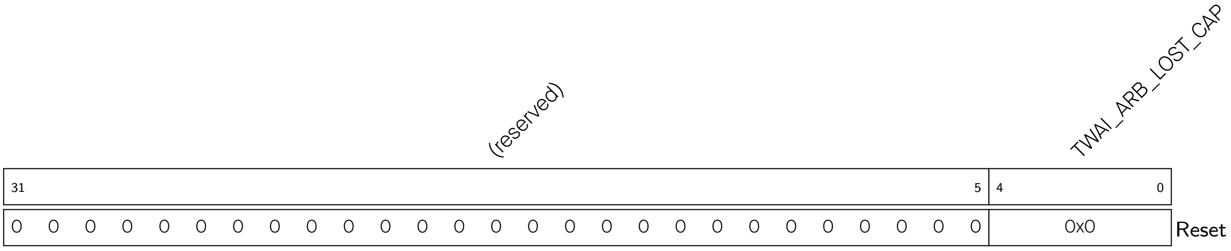
TWAI_TX_ST 1: The TWAI Controller is transmitting a message to the bus. (RO)

TWAI_ERR_ST 1: At least one of the RX/TX error counter has reached or exceeded the value set in register TWAI_ERR_WARNING_LIMIT_REG. (RO)

TWAI_BUS_OFF_ST 1: In bus-off status, the TWAI Controller is no longer involved in bus activities. (RO)

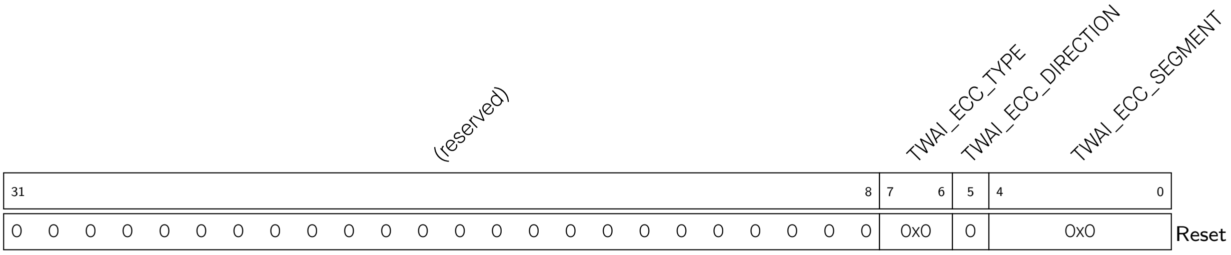
TWAI_MISS_ST This bit reflects whether the data packet in the RX FIFO is complete. 1: The current packet is missing; 0: The current packet is complete (RO)

Register 31.21. TWAI_ARB LOST CAP_REG (0x002C)



TWAI_ARB_LOST_CAP This register contains information about the bit position of lost arbitration. (RO)

Register 31.22. TWAI_ERR_CODE_CAP_REG (0x0030)

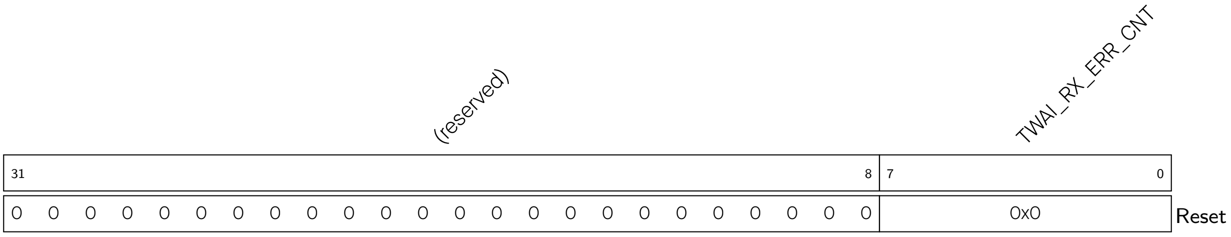


TWAI_ECC_SEGMENT This register contains information about the location of errors, see Table 31-16 for details. (RO)

TWAI_ECC_DIRECTION This register contains information about transmission direction of the node when error occurs. 1: Error occurs when receiving a message; 0: Error occurs when transmitting a message (RO)

TWAI_ECC_TYPE This register contains information about error types: 00: bit error; 01: form error; 10: stuff error; 11: other type of error (RO)

Register 31.23. TWAI_RX_ERR_CNT_REG (0x0038)



TWAI_RX_ERR_CNT The RX error counter register, reflects value changes in reception status. (RO | R/W)

Register 31.24. TWAI_TX_ERR_CNT_REG (0x003C)

(reserved)	TWAI_TX_ERR_CNT	
31 8	7 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

TWAI_TX_ERR_CNT The TX error counter register, reflects value changes in transmission status. (RO | R/W)

Register 31.25. TWAI_RX_MESSAGE_CNT_REG (0x0074)

(reserved)	TWAI_RX_MESSAGE_COUNTER	
31 7	6 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x0	Reset

TWAI_RX_MESSAGE_COUNTER This register reflects the number of messages available within the RX FIFO. (RO)

Register 31.26. TWAI_INT_RAW_REG (0x000C)

(reserved)	TWAI_BUS_STATE_INT_ST	TWAI_BUS_ERR_INT_ST	TWAI_ARB_LOST_INT_ST	TWAI_ERR_PASSIVE_INT_ST	(reserved)	TWAI_OVERRUN_INT_ST	TWAI_ERR_WARN_INT_ST	TWAI_TX_INT_ST	TWAI_RX_INT_ST	
31 9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	Reset

TWAI_RX_INT_ST Receive interrupt. If this bit is set to 1, it indicates there are messages to be handled in the RX FIFO. (RO)

TWAI_TX_INT_ST Transmit interrupt. If this bit is set to 1, it indicates the message transmission is finished and a new transmission is able to start. (RO)

TWAI_ERR_WARN_INT_ST Error warning interrupt. If this bit is set to 1, it indicates the error status signal and the bus-off status signal of Status register have changed (e.g., switched from 0 to 1 or from 1 to 0). (RO)

TWAI_OVERRUN_INT_ST Data overrun interrupt. If this bit is set to 1, it indicates a data overrun interrupt is generated in the RX FIFO. (RO)

TWAI_ERR_PASSIVE_INT_ST Error passive interrupt. If this bit is set to 1, it indicates the TWAI Controller is switched between error active status and error passive status due to the change of error counters. (RO)

TWAI_ARB_LOST_INT_ST Arbitration lost interrupt. If this bit is set to 1, it indicates an arbitration lost interrupt is generated. (RO)

TWAI_BUS_ERR_INT_ST Error interrupt. If this bit is set to 1, it indicates an error is detected on the bus. (RO)

TWAI_BUS_STATE_INT_ST Bus state interrupt. If this bit is set to 1, it indicates the status of TWAI controller has changed. (RO)

Register 31.27. TWAI_INT ENA_REG (0x0010)

(reserved)	TWAI_BUS_STATE_INT_ENA	TWAI_BUS_ERR_INT_ENA	TWAI_ARB_LOST_INT_ENA	TWAI_ERR_PASSIVE_INT_ENA	(reserved)	TWAI_OVERRUN_INT_ENA	TWAI_ERR_WARN_INT_ENA	TWAI_TX_INT_ENA	TWAI_RX_INT_ENA

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	Reset

TWAI_RX_INT_ENA Set this bit to 1 to enable receive interrupt. (R/W)

TWAI_TX_INT_ENA Set this bit to 1 to enable transmit interrupt. (R/W)

TWAI_ERR_WARN_INT_ENA Set this bit to 1 to enable error warning interrupt. (R/W)

TWAI_OVERRUN_INT_ENA Set this bit to 1 to enable data overrun interrupt. (R/W)

TWAI_ERR_PASSIVE_INT_ENA Set this bit to 1 to enable error passive interrupt. (R/W)

TWAI_ARB_LOST_INT_ENA Set this bit to 1 to enable arbitration lost interrupt. (R/W)

TWAI_BUS_ERR_INT_ENA Set this bit to 1 to enable bus error interrupt. (R/W)

TWAI_BUS_STATE_INT_ENA Set this bit to 1 to enable bus state interrupt. (R/W)

32 LED PWM Controller (LEDC)

32.1 Overview

The LED PWM Controller is a peripheral designed to generate PWM signals for LED control. It has specialized features such as automatic duty cycle fading. However, the LED PWM Controller can also be used to generate PWM signals for other purposes.

32.2 Features

The LED PWM Controller has the following features:

- Six independent PWM generators (i.e. six channels)
- Four independent timers that support division by fractions
- Automatic duty cycle fading (i.e. gradual increase/decrease of a PWM's duty cycle without interference from the processor) with interrupt generation on fade completion
- Adjustable phase of PWM signal output
- PWM signal output in low-power mode (Light-sleep mode)
- Maximum PWM resolution: 14 bits

Note that the four timers are identical regarding their features and operation. The following sections refer to the timers collectively as Timer*x* (where *x* ranges from 0 to 3). Likewise, the six PWM generators are also identical in features and operation, and thus are collectively referred to as PWM*n* (where *n* ranges from 0 to 5).

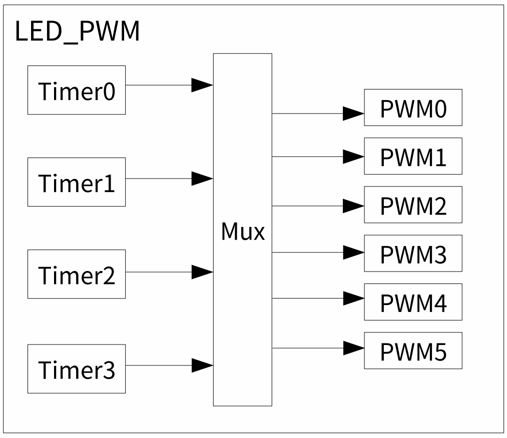

Figure 32-1. LED PWM Architecture

32.3 Functional Description

32.3.1 Architecture

Figure 32-1 shows the architecture of the LED PWM Controller.

The four timers can be independently configured (i.e. configurable clock divider, and counter overflow value) and each internally maintains a timebase counter (i.e. a counter that counts on cycles of a reference clock).

Each PWM generator selects one of the timers and uses the timer's counter value as a reference to generate its PWM signal.

Figure 32-2 illustrates the main functional blocks of the timer and the PWM generator.

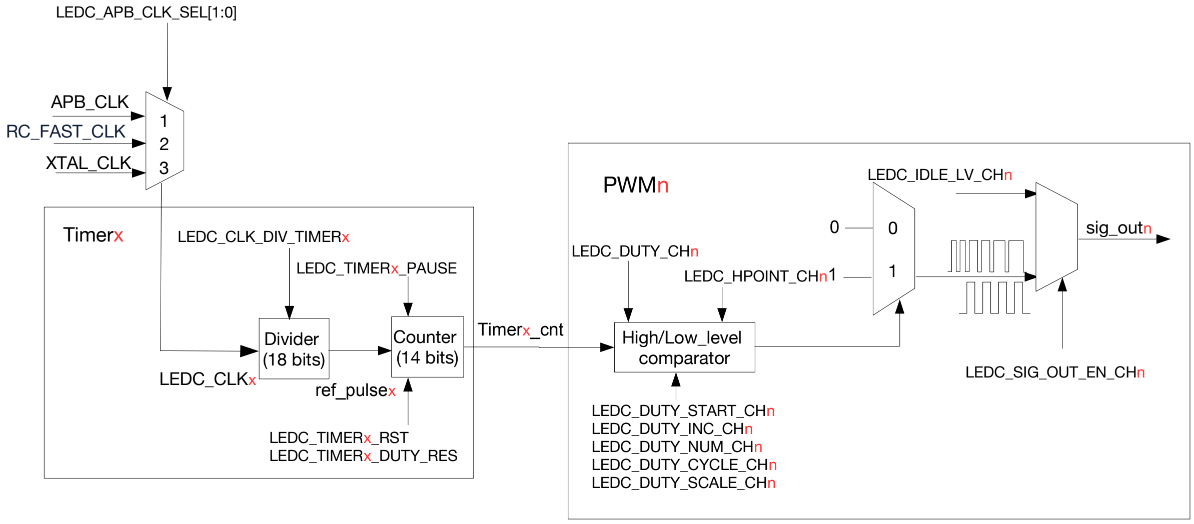

Figure 32-2. LED PWM Generator Diagram

32.3.2 Timers

Each timer in LED PWM Controller internally maintains a timebase counter. Referring to Figure 32-2, this clock signal used by the timebase counter is named ref_pulse*x*. All timers use the same clock source LEDC_CLK*x*, which is then passed through a clock divider to generate ref_pulse*x* for the counter.

32.3.2.1 Clock Source

LED PWM registers configured by software are clocked by APB_CLK. For more information about APB_CLK, see Chapter 6 *Reset and Clock*. To use the LED PWM peripheral, the APB_CLK signal to the LED PWM has to be enabled. The APB_CLK signal to LED PWM can be enabled by setting the SYSTEM_LEDC_CLK_EN field in the register SYSTEM_PERIP_CLK_EN0_REG and be reset via software by setting the SYSTEM_LEDC_RST field in the register SYSTEM_PERIP_RST_EN0_REG. For more information, please refer to Table 16-1 in Chapter 16 *System Registers (SYSREG)*.

Timers in the LED PWM Controller choose their common clock source from one of the following clock signals: APB_CLK, RC_FAST_CLK and XTAL_CLK (see Chapter 6 *Reset and Clock* for more details about each clock signal). The procedure for selecting a clock source signal for LEDC_CLK*x* is described below:

- APB_CLK: Set LEDC_APB_CLK_SEL[1:0] to 1
- RC_FAST_CLK: Set LEDC_APB_CLK_SEL[1:0] to 2
- XTAL_CLK: Set LEDC_APB_CLK_SEL[1:0] to 3

The LEDC_CLK*x* signal will then be passed through the clock divider.

32.3.2.2 Clock Divider Configuration

The LEDC_CLK*x* signal is passed through a clock divider to generate the ref_pulse*x* signal for the counter. The frequency of ref_pulse*x* is equal to the frequency of LEDC_CLK*x* divided by the divisor LEDC_CLK_DIV (see Figure 32-2).

The divisor LEDC_CLK_DIV is a fractional value. Thus, it can be a non-integer. LEDC_CLK_DIV is configured according to the following equation.

$$LEDC\_CLK\_DIV = A + \frac{B}{256}$$

- *A* corresponds to the most significant 10 bits of LEDC_CLK_DIV_TIMER*x* (i.e. LEDC_TIMER*x*_CONF_REG[21:12])
- The fractional part *B* corresponds to the least significant 8 bits of LEDC_CLK_DIV_TIMER*x* (i.e. LEDC_TIMER*x*_CONF_REG[11:4])

When the fractional part *B* is zero, LEDC_CLK_DIV is equivalent to an integer divisor (i.e. an integer prescaler). In other words, a ref_pulse*x* clock pulse is generated after every *A* number of LEDC_CLK*x* clock pulses.

However, when *B* is nonzero, LEDC_CLK_DIV becomes a non-integer divisor. The clock divider implements non-integer frequency division by alternating between *A* and (*A*+1) LEDC_CLK*x* clock pulses per ref_pulse*x* clock pulse. This will result in the average frequency of ref_pulse*x* clock pulse being the desired frequency (i.e. the non-integer divided frequency). For every 256 ref_pulse*x* clock pulses:

- A number of *B* ref_pulse*x* clock pulses will consist of (*A*+1) LEDC_CLK*x* clock pulses
- A number of (256-*B*) ref_pulse*x* clock pulses will consist of *A* LEDC_CLK*x* clock pulses
- The ref_pulse*x* clock pulses consisting of (*A*+1) pulses are evenly distributed amongst those consisting of *A* pulses

Figure 32-3 illustrates the relation between LEDC_CLK*x* clock pulses and ref_pulse*x* clock pulses when dividing by a non-integer LEDC_CLK_DIV .

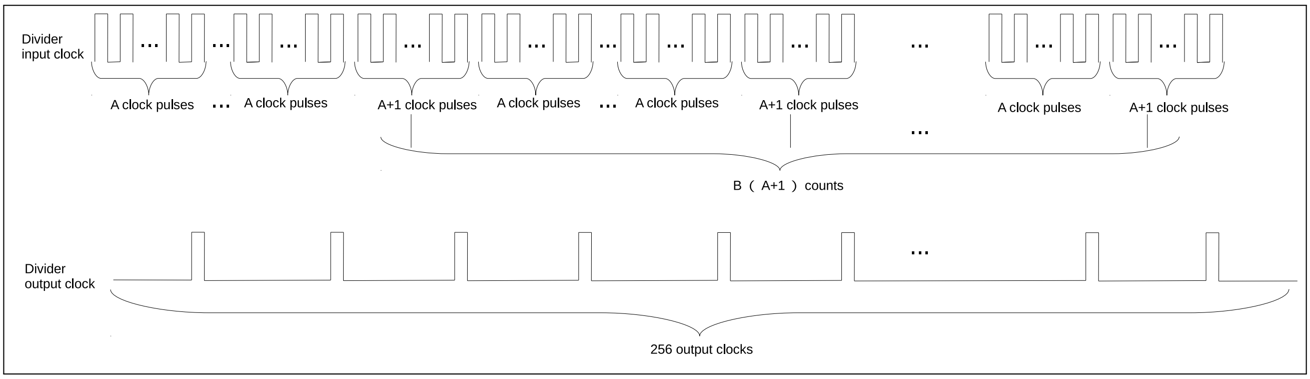

Figure 32-3. Frequency Division When LEDC_CLK_DIV is a Non-Integer Value

To change the timer's clock divisor at runtime, first configure the LEDC_CLK_DIV_TIMER*x* field, and then set the LEDC_TIMER*x*_PARA_UP field to apply the new configuration. This will cause the newly configured values to take effect upon the next overflow of the counter. The LEDC_TIMER*x*_PARA_UP field will be automatically cleared by hardware.

32.3.2.3 14-bit Counter

Each timer contains a 14-bit timebase counter that uses ref_pulsex as its reference clock (see Figure 32-2). The LEDC_TIMERx_DUTY_RES field configures the overflow value of this 14-bit counter. Hence, the maximum resolution of the PWM signal is 14 bits. The counter counts up to $2^{LEDC\_TIMERx\_DUTY\_RES} - 1$, overflows and begins counting from 0 again. The counter's value can be read, reset, and suspended by software.

The counter can trigger LEDC_TIMERx_OVF_INT interrupt (generated automatically by hardware without configuration) every time the counter overflows. It can also be configured to trigger LEDC_OVF_CNT_CHn_INT interrupt after the counter overflows $LEDC\_OVF\_NUM\_CHn + 1$ times. To configure LEDC_OVF_CNT_CHn_INT interrupt, please:

1. Configure LEDC_TIMER_SEL_CHn as the counter for the PWM generator
2. Enable the counter by setting LEDC_OVF_CNT_EN_CHn
3. Set LEDC_OVF_NUM_CHn to the number of counter overflows to generate an interrupt, minus 1
4. Enable the overflow interrupt by setting LEDC_OVF_CNT_CHn_INT_ENA
5. Set LEDC_TIMERx_DUTY_RES to enable the timer and wait for a LEDC_OVF_CNT_CHn_INT interrupt

Referring to Figure 32-2, the frequency of a PWM generator output signal (sig_outn) is dependent on the frequency of the timer's clock source LEDC_CLKx, the clock divisor LEDC_CLK_DIV, and the duty resolution (counter width) LEDC_TIMERx_DUTY_RES:

$$f_{\text{PWM}} = \frac{f_{\text{LEDC\_CLK}x}}{\text{LEDC\_CLK\_DIV} \cdot 2^{\text{LEDC\_TIMER}x\text{\_DUTY\_RES}}}$$

Based on the formula above, the desired duty resolution can be calculated as follows:

$$\text{LEDC\_TIMER}x\text{\_DUTY\_RES} = \log_2\left(\frac{f_{\text{LEDC\_CLK}x}}{f_{\text{PWM}} \cdot \text{LEDC\_CLK\_DIV}}\right)$$

Table 32-1 lists the commonly-used frequencies and their corresponding resolutions.

