HITHERTO we have observed only the distinctions of dignity among pleasures of sense, considered merely as such, and the way in which *any* of them may become theoretic in being received with right feeling.

§ 1. *By what test is the health of the Perceptive faculty to be determined?*

But as we go farther, and examine the distinctive nature of ideas of beauty, we shall, I believe, perceive something in them besides æsthetic pleasure, something which attests a more important function belonging to them than attaches to other sensual ideas, and exhibits a more exalted character in the faculty by which they are received. And this was what I alluded to when I said in the chapter already referred to (§ 1)¹ that “we may indeed perceive, as far as we are acquainted with the nature of God, that we have been so constructed as in a healthy state of mind to derive pleasure from whatever things are illustrative of that nature.”

This point it is necessary now farther to develope.

* Without giving new headings to chapters, I think it will be useful to mark occasionally for the reader, in simpler terms than he finds in the text, the real progress of the argument.

The first chapter asserts, and I think with sufficient force proves, that the external creation is not merely useful to man in furnishing him with food, but chiefly in giving him subjects of admiration and reflection.

The second chapter asserts (but has not yet attempted to prove) that this creation cannot be rightly admired, nor truly thought of, but as the work and gift of a loving Creator.

The third chapter now enters on the question, what parts or characters of natural things bear most clearly the evidence of having been so created; and by what faculties we discern and prefer them.² [1883.]

¹ [The chapter, referred to above (p. 48), on “Ideas of Beauty,” in vol. i. of the book, Vol. III. p. 109 in this edition.]

² [This note was in the ed. of 1883 printed at the head of the chapter.]

Our first inquiry must evidently be, how we are authorized to affirm of any man's mind, that it is in a healthy state or otherwise, respecting impressions of sight;¹ and what canon or test there is by which we may determine of these impressions that they are or are not *rightly* esteemed beautiful. For it does not at first appear easy to prove that men ought to like one thing rather than another; and although this is granted generally by men's speaking of 'bad' or 'good' taste, yet the right of individual opinion (sometimes claimed even in moral matters, though then palpably without foundation) does not appear altogether irrational in matters æsthetic, wherein little operation of voluntary choice is supposed possible. It would appear strange, for instance, to assert, respecting a particular person who preferred the scent of violets to that of roses, that he had no right to do so. And yet, while I have said that the sensation of beauty is intuitive and necessary, as men derive pleasure from the scent of a rose, I have assumed that there are some sources from which it is *rightly* derived, and others from which it is *wrongly* derived; in other words, that men have no right to think some things beautiful and no right to remain apathetic with regard to others.

Hence then arise two questions, according to the sense in which the word *right* is taken: the first, in what way an impression of sense may be *deceptive*, and therefore a conclusion respecting it untrue; and the second, in what way an impression of sense, or the preference of one, may be a subject of *will*, and therefore of moral duty or delinquency.

§ 2. *And in what sense may the terms "right" and "wrong" be attached to its conclusions?*

¹ [The words "respecting impressions of sight," were transposed to this place in the 1883 ed.; in previous eds. they came after "any man's mind"; the 1883 ed. also inserted the "and" before "what canon." The latter passage was different in ed. 1, which reads thus:—

"What canon or test is there . . . beautiful? To what authority, when men are at variance with each other on this subject, shall it be deputed to judge which is right? or is there any such authority or canon at all?

"For it does not . . . taste, it is frequently denied, when we press to particulars, by the assertion of each individual that he has a right to his opinion—a right which is sometimes claimed even in moral matters, though then palpably without foundation, but which does not appear," etc.]

To the first of these questions I answer, that we cannot speak of the immediate impression of sense as false, nor of its preference to others as mistaken: for no one can be deceived respecting the actual sensation he perceives or prefers.* But falsity may attach to his assertion or supposition, that what he himself perceives is from the same object perceived by others, or is always to be by himself perceived, or is always to be by himself preferred; and when we speak of a man as wrong in his impressions of sense, we either mean that he feels differently from all, or from a majority, respecting a certain object, or that he prefers at present those of his impressions which ultimately he will not prefer.

To the second I answer, that over immediate impressions and immediate preferences we have no power, but over *ultimate* impressions, and especially ultimate preferences, we have; and that, though we can neither at once choose whether we shall see an object red, green, or blue, nor determine to like the red better than the blue, or the blue better than the red, yet we can, if we choose, make ourselves ultimately susceptible of such impressions in other degrees, and capable of pleasure in them in different measure. And seeing that wherever power of any kind is given there is responsibility attached, it is the duty of men to prefer certain impressions of sense to others, *because* they have the power of doing so.† And this

* I have not sufficiently carried out the analysis here. No note is taken in the passage of diseased conditions of the organs; or imperfect ones; jaundice or colour-blindness is not thought of as affecting the argument. But it is supposed that there may not be exact similarity in sensations, even among healthy and well-organized persons, and that when we say that we dislike, or like, peppermint or aniseed, it is conceivable that peppermint to some noses may not be exactly the same thing as peppermint to others. It is, however, most rational and simple to assume what is certainly the clearest probability, that the general sensations of humanity are approximately alike; that a taste for garlic or aniseed is an artificially acquired one, and that one for castor oil or asafætida¹ would only be acquired by great perseverance. [1883.]

† This rather astounding paragraph was anciently parted from the preceding text only by a semicolon! I have fenced it, at least, with two fullstops; for it is, in fact, the radical theorem, not only of this book, but of all my writings on art. [1883.]

¹ [Cf. a similar remark in *Letters to a College Friend*, Vol. I. p. 450.]

is precisely analogous to the law of the moral world, whereby men are supposed not only capable of governing their likes and dislikes, but the whole culpability or propriety of actions is dependent upon this capability; so that men are guilty or otherwise, not for what they do, but for what they desire, the command being not Thou shalt obey, but Thou shalt love, the Lord thy God; a vain command if men were not capable of governing and directing their affections.¹

I assert, therefore, that even with respect to impressions of sense, we have a power of preference, and a corresponding duty; and I shall show first the nature of the power, and afterwards the nature of the duty.

§ 3. *What power we have over impressions of sense.*

Let us take an instance from one of the lowest of the senses, and observe the kind of power we have over the impressions of lingual taste. On the first offering of two different things to the palate, it is not in our power to prevent or command the instinctive preference. One will be unavoidably and helplessly preferred to the other. But if the same two things be submitted to judgment frequently and attentively, it will be often found that their relations change. The palate, which at first perceived only the coarse and violent qualities of either, will, as it becomes more experienced, acquire greater subtlety of discrimination, perceiving in both characters² at first unnoticed, which on continued experience will probably become more influential than the first impressions; and whatever this final verdict may be, it is felt by the person who gives it, and received by others, as a more correct one than the first.

So, then, the power we have over the preference of impressions of taste is not actual nor immediate, but only a power of testing and comparing them frequently and carefully, until that which is the more permanent, the more consistently agreeable, be determined.

§ 4. *Depends on acuteness of attention.*

¹ [Matthew xxii. 37. Ed. 1 reads: "which, if men were not . . . affections, would be the command of an impossibility."]

² [For "characters" ed. 1 reads "agreeable or disagreeable qualities."]

But when the instrument of taste is thus in some degree perfected and rendered subtle, by its being practised upon a single object, its conclusions will be more rapid with respect to others; and it will be able to distinguish more quickly in other things, and even to prefer at once those qualities which are calculated finally to give it most pleasure, though more capable with respect to those on which it is more frequently exercised; whence people are called ‘judges’ with respect to this or that particular object of Taste.

Now, that verdicts of this kind are received as authoritative by others, proves another and more important fact; namely, that not only changes of opinion take place in consequence of experience, but that those changes are from *variation* of opinion to *unity* of opinion;—and that whatever may be the differences of estimate among unpractised or uncultivated tastes, there will be unity of taste among the experienced; and that, therefore, the result of repeated trial and experience is to arrive at principles of preference in some sort common to all, and which are a part of our nature.

I select the sense of taste for an instance, because it is the least favourable to the position I hold, since there is more latitude allowed, and more actual variety of verdict, in the case of this sense than of any other, and yet, however susceptible of variety even the ultimate approximations of its preferences may be, the authority of judges is distinctly allowed; and we hear every day the admission, by those of unpractised palate, that they are, or may be, wrong in their opinions respecting the real pleasurable-ness of things either to themselves or to others.

The sense, however, in which they thus use the word “wrong” is merely that of falseness or inaccuracy in conclusion, not of moral delinquency. But there is, as I have stated, a duty, more or less imperative, attached to every power we possess, and therefore to this power over the lower senses as well as to all others.

§ 5. *Ultimate conclusions universal.*

§ 6. *What duty is attached to this power over impressions of sense.*

And this duty is, evidently, to bring every sense into that state of cultivation in which it shall form the truest conclusions respecting all that is submitted to it, and procure us the greatest amount of pleasure consistent with its due relation to other senses and functions. Which three constituents of perfection in sense, (1) true judgment, (2) maximum sensibility, and (3) right relation to others, are invariably coexistent and involved one by the other; for the true judgment is the result of the high sensibility, and the high sensibility of the right relation.* Thus, for instance, with respect to pleasures of taste, it is our duty not to devote such inordinate attention to the discrimination of them as must be inconsistent with our pursuit, and destructive of our capacity, of higher and preferable pleasures, but to cultivate the sense of them in that way which is consistent with all other good; by temperance, namely, and by such attention as the mind, at certain resting moments, may fitly pay even to so ignoble a source of pleasure as this. By which discipline we shall bring the faculty of taste itself to its real maximum of sensibility;† for it cannot be doubted that health, hunger, and such general refinement of bodily habits as shall make the body a perfect and fine instrument in all respects, are better promoters of actual enjoyment of taste, than the sickened, sluggish, hard-stimulated fastidiousness of Epicurism.

So also it will certainly be found with all the senses, that they § 7. *How re-* individually receive the greatest and purest pleasure *warded.* when they are in right condition and degree of subordination to all the rest; and that by the overcultivation of any one (for morbid sources of pleasure, and correspondent temptations to irrational indulgence, confessedly are attached to all) we shall add more to their power as instruments of punishment than of pleasure.

* This paragraph reads rather headlong, again; but it is well considered and extremely weighty and valuable. [1883.]

† Alas, for all this fine talking, I never took pains enough to learn from my father to be a good judge of wine; an unfilial folly of which I daily repent,—with such a sense of its cruelty and absurdity as—I need not try to express, since it would not be believed. [1883.]

If then, as we find in this example of the lowest sense, the power we have over sensation depends mainly on the exercise of attention through certain prolonged periods; and if by this exercise we arrive at ultimate, constant, and common sources of agreeableness, casting off those which are external, accidental, and individual;¹ that which is required in order to the attainment of accurate conclusions respecting the essence of the Beautiful is nothing more than earnest, loving, and unselfish attention to our impressions of it, by which those which are shallow, false, or peculiar to times and temperaments, may be distinguished from those that are eternal. And this dwelling upon and fond contemplation of them (the *Anschauung* of the Germans),* is perhaps as much as was meant by the Greek *Theoria*: and it is indeed a very noble exercise of the souls of men, and one by which they are peculiarly distinguished from the anima of lower creatures, which cannot, I think, be proved to have any capacity of contemplation at all, but only a restless vividness of perception and conception, the “fancy” of Hooker (*Eccl. Pol.*, book i. chap. vi. 2).²

But two very important points are to be observed respecting the direction and discipline of the attention in the early

* I have not the least idea, now, what the “*Anschauung*” of the Germans is; and whatever it may be, beg my pupils to have nothing to do with it. [1883.]³

¹ [Ed. 1 does not contain the passage “If then, as we find . . . individual,” but reads, “That then which is required,” etc.]

² [Ed. 1 adds a further sentence to this paragraph thus:—

“And yet this dwelling upon them comes not up to that which I wish to express by the word *Theoria*, unless it be accompanied by full perception of their being a gift from and manifestation of God, and of all those other nobler emotions before described, since not until so felt is their essential nature comprehended.”]

³ [But see in *Love’s Meinie*, ch. iii., a passage in which Ruskin explains that “for what is now called ‘æsthesis’ he used the word ‘sensation’ (the sensation of cold or heat, of a peacock’s or a lark’s cry, etc.). “But,” he adds, “for the Perception of Beauty, I always used Plato’s word, which is the proper word in Greek, and the only possible *single* word that can be used in any other language by any man who understands the subject,—’*Theoria*,—the Germans only having a term parallel to it, ‘*Anschauung*,’ assumed to be its equivalent in p. 22 of the old edition of *Modern Painters*, but which is not its real equivalent, for *Anschauung* does not (I believe) *include* bodily sensation, whereas Plato’s *Theoria* does, so far as is necessary; and mine, somewhat more than Plato’s.” For Ruskin’s dislike of German philosophy, see the parody in the next volume, ch. xii. § 3 n. and Appendix ii., and *Præterita*, i. ch. xii. § 252.]

stages of judgment. The first, that, for beneficent purposes, the nature of man has been made reconcilable by custom to many things naturally painful to it, and even improper for it; and that therefore, though by continual experience, united with thought, we may discover that which is best of several, yet if we submit ourselves to authority or fashion, and close our eyes, we may be by custom made to tolerate, and even to love and long for, that which is naturally painful and pernicious to us; whence arise incalculable embarrassments on the subject of art.

§ 8. *Errors induced by the power of habit.*

The second, that, in order to the discovery of that which is better of two things, it is necessary that both should be equally submitted to the attention, and therefore that we should have so much faith in authority as shall make us repeatedly observe and attend to that which is said to be right, even though at present we may not feel it so. And in the right mingling of this faith with the openness of heart which proves all things, lies the great difficulty of the cultivation of the taste, as far as the spirit of the scholar is concerned; though, even when he has this spirit, he may be long retarded by having evil examples submitted to him by ignorant masters.*

§ 9. *The necessity of submission in early stages of judgment.*

The temper,¹ therefore, by which right taste is formed, is characteristically patient. It dwells upon what is submitted to it. It does not trample upon it, lest it should be pearls, even though it look like husks. It is a good ground, soft, penetrable, retentive; it does not send up thorns of unkind thoughts, to choke the weak seed; it is hungry and thirsty too, and drinks all the dew that falls on it. It is “an honest and good

* This and the next paragraph are of extreme value and importance. The eleventh paragraph should be also remembered in connection with them. [1883.]

¹ [The passage from here to the end of § 9 is § 2 in *Fronde Agrestes*. For “characteristically” ed. 1 reads “first”; and in ed. 1 there are commas and in ed. 2 semicolons instead of full-stops, after “submitted to it,” “husks,” and “falls on it.”]

heart,”¹ that shows no too ready springing before the sun be up, but fails not afterwards; it is distrustful of itself, so as to be ready to believe and to try all things, and yet so trustful of itself, that it will neither quit what it has tried, nor take anything without trying. And the pleasure which it has in things that it finds true and good is so great, that it cannot possibly be led aside by any tricks of fashion, or diseases of vanity; it cannot be cramped in its conclusions by partialities and hypocrisies; its visions and its delights are too penetrating, too living, for any whitewashed object or shallow fountain long to endure or supply. It clasps all that it loves so hard, that it crushes it if it be hollow.

Now, the conclusions of this disposition are sure to be eventually right; more and more right according to the general maturity of all the powers, but it is sure to come (*quite*)* right at last, because its operation is in analogy to, and in harmony with, the whole spirit of the Christian moral system, and must ultimately love and rest in the great sources of happiness common to all the human race, and based on the relations they hold to their Creator.

These common and general sources of pleasure consist, I believe, in a certain seal, or impress of divine work and character, upon whatever God has wrought in all the world; only, it being necessary for the perception of them, that their contraries should also be set before us, these divine characteristics, though inseparable from all divine works, are yet suffered to exist in such varieties of degree, that their most limited manifestation shall, in opposition to their most abundant, act as a foil or contrary; just as we conceive of cold as contrary to heat, though the most extreme cold we can produce or conceive is not inconsistent with an unknown amount of heat in the body.

* I have inserted this “quite” because I meant it, and the sentence needs it; but I must beg the reader to observe that I don’t, even now, think myself *quite* right in *all* matters, even of taste. [1883.]

¹ [Luke viii. 15.]

§ 10. *The large scope of matured judgment.*

Our purity of taste, therefore, is best tested by its universality; for if we can only admire this thing or that, we may be sure that our cause for liking is of a finite and false nature. But if we can perceive beauty in everything of God's doing, we may argue that we have reached the true perception of its universal laws. Hence, false taste may be known by its fastidiousness, by its demands of pomp, splendour, and unusual combination, by its enjoyment only of particular styles and modes of things, and by its pride also: for it is for ever meddling, mending, accumulating, and self-exulting; its eye is always upon itself, and it tests all things round it by the way they fit it. But true taste is for ever growing, learning, reading, worshipping, laying its hand upon its mouth because it is astonished, lamenting over itself, and testing itself by the way that it fits things.¹ And it finds whereof to feed, and whereby to grow, in all things. The complaint so often heard from young artists, that they have not within their reach materials or subjects enough for their fancy, is utterly groundless, and the sign only of their own blindness and inefficiency; for there is that to be seen in every street and lane of every city,—that to be felt and found in every human heart and countenance,—that to be loved in every roadside weed and moss-grown wall which, in the hands of faithful men, may convey emotions of glory and sublimity continual and exalted.

Let therefore the young artist beware of the spirit of Choice;* it is an insolent spirit at the best, and commonly a base and blind one too, checking all progress and blasting all power, encouraging weaknesses, pampering partialities, and teaching us to look to accidents of nature for the help and the joy which should come from our own hearts. He draws nothing well who

* "Nothing comes amiss,
A good digestion turneth all to health."—G. HERBERT.²

¹ [Very true of Ruskin himself; see above, Introduction, p. xxxix.]

² [*The Church Porch*, lx.]

thirsts not to draw *everything*; when a good painter shrinks, it is because he is humbled, not fastidious; when he stops, it is because he is surfeited, and not because he thinks Nature has given him unkindly food, or that he fears famine.*¹

Hence, it becomes a more imperative duty to accustom ourselves to the enjoyment of those pleasures of sight which are most elevated in character, because these are not only the most acute, but the most easily, constantly, and unselfishly attainable.[†] For had it been ordained by the Almighty² that the highest pleasures of sight should be those of most difficult attainment, and that to arrive at them it should be necessary to accumulate gilded palaces, tower over tower, and pile artificial mountains around insinuated lakes, there would have been a direct contradiction between the unselfish duties and inherent desires of every individual. But no such contradiction exists in the system of Divine Providence; which, leaving it open to us if we will, as creatures in probation, to abuse this sense like every other, and pamper it with selfish and thoughtless vanities as we pamper the palate with deadly meats, until the appetite of tasteful cruelty is lost in its sickened

* Yet note the difference between the choice that comes of Pride, and the choice that comes of Love, and compare Chap. XV. § 6.

[†] This is all true, in the sense attached to it; but requires reconciliation with what I have said elsewhere of the rarity of extremely beautiful things.³ I will not trouble the reader at present with more than the immediate statement in the text. [1883.]

¹ [Ed. 1 adds a sentence, and reads as follows:—

“ . . . fears famine. I have seen a man of true taste pause for a quarter of an hour to look at the channellings that recent rain had traced in a heap of cinders.

“And here is evident another reason of that duty which we owe respecting our impressions of sight, namely, to discipline ourselves to the enjoyment of those which are eternal in their nature, not only because these are the most acute, but because they are the most easily . . .”]

² [The passage “For had it been” down to the end of § 13 is § 4 in *Fronde Agrestes*, where, at this point, Ruskin added the following note:—

“The reader must observe, that having been thoroughly disciplined in the Evangelical schools, I supposed myself, at four-and-twenty, to know all about the ordinances of the Almighty. Nevertheless, the practical contents of the sentence are good; if only they are intelligible, which I doubt.”]

³ [See *Modern Painters*, vol. i. pt. ii. sec. i. ch. iv. § 3, Vol. III. p. 156 of this edition.]

satiety, incapable of pleasure, unless, Caligula like,¹ it concentrate the labour of a million of lives into the sensation of an hour, leaves it also open to us, by humble and loving ways, to make ourselves susceptible of deep delight from the meanest objects of creation;—a delight which shall not separate us from our fellows, nor require the sacrifice of any duty or occupation, but which shall bind us closer to men and to God, and be with us always, harmonized with every action, consistent with every claim, unchanging and eternal.

Seeing then that these qualities of material objects which are calculated to give us this universal pleasure, are demonstrably constant in their address to human nature, they must belong in some measure to whatever has been esteemed beautiful throughout successive ages of the world, and they are also by their definition common to all the works of God. Therefore it is evident that it must be possible to reason them out, as well as to feel them out; possible to divest every object of that which makes it accidentally or temporarily pleasant, and to strip it bare of distinctive qualities, until we arrive at those which it has in common with all other beautiful things, which we may then safely affirm to be the cause of its ultimate and true delightfulness.

Now this process of reasoning will be that which I shall endeavour to employ in the succeeding investigations, a process perfectly safe, so long as we are quite sure that we are reasoning concerning objects which produce in us one and the same sensation, but not safe if the sensation produced be of a different nature,* though it may be equally agreeable; for what produces a different

* The word "nature" is not sufficiently explained in this passage; and it ought to have reiterated in full,—what produces "a sensation of a different nature" must be a different cause; for instance, the prick of a thorn on the tongue as distinguished from the pungency of a flavour. Mr. Alison would have called both beautiful, or both ugly, indiscriminately. [1883.]

¹ [The reference is to Caligula's scheme for building a city upon the highest Alps, or to the bridge which he threw across from Baiae to Puteoli, upwards of three miles in length, in order to march along it in state and furnish a two days' wonder to the world; see Suetonius, c. 19.]

sensation must be a different cause. And the difficulty of reasoning respecting Beauty arises chiefly from the ambiguity of the word, which stands in different people's minds for totally different sensations, for which there can be no common cause.

When, for instance, Mr. Alison endeavours to support his position, that "no man is sensible to beauty in those objects with regard to which he has not previous ideas," by the remark that "the beauty of a theory, or of a relic of antiquity, is unintelligible to a peasant,"¹ we see at once that it is hopeless to argue with a man who, under his general term Beauty, may, for anything we know, be sometimes speaking of mathematical demonstrability and sometimes of historical interest.² While, even if we could succeed in limiting the term to the sense of external attractiveness, there would be still room for many phases of error; for though the beauty of a snowy mountain and of a human cheek or forehead, so far as both are considered as mere matter, is the same, and traceable to certain qualities of colour and line, common to both, and by reason extricable; yet the flush of the cheek and moulding of the brow, as they express modesty, affection, or intellect, possess sources of agreeableness* which are not common to the snowy mountain, and the interference of whose influence we must be cautious to prevent in our examination of those which are material or universal.[†]

The first thing, then, that we have to do, is accurately to

* The general tendency of modern art, under the guidance of Paris, renders it necessary to explain now to the reader, what I before left him to feel, that the sexual instinct is entirely excluded from consideration throughout the argument of this essay; I take no notice of the feelings of the beautiful, which we share with flies and spiders. Conf. the 2nd paragraph of next chapter. [1883.]

† Compare Spenser (Hymn to Beauty):

"But ah, believe me, there is more than so,
That works such wonders in the minds of men."

¹ [*Essays on the Nature and Principles of Taste*, by Archibald Alison, LL.B., F.R.S. (1st ed. 1790), Essay i., ch. i. § 3 (vol. i. p. 37 of the 4th ed. of 1815).]

² [*Cf. a similar remark in Letters to a College Friend*, Vol. I. p. 450.]

discriminate and define those appearances from which we are about to reason as belonging to beauty, properly so called, and to clear the ground of all the confused ideas and erroneous theories with which the misapprehension or metaphorical use of the term has encumbered it.

§ 16. *The term "beauty," how limitable in the outset. Divided into typical and vital.*

By the term Beauty, then, properly are signified two things. First, that external quality of bodies already so often spoken of, and which, whether it occur in a stone, flower, beast, or in man, is absolutely identical, which, as I have already asserted, may be shown to be in some sort typical of the Divine attributes, and which therefore I shall, for distinction's sake, call Typical Beauty: and, secondarily, the appearance of felicitous fulfilment of function in living things, more especially of the joyful and right exertion of perfect life in man; and this kind of beauty I shall call Vital Beauty.

Any application of the word Beautiful to other appearances or qualities than these is either false or metaphorical; as, for instance, to the splendour of a discovery, the fitness* of a proportion, the coherence of a chain of reasoning,¹ or the power of bestowing pleasure which objects receive from association, a power confessedly great, and interfering, as we shall presently find, in a most embarrassing way with the attractiveness of inherent beauty.

But in order that the mind of the reader may not be biassed at the outset by that which he may happen to have received of current theories respecting beauty, founded on the

* *Constructive* fitness, I should have said, or mechanical; as between the length of arms in a lever. [1883.]

¹ [In the first draft this point, of the loose use of the term beauty, is put in a more familiar way:—

“The clown in every Christmas pantomime licking the freshly purloined ham, immediately informs us that it's ‘Beautiful. ‘ ‘Beautiful, ‘ exclaims the young surgeon beneath his breath, as he watches the quivering muscles and curdling veins writhe and knot beneath the swift knife of the practised operator. ‘Beautiful, ‘ exclaims the mathematician, as he finishes the investigation of one of Newton's boldest problems. Are we to suppose because in these three cases the same word is used that there is anything of common feeling between any one of them and the artist who stands for the first time before Raphael's St. Catherine?”]

above metaphorical uses of the word (theories which are less to be reprobated as accounting falsely* for the sensations of which they treat, than as confusing two or more pleasurable sensations together), I shall briefly glance at the four erroneous positions most frequently held upon this subject, before proceeding to examine those typical and vital properties of things, to which I conceive that all our original conceptions of beauty may be traced.

* I meant, that they are not so false, or sometimes are not false at all, in accounting, etc. [1883.]

CHAPTER IV

OF FALSE OPINIONS HELD CONCERNING BEAUTY*

I PURPOSE at present to speak only of four of the more current opinions respecting Beauty, for of the errors connected with the pleasurable-ness of constructive¹ proportion, and of the expression of right feelings in the countenance, I shall have opportunity to treat in the succeeding chapters (compare Ch. VI., Ch. XIV.).

Those erring or inconsistent positions which I would at once dismiss are: the first, that the Beautiful is the True; the second, that the Beautiful is the Useful; the third, that it is dependent on Custom; and the fourth, that it is dependent on the Association of Ideas.

(A) To assert that the Beautiful is the True, appears, at first, like asserting that propositions are matter, and matter propositions. But giving the best and most rational interpretation we can, and supposing the holders of this strange position to mean only that things are beautiful which appear what they indeed are, and ugly which appear what they are not, we find them instantly contradicted by each and every conclusion of experience. A stone looks as truly a stone as a rose looks a rose, and yet is not so beautiful: a cloud may look more like a castle than a cloud, and be the more beautiful on that account. The mirage of the desert is fairer than its sands; the false image of the under heaven fairer than the

* The whole of this chapter is extremely well reasoned and clearly put; nor can I in any necessary point better it. The importance of its contents to future analysis may justify my requesting the reader's fixed attention to its distinctions and definitions. [1883.]²

¹ [The word "constructive" was inserted in the 1883 ed.]

² [This note was in the ed. of 1883 printed at the head of the chapter.]

sea.* I am at a loss to know how any so untenable a position could ever have been advanced; but it may, perhaps, have arisen from some confusion of the beauty of art with the beauty of nature, and from an illogical expansion of the very certain truth, that nothing is beautiful in art, which, professing to be an imitation, or a statement, is not as such in some sort true.†

(B) That the Beautiful is the Useful, is an assertion evidently based on that limited and false sense of the latter term which I have already deprecated. As it is the most degrading and dangerous supposition which can be advanced on the subject, so, fortunately, it is the most palpably absurd. It is to confound admiration with hunger, love with lust, and life with sensation; it is to assert that the human creature has no ideas and no feelings except those ultimately referable to its brutal appetites. It has not a single fact nor appearance of fact to support it, and needs no combating; at least until its advocates have obtained the consent of the majority of mankind, that the most beautiful productions of nature are seeds and roots; and of art, spades and millstones.

(C) Somewhat more rational grounds appear for the assertion that the sense of the Beautiful arises from Familiarity with the object, though even this could not long be maintained by a thinking person. For all that can be alleged in defence of such a supposition is, that familiarity deprives some objects, which at first appeared ugly, of much of their repulsiveness;‡ whence it is as rational to conclude that

* I should have written, "image of heaven under the sea, fairer than the sea itself." [1883.]

† Observe the careful limitation,—*in some sort* true. Altogether true, it never can be,—far short of true, it often *ought* to be. [1883.]

‡ The sternest sense of Johnson, and brightest wit of Goldsmith, have been used to exhibit the follies of fashion, and show the power of national habit; but they never seriously deny the reality of beauty, however the Chinese Citizen of the World may be shocked by the white teeth and long feet of English ladies.¹ [1883.]

[¹ These references are explained in the next volume, ch. iii. §§ 1, 2, where Ruskin reverts to the subject here discussed.]

§ 2. *Of the false opinion that Beauty is Usefulness. Compare Chap. XII. § 5.*

§ 3. *Of the false opinion that Beauty results from Custom. Compare Chap. VI. § 1.*

familiarity is the cause of beauty, as it would be to argue that because it is possible to acquire a taste for olives, therefore custom is the cause of lusciousness in grapes.¹ Nevertheless, there are some phenomena resulting from the tendency of our nature to be influenced by habit, of which it may be well to observe the limits.

Custom has a two-fold operation; the one to deaden the frequency and force of repeated impressions, the other to endear the familiar object to the affections. Commonly, where the mind is vigorous, and the power of sensation very perfect, it has rather the last operation than the first; with meaner minds, the first takes place in the higher degree, so that they are commonly characterized by a desire of excitement, and the want of the loving, fixed, theoretic power. But both take place in some degree with all men; so that as life advances impressions of all kinds become less rapturous, owing to their repetition. It is however beneficently ordained that repulsiveness shall be diminished by custom in a far greater degree than the sensation of beauty; so that the anatomist in a little time loses all sense of horror in the torn flesh and carious bone, while the sculptor ceases not to feel, to the close of his life, the deliciousness of every line of the outward frame. So then, as in that with which we are made familiar the repulsiveness is constantly diminishing, and such claims as it may be able to put forth on the affections are daily becoming stronger, while, in what is submitted to us of new or strange, that which may be repulsive is felt in its full force while no hold is as yet laid on the affections, there is a very strong preference induced in most minds for that to which they are accustomed over that they know not, and this is strongest in those which are least open to sensations of positive beauty. But however far this operation may be carried, its utmost effect is but the deadening and approximating of the sensations of beauty and ugliness. It never mixes, nor crosses, nor in any way alters them; it

§ 4. *The two-fold operation of Custom. It deadens sensation, but confirms affection.*

§ 5. *But never either creates or destroys the essence of Beauty.*

¹ [For another refutation of the theory that beauty results from custom, see *Lectures on Architecture and Painting*, § 10.]

has not the slightest connection with, or power over, their nature. By tasting two wines alternately, we may deaden our perception of their flavour; nay, we may even do more than can ever be done in the case of sight, we may confound the two flavours together; but it will hardly be argued, therefore, that custom is the cause of either flavour. And so, though by habit we may deaden the effect of ugliness or beauty, it is not for that reason to be affirmed that habit is the cause of either sensation. We may keep a skull beside us¹ as long as we please, we may overcome its repulsiveness, we may render ourselves capable of perceiving many qualities of beauty about its lines, we may contemplate it for years together if we will,—it and nothing else,—but we shall not get ourselves to think as well of it as of a child's fair face.

It would be easy to pursue the subject farther, but I believe that every thoughtful reader will be perfectly well able to supply farther illustrations, and sweep away the sandy fountains of the opposite theory, unassisted. Let it, however, be observed, that, in spite of all custom, an Englishman § 6. *Instances.* instantly acknowledges, and at first sight, the superiority of the turban to the hat, or of the plaid to the coat; that, whatever the dictates of immediate fashion may compel, the superior gracefulness of the Greek or middleage costumes is invariably felt; and that, respecting what has been asserted of negro nations looking with disgust on the white face, no importance whatever is to be attached to the opinions of races who have never received any ideas of beauty whatsoever (these ideas being only received by minds under some certain degree of cultivation),² and whose disgust arises

¹ [As Ruskin himself at one time did; see *Præterita*, iii. ch. ii. § 25, and *cf.* Vol. II. p. 57 *n.* of this edition.]

² [Ed. 2 here adds a footnote, given in ed. 1 among the Addenda at the end, as follows:—

“Some confusion may arise in the mind of the reader on comparing this passage with others in the course of the volume, such as the second paragraph of the next chapter, in which the instinctive sense of beauty is asserted as existing in the child. But it is necessary always to observe the distinction made in the second chapter between the instinctive, or æsthetic, and the real or theoretic perception of Beauty; and farther, it is to be remembered, that every elevated human instinct is in a measure put under voluntary power, and

naturally from what they may suppose to be a sign of weakness or ill health. It would be futile to proceed into farther detail.

