## 4 Boot Configurations

**Note:**

The content below is excerpted from [ESP8685 Series Datasheet](#) > Section *Boot Configurations*. For the strapping pin mapping between the chip and modules, please refer to Chapter [8 Module Schematics](#).

The chip allows for configuring the following boot parameters through strapping pins and eFuse bits at power-up or a hardware reset, without microcontroller interaction.

- **Chip boot mode**
  - Strapping pins: GPIO2, GPIO8, and GPIO9
- **ROM message printing**
  - Strapping pin: GPIO8
  - eFuse parameters: EFUSE\_UART\_PRINT\_CONTROL and EFUSE\_USB\_PRINT\_CHANNEL

The default values of all the above eFuse bits are 0, which means that they are not burnt. Given that eFuse is one-time programmable, once an eFuse bit is programmed to 1, it can never be reverted to 0. For how to program eFuse bits, please refer to [ESP32-C3 Technical Reference Manual](#) > Chapter *eFuse Controller*.

The default values of the strapping pins, namely the logic levels, are determined by pins' internal weak pull-up/pull-down resistors at reset if the pins are not connected to any circuit, or connected to an external high-impedance circuit.

**Table 3: Default Configuration of Strapping Pins**

Strapping Pin	Default Configuration	Bit Value
GPIO2	Floating	–
GPIO8	Floating	–
GPIO9	Weak pull-up	1

To change the bit values, the strapping pins should be connected to external pull-down/pull-up resistances. If the ESP8685 is used as a device by a host MCU, the strapping pin voltage levels can also be controlled by the host MCU.

All strapping pins have latches. At system reset, the latches sample the bit values of their respective strapping pins and store them until the chip is powered down or shut down. The states of latches cannot be changed in any other way. It makes the strapping pin values available during the entire chip operation, and the pins are freed up to be used as regular IO pins after reset.

The timing of signals connected to the strapping pins should adhere to the *setup time* and *hold time* specifications in Table 4 and Figure 3.

Table 4: Description of Timing Parameters for the Strapping Pins

Parameter	Description	Min (ms)
$t_{SU}$	Setup time is the time reserved for the power rails to stabilize before the CHIP_EN pin is pulled high to activate the chip.	0
$t_H$	Hold time is the time reserved for the chip to read the strapping pin values after CHIP_EN is already high and before these pins start operating as regular IO pins.	3

Figure 3: Visualization of Timing Parameters for the Strapping Pins

## 4.1 Chip Boot Mode Control

GPIO2, GPIO8, and GPIO9 control the boot mode after the reset is released. See Table 5 [Chip Boot Mode Control](#).

Table 5: Chip Boot Mode Control

Boot Mode	GPIO2 <sup>2</sup>	GPIO8	GPIO9
SPI Boot	1	Any value	<b>1</b>
Joint Download Boot <sup>3</sup>	1	1	0

<sup>1</sup> **Bold** marks the default value and configuration.

<sup>2</sup> GPIO2 actually does not determine SPI Boot and Joint Download Boot mode, but it is recommended to pull this pin up due to glitches.

<sup>3</sup> Joint Download Boot mode supports the following download methods:

- USB-Serial-JTAG Download Boot
- UART Download Boot

In SPI Boot mode, the ROM bootloader loads and executes the program from SPI flash to boot the system.

In Joint Download Boot mode, users can download binary files into flash using UART0 or USB interface. It is also possible to download binary files into SRAM and execute it from SRAM.

In addition to SPI Boot and Joint Download Boot modes, ESP8685 also supports SPI Download Boot mode. For details, please see [ESP32-C3 Technical Reference Manual](#) > Chapter *Chip Boot Control*.

## 4.2 ROM Messages Printing Control

During the boot process, the messages by the ROM code can be printed to:

- **(Default) UART0 and USB Serial/JTAG controller**
- UART0
- USB Serial/JTAG controller

EFUSE\_UART\_PRINT\_CONTROL and GPIO8 control ROM messages printing to **UART0** as shown in Table 6 [UART0 ROM Message Printing Control](#).