Table 32-1. Commonly-used Frequencies and Resolutions

LEDC_CLKx	PWM Frequency	Highest Resolution (bit) [1]	Lowest Resolution (bit) [2]
APB_CLK (80 MHz)	1 kHz	14	6
APB_CLK (80 MHz)	5 kHz	13	3
APB_CLK (80 MHz)	10 kHz	12	2
XTAL_CLK (40 MHz)	1 kHz	14	5
XTAL_CLK (40 MHz)	4 kHz	13	3
RC_FAST_CLK (17.5 MHz)	1 kHz	14	4
RC_FAST_CLK (17.5 MHz)	1.75 kHz	13	3

[1] The highest resolution is calculated when the clock divisor LEDC_CLK_DIV is 1. If the highest resolution calculated by the formula is higher than the counter's width 14 bits, then the highest resolution should be 14 bits.

[2] The lowest resolution is calculated when the clock divisor LEDC_CLK_DIV is $1023 + \frac{255}{256}$. If the lowest resolution calculated by the formula is lower than 0, then the lowest resolution should be 1.

To change the overflow value at runtime, first set the LEDC_TIMERx_DUTY_RES field, and then set the LEDC_TIMERx_PARA_UP field. This will cause the newly configured values to take effect upon the next overflow of the counter. If LEDC_OVF_CNT_EN_CHn field is reconfigured, LEDC_PARA_UP_CHn should be set to apply the new configuration. In summary, these configuration values need to be updated by setting LEDC_TIMERx_PARA_UP or LEDC_PARA_UP_CHn. LEDC_TIMERx_PARA_UP and LEDC_PARA_UP_CHn will be automatically cleared by hardware.

32.3.3 PWM Generators

To generate a PWM signal, a PWM generator (PWMn) selects a timer (Timerx). Each PWM generator can be configured separately by setting LEDC_TIMER_SEL_CHn to use one of four timers to generate the PWM output.

As shown in Figure 32-2, each PWM generator has a comparator and two multiplexers. A PWM generator compares the timer's 14-bit counter value (Timerx_cnt) to two trigger values Hpointn and Lpointn. When the timer's counter value is equal to Hpointn or Lpointn, the PWM signal is high or low, respectively, as described below:

- If Timerx_cnt == Hpointn, sig_outn is 1.
- If Timerx_cnt == Lpointn, sig_outn is 0.

Figure 32-4 illustrates how Hpointn or Lpointn are used to generate a fixed duty cycle PWM output signal.

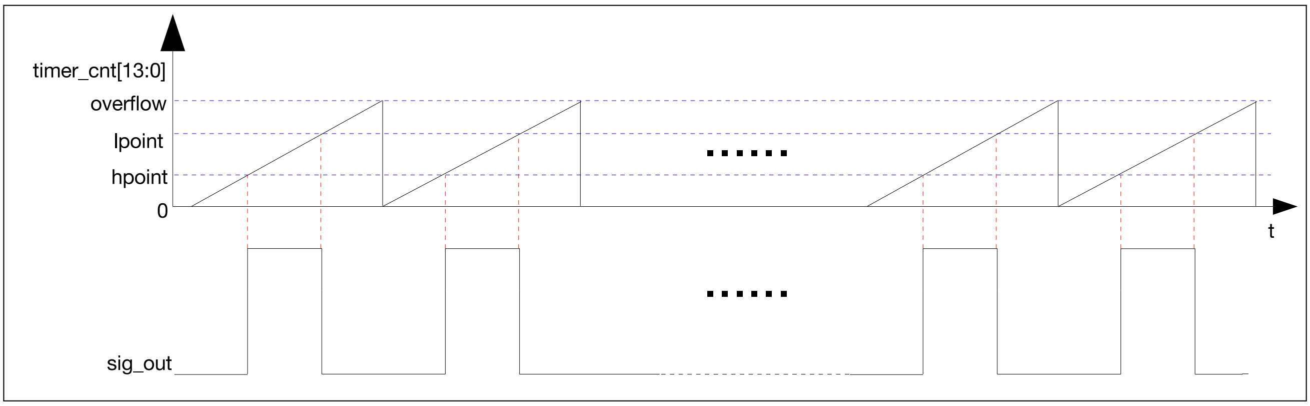

Figure 32-4. LED_PWM Output Signal Diagram

For a particular PWM generator (PWMn), its Hpointn is sampled from the LEDC_HPOINT_CHn field each time the selected timer's counter overflows. Likewise, Lpointn is also sampled on every counter overflow and is calculated from the sum of the LEDC_DUTY_CHn[18:4] and LEDC_HPOINT_CHn fields. By setting Hpointn and Lpointn via the LEDC_HPOINT_CHn and LEDC_DUTY_CHn[18:4] fields, the relative phase and duty cycle of the PWM output can be set.

The PWM output signal (sig_outn) is enabled by setting LEDC_SIG_OUT_EN_CHn. When LEDC_SIG_OUT_EN_CHn is cleared, PWM signal output is disabled, and the output signal (sig_outn) will output a constant level as specified by LEDC_IDLE_LV_CHn.

The bits LEDC_DUTY_CHn[3:0] are used to dither the duty cycles of the PWM output signal (sig_outn) by periodically altering the duty cycle of sig_outn. When LEDC_DUTY_CHn[3:0] is set to a non-zero value, then for every 16 cycles of sig_outn, LEDC_DUTY_CHn[3:0] of those cycles will have PWM pulses that are one timer tick longer than the other (16- LEDC_DUTY_CH*n*[3:0]) cycles. For instance, if LEDC_DUTY_CH*n*[18:4] is set to 10 and LEDC_DUTY_CH*n*[3:0] is set to 5, then 5 of 16 cycles will have a PWM pulse with a duty value of 11 and the rest of the 16 cycles will have a PWM pulse with a duty value of 10. The average duty cycle after 16 cycles is 10.3125.

If fields LEDC_TIMER_SEL_CH*n*, LEDC_HPOINT_CH*n*, LEDC_DUTY_CH*n*[18:4] and LEDC_SIG_OUT_EN_CH*n* are reconfigured, LEDC_PARA_UP_CH*n* must be set to apply the new configuration. This will cause the newly configured values to take effect upon the next overflow of the counter. LEDC_PARA_UP_CH*n* field will be automatically cleared by hardware.

32.3.4 Duty Cycle Fading

The PWM generators can fade the duty cycle of a PWM output signal (i.e. gradually change the duty cycle from one value to another). If Duty Cycle Fading is enabled, the value of Lpoint*n* will be incremented/decremented after a fixed number of counter overflows has occurred. Figure 32-5 illustrates Duty Cycle Fading.

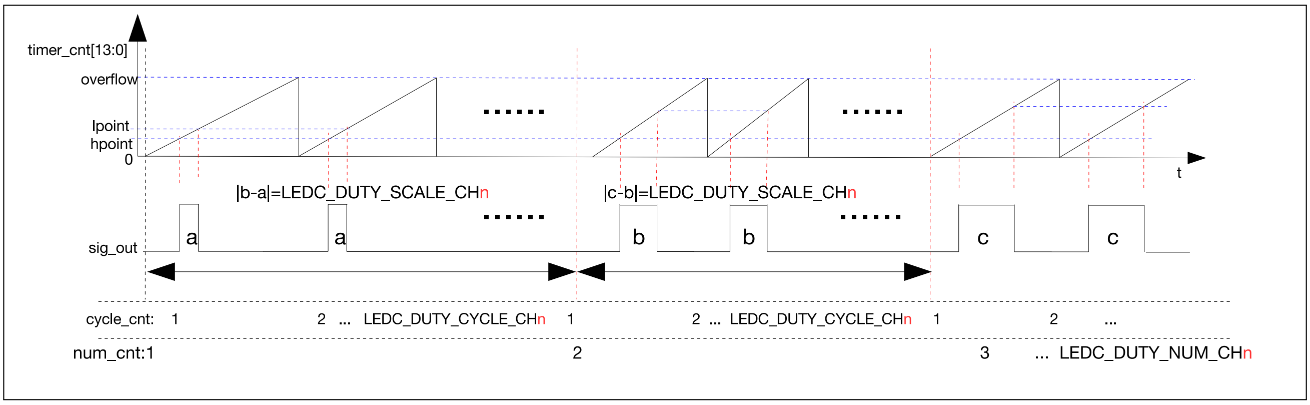

Figure 32-5. Output Signal Diagram of Fading Duty Cycle

Duty Cycle Fading is configured using the following register fields:

- LEDC_DUTY_CH*n* is used to set the initial value of Lpoint*n*.
- LEDC_DUTY_START_CH*n* will enable/disable duty cycle fading when set/cleared.
- LEDC_DUTY_CYCLE_CH*n* sets the number of counter overflow cycles for every Lpoint*n* increment/decrement. In other words, Lpoint*n* will be incremented/decremented after LEDC_DUTY_CYCLE_CH*n* counter overflows.
- LEDC_DUTY_INC_CH*n* configures whether Lpoint*n* is incremented/decremented if set/cleared.
- LEDC_DUTY_SCALE_CH*n* sets the amount that Lpoint*n* is incremented/decremented.
- LEDC_DUTY_NUM_CH*n* sets the maximum number of increments/decrements before duty cycle fading stops.

If the fields LEDC_DUTY_CH*n*, LEDC_DUTY_START_CH*n*, LEDC_DUTY_CYCLE_CH*n*, LEDC_DUTY_INC_CH*n*, LEDC_DUTY_SCALE_CH*n*, and LEDC_DUTY_NUM_CH*n* are reconfigured, LEDC_PARA_UP_CH*n* must be set to apply the new configuration. After this field is set, the values for duty cycle fading will take effect at once. LEDC_PARA_UP_CH*n* field will be automatically cleared by hardware.

32.3.5 Interrupts

- LEDC_OVF_CNT_CH*n*_INT: Triggered when the timer counter overflows for (LEDC_OVF_NUM_CH*n* + 1) times and the register LEDC_OVF_CNT_EN_CH*n* is set to 1.
- LEDC_DUTY_CHNG_END_CH*n*_INT: Triggered when a fade on an LED PWM generator has finished.
- LEDC_TIMER*x*_OVF_INT: Triggered when an LED PWM timer has reached its maximum counter value.

32.4 Register Summary

The addresses in this section are relative to the LED PWM Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Register			
LEDC_CH0_CONF0_REG	Configuration register 0 for channel 0	0x0000	varies
LEDC_CH0_CONF1_REG	Configuration register 1 for channel 0	0x000C	varies
LEDC_CH1_CONF0_REG	Configuration register 0 for channel 1	0x0014	varies
LEDC_CH1_CONF1_REG	Configuration register 1 for channel 1	0x0020	varies
LEDC_CH2_CONF0_REG	Configuration register 0 for channel 2	0x0028	varies
LEDC_CH2_CONF1_REG	Configuration register 1 for channel 2	0x0034	varies
LEDC_CH3_CONF0_REG	Configuration register 0 for channel 3	0x003C	varies
LEDC_CH3_CONF1_REG	Configuration register 1 for channel 3	0x0048	varies
LEDC_CH4_CONF0_REG	Configuration register 0 for channel 4	0x0050	varies
LEDC_CH4_CONF1_REG	Configuration register 1 for channel 4	0x005C	varies
LEDC_CH5_CONF0_REG	Configuration register 0 for channel 5	0x0064	varies
LEDC_CH5_CONF1_REG	Configuration register 1 for channel 5	0x0070	varies
LEDC_CONF_REG	Global LEDC configuration register	0x00D0	R/W
Hpoint Register			
LEDC_CH0_HPOINT_REG	High point register for channel 0	0x0004	R/W
LEDC_CH1_HPOINT_REG	High point register for channel 1	0x0018	R/W
LEDC_CH2_HPOINT_REG	High point register for channel 2	0x002C	R/W
LEDC_CH3_HPOINT_REG	High point register for channel 3	0x0040	R/W
LEDC_CH4_HPOINT_REG	High point register for channel 4	0x0054	R/W
LEDC_CH5_HPOINT_REG	High point register for channel 5	0x0068	R/W
Duty Cycle Register			
LEDC_CH0_DUTY_REG	Initial duty cycle for channel 0	0x0008	R/W
LEDC_CH0_DUTY_R_REG	Current duty cycle for channel 0	0x0010	RO
LEDC_CH1_DUTY_REG	Initial duty cycle for channel 1	0x001C	R/W
LEDC_CH1_DUTY_R_REG	Current duty cycle for channel 1	0x0024	RO
LEDC_CH2_DUTY_REG	Initial duty cycle for channel 2	0x0030	R/W
LEDC_CH2_DUTY_R_REG	Current duty cycle for channel 2	0x0038	RO
LEDC_CH3_DUTY_REG	Initial duty cycle for channel 3	0x0044	R/W
LEDC_CH3_DUTY_R_REG	Current duty cycle for channel 3	0x004C	RO
LEDC_CH4_DUTY_REG	Initial duty cycle for channel 4	0x0058	R/W
LEDC_CH4_DUTY_R_REG	Current duty cycle for channel 4	0x0060	RO
LEDC_CH5_DUTY_REG	Initial duty cycle for channel 5	0x006C	R/W
LEDC_CH5_DUTY_R_REG	Current duty cycle for channel 5	0x0074	RO
Timer Register			
LEDC_TIMER0_CONF_REG	Timer 0 configuration	0x00A0	varies
LEDC_TIMER0_VALUE_REG	Timer 0 current counter value	0x00A4	RO
LEDC_TIMER1_CONF_REG	Timer 1 configuration	0x00A8	varies

Name	Description	Address	Access
LEDC_TIMER1_VALUE_REG	Timer 1 current counter value	0x00AC	RO
LEDC_TIMER2_CONF_REG	Timer 2 configuration	0x00B0	varies
LEDC_TIMER2_VALUE_REG	Timer 2 current counter value	0x00B4	RO
LEDC_TIMER3_CONF_REG	Timer 3 configuration	0x00B8	varies
LEDC_TIMER3_VALUE_REG	Timer 3 current counter value	0x00BC	RO
Interrupt Register			
LEDC_INT_RAW_REG	Raw interrupt status	0x00C0	R/WTC/SS
LEDC_INT_ST_REG	Masked interrupt status	0x00C4	RO
LEDC_INT_ENA_REG	Interrupt enable bits	0x00C8	R/W
LEDC_INT_CLR_REG	Interrupt clear bits	0x00CC	WT
Version Register			
LEDC_DATE_REG	Version control register	0x00FC	R/W

32.5 Registers

The addresses in this section are relative to LED PWM Controller base address provided in Table 3-3 in Chapter *3 System and Memory*.

Register 32.1. LEDC_CHn_CONF0_REG (n: 0-5) (0x0000+20*n)

(reserved)	LEDC_OVF_CNT_RESET_CHn	LEDC_OVF_CNT_EN_CHn	LEDC_OVF_NUM_CHn	LEDC_PARA_UP_CHn	LEDC_IDLE_LV_CHn	LEDC_SIG_OUT_EN_CHn	LEDC_TIMER_SEL_CHn	
31 17	16	15	14 5	4	3	2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	Reset

LEDC_TIMER_SEL_CHn This field is used to select one of the timers for channel n.

0: select Timer0; 1: select Timer1; 2: select Timer2; 3: select Timer3 (R/W)

LEDC_SIG_OUT_EN_CHn Set this bit to enable signal output on channel n. (R/W)

LEDC_IDLE_LV_CHn This bit is used to control the output value when channel n is inactive (when LEDC_SIG_OUT_EN_CHn is 0). (R/W)

LEDC_PARA_UP_CHn This bit is used to update the listed fields below for channel n, and will be automatically cleared by hardware. (WT)

- LEDC_HPOINT_CHn
- LEDC_DUTY_START_CHn
- LEDC_SIG_OUT_EN_CHn
- LEDC_TIMER_SEL_CHn
- LEDC_DUTY_NUM_CHn
- LEDC_DUTY_CYCLE_CHn
- LEDC_DUTY_SCALE_CHn
- LEDC_DUTY_INC_CHn
- LEDC_OVF_CNT_EN_CHn

LEDC_OVF_NUM_CHn This field is used to configure the maximum times of overflow minus 1.

The LEDC_OVF_CNT_CHn_INT interrupt will be triggered when channel n overflows for (LEDC_OVF_NUM_CHn + 1) times. (R/W)

LEDC_OVF_CNT_EN_CHn This bit is used to count the number of times when the timer selected by channel n overflows. (R/W)

LEDC_OVF_CNT_RESET_CHn Set this bit to reset the timer-overflow counter of channel n. (WT)

Register 32.2. LEDC_CH*n*_CONF1_REG (*n*: 0-5) (0x000C+20**n*)

LEDC_DUTY_START_CH*n*	LEDC_DUTY_INC_CH*n*	LEDC_DUTY_NUM_CH*n*	LEDC_DUTY_CYCLE_CH*n*	LEDC_DUTY_SCALE_CH*n*	
31	30	29 20	19 10	9 0	
0	1	0x0	0x0	0x0	Reset

LEDC_DUTY_SCALE_CH*n* This field configures the step size of the duty cycle change during fading. (R/W)

LEDC_DUTY_CYCLE_CH*n* The duty will change every LEDC_DUTY_CYCLE_CH*n* cycle on channel *n*. (R/W)

LEDC_DUTY_NUM_CH*n* This field controls the number of times the duty cycle will be changed. (R/W)

LEDC_DUTY_INC_CH*n* This bit determines whether the duty cycle of the output signal on channel *n* increases or decreases. 1: Increase; 0: Decrease. (R/W)

LEDC_DUTY_START_CH*n* If this bit is set to 1, other configured fields in LEDC_CH*n*_CONF1_REG will take effect upon the next timer overflow. (R/W/SC)

Register 32.3. LEDC_CONF_REG (0x00D0)

LEDC_CLK_EN	(reserved)	LEDC_APB_CLK_SEL	
31	30 2	1 0	
0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

LEDC_APB_CLK_SEL This field is used to select the common clock source for all the 4 timers.

1: APB_CLK; 2: RC_FAST_CLK; 3: XTAL_CLK. (R/W)

LEDC_CLK_EN This bit is used to control the clock.