I pass to the last and most weighty theory, that the agreeableness in objects which we call Beauty, is the result of the Association with them of agreeable or interesting ideas.

(D) Frequent has been the support and wide the acceptance of this supposition, and yet I suppose that no two consecutive sentences were ever written in defence of it, without involving either a contradiction or a confusion of terms.¹ Thus Alison: "There are scenes undoubtedly more beautiful than Runnymede, yet, to those who recollect the great event that passed there, there is no scene perhaps which so strongly seizes on the imagination²:"—where we are wonder-struck at the audacious obtuseness which would prove the power of imagination by its *overcoming that very other power* (of inherent beauty) whose existence the arguer denies. For the only logical conclusion which can possibly be drawn from the above sentence is, that imagination is *not* the source of beauty, for although no scene seizes so strongly on the imagination, yet there are scenes "more beautiful than Runnymede." And though instances of self-contradiction as laconic and complete as this are³ to be found in few writers except Alison,* yet if the arguments on the subject be fairly sifted from the mass of confused language with which they are always encumbered, and placed

* The reader must not confuse the metaphysician with the historian. I know no work of as wide range in which the argument is more logically sustained, or more justly in many points conclusive, than that of Sir A. Alison's *History of Europe*. [1883.]⁴

when highly cultivated, appears in increasing purity and intensity in each succeeding generation, or, on the other hand, diminishes until the race sinks into degradation nearly total, out of which no general laws may safely be deduced."]

¹ [On this subject, cf. *Letters to a College Friend*, Vol. I. p. 450.]

² [*Essays on the Nature and Principles of Taste*, 1815 ed., i. 25.]

³ [For "are to be found . . . Alison," eds. 1 and 2 read "are rare," and also omit the words "and placed in logical form," and instead of "involve . . . syllogisms," read "fall into . . . forms."]

⁴ [For a less favourable opinion of Alison's *History of Europe*, see Vol. I. p. 458.]

in logical form, they will be found invariably to involve one of these two syllogisms: either, Association gives pleasure, and Beauty gives pleasure, therefore Association is Beauty; or, the power of Association is stronger than the power of Beauty, therefore the power of Association *is* the power of Beauty.¹

Nevertheless* it is necessary for us to observe the real value and authority of association in the moral system, and how ideas of actual beauty may be affected by it, otherwise we shall be liable to embarrassment throughout the whole of the succeeding argument.

§ 8. Association is, first, rational. It is of no efficiency as a cause of Beauty.

Association is of two kinds, Rational and Accidental. By Rational Association I understand the interest which any object may bear historically, as having been in some way connected with the affairs or affections of men; an interest shared in the minds of all who are aware of such connection: which to call beauty is mere and gross confusion of terms; it is no theory to be confuted, but a misuse of language to be set aside, a misuse involving the positions that in uninhabited countries the vegetation has no grace, the rock no dignity, the cloud no colour, and that the snowy summits of the Alps receive no loveliness from the sunset light, because they have not been polluted by the wrath, ravage, and misery of men.[†]

By Accidental Association, I understand the accidental

* The four false theories are now dismissed; nor farther regarded throughout the whole essay. [1883.]

† It is curious to note in this passage the single emotion of youth, so often described by Wordsworth.² The more advanced perception indicated in the opening paragraph of the "Lamp of Memory," in the *Seven Lamps*, should be compared. As I have grown older, the aspects of nature conducive to human life have become hourly more dear to me; and I had rather now see a brown harvest field than the brightest Aurora Borealis. [1883.]

¹ [For some additional passages on this subject, printed from the author's first draft, see Appendix i., pp. 365–366.]

² [As, for instance, in the passage quoted below, at the end of § 11, and in the *Ode on Intimations of Immortality*; in which connection see *Præterita*, i. ch. xii. § 244.]

connection of ideas and memories with material things, owing to which those material things are regarded as agreeable or otherwise, according to the nature of the feelings or recollections they summon; the association being commonly involuntary and oftentimes so vague as that no distinct image is suggested by the object, but we feel a painfulness in it or pleasure from it, without knowing wherefore. Of this operation of the mind (which is that of which I spoke as causing inextricable embarrassments on the subject of beauty) the experience is constant, so that its more energetic manifestations require no illustration. But I do not think that the minor degrees and shades of this great influence have been sufficiently appreciated. Not only all vivid emotions, and all circumstances of exciting interest, leave their light and shadow on the senseless things and instruments among which, or through whose agency, they have been felt or learned, but I believe that the eye cannot rest on a material form, in a moment of depression or exultation, without communicating to that form a spirit and a life,—a life which will make it afterwards in some degree loved or feared,—a charm or a painfulness for which we shall be unable to account even to ourselves, which will not indeed be perceptible, except by its delicate influence on our judgment in cases of complicated beauty.¹ Let the eye but rest on a rough piece of branch of curious form during a conversation with a friend, rest however unconsciously, and though the conversation be forgotten, though every circumstance connected with it be as utterly lost to the memory as though it had not been, yet the eye will, through the whole life after, take a certain pleasure in such boughs which it had not before, a pleasure so slight, a trace of feeling so delicate, as to leave us utterly unconscious of its peculiar power; but undestroyable by any reasoning, a part, thenceforward, of our constitution, destroyable only by the same arbitrary process

§ 9. *Association accidental. The extent of its influence.*

¹ [The words, "which will not . . . beauty," were omitted in ed. 2, which also reads "some rude or uncouth form" for "a rough piece of branch of curious form," and, five lines lower down, "forms" for "boughs."]

of association by which it was created. Reason has no effect upon it whatsoever. And there is probably no one opinion which is formed by any of us, in matters of taste, which is not in some degree influenced by unconscious association of this kind. In many who have no definite rules of judgment, preference is decided by little else, and thus, unfortunately,* its operations are mistaken for, or rather substituted for, those of inherent beauty, and its real position and value in the moral system are in a great measure overlooked.

For I believe that mere pleasure and pain have less associative power than duty performed or omitted, and that the great use of the Associative faculty is not to add beauty to material things, but to add force to the Conscience. But for this external and all-powerful witness, the voice of the inward guide might be lost in each particular instance, almost as soon as disobeyed; the echo of it in after time, whereby, though perhaps feeble as warning, it becomes powerful as punishment, might be silenced, and the strength of the protection pass away in the lightness of the lash. Therefore it has received the power of enlisting external and unmeaning things in its aid, and transmitting to all that is indifferent its own authority to reprove or reward; so that, as we travel the way of life, we have the choice, according to our working, of turning all the voices of Nature into one song of rejoicing, and all her lifeless creatures into a glad company, whereof the meanest shall be beautiful in our eyes by its kind message, or of withering and quenching her sympathy into a fearful withdrawn silence of condemnation, or into a crying out of her stones, and a shaking of her dust against us. Nor is it any marvel that the theoretic faculty should be overpowered by this momentous operation, and the indifferent appeals and inherent glories of external things in the end overlooked, when the perfection of God's works is felt only as the sweetness of His

* "Unfortunately" is a wrong word here. Nothing is unfortunate in the system of our nature; we become unfortunate in refusing to understand it and obey. See the more careful sequel, § 11, "And it is well for us," etc. [1883.]

§ 10. *The dignity of its function.*

promises, and their admirableness only as the threatenings of His power.

But it is evident that the full exercise of this noble function of the Associative faculty is inconsistent with absolute and incontrovertible conclusions on subjects of theoretic preference. For it is quite impossible for any individual to distinguish in himself the unconscious underworking of indefinite association peculiar to him individually, from those great laws of choice under which he is comprehended with all his race. And it is well for us that it is so, the harmony of God's good work is not in us interrupted by this mingling of universal and peculiar principles: for by these such difference is secured in the feelings as shall make fellowship itself more delightful, by its inter-communicate character; and such variety of feeling also in each of us separately as shall make us capable of enjoying scenes of different kinds and orders, instead of morbidly seeking for some perfect epitome of the Beautiful in one. And also that deadening by custom of theoretic impressions to which I have above alluded, is counterbalanced by the pleasantness of acquired association; and the loss of a the intense feeling of the youth, "which had no need of a remoter charm, by thought supplied, or any interest unborrowed from the eye,"¹ is replaced by the gladness of conscience, and the vigour of the reflecting and imaginative faculties, as they take their wide and aged grasp of the great relations between the earth and its dead people.*

In proportion therefore to the value, constancy, and efficiency of this influence, we must be modest and cautious in the pronouncing of positive opinions on the subject of beauty. For every one of us has peculiar sources of enjoyment necessarily opened to him in certain scenes and things, sources which are sealed to

§ 11. *How it is connected with impressions of beauty.*

§ 12. *And what caution it renders necessary in the examination of them.*

* And, much more, its living people, and those hereafter to live. [1883.]

¹ [Wordsworth: *Tintern Abbey*; the lines are quoted also in *Modern Painters*, vol. iii. ch. xvii. § 2, and in a letter to Liddell, Vol. I. p. 671.]

others; and we must be wary, on the one hand, of confounding these in ourselves with ultimate conclusions of taste, and so forcing them upon all as authoritative, and on the other, of supposing that the enjoyments of others which we cannot share are shallow or unwarrantable, because incommunicable. I fear, for instance, that in the former portion of this work I may have attributed too much community and authority to certain affections of my own for scenery inducing emotions of wild, impetuous, and enthusiastic characters, and too little to those which I perceive in others for things peaceful, humble, meditative, and solemn. So also between youth and age there will be found differences of seeking, which are not wrong, nor of false choice in either, but of different temperament; the youth sympathizing more with the gladness, fulness, and magnificence of things, and the grey hairs with their completion, sufficiency, and repose. And so, neither condemning the delights of others, nor altogether distrustful of our own, we must advance, as we live on, from what is brilliant to what is pure, and from what is promised to what is fulfilled, and from what is our strength to what is our crown, only observing in all things how that which is indeed wrong, and to be cut up from the root, is *dislike*,* and not affection. For by the very nature of these Beautiful qualities, which I have defined to be the signature of God upon His works, it is evident that in whatever we altogether dislike, we see not all; that the keenness of our vision is to be tested by the expansiveness of our love, and that as far as the influence of association has voice in the question, though it is indeed possible that the inevitable painfulness of an object, for which we can render no sufficient reason, may be owing to its recalling of a sorrow, it is more probably dependent on its accusation of a crime.

* An admirable conclusion,—yet needing this much of drawback, that things justly disliked, and ascertained to be so, ought to be disliked more and more until we put an end to them; and that we have always to beware of getting used to evil, no less than of forgetting good. [1883.]

CHAPTER V¹

OF TYPICAL BEAUTY:—FIRST, OF INFINITY, OR THE TYPE OF DIVINE INCOMPREHENSIBILITY*

THE subject being now in some measure cleared of embarrassment, let us briefly distinguish those qualities or types on whose combination is dependent the power of mere material loveliness. I pretend neither to enumerate nor to perceive them all: for it may be generally observed that whatever good there may be desirable by man, more especially good belonging to his moral nature, there will be a corresponding agreeableness in whatever external object reminds him of such good, whether it remind him by arbitrary association, or by typical resemblance; and that the infinite ways, whether by reason or experience discoverable, by which² matter in some sort may remind[†] us of moral perfections, are hardly within any reasonable limits to be explained, if even by any single mind they might all be traced. Yet certain palpable and powerful modes there are, by observing which we may come at such general conclusions on the subject as may be practically useful, and more than these I shall not attempt to obtain.

§ 1. *Impossibility of adequately treating the subject.*

* The preceding chapter, though one of great importance, is throughout a parenthesis, and the proper subject of enquiry is now taken up, a little too hurriedly. The word "typical" might also have been better chosen; especially since it has lately been used so often to signify representative examples of things. It means here any character in material things by which they convey an idea of immaterial ones. [1883.]

† "Put us in mind" would have been a better phrase; as a rock, of stability—or its shadow, of kindness, etc. [1883.]

¹ [In the "re-arranged" 1883 ed. a new Section (II.) began here, "Of Typical Beauty," this being ch. i. "Of Infinity," etc.]

² [Ed. 2 reads, ". . . resemblance; and that the numberless ways in which matter . . ." Ed. 1 reads as here; in ed. 3 Ruskin returned to the first form of the passage.]

And first, I would ask of the reader to enter upon the subject with me, as far as may be, as a little child, ridding himself of all conventional and authoritative thoughts, and especially of such associations as arise from his respect for Pagan art, or which are in any way traceable to classical readings. I recollect that Mr. Alison traces his first perceptions of beauty in external nature to this most corrupt source,¹ thus betraying so total and singular a want of natural sensibility as may well excuse the deficiencies of his following arguments.² For there was never yet the child of any promise (so far as the Theoretic faculties are concerned) but awaked to the sense of beauty with the first gleam of reason; and I suppose there are few among those who love Nature otherwise than by profession and at second-hand, who look not back to their youngest and least-learned days as those of the most intense, superstitious, insatiable, and beatific perception of her splendours.³ And the bitter decline of this

§ 2. *With what simplicity of feeling to be approached.*

¹ [The reference appears to be to scattered remarks in the earlier pages of Alison's *Essays on . . . Taste*, in which the writer refers to classical allusions as giving sublimity to natural scenery; as, for instance, remembrances of the *Georgics*, or of Hannibal's march over the Alps.]

² [In the first draft this point was elaborated at much greater length; see passages from the MSS. in Appendix i. pp. 367–368.]

³ [Ruskin is here recording his own experience, as in the following argument he is adopting the philosophy of recollection which Wordsworth, in his *Ode on Intimations of Immortality*, borrowed from Plato. Ruskin's love of nature in his earliest years has been sufficiently illustrated in his Juvenilia, and especially in the *Poems* (Vol. II.). Already, when he was thinking of this volume of *Modern Painters*, he was conscious at times of losing something of his earliest rapture. Thus he writes in his diary of 1844—at Geneva (June 1):—

“I have been singularly down-hearted all this journey, and conceive not why. I have felt more than I ever did, I think; and yet not with the buoyancy or life of old time. I think always of those who have no power of seeing what I see, and am full of remorse that I see it, and of the time that may—and that must come—when I shall not see it myself.”

And so, again, even at Chamouni (June 6):—

“A lovely day, to light me to my own valley. I have just come down (½ past 8) from my old seat on the block of the Brevent. But I do not feel as I ought to feel. For the first time in my life, I begin to miss the exhilaration of spirit which these scenes awakened in my childhood. I am not likely to wake to-morrow mad with delight at the idea of climbing a hill, I shall not be singing about the passages at the thought of sketching among rocks—the sketching has become a labour, the climbing a tranquil enjoyment; I am a man in feeling, though not in knowledge, and deeply am I grieved to find it so. But it is perhaps better for me.”

But this mood soon passed. “I enjoyed the whole day,” he writes on June 8, “*in my old way*, and walked home all the way from the Flégère, level and all, with a *child's springiness of mind and step*” (so italicised by Ruskin in reading his diary for *Præterita*.)

glorious feeling, though many note it not, partly owing to the cares and weight of manhood, which leave them not the time nor the liberty to look for their lost treasure, and partly to the human and divine affections which are appointed to take its place, yet has formed the subject, not indeed of lamentation, but of holy thankfulness for the witness it bears to the immortal origin and end* of our nature, to one whose authority is almost without appeal in all questions relating to the influence of external things upon the pure human soul.

“Heaven lies about us in our infancy.
 Shades of the prison-house begin to close
 Upon the growing boy:
 But he beholds the light, and whence it flows,
 He sees it in his joy.
 The youth, who daily farther from the east
 Must travel, still is nature’s priest,
 And by the vision splendid
 Is on his way attended.
 At length the man perceives it die away
 And fade into the light of common day.”¹

And if it were possible for us to recollect all the unaccountable and happy instincts of the careless time, and to reason upon them with the maturer judgment, we might arrive at more rapid and right results than either the philosophy or the sophisticated practice of art has yet attained. But we lose the

* To the origin and *purpose* of it, yes; but not to the immortality of it,—else the lamb might be proved as immortal as its slaughterer. Wordsworth is indeed “almost without appeal” as to the impressions of natural things on the human mind,—but by no means as to the logical conclusions to be surely drawn from them. [1883.]²

¹ [So in eds. 1, 3, and others. In ed. 2 Ruskin substituted some other lines from the same poem, thus:—

“Not for these I raise
 The songs of thanks and praise,
 But for these obstinate questionings
 Of sense, and outward things,
 Fallings from us: vanishings,
 Blank misgivings of a creature
 Moving about in worlds not realized.”]

² [Ruskin had two or three years before the date of this note been analyzing Wordsworth’s position as a poet; see *Fiction Fair and Foul*, e.g. §§ 50–52, 79, 80. See also *Modern Painters*, vol. iii. ch. xvii. § 11; and on the *Ode*, see *Fors Clavigera*, Letter 92, and *Præterita*, i. ch. xii. § 244.]

perceptions before we are capable of methodizing or comparing them.

One, however, of these child instincts, I believe that few forget, the emotion, namely, caused by all open ground, or lines of any spacious kind against the sky, behind which there might be conceived the Sea. It is an emotion more pure than that caused by the sea itself, for I recollect distinctly running down behind the banks of a high beach to get their land line cutting against the sky, and receiving a more strange delight from this than from the sight of the ocean.¹ I am not sure that this feeling is common to all children, (or would be common, if they were all in circumstances admitting it,) but I have ascertained it to be frequent among those who possess the most vivid sensibilities for nature;² and I am certain that the modification of it which belongs to our after years is common to all, the love, namely, of a light distance appearing over a comparatively dark horizon. This I have tested too frequently to be mistaken, by offering to indifferent spectators forms of equal abstract beauty in half tint, relieved, the one against dark sky, the other against a bright distance. The preference is invariably given to the latter; and it is very certain that this preference arises not from any supposition of there being greater truth in this than the other, for the same preference is unhesitatingly accorded to the same effect in Nature herself. Whatever beauty there may result from effects of light on foreground objects,—from the dew of the grass, the flash of the cascade, the glitter of the birch trunk, or the fair daylight hues of darker things (and joyfulness there is in all of them), there is yet a light which the eye invariably seeks with a deeper feeling of the beautiful,—the light of the declining or breaking day, and the flakes of scarlet cloud burning like watch-fires in the green sky of the horizon; a deeper feeling, I say, not perhaps more acute, but having more of spiritual hope and

§ 3. *The child instinct respecting space.*

§ 4. *Continued in after life.*

¹ [For Ruskin's early love of the sea, cf. *Præterita*, i. ch. iv. § 86. But as a child, he says, he "cared more for a beach on which the waves broke than for wide sea" (*ibid.* ch. vi. § 121).]

² [Ed. 2 (only) omits the words "have ascertained . . . and I."]

longing, less of animal and present life, more manifest, invariably, in those of more serious and determined mind, (I use the word serious, not as being opposed to cheerful, but to trivial and volatile,) but I think, marked and unflinching even in those of the least thoughtful dispositions. I am willing to let it rest on the determination of every reader, whether the pleasure which he has received from these effects of calm and luminous distance be not the most singular and memorable of which he has been conscious; whether all that is dazzling in colour, perfect in form, gladdening in expression, be not of evanescent and shallow appealing, when compared with the still small voice of the level twilight behind purple hills, or the scarlet arch of dawn over the dark troublous-edged sea.

Let us try to discover that which effects of this kind possess or suggest, peculiar to themselves,¹ and which other effects of light and colour possess not. There *must* be something in them of a peculiar character, and that, whatever it be, must be one of the primal and most earnest motives of beauty to human sensation.

Do they show finer characters of form than can be developed by the broader daylight? Not so; for their power is almost independent of the forms they assume or display; it matters little whether the bright clouds be simple or manifold, whether the mountain line be subdued or majestic; the fairer forms of earthly things are by them subdued and disguised, the round and muscular growth of the forest trunks is sunk into skeleton lines of quiet shade, the purple clefts of the hill-side are labyrinthed in the darkness, the orbed spring and whirling wave of the torrent have given place to a white, ghastly, interrupted gleaming. Have they more perfection or fulness of colour? Not so; for their effect is oftentimes deeper when their hues are dim, than when they are blazoned with crimson and pale gold: and assuredly, in the blue of the rainy sky, in the many tints of morning flowers, in the sunlight on summer foliage and field, there are more sources of

¹ [Ed. 2 (only) was here again shorter; reading, instead of "and which . . . and that," simply "for this . . ." For "earnest" ed. 2 reads "effectual."]

mere sensual¹ colour-pleasure than in the single streak of wan and dying light. It is not then by nobler form, it is not by positiveness of hue, it is not by intensity of light (for the sun itself at noonday is effectless upon the feelings), that this strange distant space possesses its attractive power. But there is one thing that it has, or suggests, which no other object of sight suggests in equal degree, and that is—Infinity. It is of all visible things the least material, the least finite, the farthest withdrawn from the earth prison-house, the most typical of the nature of God, the most suggestive of the glory of His dwelling-place. For the sky of night though we may know it boundless, is dark; it is a studded vault, a roof that seems to shut us in and down; but the bright distance has no limit, we feel its infinity, as we rejoice in its purity of light.

Now not only is this expression of infinity in distance most precious wherever we find it, however solitary it may be, and however unassisted by other forms and kinds of beauty, but it is of that value that no such other forms will altogether recompense us for its loss; and, much as I dread the enunciation of anything that may seem like a conventional rule, I have no hesitation in asserting that no work of any art, in which this expression of infinity is possible, can be perfect, or supremely elevated, without it, and that, in proportion to its presence, it will exalt and render impressive even the most tame and trivial themes. And I think if there be any one grand division, by which it is at all possible to set the productions of painting, so far as their mere plan or system is concerned, on our right and left hands, it is this of light and dark background, of *heaven light* or of *object light*.* For I know not any truly great painter of any time, who manifests not the most intense pleasure in the luminous space of his backgrounds, or who ever sacrifices

* This quite true conclusion reaches farther than I then knew, or at least felt clearly enough to express. Not only light *in* the sky, but light *from* it, is essential to the greatest work; the diffused light of heaven on all sides, as distinguished from chiaroscuro in a room. [1883.]

¹ ["sensual" is omitted in ed. 2 only.]

this pleasure where the nature of his subject admits of its attainment; as, on the other hand, I know not that the habitual use of dark backgrounds can be shown as having ever been coexistent with pure or high feeling, and, except in the case of Rembrandt (and then under peculiar circumstances only), with any high power of intellect. It is, however, necessary carefully to observe the following modifications of this broad principle.

The absolute necessity, for such I indeed consider it, is of no § 7. *Conditions of its necessity.* more than such a mere luminous distant point as may give to the feelings a species of escape from all the finite objects about them. There is a spectral etching of Rembrandt, a Presentation of Christ in the Temple,¹ where the figure of a robed priest stands glaring by its gems out of the gloom, holding a crozier. Behind it there is a subdued window-light, seen in the opening between two columns, without which the impressiveness of the whole subject would, I think, be incalculably brought down. I cannot tell whether I am at present allowing too much weight to my own fancies and predilections,* but without so much escape into the outer air and open heaven as this, I can take permanent pleasure in no picture.

And I think I am supported in this feeling by the unanimous § 8. *And connected analogies.* practice, if not the confessed opinion, of all artists. The painter of portrait is unhappy without his conventional white stroke under the sleeve, or beside the arm-chair; the painter of interiors feels like a caged bird, unless he can throw a window open, or set the door ajar; the landscapist dares not lose himself in forest without a gleam of light under its farthest branches, nor venture out in rain unless he may somewhere pierce to a better promise in the distance, or cling to some closing gap of variable blue above.

* No: but far too much weight to little matters. A vulgar picture cannot be made a religious one by a hole in a wall. [1883.]

¹ [There are two impressions of this in the British Museum Collection; Nos. 275 and 276 in the Exhibition Catalogue of 1899. For Ruskin's later criticism of such passages in Rembrandt's work, see *Cestus of Aglaia*, §§ 52–54.]

Escape, Hope, Infinity, by whatever conventionalism sought, the desire is the same in all, the instinct constant: it is no mere point of light that is wanted in the etching of Rembrandt above instanced, a gleam of armour or fold of temple curtain would have been utterly valueless; neither is it liberty, for though we cut down hedges and level hills, and give what waste and plain we choose, on the right hand and the left, it is all comfortless and undesired, so long as we cleave not a way of escape forward; and however narrow and thorny and difficult the nearer path, it matters not, so only that the clouds open for us at its close.* Neither will any amount of beauty in nearer form make us content to stay with it, so long as we are shut down to that alone; † nor is any form so cold or so hurtful but that we may look upon it with kindness, so only that it rise against the infinite hope of light beyond. The reader can follow out the analogies of this unassisted.

But although this narrow portal of escape be all that is absolutely necessary, I think that the dignity of the painting increases with the extent and amount of the expression. With the earlier and mightier painters of Italy, the practice is commonly to leave their distance of pure and open sky, of such simplicity that it in nowise shall interfere with, or draw the attention from, the interest of the figures; and of such purity that, especially towards the horizon, it shall be in the highest degree expressive of the infinite space of heaven. I do not mean to say that they did this with any occult or metaphysical motives. They did it, I think, with the unpretending simplicity of all earnest men; they did what they loved and felt; they sought what the heart naturally seeks, and gave what it most gratefully receives; and I look to them as in all points of principle (not, observe, of knowledge or empirical attainment)

§ 9. *How the dignity of treatment is proportioned to the expression of Infinity.*

* All this is—in the main—true; but much too emphatically put. Disagreeable things may be less disagreeable when one sees a way out of them, but one prefers things pleasant in the meantime, whether there's a way out, or not. [1883.]

† Well; I don't feel justified in saying that, till I've had the chance. [1883.]

as the most irrefragable authorities, precisely on account of the child-like innocence, which never deemed itself authoritative, but acted upon desire, and not upon dicta, and sought for sympathy, not for admiration.

And so we find the same simple and sweet treatment, the open sky, the tender, unpretending horizontal white clouds, the far winding and abundant landscape, in Giotto, Taddeo Gaddi, Laurati, Angelico, Benozzo, Ghirlandajo, Francia, Perugino, and the young Raffaele;¹ the first symptom of conventionality appearing in Perugino, who, though with intense feeling of light and colour he carried the glory of his luminous distance far beyond all his predecessors, began at the same time to use a somewhat morbid relief of his figures against the upper sky. This he has done in the Assumption of the Florentine Academy, in that of l' Annunziata, and of the Gallery of Bologna;² in all which pictures the lower portions are incomparably the finest, owing to the light distance behind the heads.* Raffaele, in his fall,

* This is quite true; but not for metaphysical reasons only. Against a light background, the dark points and half tones of a head have double power; and are just so far additional elements in its expression. [1883.]

¹ [All these painters had been studied by Ruskin in 1845 at Pisa and Florence. Laurati (so called by Vasari) is more generally known as Pietro Lorenzetti; frescoes by him in the Campo santo at Pisa were much admired by Ruskin.]

² [In his picture diary of 1845 Ruskin notices among other things the re-painting of Perugino's Assumption in the Florentine Academy:—

“The Assumption of the Virgin.—The four figures at the bottom of this picture would by themselves with the bright distance be perfectly exquisite, but the upper figures which come light against the dark upper half of the sky are a little inferior in effect, the angels especially fluttery and poor. (Indeed there is a little tendency to this fault in Perugino not infrequently. It occurs again, I see, as far as one can judge of engravings, in his works at Siena, and in the Assumption here in the Annunziata it is very painful. Notwithstanding, this latter is for the grace and unity of action in its many figures most distinguished, and far from deserving the unkind mention of it in Rio.) The distance of this . . . picture (the Assumption) has once been very heavenly. Vestiges of its lovely trees and delicate hills are just perceptible under the load of French ultra-marine, which the picture-cleaner has laid on apparently with the house-painter's brush. Where any of the real distance is left, he has changed its colour and turned all the greens to the same crude blue.”

(The word left blank is indecipherable). Rio's unkind mention" of the Assumption in the Annunziata is that, "to the triumph of his enemies, it was not thought worthy to occupy the place that had been reserved for it;" and that it "unfortunately confirms the severe judgment passed upon it by his contemporaries" (*The Poetry of Christian Art*, 1854, p. 177).]

betrayed the faith he had received from his father and his master, and substituted for the radiant sky of the Madonna del Cardellino, the chamber-wall of the Madonna della Seggiola, and the brown wainscot of the Baldacchino.¹ Yet it is curious to observe how much of the dignity even of his later pictures depends on such portions as the green light of the lake, and sky behind the rocks, in the St. John of the Tribune; and how the repainted distortion of the Madonna dell' Impannata is redeemed into something like elevated character, merely by the light of the linen window from which it takes its name.

That which was done by the Florentines in pure simplicity of heart, the Venetians did through love of the colour and splendour of the sky itself, even to the frequent sacrificing of their subject to the passion of its distance. In Carpaccio, John Bellini, Giorgione, Titian, Veronese,

¹ [The Madonna del Cardellino (painted about 1506) is in the Tribune of the Uffizi. Plate No. 11 in vol. iii. of *Modern Painters* (ch. xviii. § 12) is engraved from Ruskin's drawing of the background. The Madonna della Seggiola (or della Sedia) is in the Pitti; painted between 1510 and 1514. The Madonna del Baldacchino (left unfinished by Raphael before 1508) is also in the Pitti, as also is the Madonna dell' Impannata (painted about 1513). Ruskin's notes on these pictures, in his Florentine diary of 1845, are as follows:—

“The Seggiola struck me exactly as it did before—a clever, well-finished, vulgar, piece of maternity, very uncopiable. The Madonna dell' Impannata I thought less of than ever before. I see the execution is chiefly attributed to Raffaello's scholars, but it does not matter who it is by, the picture is a coarse and vulgar one, full of grimace without feeling. The figures are all brought out in full light, except only the left limb of St. John, which shows its dark side against the light. Owing to this, the picture would have appeared intolerably vulgar and modern, if one were only to take away the green window behind, from which it has its name.

“Madonna del Baldacchino.—I had several times past this, not only without knowing it to be a Raffaello, but thinking it one of the worst pictures in the Gallery, before I accidentally cast my eye on its name in the catalogue. Without any exception it is the worst Raffaello I ever saw. The architecture behind is brown, without air, tone, and more like wood than stone, the conical canopy looks as if the Virgin had been a Chinese instead of an Israelite. Vulgar, kicking angels, with ragged straggly hair drifting in the Salvator style, hold up the curtain with the studied grace of infant phenomena at the Olympic. The Madonna of most common type with a frizzed head-dress, attacked most justly by Rio; the bishops and saints silly, affected, and beggarly studies—I should say from the Pincian steps; they are moreover carelessly painted and unfinished, their great black eyes as meaningless as Murillo's, the flesh is throughout brown, and the blues of the drapery are raw and vapid.”

Rio's remark is that “the strange and artificial arrangement of the hair . . . seems to have been adopted for the express purpose of spoiling the effect,” a fault which he attributes to other hands than Raphael's (*l.c.* p. 218).]

and Tintoret, the preciousness of the luminous sky, so far as it might be at all consistent with their subject, is nearly constant; abandoned altogether in portraiture only, seldom even there, and never with advantage. Titian and Veronese, who had less exalted feeling than the others, afford a few instances of exception: the latter overpowering his silvery distances with foreground splendour; the former sometimes sacrificing them to a luscious fulness of colour, as in the Flagellation in the Louvre, by a comparison of which with the unequalled majesty of the Entombment opposite, the applicability of the general principle may at once be tested.¹

But of the value of this mode of treatment there is a farther and more convincing proof than its adoption either by the innocence of the Florentine or the ardour of the Venetian; namely, that when retained or imitated from them by the landscape painters of the seventeenth century, when appearing in isolation from all other good, among the weaknesses and paltrinesses of Claude, the mannerisms of Gaspar, and the caricatures and brutalities of Salvator, it yet redeems and upholds all three, conquers all foulness by its purity, vindicates all folly by its dignity,* and puts an uncomprehended power of permanent address to the human heart upon the lips of the senseless and the profane.[†]

* Too fast and far again! by much; the impetus of phrase running away with me. See the mischief of fine writing. [1883.]

† In one of the smaller rooms of the Pitti Palace, over the door, is a Temptation of St. Anthony, by Salvator, wherein such power as the artist possessed is fully manifested, and less offensively than is usual in his sacred subjects.² It is a vigorous and ghastly thought, in that kind of horror which is dependent on scenic effect perhaps unrivalled, and I shall have occasion to refer to it again in speaking of the powers of Imagination. I allude to it here, because the sky of the distance affords a remarkable instance of the power of light at present under discussion. It is formed of flakes of black cloud, with rents and openings of intense and lurid green, and at least half of the impressiveness of the picture depends on these openings. Close them, make the sky one mass of gloom, and the spectre will be awful no longer. It

¹ [For Ruskin's notes on these pictures, in his 1844 diary, see *Præterita*, ii. ch. v. § 102.]