**Table 6: UART0 ROM Message Printing Control**

UART0 ROM Code Printing	EFUSE_UART_PRINT_CONTROL	GPIO8
<b>Enabled</b>	<b>0</b>	Ignored
	1	0
	2	1
Disabled	1	1
	2	0

<sup>1</sup> **Bold** marks the default value and configuration.

EFUSE\_USB\_PRINT\_CHANNEL controls the printing to **USB Serial/JTAG controller** as shown in Table 7 [USB Serial/JTAG ROM Message Printing Control](#).

**Table 7: USB Serial/JTAG ROM Message Printing Control**

USB Serial/JTAG ROM Code Printing	EFUSE_DIS_USB_SERIAL_JTAG <sup>2</sup>	EFUSE_USB_PRINT_CHANNEL

<sup>1</sup> **Bold** marks the default value and configuration.

<sup>2</sup> EFUSE\_DIS\_USB\_SERIAL\_JTAG controls whether to disable USB Serial/JTAG.

## 6.4 Current Consumption Characteristics

### 6.4.1 RF Current Consumption in Active Mode

The current consumption measurements are taken with a 3.3 V supply at 25 °C ambient temperature.

TX current consumption is rated at a 100% duty cycle.

RX current consumption is rated when the peripherals are disabled and the CPU idle.

Table 11: Current Consumption for Wi-Fi (2.4 GHz) in Active Mode

Work mode	RF Condition	Description	Peak (mA)
Active (RF working)	TX	802.11b, 1 Mbps, @20 dBm	330
		802.11g, 54 Mbps, @17.5 dBm	280
		802.11n, HT20, MCS7, @17 dBm	275
		802.11n, HT40, MCS7, @16.5 dBm	202
	RX	802.11b/g/n, HT20	82
		802.11n, HT40	84.5

**Note:**

The content below is excerpted from *Section Power Consumption in Other Modes* in [ESP8685 Series Datasheet](#).

### 6.4.2 Current Consumption in Other Modes

Table 12: Current Consumption in Modem-sleep Mode

Mode	CPU Frequency (MHz)	Description	Typ	
			All Peripherals Clocks Disabled (mA)	All Peripherals Clocks Enabled (mA) <sup>1</sup>
Modem-sleep <sup>2,3</sup>	160	CPU is running	23	28
		CPU is idle	16	21
	80	CPU is running	17	22
		CPU is idle	13	18

<sup>1</sup> In practice, the current consumption might be different depending on which peripherals are enabled.

<sup>2</sup> In Modem-sleep mode, Wi-Fi is clock gated.

<sup>3</sup> In Modem-sleep mode, the consumption might be higher when accessing flash. For a flash rated at 80 Mbit/s, in SPI 2-line mode the consumption is 10 mA.

Table 13: Current Consumption in Low-Power Modes

Mode	Description	Typ ( $\mu\text{A}$ )
Light-sleep	Wi-Fi are powered down, and all GPIOs are high-impedance	130
Deep-sleep	RTC timer + RTC memory	5
Power off	CHIP_EN is set to low level, the chip is powered off	1

## 7 RF Characteristics

This section contains tables with RF characteristics of the Espressif product.

The RF data is measured at the antenna port, where RF cable is connected, including the front-end loss.

Devices should operate in the center frequency range allocated by regional regulatory authorities. The target center frequency range and the target transmit power are configurable by software. See [ESP RF Test Tool and Test Guide](#) for instructions.

Unless otherwise stated, the RF tests are conducted with a 3.3 V ( $\pm 5\%$ ) supply at 25 °C ambient temperature.