1: Force clock on for register. 0: Support clock only when application writes registers. (R/W)

Register 32.4. LEDC_CHn_HPOINT_REG (n: 0-5) (0x0004+20*n)

(reserved)	LEDC_HPOINT_CHn	
31 14	13 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x00	Reset

LEDC_HPOINT_CH*n* The output value changes to high when the selected timer for this channel has reached the value specified by this field. (R/W)

Register 32.5. LEDC_CHn_DUTY_REG (n: 0-5) (0x0008+20*n)

(reserved)	LEDC_DUTY_CHn	
31 19	18 0	
0 0 0 0 0 0 0 0 0 0 0 0 0	0x000	Reset

LEDC_DUTY_CH*n* This field is used to change the output duty by controlling the Lpoint. The output value turns to low when the selected timer for this channel has reached the Lpoint. (R/W)

Register 32.6. LEDC_CHn_DUTY_R_REG (n: 0-5) (0x0010+20*n)

(reserved)	LEDC_DUTY_R_CHn	
31 19	18 0	
0 0 0 0 0 0 0 0 0 0 0 0 0	0x000	Reset

LEDC_DUTY_R_CH*n* This field stores the current duty cycle of the output signal on channel *n*. (RO)

Register 32.7. LEDC_TIMERx_CONF_REG (x: 0-3) (0x00A0+8*x)

(reserved)	LEDC_TIMERx_PARA_UP	(reserved)	LEDC_TIMERx_RST	LEDC_TIMERx_PAUSE	LEDC_CLK_DIV_TIMERx	LEDC_TIMERx_DUTY_RES	
31 26	25	24	23	22	21 4	3 0	
0 0 0 0 0 0	0	0	1	0	0x000	0x0	Reset

LEDC_TIMERx_DUTY_RES This field is used to control the range of the counter in timer x. (R/W)

LEDC_CLK_DIV_TIMERx This field is used to configure the divisor for the divider in timer x. The least significant eight bits represent the fractional part. (R/W)

LEDC_TIMERx_PAUSE This bit is used to suspend the counter in timer x. (R/W)

LEDC_TIMERx_RST This bit is used to reset timer x. The counter will show 0 after reset. (R/W)

LEDC_TIMERx_PARA_UP Set this bit to update LEDC_CLK_DIV_TIMERx and LEDC_TIMERx_DUTY_RES. (WT)

Register 32.8. LEDC_TIMERx_VALUE_REG (x: 0-3) (0x00A4+8*x)

(reserved)	LEDC_TIMERx_CNT	
31 14	13 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

LEDC_TIMERx_CNT This field stores the current counter value of timer x. (RO)

Register 32.9. LEDC_INT_RAW_REG (0x00C0)

(reserved)	LEDC_OVF_CNT_CH5_INT_RAW	LEDC_OVF_CNT_CH4_INT_RAW	LEDC_OVF_CNT_CH3_INT_RAW	LEDC_OVF_CNT_CH2_INT_RAW	LEDC_OVF_CNT_CH1_INT_RAW	LEDC_OVF_CNT_CH0_INT_RAW	LEDC_DUTY_CHNG_END_CH5_INT_RAW	LEDC_DUTY_CHNG_END_CH4_INT_RAW	LEDC_DUTY_CHNG_END_CH3_INT_RAW	LEDC_DUTY_CHNG_END_CH2_INT_RAW	LEDC_DUTY_CHNG_END_CH1_INT_RAW	LEDC_DUTY_CHNG_END_CH0_INT_RAW	LEDC_TIMER3_OVF_INT_RAW	LEDC_TIMER2_OVF_INT_RAW	LEDC_TIMER1_OVF_INT_RAW	LEDC_TIMER0_OVF_INT_RAW

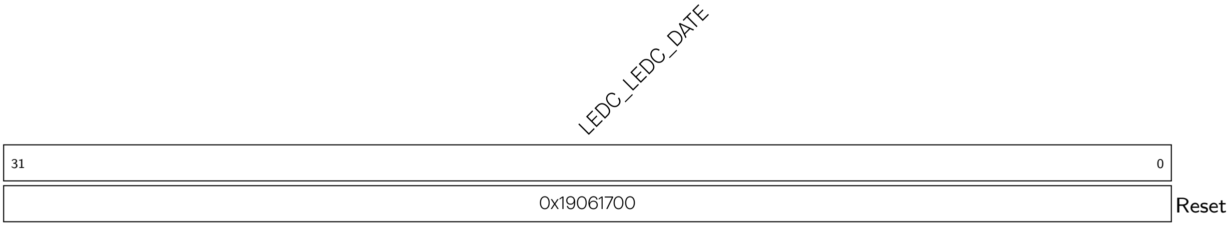
LEDC_TIMER*x*_OVF_INT_CLR Set this bit to clear the LEDC_TIMER*x*_OVF_INT interrupt. (WT)

LEDC_DUTY_CHNG_END_CH*n*_INT_CLR Set this bit to clear the LEDC_DUTY_CHNG_END_CH*n*_INT interrupt. (WT)

LEDC_OVF_CNT_CH*n*_INT_CLR Set this bit to clear the LEDC_OVF_CNT_CH*n*_INT interrupt. (WT)

Register 32.13. LEDC_DATE_REG (0x00FC)



LEDC_LEDC_DATE This is the version control register. (R/W)

33 Remote Control Peripheral (RMT)

33.1 Overview

The RMT (Remote Control) module is designed to send and receive infrared remote control signals. A variety of remote control protocols are supported. The RMT module converts pulse codes stored in the module's built-in RAM into output signals, or converts input signals into pulse codes and stores them back in RAM. Optionally, the RMT module modulates its output signals with a carrier wave, or demodulates and filters its input signals.

The RMT module has four channels, numbered from zero to three. Channels 0 ~ 1 (TX channels) are dedicated to transmit signals, and channels 2 ~ 3 (RX channels) to receive signals. Each TX/RX channel has the same functionality controlled by a dedicated set of registers and is able to independently either transmit or receive data. TX channels are indicated by *n* which is used as a placeholder for the channel number, and by *m* for RX channels.

33.2 Features

- Two TX channels
- Two RX channels
- Support multiple channels (programmable) transmitting data simultaneously
- Four channels share a 192 x 32-bit RAM
- Support modulation on TX pulses
- Support filtering and demodulation on RX pulses
- Wrap TX mode
- Wrap RX mode
- Continuous TX mode

33.3 Functional Description

33.3.1 RMT Architecture

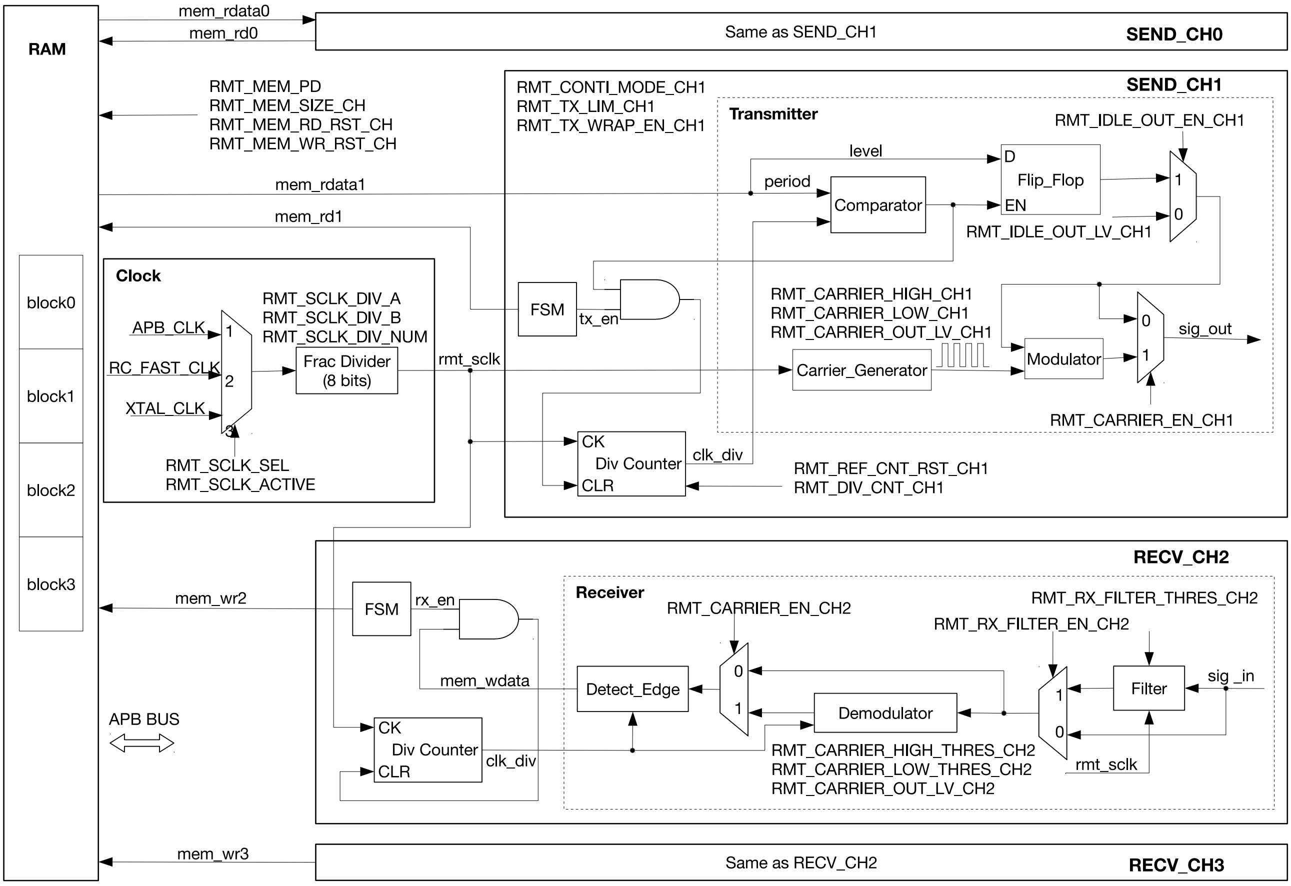


Figure 33-1. RMT Architecture

The RMT module has four independent channels, two of which are TX channels and the other two are RX channels. Each TX channel has its own clock-divider counter, state machine, and transmitter. Each RX channel also has its own clock-divider counter, state machine, and receiver. The four channels share a 192 x 32-bit RAM.

33.3.2 RMT RAM

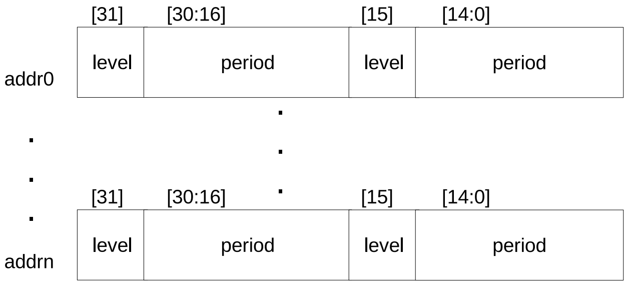

Figure 33-2. Format of Pulse Code in RAM

Figure 33-2 shows the format of pulse code in RAM. Each pulse code contains a 16-bit entry with two fields, level and period.

- Level (0 or 1): indicates a low-/high-level value was received or is going to be sent.
- Period: points out how many clk_div clock cycles the level lasts for, see Figure 33-1.

A zero (0) period is interpreted as a transmission end-marker. If the period is not an end-marker, its value is limited by APB clock and RMT clock:

$$3 \times T_{apb\_clk} + 5 \times T_{\text{rmt\_sclk}} < period \times T_{\text{clk\_div}}(1)$$

The RAM is divided into four 48 x 32-bit blocks. By default, each channel uses one block, block zero for channel zero, block one for channel one, and so on.

If the data size of one single transfer is larger than this block size of TX channel *n* or RX channel *m*, users can configure the channel

- to enable wrap mode by setting RMT_MEM_TX_WRAP_EN_CH*n*/*m*.
- or to use more blocks by configuring RMT_MEM_SIZE_CH*n*/*m*.

Setting RMT_MEM_SIZE_CH*n*/*m* > 1 allows channel *n*/*m* to use the memory of subsequent channels, block (*n*/*m*) ~ block (*n*/*m* + RMT_MEM_SIZE_CH*n*/*m* -1). If so, the subsequent channels *n*/*m* + 1 ~ *n*/*m* + RMT_MEM_SIZE_CH*n*/*m* - 1 can not be used once their RAM blocks are occupied.

Note that the RAM used by each channel is mapped from low address to high address. In such mode, channel 0 is able to use the RAM blocks for channels 1, 2 and 3 by setting RMT_MEM_SIZE_CH0, but channel 3 can not use the blocks for channels 0, 1, or 2. Therefore, the maximum value of RMT_MEM_SIZE_CH*n* should not exceed (4 - *n*) and the maximum value of RMT_MEM_SIZE_CH*m* should not exceed (2 - *m*).

The RMT RAM can be accessed via APB bus, or read by the transmitter and written by the receiver. To avoid any possible access conflict between the receiver and the APB bus, RMT can be configured to designate the RAM block's owner, be it the receiver or the APB bus, by configuring RMT_MEM_OWNER_CH*m*. If this ownership is violated, a flag signal RMT_CH*m*_OWNER_ERR will be generated.

APB bus is able to access RAM in FIFO mode and in Direct Address (NONFIFO) mode, depending on the configuration of RMT_FIFO_MASK:

- 1: use NONFIFO mode;
- 0: use FIFO mode.

When the RMT module is inactive, the RAM can be put into low-power mode by setting RMT_MEM_FORCE_PD.

33.3.3 Clock

The clock source of RMT can be APB_CLK, RC_FAST_CLK or XTAL_CLK, depending on the configuration of RMT_SCLK_SEL. RMT clock can be enabled by setting RMT_SCLK_ACTIVE. RMT working clock (rmt_sclk) is obtained by dividing the selected clock source with a fractional divider, see Figure 33-1. The divider is:

$$RMT\_SCLK\_DIV\_NUM + 1 + RMT\_SCLK\_DIV\_A/RMT\_SCLK\_DIV\_B$$

For more information, please check Chapter 6 *Reset and Clock*.

RMT_DIV_CNT_CH*n*/*m* is used to configure the divider coefficient of internal clock divider for RMT channels. The coefficient is normally equal to the value of RMT_DIV_CNT_CH*n*/*m*, except value 0 that represents coefficient 256. The clock divider can be reset by clearing RMT_REF_CNT_RST_CH*n*/*m*. The clock generated from the divider can be used by the counter (see Figure 33-1).

33.3.4 Transmitter

33.3.4.1 Normal TX Mode

When RMT_TX_START_CH*n* is set, the transmitter of channel *n* starts reading and sending pulse codes from the starting address of its RAM block. The codes are sent starting from low-address entry.

When an end-marker (a zero period) is encountered, the transmitter stops the transmission, returns to idle state and generates an RMT_CH*n*_TX_END_INT interrupt. Setting RMT_TX_STOP_CH*n* to 1 also stops the transmission and immediately sets the transmitter back to idle.

The output level of a transmitter in idle state is determined by the "level" field of the end-marker or by the content of RMT_IDLE_OUT_LV_CH*n*, depending on the configuration of RMT_IDLE_OUT_EN_CH*n*.

To implement the above-mentioned configurations, please set RMT_CONF_UPDATE_CH*n* first. For more information, see Section 33.3.6.

33.3.4.2 Wrap TX Mode

To transmit more pulse codes than can be fitted in the channel's RAM, users can enable wrap TX mode by setting RMT_MEM_TX_WRAP_EN_CH*n*. In this mode, the transmitter sends the data from RAM in loops till an end-marker is encountered.

For example, if RMT_MEM_SIZE_CH*n* = 1, the transmitter starts sending data from the address 48 * *n*, and then the data from higher RAM address. Once the transmitter finishes sending the data from (48 * (*n* + 1) - 1), it continues sending data from 48 * *n* again till an end-marker is encountered. Wrap mode is also applicable for RMT_MEM_SIZE_CH*n* > 1.

When the size of transmitted pulse codes is larger than or equal to the value set by RMT_TX_LIM_CH*n*, an RMT_CH*n*_TX_THR_EVENT_INT interrupt is triggered. In wrap mode, RMT_TX_LIM_CH*n* can be set to a half or a fraction of the size of the channel's RAM block. When an RMT_CH*n*_TX_THR_EVENT_INT interrupt is detected by software, the already used RAM region can be updated with new pulse codes. In this way the transmitter can seamlessly send unlimited pulse codes in wrap mode.

To update the configuration of RMT_MEM_TX_WRAP_EN_CH*n*, RMT_MEM_SIZE_CH*n*, and RMT_TX_LIM_CH*n*, please set RMT_CONF_UPDATE_CH*n* first. For more information, see Section 33.3.6.

33.3.4.3 TX Modulation

Transmitter output can be modulated with a carrier wave by setting RMT_CARRIER_EN_CH*n*. The carrier waveform is configurable.

In a carrier cycle, high level lasts for (RMT_CARRIER_HIGH_CH*n* + 1) rmt_sclk cycles, while low level lasts for (RMT_CARRIER_LOW_CH*n* + 1) rmt_sclk cycles. When RMT_CARRIER_OUT_LV_CH*n* is set, carrier wave is added on the high-level of output signals; while RMT_CARRIER_OUT_LV_CH*n* is cleared, carrier wave is added on the low-level of output signals.

Carrier wave can be added on all output signals during modulation, or just added on valid pulse codes (the data stored in RAM), depending on the configuration of RMT_CARRIER_EFF_EN_CH*n*:

- 0: add carrier wave on all output signals;
- 1: add carrier wave only on valid signals.

To implement the modulation configuration, please set RMT_CONF_UPDATE_CH*n* first. For more information, see Section 33.3.6.

33.3.4.4 Continuous TX Mode

This continuous TX mode can be enabled by setting RMT_TX_CONTI_MODE_CH*n*. In this mode, the transmitter sends the pulse codes from RAM in loops.

- If an end-marker is encountered, the transmitter starts transmitting the first data again.
- If no end-marker is encountered, the transmitter starts transmitting the first data again after the last data is transmitted.

If RMT_TX_LOOP_CNT_EN_CH*n* is set, the loop counting is incremented by 1 each time an end-marker is encountered. If the counting reaches the value set in RMT_TX _LOOP_NUM_CH*n*, an RMT_CH*n*_TX_LOOP_INT is generated.

In an end-marker, if its period[14:0] is 0, then the period of the previous data must satisfy the following requirement:

$$6 \times T_{apb\_clk} + 12 \times T_{rmt\_sclk} < period \times T_{clk\_div} (2)$$

The period of the other data only need to satisfy relation (1).

To implement the above-mentioned configuration, please set RMT_CONF_UPDATE_CH*n* first. For more information, see Section 33.3.6.

33.3.4.5 Simultaneous TX Mode

RMT module supports multiple channels transmitting data simultaneously. To use this function, follow the steps below.

1. Configure RMT_TX_SIM_CH*n* to choose which multiple channels are used to transmit data simultaneously.
2. Set RMT_TX_SIM_EN to enable this transmission mode.
3. Set RMT_TX_START_CH*n* for each selected channel, to start data transmitting.

Once the last channel is configured, these channels start transmitting data simultaneously. Due to hardware limitations, there is no guarantee that two channels can start sending data exactly at the same time. The interval between two channels starting transmitting data is within 3 x T_{clk_div}.

To configure RMT_TX_SIM_EN, please set RMT_CONF_UPDATE_CH*n* first. For more information, see Section 33.3.6.