² [Ed. 1 reads, "fully manifested with little, comparatively, that is offensive." For another reference to the picture, see below, sec. ii. ch. v. § 7 n., p. 319.]

Now although I doubt not that the general value of this treatment will be acknowledged by all lovers of art, it is not certain that the point to prove which I have brought it forward will be as readily conceded; namely, the inherent power of all representations of infinity over the human heart. For there are, indeed, countless associations of pure and religious kind, which combine with each other to enhance the impression when presented in this particular form, whose power I neither deny nor am careful to distinguish, seeing that they all tend to the same point, and have reference to heavenly hopes; delights they are in seeing the narrow, black, miserable earth fairly compared with the bright firmament; reaching forward unto the things that are before, and joyfulness in the apparent, though unreachable, nearness and promise of them. But there are other modes in which infinity may be represented, which are confused by no associations of the kind, and which would, as being in mere matter, appear trivial and mean, but for their incalculable influence on the forms of all that we feel to be beautiful. The first of these is the curvature of lines and surfaces, wherein it at first appears futile to insist upon any resemblance or suggestion of infinity, since there is certainly, in our ordinary contemplation of it, no sensation of the kind. But I have repeated again and again that the ideas of beauty are instinctive, and that it is only upon consideration, and even then in doubtful and disputable way, that they appear in their typical character. Neither do I intend at all to insist upon the particular meaning which they appear to myself to bear, but merely on their actual and demonstrable agreeableness: so that in the present case, while I assert positively,

§ 13. *Other modes in which the power of Infinity is felt.*

§ 14. *The beauty of Curvature.*

owes to the light of the distance both its size and its spirituality. The time would fail me, if I were to name the tenth part of the pictures, which occur to me, whose vulgarity is redeemed by this circumstance alone: and yet let not the artist trust to such morbid and conventional use of it as may be seen in the common blue and yellow effectism of the present day. Of the value of moderation and simplicity in the use of this, as of all other sources of pleasurable emotion, I shall presently have occasion to speak farther.

and have no fear of being able to prove, that a curve of any kind is more beautiful than a right line, I leave it to the reader to accept or not, as he pleases, that reason of its agreeableness which is the only one that I can at all trace; namely, that every curve divides itself infinitely by its changes of direction.

That all forms of acknowledged beauty are composed exclusively of curves will, I believe, be at once allowed; but that which there will be need more especially to prove is, the subtlety and constancy of curvature in all natural forms whatsoever.¹ I believe that, except in crystals, in certain mountain forms admitted for the sake of sublimity or contrast (as in the slope of débris), in rays of light, in the levels of calm water and alluvial land,* and in some few organic developments, there are no lines nor surfaces of nature without curvature; though as we before saw in clouds, more especially in their under lines towards the horizon, and in vast and extended plains, right lines are often suggested which are not actual. Without these we could not be sensible of the value of the contrasting curves; and while, therefore, for the most part the eye is fed in natural forms with a grace of curvature which no hand nor instrument can follow, other means are provided to give beauty to those surfaces which are admitted for contrast, as in water by its reflection of the gradations which it possesses not itself. In freshly broken ground which Nature has not yet had time to model, in quarries and pits which are none of her cutting, in those convulsions and evidences of convulsion of whose influence on ideal landscape I shall presently have occasion to speak,² and generally in all ruin and disease, and interference of one order of being with another

* These seem important exceptions; they are not so, and are themselves liable to much exception. Crystals are indeed subject to rectilinear limitations; but their real surfaces are continually curved. Rays of light are varied, by infinite gradation—the level of calm water is only right-lined when it is shoreless. [1883.]

¹ [On this subject, cf. *Stones of Venice*, vol. i. ch. xx. § 19, and vol. iii. ch. i. § 8.]

² [See below, sec. ii. ch. v. § 9, p. 320.]

(as in the browsing¹ line of park trees), the curves vanish, and violently opposed or broken and unmeaning lines take their place.

What curvature is to lines, gradation is to shades and colours. It is their infinity, and divides them into an infinite number of degrees. Absolutely without gradation no natural surface can possibly be, except under circumstances of so rare conjunction as to amount to a *lusus naturæ*: for we have seen that few surfaces are without curvature, and every curved surface must be gradated by the nature of light;² and for the gradation of the few plane surfaces that exist, means are provided in local colour, aërial perspective, reflected lights, etc., from which it is but barely conceivable that they should ever escape. For instances of the complete absence of gradation we must look to man's work, or to his disease and decrepitude. Compare the gradated colours of the rainbow with the stripes of a target, and the gradual deepening of the youthful blood in the cheek with an abrupt patch of rouge, or with the sharply drawn veins of old age.

Gradation is so inseparable a quality of all natural shade, that the eye refuses in painting to understand a shadow which appears without it; while, on the other hand, nearly all the gradations of nature are so subtle, and between degrees of tint so slightly separated, that no human hand can in any wise equal, or do anything more than suggest the idea of them. In proportion to the space over which gradation extends, and to its invisible subtlety, is its grandeur: and in proportion to its narrow limits and violent degrees, its vulgarity. In Correggio, it is morbid in spite of its refinement of execution, because the eye is drawn to it, and it is made the most observable character of the picture; whereas natural gradation is for ever escaping observation to that degree that the greater part of artists in working from nature

¹ [Eds. 1 and 2 read "cattle" for "browsing," and, four lines lower, ed. 1 italicises "their infinity."]

² [Ed. 1 here adds, "which is most intense when it impinges at the highest angle."]

§ 16. *The beauty of Gradation.*

§ 17. *How found in nature.*

see it not,¹ but either lay down such continuous lines and colours as are both disagreeable and impossible; or, receiving the necessity of gradation as a principle instead of a fact,* use it in violently exaggerated measure, and so lose both the dignity of their own work, and, by the constant dwelling of their eyes upon exaggeration, their sensibility to that of the natural forms. So that we find the majority of painters divided between the two evil extremes of insufficiency and affectation; and only the greatest men capable of making gradation continuous and yet extended over enormous spaces and within degrees of narrow difference, as in the body of a strong light.[†]

From the necessity of gradation results what is commonly given as a rule of art, though its authority as a rule obtains only from its being a fact of nature, that the extremes of high light and pure colour can exist only in points. The common rules respecting sixths and eighths, held concerning light and shade, are entirely absurd and conventional; according to the subject and the effect of light, the greater part of the picture will be, or ought to be, light or dark; but that principle which is not conventional is, that of all light, however high, there is some part that is higher than the rest; and that of all colour, however pure, there is some part that is purer than the rest; and that generally of all shade, however deep, there is some part deeper than the rest, though this last fact is frequently sacrificed in art, owing to the narrowness of its means. But on the right gradation of focusing of light and colour depends, in great measure, the value of both. Of this I have spoken sufficiently in pointing out the singular constancy of it in the works of Turner. (Part II. Sec. II. Chap. II. § 16.) And it is generally to be

* I meant, as a trick for the emphasis of colour, instead of an exponent of actual form or effect. This, however, is done legitimately in illumination, and other merely decorative, not imitative, coloured work. [1883.]

†This is a valuable practical passage, of which the substance is often reiterated in my later works. [1883.]²

¹ [Ed. 1 inserts "(except in certain of its marked developments)."]

² [See, e.g., *Lectures on Art*, ch. vi., "Light."]

observed that even raw and valueless colour, if rightly and subtly gradated, will, in some measure, stand for light; and that the most transparent and perfect hue will be, in some measure, unsatisfactory if entirely unvaried. I believe the early skies of Raffaele owe their luminousness more to their untraceable and subtle gradation than to inherent quality of hue.

Such are the expressions of infinity which we find in creation,* of which the importance is to be estimated rather by their frequency than by their distinctness. Let, however, the reader bear constantly in mind that I insist not on his accepting any interpretation of mine, but only on his dwelling so long on those objects which he perceives to be beautiful, as to determine whether the qualities to which I trace their beauty be necessarily there or not. Farther expressions of infinity there are in the mystery of Nature, and, in some measure, in her vastness; but these are dependent on our own imperfections, and therefore, though they produce sublimity, they are unconnected with beauty. For that which we foolishly call vastness is, rightly considered, not more wonderful, not more impressive, than that which we insolently call littleness: and the infinity of God is not mysterious, it is only unfathomable; not concealed, but incomprehensible; it is a clear infinity, the darkness of the pure unsearchable sea.

*§ 19. Infinity
not rightly im-
plied by vast-
ness.*

* I meant, "in those conditions of the creation which appeal to the pleasure of the human eyes." Of course those which appeal to thought are themselves infinite. This last paragraph is heedlessly and insolently written; yet not wholly valueless, for the gist of it in the close is true; that the lessons of Heaven are not written illegibly for its creatures: and that all the smoke of the darkness which hides the Maker from this world, is of the world's making. [1883.]

CHAPTER VI¹

OF UNITY, OR THE TYPE OF THE DIVINE COMPREHENSIVENESS²

“ALL things,” says Hooker, “God only excepted, besides the nature which they have in themselves, receive externally some perfection from other things.”³

§ 1. *The general
conception of
divine Unity.*

Hence the appearance of separation or isolation in anything, and of self-dependence, is an appearance of imperfection; and all appearances of connection and brotherhood are pleasant and right, both as significative of perfection in the things united, and as typical of that Unity which we attribute to God, and of which our true conception is rightly explained and limited by Dr. Brown in his XCII.nd lecture;⁴ that Unity which consists not in His own singleness or separation, but in the necessity of His inherence in all things that be, without which no creature of any kind could hold existence for a moment. Which necessity of divine essence I think it better to speak of as Comprehensiveness, than as Unity; because unity is often understood in the sense of oneness or singleness, instead of universality; whereas the only unity which by any means can become grateful or an object of hope to men, and whose types therefore in material things can be beautiful, is that on which turned the last words and prayer of Christ before His crossing of the Kedron brook, “Neither pray I for these alone, but for them also which shall believe on Me through their word; that they all may be one, as Thou, Father, art in Me, and I in Thee.”⁵

¹ [The ed. of 1883 makes this ch. ii. of section ii. (“Of Typical Beauty”).]

² [On unity as a principle in decoration, see *Stones of Venice*, vol. i. ch. xxi. § 33, and *cf.* vol. iii. ch. i. § 26.]

³ [*Ecclesiastical Polity*, I. xi. 1.]

⁴ [*Lectures on the Philosophy of the Human Mind*. By Thomas Brown, M.D., Professor of Moral Philosophy in the University of Edinburgh. (Lecture xcii.: “On the Existence of the Deity.”)]

⁵ [John xvii. 20.]

And so there is not any matter, nor any spirit, nor any creature, but it is capable of a unity of some kind with other creatures; and in that unity is its perfection and theirs, and a pleasure also for the beholding of all other creatures that can behold. So the unity of spirits* is partly in their sympathy, and partly in their giving and taking, and always in their love; and these are their delight and their strength; for their strength is in their co-working and army fellowship, and their delight is in the giving and receiving of alternate and perpetual good; their inseparable dependency on each other's being, and their essential and perfect depending on their Creator's. And so the unity of earthly creatures is their power and their peace; not like the dead and cold peace of undisturbed stones and solitary mountains; but the living peace of trust, and the living power of support; of hands that hold each other and are still.¹ And so the unity of matter is, in its noblest form, the organization of it which builds it up into temples for the spirit; and in its lower form, the sweet and strange affinity which gives to it the glory of its orderly elements, and the fair variety of change and assimilation that turns the dust into the crystal, and separates the waters that be above the firmament from the waters that be beneath: and, in its lowest form, it is the working and walking and clinging together that gives their power to the winds, and its syllables and soundings to the air, and their weight to the waves, and their burning to the sunbeams, and

§ 2. *The glory of all things is their Unity.*

* I meant, of course, human spirits: modern desecration of the latter word has cast so much shadow on it that one cannot read it without shrinking.

This second paragraph is one of the most valuable in essential contents I have ever written, but the literary art and pedantry of it, employed to express the most solemn of truths in a tinkle that shall be pleasant to the ear, are now very grievous to me. It was well meant at the time, however, and may perhaps yet have its use. [1883.]

¹ [§ 2 down to this point is § 72 of *Fronde Agrestes*, where Ruskin added the following note:—

“A long, affected, and obscure second volume sentence, written in imitation of Hooker. One short sentence from Proverbs is the sum of it: ‘How can one be warm alone?’ ”

The sentence is from Ecclesiastes iv. 11: “Two have heat, how can one be warm alone.” Eds. 1 and 2 went on “breathlessly,” with only a colon after “are still.”]

their stability to the mountains, and to every creature whatsoever operation is for its glory and for others' good.

Now of that which is thus necessary to the perfection of all things, all appearance, sign, type, or suggestion must be beautiful, in whatever matter it may appear; and the appearance of some species of unity is, in the most determined sense of the word, essential to the perfection of beauty in lines, colours, or forms.¹

But of the appearances of unity, as of unity itself, there are several kinds, which it will be found hereafter convenient to consider separately.* Thus there is the Unity of different and separate things, subjected to one and the same influence, which may be called Subjectional Unity; and this is the unity of the clouds, as they are driven by the parallel winds, or as they are ordered by the electric currents; this the unity of the sea-waves, this of the bending and undulation of the forest masses; and in creatures capable of will it is the unity of will or of impulse. And there is Unity of Origin, which we may call Original Unity; which is of things arising from one spring and source, and speaking always of this their brotherhood; and this in matter is the unity of the branches of the trees, and of the petals and starry rays of flowers, and of the beams of light; and in spiritual creatures it is their filial relation to Him from whom they have their being. And there is unity of Sequence, which is that of things that form links in chains, and steps in ascents, and stages in journeys; and this, in matter, is the unity of communicable forces in their continuance from one thing to another; and it is the passing upwards and downwards of beneficent effects among

* Yes, I should rather think so; and they ought to have been named separately, too, and very slowly; and not upset in a heap on the floor, as they are in this terrific two-page sentence. It is all right, however, when once it is sorted. See note † on p. 99.² [1883.]

¹ [For "and the appearance . . . forms," ed. 1 reads:—

"And so to the perfection of beauty in lines, or colours, or forms, or masses, or multitudes, the appearance of some species of Unity is in the most determined sense of the word essential."]

² [The reference was wrongly given in previous eds. as "note at end of chapter."]

all things,¹ the melody of sounds, the continuity of lines, and the orderly succession of motions and times; and in spiritual creatures it is their own constant building up, by true knowledge and continuous reasoning, to higher perfection, and the singleness and straightforwardness of their tendencies to more complete communion with God. And there is the unity of Membership, which we may call Essential Unity, which is the unity of things separately imperfect into a perfect whole; and this is the great unity of which other unities are but parts and means; it is in matter the harmony of sounds and consistency of bodies, and among spiritual creatures their love and happiness and very life in God.

Now of the nature of this last kind of unity, the most important whether in moral or in those material things with which we are at present concerned, there is this necessary to be observed; that it cannot exist between things similar to each other. Two or more equal and like things cannot be members one of another, nor can they form one, or a whole thing. Two they must remain, both in nature, and in our conception, so long as they remain alike, unless they are united by a third different from both. Thus the arms, which are like each other, remain two arms in our conception. They could not be united by a third arm; they must be united by something which is not an arm, and which, imperfect without them as they without it, shall form one perfect body. Nor is unity even thus accomplished, without a difference and opposition of direction in the setting on of the like members. Therefore, among all things which are to have unity of membership one with another, there must be difference of variety; and though it is possible that many like things may be made members of one body, yet it is remarkable that this structure appears characteristic of the lower creatures, rather than the higher, as the many legs of a caterpillar, and the many arms and suckers of the radiata;²

¹ [Ed. 1 reads "all things, and it is the melody of sounds, and the beauty of continuous lines, and . . ."]

² [In Cuvier's system of classification the 4th grand branch of the animal kingdom, containing the radiated animals or zoöphytes (polypi, infusoria, etc.). "The lower groups," says Huxley, "which he (Cuvier) knew least and which he threw into a great

and that, as we rise in order of being, the number of similar members becomes less, and their structure commonly seems based on the principle of the unity of two things by a third, as Plato states it in the *Timæus*, § 11.¹

Hence, out of the necessity of Unity, arises that of Variety; a necessity often more vividly, though never so deeply felt, because lying at the surface of things, and assisted by an influential principle of our nature, the love of change, and by the power of contrast. But it is a mistake which has led to many unfortunate results, in matters respecting art, to insist on any inherent agreeableness of variety, without reference to a farther end. For it is not even true that variety as such, and in its highest degree, is beautiful. A patched* garment of many colours is by no means so agreeable as one of a single and continuous hue; the splendid colours of many birds are eminently painful from their violent separation, and inordinate variety, while the pure and colourless swan is, under certain circumstances, the most beautiful of all feathered creatures.† A forest of all manner of trees is poor, if not disagreeable, in effect;‡ a mass of one species of tree is sublime. It is therefore only harmonious and chordal variety, that variety which is necessary to secure and extend unity (for the greater the number of objects which by their differences become members of one another, the more extended and sublime is their unity), which is rightly

* I meant, discordantly patched—else the sentence is simply untrue. [1883.]²

† Compare Chap. IX. § 5, note.

‡ Spenser's various forest is the Forest of Error.

heterogeneous assemblage, the Radiata, have been altogether remodelled and rearranged. . . . Whatever form the classification of the animal kingdom may eventually take, the Cuvierian Radiata is in my judgment effectually abolished" (*Classification*, 1869, p. 86).]

¹ [P. 31 of the ordinary arrangement: "Are we right in saying that there is one heaven, or shall we rather say that there are many and infinite? There is one, if the created heaven is to accord with the pattern. For that which includes all other intelligible creatures cannot have a second or companion; in that case there would be no need of another living being which would include these two, and of which they would be parts, and the likeness would be more truly said to resemble not those two, but that other which included them" (Jowett's translation).]

² [Cf. what Ruskin says of the quality of spottiness (*ποικιλία*) in art: *Aratra Pentelici*, § 204, and *cf.* below, p. 134 (note of 1883).]

agreeable; and so I name not Variety as essential to beauty, because it is only so in a secondary and casual sense.*

Of the Love of Change as a principle of human nature, and the pleasantness of variety resulting from it, something has already been said (Ch. IV. § 4); only as there I was opposing the idea that our being familiar with objects was the cause of our delight in them, so here I have to oppose the contrary position that their strangeness is the cause of it. For neither familiarity nor strangeness has more operation on, or connection with, impressions of one sense than of another; and they have less power over the impressions of sense, generally, than over the intellect in its joyful accepting of fresh knowledge, and dull contemplation of that it has long possessed. Only in their operation on the senses they act contrarily at different times; as for instance, the newness of a dress, or of some kind of unaccustomed food, may make it for a time delightful, but as the novelty passes away, so also may the delight, yielding to disgust or indifference; which in their turn, as custom begins to operate, may pass into affection and craving, and that which was first a luxury, and then a matter of indifference, become a necessity: † whereas in subjects of the intellect,

§ 6. *Change, and its influence on beauty.*

* It must be matter of no small wonderment to practical men, to observe how grossly the nature and connection of Unity and Variety have been misunderstood and misstated by those writers upon taste who have been guided by no experience of art, most singularly perhaps by Mr. Alison, who, confounding Unity with Uniformity, and leading his readers through thirty pages of discussion respecting Uniformity and Variety, the intelligibility of which is not by any means increased by his supposing Uniformity to be capable of existence in single things, at last substitutes for these two terms, sufficiently contradictory already, those of Similarity and Dissimilarity, the reconciliation of which opposites in one thing we must, I believe, leave Mr. Alison to accomplish.¹

† Και το ταυτα πραττειν πολλακις ηδου .□. το γαρ συνηθες ηδου ην. και το μεταβ αλλεινηδου εις φυσιν γαρ γιγνεται μεταβαλλειν.—Arist. Rhet. I. c. 11.²

¹ [See *Essays on the Nature and Principles of Taste*, ch. iv. pt. iii., vol. ii. pp. 8 seq. in ed. of 1815.]

² ["And to do the same things often is pleasant . . . for what we are accustomed to is pleasant. And to change is pleasant, for change is according to nature." The reference was wrongly given in all previous eds. as chapter 2, and ταυτα was printed ταυτα. In the 1883 edition the quotation was not given, and Ruskin noted:—

"I have cut out here a quotation from Aristotle—which was only put in to show that I had read him."]

the chief delight they convey is dependent upon their being newly and vividly comprehended; and as they become subjects of contemplation they lose their value, and become tasteless and unregarded, except as instruments for the reaching of others; only that though they sink down into the shadowy, effectless heap of things indifferent, which we pack, and crush down, and stand upon, to reach things new, they sparkle afresh at intervals as we stir them by throwing a new stone into the heap, and letting the newly admitted lights play upon them. And, both in subjects of the intellect and the senses, it is to be remembered that the love of change is a weakness and imprefection of our nature, (and implies in it the state of probation;)* and that it is to teach us that things about us here are not meant for our continual possession or satisfaction, that ever such passion of change was put in us as that “custom lies upon us with a weight, heavy as frost, and deep almost as life;”¹ and only such weak thews² and baby grasp given to our intellect as that “the best things we do are painful, and the exercise of them grievous, being continued without intermission, so as in those very actions whereby we are especially perfected in this life we are not able to persist.”[†] And

§ 7. *The love of change, how morbid and evil.*

so it will be found that they are the weakest-minded and the hardest-hearted men that most love variety and change: for the weakest-minded are those who both wonder most at things new, and digest worst things old; in so far that everything they have lies rusty, and loses lustre for want of use, neither do they make any stir among their possessions, nor look over them to see what may be made of them, nor keep any great store, nor are house-holders with storehouses of things new and old; but they

* The words I have now put in parenthesis are false. Heaven itself may be as changeful as a kaleidoscope, for aught we know. [1883.]

† Hooker,³ I think, by the sound of it: to whom Pope would have quietly and rightly answered—“Why wish to persist, then, when God says you have done enough?” [1883.]

¹ [Wordsworth: *Intimations of Immortality*; the lines are quoted again in *Modern Painters*, vol. iii. ch. xxvii. § 23.]

² [Ed. 1 read “back.”]

³ [*Ecclesiastical Polity*, I. xi. 3.]

catch at the new-fashioned garments, and let the moth and thief look after the rest; and the hardest-hearted men are those that least feel the endearing and binding power of custom, and hold on by no cords of affection to any shore, but drive with the waves that cast up mire and dirt. And certainly it is not to be held that the perception of beauty, and desire of it, are greatest in the hardest heart and weakest brain;* but the love of variety is so, and therefore variety can be no cause of the beautiful, except, as I have said, when it is necessary for the perception of unity. Neither is there any better test of beauty than its surviving or annihilating the love of change; a test which the best judges of art have need frequently to use; for there is much that surprises by its brilliancy, or attracts by its singularity, that can hardly but by course of time, though assuredly it *will* by course of time, be winnowed away from the right and real beauty whose retentive power is for ever on the increase, a bread of the soul for which the hunger is continual.

Receiving, therefore, variety only as that which accomplishes unity, or makes it perceived, its operation is found to be very precious, both in that which I have called Unity of Subjection, and Unity of Sequence, as well as in Unity of Membership; † for although things in all respects the same may, indeed, be subjected to one influence, yet the power of the influence, and their obedience to it, are best seen by varied operation of them on their individual differences; as in clouds and waves there is a glorious unity of rolling, wrought out by the wild and wonderful differences of their absolute forms; which differences, if removed, would leave in them only multitudinous

§ 8. *The conducting of variety towards Unity of Subjection.*

* Not proved. The adversary may ask,—and lately, not without good grounds for inquiry,—Why it is not to be held? [1883.]

† The four unities above specified were,—

1. Of Subjection.
2. Of Origin.
3. Of Sequence.
4. Of Membership.

That of Origin is omitted here, because things springing from one root must be of one nature. [1883.]

and petty repetition, instead of the majestic oneness of shared passion. And so in the waves and clouds of human multitude when they are filled with one thought; as we find frequently in the works of the early Italian men of earnest purpose, who despising, or happily ignorant of, the sophistications of theories and the proprieties of composition, indicated by perfect similarity of action and gesture on the one hand, and by the infinite and truthful variation of expression on the other, the most sublime strength, because the most absorbing unity, of multitudinous passion that ever human heart conceived. Hence, in the cloister of St. Mark's, the intense, fixed, statue-like silence of ineffable adoration upon the spirits in prison at the feet of Christ, side by side, the hands lifted, and the knees bowed, and the lips trembling together;* and in St.

* Fra Angelico's fresco in a cell of the upper cloister.¹ He treated the subject frequently. Another characteristic example occurs in the Vita di Cristo of the Academy, a series now unfortunately destroyed by the picture cleaners.² Simon Memmi, in Santa Maria Novella, has given another very beautiful instance.³ In Giotto the principle is universal, though his multitudes are somewhat more dramatically and powerfully varied in gesture than Angelico's. In Mino da Fiesole's altar-piece in the church of St. Ambrogio at Florence, close by Cosimo Rosselli's fresco, there is a beautiful example in marble.⁴

¹ [Of San Marco, at Florence.]

² [In his note-book of 1845, Ruskin writes:—

“With the Vita di Cristo, at the Accademia, I was grievously disappointed. I strongly suspect that the whole of this series has been lately, and since Kugler saw it, through the picture-dealer's hands, and that the greater part of Angelico's work has been washed off, and as little of the picture-cleaner put on. At all events the pictures are now in the most miserable condition, some two-thirds effaced, others so daubed and defaced as to alter the expression of the faces and make them monstrous or ludicrous; many appear to have been somewhat hastily executed by Angelico himself, and some of the open air backgrounds with architecture are very disagreeable from their raw colour, glaring without brilliancy, red walls and sand-coloured earth, and blue sky jumbled together without even feeling; in fact it could hardly be otherwise; after the seclusion of convent life, the imagination is destroyed for want of materials. Two, however, are very fine in this respect, and those are just two of the bits which, like the scene of his Annunciation in the cloister, he could get from convent life—the Washing of the Feet, which is under a cloister, the clear air seen in the open court beyond, given with wonderful light and purity; and the Giving of the Sacrament, in which the roof is dark blue and the walls green, and the whole filled with a fine transparent variable shadow . . .”]

³ [In the frescoes, once ascribed to him, in the Spanish Chapel.]

⁴ [The altar is in the chapel of the miracle of a chalice found to contain natural blood. On the altar are angels adoring the chalice; the fresco by Cosimo Rosselli

Domenico of Fiesole,* that whirlwind rush of the angels and the redeemed souls round about Him at His resurrection, in which we hear the blast of the horizontal trumpets mixed with the dying clangour of their ingathered wings. The same great feeling occurs throughout the works of the serious men, though most intensely in Angelico; and it is well to compare with it the vileness and falseness of all that succeeded, when men had begun to bring to the cross foot their systems instead of their sorrow. Take as the most marked and degraded instance, perhaps, to be anywhere found, Bronzino's treatment of the same subject (Christ visiting the spirits in prison), in the picture now in the Tuscan room of the Uffizii; which, vile as it is in colour, vacant in invention, void in light and shade, a heap of cumbrous nothingness, and sickening offensiveness, is of all its voids most void in this, that the academy models therein huddled together at the bottom, show not so much unity or community of attention to the academy model with the flag in its hand above, as a street crowd would to a fresh-staged charlatan. Some *point* to the God who has burst the gates of death, as if the rest were

* The predella of the picture behind the altar.¹

describes the miracle. Ruskin describes his discovery of the treasures in this chapel, in a letter to his father (June 20):—

“To-day I was poking about churches, and found in St. Ambrogio—a glorious fresco all burned and smoked—in a little sacred, idolatrous chapel, with an altar-piece which I was quite certain was by Mino da Fiesole. Well, I called the sacristan, and half-a-dozen more monks one after another. What was the picture? Who by? ‘Non si sa. Molto antica.’ Who was the alter-piece by? ‘Non si sa.’ What did the fresco represent? ‘O’è un miracolo del Santo Sacramento.’ What miracle? Not a soul of them could tell me anything about it. Was the altar-piece by Mino? ‘No.’ I wasn’t satisfied, made them light me some candles, and after a little search I showed them Mino’s name in a corner—OPVS MINI—he never puts more. Then they were highly delighted, for a work of Mino’s is of great value and very rare. The fresco is the *chef-d’œuvre* of Cosimo Roselli, and most magnificent. This may give you some notion of the intellectual condition of Florence.”]

¹ [The entry in the note-book (June 21) is as follows:—

“An excellent instance of the fulness of sentiment in a rushing crowd which only Angelico can give. It is in three divisions; in the centre one, a host of angels rush towards their risen Lord, those nearest blowing a blast through horizontal trumpets, as in Orcagna’s Judgment. On the right the female, on the left the male, saints, all animated with the same enthusiasm; and the play of colour and unity of action as seen from below is as fine as anything I have seen.”]

incapable of distinguishing Him for themselves; and others turn their backs upon Him, to show their unagitated faces to the spectator.*

In Unity of Sequence, the effect of variety is best exemplified by the melodies of music, wherein, by the differences of the notes, they are connected with each other in certain pleasant relations. This connection, taking place in quantities, is Proportion, respecting which certain general principles must be noted, as the subject is one open to many errors, and obscurely treated of by writers on art.

§ 9. *And towards Unity of Sequence.*

Proportion is of two distinct kinds: † *Apparent* when it takes place between quantities for the sake of connection only, without any ultimate object or causal necessity; and *Constructive*, when it has reference to some function to be discharged by the quantities depending on their proportion. From the confusion of these two kinds of proportion have arisen the greater part of the erroneous conceptions of the influence of either.

§ 10. *The nature of Proportion. 1st, of apparent Proportion.*

(A) Apparent Proportion, or the sensible relation of quantities, is one of the most important means of obtaining unity amongst things which otherwise must have remained distinct in similarity; and as it may consist with every other kind of unity, ‡ and persist when every other means of it fails, it may be considered as lying at the root of most of our

* I had much more heart power of conceiving the real scenes when I wrote this book than I have now, and was therefore a far better judge of religious art. I have just been looking at all these pictures again, and find myself a little weary of rows of heads turned in the same direction; and disposed sometimes to say a good word even for Bronzino, in his portraits.¹ (Florence, September, 1882.) [1883.]

† This digression on Proportion, as one of the elements of Unity of Sequence, contains a good deal that is extremely right and useful; but it ought to have been given in a separate chapter. [1883.]

‡ Thus the proportions of increase in the lobes, or intervals between the serrations of a leaf, are associated with the beautiful Unity of Origin in the divergence of the ribs from the stem. [1883.]

¹ [Bronzino's portraiture may be judged also in London, at the National Gallery, where there are five examples of it; see especially No. 649.]

impressions of the beautiful. There is no sense of rightness or wrongness connected with it; no sense of utility, propriety, or expediency. These ideas enter only where the proportion of quantities has reference to some function to be performed by them. It cannot be asserted that it is right or that it is wrong that A should be to B as B to C; unless A, B, and C have some desirable operation dependent on that relation. But nevertheless it may be highly agreeable to the eye that A, B, and C, if visible things, should have visible connection of ratio, even though nothing be accomplished by such connection.