## 9 Peripheral Schematics

This is the typical application circuit of the module connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

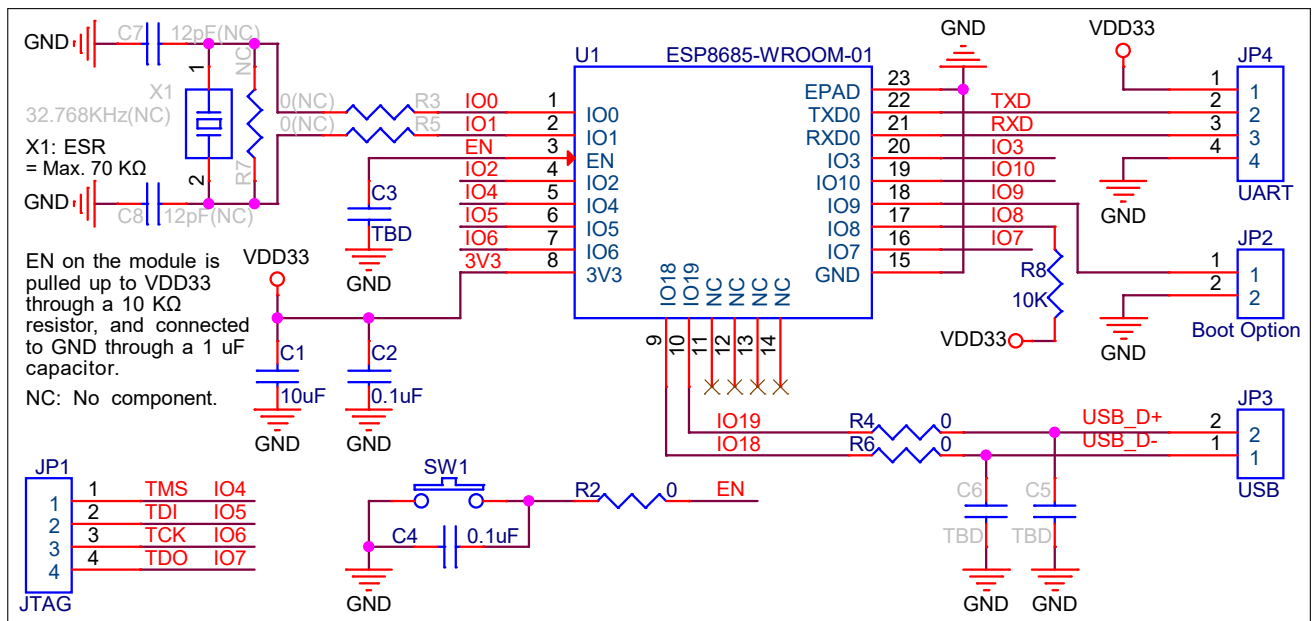

Figure 5: Peripheral Schematics

- Soldering the EPAD to the ground of the base board is not a must, however, it can optimize thermal performance. If you choose to solder it, please apply the correct amount of soldering paste. Too much soldering paste may increase the gap between the module and the baseboard. As a result, the adhesion between other pins and the baseboard may be poor.
- To ensure that the power supply to the ESP8685 chip is stable during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually  $R = 10\text{ k}\Omega$  and  $C = 1\text{ }\mu\text{F}$  (such RC delay circuit has already been built into the module). However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip.

For ESP8685's power-up and reset sequence timing diagram, please refer to [ESP8685 Series Datasheet](#) > Section *Power Supply*.

## 11.2 Module Placement for PCB Design

If module-on-board design is adopted, attention should be paid while positioning the module on the base board. The interference of the base board on the module's antenna performance should be minimized.

For details about module placement for PCB design, please refer to [ESP32-C3 Hardware Design Guidelines](#) > Section *Positioning a Module on a Base Board*.

## 12 Product Handling

### 12.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of  $< 40\text{ }^{\circ}\text{C}$  and 90%RH. The module is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the module must be soldered within 168 hours with the factory conditions  $25\pm 5\text{ }^{\circ}\text{C}$  and 60%RH. If the above conditions are not met, the module needs to be baked.

### 12.2 Electrostatic Discharge (ESD)

- Human body model (HBM):  $\pm 2000\text{ V}$
- Charged-device model (CDM):  $\pm 500\text{ V}$

### 12.3 Reflow Profile

Solder the module in a single reflow.

Figure 8: Reflow Profile

## 12.4 Ultrasonic Vibration

Avoid exposing Espressif modules to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-module crystal and lead to its malfunction or even failure. As a consequence, **the module may stop working or its performance may deteriorate.**