33.3.5 Receiver

33.3.5.1 Normal RX Mode

The receiver of channel *m* is controlled by RMT_RX_EN_CH*m*:

- RMT_RX_EN_CH*m* = 1, the receiver starts working.
- RMT_RX_EN_CH*m* = 0, the receiver stops receiving data.

When the receiver becomes active, it starts counting from the first edge of the signal, detecting signal levels and counting clock cycles the level lasts for. Each cycle count is then written back to RAM.

When the receiver detects no change in a signal level for a number of clock cycles more than the value set by RMT_IDLE_THRES_CH*m*, the receiver will stop receiving data, return to idle state, and generate an RMT_CH*m*_RX_END_INT interrupt.

Please note that RMT_IDLE_THRES_CH*m* should be configured to a maximum value according to your application, otherwise a valid received level may be mistaken as a level in idle state.

If RAM block of this RX channel is used up by the received data, the receiver will stop receiving data, and generate an RMT_CH*m*_ERR_INT interrupt triggered by RAM FULL event.

To implement configuration above, please set RMT_CONF_UPDATE_CH*m* first. For more information, see Section 33.3.6.

33.3.5.2 Wrap RX Mode

To receive more pulse codes than can be fitted in the channel's RAM, users can enable wrap RX mode for channel *m* by configuring RMT_MEM_RX_WRAP_EN_CH*m*. In wrap mode, the receiver stores the received data to RAM block of this channel in loops.

Receiving ends, when the receiver detects no change in a signal level for a number of clock cycles more than the value set by RMT_IDLE_THRES_CH*m*. The receiver then returns to idle state and generates an RMT_CH*m*_RX_END_INT interrupt.

For example, if RMT_MEM_SIZE_CH*m* is set to 1, the receiver starts receiving data and stores the data to address 48 * *m*, and then to higher RAM address. When the receiver finishes storing the received data to address (48 * (*m* + 1) - 1), the receiver continues receiving data and storing data to the address 48 * *m* again, till no change is detected on a signal level for more than RMT_IDLE_THRES_CH*m* clock cycles. Wrap mode is also applicable for RMT_MEM_SIZE_CH*m* > 1.

An RMT_CH*m*_RX_THR_EVENT_INT is generated when the size of received pulse codes is larger than or equal to the value set by RMT_RX_LIM_CH*m*. In wrap mode, RMT_RX_LIM_CH*M* can be set to a half or a fraction of the size of the channel's RAM block. When an RMT_CH*m*_RX_THR_EVENT_INT interrupt is detected by software, the system will be notified to copy out data stored in already used RMT RAM region, and then the region can be updated by subsequent data. In this way an arbitrary amount of data can be seamlessly received.

To implement the configuration above, please set RMT_CONF_UPDATE_CH*m* first. For more information, see Section 33.3.6.

33.3.5.3 RX Filtering

Users can enable the receiver to filter input signals by setting RMT_RX_FILTER_EN_CH*m* for each channel. The filter samples input signals continuously, and detects the signals which remain unchanged for a continuous RMT_RX_FILTER_THRES_CH*m* rmt_sclk cycles as valid, otherwise, the signals are rejected. Only the valid signals can pass through this filter. The filter removes pulses with a length of less than RMT_RX_FILTER_THRES_CH*n* rmt_sclk cycles.

To implement the configuration above, please set RMT_CONF_UPDATE_CH*m* first. For more information, see Section 33.3.6.

33.3.5.4 RX Demodulation

Users can enable demodulation function on input signals or on filtered output signals by setting RMT_CARRIER_EN_CH*m*. RX demodulation can be applied to high-level carrier wave or low-level carrier wave, depending on the configuration of RMT_CARRIER_OUT_LV_CH*m*:

- 1: demodulate high-level carrier wave
- 0: demodulate low-level carrier wave

Users can configure RMT_CARRIER_HIGH_THRES_CH*m* and RMT_CARRIER_LOW_THRES_CH*m* to set the thresholds to demodulate high-level carrier wave or low-level carrier wave.

If the high-level of a signal lasts for less than RMT_CARRIER_HIGH_THRES_CH*m* clk_div cycles, or the low-level lasts for less than RMT_CARRIER_LOW_THRES_CH*m* clk_div cycles, such level is detected as a carrier wave and then is filtered out.

To implement the configuration above, please set RMT_CONF_UPDATE_CH*m* first. For more information, see Section 33.3.6.

33.3.6 Configuration Update

To update RMT registers configuration, please set RMT_CONF_UPDATE_CH*n*/*m* for each channel first.

All the bits/fields listed in the second column of Table 33-1 should follow this rule.

Table 33-1. Configuration Update

Register	Bit/Field Configuration Update

33.3.7 Interrupts

- RMT_CH*n*/*m*_ERR_INT: triggered when channel *n*/*m* does not read or write data correctly. For example, if the transmitter still tries to read data from RAM when the RAM is empty, or the receiver still tries to write data into RAM when the RAM is full, this interrupt will be triggered.
- RMT_CH*n*_TX_THR_EVENT_INT: triggered when the amount of data the transmitter has sent matches the value of RMT_CH*n*_TX_LIM_REG.
- RMT_CH*m*_RX_THR_EVENT_INT: triggered each time when the amount of data received by the receiver reaches the value set in RMT_CH*m*_RX_LIM_REG.
- RMT_CH*n*_TX_END_INT: Triggered when the transmitter has finished transmitting signals.
- RMT_CH*m*_RX_END_INT: Triggered when the receiver has finished receiving signals.
- RMT_CH*n*_TX_LOOP_INT: Triggered when the loop counting reaches the value set by RMT_TX_LOOP_NUM_CH*n*.

33.4 Register Summary

The addresses in this section are relative to RMT base address provided in Table 3-3 in Chapter 3 *System and Memory* .

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

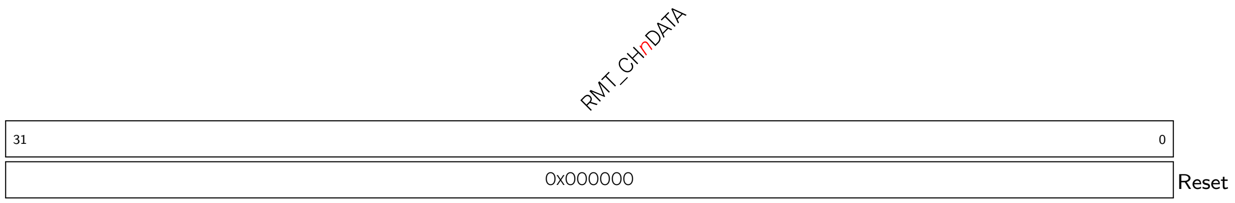
Name	Description	Address	Access
FIFO R/W Registers			
RMT_CH0DATA_REG	The read and write data register for channel 0 by APB FIFO access.	0x0000	RO
RMT_CH1DATA_REG	The read and write data register for channel 1 by APB FIFO access.	0x0004	RO
RMT_CH2DATA_REG	The read and write data register for channel 2 by APB FIFO access.	0x0008	RO
RMT_CH3DATA_REG	The read and write data register for channel 3 by APB FIFO access.	0x000C	RO
Configuration Registers			
RMT_CH0CONF0_REG	Configuration register 0 for channel 0	0x0010	varies
RMT_CH1CONF0_REG	Configuration register 0 for channel 1	0x0014	varies
RMT_CH2CONF0_REG	Configuration register 0 for channel 2	0x0018	R/W
RMT_CH2CONF1_REG	Configuration register 1 for channel 2	0x001C	varies
RMT_CH3CONF0_REG	Configuration register 0 for channel 3	0x0020	R/W
RMT_CH3CONF1_REG	Configuration register 1 for channel 3	0x0024	varies
RMT_SYS_CONF_REG	Configuration register for RMT APB	0x0068	R/W
RMT_REF_CNT_RST_REG	Reset register for RMT clock divider	0x0070	WT
Status Registers			
RMT_CH0STATUS_REG	Channel 0 status register	0x0028	RO
RMT_CH1STATUS_REG	Channel 1 status register	0x002C	RO
RMT_CH2STATUS_REG	Channel 2 status register	0x0030	RO
RMT_CH3STATUS_REG	Channel 3 status register	0x0034	RO
Interrupt Registers			
RMT_INT_RAW_REG	Raw interrupt status	0x0038	R/WTC/SS
RMT_INT_ST_REG	Masked interrupt status	0x003C	RO
RMT_INT_ENA_REG	Interrupt enable bits	0x0040	R/W
RMT_INT_CLR_REG	Interrupt clear bits	0x0044	WT
Carrier Wave Duty Cycle Registers			
RMT_CH0CARRIER_DUTY_REG	Duty cycle configuration register for channel 0	0x0048	R/W
RMT_CH1CARRIER_DUTY_REG	Duty cycle configuration register for channel 1	0x004C	R/W
RMT_CH2_RX_CARRIER_RM_REG	Carrier remove register for channel 2	0x0050	R/W
RMT_CH3_RX_CARRIER_RM_REG	Carrier remove register for channel 3	0x0054	R/W
TX Event Configuration Registers			
RMT_CH0_TX_LIM_REG	Configuration register for channel 0 TX event	0x0058	varies
RMT_CH1_TX_LIM_REG	Configuration register for channel 1 TX event	0x005C	varies
RMT_TX_SIM_REG	RMT TX synchronous register	0x006C	R/W
RX Event Configuration Registers			

Name	Description	Address	Access
RMT_CH2_RX_LIM_REG	Configuration register for channel 2 RX event	0x0060	R/W
RMT_CH3_RX_LIM_REG	Configuration register for channel 3 RX event	0x0064	R/W
Version Register			
RMT_DATE_REG	Version control register	0x00CC	R/W

33.5 Registers

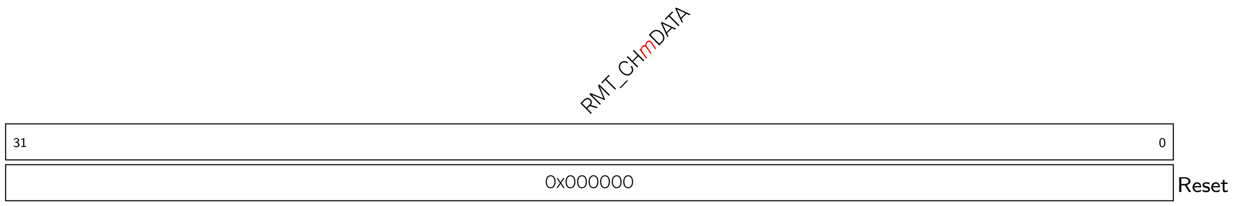
The addresses in this section are relative to RMT base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 33.1. RMT_CH*n*DATA_REG (*n* = 0, 1) (0x0000, 0x0004)



RMT_CH*n*DATA Read and write data for channel *n* via APB FIFO. (RO)

Register 33.2. RMT_CH*m*DATA_REG (*m* = 2, 3) (0x0008, 0x000C)



RMT_CH*m*DATA Read and write data for channel *m* via APB FIFO. (RO)

Register 33.3. RMT_CH*n*CONF0_REG (*n* = 0, 1) (0x0010, 0x0014)

(reserved)	RMT_CONF_UPDATE_CH*n*	(reserved)	RMT_CARRIER_OUT_LV_CH*n*	RMT_CARRIER_EN_CH*n*	RMT_CARRIER_EFF_EN_CH*n*	(reserved)	RMT_MEM_SIZE_CH*n*	RMT_DIV_CNT_CH*n*	RMT_TX_STOP_CH*n*	RMT_IDLE_OUT_EN_CH*n*	RMT_IDLE_OUT_LV_CH*n*	RMT_MEM_TX_WRAP_EN_CH*n*	RMT_TX_CONTI_MODE_CH*n*	RMT_APB_MEM_RST_CH*n*	RMT_MEM_RD_RST_CH*n*	RMT_TX_START_CH*n*	
31 25	24	23	22	21	20	19	18 16	15 8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0	0	0	1	1	1	0	0x1	0x2	0	0	0	0	0	0	0	0	Reset

RMT_TX_START_CH*n* Set this bit to start sending data in channel *n*. (WT)

RMT_MEM_RD_RST_CH*n* Set this bit to reset RAM read address accessed by the transmitter for channel *n*. (WT)

RMT_APB_MEM_RST_CH*n* Set this bit to reset RAM W/R address accessed by APB FIFO for channel *n*. (WT)

RMT_TX_CONTI_MODE_CH*n* Set this bit to enable continuous TX mode for channel *n*. (R/W)

In this mode, the transmitter starts its transmission from the first data, and in the following transmission:

- if an end-marker is encountered, the transmitter starts transmitting data from the first data again;
- if no end-marker is encountered, the transmitter starts transmitting the first data again when the last data is transmitted.

RMT_MEM_TX_WRAP_EN_CH*n* Set this bit to enable wrap TX mode for channel *n*. In this mode, if the TX data size is larger than the channel's RAM block size, the transmitter continues transmitting the first data to the last data in loops. (R/W)

RMT_IDLE_OUT_LV_CH*n* This bit configures the level of output signal for channel *n* when the transmitter is in idle state. (R/W)

RMT_IDLE_OUT_EN_CH*n* This is the output enable-bit for channel *n* in idle state. (R/W)

RMT_TX_STOP_CH*n* Set this bit to stop the transmitter of channel *n* sending data out. (R/W/SC)

Continued on the next page...

Register 33.3. RMT_CH*n*CONF0_REG (*n* = 0, 1) (0x0010, 0x0014)

Continued from the previous page...

RMT_DIV_CNT_CH*n* This field is used to configure the divider for clock of channel *n*. (R/W)

RMT_MEM_SIZE_CH*n* This register is used to configure the maximum number of memory blocks allocated to channel *n*. (R/W)

RMT_CARRIER_EFF_EN_CH*n* 1: Add carrier modulation on the output signal only at data-sending state for channel *n*. 0: Add carrier modulation on the output signal at data-sending state and idle state for channel *n*. Only valid when RMT_CARRIER_EN_CH*n* is 1. (R/W)

RMT_CARRIER_EN_CH*n* This is the carrier modulation enable-bit for channel *n*. 1: Add carrier modulation on the output signal. 0: No carrier modulation is added on output signal. (R/W)

RMT_CARRIER_OUT_LV_CH*n* This bit is used to configure the position of carrier wave for channel *n*. (R/W)

1'h0: add carrier wave on low level.

1'h1: add carrier wave on high level.

RMT_CONF_UPDATE_CH*n* Synchronization bit for channel *n* (WT)

Register 33.4. RMT_CH*m*CONF0_REG (*m* = 2, 3) (0x0018, 0x0020)

(reserved)	RMT_CARRIER_OUT_LV_CH*m*	RMT_CARRIER_EN_CH*m*	(reserved)	RMT_MEM_SIZE_CH*m*	RMT_IDLE_THRES_CH*m*	RMT_DIV_CNT_CH*m*	
31 30	29	28	27 26	25 23	22 8	7 0	
0 0	1	1	0 0	0x1	0x7fff	0x2	Reset

RMT_DIV_CNT_CH*m* This field is used to configure the clock divider of channel *m*. (R/W)

RMT_IDLE_THRES_CH*m* This field is used to configure RX threshold. When no edge is detected on the input signal for continuous clock cycles longer than this field value, the receiver stops receiving data. (R/W)

RMT_MEM_SIZE_CH*m* This field is used to configure the maximum number of memory blocks allocated to channel *m*. (R/W)

RMT_CARRIER_EN_CH*m* This is the carrier modulation enable-bit for channel *m*. 1: Add carrier modulation on output signal. 0: No carrier modulation is added on output signal. (R/W)

RMT_CARRIER_OUT_LV_CH*m* This bit is used to configure the position of carrier wave for channel *m*. (R/W)

1'h0: add carrier wave on low level.

1'h1: add carrier wave on high level.

Register 33.5. RMT_CH*m*CONF1_REG(*m* = 2, 3) (0x001C, 0x0024)

(reserved)	RMT_CONF_UPDATE_CH*m*	(reserved)	RMT_MEM_RX_WRAP_EN_CH*m*	RMT_RX_FILTER_THRES_CH*m*	RMT_RX_FILTER_EN_CH*m*	RMT_MEM_OWNER_CH*m*	RMT_APB_MEM_RST_CH*m*	RMT_MEM_WR_RST_CH*m*	RMT_RX_EN_CH*m*	
31 16	15	14	13	12 5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0xf	0	1	0	0	0	Reset

RMT_RX_EN_CH*m* Set this bit to enable the receiver to start receiving data in channel *m*. (R/W)

RMT_MEM_WR_RST_CH*m* Set this bit to reset RAM write address accessed by the receiver for channel *m*. (WT)

RMT_APB_MEM_RST_CH*m* Set this bit to reset RAM W/R address accessed by APB FIFO for channel *m*. (WT)

RMT_MEM_OWNER_CH*m* This bit marks the ownership of channel *m*'s RAM block. (R/W/SC)

1'h1: Receiver is using the RAM.

1'h0: APB bus is using the RAM.