(B) On the other hand, Constructive Proportion, or the adaptation of quantities to functions, is agreeable, not (necessarily) to the eye, but to the mind, which is cognizant of the function to be performed. Thus the pleasantness or rightness of the proportions of a column depends not on the mere relation of diameter and height (which is not proportion at all, for proportion is between three terms at least); but on three other involved terms, the strength of materials, the weight to be borne, and the scale of the building. The proportions of a wooden column are wrong in a stone one, and of a small building wrong in a large one;* and this owing solely to

* It seems never to have been rightly understood, even by the more intelligent among our architects, that Proportion is in any way connected with positive size; it seems to be held among them that a small building may be expanded to a large one merely by proportionally expanding all its parts: and that the harmony will be equally agreeable on whatever scale it be rendered. Now this is true of apparent proportion, but utterly false of constructive; and, as much of the value of architectural proportion *is* constructive, the error is often productive of the most painful results. It may be best illustrated by observing the conditions of proportion in animals. Admiration has often been thoughtlessly claimed for the strength, supposed gigantic, of insects and smaller animals; as being capable of lifting weights, leaping distances, and surmounting obstacles, of proportion apparently overwhelming. Thus the *Formica Herculanea* will lift in its mouth and brandish like a baton, sticks thicker than itself and six times its length, all the while scrambling over crags of about the proportionate height of the Cliffs of Dover, three or four in a minute. There is nothing extraordinary in this, nor any exertion of strength necessarily greater than human, in proportion to the size of the body. For it is evident that if the *bulk* and *strength* of any creature be expanded or diminished in proportion to each other, the distance through which it can leap, the time it can maintain exertion, or any other third term resultant,

mechanical considerations which have no more connection with ideas of beauty, than the relation between the arms of a lever adapted to the raising of a given weight; and yet it is highly agreeable to perceive that such constructive proportion has been duly observed, as it is agreeable to see that anything is fit for its purpose or for ours, and also that it has been the

remains *constant*; that is, diminish weight of powder and of ball proportionately, and the distance carried is constant, or nearly so. Thus, a grasshopper, a man, and a giant 100 feet high, supposing their muscular strength equally proportioned to their size, can or could all leap, not proportionate distance, but the same, or nearly the same, distance; say, four feet the grasshopper, or forty-eight times his length; six feet the man, or his length exactly; ten feet the giant, or the tenth of his length; some allowance being made for the greater resistance of the air to the smaller animal, and other slight disadvantages.¹ Hence, all small animals can, proportionally, perform feats of strength and agility exactly so much greater than those possible to large ones, as the animals themselves are smaller; and to enable an elephant to leap like a grasshopper, he must be endowed with strength a million times greater in *proportion* to his size. Now the consequence of this general mechanical law is, that as we increase the scale of animals, their means of power, whether muscles of motion or bones of support, must be increased in a more than proportionate degree, or they become utterly unwieldy and incapable of motion. And there is a limit to this increase of strength. If the elephant had legs as long as a spider's, no combination of animal matter that could be hide-bound would have strength enough to move them. To support the megatherium, we must have a humerus a foot in diameter, though perhaps not more than two feet long, and that in a vertical position under him; while the gnat can hang on the window-frame, and poise himself to sting, in the middle of crooked stilts like threads, stretched out to ten times the breadth of his body on each side. Increase the size of the megatherium a little more, and no phosphate of lime will bear him: he would crush his own legs to powder. (Compare Sir Charles Bell, *Bridgewater Treatise on the Hand*, p. 296, and the note.) Hence there is not only a limit to the size of animals, in the conditions of matter, but to their activity also, the largest being always least capable of exertion; and this would be the case to a far greater extent, but that nature beneficently alters her proportions as she increases her scale; giving slender frames to the smaller tribes, and ponderous strength to the larger.² So in vegetables, compare the stalk of an ear of oat, and the trunk of a pine, the mechanical structure being in both the same. So also in waves, of which the large never can be mere exaggerations of the small, but have different slopes and curvatures. So in mountains, and all things else, necessarily, and from ordinary mechanical laws. Whence in architecture, according

¹ [The words, "some allowance . . . disadvantages," were omitted in ed. 1, which also read "*cæteris paribus*" for "proportionally," and, in the next line, "to be executed by" for "possible to."]

² [Ed. 1 reads, "giving, as we have seen, long legs and enormous wings to the smaller tribes, and short and thick proportion to the larger."]

result of intelligence in the artificer of it; so that we sometimes feel a pleasure in apparent non-adaptation, if it be a sign of ingenuity, as in the unnatural and seemingly impossible lightness of Gothic spires and roofs.

Now, the errors against which I would caution the reader in this matter* are three. The first is, the overlooking or denial of the power of Apparent Proportion, of which power neither Burke, nor any other writer whose works I have met with, takes cognizance. The second is, the attribution of *beauty* to the appearances of Constructive Proportion. And the third, the denial, with Burke, of *any* value or agreeableness in Constructive Proportion.¹

to the scale of the building, its proportions *must* be altered constructively, and ought to be so apparently even where the constructive expedients are capable of disguise;² and I have no hesitation in calling that unmeaning exaggeration of parts in St. Peter's,³ of flutings, volutes, friezes, etc., in the proportions of a smaller building, a vulgar blunder, and one that destroys all the majesty that the building ought to have had; and still more I should so call all imitations and adaptations of *large* buildings on a *small* scale. The true test of right proportion is, that it shall itself inform us of the scale of the building, and be such that even in a drawing it shall instantly induce the conception of the actual size, or size intended. I know not what Fuseli means by that aphorism of his:—

“Disproportion of parts is the element of hugeness; proportion, of grandeur. All Gothic styles of Architecture are huge. The Greek alone is grand.”⁴

When a building *is* vast, it ought to look so; and the proportion is right which exhibits its vastness. Nature loses no size by her proportion; her buttressed mountains have more of Gothic than of Greek in them.

* I meant, “with respect to the subject of Proportion altogether;” the two kinds of it being both considered in the definitions of popular error. [1883.]

¹ [*Of the Sublime and Beautiful*, part iii. secs. ii.-v. The passage quoted below, in § 14, is from sec. v.; p. 173 in the ed. of 1782.]

² [Ed. 1 omits “constructively, and ought to be . . . disguise.”]

³ [*Cf.* Vol. I. p. 380.]

⁴ [Aphorism 107, *Life and Writings of Fuseli*, 1831, vol. iii. p. 103. The text is “All Oriental, all Gothic styles,” etc. In a note to an additional passage in the MS., which was ultimately struck out, Ruskin, in referring to another aphorism of Fuseli, says:—

“It is a pity his love of epigram destroys his power of persuasion. A sentence is couched in too few words when they contain its meaning indeed, but neither display it nor recommend it.”

For other references to Fuseli's Aphorisms, see pp. 137, 236, 259.]

Now, the full proof of the influence of Apparent Proportion, I must reserve for illustration by diagram;¹ one or two instances, however, may be given at present, for the better understanding of its nature.

§ 11. *The value of Apparent Proportion in curvature.*

We have already asserted that all curves are more beautiful than right lines. All curves, however, are not equally beautiful, and their differences of beauty depend on the different proportions borne to each other by those infinitely small right lines of which they may be conceived as composed.

When these lines are equal and contain equal angles, there can be no connection nor unity of sequence in them. The resulting curve, the circle, is therefore the least beautiful of all curves.

When the lines bear to each other some certain proportion: or when, the lines remaining equal, the angles vary; or when by any means whatsoever, and in whatever complicated modes, such differences as shall imply connection are established between the infinitely small segments, the resulting curves become beautiful. The simplest of the beautiful curves are the conic, and the various spirals; but it is difficult to trace any ground of superiority or inferiority among the infinite numbers of the higher curves. I believe that almost all are beautiful in their own nature, and that their comparative beauty depends on the constant quantities involved in their equations. Of this point I shall speak hereafter at greater length.²

The universal forces of nature, and the individual energies of the matter submitted to them, are so appointed and balanced, that they are continually bringing out curves of this kind in all visible forms, and that circular lines become nearly impossible under any circumstances. The acceleration, for instance, of velocity, in streams that descend from hill-sides, gradually increases their

§ 12. *How produced in natural forms.*

¹ [An intention not fulfilled.]

² [See *Modern Painters*, vol. iv. ch. xvii.]

power of erosion, and in the same degree¹ the rate of curvature in the descent of the slope, until at a certain degree of steepness this descent meets, and is concealed by, the straight line of the detritus. The junction of this right line with the plain is again modified by the farther bounding of the larger blocks, and by the successively diminishing scale of landslips caused by the erosion at the bottom.* So that the whole contour of the hill is one of curvature; first, gradually increasing in rapidity to the maximum steepness of which the particular rock is capable, and then decreasing in a decreasing ratio, until it arrives at the plain-level. This type of form, modified of course more or less by the original boldness of the mountain, and dependent on its age, its constituent rock, and the circumstances of its exposure, is yet in its general formula applicable to all.† So the curves of all things in motion, and of all organic forms, most rude and simple in the shell spirals, and most complicated in the muscular lines of the higher animals.

This influence of Apparent Proportion, a proportion, be it observed, which has no reference to ultimate ends, but which

* This is, I believe, the first intimation given in my writings of the care with which they were to enforce and follow out the study of abstract curvature;² a study which, as yet unknown in our drawing schools, is nevertheless the indispensable basis of all noble design in art, and all accurate observation of external form by science. Twenty years of useless debate and senseless theory respecting glacier motion might have been spared us, if Professor Agassiz had been able to draw with his own hand, accurately, a single curve of mountain crest, glacier wave, river's bank, or fish's tail. [1883.]³

† It has been mathematically analyzed by Mr. Alfred Tylor, who was, I believe, the first investigator of the laws of curve in descent of great rivers.⁴ [1883.]

¹ [Ed. 1 reads, "as it gradually increases their power of erosion increases in the same gradual degree," etc., and, two lines lower, reads, "right" for "straight." Three lines lower again, ed. 1 reads "proportion" for "scale," and, in the next line, "line" for "contour."]

² [See vol. iv. of *Modern Painters, Elements of Drawing*, etc.]

³ [An echo of a controversy into which Ruskin entered with much warmth; see *Fors Clavigera*, Letter 34, and *Deucalion*, *passim*. What Ruskin here means is apparently that Agassiz, if he had had the gift of drawing accurately, might have hit upon the viscous theory which was reserved for Forbes. For Ruskin's remarks on Tyndall's similar inability to draw, see *Deucalion*, i. ch. vi. § 11.]

⁴ [Alfred Tylor (1824–1884), geologist, author of *On Changes of Sea Level* and other scientific papers.]

is itself, seemingly, the end¹ of operation to many of the forces of nature, is therefore at the root of all our delight in any beautiful form whatsoever. For no form can be beautiful which is not composed of curves whose unity is secured by relations of this kind.

Not only however in curvature, but in all associations of lines whatsoever, it is desirable that there should be reciprocal relation, and the eye is unhappy without perception of it. It is utterly vain to endeavour to reduce this proportion to finite rules, for it is as various as musical melody, and the laws to which it is subject are of the same general kind; so that the determination of right or wrong proportion is as much a matter of feeling and experience as the appreciation of good musical composition. Not but that there is a science of both, and principles which may not be infringed; but that within these limits the liberty of invention is infinite, and the degrees of excellence infinite also. Whence the curious error of Burke, in imagining that because he could not fix upon some one given proportion of lines as better than any other, therefore proportion had no value or influence at all.² It would be as just to conclude that there is no such thing as melody in music, because no one melody can be fixed upon as best.*

The argument of Burke on this subject³ is summed up in the following words:—"Examine the head of a beautiful horse, find what proportion that bears to his body and to his limbs, and what relations these have to each other; and when you have settled these proportions as a standard of beauty, then take a dog or cat, or any

§ 13. *Apparent Proportion in lines.*

§ 14. *Error of Burke in this matter.*

* The reader will please observe that a Positive Good, and Positive Evil, are always assumed in my writings as existing in total independence of our opinions about such good and evil. It is for us to find out what *they are*: not to concern ourselves with what we, or anybody else, happen to think. [1883.]

¹ [Eds. 1 and 2 add, "and object."]

² [Eds. 1 and 2 read "nor" for "or." Ed. 1 reads, "at all, which is the same as to conclude . . . because there are more melodies than one."]

³ [See above, p. 105 *n.*, for the reference.]

other animal, and examine how far the same proportions between their heads and their necks, between those and the body, and so on, are found to hold; I think we may safely say, that they differ in every species, yet that there are individuals found in a great many species so differing, that have a very striking beauty. Now if it be allowed that very different, and even contrary, forms and dispositions are consistent with beauty, it amounts, I believe, to a concession, that no certain measures operating from a natural principle are necessary to produce it, at least so far as the brute species is concerned.”*

In this argument there are three very palpable fallacies. The first is, the rough application of measurement to the heads, necks, and limbs, without observing the subtle differences of proportion and position of parts in the members themselves; for it would be strange if the different adjustment of the ears and brow in the dog and horse, did not require a harmonizing difference of adjustment in the head and neck. The second fallacy is that above specified, the supposition that proportion cannot be beautiful if susceptible of variation; whereas the whole meaning of the term has reference to the adjustment and functional correspondence of *infinitely variable* quantities. And the third error is, the oversight of the very important fact, that, although “different and even contrary forms and dispositions are consistent with beauty,” they are by no means consistent with equal *degrees* of beauty: so that, while we find in all animals such proportion and harmony of form as gift them with positive agreeableness consistent with the station and dignity of each, we

* This is an admirable sentence, and although there are fallacies in it,—and even more than the three which are examined in the following paragraph,—they are not, as with Alison, fallacies of logic, but only omissions of points needing to be relatively considered. Burke is perfectly right, as far as he goes, or intended to go; he meant only to prove that the ratios of definite number which were beautiful in one thing, were not so in another; and he was the first English writer on art who used his common sense and reason on this subject. The essay on the Sublime and Beautiful is, like all his writing, extremely rational and forcible; and deserves most careful and reverent reading.¹ [1883.]

¹ [Cf. Vol. III. p. 128 n.]

perceive, also, a better proportion in some (as the horse, eagle, lion, and man, for instance,) expressing the nobler functions and more exalted powers of the animal.

And this allowed superiority of some animal forms is, in itself, argument against the second error above named,* that of attributing the sensation of beauty to the perception of Expedient or Constructive Proportion. (For everything that God has made is equally well constructed with reference to its intended functions.)[†] But all things are not equally beautiful. The megatherium is absolutely as well proportioned, in the adaptation of parts to purposes, as the horse or the swan; but by no means so handsome as either. The fact is, that the perception of expediency of proportion can but rarely affect our estimates of beauty, for it implies a knowledge which we very rarely and imperfectly possess, and the want of which we tacitly acknowledge.[‡]

Let us consider that instance of the proportion of the stalk of a plant to its head, § given by Burke. In order to judge of the expediency of this proportion, we must know, First, the scale of the plant; for the smaller the scale, the longer the stem may safely be: Secondly, the toughness of the materials of the stem, and the mode of their mechanical structure: Thirdly, the specific gravity of the head: Fourthly, the position of the head which the nature of fructification requires:

* P. 64 [in this edition]. This whole chapter is terribly confused: but the gist of it all is right, and worth the reader's pains to disentangle. [1883.]

† The sentence put in brackets [in 1883 ed.] is a mere piece of pious insolence. No mortal has any business with God's intentions, or pretence of insight into them; but assuredly some animals are awkwardly made, and others well made, with reference to similar functions. [1883.]

‡ If we acknowledged it openly, we should be wiser. [1883.]

§ The passage ought to have been quoted; but it is to the same intent as the preceding one. [1883.]

¹ ["What proportion do we discover between the stalks and the leaves of flowers, or between the leaves and the pistils? How does the slender stalk of the rose agree with the bulky head under which it bends? but the rose is a beautiful flower; and can we undertake to say that it does not owe a great deal of its beauty even to that disproportion?" (*Of the Sublime and Beautiful*, pt. iii. sec. ii. p. 169, ed. 1782).]

Fifthly, the accidents and influences to which the situation for which the plant was created is exposed. Until we know all this, we cannot say that proportion or disproportion exists: and because we cannot know all this, the idea of expedient proportion enters but slightly into our impression of vegetable beauty, but rather, since the very existence of the plant proves that these proportions have been observed, and we know that nothing but our own ignorance prevents us from perceiving them, we take their accuracy on trust,¹ and are delighted by the variety of results which the Divine intelligence has attained in the various involutions of these quantities; and perhaps most when, to outward appearance, such proportions have been neglected; more by the slenderness of the campanula* than the security of the pine.

What is obscure in plants is utterly concealed in animals, owing to the greater number of means employed § 16. *And* and functions performed. To judge of Expedient *animals.* Proportion in them, we must know all that each member has to do, its bones, its muscles, and the amount of nervous energy communicable to them; and yet, as we have more experience and instinctive sense of the strength of muscles than of wood, and more practical knowledge of the use of a head or a foot than of a flower or a stem, we are much more likely to presume upon our judgment respecting proportions here; and are not afraid² to assert that the plesiosaurus and camelopard have necks too long, that the turnspit has legs too short, and the elephant a body too ponderous.

But the painfulness arising from the idea of this being the case is occasioned partly by our sympathy with the animal, partly by our false apprehension of incompleteness in the Divine

* Meaning blue-bell, or Scottish hare-bell: but I spoiled the clearness of idea in the sentence, for the sake of the alliteration of panula and pine. [1883.]³

¹ [Ed. 1 reads, "we take the proportion on credit, and are delighted . . ."; and, four lines lower, reads "violated" for "neglected."]

² [Ed. 1 reads, "and we are very apt to . . ."]

³ [The MS. reads, "the harebell . . . the oak."]

work;* nor in either case has it any connection with impressions of that typical beauty of which we are at present speaking; though some, perhaps, with that vital beauty which will hereafter come under discussion.

§ 17. *Summary.*

I wish therefore the reader to hold, respecting proportion generally:

1st, That Apparent Proportion, or the melodious connection of quantities, is a cause of unity, and therefore one of the sources of all beautiful form.

2ndly, That Constructive Proportion is agreeable to the mind when it is known or supposed, and that its seeming absence is painful in a like degree; but that this pleasure and pain have nothing in common with those dependent on Ideas of Beauty.

Farther illustrations of the value of Unity I shall reserve for our detailed examination, as the bringing them forward here would interfere with the general idea of the subject-matter of the Theoretic faculty which I wish succinctly to convey.

* For the just and severe reproof of which, compare Sir Charles Bell, *On the Hand*, pp. 31, 32.**

** I can't compare Sir Charles, at present!—and don't want to, for the real impertinence to be reproved is in supposing ourselves to be able to understand the depths and meanings of the Creation, as if we had been by, all the time. In practical and visible fact, some creatures *are* weak, incomplete, and in that degree ugly, by comparison with others; and a lizard, who shakes his tail off in a tremor, is as much inferior to a dog who can wag it comfortably, as a feeble person who changes his mind in a minute is to a man who can both pause and persevere. [1883.]

¹ [“The Bridgewater Treatises, iv.”: *The Hand: Its Mechanism and Vital Endowments as evincing Design*: 1834. At the pages cited, Bell says: “The compassion excited by these philosophers for animals, which they consider imperfectly organised, is uncalled for; as well might they pity the larva of the summer fly, which creeps in the bottom of a pool, because it cannot yet rise upon the wing. . . . We must not estimate the slow motions of animals by our own sensations,” etc.]

CHAPTER VII¹

OF REPOSE, OR THE TYPE OF DIVINE PERMANENCE

THERE is probably no necessity more imperatively felt by the artist, no test more unfailing of the greatness of artistic treatment, than that of the appearance of repose; yet there is no quality whose semblance in matter is more difficult to define or illustrate.

§ 1. Universal feeling respecting the necessity of repose in art. Its sources.

Nevertheless, I believe that our instinctive love of it, as well as the cause to which I attribute that love, (although here also, as in the former cases, I contend not for the interpretation, but for the fact,)* will be readily allowed by the reader. As opposed to passion, change, fulness, or laborious exertion, Repose is the especial and separating characteristic of the eternal mind and power. It is the “I am” of the Creator opposed to the “I become” of all creatures; it is the sign alike of the supreme knowledge which is incapable of surprise, the supreme power which is incapable of labour, the supreme volition which is incapable of change; it is the stillness of the beams of the eternal chambers laid upon the variable waters of ministering creatures. And as we saw before that the infinity which was a type of the Divine nature on the one hand, became yet more desirable on the other from its peculiar address to our prison hopes, and to the expectations of an unsatisfied and unaccomplished existence; so the types of this third attribute of the Deity might seem to have been rendered farther attractive to mortal instinct through the infliction upon the fallen creature of a curse necessitating

* The reader will please note these guarding sentences: they were perfectly sincere; and it is always open to the rationalist to reject the metaphysical conclusions, or propositions, in this book, while he may accept with confidence its statements of all primary laws of judgment in design. [1883.]

¹ [The ed. of 1883 makes this ch. iii. of section ii.]

a labour once unnatural and still most painful; so that¹ the desire of rest planted in the heart is no sensual nor unworthy one, but a longing for renovation and for escape from a state whose every phase is mere preparation for another equally transitory, to one in which permanence shall have become possible through perfection.² Hence the great call of Christ to men, that call on which St. Augustine fixed as the essential expression of Christian hope,³ is accompanied by the promise of rest;* and the death bequest of Christ to men is peace.⁴

Repose, as it is expressed in material things, is either a simple appearance of permanence and quietness, as
 § 2. *Repose,*
how expressed
in matter. in the massy forms of a mountain or rock,
 accompanied by the lulling effect of all mighty sight
 and sound, which all feel and none define (it would be less
 sacred if more explicable)

ευδουσιν δ ορεων κορυφαι τε και φαραγγες⁵

or else it is repose proper, the rest of things in which there is vitality or capability of motion actual or imagined: and with respect to these the expression of repose is greater in proportion

* Matt. xi. 28.

¹ [The passage, "The desire of rest" to the end of § 1, is § 83 in *Frondes Agrestes*.]

² [The corresponding passage in the first draft is here given as an illustration of the way in which, in places where Ruskin made the same points and in part embodied his first words, he yet severely compressed in re-writing:—

"The infliction upon us as fallen creatures of a curse necessitating a labour once unnatural, always painful to us, must at once plant in our hearts, as one of their holiest aspirations, the desire of *rest*; and the frequent setting forth, in the tenderest passages of Scripture, of peace and rest as the utmost good and comfort which could be bought for us by the Redeemer, must necessarily so bind the idea of them up in our bosoms with all that is dearest to them that the very words fall in a species of music on the bodily ears and a very material object becomes delightful to us, in proportion as it realises to the eye our mental conception of repose."

³ [The text is, "Come unto Me, all ye that labour and are heavy laden, and I will give you rest." This call and Christian hope is constantly referred to in the *Confessions* of St. Augustine.]

⁴ [John xiv. 27.]

⁵ [In the ed. of 1883 these words were omitted, and the following note given:—

"'The crests and chasms of the mountains are asleep.' It was quoted in Greek, and I forget from whom."

The line is from Alcman, 44, in Bergk's *Lyrici Gr*. Ruskin took it, as appears from one of his note-books, from T. Mitchell's edition of the *Wasps* of Aristophanes, where it is quoted in a note.]

to the amount and sublimity of the action which is *not* taking place, as well as to the intensity of the negation of it. Thus we do not speak of repose in a pebble, because the motion of a pebble has nothing in it of energy or vitality, neither its repose of stability.¹ But having once seen a great rock come down a mountain side, we have a noble sensation of its rest, now bedded immovably among the fern; because the power and fearfulness of its motion were great, and its stability and negation of motion are now great in proportion. Hence the imagination, which delights in nothing more than in the enhancing of the characters of repose, effects this usually by either attributing to things visibly energetic an ideal stability, or to things visibly stable an ideal activity or vitality. Thus Wordsworth speaks of the Cloud, which in itself has too much of changefulness for his purpose, as one

“That heareth not the loud winds when they call,
And moveth altogether² if it move at all.”

And again the children, which, that it may remove from them the child-restlessness, the imagination conceives as rooted flowers,

“Beneath an old grey oak, as violets, lie.”³

On the other hand, the scattered rocks, which have not, as such, vitality enough for rest, are gifted with it by the living image: they

“Lie couched around us like a flock of sheep.”⁴

¹ [The draft gives another illustration here:—

“They are the small and weak waves which splash and dance, and spend themselves in vain turbulence; the surges of the deep sea move in mighty and quiet lines—slow and unbroken—and soundless but irresistible.”]

² [“Resolution and Independence,” xi. The passage is referred to by Wordsworth in his remarks on the Imagination in the “Preface” of 1815.]

³ [This is line 149 in the earlier editions of Wordsworth’s “Descriptive Sketches during a Pedestrian Tour among the Alps.” In the 1835 and later editions, the passage was revised, the children being likened to “lambs or fawns” and placed “under a hoary oak’s thin canopy.”]

⁴ [Quoted from memory. The passage in “Nutting” is:—

“And—with my cheek on one of those green stones
That fleeced with moss, under the shady trees,
Lay round me, scattered like a flock of sheep . . .”]

Thus, as we saw that Unity demanded for its expression what at first might have seemed its contrary, Variety, so
 § 3. *The necessity to Repose of an implied energy.* Repose demands for its expression the implied capability of its opposite, Energy: and this even in its lower manifestations, in rocks and stones and trees. By comparing the modes in which the mind is disposed to regard the boughs of a fair and vigorous tree, motionless in the summer air, with the effect produced by one of the same boughs hewn square and used for threshold or lintel, the reader will at once perceive the connection of vitality with repose, and the part they both bear in beauty.*

But that which in lifeless things ennobles them by seeming to
 § 4. *Mental Repose, how noble.* indicate life, ennobles higher creatures by indicating the exaltation of their earthly vitality into a Divine vitality; and raising the life of sense into the life of faith: faith, whether we receive it in the sense of adherence to resolution, obedience to law, regardfulness of promise, in which from all time it has been the test, as the shield, of the true being and life of man; or in the still higher sense of trustfulness in the presence, kindness, and word of God, in which form it has been exhibited under the Christian dispensation. For, whether in one or other form,—whether the faithfulness of men whose path is chosen and portion fixed, in the following and receiving of that path and portion, as in the Thermopylæ camp; or the happier faithfulness of children in the good giving of their Father, and of subjects in the conduct of their King, as in the “Stand still and see the salvation of God”¹ of the Red Sea shore, there is rest and peacefulness, the “standing still,” in both, the quietness of action determined, of spirit unalarmed, of expectation unimpatient: beautiful even when based only, as of old, on the self-command and self-possession,

* The two preceding paragraphs, second and third, are extremely well thought out, and clearly worded: the succeeding fourth is one of the best in all my books, relating to religious subjects; and of peculiar value at this time, when even the *conceptions* of Faith and Obedience have become impossible to the vulgar heart, in England. [1883.]

¹ [Exodus xiv. 13.]

the persistent dignity or the uncalculating love, of the creature;* but more beautiful yet when the rest is one of humility instead of pride, and the trust no more in the resolution we have taken, but in the hand we hold.

Hence I think that there is no desire more intense or more exalted than that which exists in all rightly disciplined minds for the evidences of repose in external signs: and what I cautiously said respecting infinity, I say fearlessly respecting repose; that no work of art can be great without it, and that all art is great in proportion to the appearance of it.† It is the most unfailing test of beauty,

§ 5. *Its universal value as a test of art.*

* “The universal instinct of repose,
The longing for confirmed tranquillity
Inward and outward, humble, yet sublime,
The life where hope and memory are as one.
Earth quiet and unchanged; the human soul
Consistent in self-rule; and heaven revealed
To meditation, in that quietness.”

—WORDSWORTH, *Excursion*, book iii.

But compare carefully (for this is put into the mouth of one diseased in thought and erring in seeking) the opening of the ninth book; and observe the difference between the mildew of inaction—the slumber of Death; and the patience of the Saints—the rest of the Sabbath Eternal. Rev. xiv. 13.1

† This is wildly overstated; and the rest of the paragraph is nearly pure nonsense,—yet with a grain of meaning at the bottom, which is worth explanation, and, once explained, contains an apology due to the reader, and a palliation, just to myself, for the extravagance, not of this passage only, but of many subsequent ones like it.

When I was first in Rome, in the winter of 1840, my own real art pleasures were only in Turner and Prout: but I desired earnestly to profit by the opportunities round me; and when Mr. George Richmond and Mr. Joseph Severn took me to the Vatican, looked very reverently at whatever I was bid.

Of Raphael, however, I found I could make nothing whatever. The only thing clearly manifest to me in his compositions was, that everybody seemed to be pointing at everybody else, and that nobody, to my notion, was worth pointing at.

But the colossal perplexities and subtle chiaroscuro of the Sistine Chapel impressed me, like the sublimity of mountains; the authority of Reynolds, which was at that time conclusive with me, enforced the feeling of which I was already not a little vain, that I could sympathize with the greatest (so he

¹ [The prose part of the note was omitted in the ed. of 1883, and the following note inserted:—

“I have italicised the beautiful line which describes a perfectly happy life; and cut out a useless note, which in the old edition introduced irrelevant matter.”]

whether of matter or of motion; nothing can be ignoble that possesses it, nothing right that has it not; and in strict proportion to its appearance in the work is the majesty of mind to be inferred in the artificer. Without regard to other qualities, we may look to this for our evidence; and by the search for this alone we may be led to the rejection of all that is base, and the accepting of all that is good and great, for the paths of wisdom are all peace. We shall see, by this light, three colossal images standing up side by side, looming in their great rest of spirituality above the whole world-horizon, Phidias,¹ Michael Angelo, and Dante; and then, separated from their great religious thrones only by less fulness and earnestness of faith, Homer and Shakespeare; and from these we may go down step by step among the mighty men of every

was called by all my friends) of Italian masters. I set myself almost exclusively to the study of him, and long before I had begun writing *Modern Painters*, knew every figure and statue by Michael Angelo, either in Rome or Florence, very literally by heart: while I remained in total ignorance of the antecedent religious schools. When, in 1845, the writings of Lord Lindsay² led me to these, and I worked for the first time in Santa Maria Novella, and also for the first time read Dante, it seemed to me that the entire virtue and intellectual power of the older schools had been consummated in Dante; and then the three dynasties of Greek, Christian Mystic, and Christian Naturalist, became represented to me by the three men, Phidias, Michael Angelo, and Dante, named in the text; and represented also, with a power and simplicity unqualified by relative or intermediate knowledge. The physical repose of the statues of the Theseus, and of the Dawn and Twilight, and the spiritual repose of the conceptions of Paradise, by Dante and Angelico, impressed me as their distinctive character: and the apparently sudden enthusiasm of the pages I am excusing, was indeed the outcome of the eager emotions of five youthful years. Rightly expanded, or even understood as it was meant, the paragraph has a considerable measure of subtle truth in it; but as it stands, it is, as I have just confessed, nearly pure nonsense; for although great work is for the most part quiet, there is a great deal of quiet work in the world which is also extremely small, and extremely dull.

The sense in which Homer and Shakespeare are spoken of as separate from the masters of the definitively Christian schools, will be found afterwards developed in my essay on *The Mystery of Life*.³ It is curious, now, to myself, to see how early this feeling was in my mind. [1883.]

¹ [This passage—in which Phidias is spoken of by Ruskin in the same breath with Michael Angelo and Dante—is cited in *The Two Paths* (§ 80) in order to negative “the supposition that I have attacked or despised Greek work.”]

² [See above, p. xxiii. n.]

³ [The third lecture in *Sesame and Lilies*, § 113.]

age, securely and certainly observant of diminished lustre in every appearance of restlessness and effort, until the last trace of true inspiration vanishes in tottering affectation or tortured insanity.¹ There is no art, nor pursuit whatsoever, but its results may be classed by this test alone. Everything of evil is betrayed and winnowed away by it; glitter, confusion, or glare of colour; inconsistency² of thought; forced expression; evil choice of subject; redundance of materials, pretence, over-charged decoration, or excessive division of parts; and this in everything. In architecture, in music, in acting, in dancing, in whatsoever art, great or mean, there are yet degrees of greatness or meanness entirely dependent on this single quality of repose.

Particular instances are at present needless, and cannot but be inadequate; needless, because I suppose that every reader, however limited his experience of art, can supply many for himself; and inadequate, because no number of them could illustrate the full extent of the influence of the expression. I believe, however, that by comparing the convulsions of the Laocoon with the calmness of the Elgin Theseus,³ we may obtain a general idea of the effect of the influence, as shown by its absence in one, and

¹ [Ed. 1 reads, "vanishes in the tottering affectations or the tortured insanities of modern times."]

² [Ed. 1 inserts "or absence," and instead of "redundance of materials, . . . In architecture, in music, . . ." reads:—

"over accumulation of materials, whether in painting or literature, the shallow and unreflecting nothingness of the English schools of art, the strained and disgusting horrors of the French, the distorted feverishness of the German:—pretence, over decoration, over division of parts in architecture, and again in music, in acting . . ."]

³ [In the draft Ruskin used, not the "Theseus," but the so-called "Dying Gladiator" of the Capitol at Rome, to contrast with the "Laocoon":—

"The dying gladiator—though the statue of a vanquished slave—a mere victim of some butcher of the arena—is yet noble and exalted in its whole tone and character, for the very reason—strange as it may appear—that in its numbing clasp the right hand has already forgotten its cunning, and death has stamped upon the seared and disgraced brow the nobility of its repose."

