

# Compressed Texture Transmission Format

Mark Callow gITF Meetup, June 14th, 2018

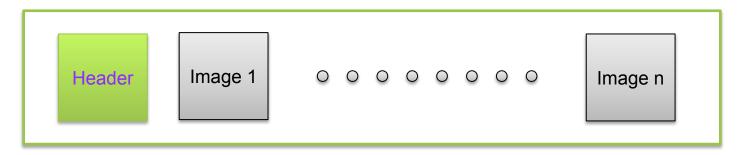

# This Talk Describes a Work in Progress

# **Required Specifications**

- Container
  - Textures often consist of multiple images
  - A container makes for easier use.

• Format(s) for the image bits

# Image Bits - Issues

- Can use image formats defined by the GPU APIs but
  - Uncompressed formats too large for transmission
  - GPU block-compressed formats too large for transmission
  - Compression to GPU formats slow or unavailable on most clients
  - Nightmare of many GPU/Platform-Specific formats

# Image Bits - Solutions Under Discussion

### Rate Distortion Optimization (Crunch RDO Mode)

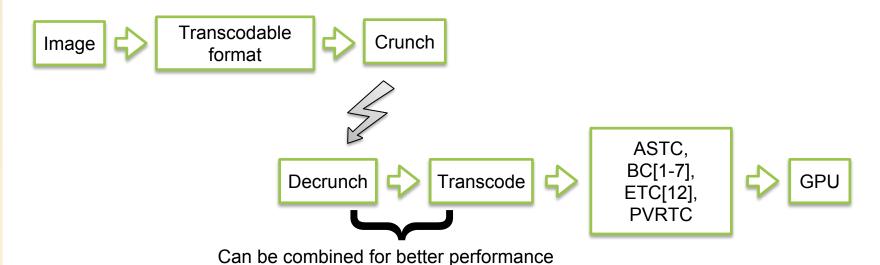

### **Supercompression (Crunch CRN mode)**

# KHRON NOS

# Image Bits - Solutions Under Discussion

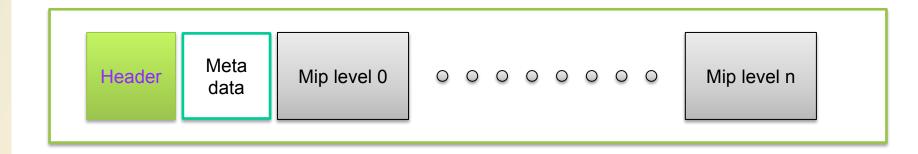

#### **Universal Transcodable Format**

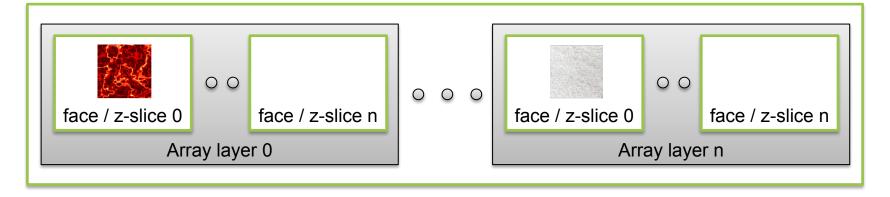

6

# KHRON OS

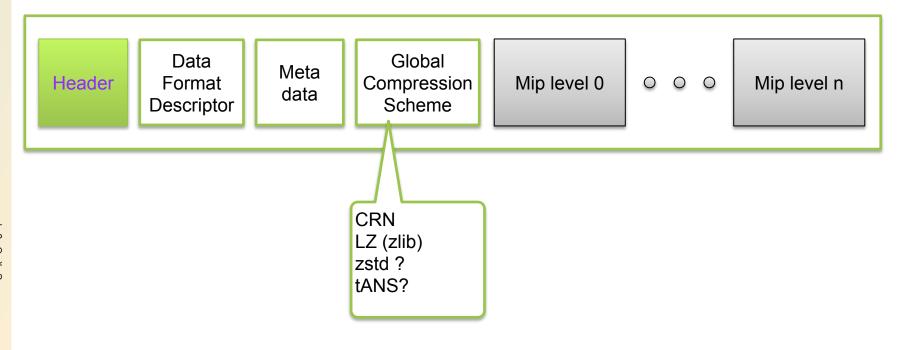

### **KTX File Structure**

**Mip Level Structure** 

### **KTX2** File Structure

### **KTX 2 Header Additions**

- vkFormat field
  - makes loading of Vulkan textures easier
- levelOrder field
  - lets mip levels be ordered from smallest first, enabling streaming

### **Metadata Additions**

- KTXswizzle
  - Indicates desired component mapping for a texture

# **Data Format Descriptor\***

- provides exact description of texel format and color space
  - non-OpenGL and non-Vulkan applications no longer need to understand OpenGL or Vulkan enums to use the image data.
  - provides applications that care about correct color with the necessary information.
  - KTX files can now contain multisample images

<sup>\*</sup> See <a href="https://www.khronos.org/dataformat">https://www.khronos.org/dataformat</a>.

# **Global Compression**

- CRN, LZ (zlib) compression.
  - Inclusion of zstd and tANS under discussion.
  - Use only with RDO mode or uncompressed images
- Transcodable format can be encoded by either CRN or RDO so KTX2 also supports it.

### **Open Issues**

- Specification has several unresolved open issues listed inside.
- Please look. I want your opinion.
  - Read the specification at <a href="http://github.khronos.org/KTX-Specification/">http://github.khronos.org/KTX-Specification/</a>
  - File issues at <a href="https://github.com/KhronosGroup/KTX-Specification">https://github.com/KhronosGroup/KTX-Specification</a>

# WiP Reminder

# Watch these places for progress

Crunch GitHub Repo: <a href="https://github.com/BinomialLLC/crunch">https://github.com/BinomialLLC/crunch</a>

Improvements to Crunch to support ETC were done by Alexander Suvorov of Unity. His blog describing the work is:

https://blogs.unity3d.com/2017/12/15/crunch-compression-of-etc-textures/

Crunch and the transcoders were developed by Rich Geldreich now at Binomial LLC. Some relevant blogs are:

http://richg42.blogspot.com/2018/06/etc1s-texture-format-encoding.html
http://richg42.blogspot.com/2018/05/some-basis-baseline-universal-format.html

KTX2 specification source: <a href="https://github.com/KhronosGroup/KTX-Specification">https://github.com/KhronosGroup/KTX-Specification</a>

KTX software (currently only supports KTX1): <a href="https://github.com/KhronosGroup/KTX-Software">https://github.com/KhronosGroup/KTX-Software</a>.

I am about to land a huge change bringing Vulkan support and much easier use when not using OpenGL or Vulkan