RMT_RX_FILTER_EN_CH*m* Set this bit to enable the receiver's filter for channel *m*. (R/W)

RMT_RX_FILTER_THRES_CH*m* When receiving data, the receiver ignores the input pulse when its width is shorter than this register value in units of rmt_sclk cycles. (R/W)

RMT_MEM_RX_WRAP_EN_CH*m* Set this bit to enable wrap RX mode for channel *m*. In this mode, if the RX data size is larger than channel *m*'s RAM block size, the receiver stores the RX data from the first address to the last address in loops. (R/W)

RMT_CONF_UPDATE_CH*m* Synchronization bit for channel *m*. (WT)

Register 33.6. RMT_SYS_CONF_REG (0x0068)

RMT_CLK_EN	(reserved)	RMT_SCLK_ACTIVE	RMT_SCLK_SEL	RMT_SCLK_DIV_B	RMT_SCLK_DIV_A	RMT_SCLK_DIV_NUM	RMT_MEM_FORCE_PU	RMT_MEM_FORCE_PD	RMT_MEM_CLK_FORCE_ON	RMT_APB_FIFO_MASK	
31	30 27	26	25 24	23 18	17 12	11 4	3	2	1	0	
0	0 0 0 0	1	0x1	0x0	0x0	0x1	0	0	0	0	Reset

RMT_APB_FIFO_MASK 1'h1: Access memory directly. 1'h0: Access memory by FIFO. (R/W)

RMT_MEM_CLK_FORCE_ON Set this bit to enable the clock for RMT memory. (R/W)

RMT_MEM_FORCE_PD Set this bit to power down RMT memory. (R/W)

RMT_MEM_FORCE_PU 1: Disable the power-down function of RMT memory in Light-sleep. 0: Power down RMT memory when RMT is in Light-sleep mode. (R/W)

RMT_SCLK_DIV_NUM The integral part of the fractional divider. (R/W)

RMT_SCLK_DIV_A The numerator of the fractional part of the fractional divider. (R/W)

RMT_SCLK_DIV_B The denominator of the fractional part of the fractional divider. (R/W)

RMT_SCLK_SEL Choose the clock source of rmt_sclk. 1: APB_CLK; 2: RC_FAST_CLK; 3: XTAL_CLK. (R/W)

RMT_SCLK_ACTIVE rmt_sclk switch. (R/W)

RMT_CLK_EN The enable signal of RMT register clock gate. 1: Power up the drive clock of registers. 0: Power down the drive clock of registers. (R/W)

Register 33.7. RMT_REF_CNT_RST_REG (0x0070)

(reserved)	RMT_REF_CNT_RST_CH3	RMT_REF_CNT_RST_CH2	RMT_REF_CNT_RST_CH1	RMT_REF_CNT_RST_CH0	
31 4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	Reset

RMT_REF_CNT_RST_CH0 This bit is used to reset the clock divider of channel 0. (WT)

RMT_REF_CNT_RST_CH1 This bit is used to reset the clock divider of channel 1. (WT)

RMT_REF_CNT_RST_CH2 This bit is used to reset the clock divider of channel 2. (WT)

RMT_REF_CNT_RST_CH3 This bit is used to reset the clock divider of channel 3. (WT)

Register 33.8. RMT_CHnSTATUS_REG (n = 0, 1) (0x0028, 0x002C)

RMT_APB_MEM_RADDR_CHn	RMT_APB_MEM_WR_ERR_CHn	RMT_MEM_EMPTY_CHn	RMT_APB_MEM_RD_ERR_CHn	RMT_APB_MEM_WADDR_CHn	RMT_STATE_CHn	RMT_MEM_RADDR_EX_CHn	
31 24	23	22	21	20 12	11 9	8 0	
0x0	0	0	0	0	0	0	Reset

RMT_MEM_RADDR_EX_CH*n* This field records the memory address offset when transmitter of channel *n* is using the RAM. (RO)

RMT_STATE_CH*n* This field records the FSM status of channel *n*. (RO)

RMT_APB_MEM_WADDR_CH*n* This field records the memory address offset when writes RAM over APB bus. (RO)

RMT_APB_MEM_RD_ERR_CH*n* This status bit will be set if the offset address is out of memory size (overflows) when reads RAM via APB bus. (RO)

RMT_MEM_EMPTY_CH*n* This status bit will be set when the TX data size is larger than the memory size and the wrap TX mode is disabled. (RO)

RMT_APB_MEM_WR_ERR_CH*n* This status bit will be set if the offset address is out of memory size (overflows) when writes via APB bus. (RO)

RMT_APB_MEM_RADDR_CH*n* This field records the memory address offset when reads RAM over APB bus. (RO)

Register 33.9. RMT_CH*m*STATUS_REG (*m* = 2, 3) (0x0030, 0x0034)

(reserved)	RMT_APB_MEM_RD_ERR_CH*m*	RMT_MEM_FULL_CH*m*	RMT_MEM_OWNER_ERR_CH*m*	RMT_STATE_CH*m*	(reserved)	RMT_APB_MEM_RADDR_CH*m*	(reserved)	RMT_MEM_WADDR_EX_CH*m*	
31 28	27	26	25	24 22	21	20 12	11 9	8 0	
0 0 0 0	0	0	0	0	0	0	0 0 0	0	Reset

RMT_MEM_WADDR_EX_CH*m* This field records the memory address offset when the receiver of channel *m* is using the RAM. (RO)

RMT_APB_MEM_RADDR_CH*m* This field records the memory address offset when reads RAM over APB bus. (RO)

RMT_STATE_CH*m* This field records the FSM status of channel *m*. (RO)

RMT_MEM_OWNER_ERR_CH*m* This status bit will be set when the ownership of memory block is wrong. (RO)

RMT_MEM_FULL_CH*m* This status bit will be set if the receiver receives more data than the memory can fit. (RO)

RMT_APB_MEM_RD_ERR_CH*m* This status bit will be set if the offset address is out of memory size (overflows) when reads RAM via APB bus. (RO)

Register 33.10. RMT_INT_RAW_REG (0x0038)

(reserved)	RMT_CH1_TX_LOOP_INT_RAW	RMT_CH0_TX_LOOP_INT_RAW	RMT_CH3_RX_THR_EVENT_INT_RAW	RMT_CH2_RX_THR_EVENT_INT_RAW	RMT_CH1_TX_THR_EVENT_INT_RAW	RMT_CH0_TX_THR_EVENT_INT_RAW	RMT_CH3_ERR_INT_RAW	RMT_CH2_ERR_INT_RAW	RMT_CH1_ERR_INT_RAW	RMT_CH0_ERR_INT_RAW	RMT_CH3_RX_END_INT_RAW	RMT_CH2_RX_END_INT_RAW	RMT_CH1_TX_END_INT_RAW	RMT_CH0_TX_END_INT_RAW	
31 14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

RMT_CH0_TX_END_INT_RAW The interrupt raw bit of RMT_CH0_TX_END_INT. (R/WTC/SS)

RMT_CH1_TX_END_INT_RAW The interrupt raw bit of RMT_CH1_TX_END_INT. (R/WTC/SS)

RMT_CH2_RX_END_INT_RAW The interrupt raw bit of RMT_CH2_RX_END_INT. (R/WTC/SS)

RMT_CH3_RX_END_INT_RAW The interrupt raw bit of RMT_CH3_RX_END_INT. (R/WTC/SS)

RMT_CH0_ERR_INT_RAW The interrupt raw bit of RMT_CH0_ERR_INT. (R/WTC/SS)

RMT_CH1_ERR_INT_RAW The interrupt raw bit of RMT_CH1_ERR_INT. (R/WTC/SS)

RMT_CH2_ERR_INT_RAW The interrupt raw bit of RMT_CH2_ERR_INT. (R/WTC/SS)

RMT_CH3_ERR_INT_RAW The interrupt raw bit of RMT_CH3_ERR_INT. (R/WTC/SS)

RMT_CH0_TX_THR_EVENT_INT_RAW The interrupt raw bit of RMT_CH0_TX_THR_EVENT_INT. (R/WTC/SS)

RMT_CH1_TX_THR_EVENT_INT_RAW The interrupt raw bit of RMT_CH0_TX_THR_EVENT_INT. (R/WTC/SS)

RMT_CH2_RX_THR_EVENT_INT_RAW The interrupt raw bit of RMT_CH2_RX_THR_EVENT_INT. (R/WTC/SS)

RMT_CH3_RX_THR_EVENT_INT_RAW The interrupt raw bit of RMT_CH3_RX_THR_EVENT_INT. (R/WTC/SS)

RMT_CH0_TX_LOOP_INT_RAW The interrupt raw bit of RMT_CH0_TX_LOOP_INT. (R/WTC/SS)

RMT_CH1_TX_LOOP_INT_RAW The interrupt raw bit of RMT_CH1_TX_LOOP_INT. (R/WTC/SS)

Register 33.11. RMT_INT_ST_REG (0x003C)

(reserved)	RMT_CH1_TX_LOOP_INT_ST	RMT_CH0_TX_LOOP_INT_ST	RMT_CH3_RX_THR_EVENT_INT_ST	RMT_CH2_RX_THR_EVENT_INT_ST	RMT_CH1_TX_THR_EVENT_INT_ST	RMT_CH0_TX_THR_EVENT_INT_ST	RMT_CH3_ERR_INT_ST	RMT_CH2_ERR_INT_ST	RMT_CH1_ERR_INT_ST	RMT_CH0_ERR_INT_ST	RMT_CH3_RX_END_INT_ST	RMT_CH2_RX_END_INT_ST	RMT_CH1_TX_END_INT_ST	RMT_CH0_TX_END_INT_ST	
31 14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

RMT_CH0_TX_END_INT_ST The masked interrupt status bit for RMT_CH0_TX_END_INT. (RO)

RMT_CH1_TX_END_INT_ST The masked interrupt status bit for RMT_CH1_TX_END_INT. (RO)

RMT_CH2_RX_END_INT_ST The masked interrupt status bit for RMT_CH2_RX_END_INT. (RO)

RMT_CH3_RX_END_INT_ST The masked interrupt status bit for RMT_CH3_RX_END_INT. (RO)

RMT_CH0_ERR_INT_ST The masked interrupt status bit for RMT_CH0_ERR_INT. (RO)

RMT_CH1_ERR_INT_ST The masked interrupt status bit for RMT_CH1_ERR_INT. (RO)

RMT_CH2_ERR_INT_ST The masked interrupt status bit for RMT_CH2_ERR_INT. (RO)

RMT_CH3_ERR_INT_ST The masked interrupt status bit for RMT_CH3_ERR_INT. (RO)

RMT_CH0_TX_THR_EVENT_INT_ST The masked interrupt status bit for RMT_CH0_TX_THR_EVENT_INT. (RO)

RMT_CH1_TX_THR_EVENT_INT_ST The masked interrupt status bit for RMT_CH1_TX_THR_EVENT_INT. (RO)

RMT_CH2_RX_THR_EVENT_INT_ST The masked interrupt status bit for RMT_CH2_RX_THR_EVENT_INT. (RO)

RMT_CH3_RX_THR_EVENT_INT_ST The masked interrupt status bit for RMT_CH3_RX_THR_EVENT_INT. (RO)

RMT_CH0_TX_LOOP_INT_ST The masked interrupt status bit for RMT_CH0_TX_LOOP_INT. (RO)

RMT_CH1_TX_LOOP_INT_ST The masked interrupt status bit for RMT_CH1_TX_LOOP_INT. (RO)

Register 33.12. RMT_INT_ENA_REG (0x0040)

(reserved)	RMT_CH1_TX_LOOP_INT_ENA	RMT_CH0_TX_LOOP_INT_ENA	RMT_CH3_RX_THR_EVENT_INT_ENA	RMT_CH2_RX_THR_EVENT_INT_ENA	RMT_CH1_TX_THR_EVENT_INT_ENA	RMT_CH0_TX_THR_EVENT_INT_ENA	RMT_CH3_ERR_INT_ENA	RMT_CH2_ERR_INT_ENA	RMT_CH1_ERR_INT_ENA	RMT_CH0_ERR_INT_ENA	RMT_CH3_RX_END_INT_ENA	RMT_CH2_RX_END_INT_ENA	RMT_CH1_TX_END_INT_ENA	RMT_CH0_TX_END_INT_ENA	
31 14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

RMT_CH0_TX_END_INT_ENA The interrupt enable bit for RMT_CH0_TX_END_INT. (R/W)

RMT_CH1_TX_END_INT_ENA The interrupt enable bit for RMT_CH1_TX_END_INT. (R/W)

RMT_CH2_RX_END_INT_ENA The interrupt enable bit for RMT_CH2_RX_END_INT. (R/W)

RMT_CH3_RX_END_INT_ENA The interrupt enable bit for RMT_CH3_RX_END_INT. (R/W)

RMT_CH0_ERR_INT_ENA The interrupt enable bit for RMT_CH0_ERR_INT. (R/W)

RMT_CH1_ERR_INT_ENA The interrupt enable bit for RMT_CH1_ERR_INT. (R/W)

RMT_CH2_ERR_INT_ENA The interrupt enable bit for RMT_CH2_ERR_INT. (R/W)

RMT_CH3_ERR_INT_ENA The interrupt enable bit for RMT_CH3_ERR_INT. (R/W)

RMT_CH0_TX_THR_EVENT_INT_ENA The interrupt enable bit for RMT_CH0_TX_THR_EVENT_INT. (R/W)

RMT_CH1_TX_THR_EVENT_INT_ENA The interrupt enable bit for RMT_CH1_TX_THR_EVENT_INT. (R/W)

RMT_CH2_RX_THR_EVENT_INT_ENA The interrupt enable bit for RMT_CH2_RX_THR_EVENT_INT. (R/W)

RMT_CH3_RX_THR_EVENT_INT_ENA The interrupt enable bit for RMT_CH3_RX_THR_EVENT_INT. (R/W)

RMT_CH0_TX_LOOP_INT_ENA The interrupt enable bit for RMT_CH0_TX_LOOP_INT. (R/W)

RMT_CH1_TX_LOOP_INT_ENA The interrupt enable bit for RMT_CH1_TX_LOOP_INT. (R/W)

Register 33.13. RMT_INT_CLR_REG (0x0044)

	(reserved)	RMT_CH1_TX_LOOP_INT_CLR	RMT_CH0_TX_LOOP_INT_CLR	RMT_CH3_RX_THR_EVENT_INT_CLR	RMT_CH2_RX_THR_EVENT_INT_CLR	RMT_CH1_TX_THR_EVENT_INT_CLR	RMT_CH0_TX_THR_EVENT_INT_CLR	RMT_CH3_ERR_INT_CLR	RMT_CH2_ERR_INT_CLR	RMT_CH1_ERR_INT_CLR	RMT_CH0_ERR_INT_CLR	RMT_CH3_RX_END_INT_CLR	RMT_CH2_RX_END_INT_CLR	RMT_CH1_TX_END_INT_CLR	RMT_CH0_TX_END_INT_CLR
	31 14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RMT_CH0_TX_END_INT_CLR Set this bit to clear the RMT_CH0_TX_END_INT interrupt. (WT)

RMT_CH1_TX_END_INT_CLR Set this bit to clear the RMT_CH1_TX_END_INT interrupt. (WT)

RMT_CH2_RX_END_INT_CLR Set this bit to clear the RMT_CH2_RX_END_IN interrupt. (WT)

RMT_CH3_RX_END_INT_CLR Set this bit to clear the RMT_CH3_RX_END_IN interrupt. (WT)

RMT_CH0_ERR_INT_CLR Set this bit to clear the RMT_CH0_ERR_INT interrupt. (WT)

RMT_CH1_ERR_INT_CLR Set this bit to clear the RMT_CH1_ERR_INT interrupt. (WT)

RMT_CH2_ERR_INT_CLR Set this bit to clear the RMT_CH2_ERR_INT interrupt. (WT)

RMT_CH3_ERR_INT_CLR Set this bit to clear the RMT_CH3_ERR_INT interrupt. (WT)

RMT_CH0_TX_THR_EVENT_INT_CLR Set this bit to clear the RMT_CH0_TX_THR_EVENT_INT interrupt. (WT)

RMT_CH1_TX_THR_EVENT_INT_CLR Set this bit to clear the RMT_CH1_TX_THR_EVENT_INT interrupt. (WT)

RMT_CH2_RX_THR_EVENT_INT_CLR Set this bit to clear the RMT_CH2_RX_THR_EVENT_INT interrupt. (WT)

RMT_CH3_RX_THR_EVENT_INT_CLR Set this bit to clear the RMT_CH3_RX_THR_EVENT_INT interrupt. (WT)

RMT_CH0_TX_LOOP_INT_CLR Set this bit to clear the RMT_CH0_TX_LOOP_INT interrupt. (WT)

RMT_CH1_TX_LOOP_INT_CLR Set this bit to clear the RMT_CH1_TX_LOOP_INT interrupt. (WT)

Register 33.14. RMT_CH*n*CARRIER_DUTY_REG (*n* = 0, 1) (0x0048, 0x004C)

RMT_CARRIER_HIGH_CH*n*		RMT_CARRIER_LOW_CH*n*		
31	16	15	0	
0x40		0x40		Reset

RMT_CARRIER_LOW_CH*n* This field is used to configure carrier wave's low level clock period for channel *n*. (R/W)

RMT_CARRIER_HIGH_CH*n* This field is used to configure carrier wave's high level clock period for channel *n*. (R/W)

Register 33.15. RMT_CH*m*_RX_CARRIER_RM_REG (*m* = 2, 3) (0x0050, 0x0054)

RMT_CARRIER_HIGH_THRES_CH*m*		RMT_CARRIER_LOW_THRES_CH*m*		
31	16	15	0	
0x00		0x00		Reset

RMT_CARRIER_LOW_THRES_CH*m* The low level period in a carrier modulation mode is (RMT_CARRIER_LOW_THRES_CH*m* + 1) for channel *m*. (R/W)

RMT_CARRIER_HIGH_THRES_CH*m* The high level period in a carrier modulation mode is (RMT_CARRIER_HIGH_THRES_CH*m* + 1) for channel *m*. (R/W)

Register 33.16. RMT_CH*n*_TX_LIM_REG (*n* = 0, 1) (0x0058, 0x005C)

(reserved)	RMT_LOOP_COUNT_RESET_CH*n*	RMT_TX_LOOP_CNT_EN_CH*n*	RMT_TX_LOOP_NUM_CH*n*	RMT_TX_LIM_CH*n*	
31 21	20	19	18 9	8 0	
0 0 0 0 0 0 0 0 0 0 0	0	0	0	0x80	Reset

RMT_TX_LIM_CH*n* This field is used to configure the maximum entries that channel *n* can send out. (R/W)

RMT_TX_LOOP_NUM_CH*n* This field is used to configure the maximum loop count when continuous TX mode is enabled. (R/W)

RMT_TX_LOOP_CNT_EN_CH*n* This bit is the enable bit for loop counting. (R/W)

RMT_LOOP_COUNT_RESET_CH*n* This bit is used to reset the loop count when continuous TX mode is enabled. (WT)

Register 33.17. RMT_TX_SIM_REG (0x006C)

(reserved)	RMT_TX_SIM_EN	RMT_TX_SIM_CH1	RMT_TX_SIM_CH0	
31 3	2	1	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	Reset

RMT_TX_SIM_CH0 Set this bit to enable channel 0 to start sending data synchronously with other enabled channels. (R/W)

RMT_TX_SIM_CH1 Set this bit to enable channel 1 to start sending data synchronously with other enabled channels. (R/W)

RMT_TX_SIM_EN This bit is used to enable multiple of channels to start sending data synchronously. (R/W)

Register 33.18. RMT_CH*m*_RX_LIM_REG (*m* = 2, 3) (0x0060, 0x0064)

(reserved)	RMT_CH*m*_RX_LIM_REG	
31 9	8 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x80	Reset

RMT_RX_LIM_CH*m* This field is used to configure the maximum entries that channel *m* can receive. (R/W)

Register 33.19. RMT_DATE_REG (0x00CC)

(reserved)	RMT_RMT_DATE	
31 28	27 0	
0 0 0 0	0x2006231	Reset

RMT_DATE Version control register. (R/W)

34 On-Chip Sensor and Analog Signal Processing

34.1 Overview

ESP32-C3 provides the following on-chip sensor and analog signal processing peripherals:

- Two 12-bit Successive Approximation ADCs (SAR ADCs): SAR ADC1 and SAR ADC2, for measuring analog signals from six channels.
- One temperature sensor for measuring the internal temperature of the ESP32-C3 chip.

34.2 SAR ADCs

34.2.1 Overview

ESP32-C3 integrates two 12-bit SAR ADCs, which are able to measure analog signals from up to six pins. It is also possible to measure internal signals, such as vdd33. The SAR ADCs are managed by two dedicated controllers:

- DIG ADC controller: drives Digital_Reader0 and Digital_Reader1 to sample channel voltages of SAR ADC1 and SAR ADC2, respectively. This DIG ADC controller supports high-performance multi-channel scanning and DMA continuous conversion.
- PWDET controller: monitors RF power. Note this controller is only for RF internal use.