Ruskin had been studying the Elgin Marbles much at this time (see Vol. III. p. 669), and now, as well as in his later works, he constantly referred to the so-called "Theseus" (from the East Pediment of the Parthenon) as a standard of perfection in its kind. See, e.g., below, sec. ii. ch. iv. § 19; *Two Paths*, § 21; *Fors Clavigera*, Letter 23; *Eagle's Nest*, § 39; *Bibliotheca Pastorum*, vol. i. (*The Economist* of Xenophon), Preface.]

presence in the other, of two works which, as far as artistical merit is concerned, are in some measure parallel; not that I believe, even in this respect, the Laocoon is justifiably comparable with the Theseus. I suppose that no group has exercised so pernicious an influence on art as this; a subject ill-chosen, meanly conceived, and unnaturally treated, recommended to imitation by subtleties of execution and accumulation of technical knowledge.*

* I would also have the reader compare with the meagre lines and contemptible tortures of the Laocoon, the awfulness and quietness of M. Angelo's treatment of a subject in most respects similar (the Plague of the Fiery Serpents),¹ but of which the choice was justified both by the place which the event holds in the typical system he had to arrange, and by the grandeur of the plague itself, in its multitudinous grasp, and its mystical salvation; sources of sublimity entirely absent in the death² of the Dardan priest. It is good to see how his gigantic intellect reaches after repose, and truthfully finds it, in the falling hand of the near figure, and in the deathful decline of that whose hands are held up even in their venomous coldness to the cross; and though irrelevant to our present purpose, it is well also to note how the grandeur of this treatment results, not merely from choice, but from the greater knowledge and more faithful rendering of truth. For whatever knowledge of the human frame there may be in the Laocoon, there is certainly none of the habits of serpents. The fixing of the snake's head in the side of the principal figure is as false to nature as it is poor in composition of line. A large serpent never wants to bite, it wants to hold; it seizes therefore always where it can hold best, by the extremities, or throat; it seizes once and for ever, and that before it coils; following up the seizure with a cast of its body round the victim, as invisibly swift as the twist of a whip-lash round any hard object it may strike: and then it holds fast, never moving the jaws or the body; if the prey has any power of struggling left, it throws round another coil, without quitting the hold with the jaws. If Laocoon had had to do with real serpents, instead of pieces of tape with heads to them, he would have been held still, and not allowed to throw his arms or legs about. It is most instructive to observe the accuracy of Michael Angelo, in the rendering of these circumstances; the binding of the arms to the body, and the knotting of the whole mass of agony together, until we hear the crashing of the bones beneath the grisly sliding of the engine folds. Note also in all the figures the expression of another circumstance; the torpor and cold numbness of the limbs induced by the serpent venom, which, though justifiably overlooked by the sculptor of the Laocoon, as well as by Virgil, in consideration of the rapidity of the death by crushing, adds infinitely to the power of the Florentine's conception, and would have been better hinted by Virgil, than that sickening distribution of venom on the garlands. In fact, Virgil has missed both of

¹ [The painting on one of the corner spandrels of the ceiling of the Sistine Chapel; one of four Biblical subjects symbolical of man's redemption.]

² [Ed. 1 reads, ". . . entirely wanting in the slaughter of . . ."]

In Christian art, it would be well to compare the feeling of the finer among the altar-tombs of the middle ages, § 7. *And in altar-tombs.* with any monumental works after Michael Angelo; perhaps more especially with works of Roubillac or Canova.¹

truth and impressiveness every way: the “morsu depascitur” is unnatural butchery, the “perfusus veneno” gratuitous foulness, the “clamores horrendos” impossible degradation. Compare carefully the remarks on this statue in Sir Charles Bell’s *Essay on Expression* (third edition, p. 192), where he has most wisely and incontrovertibly deprived the statue of all claim to expression of energy and fortitude of mind, and shown its common and coarse intent of mere bodily exertion and agony; while he has confirmed Payne Knight’s just condemnation of the passage in Virgil.² Observe,³ however, that no fault is to be found with the uniting of the poisonous and crushing powers in the serpents; this is, both in Virgil and Michael Angelo, a healthy operation of the imagination, since though those two powers are not, I believe, united in any known serpent, yet in the essence or idea of serpent they are; nor is there anything contradictory in them or incapable of perfect unity. But in Virgil it is unhealthy operation of the imagination which destroys the verity both of the venom and the crushing, by attributing impossible concomitants to both; by supposing in the poison an impossible quantity uselessly directed, and leaving the victim capability of crying out, under the action of the coils.

If the reader wishes to see the opposite view of the subject, let him compare Winckelmann; and Schiller, letters on *Æsthetic Culture*.⁴

¹ [Louis François Roubillac (1695–1762), settled in London in 1720, and became the most popular sculptor of the time in this country. His tombs in Westminster Abbey, more theatrical than sepulchral, are well known. They hit the taste of the time; but Roubillac himself, when he came back from Italy and once more saw his own sculptures, had the magnanimity to exclaim: “By God! my own works looked to me as meagre and starved as if they had been made of tobacco pipes” (Stanley’s *Memorials of Westminster Abbey*, 1882, p. 235). For Ruskin’s opinion of Canova, see Vol. III. pp. 154, 230, and *cf.* below, sec. ii. ch. iii. § 27, p. 279.]

² [Sir Charles Bell (*Essays on the Anatomy of Expression in Painting*, quotes and confirms by remarks of his own the following criticism by Payne Knight (*On Taste*, p. 333): “It is not with the agonies of a man, writhing in the pangs of death, that we sympathise, on beholding the celebrated group of Laocoon and his sons; for such sympathies can only be painful and disgusting; but it is with the energy and fortitude of mind which those agonies call into action and display. For though every feature and every muscle is convulsed, and every nerve contracted, yet the breast is expanded and the throat compressed, to shew that the suffers in silence. I therefore still maintain in spite of the blind and indiscriminate admiration, which pedantry always shews for everything which leaves the stamp of high authority, that Virgil has debased the character, and robbed it of all its sublimity and grandeur of expression, by making Laocoon *roar like a bull.*”]

³ [This and the next sentence of the footnote appear in ed. 1 as a note in the Addenda, thus:—“It ought to have been noticed respecting the Virgilian conception of the Laocoon, that no fault . . .”]

⁴ [Winckelmann’s appreciation of the group is quoted at the beginning of a treatise, to which it is curious that Ruskin does not refer—namely, Lessing’s *Laocoon*. Virgil’s

In the Cathedral of Lucca, near the entrance-door of the north transept, there is a monument by Jacopo della Quercia to Ilaria di Caretto, the wife of Paolo Guinigi.¹ I name it not as more beautiful or perfect than other examples of the same period;* but as furnishing an instance of the exact and right mean between the rigidity and rudeness of the earlier monumental effigies, and the morbid imitation of life, sleep, or death, of which the fashion has taken place in

* It is forty years since I first saw it, and I have never found its like.—(Pisa, 5th November, 1882.) [1883.]

description, on which some have supposed that the sculptor based his work, is in *Aeneid*, xi. 199 *seqq.* Schiller's discussion of the Laocoon will be found in the paper entitled "Pathos," in the *Philosophical and Æsthetic Letters and Essays of Schiller*, translated by J. Weiss, 1845, pp. 223–228.]

¹ [Ruskin's first note of Ilaria is contained in a letter to his father describing the days at Lucca (May 6, 1845):—

"When the rose tints leave the clouds I go and spend a quarter of an hour beside the tomb of Ilaria di Caretto. It is in the Cathedral. She was the second wife of Paolo Guinigi, Signore of Lucca in 1430. He left the Lucchese several good laws which they have still, but in a war with the Florentines he was betrayed by his allies, and died in a prison at Pavia. The tower of his palace fortress is overgrown with copse-wood, but the iron rings, to which his horses used to be fastened, still are seen along the length of the street before it; and the hooks by which the silken draperies were suspended on festa days.

"This, his second wife, died young, and her monument is by Jacopo della Quercia, erected soon after her death. She is lying on a simple pillow, with a hound at her feet. Her dress is of the simplest middle age character, folding closely over the bosom and tight to the arms, clasped about the neck. Round her head is a circular fillet with three star-shaped flowers. From under this the hair falls like that of the Magdalene, its undulation just felt as it touches the cheek, and no more. The arms are not folded, nor the hands clasped nor raised. Her arms are laid softly at length upon her body, and her hands cross as they fall. The drapery flows over the feet and half hides the hound. It is impossible to tell you the perfect sweetness of the lips and closed eyes, nor the solemnity of the seal of death which is set upon the whole figure. The sculpture—as art—is in every way perfect: truth itself, but truth selected with inconceivable refinement of feeling. The cast of the drapery, for severe natural simplicity and perfect grace, I never saw equalled, nor the fall of the hands; you expect every instant, nay rather you seem to see every instant, the last sinking into death. There is no decoration nor work about it; not even enough for protection; you may stand beside it leaning on the pillow, and watching the twilight fade off the sweet dead lips and arched eyes in their sealed close."

Many years later (1878) Ruskin wrote another description of the tomb (*The Three Colours of Pre-Raphaelitism*, § 24); for a minor reference to it, see also *Fors Clavigera*, Letter 66; and for its influence on Ruskin, *Fors*, Letter 45, *Præterita*, ii. ch. vi. § 113, and Epilogue to the present volume, § 5, p. 347. A head of Ilaria, reproduced from a drawing made by Ruskin in 1882, will be found in a later volume of this edition. A water-colour drawing of the head, by Mr. W. G. Collingwood, is in the Ruskin Museum at Sheffield. The plate of the whole tomb here given is from a photograph.]

From a photograph

Allen & Co. Po

Tomb of Maria di Caretto, Lucca.

modern times.* She is lying on a simple couch with a hound at her feet; not on the side, but with the head laid straight and simply on the hard pillow, in which, let it be observed, there is no effort at deceptive imitation of pressure. It is understood as a pillow, but not mistaken for one. The hair is bound in a flat braid over the fair brow, † the sweet and arched eyes are closed, the tenderness of the loving lips is set and quiet; there is that about them which forbids breath; something which is not death nor sleep, but the pure image of both. The hands are not lifted in prayer, neither folded, but the arms are laid at length upon the body, and the hands cross as they fall. The feet are hidden by the drapery, and the forms of the limbs concealed, but not their tenderness.¹

* Whenever, in monumental work, the sculptor reaches a deceptive appearance of life or death, or of concomitant details, he has gone too far. The statue should be felt to be a statue, not look like a dead or sleeping body; it should not convey the impression of a corpse, nor of sick and outworn flesh, but it should be the marble *image* of death or weariness. So the concomitants should be distinctly marble, severe and monumental in their lines: not shroud, not bed-clothes, not actual armour nor brocade; not a real soft pillow, not a downright hard-stuffed mattress; but the mere type and suggestion of these, and the ruder, often the nobler.² Not that they are to be unnatural; such lines as are given should be true,³ and clear of the hardness and mannered rigidity of the strictly Gothic types; but lines so few and grand as to appeal to the imagination only, and always to stop short of realization. A monument by a modern Italian sculptor has been lately placed in one of the side chapels of Santa Croce, forcible as portraiture, and delicately finished, but looking as if the person had been restless all night, and the artist admitted to a faithful study of the disturbed bed-clothes in the morning.⁴

† The braiding is not flat, but in tresses, of which the lightest escape, and fall free. [1883.]

¹ [The passage, "In the Cathedral of Lucca . . . tenderness," is § 85 in *Fronde Agrestes*.]

² [For "and the ruder, often the nobler," ed. 1 has "a certain rudeness and incompleteness of finish is very noble in all . . ." And the last sentence runs thus:—

"There is a monument put up lately by a modern Italian sculptor in one of the side chapels of Santa Croce; the face fine and the execution dexterous. But it looks as if . . ."]

³ [Ed. 1 reads "should be pure and true."]

⁴ [In the Capella Aldobrandini Borghese, in the North Transept. The monument is to the Countess Zamoyska, and is by Lorenzo Bartolini (1777–1850).]

If any of us, after staying for a time beside this tomb, could see, through his tears, one of the vain and unkind encumbrances of the grave, which, in these hollow and heartless days, feigned sorrow builds to foolish pride, he would, I believe, receive such a lesson of love as no coldness could refuse, no fatuity forget, and no insolence disobey.

CHAPTER VIII¹

OF SYMMETRY, OR THE TYPE OF DIVINE JUSTICE

WE shall not be long detained by the consideration of this, the fourth constituent of beauty, as its nature is universally felt and understood. In all perfectly beautiful objects, there is found the opposition of one part to another, and a reciprocal balance, in animals commonly between opposite sides (note the disagreeableness occasioned by the exception in flat-fish, having the eyes on one side of the head); while in vegetables the opposition is less distinct, as in the boughs on opposite sides of trees, and the leaves and sprays on each side of the boughs; and in dead matter less perfect still, often amounting only to a certain tendency towards a balance, as in the opposite sides of valleys and alternate windings of streams. In things in which perfect symmetry is from their nature impossible or improper, a balance must be at least in some measure expressed before they can be beheld with pleasure. Hence the necessity of what artists require as opposing lines or masses in composition, the propriety of which, as well as their value, depends chiefly on their inartificial and natural invention. Absolute equality is not required, still less absolute similarity. A mass of subdued colour may be balanced by a point of a powerful one, and a long and latent line overpowered by a short and conspicuous one. The only error against which it is necessary to guard the reader, with respect to symmetry, is, the confounding of it with proportion, though it seems strange that the two terms could ever have been used as synonymous. Symmetry is the *opposition of equal quantities to each other*; proportion,

§ 1. *Symmetry, what, and how found in organic nature.*

§ 2. *How necessary in art.*

¹ [Ch. iv. of sec. ii. in the re-arranged edition of 1883.]

the *connection* of *unequal* quantities with each other. The property of a tree sending out equal boughs on opposite sides is symmetrical; its sending out shorter and smaller towards the top, proportional. In the human face, its balance of opposite sides is symmetry; its division upwards, proportion.

Whether the agreeableness of symmetry be in any way referable to its expression of the Aristotelian *ισοτης* that is to say, of abstract justice,¹ I leave the reader to determine; I only assert respecting it, that it is necessary to the dignity of every form, and that by the removal of it we shall render the other elements of beauty comparatively ineffectual: though, on the other hand, it is to be observed that it is rather a mode of arrangement of qualities than a quality itself; and hence symmetry has little power over the mind, unless all the other constituents of beauty be found together with it. A form may be symmetrical and ugly, as many Elizabethan ornaments, and yet not so ugly as it would have been if unsymmetrical, but bettered always by increasing degrees of symmetry: as in star figures wherein there is a circular symmetry of many like members, whence their frequent use for the plan and ground of ornamental designs. So also it is observable that foliage in which the leaves are concentrically grouped, as in the chestnuts, and many shrubs, rhododendrons, for instance,² is far nobler in its effects than any other, so that the sweet chestnut most fondly and frequently occurs in the landscape of Tintoret and Titian (beside which all other landscape grandeur vanishes).* And even in the meanest things the rule holds, as in the kaleidoscope, wherein agreeableness is given to forms altogether accidental, merely by their repetition and reciprocal opposition. Which orderly balance and arrangement are essential to the perfect operation of the

* Nonsense, again; from believing the talk about Titian's landscape too easily. [1883.]

¹ [See *Ethics*, v. 3, 1.]

² [Eds. 1 and 2 insert here “—(whence the perfect beauty of the Alpine rose)—” For Ruskin's love for that flower, *cf.* Vol. II. p. 371.]

more earnest and solemn qualities of the Beautiful, as being heavenly in their nature, and contrary to the violence and disorganization of sin; so that the seeking of them, and submission to them, are characteristic of minds that have been subjected to high moral discipline, and constant in all the great religious painters, to the degree of being an offence and a scorn to men of less tuned and tranquil feeling. Equal ranks of saints are placed on each side of the picture; if there be a kneeling figure on one side, there is a corresponding one on the other; the attendant angels beneath and above are arranged in like order;¹ and the balance is preserved even in actions necessitating variety of grouping, as always by Giotto; and by Ghirlandajo in the introduction of his chorus-like side figures; and by Tintoret most eminently in his noblest work, the Crucifixion,² where not only the grouping, but the arrangement of light, is absolutely symmetrical. Where there is no symmetry, the effects of passion and violence are increased, and many very sublime pictures derive their sublimity from the want of it, but they lose proportionally in the diviner quality of beauty. In landscape the same sense of symmetry is preserved, as we shall presently see, even to artificialness, by the greatest men; and it is one of the principal faults in the landscapes of the present day, that the symmetry of nature is sacrificed to irregular picturesqueness. Of this, however, hereafter.³

¹ [Ed. 1 reads here:—

“in like order. The *Rafaelle* at Blenheim, the *Madonna di San Sisto*, the *St. Cecilia*, and all the works of Perugino, Francia, and John Bellini present some such form, and the balance at least is preserved even in pictures of action necessitating . . .”

For the *Raphael* at Blenheim (now No. 1171 in the National Gallery), see Vol. I. p. 495; for the *San Sisto* (at Dresden), Vol. III. p. 13 *n.*, and p. 369 of this vol.; for the *St. Cecilia* (at Bologna), Vol. II. p. 167.]

² [See below, sec. ii. ch. iii. § 20, p. 270.]

³ [See next volume, ch. xiv.]

CHAPTER IX¹

OF PURITY, OR THE TYPE OF DIVINE ENERGY

IT may at first appear strange that I have not, in my enumeration of the Types of Divine attributes, included that which is certainly the most visible and evident of all, as well as the most distinctly expressed in Scripture; “God is light, and in Him is no darkness at all.”² But I could not logically class the presence of an actual substance or motion with mere conditions and modes of being; neither could I logically separate from any of these, that which is evidently necessary to the perception of all. And it is also to be observed, that, though the love of light is more instinctive in the human heart than any other of the desires connected with beauty, we can hardly separate its agreeableness in its own nature from the sense of its necessity and value for the purposes of life; neither the abstract painfulness of darkness from the sense of danger and powerlessness connected with it. And note also that it is not *all* light, but light possessing the universal qualities of beauty, diffused or infinite rather than in points; tranquil, not startling and variable; pure, not sullied or oppressed; which is indeed pleasant and perfectly typical of the Divine nature.

Observe, however, that there is one quality, the idea of which has been just introduced in connection with light, which might have escaped us in the consideration of mere matter, namely Purity: and yet I think that the original notion of this quality is altogether material, and has only been attributed to colour when such colour is suggestive of the condition of matter from which

§ 1. *The influence of Light, as a sacred symbol.*

§ 2. *The idea of Purity connected with it.*

¹ [Ch. v. of sec. ii. in the re-arranged edition of 1883.]

² [1 John i. 5.]

we originally received the idea. For I see not in the abstract how one colour should be considered *purser* than another, except as more or less compounded: whereas there is certainly a sense of purity or impurity in the most compound and neutral colours, as well as in the simplest; a quality difficult to define, and which the reader will probably be surprised by my calling the type of Energy, with which it has certainly little traceable connection in the mind.

I believe, however, if we carefully analyze the nature of our ideas of impurity in general, we shall find them refer especially to conditions of matter in which its various elements are placed in a relation incapable of healthy or proper operation; and most distinctly to conditions in which the negation of vital or energetic action is most evident; as in corruption and decay of all kinds, wherein particles which once, by their operation on each other, produced a living and energetic whole, are reduced to a condition of perfect passiveness, in which they are seized upon and appropriated, one by one, piecemeal, by whatever has need of them, without any power of resistance or energy of their own. And thus there is a peculiar painfulness attached to any associations of inorganic with organic matter, such as appear to involve the inactivity and feebleness of the latter; so that things which are not felt to be foul in their own nature become so in association with things of greater inherent energy: as dust or earth, which in a mass excites no painful sensation, excites a most disagreeable one when strewing or staining an animal's skin; because it implies a decline and deadening of the vital and healthy power of the skin. But all reasoning about this impression is rendered difficult,¹ because the ocular sense of impurity connected with corruption is enhanced by the offending of other senses and by the grief and horror of it in its own nature, as the special punishment and evidence of sin: and on the other hand, the

§ 3. *Originally derived from conditions of matter.*

§ 4. *Associated ideas adding to the power of the impression. Influence of clearness.*

¹ [Ed. 1 reads, "by the host of associated ideas connected with it, for . . .," and, two lines lower, inserts "infinitely" before "enhanced."]

ocular delight in purity is mingled, as I before observed, with the love of the mere element of light, as a type of wisdom and of truth; whence it seems to me that we admire the transparency of bodies; though probably it is still rather owing to our sense of more perfect order and arrangement of particles, and not to our love of light, that we look upon a piece of rock crystal as purer than a piece of marble, and on the marble as purer than a piece of chalk. And let it be observed, also, that the most lovely objects in nature are only partially transparent. I suppose the utmost possible sense of beauty is conveyed by a feebly translucent, smooth, but not lustrous surface of white, and pale warm red, subdued by the most pure and delicate greys, as in the finer portions of the human frame; in wreaths of snow, and in white plumage under rose light,* so Viola of Olivia in *Twelfth Night*, and Homer of Atrides wounded.† And I think that transparency and lustre, both beautiful in themselves, are incompatible with the highest beauty; because they destroy form, on the full perception of which more of the divinely typical character of the object depends than upon

§ 5. *Perfect beauty of Surface, in what consisting.*

* The reader will observe that I am speaking at present of mere material qualities. If he would obtain perfect ideas respecting loveliness of luminous surface, let him closely observe a swan with its wings expanded in full light five minutes before sunset. The human cheek or the rose leaf is perhaps hardly so pure, and the forms of snow, though individually as beautiful, are less exquisitely combined.¹

† (ὡς δ' ὅτε τις τ' ἐλεφάντα γυνη φοινικί μινης
Μηονί .)

So Spenser of Shamefacedness, an exquisite piece of glowing colour, and (sweetly of Belphebe; so the roses and lilies of all poets. Compare) the making of the image of Florimel:

“The substance whereof she the body made
Was purest snow, in mossy mould congealed,
Which she had gathered in a shady glade
Of the Riphæan hills.
The same she tempered with fine mercury,
And mingled them with perfect vermily.”

With Una he perhaps overdoes the white a little. She is two degrees of comparison above snow. Compare his questioning in the Hymn to Beauty,

¹ [This note was omitted in the 1883 edition. With what is here said about the beauty of wreaths of snow, cf. Vol. III. p. 446.]

its colour.¹ Hence in the beauty of snow and of flesh, so much translucency is allowed as is consistent with the full explanation of the forms; while we are suffered to receive more intense impressions of light and transparency from other objects, which nevertheless, owing to their necessarily unperceived form, are not perfectly nor affectingly beautiful. A fair forehead outshines its diamond diadem. The sparkle of the cascade withdraws not our eyes from the snowy summits in their evening silence.

It may seem strange to many readers that I have not spoken of purity in that sense in which it is most frequently used, as a type of sinlessness. I do not deny that the frequent metaphorical use of it in Scripture may have, and ought to have, much influence on the sympathies with which we regard it; and that probably the immediate agreeableness of it to most minds arises far more from this source* than from that to

§ 6. Purity only metaphorically a type of sinlessness.

about that mixture made of colours fair; (and goodly temperament of pure complexion):

“Hath white and red in it such wondrous power
That it can pierce through the eyes into the heart?”

(Where the distinction between typical and vital beauty is very gloriously carried out.)²

* I cannot but wonder more and more at the obstinacy of the public in calling these early books my best writing. The hissing of these two lines, after “immediate,” might be made a warning example in public schools. [1883.]

¹ [On this point, cf. *Modern Painters*, vol. i. pt. ii. sec. i. ch. v., and see note to Vol. III. p. 162 in this edition.]

² [In the ed. of 1883 Ruskin omitted from this note the passages now placed in brackets, and added the following:—

“I have cut away some useless prolixities in the above note, and would pray the reader to take Spenser’s Hymn for his teacher, and ask to be taught no more.”

For “Viola of Olivia,” see Act i. sc. v.: “‘Tis beauty truly blent, whose red and white Nature’s own sweet and cunning hand laid on.” The line from Homer is in the *Iliad*, iv. 141: “as when a Maeonian maid has stained ivory with purple dye,” etc. Shamefacedness, with “faire blushing face, As roses did with lilies interlace,” is in *The Faerie Queene*, book v. c. 3, st. 23. Belphebe: “and in her cheekes the vermeill red did shew Like roses in a bed of lilies shed,” *ibid.* ii. 3, 22. Florimel, *ibid.* iii. 8, 6. Una: “upon a lowly asse more white than snow. Yet she much whiter,” *ibid.* i. 1, 4. Of Ruskin’s reading of Spenser at this time, there is the following note in his diary:—

Jan. 21, 1844.—Pretty good day on the whole—read a little Faery Queene also, but it is heavy, though with sweet lines occasionally.]

which I have chosen to attribute it. But, in the first place, if it be indeed in the signs of Divine and not of human attributes that beauty consists, I see not how the idea of sin can be formed with respect to the Deity; for it is an idea of a relation borne by us to Him, and not in any way to be attached to His abstract nature:¹ while the Love, Mercifulness, and Justice of God I have supposed to be symbolized by other qualities of beauty, and I cannot trace any rational connection between them and the idea of Spotlessness in matter; nor between this idea and any of the virtues which make up the righteousness of man, except perhaps those of truth and openness, which have been above spoken of as more expressed by the transparency than the mere purity of matter. So that I conceive the use of the terms purity, spotlessness, etc., in moral subjects, to be merely metaphorical; and that it is rather that we illustrate these virtues by the desirableness of material purity than that we desire material purity because it is illustrative of these virtues.*

I repeat, then, that the only idea which I think can be legitimately connected with purity of matter, is this
 § 7. *Energy, how expressed by purity of matter,* of vital and energetic connection among its particles; as that of foulness is essentially connected with dissolution and death. Thus the purity of the rock, contrasted with the foulness of dust or mould, is expressed by the epithet “living,” very singularly given to rock, in almost all languages (singularly, because life is almost the last attribute one would ascribe to stone,

* This uncertain and unsatisfactory paragraph enters on subjects far out of its grasp, and misses the things close at hand, which needed chief consideration. See final note to this chapter (p. 134, **). [1883.]

¹ [Ed. 1 reads:—

“. . . to his abstract nature. And if the idea of sin is incapable of being formed with respect to him, so also is its negative, for we cannot form an idea of negation, where we cannot form an idea of presence. If, for instance, one could conceive of taste or flavour in a proposition of Euclid, so also might we of insipidity, but if not of the one, then not of the other. So that in speaking of the goodness of God, it cannot be that we mean anything more than his Love, Mercifulness, and Justice, and these attributes I have shown to be expressed by other . . . in matter. Neither can I trace any more distinct relation between this idea . . . openness, of which I have already spoken as more expressed . . .”]

but for this visible energy and connection of its particles); and so to flowing water, opposed to stagnant.¹ And I do not think that, however pure a powder or dust may be, the idea of beauty is ever connected with it; for it is not the mere purity, but the *active* condition of the substance which is desired;* so that as soon as it shoots into crystals, or gathers into efflorescence, a sensation of active or real purity is received which was not felt in the calcined *caput mortuum*.

And again, in colour, I imagine that the quality which we term purity is dependent on the full energizing of § 8. *And of* the rays that compose it; of which if in compound *colour.* hues any are overpowered and killed by the rest, so as to be of no value nor operation, foulness is the consequence; while so long as all act together, whether side by side, or from pigments seen one through the other, so that all the colouring matter employed may come into play in the harmony desired, and none be quenched nor killed, purity results.† And so in all cases I suppose that pureness is made to us desirable, because expressive of that constant presence and energizing of the Deity by which all things live and move, and have their being;² and that foulness is painful as the accompaniment of disorder and decay, and always indicative of the withdrawal of Divine support. And the practical analogies of life, the invariable connection of outward foulness with mental sloth and degradation, as well as with bodily lethargy and disease, together with the contrary indications of freshness and purity belonging to every healthy and active organic frame (singularly seen in the effort of the young leaves when first their inward energy prevails over the earth, pierces its corruption, and shakes its dust

* Well observed, but not conclusively. Snow is a powder, practically, in hard frost; and it is perhaps easier to attach the idea of purity to flour than to bread. [1883.]

† Again well said; and the statement should have been farther enforced. The essential difference between painting and daubing is that a *painter* lays not a grain more colour than is needed. [1883.]

¹ [Ed. 1 reads, "and so of water as opposed to stagnancy."]

² [Acts xvii. 28.]

away from their own white purity of life), all these circumstances strengthen the instinct by associations countless and irresistible. And then, finally, with the idea of purity comes that of spirituality; for the essential characteristic of matter is its inertia, whence, by adding to its purity of energy, we may in some measure spiritualize even matter itself. Thus in the Apocalyptic descriptions, it is the purity of every substance that fits it for its place in heaven; the river of the water of life, that proceeds out of the throne of the Lamb, is clear as crystal,¹ and the pavement of the city is pure gold “like unto clear glass.”*

§ 9. *Spirituality, how so expressed.*

* I have not spoken here of any of the associations connected with warmth or coolness of colour; they are partly connected with Vital beauty, compare Chap. XIV. §§ 21, 22, and partly with impressions of the sublime, the discussion of which is foreign to the present subject: purity, however, it is which gives colour to both; for neither warm nor cool colour can be beautiful, if impure.

Neither have I spoken of any questions relating to melodies of colour; a subject of separate science, whose general principle has been already stated in the Seventh Chapter respecting unity of Sequence. Those qualities only are here noted which give absolute beauty, whether to separate colour or to melodies of it: for all melodies of it are not beautiful, but only those which are expressive of certain pleasant or solemn emotion; the rest are startling, or curious, or cheerful, or exciting, or sublime, but not beautiful; and so in music. And all questions relating to this grandeur, cheerfulness, or other characteristic impression of colour, must be considered under the head of Ideas of Relation.**

** I used then to slip things out of my way from one chapter to another, partly with a notion of being systematic, partly because I was tired; until at last they often slipped out of my head altogether. Thus in the sixth paragraph, the quite primary difficulty of saying whether spots are pretty or ugly; whether a fallow-deer is the worse for dappling, or a mackerel for mottling, or a fox-glove for speckling, is wholly lost sight of; and, throughout the chapter, the question why we like gold-yellow better than brass-yellow—or rose-colour better than brown—or in general any colour better than any other. I believe there is something said on these points farther on in the book:2 if not, I'll say something about them where I think it will be useful; only in the meantime, observe that we like gold because it is of a pretty and permanent yellow; and not the yellow colour because it is like gold. I overwork the epithet “golden” in most of my descriptions; not because I like guineas, but because I like buttercups and broom. [1883.]

¹ [Revelation xxii. 1, xxi. 18–21.]

² [In his first scheme for the volume Ruskin had planned to treat the question at length; and in the first draft, some pages were written on the subject: see Appendix i., p. 368. In the book as it stands, there is little discussion of the sources and order of pleasure in different colours.]

CHAPTER X¹

OF MODERATION, OR THE TYPE OF GOVERNMENT BY LAW²

OF objects which, in respect of the qualities hitherto considered, appear to have equal claims to regard, we find, nevertheless, that certain are preferred to others in consequence of an attractive power, usually expressed by the terms ‘chasteness,’ ‘refinement,’ or ‘elegance:’ and it appears also that things which in other respects have little in them of natural beauty, and are of forms altogether simple, and adapted to simple uses, are capable of much distinction and desirableness in consequence of these qualities only. It is of importance to discover the real nature of the ideas thus expressed.

Something of the peculiar meaning of the words is referable to the authority of fashion and the exclusiveness of pride, owing to which that which is the mode of a particular time is submissively esteemed, and that which by its costliness or its rarity is of difficult attainment, or in any way appears to have been chosen as the best of many things (which is the original sense of the words elegant and exquisite), is esteemed for the witness it bears to the dignity of the chooser: but neither of these ideas is in any way connected with constant³ beauty: neither do they account for that agreeableness of colour and form which is especially termed chasteness, and which it would seem to be a characteristic of rightly trained minds in all things to prefer, and of common minds to reject.

¹ [Ch. vi. of sec. ii. in the re-arranged edition of 1883.]

² [For the application of this element of beauty to ornament, see *Stones of Venice*, vol. i. ch. xxi. § 31.]

³ [Ed. 1 reads “are” for “is,” “eternal” for “constant,” and inserts “at all” before “account.”]

There is however another character of artificial productions to which these terms have partial reference, § 3. *How to the perception of Completion.* finish, exactness, or refinement: which are commonly desired in the works of men, owing both to their difficulty of accomplishment and consequent expression of care and power (compare Chapter on Ideas of Power, Part I. Sec. I.¹), and from their greater resemblance to the working of God, whose “absolute exactness,” says Hooker, “all things imitate, by tending to that which is most exquisite in every particular.”² And there is not a greater sign of the imperfection of general taste, than its capability of contentment with forms and things which, professing completion, are yet not exact nor complete; as in the vulgar with wax and clay and china figures, and in bad sculptors with an unfinished and clay-like modelling of surface, and curves and angles of no precision or delicacy; and in general, in all common and unthinking persons, with an imperfect rendering of that which might be pure and fine: as churchwardens are content to lose the sharp lines of stone carving under clogging obliterations of whitewash; and as the modern Italians scrape away and polish white all the sharpness and glory of the carvings on their old churches, as most miserably and pitifully on St. Mark’s at Venice,³ and the Baptisteries of Pistoja and Pisa,* and many others. So also

* When I came here first, in 1845, the pinnacles of the Baptistery were lying round it in shattered heaps. I have since witnessed the destruction of the Spina chapel,—see *Fors Clavigera* of 1874;⁴ and yesterday found the whole façade of one of the few remaining uninjured churches, plastered white with election bills.—(Pisa, Nov. 7th, 1882.) [1883.]

¹ [Vol. III. pp. 93–98, in this edition.]

² [*Ecclesiastical Polity*, I. v. 3. “Tending to” is “tending unto” in the original.]

³ [In a letter to his father from Venice (Sept. 14, 1845), Ruskin writes:—

“I am but barely in time to see the last of dear old St. Mark’s. They have ordered him to be ‘pulito,’ and after whitewashing the Doge’s Palace, and daubing it with the Austrian national distillation of coffins and jaundice, they are scraping St. Mark’s clean. Off go all the glorious old weather stains, the rich hues of the marble which nature, mighty as she is, has taken two centuries to bestow, and already the noble corner farthest from the sea—that on which the sixth part of the age of the generations of man was dyed in gold—is reduced to the colour of magnesia—the old marbles displaced and torn down.”]