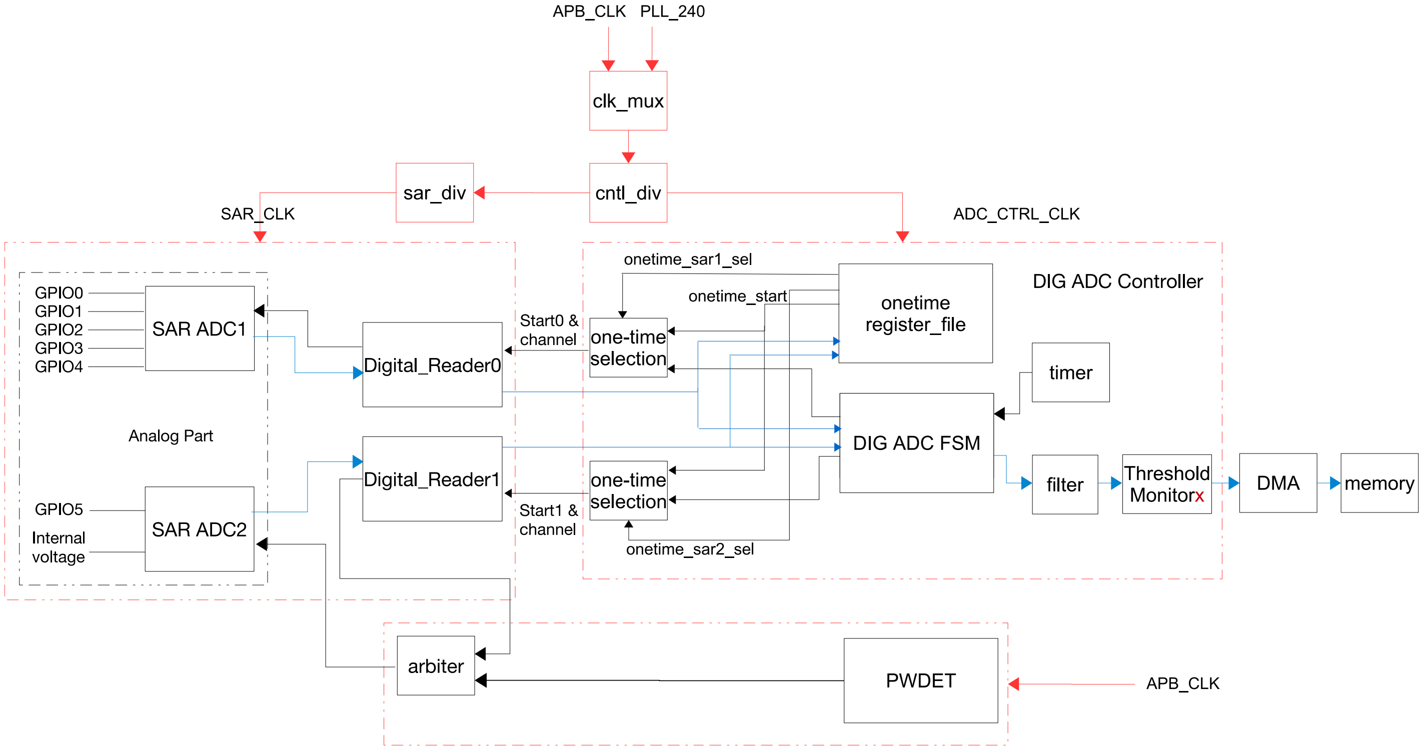
Note:
The DIG ADC controller of SAR ADC2 for ESP32-C3 does not work properly and it is suggested to use SAR ADC1. For more information, please refer to ESP32-C3 Series SoC Errata.

34.2.2 Features

- Each SAR ADC has its own ADC Reader module (Digital_Reader0 or Digital_Reader1), which can be configured and operated separately.
- Support 12-bit sampling resolution
- Support sampling the analog voltages from up to six pins
- DIG ADC controller:
  - Provides separate control modules for one-time sampling and multi-channel scanning.
  - One-time sampling and multi-channel scanning can be run independently on each ADC.
  - Channel scanning sequence in multi-channel scanning mode is user-defined.
  - Provides two filters with configurable filter coefficient.
  - Supports threshold monitoring. An interrupt will be triggered when the sampled value is greater than the pre-set high threshold or less than the pre-set low threshold.
  - Supports DMA
- PWDET controller: monitors RF power (for internal use only)

34.2.3 Functional Description

The major components of SAR ADCs and their interconnections are shown in Figure 34-1.



—: data flow; —: clock signal; —: ADC control signal

Figure 34-1. SAR ADCs Function Overview

As shown in Figure 34-1, the SAR ADC module consists of the following components:

- SAR ADC1: measures voltages from up to five channels.
- SAR ADC2: measures the voltage from one channel, or measures the internal signals such as vdd33.
- Clock management: selects clock sources and their dividers:
  - Clock sources: can be APB_CLK or PLL_240.
  - Divided Clocks:
    - SAR_CLK: operating clock for SAR ADC1, SAR ADC2, Digital_Reader0, and Digital_Reader1. Note that the divider (sar_div) of SAR_ADC must be no less than 2.
    - ADC_CTRL_CLK: operating clock for DIG ADC FSM.
- Arbiter: this arbiter determines which controller is selected as the ADC2's working controller, DIG ADC controller or PWDET controller.
- Digital_Reader0 (driven by DIG ADC FSM): reads data from SAR ADC1.
- Digital_Reader1 (driven by DIG ADC FSM): reads data from SAR ADC2.
- DIG ADC FSM: generates the signals required throughout the ADC sampling process.
- Threshold monitorx: threshold monitor 1 and threshold monitor 2. The monitorx will trigger a interrupt when the sampled value is greater than the pre-set high threshold or less than the pre-set low threshold.

The following sections describe the individual components in details.

34.2.3.1 Input Signals

In order to sample an analog signal, an SAR ADC must first select the analog pin or internal signal to measure via an internal multiplexer. A summary of all the analog signals that may be sent to the SAR ADC module for processing by either ADC1 or ADC2 are presented in Table 34-1.

Table 34-1. SAR ADC Input Signals

Signal	Channel	ADC Selection
GPIO0	0	SAR ADC1
GPIO1	1	
GPIO2	2	
GPIO3	3	
GPIO4	4	
GPIO5	0	SAR ADC2
Internal voltage	n/a	

34.2.3.2 ADC Conversion and Attenuation

When the SAR ADCs convert an analog voltage, the resolution (12-bit) of the conversion spans voltage range from 0 mV to V_{ref}. V_{ref} is the SAR ADC's internal reference voltage. The output value of the conversion (data) is mapped to analog voltage V_{data} using the following formula:

$$V_{data} = \frac{V_{ref}}{4095} \times data$$

In order to convert voltages larger than V_{ref}, input signals can be attenuated before being input into the SAR ADCs. The attenuation can be configured to 0 dB, 2.5 dB, 6 dB, and 12 dB.

34.2.3.3 DIG ADC Controller

The clock of the DIG ADC controller is quite fast, thus the sample rate is high. For more information, see Section ADC Characteristics in ESP32-C3 Series Datasheet.

This controller supports:

- up to 12-bit sampling resolution
- software-triggered one-time sampling
- timer-triggered multi-channel scanning

The configuration of a one-time sampling triggered by the software is as follows:

- Select SAR ADC1 or SAR ADC2 to perform a one-time sampling:
  - if APB_SARADC1_ONETIME_SAMPLE is set, SAR ADC1 is selected.
  - if APB_SARADC2_ONETIME_SAMPLE is set, SAR ADC2 is selected.
- Configure APB_SARADC_ONETIME_CHANNEL to select one channel to sample.

- Configure APB_SARADC_ONETIME_ATTEN to set attenuation.
- Configure APB_SARADC_ONETIME_START to start this one-time sampling.
- On completion of sampling, APB_SARADC_ADC*x*_DONE_INT_RAW interrupt is generated. Software can use this interrupt to initiate reading of the sample values from APB_SARADC_ADC*x*_DATA. *x* can be 1 or 2. 1: SAR ADC1; 2: SAR ADC2.

If the timer-triggered multi-channel scanning is selected, follow the configuration below. Note that in this mode, the scan sequence is performed according to the configuration entered into pattern table.

- Configure APB_SARADC_TIMER_TARGET to set the trigger target for DIG ADC timer. When the timer counting reaches two times of the pre-configured cycle number, a sampling operation is triggered. For the working clock of the timer, see Section 34.2.3.4.
- Configure APB_SARADC_TIMER_EN to enable the timer.
- When the timer times out, it drives DIG ADC FSM to start sampling according to the pattern table;
- Sampled data is automatically stored in memory via DMA. An interrupt is triggered once the scan is completed.

Note:
Any SAR ADC can not be configured to perform both one-time sampling and multi-channel scanning at the same time. Therefore, if a pattern table is configured to use any SAR ADC for multi-channel scanning, then this SAR ADC can not be configured to perform one-time sampling.

34.2.3.4 DIG ADC Clock

Two clocks can be used as the working clock of DIG ADC controller, depending on the configuration of APB_SARADC_CLK_SEL:

- 1: Select the clock (ADC_CTRL_CLK) divided from PLL_240.
- 0: Select APB_CLK.

If ADC_CTRL_CLK is selected, users can configure the divider by APB_SARADC_CLKM_DIV_NUM. Note that due to speed limits of SAR ADCs, the operating clock of Digital_Reader0, SAR ADC1, Digital_Reader1, and SAR ADC2 is SAR_CLK, the frequency of which affects the sampling precision. The lower the frequency, the higher the precision. SAR_CLK is divided from ADC_CTRL_CLK. The divider coefficient is configured by APB_SARADC_SAR_CLK_DIV.

The ADC needs 25 SAR_CLK clock cycles per sample, so the maximum sampling rate is limited by the SAR_CLK frequency.

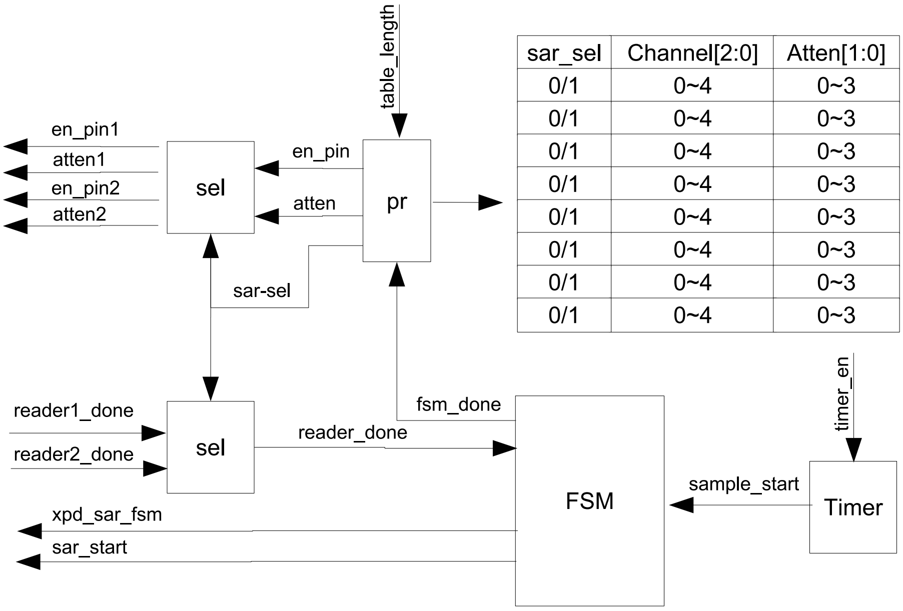
34.2.3.5 DMA Support

DIG ADC controller supports direct memory access via peripheral DMA, which is triggered by DIG ADC timer. Users can switch the DMA data path to DIG ADC by configuring APB_SARADC_APB_ADC_TRANS via software. For specific DMA configuration, please refer to Chapter 2 *GDMA Controller (GDMA)*.

34.2.3.6 DIG ADC FSM

Overview

Figure 34-2 shows the diagram of DIG ADC FSM.



sar_sel	Channel[2:0]	Atten[1:0]
0/1	0~4	0~3
0/1	0~4	0~3
0/1	0~4	0~3
0/1	0~4	0~3
0/1	0~4	0~3
0/1	0~4	0~3
0/1	0~4	0~3
0/1	0~4	0~3

Figure 34-2. Diagram of DIG ADC FSM

Wherein:

- Timer: a dedicated timer for DIG ADC controller, to generate a sample_start signal.
- pr: the pointer to pattern table entries. FSM sends out corresponding signals based on the configuration of the pattern table entry that the pointer points to.

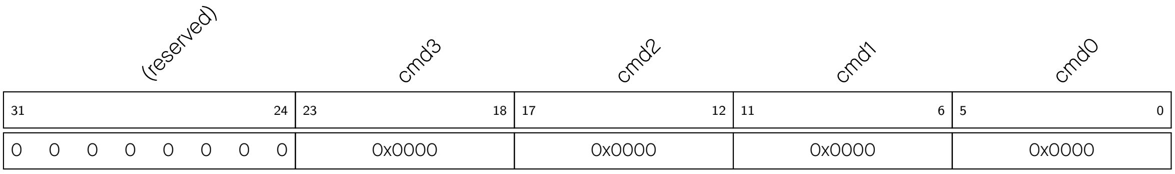
The execution process is as follows:

- Configure APB_SARADC_TIMER_EN to enable the DIG ADC timer. The timeout event of this timer triggers an sample_start signal. This signal drives the FSM module to start sampling.
- When the FSM module receives the sample_start signal, it starts the following operations:
  - Power up SAR ADC.
  - Select SAR ADC1 or SAR ADC2 as the working ADC, configure the ADC channel and attenuation, based on the pattern table entry that the current pr points to.
  - According to the configuration information, output the corresponding en_pad and atten signals to the analog side.
  - Initiate the sar_start signal and start sampling.
- When the FSM receives the reader_done signal from ADC Reader (Digital_Reader0 or Digital_Reader1), it will
  - stop sampling,
  - transfer the data to the filter, and then threshold monitor transfers the data to memory via DMA,

  - update the pattern table pointer pr and wait for the next sampling. Note that if the pointer pr is smaller than APB_SARADC_SAR_PATT_LEN (table_length), then pr = pr + 1, otherwise, pr is cleared.

Pattern Table

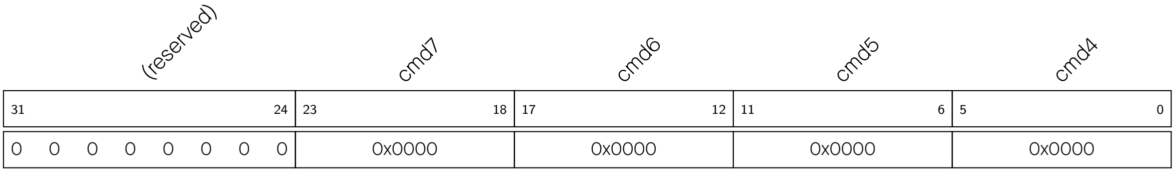
There is one pattern table in the controller, consisting of the APB_SARADC_SAR_PATT_TAB1_REG and APB_SARADC_SAR_PATT_TAB2_REG registers, see Figure 34-3 and Figure 34-4:



(reserved)	cmd3	cmd2	cmd1	cmd0
31 24	23 18	17 12	11 6	5 0
0 0 0 0 0 0 0 0	0x0000	0x0000	0x0000	0x0000

cmd *x* represents pattern table entries. *x* here is the index, 0 ~ 3.

Figure 34-3. APB_SARADC_SAR_PATT_TAB1_REG and Pattern Table Entry 0 - Entry 3

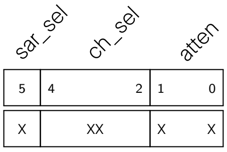


(reserved)	cmd7	cmd6	cmd5	cmd4
31 24	23 18	17 12	11 6	5 0
0 0 0 0 0 0 0 0	0x0000	0x0000	0x0000	0x0000

cmd *x* represents pattern table entries. *x* here is the index, 4 ~ 7.

Figure 34-4. APB_SARADC_SAR_PATT_TAB2_REG and Pattern Table Entry 4 - Entry 7

Each register consists of four 6-bit pattern table entries. Each entry is composed of three fields that contain working ADC, ADC channel and attenuation information, as shown in Table 34-5.



sar_sel	ch_sel	atten
5	4 2	1 0
x	xx	x x

Figure 34-5. Pattern Table Entry

atten Attenuation. 0: 0 dB; 1: 2.5 dB; 2: 6 dB; 3: 12 dB.

ch_sel ADC channel, see Table 34-1.

sar_sel Working ADC. 0: SAR ARC1; 1: SAR ADC2.

Configuration of multi-channel scanning

In this example, two channels are selected for multi-channel scanning:

- Channel 2 of SAR ADC1, with the attenuation of 12 dB
- Channel 0 of SAR ADC2, with the attenuation of 2.5 dB

The detailed configuration is as follows:

- Configure the first pattern table entry (cmd0):

sar_sel	ch_sel	atten
5	4 2	1 0
0	2	3

Figure 34-6. cmd0 Configuration

atten write the value of 3 to this field, to set the attenuation to 12 dB.

ch_sel write the value of 2 to this field, to select channel 2 (see Table 34-1).

sar_sel write the value of 0 to this bit, to select SAR ADC1 as the working ADC.

- Configure the second pattern table entry (cmd1):

sar_sel	ch_sel	atten
5	4 2	1 0
1	0	1

Figure 34-7. cmd1 configuration

atten write the value of 1 to this field, to set the attenuation to 2.5 dB.

ch_sel write the value of 0 to this field, to select channel 0 (see Table 34-1).

sar_sel write the value of 1 to this bit, to select SAR ADC2 as the working ADC.

- Configure APB_SARADC_SAR_PATT_LEN to 1, i.e., set pattern table length to (this value + 1 = 2). Then pattern table entries cmd0 and cmd1 will be used.
- Enable the timer, then DIG ADC controller starts scanning the two channels in cycles, as configured in the pattern table entries.

DMA Data Format

The ADC eventually passes 32-bit data to the DMA, see the figure below.

reserved	sar_sel	ch_sel	reserved	data
31 17	16	15 13	12	11 0
XX	x	xxx	x	x x

Figure 34-8. DMA Data Format

data SAR ADC read value, 12-bit

ch_sel Channel, 3-bit

sar_sel SAR ADC selection, 1-bit

34.2.3.7 ADC Filters

The DIG ADC controller provides two filters for automatic filtering of sampled ADC data. Both filters can be configured to any channel of either SAR ADC and then filter the sampled data for the target channel. The filter's formula is shown below:

$$data_{cur} = \frac{(k-1)data_{prev}}{k} + \frac{data_{in}}{k} - 0.5$$

- $data_{cur}$: the filtered data value.
- $data_{in}$: the sampled data value from the ADC.
- $data_{prev}$: the last filtered data value.
- k: the filter coefficient.

The filters are configured as follows:

- Configure APB_SARADC_FILTER_CHANNELx to select the ADC channel for filter x;
- Configure APB_SARADC_FILTER_FACTORx to set the coefficient for filter x;

Note that x is used here as the placeholder of filter index. 0: filter 0; 1: filter 1.

34.2.3.8 Threshold Monitoring

DIG ADC controller contains two threshold monitors that can be configured to monitor on any channel of SAR ADC1 and SAR ADC2. A high threshold interrupt is triggered when the ADC sample value is larger than the pre-configured high threshold, and a low threshold interrupt is triggered if the sample value is lower than the pre-configured low threshold.

The configuration of threshold monitoring is as follows:

- Set APB_SARADC_THRESx_EN to enable threshold monitor x.
- Configure APB_SARADC_THRESx_LOW to set a low threshold;
- Configure APB_SARADC_THRESx_HIGH to set a high threshold;
- Configure APB_SARADC_THRESx_CHANNEL to select the SAR ADC and the channel to monitor.