⁴ [See *Fors*, Letter 20 (of 1872, not 1874).]

J. Hawks

Allen & Co. No.

Sta. Maria della Spina, Pisa.
(1840)

the delight of vulgar painters in coarse and slurred painting, merely for the sake of its coarseness;* as of Spagnoletto, Salvator, or Murillo, opposed to the divine finish which the greatest and mightiest of men disdained not, but rather wrought

* It is to be carefully noted that when rude execution is evidently not the result of imperfect feeling and desire (as in these men above named it is), but¹ either of impatient thought which there was necessity to note swiftly, or agitated thought which it was well to note with a certain wildness of manner, as pre-eminently and in both kinds the case with Tintoret, and in lower and more degraded modes with Rubens, and generally in the sketches and first thoughts of great masters, there is received a very noble pleasure, connected both with ideas of power (compare again Part I. Sec. II. Chap. I.) and with certain actions of the imagination of which we shall speak presently. But this pleasure is not received from the beauty of the work, for nothing can be perfectly beautiful unless complete, but from its simplicity and sufficiency to its immediate purpose, where the purpose is not of beauty at all, as often in things rough hewn; pre-eminently, for instance, in the stones of the foundations of the Pitti and Strozzi Palaces, whose noble rudeness is to be opposed both to the useless polish and the barbarous rustications of modern times,² although indeed this instance is not to be received without exception, for the majesty of these rocky buildings depends also in some measure upon the real beauty and finish of the natural curvilinear fractures opposed to the coarseness of human chiselling. And again, as respects works of higher art, the pleasure of their hasty or imperfect execution is not indicative of their beauty, but of their majesty and fulness of thought and vastness of power. Shade is only beautiful when it magnifies and sets forth the forms of fair things; so negligence is only noble when it is, as Fuseli hath it, "the shadow of energy."³ Which that it may be, secure the substance and the shade will follow; but let the artist beware of stealing the manner of giant intellects when he has not their intention, and of assuming large modes of treatment when he has little thoughts to treat. There is wide difference between *indolent* impatience of labour and *intellectual* impatience of delay; large difference between leaving things unfinished because we have *more to do*, and because we are satisfied with what we *have done*. Tintoret, who prayed hard, and hardly obtained, that he might be permitted, the charge of his colours only being borne, to paint a newly-built house from base to battlement,⁴ was not one to shun labour; it is the pouring in upon him of glorious thoughts, in inexpressible multitude, that his sweeping hand follows so fast. It is as easy to know the slightness of earnest haste from the slightness of blunt feeling, indolence, or affectation, as it is to know the dust of a race, from the dust of dissolution.

¹ [Ed. 1 reads:—

"... it is) but of thought; either impatient, which there was necessity to note swiftly, or impetuous, which it was well to note in mighty manner, as pre-eminently . . . with Tintoret, and often with Michael Angelo, and in lower," etc.]

² [For another reference to the architecture of the Pitti Palace, see *Seven Lamps*, ch. iii. § 11.]

³ [Aphorism 21; *Life and Writings*, iii. 68.]

⁴ [This story is told by Carlo Ridolfi in his *Vita di Tintoretto*, Venice, 1642.]

out with painfulness and life-spending; as Leonardo and Michael Angelo (for the latter, however many things he left unfinished, did finish, if at all, with a refinement that the eye cannot follow, but the feeling only, as in the Pietà of Genoa);¹ and Perugino always, even to the gilding of single hairs among his angel tresses; and the young Raffaello when he was heaven-taught; and Angelico, and Pinturicchio, and John Bellini, and all other such serious and loving men. Only it is to be observed that this finish is not a part nor constituent of beauty, but the full and ultimate rendering of it; so that it is an idea only connected with the works of men, for all the works of the Deity are finished with the same, that is, infinite, care and completion: and so what degrees of beauty exist among them can in no way be dependent upon this source, inasmuch as there are between them no degrees of care. And therefore, as there certainly is admitted a difference of degree in what we call chasteness, even in Divine work (compare the hollyhock or the sunflower with the vale lily), we must seek for it some other explanation and source than this.

And if, bringing down our ideas of it from complicated objects to simple lines and colours, we analyze and regard them carefully, I think we shall be able to trace them to an under-current of constantly agreeable feeling, excited by the appearance in material things of a self-restrained liberty; that is to say, by the image of that acting of God with regard to all His creation, wherein, though free to operate in whatever arbitrary, sudden, violent, or inconstant ways He will, He yet, if we may reverently so speak, restrains in Himself this His omnipotent liberty, and works always in consistent modes, called by us laws. And this restraint or moderation (according to the words of Hooker,² “that which doth moderate the force and power, that which

¹ [A medallion in high relief of the Madonna clasping her dead Son, in the chapel of the Albergo dei Poveri; its attribution to Michael Angelo has been disputed (see J. A. Symonds: *Life of Michelangelo*, 1893, ii. 203). Ruskin had noted it at Genoa in 1845, and wrote to his father (April 27), that it was “worth coming here twice for.”]

² [*Ecclesiastical Polity*, I. ii. 1.]

§ 4. *Finish, by great masters esteemed essential.*

§ 5. *Moderation, its nature and value.*

doth appoint the form and measure of working, the same we term a Law,") is in the Deity not restraint, such as it is said of creatures, but, as again says Hooker,¹ "the very being of God is a law to His working," so that every appearance of painfulness or want of power and freedom in material things is wrong and ugly; for the right restraint, the image of Divine operation, is, both in them and in the spirit of* men, a willing and not painful stopping short of the utmost degree to which their power might reach, and the appearance of fettering or confinement is the cause of ugliness in the one, as the slightest painfulness or effort in restraint is a sign of sin in the other.

I have put this attribute of beauty last, because I consider it the girdle and safeguard of all the rest, and in this respect the most essential of all; for it is possible that a certain degree of beauty may be attained even in the absence of one of its other constituents, as sometimes in some measure without symmetry or without unity. But the least appearance of violence or extravagance, of the want of moderation and restraint, is, I think, destructive of all beauty whatsoever in everything, colour, form, motion, language, or thought; giving rise to that which in colour we call glaring, in form inelegant, in motion ungraceful, in language coarse, in thought undisciplined, in all unchastened; which qualities are in everything most painful, because the signs of disobedient and irregular operation. And herein we at last find the reason of that which has been so often noted² respecting the subtlety and almost invisibility of natural curves and colours, and why it is that we look on those lines as least beautiful which fall into wide and far license of curvature, and as most

§ 6. *It is the girdle of Beauty.*

§ 7. *How found in natural curves and colours.*

* I am obliged to insert these three words, ["the spirit of"] to show what I meant. For the text, as it stood, implied that men were immaterial. Also it should have been observed that the ideas of liberty and restraint can only be attached to things capable of different kinds of energy or motion,—as to a stream and a canal, a tree wild or pruned, and the like. [1883.]

¹ [Ecclesiastical Polity, I. ii. 2.]

² [See above, sec. i. ch. v. § 14, p. 87.]

beautiful which approach nearest (so that the curvilinear character be distinctly asserted) to the government of the right line; as in the pure and severe curves of the draperies of the religious painters. And thus in colour it is not red, but rose colour, which is most beautiful; neither such actual green as we find in summer foliage partly, and in our painting of it constantly, but such grey green as that into which nature modifies her distant tints, or such pale green and uncertain as we see in sunset sky, and in the clefts of the glacier and the chrysoprase,¹ and the sea-foam: and so of all colours; not that they may not sometimes be deep and full, but that there is a solemn moderation even in their very fulness, and a holy reference, beyond and out of their own nature, to great harmonies by which they are governed, and in obedience to which is their glory. Whereof the ignorance is shown in all evil colourists by the violence and postiveness of their hues, and by dulness and discordance consequent; for the very brilliancy and real power of all colour is dependent on the chastening of it, as of a voice on its gentleness, and as of action on its calmness, and as

§ 8. *How difficult of attainment, yet essential to all good.*

all moral vigour on self-command. And therefore as that virtue which men last, and with most difficulty, attain unto,* and which many attain not at all, and yet that which is essential to the conduct and almost to the being of all other virtues; since neither imagination, nor invention, nor industry, nor sensibility, nor energy, nor any other good having, is of full avail without this of self-command, whereby works truly masculine and mighty are produced, and by the signs of which they are separated from that lower host of things brilliant, magnificent, and redundant, and farther yet from that of the loose, the lawless, the exaggerated, the insolent, and the profane; I would have the necessity of

* I would fain strike out the "unto," and otherwise "moderate" the whole passage—but will trust the reader's patience with it, rather than my own vexation. See the terminal note.² [1883.]

¹ [See Vol. III. pp. 17, 529.]

² [*i.e.* note at the end of the present chapter.]

it foremost among all our inculcating, and the name of it largest among all our inscribing, in so far that, over the doors of every school of Art, I would have* this one word, relieved out in deep letters of pure gold,—Moderation.

* How the public ever pardoned, as they did, the steady self-confidence and general “I would have” (it so) of this book, is extremely difficult for me now to conceive: and yet they were right; for at the root of this simplicity of egotism, there was a natural consciousness of my real power of discrimination which I no more cared to assert than a good dog his power of scent; and on the other hand,—and *this* I wish I *had* more distinctly asserted,—there was in me as firmly rooted conviction of my own littleness, or nothingness, in relation to the men whom I loved and praised. [1883.]

CHAPTER XI¹

GENERAL INFERENCES RESPECTING TYPICAL BEAUTY*

I HAVE now enumerated and, in some measure, explained those characteristics of *mere* matter by which I conceive it becomes agreeable to the Theoretic faculty, under whatever form, dead, organized, or animated, it may present itself. It will be our task in the succeeding volume² to examine, and illustrate by examples, the mode in which these characteristics appear in every division of creation, in stones, mountains, waves, clouds, and all organic bodies, beginning with vegetables, and then taking instances in the range of animals, from

§ 1. *The subject incompletely treated, yet admitting of general conclusions.*

* Before attempting these generalizations of the subject, I ought to have given one or two simple examples of the practical application of the foregoing section: and to have shown how, for instance, a wild rose is pretty because it has concentric petals,—because each petal is bounded by varying curves,—because these curves are dual, and symmetrically opposed,—because the five petals are bent into the form of a cup which gives them gradated depth of shade,—because the shade as well as the light is coloured with crimson and gold,—and because both the gold and the crimson are used in their most subtle degrees and tints. I will not, however, now alter or interrupt the course of the old essay, but must at least make the reader clearly aware, that hitherto, the circumstances said to be productive of beauty have been simply those which please the eye, wherever they occur; that blue is thought of as an agreeable colour, when it is a pure blue, whether in a butterfly's wing, or in the sky; and a consistently varied curve is thought of as a pleasant line, whether it limits a mountain, a wave, or a limb. And chiefly I must reiterate, with reference to modern narrownesses or meannesses of thought, that the pleasure of the eye is never confused with the blind and temporary instincts of the blood; and that, briefly, and always, a girl is praised because she is like a rose,—not a rose because it is like a girl.³ [1883.]

¹ [Ch. vii. of sec. ii. in the re-arranged edition of 1883.]

² [The succeeding volume, when it came to be published ten years later, was, however, constructed on a different plan, being in some measure an interpolation; the subjects specified above were resumed in vol. iv. of the work.]

³ [This note was in the edition of 1883 printed at the head of the chapter.]

the mollusc* to man; examining how one animal form is nobler than another, by the more manifest presence of these attributes, and chiefly endeavouring to show how much there is of admirable and lovely, even in what is commonly despised. At present I have only to mark the conclusions at which we have as yet arrived respecting the rank of the Theoretic faculty, and then to pursue the inquiry farther into the nature of vital beauty.

As I before said, I pretend not to have enumerated all the sources of material beauty, nor the analogies connected with them; it is probable that others may occur to many readers, or to myself, as I proceed into more particular inquiry; but I am not careful to collect all evidence within reach¹ on the subject. I desire only to assert and prove some certain principles, and by means of these to show something of the relations which the material works of God bear to the human mind, leaving the subject to be fully pursued, as it only can be, by the ardour and affection of those whom it may interest.

The characters above enumerated are not to be considered as stamped upon matter for our teaching or enjoyment only, but as the *necessary perfection*² of God's working, and the inevitable stamp of His image on what He creates. For it would be inconsistent with His Infinite perfection to work imperfectly in any place, or in any matter; wherefore we do not find that flowers and fair trees, and kindly skies, are given only where man may see them and be fed by them; but the Spirit of God works

§ 2. *Typical
Beauty not
created for
man's sake.*

* This was indeed the original plan of the book,—formed, the reader will please to observe, in 1845. I reflected upon it for fifteen years,—and then gave it up. In another fifteen years the scientific world professed itself to have discovered that the mollusc was the Father of Man; and the comparison of their modes of beauty became invidious; nevertheless, it is possible I may have a word or two to say, on the plan of the old book, yet. [1883.]

¹ [For “evidence within reach,” ed. 1 has “conceivable evidence,” and later reads, “to show, in some measure, the inherent worthiness and glory of God's works and something of the relations they bear to each other and to us, leaving,” etc.]

² [Ed. 1 has “necessary consequence of the perfection.”]

everywhere alike, where there is no eye to see, covering all lonely places with an equal glory; using the same pencil and outpouring the same splendour, in the caves of the waters where the sea snakes swim, and in the desert where the satyrs dance, among the fir trees of the stork, and the rocks of the conies, as among those higher creatures whom He has made capable witnesses of His working. Nevertheless, I think that the admission of different degrees of this glory and image of Himself upon creation, has the look of something meant especially for us; for although, in pursuance of the appointed system of Government by universal laws, these same degrees exist where we cannot witness them, yet the existence of degrees at all seems at first unlikely in Divine work; and I cannot see reason for it unless that palpable one of increasing in us the understanding of the sacred characters by showing us the results of their comparative absence. For I know not that if all things had been equally beautiful, we could have received the idea of beauty at all; or, if we had, certainly it had become a matter of indifference to us, and of little thought; whereas, through the beneficent ordaining of degrees in its manifestation, the hearts of men are stirred by its occasional occurrence in its noblest form, and all their energies are awakened in the pursuit of it, and endeavour to arrest it or recreate it, for themselves. But whatever doubt there may be respecting the exact amount of modification of created things admitted with reference to us, there can be none respecting the dignity of that faculty by which we receive the mysterious evidence of their divine origin. The fact of our deriving constant pleasure from whatever is a type or semblance of divine attributes, and from nothing but that which is so, is the most glorious of all that can be demonstrated of human nature; it not only sets a great gulf of specific separation between us and the lower animals, but it seems a promise of a communion ultimately deep, close, and conscious, with the Being whose darkened manifestations we here feebly and unthinkingly

§ 3. *But degrees of it admitted for his sake.*

§ 4. *What encouragement hence to be received.*

delight in. Probably to every higher order of intelligence more of His image becomes palpable in all around them, and the glorified spirits and the angels have perceptions as much more full and rapturous than ours, as ours than those of beasts and creeping things. And receiving it, as we must, for a universal axiom that “no natural desire can be entirely frustrate,” and seeing that these desires are indeed so unfailing in us that they have escaped not the reasoners of any time, but were held divine of old, and in even heathen countries,* may we not see in these visionary pleasures, lightly as we too often regard them, cause for thankfulness, ground for hope, anchor for faith, more than in all the other manifold gifts and guidances, wherewith God crowns the years,¹ and hedges the paths of Men?

*

Ἡ δὲ τελεία ἐνδαιμονία θεωρητικὴ τις ἐστὶν ἐνεργεία. . . . τοῖς μὲν γὰρ θεοῖς ἀπᾶς ὁ βίος μακαρίος, τοῖς δὲ ἀνθρώποις, εἴ ὅσον ὁμοίωμα τι τῆς τοιαύτης ἐνεργείας νπαρχει. τῶν δὲ ἀλλῶν ζῶων οὐδὲν ἐνδαιμονεῖ, ἐπειδὴ οὐδαμῆ κοινῶ νει θεωρίας.—Arist. *Eth.* lib. 10 [cap. 8, §§ 7, 8].**

** It seems to me now amazing that I acknowledge no indebtedness to this passage and its context, which seem, looking from this distance of years, to have suggested the whole idea of my own essay.² But my impression is that I simply did not understand them on first reading the Ethics, and only after working the matter out from my own Evangelical points of view, saw with surprise that the persons whom I had been in the habit of calling “Heathen” knew as much before. The sentence will now be found translated [see p. 7] and illustrated in the Preface to this volume. [1883.]

¹ [Psalms xv. 11.]

² [In the first edition Ruskin added to the quotation the following words: “The concluding book of the Ethics should be carefully read. It is all most valuable.”]
IV. K

CHAPTER XII¹

OF VITAL BEAUTY

I. OF RELATIVE VITAL BEAUTY²

I PROCEED more particularly to examine the nature of that second kind of Beauty of which I spoke in the third chapter,³ as consisting in “the appearance of felicitous fulfilment of function in living things.” I have already noticed⁴ the example of very pure and high typical beauty which is to be found in the lines and gradations of unsullied snow: if,⁵ passing to the edge of a sheet of it, upon the Lower Alps, early in May, we find, as we are nearly sure to find, two or three little round openings pierced in it, and through these emergent, a slender, pensive, fragile flower,* whose small, dark purple, fringed⁶ bell hangs down and shudders over the icy cleft that it has cloven, as if partly wondering at its own recent grave,⁷ and partly dying of very fatigue after its

§ 1. *Transition from typical to vital Beauty.*

* *Soldanella alpina.*

¹ [Here, in the re-arranged edition of 1883, began section iii. “Of Vital Beauty,” ch. i. being entitled “Of Vital Beauty. I. Relative.”]

² [For the application of this principle to architecture, see *Seven Lamps*, ch. iv. § 1, ch. v. § 1.]

³ [§ 16, p. 64.]

⁴ [In the preceding volume, p. 446, pt. ii. sec. iv. ch. ii. § 19.]

⁵ [This passage down to “surely sighted” forms § 54 of *Fronde Agrestes* (together with a passage from pt. ii. sec. iv. ch. ii. § 19 of vol. i.). In *Fronde Agrestes* Ruskin added the following note to *Soldanella Alpina*:—

“I think it is the only Alpine flower which actually pierces snow, though I have seen gentians filling thawed hoof-prints. Crocuses are languid till they have had sun for a day or two. But the soldanella enjoys its snow, at first, and afterwards its fields. I have seen it make a pasture look like a large lilac silk gown.”

See below, ch. xiii. § 11, p. 172 n.]

⁶ [In all previous editions, and in *Fronde Agrestes*, the bell of the soldanella is described as “small, dark purple-fringed,” but the whole bell is purple. Ruskin in his own copy of *Modern Painters* notes the misprint, and corrects as above.]

⁷ [This was a touch added by the author in revising; the MS. reads, “wondering at its own doings.”]

hard-won victory; we shall be, or we ought to be, moved by a totally different impression of loveliness from that which we receive among the dead ice and the idle clouds. There is now uttered to us a call for sympathy, now offered to us an image of moral purpose and achievement, which, however unconscious or senseless the creature may indeed be that so seems to call, cannot be heard without affection, nor contemplated without worship, by any of us whose heart is rightly tuned, or whose mind is clearly and surely sighted.

Throughout the whole of the organic creation every being in a perfect state exhibits certain appearances or evidences of happiness; and is in its nature, its desires, its modes of nourishment, habitation, and death, illustrative or expressive of certain moral dispositions or principles. Now, first, in the keenness of the sympathy which we feel in the happiness, real or apparent, of all organic beings, and which, as we shall presently see, invariably prompts us, from the joy we have in it, *to look upon those as most lovely which are most happy*;^{*} and, secondly, in the justness of the moral sense which rightly reads the lesson they are all intended to teach, and classes them in orders of worthiness and beauty according to the rank and nature of that lesson, whether it be of warning or example, in those that wallow or in those that soar;¹—in our right accepting and reading of all this, consists, I say, the ultimately perfect condition of that noble Theoretic faculty, whose place in the system of our nature I have already partly vindicated with respect to typical, but which can only fully be established with respect to vital beauty.

Its first perfection,² therefore, relating to Vital Beauty, is

* I have italicised this important sentence, on the truth of which far more depends than this poor book brings out of it.³ [1883.]

¹ [Ed. 1 reads, “of those that wallow or of those that soar” instead of “in,” and then adds:—

“of the fiend hunted swine by the Gennesaret lake, or of the dove returning to its ark of rest;—in our right . . .”]

² [This § 2 is repeated, with some general explanations, in *Love’s Meinie*, ch. iii. §§ 130–131.]

³ [Contrast the author’s earlier feeling of the connection between beauty and sadness; see *The Poetry of Architecture*, Vol. I. p. 18.]

the kindness and unselfish fulness of heart, which receives the
 § 2. *The perfection of the Theoretic faculty, as concerned with vital Beauty, is Charity.* utmost amount of pleasure from the happiness of all things. Of which in high degree the heart of man is incapable; neither what intense enjoyment the angels may have in all that they see of things that move and live, and in the part they take in the shedding of God's kindness upon them, can we know or conceive: only in proportion as we draw near to God, and are made in measure like unto Him, can we increase this our possession of Charity, of which the entire essence is in God only. But even the ordinary exercise of this faculty implies a condition of the whole moral being in some measure right and healthy, and to the entire exercise of it there is necessary the entire perfection of the Christian character; for he¹ who loves not God, nor his brother, cannot love the grass beneath his feet,* and the creatures which live not for his uses, filling those spaces in the universe which he needs not;² while on the other hand, none can love God, nor his human brother, without loving all things which his Father loves; nor

* Untrue, I am sorry to say, in both clauses of the sentence. It is very possible to love grasses and ferns without loving God, and much too possible to be religious without loving either fields or beasts. The simple statement that the degree of beauty we can see, in visible things, depends on the love we can bear them, is trustworthy: the end of the paragraph about hunting should be re-written in a different manner,—to the same purpose,—and the rest of it left out. [1883.]

¹ [The passage, "He who loves not . . . touched more truly," is § 74 in *Fronde Agrestes*, and the following passage, "It is good to read . . . for their necessities" (end of § 2), is § 73. Ruskin added in that book the following notes—the first to the second passage (in its order here), the second to the first:—

¹ "I am more and more grieved, as I re-read this and other portions of the most affected and weak of all my books, (written in a moulting time of my life,)—the second volume of *Modern Painters*,—at its morbid violence of passion and narrowness of thought. Yet, at heart, the book was, like my others, honest; and in substance it is mostly good; but all boiled to rags."

² "Morbidly Franciscan, again! and I am really compelled to leave out one little bit my friend liked,—as all kindly and hopeful women would,—about everything turning out right, and being to some good end. For we have no business whatever with the ends of things, but with their beings; and their beings are often entirely bad.]"

² [Ed. 1 adds:—

" . . . and which live not for his uses; nay, he has seldom grace to be grateful even to those that love and serve him, while, on the other hand, . . . more truly. Wherefore it is good . . ."]

without looking upon them, every one, as in that respect his brethren also, and perhaps worthier than he, if, in the under concords they have to fill, their part is touched more truly.¹ It is good to read of that kindness and humbleness of St. Francis of Assisi, who spoke never to bird nor to cicala, nor even to wolf and beast of prey, but as his brother;² and so we find are moved the minds of all good and mighty men, as in the lesson that we have from the Mariner of Coleridge,³ and yet more truly and rightly taught in the Hartleap Well,

“Never to blend our pleasure, or our pride,
With sorrow of the meanest thing that feels;”

and again in the White Doe of Rylstone, with the added teaching,⁴ that anguish of our own—

“Is tempered and allayed by sympathies,
Aloft ascending and descending deep,
Even to the inferior kinds.”

So that I know not of anything more destructive of the whole Theoretic faculty, not to say of the Christian character and human intellect,⁵ than those accursed sports in which man makes of himself, cat, tiger, serpent, chætodon and alligator in one; and gathers into one continuance of cruelty, for his amusement, all the devices that brutes sparingly and at intervals use against each other for their necessities.⁶

¹ [Here, in *Fronde Agrestes*, came note (2) above.]

² [So Tennyson, in *Locksley Hall Sixty Years After*:—

“Sweet St. Francis of Assisi, would that he were here again, He that in his catholic wholeness used to call the very flowers Sisters, brothers—and the beasts—whose pains are hardly less than ours.”]

³ [“He prayeth best, who loveth best

All things both great and small;
For the dear God who loveth us,
He made and loveth all.”

For a comparison of “the Modern with the Ancient Mariner,” see *Deucalion*, ii. ch. ii. (“Revision”) § 18 *n.*]

⁴ [Ed. 1 reads, “added teaching of that gift, which we have from things beneath us, in thanks for the love they cannot equally return; that anguish . . .”]

⁵ [Here, in *Fronde Agrestes*, came note (1) above.]

⁶ [Ed. 1 has the following note here:—

“I would have Mr. Landseer, before he gives us any more writhing otters, or yelping packs, reflect whether that which is best worthy of contemplation in a hound be its ferocity, or in an otter its agony, or in a human being its victory, hardly achieved even with the aid of its more sagacious brutal allies, over a poor little fish-catching creature, a foot long.”]

As we pass from those beings of whose happiness and pain
 § 3. *Only with respect to plants, less affection than sympathy.* we are certain, to those in which it is doubtful, or only seeming, as possibly in plants (though I would fain hold, if I might, “the faith that every flower enjoys the air it breathes,”) ¹ yet our feeling for them has in it more of sympathy than of actual love, as receiving from them in delight far more than we can give; for love, I think, chiefly grows in giving;* at least its essence is the desire of doing good or giving happiness.² Still the sympathy of very sensitive minds usually reaches so far as to the conception of life in the plant, and so to love, as with³ Shakspeare always, as he has taught us in the sweet voices of Ophelia and Perdita,⁴ and Wordsworth always, as of the daffodils and the celandine:

“It doth not love the shower, nor seek the cold.
 This neither is its courage, nor its choice,
 But its necessity in being old:”

and so all other great poets;[†] nor do I believe that any mind, however rude, is without some slight perception or

* This third paragraph, again, is mostly nonsense. Love can grow either in giving or taking, it does not matter which, when either is right,—and it will grow by neither, when they are wrong. And although it is very pretty and amusing to think of flowers as friends, or pets, yet it is to be remembered that an immense quantity of the pleasure we take in the beauty of the botanic world is given us by vegetables, which we are prepared mercilessly to thresh, mince, boil, and dine on. [1883.]

[†] Compare Milton:

“They at her coming sprung,
 And, touched by her fair tendance, gladlier grew.”⁵

¹ [Ed. 1 adds, “neither do I ever crush or gather one without some pain.” The quotation is of course from Wordsworth’s “Lines written in Early Spring.”]

² [Ed. 1 reads:—

“ . . . giving happiness, and we cannot feel the desire of that which we cannot conceive, so that if we conceive not of a plant as capable of pleasure, we cannot desire to give it pleasure, that is, we cannot love it in the entire sense of the term.

“Nevertheless, the sympathy . . .”]

³ [Ed. 1 inserts, “Shelley of the Sensitive Plant, and . . .” For other references to that poem, see Vol. I. p. 158.]

⁴ [For other references to the flower fancies of Shakspeare, see Vol. I. p. 158, and Vol. III. p. 37. The following quotation is from “The Small Celandine.”]

⁵ [*Paradise Lost*, viii. 46.]

acknowledgment of joyfulness in breathless things, as most certainly there are none but feel instinctive delight in the appearances of such enjoyment.

For it is matter of easy demonstration,* that setting the characters of typical beauty aside, the pleasure afforded by every organic form is in proportion to its appearance of healthy vital energy. In a rose-tree, setting aside all the considerations of gradated flushing of colour, and fair folding of line, which its flowers share with the cloud or the snow-wreath, we find, in and through all this, certain signs pleasant and acceptable as signs of life and strength in the plant.¹ Every leaf and stalk is seen to have a function, to be constantly exercising that function, and as it *seems, solely* for the good and enjoyment of the plant. It is true that reflection will show us that the plant is not living for itself alone, that its life is one of benefaction, that it gives as well as receives; but no sense of this whatsoever mingles with our perception of physical beauty in its forms. Those forms appear to be necessary to its health; the symmetry of its leaflets, the smoothness of its stalks, the vivid green of its shoots, are looked upon by us as signs of the plant's own happiness and perfection; they are useless to us, except as they give us pleasure in our sympathizing with that of the plant; and if we see a leaf withered, or shrunk, or worm-eaten, we say it is ugly, and feel it to be painful, not because it hurts *us*, but because it seems to hurt the plant, and conveys to us an idea of pain and disease and failure of life in *it*.

§ 4. Which is proportioned to the appearance of Energy in the Plants.

That the amount of pleasure we receive is in exact proportion to the appearance of vigour and sensibility in the plant,² is easily proved by observing the effect of those which

* Here the rational development of the original proposition begins; and the reasoning is henceforward accurate and trustworthy, leading to many very useful conclusions, down to the end of the chapter. [1883.]

¹ [Ed. 1 reads, "signs of life and enjoyment in the particular individual plant itself."]

² [Compare *Sesame and Lilies*, § 27.]

show the evidences of it in the least degree, as, for instance, any of the cacti not in flower. Their masses are heavy and simple, their growth slow; their various parts, if they are ramified,¹ jointed on one to another, as if they were buckled or pinned together instead of growing out of each other: and the fruit imposed upon the body of the plant, so that it looks like a swelling or disease. All these circumstances so concur to deprive the plant of vital evidences, that we receive from it more sense of pain than of beauty, and yet, even here, the sharpness or the angles, the symmetrical order and strength of the spines, the fresh and even colour of the body, are looked for earnestly as signs of healthy condition; our pain is increased by their absence, and indefinitely increased if blotches, and other appearances of decay, interfere with that little life which the plant seems to possess.

The same singular characters belong in animals to the crustacea, as to the lobster, crab, scorpion, etc., and in great measure deprive them of the beauty which we find in higher orders; so that we are reduced to look for their beauty to single parts and joints, and not to the whole animal.

Now I wish particularly to impress upon the reader that all these higher² sensations of beauty in the plant arise from our unselfish sympathy with its happiness, and not from any view of the qualities in it which may bring good to us, nor even from our acknowledgment in it of any moral condition beyond that of mere felicity; for such an acknowledgment belongs to the second operation of the Theoretic faculty (compare § 1),*

§ 5. *This sympathy is unselfish, and does not regard utility.*

* This ought to have been put down much more clearly, under *a* and *b* and *c* and *d*; but then it would not have read so prettily. It may be enough clarified if the reader will recollect simply that the first state of vital beauty

¹ [Ed. 1 omits the words "if they are ramified," and instead of "and the fruit . . . disease," reads:—

"(note the singular imposition in many of them, the prickly pear for instance, of the fruit upon the body of the plant, so that it looks like a swelling or disease) and often farther opposed by branch truncation of line as in the cactus truncato-phylla."]

² [This word "higher" was inserted by Ruskin in his copy for revision.]

and not to the sympathetic part which we are at present examining; so that we even find that in this respect, the moment we begin to look upon any creature as subordinate to some purpose out of itself, some of the sense of organic beauty is lost. Thus, when we are told that the leaves of a plant are occupied in decomposing carbonic acid, and preparing oxygen for us, we begin to look upon it with some such indifference as upon a gasometer. It has become a machine; some of our sense of its happiness is gone; its emanation of inherent life is no longer pure. The bending trunk, waving to and fro in the wind above the waterfall, is beautiful because it is happy, though it is perfectly useless to us.* The same trunk, hewn down, and thrown across the stream, has lost its beauty. It serves as a bridge,—it has become useful;¹ and its beauty is gone, or what it retains is purely typical, dependent on its lines and colours, not on its functions. Saw it into planks, and though now adapted to become permanently useful, its beauty is lost for ever, or to be regained only when decay and ruin shall have withdrawn it again from use, and left it to receive from the hand of nature the velvet moss and varied lichen, which may again suggest ideas of inherent happiness, and tint its mouldering sides with hues of life.

There is something, I think, peculiarly beautiful and instructive in this unselfishness of the Theoretic faculty, and in its abhorrence of all utility to one creature which is based on the pain or destruction of any other; for in such services as are² consistent with the essence and energy of both it takes

is defined to be Happiness, perceived with sympathy; the second, Moral intention, perceived with praise. Hence the first aphorism of the “Laws of Fésole”: “All great art is praise.” [1883.]

* “Exiit ad cælum ramis felicibus arbos.”³

¹ [Ed. 1 adds, “it lives not for itself;” and, four lines lower, inserts “in part” after “only.”]

² [This passage was differently worded in ed. 1, thus:—“abhorrence of all utility which is based on the pain or destruction of any creature, for in such ministering to each other as is consistent . . .”]

³ [Virgil’s *Georgics*, ii. 81.]

delight, as in the clothing of the rock by the herbage, and the feeding of the herbage by the stream.

But still clearer evidence of its being indeed the expression of happiness to which we look for our first pleasure in organic form, is to be found in the way in which we regard the bodily frame of animals: of which it is to be noted first, that there is not anything which causes so intense and tormenting a sense of ugliness as any scar, wound, monstrosity, or imperfection which seems inconsistent with the animal's ease and health; and that although in vegetables, where there is no immediate sense of pain, we are comparatively little hurt by excrescences and irregularities, but are sometimes even delighted with them, and fond of them, as children of the oak-apple, and sometimes look upon them as more interesting than the uninjured conditions, as in the gnarled and knotted trunks of trees; yet the slightest approach to anything of the kind in *animal* form is regarded with intense horror, merely from the sense of pain it conveys.

And, in the second place, it is to be noted that whenever we dissect the animal frame, or conceive it as dissected, and substitute in our thoughts the neatness of mechanical contrivance for the pleasure of the animal; the moment we reduce enjoyment to ingenuity, and volition to leverage, that instant all sense of beauty ceases. Take, for instance, the action of the limb of the ostrich, which is beautiful so long as we see it in its swift uplifting along the Desert sands, and trace in the tread of it her scorn of the horse and his rider, but would infinitely lose of its impressiveness, if we could see the spring ligament playing backwards and forwards in alternate jerks over the tubercle at the hock joint. Take again the action of the dorsal fin of the shark tribe.* So long as we observe the

* A grievously ill-chosen example! The pretty dorsal crest of the little Venetian sea-horse had been more to the purpose; but I don't know whether there are either pins or needles in it.¹ [1883.]

¹ [For note on the author's drawing of the Venetian sea-horse here given, see Introduction, p. 1.]

Drawn by J. Ruskin.

Study of the Sea-Horse of Venice.

consistent energy of motion in the whole frame, the lash of the tail, bound of body, and instantaneous lowering of the dorsal, to avoid the resistance of the water, as it turns, there is high sense of organic power and beauty. But when we dissect the dorsal, and find that its superior ray is supported in its position by a peg in a notch at its base, and that, when the fin is to be lowered, the peg has to be taken out, and, when it is raised, put in again; although we are filled with wonder at the ingenuity of the mechanical contrivance, all our sense of beauty is gone, and not to be recovered until we again see the fin playing on the animal's body, apparently by its own will alone, with the life running along its rays. It is by a beautiful ordinance of the Creator that all these mechanisms are concealed from sight, though open to investigation; and that in all which is outwardly manifested, we seem to see His presence rather than His workmanship, and the mysterious breath of life rather than the adaptation of matter.*

If therefore,¹ as I think appears from all evidence, it is the sense of felicity which we first desire in organic form, those forms will be the most beautiful (always, observe, leaving typical beauty out of the question) which exhibit most of power, and seem capable of most quick and joyous sensation. Hence we find gradations of beauty, from the impenetrable hide and slow movement of the elephant and the rhinoceros,

* These continually reiterated passages against the study of anatomy ought to be collated by careful students of my books, for illustration of the final statements on the subject in *Eagle's Nest*.² [1883.]

¹ [Here again the phrasing was different in ed. 1, which reads:—

“As, therefore, it appears from all evidence that it is the sense of felicity which we most desire in organic form, it is evident from reason, as demonstrable by experience, that those forms . . . gradations of beauty, from the apparent impenetrableness of hide . . .”]

² [The “final statements” are in *Eagle's Nest*, lecture viii.; cf. what Ruskin said in his course entitled “Readings in *Modern Painters*,” that one of the three main things he had tried to teach was “that the food of art is ocular and passionate study of nature”—ocular as opposed to “telescopic, scalpellic and dispassionate.” See also *Love's Meinie*, § 76 seq. For other references, see in *Modern Painters*, in this vol. sec. ii. ch. v. § 17; vol. iv. ch. xiv. § 18, and Appendix ii.; *Seven Lamps of Architecture*, ch. iv. § 3; *Stones of Venice*, vol. iii. ch. ii. §§ 23 n., 32, 47 n.; *Ethics of the Dust*, § 56; Letters on “A Museum or Picture Gallery,” in the *Art Journal*, 1880 (*On the Old Road*, ed. 1899, ii. §§ 200–202).]

from the foul occupation of the vulture, from the earthy struggling of the worm, to the brilliancy of the moth, the buoyancy of the bird, the swiftness of the fawn and the horse, the fair and kingly sensibility of man.

Thus far then, the Theoretic faculty is concerned with the § 8. *The second happiness* of animals, and its exercise depends *perfection of* on the cultivation of the affections only. Let us *the Theoretic* next observe how it is concerned with the *moral* *faculty, as con-* *functions* of animals, and therefore how it is *cerned with life,* dependent on the cultivation of every moral *is justice of* sense. There is not any organic creature but, in *moral judg-* its history and habits, will exemplify or illustrate *ment.* to us some moral excellence or deficiency, or some point of God's providential government, which it is necessary for us to know. Thus the functions and the fates of animals are distributed to them, with a variety which exhibits to us the dignity and results of almost every passion and kind of conduct: some filthy and slothful, pining and unhappy; some rapacious, restless, and cruel; some ever earnest and laborious, and, I think, unhappy in their endless labour; creatures, like the bee, that heap up riches and cannot tell who shall gather them,¹ and others employed, like angels, in endless offices of love and praise. Of which, when in right condition of mind, we esteem those most beautiful, whose functions are the most noble, whether as some, in mere energy, or as others, in moral honour: so that we look with hate on the foulness of the sloth, and the subtlety of the adder, and the rage of the hyæna; with the honour due to their earthly wisdom we invest the earnest ant and unwearied bee; but we look with full perception of sacred function to the tribes of burning plumage and choral voice.* And so what lesson we might receive for our earthly conduct from the creeping and laborious things, was taught us by that earthly

* "True to the kindred points of heaven and home."

—WORDSWORTH, *To the Skylark*.²

functions of the animal tribes, owing to the peded.
 independent and often opposing characters of typical beauty, as it seems arbitrarily distributed among them; so that the most fierce and cruel creatures are often clothed in the liveliest colours, and strengthened by the noblest forms; with this only exception, that so far as I know, *there is no high beauty in any slothful animal*; while even among those of prey, its characters exist in exalted measure upon those that range and pursue, and are in equal degree withdrawn from those that lie subtly and silently in the covert of the reed and fens. But we should sometimes check the repugnance or sympathy with which the ideas of their destructiveness or innocence accustom us to regard the animal tribes, as well as those meaner likes and dislikes which arise, I think, from the greater or less resemblance of animal powers to our own; and pursue the pleasures of typical beauty down to the scales of the alligator, the coils of the serpent, and the joints of the beetle; and again, on the other hand, sometimes regardless of the impressions of typical beauty, accept from each creature, great or small, the more important lessons taught by its position in creation as sufferer

* The reader had better take Dante's beautiful reading of the character of Solomon, than mine,—“Spira di tal amor,” etc., *Par.* X. 109; and “ch'ei fu Re,” etc., *Par.* XIII. 95. [1883.]

¹ [1 Kings x. 27.]

² [Matthew viii. 20.]

³ [Matthew vi. 26.]

⁴ [This is another § which was largely revised in ed. 2. The first ed. reads:—

“There is much difficulty in the way of . . . typical beauty, which are among them, as it seems, arbitrarily distributed; so that . . . cruel are often clothed . . . covert of the reeds and fens. But that mind only is fully disciplined in its Theoretic power, which can, when it chooses, throwing off the sympathies and repugnancies with which the ideas of *destructiveness* (misprinted *distinctiveness*) or innocence . . . of animal powers to our own, can pursue . . .”]

or chastiser, as lowly or having dominion, as of foul habit or lofty aspiration; and from the several perfections which all illustrate or possess, courage, perseverance, industry, or intelligence, or, higher yet, love, and patience, and fidelity, and rejoicing, and never wearied praise. That these moral perfections indeed are causes of beauty in proportion to their expression, is best proved by comparing those features of animals in which they are more or less apparent;¹ as, for instance, the eyes, of which we shall find those ugliest which have in them no expression nor life whatever, but a corpse-like stare, or an indefinite meaningless glaring, as (in some lights) those of owls and cats; and mostly of insects and of all creatures in which *the eye seems rather an external optical instrument, than a bodily member through which emotion and virtue of soul may be expressed** as pre-eminently in the chamæleon,² because the seeming want of sensibility and vitality in a creature is the most painful of all wants. And next to these in ugliness, come the eyes that gain vitality indeed, but only in the expression of intense malignity, as in the serpent and alligator; and next, to whose malignity is added the virtue of subtlety and keenness, as of the lynx and hawk; and then, by diminishing the malignity and increasing the expressions of comprehensiveness and determination, we arrive at those of the lion and eagle; and at last, by destroying

* Modern science, as it has been often noticed in my subsequent writings, entirely ceases to understand the difference between eyes and microscopes.³ [1883.]

¹ [Ed. 1 reads:—

“Which moral perfections, that they indeed are productive, in proportion to their expression of instant beauty instinctively felt, is best proved by comparing those parts of animals in which they are definitely expressed, . . .”]

² [The words “as pre-eminently in the chamæleon,” were omitted in the 1883 ed., in which also the preceding italicising was first introduced.]

³ [See *Eagle's Nest*, § 99, where Ruskin emphasises “the difference between eyes and telescopes,” and claims for sight that it is “an absolutely spiritual phenomenon” (with which passage cf. *Fors Clavigera*, Letter 66). Again, in *Fors Clavigera*, Letter 75, Ruskin illustrates his argument in the case of astronomy; in Letter 95 he explains how he would have no microscopic study of botany in his ideal schools and museums. In the *Art of England*, §§ 117, 118, he applies the doctrine to minuteness in art—“all delicacy which is rightly pleasing to the human mind is addressed to the unaided human sight, not to microscopic help or mediation.” See also *Mornings in Florence*, § 34; *Deucalion*, ch. ii.; and *Præterita*, ii. ch. x. § 200.]

malignity altogether, at the fair eye of the herbivorous tribes, wherein the superiority of beauty consists always in the greater or less sweetness and gentleness, primarily; as in the gazelle, camel,* and ox; and in the greater, or less intellect, secondarily; as in the horse and dog; and, finally, in gentleness and intellect both in man. And, again, taking the mouth, another source of expression, we find it ugliest where it has none, as mostly in fish; or perhaps where, without gaining much in expression of any kind, it becomes a formidable destructive instrument, as again in the alligator; and then, by some increase of expression, we arrive at birds' beaks, wherein there is much obtained by the different ways of setting on the mandibles (compare the bills of the duck and the eagle); and thence we reach the finely developed lips of the carnivora (which nevertheless lose their beauty in the actions of snarling and biting), and from these we pass to the nobler because gentler and more sensible, of the horse, camel, and fawn, and so again up to man: only the principle is less traceable in the mouths of the lower animals, because they are only in slight measure capable of expression, and chiefly used as instruments, and that of low function: whereas in man the mouth is given most definitely as a means of expression, beyond and above its lower functions. (See the remarks of Sir Charles Bell on this subject in his *Essay on Expression*; and compare the mouth of the negro head given by him (page 28, third edition) with that of Raffaello's *St. Catherine*.¹) I shall illustrate the subject farther hereafter, by giving the mouth of one of the demons of Orcagna's *Inferno*,² with projecting incisors, and that

* The gentle expression of the camel's eye is wholly deceptive. See Mr. Palgrave's account of him, *Arabia*, Chap. I., p. 39. [1883.]

¹ [*Cf.* in the preceding volume, p. 253, and below, p. 331.]

² [In the Campo Santo at Pisa. Ruskin writes in his 1845 note-book:—

“The demons are a good deal like those on what is commonly known as the ‘dragon pattern’ of Wedgwood ware. But they are nevertheless, many, very inventive and all full of energy and expression. Most of them have birds' claws of some kind; one, however, is cloven-footed, and another, the one sketched in my book, web-footed. They have boat-hooks much like those of Thames watermen.”

With this extract, *cf.* Ruskin's review of Lord Lindsay, *On the Old Road*, 1899, i. § 72.]

of a fish and a swine, in opposition to pure graminivorous and human forms;* but at present it is sufficient for my purpose to insist on the single great principle, that wherever expression is possible, and uninterfered with by characters of typical beauty, which confuse the subject exceedingly as regards the mouth, for the typical beauty of the carnivorous lips is on a grand scale, while it exists in very low degree in the beaks of birds; wherever, I say, these considerations do not interfere, the beauty of the animal form is in exact proportion to the amount of moral or intellectual virtue expressed by it; and wherever beauty exists at all, there is some kind of *virtue* to which it is owing; as the majesty of the lion's eye is owing not to its ferocity but to its seriousness and seeming intellect, and of the lion's mouth to its strength and sensibility, and not its gnashing of teeth, nor wrinkling in its wrath; and farther be it noted, that of the intellectual or moral virtues, the moral are those which are attended with most beauty; so that the gentle eye of the gazelle is fairer to look upon than the more keen glance of men, if it be unkind.

Of the parallel effects of expression upon plants there is little to be noted, as the mere naming of the subject cannot § 11. *As also* but bring countless illustrations to the mind of every *in plants.* reader: only this, that, as we saw they were less susceptible of our sympathetic love, owing to the absence in them of capability of enjoyment, so they are less open to the affections based upon the expression of moral virtue, owing to their want of volition; so that even on those of them which are deadly and unkind we look not without pleasure, the more because this their evil operation cannot be by them outwardly expressed, but only by us empirically known; so that of the outward seemings and expressions of plants, there are few but are in some way good and therefore beautiful, as of humility, and modesty, and love of places and things, in the reaching

* Never done yet! in my published books: but the sketches and engravings of animals in my school at Oxford are enough to show what I meant. [1883.]¹

¹ [See *Catalogue of the Rudimentary Series.*]

out of their arms, and clasping of their tendrils; and energy of resistance, and patience of suffering, and beneficence one toward another in shade and protection; and to us also in scents and fruits (for of their healing virtues, however important to us, there is no more outward sense nor seeming than of their properties mortal or dangerous).

Whence, in fine, looking to the whole kingdom of organic nature, we find that our full receiving of its beauty § 12. *Recapitulation.* depends, first on the sensibility, and then on the accuracy and faithfulness,¹ of the heart in its moral judgments; so that it is necessary that we should not only love all creatures well, but esteem them in that order which is according to God's laws and not according to our own human passions and predilections; not looking for swiftness, and strength, and cunning, rather than for patience and kindness; still less delighting in their animosity and cruelty one toward another: neither, if it may be avoided, interfering with the working of nature in any way; nor, when we interfere to obtain service, judging from the morbid conditions of the animal or vegetable so induced; for we see every day the power of general taste² destroyed in those who are interested in particular animals, by their delight in the results of their own teaching, and by the vain straining of curiosity for new forms such as nature never intended; as the false types, for instance, which we seen earnestly sought for by the fanciers of rabbits and pigeons,* and constantly in horses, substituting for the true and balanced beauty of the free creature some morbid development of a single power, as of swiftness in the racer, at the expense, in certain measure, of the animal's healthy constitution and fineness of form; and so the delight of horticulturists in the spoiling of plants; so that in all cases we are to beware of such opinions as seem in any way referable

* Since, extended into the basis of the theory of Development!³ [1883.]

¹ [Ed. 1 reads, "touchstone faithfulness."]

² [Ed. 1 reads, "the Theoretic faculty entirely destroyed."]

³ [Ruskin was, however, interested in the subject of pigeons, and in 1886 accepted the dedication of a book on *The Pleasures of a Pigeon Fancier*, by the Rev. J. Lucas.]

to human pride, or even to the grateful or pernicious influence of things upon ourselves; and to cast the mind free, and out of ourselves, humbly, and yet always in that noble position of pause above the other visible creatures, nearer God than they, which we authoritatively hold, thence looking down upon them, and testing the clearness of our moral vision by the extent, and fulness, and constancy of our pleasure in the light of God's love as it embraces them, and the harmony of His holy laws, that for ever bring mercy out of rapine, and religion out of wrath.¹

¹ [Ruskin read the greater part of this chapter in one of his Oxford lectures (the seventh or eighth "Readings in *Modern Painters*"), and then passed to show and talk about some of Carpaccio's pictures. The passages to be read are marked in his copy of the book, and at the end of the chapter he has written (as a note for his lecture): "That is good preface for our Carpaccio work to-day—though written 30 years ago. And our work to-day begins very nearly at the beginning of his"—*i.e.* presumably (for the MS. of the lectures here fails) with the representations of animals in some early works by Carpaccio.]

CHAPTER XIII¹

II. OF GENERIC VITAL BEAUTY

HITHERTO we have observed the conclusions of the Theoretic faculty with respect to the relations of happiness, and of *more or less exalted* function existing between *different orders* of organic being. But we must pursue the inquiry farther yet, and observe what impressions of beauty are connected with more or less perfect fulfilment of the *appointed* function by *different individuals* of the same species. We are now no longer called to pronounce upon worthiness of occupation or dignity of disposition; but both employment and capacity being known, and the animal's position and duty fixed, we have to regard it in that respect alone, comparing it with other individuals of its species, and to determine how far it worthily executes its office; whether, if scorpion, it have poison enough, or if tiger, strength enough, or if dove, innocence enough, to sustain rightly its place in creation, and come up to the perfect idea of dove, tiger, or scorpion.²

§ 1. *The beauty of fulfilment of appointed function in every animal.*

In the first or sympathetic operation of the Theoretic faculty, it will be remembered, we receive pleasure from the signs of mere happiness in living things. In the second theoretic operation of comparing and judging, we constituted ourselves such judges of the lower creatures as Adam was made by God when they were brought to him to be named; and we allowed of beauty in them as they reached, more or

¹ [Ch. ii. ("Of Vital, Beauty, II. Generic") of sec. iii. in the re-arranged edition of 1883.]

² [The MS. here has an additional passage:—

“. . . or scorpion; and the ideas of beauty connected with it are perhaps as purely moral in their character, owing to the kind of faith and trust of which they require the exercise, as any of which we have hitherto treated.”]

less, to that standard of moral perfection by which we test ourselves. But in the third place we are to come down again from the judgment seat, and, taking it for granted that every creature of God is in some way good, and has a duty and specific operation providentially necessary to the wellbeing of all, we are to look, in this faith, to that employment and nature of each, and to derive pleasure from their entire perfection and fitness for the duty they have to do, and in their entire fulfilment of it; and so we are to take pleasure and find beauty in the magnificent binding together of the jaws of the ichthyosaurus for catching and holding, and in the adaptation of the lion for springing, and of the locust for destroying, and of the lark for singing, and in every creature for the doing of that which God has made it to do. Which faithful pleasure in the perception of the perfect operation of lower creatures I have placed last among the perceptions of the Theoretic faculty concerning them, because it is commonly last acquired, both owing to the humbleness and trustfulness of heart which it demands, and because it implies a knowledge of the habits and structure of every creature, such as we can but imperfectly possess.

The perfect *idea* of the form and condition in which all the properties of the species are fully developed, is called the Ideal of the species.* The question of the nature of ideal conception of species, and of the mode in which the mind arrives at it, has been the subject of so much discussion, and source of so much embarrassment, chiefly owing to that unfortunate distinction between Idealism and Realism which leads most people to imagine the Ideal opposed to the Real, and therefore *false*, that I think it necessary to request the reader's most careful attention to the following positions.†

Any work of art which represents, not a material object,

* For the definition of species itself,—rarely, if ever, given amidst the contentions for its origin,—see *Deucalion*, Vol. II., Chap. I. [1883.]

† The following paragraphs are indeed of extreme importance, but parenthetic in this chapter. [1883.]

but the mental conception of a material object, is, in the primary sense of the word, ideal. That is to say, it represents an idea and not a thing. Any work of art which represents or realizes a material object is, in the primary sense of the term, unideal.

Ideal works of art, therefore, in the first sense, represent the result of an act of imagination, and are good or bad in proportion to the healthy condition and general power of the imagination whose acts they represent.

Unideal works of art (the studious production of which is termed Realism) represent actual existing things, and are good or bad in proportion to the perfection of the representation.

All entirely bad works of art may be divided into those which, professing to be imaginative, bear no stamp of imagination, and are therefore false; and those which, professing to be representative of matter, miss of the representation, and are therefore nugatory.

It is the habit of most observers to regard art as representative of matter, and to look only for the entireness of representation; and it was to this view of art that I limited the arguments of the former sections of the present work, wherein, having to oppose the conclusions of a criticism entirely based upon the realist system, I was compelled to meet that criticism on its own grounds. But the greater parts of works of art, more especially those devoted to the expression of ideas of beauty, are the results of the agency of imagination, their worthiness depending, as above stated, on the healthy condition of the imagination.

Hence it is necessary for us, in order to arrive at conclusions respecting the worthiness of such works, to define and examine the nature of the imaginative faculty, and to determine, first, what are the signs or conditions of its existence at all; and, secondly, what are the evidences of its healthy and efficient existence, upon which examination I shall enter in the 2nd Section of the present Part.

But there is another sense of the word 'Ideal' besides this,

and it is that with which we are here concerned.* It is evident that, so long as we apply the word to that art which represents ideas and not things, we may use it as truly of the art which represents an idea of Caliban, and not real Caliban, as of the art which represents an idea of Antinous, and not real Antinous. For that is as much imagination which conceives the monster, as which conceives the man. If, however, Caliban and Antinous be creatures of the same species, and the form of the one contain not the fully developed types or characters of the species, while the form of the other presents the greater part of them, then the latter is said to be a form more ideal than the other, as a nearer approximation to the general 'idea' or conception of the species.

Now it is evident that this use of the word Ideal is much less accurate than the other from which it is derived; for it rests on the assumption that the assemblage of all the characters of a species in their perfect development cannot exist but in the imagination.

For if it can actually and in reality exist, it is not right to call it ideal or imaginary; it would be better to call it characteristic or general, and to reserve the word Ideal for the results of the operation of the imagination, either on the perfect or imperfect forms.

Nevertheless, the word Ideal has been so long and universally accepted in this sense, that it becomes necessary to continue the use of it, so only that the reader will be careful to observe the distinction in the sense, according to the

* And I heartily wish we had been *unconcerned* about it. The whole of this chapter is extremely pedantic and tiresome; but not untrue, and towards the end containing some rather pretty talk, long afterwards carried on in *Proserpina*. There is also an undercurrent of meaning in it—double meaning indeed—afterwards more or less enforced in all my writings,—first, that Greek idealism is dull, and that living girls may be very pretty without being like the Venus de' Medici;¹—secondly that, as Mr. Wordsworth says, the imagination has still perhaps a point or two to "bestow" on them.² [1883.]

¹ [So Ruskin says in *The Queen of the Air* (§ 167), that the Venus of Melos "could not hold her own for a moment against the beauty of a simple English girl, of pure, rare and kind heart."]

² ["Confer" seems to be Wordsworth's favourite word in his account of the Imagination in the "Preface" of 1815.]

subject matter under discussion. At present then, using it as expressive of the noble generic form which indicates the full perfection of the creature in all its functions, I wish to examine how far this perfection exists, or may exist, in nature, and, if not in nature, how it is by us discoverable or imaginable.

It is well, when we wish to arrive at truth, always to take familiar instances, wherein the mind is not likely to be biassed by any elevated associations or favourite theories. Let us ask therefore, first, what kind of ideal form may be attributed to a limpet or an oyster; that is to say, whether all oysters do or do not come up to the entire notion or idea of an oyster.* I apprehend that,¹ of those which are of full size and healthy condition, there will be found many which fulfil the conditions of an oyster in every respect; and that so perfectly, that we could not, by combining the features of two or more together, produce a more perfect oyster than any that we see. I suppose, also, that out of a number of healthy fish, birds, or beasts, of the same species, it would not be easy to select an individual as superior to *all* the rest; neither, by comparing two or more of the nobler examples together, to arrive at the conception of a form superior to that of either; but that, though the accidents of more abundant food or more fitting habitation

§ 5. *Of ideal form. First in the lower animals.*

* This paragraph was, with too good reason, objected to by my critical friends.² I thought it extremely crushing and Socratic; besides that, it began my proposed series of illustrations "from the mollusc to man."³ Long afterwards, I got Mr. Hunt to make me a drawing of the shell, but without the oyster! which, not being wholly satisfied with, I let pass out of my hands, much now to my regret. [1883.]

¹ [Ed. 1 reads, "I apprehend that, although in respect of size, age, and kind of feeling, there may be some differences between them, yet of those . . ."]

² [The reference may be to the following passage in the review of the volume in the *Daily News* (June 22, 1846): "He is as yet all sentiment and fine words; and this accounts for the unconscious gravity with which he at times utters the richest burlesque. The dissertation on the moral duty of cultivating the taste of the palate, and the equally grave remarks on the ideal of an oyster, may be appreciated by many; but no pen could do them justice save that which drew the *Hermitte of Belly fulle*."]

³ [See above, sec. i. ch. xi. § 1, p. 143. For Ruskin's commission to William Hunt to paint some studies of still life for country schools of art, see *Notes on Prout and Hunt*, s. No. 146.]

may induce among them some varieties of size, strength, and colour, yet the entire generic form would be presented by many, neither would any art be able to add to or diminish from it.

It is, therefore, hardly right to use the word Ideal of the § 6. *In what* generic forms of these creatures, of which we see *consistent.* actual examples; but if we are to use it, then be it distinctly understood that its ideality consists in the full development of all the powers and properties of the creature as such, and is inconsistent with accidental or imperfect developments, and even with great variation from average size; the ideal size being neither gigantic nor diminutive, but the utmost grandeur and entireness of proportion at a certain point above the mean size; for as more Individuals always fall short of generic size than rise above it, the generic is above the average or mean size.* And this perfection of the creature invariably involves the utmost possible degree of all those properties of beauty, both typical and vital, which it is appointed to possess.

Let us next observe the conditions of ideality in vegetables.

§ 7. *Ideal form* Out of a large number of primroses or violets, I *in vegetables.* apprehend that, although one or two might be larger than all the rest, the greater part would be very sufficient primroses and violets; and that we could, by no study nor combination of violets, conceive of a better violet than many in the bed. And so generally of the blossoms and separate members of all vegetables.

But among the entire forms of the complex vegetables, as of oak trees, for instance, there exists very large and constant difference; some being what we hold to be fine oaks, as in parks and places where they are taken care of, and have their own way, and some are but poor and mean oaks, which

* Wrong. The mean size is the generic one,—and some ideals lean toward the tiny. Of course, I was thinking of Michael Angelo,—but had better have taken warning from Bandinelli.¹ [1883.]

¹ [For Bandinelli, see preceding volume, p. 618, and below, sec. i. ch. xiv. § 20, sec. ii. ch. iii. § 27, pp. 194, 279.]

have had no one to take care of them, but have been obliged to maintain themselves.

That which we have to determine is, whether ideality be predicable of the fine oaks only, or whether the poor and mean oaks also may be considered as ideal, that is, coming up to the conditions of oak, and the general notion of oak.

Now there is this difference between the positions held in creation by animals and plants, and thence in the dispositions with which we regard them; that the animals, being for the most part locomotive, are capable both of living where they choose, and of obtaining what food they want, and of fulfilling all the conditions necessary to their health and perfection. For which reason they are answerable for such health and perfection, and we should be displeased and hurt, if we did not find it in one individual as well as another.

§ 8. *The difference of position between plants and animals.*

But the case is evidently different with plants. They are intended fixedly to occupy many places comparatively unfit for them, and to fill up all the spaces where greenness, and coolness, and ornament, and oxygen are wanted, and that with very little reference to their comfort or convenience.* Now it would be hard upon the plant, if, after being tied to a particular spot, where it is indeed much wanted, and is a great blessing, but where it has enough to do to live; whence it cannot move to obtain what it needs or likes, but must stretch its unfortunate arms here and there for bare breath and light, and split its way among rocks, and grope for sustenance in unkindly soil; it would be hard upon the plant, I say, if under all these disadvantages, it were made answerable for its appearance, and found fault with because it was not a fine plant of the kind. And it seems to be that, in order that no unkind comparisons may be drawn between one and another, there are not appointed to plants the fixed number, position, and proportion of members which are ordained in animals (and any variation from which in these is unpardonable), but a

§ 9. *Admits of variety in the Ideal of the former.*

* Compare the chapter on the Root, in *Proserpina*. [1883.]

continually varying number and position, even among the more freely growing examples, admitting therefore all kinds of license to those which have enemies to contend with; and that without in any way detracting from their dignity and perfection.

So then there is in trees no perfect form which can be fixed upon or reasoned out as ideal; but that is always an ideal oak which, however poverty-stricken, or hunger-pinched, or tempest-tortured, is yet seen to have done, under its appointed circumstances, all that could be expected of oak.

The ideal, therefore, of the park oak is that which was described in the conclusion of the former part of this work;¹ full size, united terminal curve, equal and symmetrical range of branches on each side. The wild oak may be anything, gnarled,² and leaning, and shattered, and rock-encumbered, and yet ideal, so only that, amidst all its misfortunes, it maintain the dignity of oak; and, indeed, I look upon this kind of tree as more ideal than the other, in so far as by its efforts and struggles, more of its nature,—enduring power, patience in waiting for, and ingenuity in obtaining what it needs,—is brought out, and so more of the essence of oak exhibited, than under more fortunate conditions.

And herein, then, we at last find the cause of that fact which we have twice already noted,³ that the exalted or seemingly improved condition, whether of plant or animal, induced by human interference, is not the true and artistical idea of it.* It has

§ 10. *Ideal form in vegetables destroyed by cultivation.*

* I speak not here of those conditions of vegetation which have especial reference to man, as of seeds and fruits, whose sweetness and farina seem in great measure given, not for the plant's sake, but for his, and to which therefore the interruption in the harmony of creation of which he was the cause is extended, and their sweetness and larger measure of good to be obtained only by his redeeming labour. His curse has fallen on the corn and the vine; and the wild barley misses of its fulness, that he may eat bread by the sweat of his brow.⁴

¹ [*Modern Painters*, vol. i. pt. ii. sec. vi. ch. i. §§ 16 *seq.*; Vol. III. p. 588 of this ed.]

² [Ed. 1 reads, "The ideal . . . that to which I alluded in . . . side. The ideal of the mountain oak may be anything, twisting, and . . . rock-encumbered, so only that . . . what it wants . . ."]

³ [Above, ch. xii. § 12, ch. xiii. § 6.]

⁴ [Genesis iii. 19.]

been well shown¹ by Dr. Herbert,* that many plants are found alone on a certain soil or subsoil in a wild state, not because such soil is favourable to them, but because they alone are capable of existing on it, and because all dangerous rivals are by its inhospitality removed. Now if we withdraw the plant from this position, which it hardly endures, and supply it with the earth, and maintain about it the temperature, that it delights in; withdrawing from it, at the same time, all rivals, which, in such conditions, nature would have thrust upon it, we shall indeed obtain a magnificently developed example of the plant, colossal in size, and splendid in organization; but we shall utterly lose in it that moral ideal which is dependent on its right fulfilment of its appointed functions. It was intended and created by the Deity for the covering of those lonely spots where no other plant could live; it has been thereto endowed with courage and strength, and capacities of endurance; its character and glory are not therefore in the gluttonous and idle feeding of its own over luxuriance, at the expense of other creatures utterly destroyed and rooted out for its good alone, but in its right doing of its hard duty, and forward climbing into those spots of forlorn hope where it alone can bear witness to the kindness and presence of the Spirit that cutteth out rivers among the rocks, as He covers the valleys with corn;² and there, in its vanward place, and only there, where nothing is withdrawn for it, nor hurt by it, and where nothing can take part of its honour, nor usurp its throne, are its strength and fairness, and price, and goodness in the sight of God to be truly esteemed.

The first time that I saw the *Soldanella alpina*, before spoken of,³ it was growing, of magnificent size, on a sunny alpine

* *Journal of the Horticultural Society*, Part I.

¹ [This passage, down to "constellations of the earth" in § 11, is § 55 of *Frondes Agrestes*.]

² [Job xxviii. 10; Psalms lxxv. 13.]

³ [Above, p. 146. Ruskin is here recalling what he noted in his diary in 1844:—

ST. MARTINS, *June 5*.—Two of the most delicious and instructive days I ever spent in my life. Note, first, of the two purple flowers which I dried to-day, the round bushy one grows in enormous quantities near the

pasture, among bleating of sheep and lowing of cattle, associated with a profusion of *Geum montanum*, and *Ranunculus pyrenæus*. I noticed it only because new to me, nor perceived any peculiar beauty in its cloven flower. Some days after, I found it alone, among the rack of the higher clouds, and howling of glacier winds; and, as I described it (p. 146), piercing through an edge of avalanche, which, in its retiring, had left the new ground brown and lifeless, and as if burned by recent fire; the plant was poor and feeble, and seemingly exhausted with its efforts, but it was then that I comprehended its ideal character, and saw its noble function and order of glory among the constellations of the earth.

The *Ranunculus glacialis* might perhaps by cultivation be blanched from its wan and corpselike paleness to purer white, and won to more branched and lofty development of its ragged leaves. But the ideal of the plant is to be found only in the last, loose stones of the moraine, alone there; wet with the cold, unkindly drip of the glacier water, and trembling as the loose and steep dust to which it clings yields ever and anon, and shudders and crumbles away from about its root.