Note that x is used here as the placeholder of monitor index. 0: monitor 0; 1: monitor 1.

34.2.3.9 SAR ADC2 Arbiter

SAR ADC2 can be controlled by two controllers, namely, DIG ADC controller and PWDET controller. To avoid any possible conflicts and to improve the efficiency of SAR ADC2, ESP32-C3 provides an arbiter for SAR ADC2. The arbiter supports fair arbitration and fixed priority arbitration.

- Fair arbitration mode (cyclic priority arbitration) can be enabled by clearing APB_SARADC_ADC_ARB_FIX_PRIORITY.
- In fixed priority arbitration, users can set APB_SARADC_ADC_ARB_APB_PRIORITY (for DIG ADC controller) and APB_SARADC_ADC_ARB_WIFI_PRIORITY (for PWDET controller), to configure the priorities for these controllers. A larger value indicates a higher priority.

The arbiter ensures that a higher priority controller can always start a conversion (sample) when required, regardless of whether a lower priority controller already has a conversion in progress. If a higher priority controller starts a conversion whilst the ADC already has a conversion in progress from a lower priority controller, the conversion in progress will be interrupted (stopped). The higher priority controller will then start its conversion. A lower priority controller will not be able to start a conversion whilst the ADC has a conversion in progress from a higher priority controller.

Therefore, certain data flags are embedded into the output data value to indicate whether the conversion is valid or not.

- The data flag for DIG ADC controller is the {sar_sel, ch_sel} bits in DMA data, see Figure 34-8.
  - 4'b1111: Conversion is interrupted.
  - 4'b1110: Conversion is not started.
  - Corresponding channel No.: The data is valid.
- The data flag for PWDET controller is the two higher bits of the sampling result.
  - 2'b10: Conversion is interrupted.
  - 2'b01: Conversion is not started.
  - 2'b00: The data is valid.

Users can configure APB_SARADC_ADC_ARB_GRANT_FORCE to mask the arbiter, and set APB_SARADC_ADC_ARB_WIFI_FORCE or APB_SARADC_ADC_ARB_APB_FORCE to authorize corresponding controllers.

34.3 Temperature Sensor

34.3.1 Overview

ESP32-C3 provides a temperature sensor to monitor temperature changes inside the chip in real time.

34.3.2 Features

The temperature sensor has the following features:

- Supports software triggering and, once triggered, the data can be read continuously
- Configurable temperature offset based on the environment, to improve the accuracy
- Adjustable measurement range

34.3.3 Functional Description

The temperature sensor can be started by software as follows:

- Set APB_SARADC_TSENS_PU to start XPD_SAR, and then to enable temperature sensor;
- Set SYSTEM_TSENS_CLK_EN to enable temperature sensor clock;
- Wait for APB_SARADC_TSENS_XPD_WAIT clock cycles till the reset of temperature sensor is released, the sensor starts measuring the temperature;
- Wait for a while and then read the data from APB_SARADC_TSENS_OUT. The output value gradually approaches the actual temperature linearly as the measurement time increases.

The actual temperature (°C) can be obtained by converting the output of temperature sensor via the following formula:

$$T(°C) = 0.4386 * VALUE - 27.88 * offset - 20.52$$

VALUE in the formula is the output of the temperature sensor, and the offset is determined by the temperature offset. The temperature offset varies in different actual environment (the temperature range). For details, refer to Table 34-2.

Table 34-2. Temperature Offset

Measurement Range (°C)	Temperature Offset (°C)
50 ~ 125	-2
20 ~ 100	-1
-10 ~ 80	0
-30 ~ 50	1
-40 ~ 20	2

34.4 Interrupts

- APB_SARADC_ADC1_DONE_INT: Triggered when SAR ADC1 completes one data conversion.
- APB_SARADC_ADC2_DONE_INT: Triggered when SAR ADC2 completes one data conversion.
- APB_SARADC_THRES*x*_HIGH_INT: Triggered when the sampling value is higher than the high threshold of monitor *x*.
- APB_SARADC_THRES*x*_LOW_INT: Triggered when the sampling value is lower than the low threshold of monitor *x*.

34.5 Register Summary

The addresses in this section are relative to the ADC controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
APB_SARADC_CTRL_REG	SAR ADC control register 1	0x0000	R/W
APB_SARADC_CTRL2_REG	SAR ADC control register 2	0x0004	R/W
APB_SARADC_FILTER_CTRL1_REG	Filtering control register 1	0x0008	R/W
APB_SARADC_SAR_PATT_TAB1_REG	Pattern table register 1	0x0018	R/W
APB_SARADC_SAR_PATT_TAB2_REG	Pattern table register 2	0x001C	R/W
APB_SARADC_ONETIME_SAMPLE_REG	Configuration register for one-time sampling	0x0020	R/W
APB_SARADC_APB_ADC_ARB_CTRL_REG	SAR ADC2 arbiter configuration register	0x0024	R/W
APB_SARADC_FILTER_CTRL0_REG	Filtering control register 0	0x0028	R/W
APB_SARADC_1_DATA_STATUS_REG	SAR ADC1 sampling data register	0x002C	RO
APB_SARADC_2_DATA_STATUS_REG	SAR ADC2 sampling data register	0x0030	RO
APB_SARADC_THRES0_CTRL_REG	Sampling threshold control register 0	0x0034	R/W

Name	Description	Address	Access
APB_SARADC_THRES1_CTRL_REG	Sampling threshold control register 1	0x0038	R/W
APB_SARADC_THRES_CTRL_REG	Sampling threshold control register	0x003C	R/W
APB_SARADC_INT_ENA_REG	Enable register of SAR ADC interrupts	0x0040	R/W
APB_SARADC_INT_RAW_REG	Raw register of SAR ADC interrupts	0x0044	RO
APB_SARADC_INT_ST_REG	State register of SAR ADC interrupts	0x0048	RO
APB_SARADC_INT_CLR_REG	Clear register of SAR ADC interrupts	0x004C	WO
APB_SARADC_DMA_CONF_REG	DMA configuration register for SAR ADC	0x0050	R/W
APB_SARADC_APB_ADC_CLKM_CONF_REG	SAR ADC clock control register	0x0054	R/W
APB_SARADC_APB_TSENS_CTRL_REG	Temperature sensor control register 1	0x0058	varies
APB_SARADC_APB_TSENS_CTRL2_REG	Temperature sensor control register 2	0x005C	R/W
APB_SARADC_CALI_REG	SAR ADC calibration register	0x0060	R/W
APB_SARADC_APB_CTRL_DATE_REG	Version control register	0x03FC	R/W

34.6 Register

The addresses in this section are relative to the ADC controller base address provided in Table 3-3 in Chapter *3 System and Memory*.

Register 34.1. APB_SARADC_CTRL_REG (0x0000)

APB_SARADC_WAIT_ARB_CYCLE	(reserved)	APB_SARADC_XPD_SAR_FORCE	(reserved)	APB_SARADC_SAR_PATT_P_CLEAR	(reserved)	APB_SARADC_SAR_PATT_LEN	APB_SARADC_SAR_CLK_DIV	APB_SARADC_SAR_CLK_GATED	(reserved)	APB_SARADC_START	APB_SARADC_START_FORCE	
31 30	29	28 27	26 24	23	22 18	17 15	14 7	6	5 2	1	0	
1	0	0	0 0 0	0	0 0 0 0 0	7	4	1	0 0 0 0	0	0	Reset

APB_SARADC_START_FORCE 0: select FSM to start SAR ADC. 1: select software to start SAR ADC. (R/W)

APB_SARADC_START Write 1 here to start the SAR ADC by software. Valid only when APB_SARADC_START_FORCE = 1. (R/W)

APB_SARADC_SAR_CLK_GATED SAR ADC clock gate enable bit. (R/W)

APB_SARADC_SAR_CLK_DIV SAR ADC clock divider. This value should be no less than 2. (R/W)

APB_SARADC_SAR_PATT_LEN Configure how many pattern table entries will be used. If this field is set to 1, then pattern table entries (cmd0) and (cmd1) will be used. (R/W)

APB_SARADC_SAR_PATT_P_CLEAR Clear the pointer of pattern table entry for DIG ADC controller. (R/W)

APB_SARADC_XPD_SAR_FORCE Force select XPD SAR. (R/W)

APB_SARADC_WAIT_ARB_CYCLE The clock cycles of waiting arbitration signal stable after SAR_DONE. (R/W)

Register 34.2. APB_SARADC_CTRL2_REG (0x0004)

(reserved)	APB_SARADC_TIMER_EN	APB_SARADC_TIMER_TARGET	(reserved)	APB_SARADC_SAR2_INV	APB_SARADC_SAR1_INV	APB_SARADC_MAX_MEAS_NUM	APB_SARADC_MEAS_NUM_LIMIT	
31 25	24	23 12	11	10	9	8 1	0	
0 0 0 0 0 0 0	0	10	0	0	0	255	0	Reset

APB_SARADC_MEAS_NUM_LIMIT Enable the limitation of SAR ADCs maximum conversion times. (R/W)

APB_SARADC_MAX_MEAS_NUM The SAR ADCs maximum conversion times. (R/W)

APB_SARADC_SAR1_INV Write 1 here to invert the data of SAR ADC1. (R/W)

APB_SARADC_SAR2_INV Write 1 here to invert the data of SAR ADC2. (R/W)

APB_SARADC_TIMER_TARGET Set SAR ADC timer target. (R/W)

APB_SARADC_TIMER_EN Enable SAR ADC timer trigger. (R/W)

Register 34.3. APB_SARADC_FILTER_CTRL1_REG (0x0008)

APB_SARADC_FILTER_FACTOR0	APB_SARADC_FILTER_FACTOR1	(reserved)	
31 29	28 26	25 0	
0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_FILTER_FACTOR1 The filter coefficient for SAR ADC filter 1. (R/W)

APB_SARADC_FILTER_FACTOR0 The filter coefficient for SAR ADC filter 0. (R/W)

Register 34.4. APB_SARADC_SAR_PATT_TAB1_REG (0x0018)

(reserved)	APB_SARADC_SAR_PATT_TAB1	
31 24	23 0	
0 0 0 0 0 0 0 0	0x0000	Reset

APB_SARADC_SAR_PATT_TAB1 Pattern table entries 0 ~ 3 (each entry is six bits). (R/W)

Register 34.5. APB_SARADC_SAR_PATT_TAB2_REG (0x001C)

(reserved)	APB_SARADC_SAR_PATT_TAB2	
31 24	23 0	
0 0 0 0 0 0 0 0	0x0000	Reset

APB_SARADC_SAR_PATT_TAB2 Pattern table entries 4 ~ 7 (each entry is six bits). (R/W)

Register 34.6. APB_SARADC_ONETIME_SAMPLE_REG (0x0020)

APB_SARADC1_ONETIME_SAMPLE	APB_SARADC2_ONETIME_SAMPLE	APB_SARADC_ONETIME_START	APB_SARADC_ONETIME_CHANNEL	APB_SARADC_ONETIME_ATTEN	(reserved)	
31	30	29	28 25	24 23	22 0	
0	0	0	13	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_ONETIME_ATTEN Configure the attenuation for a one-time sampling. (R/W)

APB_SARADC_ONETIME_CHANNEL Configure the channel for a one-time sampling. (R/W)

APB_SARADC_ONETIME_START Start SAR ADC one-time sampling. (R/W)

APB_SARADC2_ONETIME_SAMPLE Enable SAR ADC2 one-time sampling. (R/W)

APB_SARADC1_ONETIME_SAMPLE Enable SAR ADC1 one-time sampling. (R/W)

Register 34.7. APB_SARADC_APB_ADC_ARB_CTRL_REG (0x0024)

(reserved)	APB_SARADC_ADC_ARB_FIX_PRIORITY	APB_SARADC_ADC_ARB_WIFI_PRIORITY	(reserved)	APB_SARADC_ADC_ARB_APB_PRIORITY	APB_SARADC_ADC_ARB_GRANT_FORCE	APB_SARADC_ADC_ARB_WIFI_FORCE	(reserved)	APB_SARADC_ADC_ARB_APB_FORCE	(reserved)	
31 13	12	11 10	9 8	7 6	5	4	3	2	1 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	2	1	0	0	0	0	0	0 0	Reset

APB_SARADC_ADC_ARB_APB_FORCE SAR ADC2 arbiter forces to enable DIG ADC controller. (R/W)

APB_SARADC_ADC_ARB_WIFI_FORCE SAR ADC2 arbiter forces to enable PWDET controller. (R/W)

APB_SARADC_ADC_ARB_GRANT_FORCE ADC2 arbiter force grant. (R/W)

APB_SARADC_ADC_ARB_APB_PRIORITY Set DIG ADC controller priority. (R/W)

APB_SARADC_ADC_ARB_WIFI_PRIORITY Set PWDET controller priority. (R/W)

APB_SARADC_ADC_ARB_FIX_PRIORITY ADC2 arbiter uses fixed priority. (R/W)

Register 34.8. APB_SARADC_FILTER_CTRL0_REG (0x0028)

APB_SARADC_FILTER_RESET	(reserved)	APB_SARADC_FILTER_CHANNEL0	APB_SARADC_FILTER_CHANNEL1	(reserved)	
31	30 26	25 22	21 18	17 0	
0	0 0 0 0 0	13	13	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_FILTER_CHANNEL1 The filter channel for SAR ADC filter 1. (R/W)

APB_SARADC_FILTER_CHANNEL0 The filter channel for SAR ADC filter 0. (R/W)

APB_SARADC_FILTER_RESET Reset SAR ADC1 filter. (R/W)

Register 34.9. APB_SARADC_1_DATA_STATUS_REG (0x002C)

(reserved)	APB_SARADC_APB_SARADC1_DATA	
31 17	16 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

APB_SARADC_ADC1_DATA SAR ADC1 conversion data. (RO)

Register 34.10. APB_SARADC_2_DATA_STATUS_REG (0x0030)

(reserved)	APB_SARADC_ADC2_DATA	
31 17	16 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	Reset

APB_SARADC_ADC2_DATA SAR ADC2 conversion data. (RO)

Register 34.11. APB_SARADC_THRES0_CTRL_REG (0x0034)

(reserved)	APB_SARADC_THRES0_LOW	APB_SARADC_THRES0_HIGH	(reserved)	APB_SARADC_THRES0_CHANNEL	
31	30 18	17 5	4	3 0	
0	0	0x1fff	0	13	Reset

APB_SARADC_THRES0_CHANNEL The channel for SAR ADC monitor 0. (R/W)

APB_SARADC_THRES0_HIGH The high threshold for SAR ADC monitor 0. (R/W)

APB_SARADC_THRES0_LOW The low threshold for SAR ADC monitor 0. (R/W)

Register 34.12. APB_SARADC_THRES1_CTRL_REG (0x0038)

(reserved)	APB_SARADC_THRES1_LOW	APB_SARADC_THRES1_HIGH	(reserved)	APB_SARADC_THRES1_CHANNEL	
31	30 18	17 5	4	3 0	
0	0	0x1fff	0	13	Reset

APB_SARADC_THRES1_CHANNEL The channel for SAR ADC monitor 1. (R/W)

APB_SARADC_THRES1_HIGH The high threshold for SAR ADC monitor 1. (R/W)

APB_SARADC_THRES1_LOW The low threshold for SAR ADC monitor 1. (R/W)

Register 34.13. APB_SARADC_THRES_CTRL_REG (0x003C)

APB_SARADC_THRES0_EN	APB_SARADC_THRES1_EN	(reserved)	APB_SARADC_THRES_ALL_EN	(reserved)	
31	30	29 28	27	26 0	
0	0	0 0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_THRES_ALL_EN Enable the threshold monitoring for all configured channels. (R/W)

APB_SARADC_THRES1_EN Enable threshold monitor 1. (R/W)

APB_SARADC_THRES0_EN Enable threshold monitor 0. (R/W)

Register 34.14. APB_SARADC_INT_ENA_REG (0x0040)

APB_SARADC_ADC1_DONE_INT_ENA	APB_SARADC_ADC2_DONE_INT_ENA	APB_SARADC_THRES0_HIGH_INT_ENA	APB_SARADC_THRES1_HIGH_INT_ENA	APB_SARADC_THRES0_LOW_INT_ENA	APB_SARADC_THRES1_LOW_INT_ENA	(reserved)	
31	30	29	28	27	26	25 0	
0	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_THRES1_LOW_INT_ENA Enable bit of APB_SARADC_THRES1_LOW_INT interrupt. (R/W)

APB_SARADC_THRES0_LOW_INT_ENA Enable bit of APB_SARADC_THRES0_LOW_INT interrupt. (R/W)

APB_SARADC_THRES1_HIGH_INT_ENA Enable bit of APB_SARADC_THRES1_HIGH_INT interrupt. (R/W)

APB_SARADC_THRES0_HIGH_INT_ENA Enable bit of APB_SARADC_THRES0_HIGH_INT interrupt. (R/W)

APB_SARADC_ADC2_DONE_INT_ENA Enable bit of APB_SARADC_ADC2_DONE_INT interrupt. (R/W)

APB_SARADC_ADC1_DONE_INT_ENA Enable bit of APB_SARADC_ADC1_DONE_INT interrupt. (R/W)

Register 34.15. APB_SARADC_INT_RAW_REG (0x0044)

APB_SARADC_ADC1_DONE_INT_RAW	APB_SARADC_ADC2_DONE_INT_RAW	APB_SARADC_THRES0_HIGH_INT_RAW	APB_SARADC_THRES1_HIGH_INT_RAW	APB_SARADC_THRES0_LOW_INT_RAW	APB_SARADC_THRES1_LOW_INT_RAW	(reserved)	
31	30	29	28	27	26	25 0	
0	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_THRES1_LOW_INT_RAW Raw bit of APB_SARADC_THRES1_LOW_INT interrupt. (RO)

APB_SARADC_THRES0_LOW_INT_RAW Raw bit of APB_SARADC_THRES0_LOW_INT interrupt. (RO)

APB_SARADC_THRES1_HIGH_INT_RAW Raw bit of APB_SARADC_THRES1_HIGH_INT interrupt. (RO)

APB_SARADC_THRES0_HIGH_INT_RAW Raw bit of APB_SARADC_THRES0_HIGH_INT interrupt. (RO)

APB_SARADC_ADC2_DONE_INT_RAW Raw bit of APB_SARADC_ADC2_DONE_INT interrupt. (RO)

APB_SARADC_ADC1_DONE_INT_RAW Raw bit of APB_SARADC_ADC1_DONE_INT interrupt. (RO)

Register 34.16. APB_SARADC_INT_ST_REG (0x0048)

APB_SARADC_ADC1_DONE_INT_ST	APB_SARADC_ADC2_DONE_INT_ST	APB_SARADC_THRES0_HIGH_INT_ST	APB_SARADC_THRES1_HIGH_INT_ST	APB_SARADC_THRES0_LOW_INT_ST	APB_SARADC_THRES1_LOW_INT_ST	(reserved)	
31	30	29	28	27	26	25 0	
0	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_THRES1_LOW_INT_ST Status of APB_SARADC_THRES1_LOW_INT interrupt. (RO)

APB_SARADC_THRES0_LOW_INT_ST Status of APB_SARADC_THRES0_LOW_INT interrupt. (RO)

APB_SARADC_THRES1_HIGH_INT_ST Status of APB_SARADC_THRES1_HIGH_INT interrupt. (RO)

APB_SARADC_THRES0_HIGH_INT_ST Status of APB_SARADC_THRES0_HIGH_INT interrupt. (RO)

APB_SARADC_ADC2_DONE_INT_ST Status of APB_SARADC_ADC2_DONE_INT interrupt. (RO)

APB_SARADC_ADC1_DONE_INT_ST Status of APB_SARADC_ADC1_DONE_INT interrupt. (RO)

Register 34.17. APB_SARADC_INT_CLR_REG (0x004C)

APB_SARADC_ADC1_DONE_INT_CLR	APB_SARADC_ADC2_DONE_INT_CLR	APB_SARADC_THRES0_HIGH_INT_CLR	APB_SARADC_THRES1_HIGH_INT_CLR	APB_SARADC_THRES0_LOW_INT_CLR	APB_SARADC_THRES1_LOW_INT_CLR	(reserved)	
31	30	29	28	27	26	25 0	
0	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	Reset

APB_SARADC_THRES1_LOW_INT_CLR Clear bit of APB_SARADC_THRES1_LOW_INT interrupt. (WO)

APB_SARADC_THRES0_LOW_INT_CLR Clear bit of APB_SARADC_THRES0_LOW_INT interrupt. (WO)

APB_SARADC_THRES1_HIGH_INT_CLR Clear bit of APB_SARADC_THRES1_HIGH_INT interrupt. (WO)

APB_SARADC_THRES0_HIGH_INT_CLR Clear bit of APB_SARADC_THRES0_HIGH_INT interrupt. (WO)

APB_SARADC_ADC2_DONE_INT_CLR Clear bit of APB_SARADC_ADC2_DONE_INT interrupt. (WO)

APB_SARADC_ADC1_DONE_INT_CLR Clear bit of APB_SARADC_ADC1_DONE_INT interrupt. (WO)

Register 34.18. APB_SARADC_DMA_CONF_REG (0x0050)

APB_SARADC_APB_ADC_TRANS	APB_SARADC_APB_ADC_RESET_FSM	(reserved)	APB_SARADC_APB_ADC_EOF_NUM	
31	30	29 16	15 0	
0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0	255	Reset

APB_SARADC_APB_ADC_EOF_NUM Generate dma_in_suc_eof when sample cnt = eof_num. (R/W)

APB_SARADC_APB_ADC_RESET_FSM Reset DIG ADC controller status. (R/W)

APB_SARADC_APB_ADC_TRANS When this bit is set, DIG ADC controller uses DMA. (R/W)

Register 34.19. APB_SARADC_APB_ADC_CLKM_CONF_REG (0x0054)

(reserved)	APB_SARADC_CLK_SEL	APB_SARADC_CLK_EN	APB_SARADC_CLKM_DIV_A	APB_SARADC_CLKM_DIV_B	APB_SARADC_CLKM_DIV_NUM	
31 23	22 21	20	19 14	13 8	7 0	
0 0 0 0 0 0 0 0 0	0	0	0x0	0x0	4	Reset

APB_SARADC_CLKM_DIV_NUM The integer part of ADC clock divider. Divider value = APB_SARADC_CLKM_DIV_NUM + APB_SARADC_CLKM_DIV_B/APB_SARADC_CLKM_DIV_A. (R/W)

APB_SARADC_CLKM_DIV_B The numerator value of fractional clock divider. (R/W)

APB_SARADC_CLKM_DIV_A The denominator value of fractional clock divider. (R/W)

APB_SARADC_CLK_EN Enable the SAR ADC register clock. (R/W)

APB_SARADC_CLK_SEL 0: Use APB_CLK as clock source, 1: use divided-down PLL_240 as clock source. (R/W)

Register 34.20. APB_SARADC_APB_TSENS_CTRL_REG (0x0058)

(reserved)	APB_SARADC_TSENS_PU	APB_SARADC_TSENS_CLK_DIV	APB_SARADC_TSENS_IN_INV	(reserved)	APB_SARADC_TSENS_OUT	
31 23	22	21 14	13	12 8	7 0	
0 0 0 0 0 0 0 0 0	0	6	0	0 0 0 0 0	0x0	Reset

APB_SARADC_TSENS_OUT Temperature sensor data out. (RO)

APB_SARADC_TSENS_IN_INV Invert temperature sensor input value. (R/W)

APB_SARADC_TSENS_CLK_DIV Temperature sensor clock divider. (R/W)

APB_SARADC_TSENS_PU Temperature sensor power up. (R/W)

Register 34.21. APB_SARADC_APB_TSENS_CTRL2_REG (0x005C)

(reserved)	APB_SARADC_TSENS_CLK_SEL	(reserved)	APB_SARADC_TSENS_XPD_WAIT	
31 16	15	13 12	11 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0 0	2	Reset

APB_SARADC_TSENS_XPD_WAIT The wait time before temperature sensor is powered up. (R/W)

APB_SARADC_TSENS_CLK_SEL Choose working clock for temperature sensor. 0: RC_FAST_CLK. 1: XTAL_CLK. (R/W)

Register 34.22. APB_SARADC_CALI_REG (0x0060)

(reserved)	APB_SARADC_CALI_CFG	
31 17	16 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0x8000	Reset

APB_SARADC_CALI_CFG Configure the SAR ADC calibration factor. (R/W)

Register 34.23. APB_SARADC_APB_CTRL_DATE_REG (0x03FC)

APB_SARADC_DATE	
31 0	
0x2007171	Reset

APB_SARADC_DATE Version register. (R/W)

Glossary

Abbreviations for Peripherals

AES	AES (Advanced Encryption Standard) Accelerator
DS	Digital Signature
DMA	DMA (Direct Memory Access) Controller
eFuse	eFuse Controller
HMAC	HMAC (Hash-based Message Authentication Code) Accelerator
I2C	I2C (Inter-Integrated Circuit) Controller
I2S	I2S (Inter-IC Sound) Controller
LEDC	LED Control PWM (Pulse Width Modulation)
RMT	Remote Control Peripheral
RNG	Random Number Generator
RSA	RSA (Rivest Shamir Adleman) Accelerator
SHA	SHA (Secure Hash Algorithm) Accelerator
SPI	SPI (Serial Peripheral Interface) Controller
SYSTIMER	System Timer
TIMG	Timer Group
TWAI	Two-wire Automotive Interface
UART	UART (Universal Asynchronous Receiver-Transmitter) Controller
WDT	Watchdog Timers

Abbreviations Related to Registers

REG **Register.**

SYSREG **System registers** are a group of registers that control system reset, memory, clocks, software interrupts, power management, clock gating, etc.

ISO **Isolation.** If a peripheral or other chip component is powered down, the pins, if any, to which its output signals are routed will go into a floating state. ISO registers isolate such pins and keep them at a certain determined value, so that the other non-powered-down peripherals/devices attached to these pins are not affected.

NMI **Non-maskable interrupt** is a hardware interrupt that cannot be disabled or ignored by the CPU instructions. Such interrupts exist to signal the occurrence of a critical error.

W1TS Abbreviation added to names of registers/fields to indicate that such register/field should be used to set a field in a corresponding register with a similar name. For example, the register `GPIO_ENABLE_W1TS_REG` should be used to set the corresponding fields in the register `GPIO_ENABLE_REG`.

W1TC Same as *W1TS*, but used to clear a field in a corresponding register.

Access Types for Registers

Sections *Register Summary* and *Register Description* in TRM chapters specify access types for registers and their fields.

Most frequently used access types and their combinations are as follows:

- RO
- WO
- WT
- R/W
- WL
- R/W/SC
- R/W/SS
- R/W/SS/SC
- R/WC/SS
- R/WC/SC
- R/WC/SS/SC
- R/WS/SC
- R/WS/SS
- R/WS/SS/SC
- R/SS/WTC
- R/SC/WTC
- R/SS/SC/WTC
- RF/WF
- R/SS/RC
- varies

Descriptions of all access types are provided below.

R **Read.** User application can read from this register/field; usually combined with other access types.

RO **Read only.** User application can only read from this register/field.

HRO **Hardware Read Only.** Only hardware can read from this register/field; used for storing default settings for variable parameters.

W **Write.** User application can write to this register/field; usually combined with other access types.

WO **Write only.** User application can only write to this register/field.

SS **Self set.** On a specified event, hardware automatically writes 1 to this register/field; used with 1-bit fields.

SC **Self clear.** On a specified event, hardware automatically writes 0 to this register/field; used with 1-bit and multi-bit fields.

SM **Self modify.** On a specified event, hardware automatically writes a specified value to this register/field; used with multi-bit fields.

RS **Read to set.** If user application reads from this register/field, hardware automatically writes 1 to it.

RC **Read to clear.** If user application reads from this register/field, hardware automatically writes 0 to it.

RF **Read from FIFO.** If user application writes new data to FIFO, the register/field automatically reads it.

WF **Write to FIFO.** If user application writes new data to this register/field, it automatically passes the data to FIFO via APB bus.

WS **Write any value to set.** If user application writes to this register/field, hardware automatically sets this register/field.

W1S **Write 1 to set.** If user application writes 1 to this register/field, hardware automatically sets this register/field.

W0S **Write 0 to set.** If user application writes 0 to this register/field, hardware automatically sets this register/field.

WC **Write any value to clear.** If user application writes to this register/field, hardware automatically clears this register/field.

W1C **Write 1 to clear.** If user application writes 1 to this register/field, hardware automatically clears this register/field.

W0C **Write 0 to clear.** If user application writes 0 to this register/field, hardware automatically clears this register/field.

WT **Write 1 to trigger an event.** If user application writes 1 to this field, this action triggers an event (pulse in the APB bus) or clears a corresponding WTC field (see WTC).

WTC **Write to clear.** Hardware automatically clears this field if user application writes 1 to the corresponding WT field (see WT).

W1T **Write 1 to toggle.** If user application writes 1 to this field, hardware automatically inverts the corresponding field; otherwise - no effect.

W0T **Write 0 to toggle.** If user application writes 0 to this field, hardware automatically inverts the corresponding field; otherwise - no effect.

WL **Write if a lock is deactivated.** If the lock is deactivated, user application can write to this register/field.

varies **The access type varies.** Different fields of this register might have different access types.

Programming Reserved Register Field

Introduction

A field in a register is reserved if the field is not open to users, or produces unpredictable results if configured to values other than defaults.

Programming Reserved Register Field

The reserved fields should not be modified. It is not possible to write only part of a register since registers must always be written as a whole. As a result, to write an entire register that contains reserved fields, you can choose one of the following two options:

1. Read the value of the register, modify only the fields you want to configure and then write back the value so that reserved fields are untouched.

   OR

2. Modify only the fields you want to configure and write back the default value of the reserved fields. The default value of a field is provided in the "Reset" line of a register diagram. For example, the default value of Field_A in Register X is 1.

Register 35.1. Register X (Address)

	(reserved)	Field_C	(reserved)	Field_B	Field_A
	31 … 20	19 … 16	15 … 2	1	0
Reset	0 0 0 0 0 0 0 0 0 0 0 0	0000	0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	1

Suppose you want to set Field_A, Field_B, and Field_C of Register X to 0x0, 0x1, and 0x2, you can:

- Use option 1 and fill in the reserved fields with the value you have just read. Suppose the register reads as 0x0000_0003. Then, you can modify the fields you want to configure, thus writing 0x0002_0002 to the register.
- Use option 2 and fill in the reserved fields with their defaults, thus writing 0x0002_0002 to the register.

Interrupt Configuration Registers

Generally, the peripherals' internal interrupt sources can be configured by the following common set of registers:

- **RAW** (Raw Interrupt Status) register: This register indicates the raw interrupt status. Each bit in the register represents a specific internal interrupt source. When an interrupt source triggers, its RAW bit is set to 1.
- **ENA** (Enable) register: This register is used to enable or disable the internal interrupt sources. Each bit in the ENA register corresponds to an internal interrupt source.

  By manipulating the ENA register, you can mask or unmask individual internal interrupt source as needed. When an internal interrupt source is masked (disabled), it will not generate an interrupt signal, but its value can still be read from the RAW register.
- **ST** (Status) register: This register reflects the status of enabled interrupt sources. Each bit in the ST register corresponds to a specific internal interrupt source. The ST bit being 1 means that both the corresponding RAW bit and ENA bit are 1, indicating that the interrupt source is triggered and not masked. The other combinations of the RAW bit and ENA bit will result in the ST bit being 0.

  The configuration of ENA/RAW/ST registers is shown in Table 35-4.
- **CLR** (Clear) register: The CLR register is responsible for clearing the internal interrupt sources. Writing 1 to the corresponding bit in the CLR register clears the interrupt source.

Table 35-4. Configuration of ENA/RAW/ST Registers

ENA Bit Value	RAW Bit Value	ST Bit Value
0	Ignored	0
1	0	0
	1	1

Revision History

Date	Version	Release notes
2024-01-19	v1.1	Added Section *Programming Reserved Register Field* and Section *Interrupt Configuration Registers* Updated register prefix APB_CTRL to SYSCON Updated the following chapters: • Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)*: Updated the description in Section 5.9, and deleted the GPIO_PCPU_NMI_INT_REG register and related information • Chapter 7 *Chip Boot Control*: Added SPI Download Boot mode, renamed Download Boot mode to Joint Download mode in Section 7.2, and provided more details about how FUSE_DIS_FORCE_DOWNLOAD and EFUSE_DIS_DOWNLOAD_MODE control chip boot mode • Chapter 8 *Interrupt Matrix (INTERRUPT)*: Deleted the INTERRUPT_CORE0_GPIO_INTERRUPT_PRO_NMI_MAP_REG register and related information • Chapter 9 *Low-power Management*: Updated the description of register RTC_CNTL_WDT_WKEY • Chapter 11 *Timer Group (TIMG)*: Updated the description of TIMG_WDT_CLK_PRESCALE • Chapter 14 *Permission Control (PMS)*: Removed ROM_Table related description • Chapter 26 *UART Controller (UART)*: Updated Figure 26-1 *UART Architecture Overview* and the number of rising edges required to generate the wake_up signal • Chapter 28 *I2C Controller (I2C)*: Updated I2C timeout configuration and the corresponding descriptions of I2C_TIME_OUT_VALUE, I2C_COMD0_REG, I2C_SDA_FORCE_OUT and I2C_SCL_FORCE_OUT

Date	Version	Release notes
2023-05-19	v1.0	Added Chapter 14 *Permission Control (PMS)* Updated the following chapters: • Chapter 3 *System and Memory*: Updated Table 3-3 • Chapter 2 *GDMA Controller (GDMA)*: Updated the descriptions of the GDMA_IN_SUC_EOF_CH*n*_INT interrupt and the GDMA_INLINK_DSCR_ADDR_CH*n* field • Chapter 4 *eFuse Controller (EFUSE)*: Added a note on programming the XTS-AES key • Chapter 9 *Low-power Management*: Removed UART as a reject to sleep cause, and added more description about register RTC_CNTL_GPIO_WAKEUP_REG • Chapter 11 *Timer Group (TIMG)*: Updated the procedures to read the timer's value • Chapter 12 *Watchdog Timers (WDT)*: Removed ULP-RISC-V references • Chapter 26 *UART Controller (UART)*: Added descriptions about the break condition, and updated Figure UART Architecture Overview, Figure UART Structure, and Figure Hardware Flow Control Diagram , and updated the maximum length of stop bits and related descriptions • Chapter 30 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*: Added the specific pull-up values configured by the USB_SERIAL_JTAG_PULLUP_VALUE bit • Chapter 32 *LED PWM Controller (LEDC)*: Added the formula to calculate duty cycle resolution and Table *Commonly-used Frequencies and Resolutions*

Date	Version	Release notes
2022-12-16	v0.7	Added the following chapter: • Chapter 15 *World Controller (WCL)* Updated the following chapters: • Chapter 1 *ESP-RISC-V CPU* • Chapter 3 *System and Memory* • Chapter 4 *eFuse Controller (EFUSE)* • Chapter 9 *Low-power Management* • Chapter 17 *Debug Assistant (ASSIST_DEBUG)* • Chapter 23 *External Memory Encryption and Decryption (XTS_AES)* • Chapter 25 *Random Number Generator (RNG)* • Chapter 29 *I2S Controller (I2S)* • Chapter 34 *On-Chip Sensor and Analog Signal Processing* Updated clock names: • FOSC_CLK: renamed as RC_FAST_CLK • FOSC_DIV_CLK: renamed as RC_FAST_DIV_CLK • RTC_CLK: renamed as RC_SLOW_CLK • SLOW_CLK: renamed as RTC_SLOW_CLK • FAST_CLK: renamed as RTC_FAST_CLK • PLL_160M_CLK: renamed as PLL_F160M_CLK • PLL_240M_CLK: renamed as PLL_D2_CLK Updated the Glossary section
2022-02-16	v0.6	Added the following chapters: • Chapter 27 *SPI Controller (SPI)* • Chapter 29 *I2S Controller (I2S)*
2022-01-12	v0.5	Added the following chapters: • Chapter 9 *Low-power Management* • Chapter 23 *External Memory Encryption and Decryption (XTS_AES)* Updated the following Chapters: • Chapter 1 *ESP-RISC-V CPU*, Section 1.4.1 by adding three GPIO Access CSRs; Section 1.5 by removing the list of CPU interrupt registers and providing redirection to Chapter 8 *Interrupt Matrix (INTERRUPT)* • Chapter 3 *System and Memory* • Chapter 4 *eFuse Controller (EFUSE)* • Chapter 20 *RSA Accelerator (RSA)* • Chapter 21 *HMAC Accelerator (HMAC)* • Chapter 22 *Digital Signature (DS)*

Date	Version	Release notes
2021-10-28	v0.4	Added the following chapters: • Chapter 8 *Interrupt Matrix (INTERRUPT)* • Chapter 17 *Debug Assistant (ASSIST_DEBUG)* • Chapter 28 *I2C Controller (I2C)* • Chapter 34 *On-Chip Sensor and Analog Signal Processing* • Chapter 35 *Related Documentation and Resources* Updated the following Chapters: • Chapter 4 *eFuse Controller (EFUSE)* • Chapter 33 *Remote Control Peripheral (RMT)*
2021-08-05	v0.3	Added the following chapters: • Chapter 10 *System Timer (SYSTIMER)* • Chapter 12 *Watchdog Timers (WDT)* • Chapter 13 *XTAL32K Watchdog Timers (XTWDT)* • Chapter 16 *System Registers (SYSREG)* • Chapter 21 *HMAC Accelerator (HMAC)* • Chapter 22 *Digital Signature (DS)* • Chapter 30 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)* • Chapter 33 *Remote Control Peripheral (RMT)* Updated the following Chapters: • Chapter 4 *eFuse Controller (EFUSE)* • Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)* • Chapter 7 *Chip Boot Control* • Chapter 31 *Two-wire Automotive Interface (TWAI)*
2021-05-27	v0.2	Added the following chapters: • Chapter 2 *GDMA Controller (GDMA)* • Chapter 4 *eFuse Controller (EFUSE)* • Chapter 11 *Timer Group (TIMG)* • Chapter 26 *UART Controller (UART)* • Chapter 32 *LED PWM Controller (LEDC)* Updated the Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)* Adjusted the order of chapters
2021-04-08	v0.1	Preliminary release