And if it be asked how this conception of the utmost beauty of ideal form is consistent with what we formerly argued¹ respecting the pleasantness of the appearance of felicity in the creature, let it be observed, and for ever held, that the right and

top, and about the top, of the Montagne Benit (?); the other (*) more scattered, though in profusion near the top, and more sparingly half way down. [The following note added on the opposite sheet.] (*Couttet tells me it is the very first flower which pierces the snow; in flower always the day after the snow uncovers it. Found a few, but fine, to-day above the Flégère; June 8th. Its name is Soldanella.) The oxalis acetosella, in considerable quantities under the rocks, and in the woods, about two-thirds of the way up; the anemone nemorosa more sparingly a little lower. The yellow flower, of which only one bad specimen is dried, in vast quantities, high and low on the summit itself; the bell gentian grew in mossy knots, everywhere—of luxuriant size, scattered, though not in such profusion, as far as half way down. The star gentian very rare at the top, thickly scattered below with the other. Common crowfoot, daisy, and dandelion, up to the top. In the pastures below, the globe ranunculus, yellow, mixed in profusion with the purple orchis.]

¹ [See above, sec. i. ch. iii. § 16, p. 64.]

true happiness of every creature is in this very discharge of its function, and in those efforts by which its strength and inherent energy are developed; and that the repose of which we also spoke as necessary to all beauty,¹ is, as was then stated, repose not of inanition, nor of luxury, nor of irresolution, but the repose of magnificent energy and being; in action, the calmness of trust and determination; in rest, the consciousness of duty accomplished and of victory won; and this repose and this felicity can take place as well in the midst of trial and tempest, as beside the waters of comfort; they perish only when the creature is either unfaithful to itself, or is afflicted by circumstances unnatural and malignant to its being, and for the contending with which it was neither fitted nor ordained. Hence that rest which is indeed glorious is of the chamois crouched breathless on his granite bed, not of the stalled ox over his fodder; and that happiness which is indeed beautiful is in the bearing of those trial tests which are appointed for the proving of every creature, whether it be good, or whether it be evil; and in the fulfilment to the uttermost of every command it has received, and the outcarrying to the uttermost of every power and gift it has gotten from its God.

Therefore the task of the painter, in his pursuit of ideal form, is to attain accurate knowledge, so far as may be in § 13. *The* his power, of the peculiar virtues, duties, and *ideality of Art.* characters of every species of being; down even to the stone, for there is an ideality of stones according to their kind, an ideality of granite and slate² and marble, and it is in the utmost and most exalted exhibition of such individual character, order, and use, that all ideality of art consists.*

* Extreme nonsense, I grieve to see—and say, and what is worse, unguarded nonsense; for I never really meant that “all” ideality of art consisted in specific distinctions. The passage is an impetuous slip in controversy, and meant to be conclusive against the people who had said that trees, in a painting, should be of no particular species. [1883.]

¹ [See above, ch. vii. § 3, p. 116.]

² [Misprinted “slab” in ed. of 1873.]

The more cautious he is in assigning the right species of moss to its favourite trunk, and the right kind of wood to its necessary stone; in marking the definite and characteristic leaf, blossom, seed, fracture, colour, and inward anatomy of everything, the more truly ideal his work becomes. All confusion of species, all careless rendering of character, all unnatural and arbitrary association, are vulgar and unideal in proportion to their degree.

It is to be noted, however, that Nature sometimes in a measure herself conceals these generic differences, and that when she displays them it is commonly on a scale too small for human hand to follow; the pursuit and seizure of the generic differences in their concealment, and the display of them on a larger and more palpable scale, is one of the wholesome and healthy operations of the imagination of which we are presently to speak.*

Generic differences, being often exhibited by art in different manner from that of their natural occurrence, are, in this respect, more strictly and truly ideal in art than in reality.

This only remains to be noted, that, of all creatures whose existence involves birth, progress, and dissolution, ideality is predicable all through their existence, so that they be perfect with reference to their supposed period of being. Thus there is an ideal of infancy, of youth, of old age, of death, and of decay.† But when the ideal form of the species is spoken of or conceived in general terms, the form is understood to be of that period when the generic attributes are perfectly developed, and

§ 14. *How connected with the Imaginative faculties.*

§ 15. *Ideality, how belonging to ages and conditions.*

* Compare Sec. II. Chap. IV. § 21.

† I suppose I meant this to be understood of dying vegetation, or mouldering rocks and walls. But the whole chapter is stupid and useless: all that it says, or intended to say, is fortunately put in clearer form in the following chapter¹ on the Imagination. [1883.]

¹ ["The following section," rather; but the reference is more particularly to sec. ii. ch. iv.]

previous to the commencement of their decline. At which period all the characters of vital and typical beauty are commonly most concentrated in them, though the arrangement and proportion of these characters vary at different periods; youth having more of the vigorous beauty, and age of the reposing; youth of typical outward fairness, and age of expanded and etherealized moral expression; the babe, again in some measure atoning in gracefulness for its want of strength; so that the balanced glory of the creature continues in solemn interchange, perhaps even

“Filling more and more with crystal light,
As pensive Evening deepens into night.”¹

Hitherto, however, we have confined ourselves* to the examination of ideal form in the lower animals, and we have found that, to arrive at it, no exertion of fancy is required in combining forms, but only simple choice among those naturally presented, together with careful study² of the habits of the creatures. I fear we shall arrive at a very different conclusion, in considering the ideal form of man.

* I wish we had! The assertion comes oddly after I had just been talking of babies and old ladies. [1883.]

¹ [Wordsworth. Sonnet of 1827, “To——, in her seventieth year.” The first of the lines quoted is “And filling,” etc.]

² [Ed. 1 reads, “investigation and anatomizing.”]

CHAPTER XIV

III. OF VITAL BEAUTY IN MAN

HAVING thus passed gradually through all the orders and fields of creation, and traversed that goodly line of God's happy creatures who "leap not, but express a feast, where all the guests sit close, and nothing wants,"¹ without finding any deficiency which human invention might supply, nor any harm which human interference might mend,* we come at last to set ourselves face to face with ourselves; expecting that in creatures made after the image of God,² we are to find comeliness and completion more exquisite than in the fowls of the air and the things that pass through the paths of the sea.³

But behold now a sudden change from all former experience. No longer among the individuals of the race is there equality or likeness, a distributed fairness and fixed type visible in each; but evil diversity, and terrible stamp of various degradation: features seamed by sickness, dimmed by sensuality, convulsed by passion, pinched by poverty, shadowed by sorrow, branded with remorse: bodies consumed with sloth, broken down by labour, tortured by disease, dishonoured in foul uses; intellects without power, hearts without hope, minds earthly and devilish; our bones full of the sin of our youth,⁴ the heaven revealing our iniquity, the earth rising up against us, the roots dried up beneath,

* Assumption again; and of the unblushingest. [1883.]

¹ [George Herbert: *The Temple* ("Providence," lines 133–134). The lines are quoted again by Ruskin in *Deucalion*, ii. ch. ii. ("Revision).]

² [Genesis i. 26.]

³ [Psalms viii. 8.]

⁴ [Psalms xxv. 7.]

and the branch cut off above;¹ well for us only, if, after beholding this our natural face in a glass, we desire not straightway to forget what manner of men we be.²

Herein there is at last something, and too much for that short-stopping intelligence and dull perception of ours to accomplish, whether in earnest fact, or in the seeking for the outward image of beauty:—to undo the devil's work; to restore to the body the grace and the power which inherited disease has destroyed; to restore to the spirit the purity, and to the intellect the grasp, that they had in Paradise. Now, first of all, this work, be it observed, is in no respect a work of imagination. Wrecked we are, and nearly all to pieces; but that little good *by which we are to redeem ourselves** is to be got out of the old wreck, beaten about and full of sand though it be; and not out of that desert island of pride on which the devils split first, and we after them: and so the only restoration of the body that we can reach is not to be coined out of our fancies, but to be collected out of such uninjured and bright vestiges of the old seal as we can find and set together: and the ideal of the good and perfect soul, as it is seen in the features, is not to be reached by imagination, but by the seeing and reaching forth of the better part of the soul to that of which it must first know the sweetness and goodness in itself, before it can much desire, or rightly find, the signs of it in others.[†]

* I am glad to see that even in this Evangelical burst of flame upon the "corruption of human nature," I was at least quit of the folly of hoping for redemption except in personal effort. But I don't know what I meant by "the desert island of pride" as in opposition to effort, for a true Evangelical would say, the pride was in trying to do anything ourselves. I *believe* I must have meant the notion that everybody, once converted, was as good as anybody else. [1883, when the italics in § 2 were first introduced.]

† *This* sentence certainly does mean that a painter of saints must be a saint himself,—which is true: and many a time since, I've said so more plainly. [1883.]³

¹ [Job xviii. 16.]

² [James i. 23, 24.]

³ [See, for instance, *Modern Painters*, vol. iii. ch. x. § 22, "greatness in art is the expression of a mind of a God-made great man;" *Two Paths*, § 45, "great art is

I say *much* desire and *rightly* find, because there is not any soul so sunk as not in some measure to feel the impression of mental beauty in the human features, and detest in others its own likeness, and in itself despise that which of itself it has made.

Now, of the ordinary process by which the realization of ideal bodily form is reached, there is explanation enough in all treatises on art, and it is so far well comprehended that I need not stay long to consider it. So far as the sight and knowledge of the human form, of the purest race, exercised from infancy constantly, but not excessively, in all exercises of dignity, not in straining dexterities, but in natural exercises of running, casting, or riding; practised in endurance, not of extraordinary hardship, for that hardens and degrades the body, but of natural hardship, vicissitudes of winter and summer, and cold and heat, yet in a climate where none of these are severe; surrounded also by a certain degree of right luxury, so as to soften and refine the forms of strength; so far as the sight of all this could render the mental intelligence of what is noble in human form so acute as to be able to abstract and combine, from the best examples so produced, that which was most perfect in each, so far the Greek conceived and attained the ideal of humanity: and on the Greek modes of attaining it,¹ chiefly dwell those writers whose opinions on this subject I have collected; wholly losing sight of what seems to me the most important branch of the inquiry, namely, the influence, for good or evil, of the mind upon the bodily shape, the wreck of the mind itself, and the modes by which we may conceive of its restoration.

The visible operation of the mind upon the body may be classed under three heads.

nothing else than the type of a strong and noble life;" and *Modern Painters*, vol. i. pt. ii. sec. i. ch. vii. § 37, "all great painters, of whatever school, have been great only in their rendering of what they have seen and felt." And, therefore, no man can paint religious subjects in the great style unless his mind has a natural disposition to them (*Modern Painters*, vol. iii. ch. iii. § 5); in which connexion, see what is said of Fra Angelico, *passim* in this volume.]

¹ [Ed. I adds, "as well as on what he produced, as a perfect example of it, . . ."]

First, the operation of the intellectual powers upon the features, in the fine cutting and chiselling of them, and removal from them of signs of sensuality and sloth, by which they are blunted and deadened; and substitution of energy and intensity for vacancy and insipidity (by which wants alone the faces of many fair women are utterly spoiled and rendered valueless); and by the keenness given to the eye and fine moulding and development to the brow, of which effects Sir Charles Bell has well described the desirableness and opposition to brutal types;¹ only this he has not sufficiently observed, that there are certain virtues of the intellect in measure inconsistent with each other, as perhaps great subtlety with great comprehensiveness, and high analytical with high imaginative power: or that at least, if consistent and compatible, their signs upon the features are not the same, so that the outward form cannot express both, without in a measure expressing neither; and so there are certain separate virtues of the outward form correspondent with the more constant employment or more prevailing capacity of the brain, as the piercing keenness, or open and reflective comprehensiveness, of the eye and forehead: and that all these virtues of form are ideal, only those the most so which are the signs of the worthiest powers of intellect, though which these may be, we will not at present stay to enquire.

§ 4. *Modifications of the bodily ideal owing to influence of mind. First, of Intellect.*

Secondly, the operation of the moral feelings conjointly with the intellectual powers on both the features and form.² Now, the operation of the right moral feelings on the intellect is always for the good of the latter, for *it is not possible that selfishness should reason*

§ 5. *Secondly, of the Moral Feelings.*

¹ [Ed. 1 supplies the reference, "p. 59, third edition" of the *Essays on the Anatomy of Expression in Painting*.]

² [Ed. 1 reads:—

"The second point to be considered in the influence of mind upon body, is the mode of operation and conjunction of the moral feelings on and with the intellectual powers, and then their conjoint influence on the bodily form. Now the operation . . ."]

rightly in any respect,* but must be blind in its estimation of the worthiness of all things: neither anger, for that overpowers the reason or outcries it; neither sensuality, for that overgrows and chokes it; neither agitation, for that has no time to compare things together; neither enmity, for that must be unjust; neither fear, for that exaggerates all things; neither cunning and deceit, for that which is voluntarily untrue will soon be unwittingly so; but the great reasoners are self-command, and trust unagitated, and deep-looking Love, and Faith, which as she is above Reason, so she best holds the reins of it from her high seat; so that they err grossly who think of the right development even of the intellectual type as possible, unless we look to higher sources of beauty first. Nevertheless, though in their operation *upon* them the moral feelings are thus elevatory of the mental faculties, yet in their conjunction *with* them they seem to occupy, in their own fulness, such space as to absorb and overshadow all else; so that, the simultaneous exercise of both being in a sort impossible, we occasionally find the moral part in full development and action, without corresponding expansion of the intellect (though never without healthy condition of it), as in the condition described by Wordsworth,

“In such high hour
Of visitation from the Living God,
Thought was not;”¹

only, if we look far enough, we shall perhaps find that it is not intelligence itself, but the immediate act and effort of a laborious, struggling, and imperfect intellectual faculty, with which high moral emotion is inconsistent; and though we cannot, while we feel deeply, *reason* shrewdly, yet I

* Good: and the following passage is carefully written, and of considerable value: only it should have been noted that, since Faith holds the reins of Reason, she ought to be early taught to drive. [1883.]

¹ [*The Excursion*, book i. (“The Wanderer”), line 211. The passage is quoted again in the following volume, ch. xvii. § 11. For Ruskin’s admiration, at this time, of *The Excursion*, see the letter in Appendix iii., below, p. 393.]

doubt if, *except* when we feel deeply, we can ever *comprehend* fully; so that it is only the climbing and mole-like piercing, and not the sitting upon their central throne, nor emergence into light, of the intellectual faculties, which the full heart feeling allows not. Hence, therefore, in the indications of the countenance, they are only the hard cut lines, and rigid settings, and wasted hollows,* speaking of past effort and painfulness of mental application, which are inconsistent with expression of moral feeling, for all these are of infelicitous¹ augury; but not the full and serene development of habitual command in the look, and solemn thought in the brow; only these, in their unison with the signs of emotion, become softened and gradually confounded with a serenity and authority of nobler origin. But of the sweetness which that higher serenity (of happiness), and the dignity which that higher authority (of divine law, and not human reason), can and must stamp on the features, it would be futile to speak here at length: for I suppose that both are acknowledged on all hands, and that there is not any beauty but theirs to which men pay long obedience:† at all events, if not by sympathy² discovered, it is not in words explicable with what divine lines and lights the exercise of godliness and charity will mould and gild the hardest and coldest countenance, neither to what darkness their departure will consign the loveliest. For there is not any virtue the exercise of which, even momentarily, will not impress a new fairness upon the features: neither on them only, but on the whole body, both the intelligence and the moral faculties have operation; for even

* In simpler terms, this I suppose means that angels must not be wrinkled or saints frown. [1883.]

† I do not know how “long” the obedience may last: but it may be quite universal to types extremely the reverse of “theirs,”—as in London and Paris at present—1882. [1883.]

¹ [Misprinted “felicitous” in the 1873 edition.]

² [This passage, “If not by sympathy . . . upon the features,” is § 80 in *Frondes Agrestes*.]

§ 6. *What beauty is bestowed by them.*

all the movements and gestures, however slight, are different in their modes according to the mind that governs them; and on the gentleness and decision of just feeling there follows a grace of action, and, through continuance of this, a grace of form, which by no discipline may be taught or attained.¹

The third point to be considered with respect to the corporeal expression of mental character is, that there is a certain period of the soul-culture when it begins to interfere with some of the characters of typical beauty belonging to the bodily frame, the stirring of the intellect wearing down the flesh, and the moral enthusiasm burning its way out to heaven, through the emaciation of the earthen vessel; and that there is, in this indication of subduing of the mortal by the immortal part, an ideal glory of perhaps a purer and higher range than that of the more perfect material form. We conceive, I think, more nobly of the weak presence of Paul than of the fair and ruddy countenance of David.

Now, be it observed that, in our statement of these three directions of mental influence, we have several times been compelled to stop short of definite conclusions, owing to the inconsistency,² first, of different kinds of intellect with each other; secondly, of the moral faculties with the intellectual (and if we had separately examined the moral emotions, we should have found certain inconsistencies among them also); and again, of the soul-culture generally with the bodily perfections. Such inconsistencies we should find in the perfections of no other animal. The strength or swiftness of the Dog is not inconsistent with his sagacity, nor is bodily labour in the Ant and Bee destructive of their acuteness of instinct. And

¹ ["On all the beautiful features of men and women, throughout the ages, are written the solemnities and majesty of the law they knew, with the charity and meekness of their obedience; on all unbeautiful features are written either ignorance of the law, or the malice and insolence of their disobedience" (*The Art of England*, § 83). Cf. *Sesame and Lilies*, § 70, and *Fors Clavigera*, Letter 91).]

² [Ed. 1 reads, "owing to the apparent inconsistency of certain excellencies and beauties to which they tend, as first, . . ."]

this peculiarity of relation among the perfections of man is no result of his fall or sinfulness, *but an evidence of his greater nobility*,* and of the goodness of God towards him. For the individuals of each race of lower animals, being not intended to hold among each other those relations of charity which are the privilege of humanity, are not adapted to each other's assistance, admiration, or support, by differences of power and function. But the Love¹ of the human race is increased by their individual differences, and the Unity of the creature, as before we saw of all unity, made perfect by each having something to bestow and to receive, bound to the rest by a thousand various necessities and various gratitudes; humility in each rejoicing to admire in his fellow that which he finds not in himself, and each being in some respect the complement of his race.[†] Therefore, in investigating the signs of the ideal

* I am thankful to have another sentence to italicise, introducing the better philosophy of my later works. [1883.]

† "In another sense still the human race may be considered *as one man only*. While each animal begins anew the work of its species, each human being does not begin anew the work of mankind. He continues it, and cannot but continue it. He receives, on his entrance into life, the heritage of all ages—he is the son of the whole human race. Thousands of causes, thousands of persons have co-operated since the beginning of time to make him what he is. Man, isolated either in time or space, is not truly man. Absolute solitude transforms him into an animal, and much less than an animal, since he wants its infallible instincts, or has only in their stead a powerless reason, indolent, and as it were, shrouded. A man, then, does not come up to his type, does not perfectly exist, without his race; it is the race that makes him a man. And when we picture to ourselves a man existing by himself as man, and with all the attributes of his race, we dream; since a man purely individual and isolated is an impossibility. It is not thus in any other department of the animal kingdom. A whole does not exist anywhere else as in our race; but is it not wonderful that true individuality exists only in the same race also, and that the sole being whose nature is developed fully only as one of a race is also the only one who manifests the sentiment of liberty, morality, and the consciousness implied in the word Me?"—*Vinet's (Alex.) Vital Christianity*²

¹ [This passage, "The Love of the human race . . . the complement of his race," is § 81 in *Fronde Agrestes*.]

² [This note did not appear in ed. 1. The italicising of "as one man only" was introduced in the 1883 ed.]

or perfect type of humanity, we must not presume on the singleness of that type; and yet, on the other hand, we must cautiously distinguish between differences conceivably existing in a perfect state, and differences resulting from immediate and present operation of the Adamite curse.* Of which the former are differences that bind, and the latter that separate. For although we can suppose the ideal or perfect human heart, and the perfect human intelligence, equally adapted to receive every right sensation, and pursue every order of truth, yet as it is appointed for some to be in authority and others in obedience, some in solitary functions and others in relative ones, some to receive and others to give, some to teach and some to discover; and as all these varieties of office are not only conceivable as existing in a perfect state of man, but seem almost to be implied by it, and at any rate cannot be done away with but by a total change of his constitution and dependencies, of which the imagination can take no hold; so there are habits and capacities of expression induced by these various offices, which admit of many separate ideals of equal perfection.¹ There is an ideal of

§ 10. *Consequent separation and difference of Ideals.*

Authority, of Judgment, of Affection, of Reason, and of Faith,[†] neither can any combination of these ideals be attained; not that the just judge is to be supposed incapable of affection, nor the king incapable of obedience, but as it is impossible that any essence short of the Divine should at the same instant be equally receptive of all emotions, those emotions

* In order to accept the statements in the following passage, one of the best, of its kind, in this book, it is not necessary that the reader should believe the literal story of the Fall, but only that, in some way, "Sin entered into the world, and Death by Sin."² For more definite expression of my own belief and meaning, the reader should refer to the 8th number of *Deucalion*.³ [1883.]

† I meant, of the countenances expressing these different characters. The analysis, given without explanation, is very close and subtle. "Authority" is

¹ [There is no break here in ed. 1, which reads, "of equal perfection, according to the functions of the creatures, so that there is an ideal . . ."]

² [Romans v. 12.]

³ [See above, Introduction, p. xlviii.]

which, by right and order, have the most usual victory, both leave the stamp of their habitual presence on the body, and render the individual more and more susceptible of them in proportion to the frequency of their prevalent recurrence.¹ Still less can the differences of age and sex, though seemingly of more finite influence, be banished from any human conception. David, ruddy and of a fair countenance, with the brook stone of deliverance in his hand, is not more ideal than David leaning on the old age of Barzillai, returning chastened to his kingly home. And they² who are as the angels of God in heaven, yet cannot be conceived as so assimilated that their different experiences and affections upon earth shall then be forgotten and effectless; the child taken early to his place cannot be imagined to wear there such a body, nor to have such thoughts, as the glorified apostle who has finished his course and kept the faith on earth. And so whatever perfections and likeness of love we may attribute to either the tried or the crowned creatures, there is the difference of the stars in glory among them yet; differences of original gifts, though not of occupying till their Lord come, different dispensations of trial and of trust, of sorrow and support, both in their own inward, variable hearts, and in their positions of exposure or of peace, of the gourd shadow and the smiting sun, of calling at heat of day or eleventh hour, of the house unroofed by faith, or the clouds opened by revelation; differences in warning, in mercies, in sicknesses, in signs, in time of calling to account; alike only they all are, by that which is not of them, but the gift of God's unchangeable mercy. "I will give unto this last even as unto thee."³

the character of a person who establishes law;—"Judgment," of one who applies it;—"Affection," of one whose law is love. "Reason," as the mistress of Investigation, is opposed to "Faith," the mistress of Imagination. [1883.]

¹ [Here again ed. 1 went on "breathlessly," reading thus:—"prevalent recurrence; added to which causes of distinctive character are to be taken into account the difference of age and sex, which though . . . cannot be banished . . ."]

² [This passage, "They who are" down to "even unto thee" (end of § 10), is § 82 in *Frondes Agrestes*. The Bible references here are: 1 Samuel xvii. 42; 2 Samuel xix. 31–39; 1 Cor. xv. 41; Jonah iv. 6–8; Mark ii. 4.]

³ [Matthew xx. 14, a text which afterwards gave a title to one of Ruskin's bestknown works—*Unto this Last*.]

Hence, then, it will follow, that we must not determinedly banish from the human form and countenance, in our restoration of its ideal, everything which can be ultimately traced to the Adamite Fall for its cause, but only the immediate operation and presence of the degrading power of sin. For there is not any part of our nature, nor can there be through eternity, uninfluenced or unaffected by the fall, and that not in any way of degradation, for the renewing in the divinity of Christ is a nobler condition than that of Paradise; and yet throughout eternity it must imply and refer to the disobedience, and the corrupt state of sin and death, and the suffering of Christ Himself, which can we conceive of any redeemed soul as for an instant forgetting, or as remembering without sorrow? Neither are the alternations of joy and such sorrow as by us is inconceivable, being only as it were a softness and silence in the pulse of an infinite felicity, inconsistent with the state even of the unfallen; for the angels, who rejoice over repentance, cannot but feel an uncomprehended pain as they try and try again in vain, whether they may not warm hard hearts with the brooding of their kind wings. So that we have not to banish from the ideal countenance the evidences of sorrow, nor of past suffering, nor even of past and conquered sin, but only the immediate operation of any evil, or the immediate coldness and hollowness of any good emotion. And hence in that contest before noted, between the body and the soul, we may often have to indicate the body as far conquered and outworn, and with signs of hard struggle and bitter pain upon it; and yet without ever diminishing the purity of its ideal: and since it is not in the power of any human imagination to reason out or conceive the countless modifications of experience, suffering, and separated feeling, which have modelled and written their indelible images, in various order, upon every human countenance, so no right ideal can be reached by any combination of feature nor by any moulding and melting of individual beauties together, and still less without

§ 11. *The effects of the Adamite curse are to be distinguished from signs of its immediate activity.*

§ 12. *Which latter only are to be banished from ideal form.*

model or example at all; but *there is a perfect ideal to be wrought out of every face around us* that has on its forehead the writing and the seal of the angel ascending from the East,* by the earnest study and penetration of the written history thereupon, and the banishing of the blots and stains, wherein we still see, in all that is human, the visible and instant operation of unconquered Sin.

Now I see not how any of the steps of the argument by which we have arrived at this conclusion can be evaded, and yet it would be difficult to state anything more directly opposite to the general teaching and practice of artists. It is usual to hear portraiture opposed to the pursuit of ideality, and yet we find that no face can be ideal which is not a portrait. Of this general principle, however, there are certain modifications which we must presently state; but let us first pursue it a little farther and deduce its practical consequences.

§ 13. *Ideal form is only to be obtained by portraiture.*

These are, first, that the pursuit of idealism in humanity, as of idealism in lower nature, can be successful only when followed through the most constant, patient, and humble rendering of actual models, accompanied with that earnest mental¹ study of each, which can interpret all that is written upon it, disentangle the hieroglyphics of its sacred history, rend the veil of the bodily temple, and rightly measure the relations of good and evil contending within it for mastery;† that everything done without such study must be shallow and contemptible; that generalization or combination of individual character will end less in the mending than the losing of it, and, except in certain instances of which we shall presently take note, is valueless and vapid, even if it escape being painful from its want of truth.² And that habit of the old

* Rev. vii. 2.

† Compare Part II. Sec. I. Chap. III. § 6.

¹ [Ed. 1 reads “. . . mental as well as ocular . . .”]

² [Ed. 1 adds:—

“which in these days it often in some measure does, for we indeed find faces about us with want enough of life or wholesome character in them to justify anything.”]

and great painters of introducing portrait into all their highest works, I look to, not as error in them, but as the very source and root of their superiority in all things; for they were too great and too humble not to see in every face about them that which was above them, and which no fancies of theirs could match nor take place of; wherefore we find the custom of portraiture constant with them, both portraiture of study and for purposes of analysis, as with Leonardo; and actual, professed, serviceable, hard-working portraiture of the men of their time, as with Raffaele, and Titian, and Tintoret; and portraiture of love, as with Fra Bartolomeo of Savonarola, and Simon Memmi of Petrarch, and Giotto of Dante, and Gentile Bellini of a beloved imagination of Dandolo,¹ and with Raffaele constantly; and portraiture for the sake of the nobility of personal character even in their most imaginative works,² as was the practice of Ghirlandajo perpetually, and Masaccio and Raffaele, and manifestly of the men of highest and purest ideal purpose, as again Giotto, and in his characteristic monkish heads, Angelico, and John Bellini (note especially the St. Christopher at the side of that mighty

§ 14. *Instances among the greater of the Ideal Masters.*

¹ [Fra Bartolommeo was one of the band of faithful followers who shut themselves up with Savonarola in San Marco; his portrait of his master is in the museum of the convent. (There is another of Savonarola as St. Peter Martyr in the Accademia.) Of Simone Memmi (or Martini) Vasari says, "great was his good fortune in that he lived at the same time with Messer Francesco Petrarca, and that he further chanced to meet that love-devoted poet at the court of Avignon." In the "Spanish Chapel" of S. Maria Novella, in the fresco of "The Church Militant and Triumphant" (attributed by Vasari to Simone), the portrait of Petrarch is introduced among the illustrious personages surrounding the Pope (Vasari, Bohn's ed., 1855, vol. i. pp. 182, 185). Giotto's portrait of Dante is in his fresco of Paradise in the Bargello. Ruskin describes it in his note-book of 1845:—

"The head of Dante has been drawn with love, and its completion is so delicate that I hardly know a head in fresco, at any period of art, that can compete with it. It is stippled with the greatest delicacy, its colour pure and deep, the eye deeply thoughtful, the expression beautifully calm."

It is recorded of Gentile Bellini that he cherished "enthusiasm for 'blind old Dandolo (see *Childe Harold*, iv. 12), the octogenarian doge' (ruled 1192–1205), who played so important a part in the crusade of the Latins against the Greek empire," and had "the zeal to copy the portrait of this Venetian hero from the very ancient original which was falling to pieces" (see Rio's *Poetry of Christian Art*, p. 356).]

² [Ed. 1 reads, "portraiture in real downright necessity of models, even in their noblest works, . . ."]

picture of St. Jerome, at Venice¹): and so of all: which practice had indeed a perilous tendency among men of debased mind, who used models such as and where they ought not;² or among men who looked not at their models with intellectual or loving penetration, but took the outside of them, or perhaps took the evil and left the good, as even Titian has done in that academy study at Venice which is called a St. John,³ and all workers whatsoever that I know of, after Raffaele's time, as Guido and the Carracci, and such others; but it is nevertheless the necessary and sterling basis of all ideal art, neither has any great man ever been able to do without it, nor dreamed of doing without even to the close of his days.⁴

¹ [In the church of S. Giovanni Crisostomo. The picture is described below, sec. ii. ch. v. § 8, p. 319, and *cf.* preceding volume, p. 180.]

² [Ed. 1 reads:—

“. . . ought not, as Lippi and the corrupted Raffaele; and is found often at exceeding disadvantage among men who . . .”]

³ [In the Venetian Academy; elsewhere referred to as “the Desert of Titian;” see preceding volume, p. 173.]

⁴ [In the MS. this passage was somewhat different, and some points were touched on which Ruskin afterwards made elsewhere. After noticing (though in slightly different terms) the old portraiture “for analysis,” “of love,” etc., the MS. continues:—

“. . . or else they were portraits of greater persons of the state—persons whom the more feudal system and the more frequent exercise of arbitrary power had a tendency to destroy external evidence of pride; nay, I am not sure that the greater and more frequent and palpable crime and violence of those days had not also a tendency to destroy the evidence of petty vanities, and induce a gravity and sadness on the features; or else they were of persons indeed great and who could not be proud, as was the case principally with the Doges of Venice, whose beautiful habit of representing themselves in acts of humiliation and thanksgiving is touchingly and justly noted by Rio.

“Whereas in modern times portraiture having become a rage, almost a necessity, the most vulgar and vain persons over whose diamonds and lace, crimson curtains and columnar landscapes the artist has to spend his mechanical years, necessarily corrupt and quench such feeling as he might have possessed; the copysim of emptiness makes him empty, and his faculties, unaccustomed to any perception of great qualities, miss them even in those few examples where otherwise they might have been found. The qualities of dress, too, are fatally against him; for the robes of state or ceremony, being seldom worn, are not familiarised to the person of the wearer, so that if assumed for a time, there is no life in them, and the ideas of the painter separate the man and his dress, till it comes to painting the face first and the coat afterwards. In old times the habitual dress became a part of the man and was treated naturally from being constantly seen as such. If no robe of state be admitted, the painter necessarily struggles to distinguish his subject by some peculiarity or other, and falls into affectation.”

Some of this passage was afterwards utilised, as will be seen, in § 19 below. For the choice of the Venetians in being “painted on their knees,” see *Modern Painters*, vol. v. pt. ix. ch. iii. § 15; the reference to Rio will be found in *The Poetry of Christian Art*, English ed. 1854, pp. 365, 403. For the importance of beautiful and stately dress, see *Stones of Venice*, vol. iii. ch. iv. § 31, and *A Joy for Ever*, § 54.]

And therefore there is not any greater sign of want of vitality and hopefulness in the schools of the present day, than that unhappy prettiness and sameness under which they mask, or rather for which they barter, in their lentil thirst, all the birthright and power of nature; which prettiness, wrought out and spun fine in the study,¹ till it hardly betters the blocks on which dresses and hair are tried in barbers' windows and milliners' books, cannot but be revolting to any man who has his eyes, even in a measure, open to the divinity of the immortal seal on the common features that he meets in the highways and hedges hourly and momentarily, outreaching all efforts of conception as all power of realization, were it Raffaele's three times over, even when the glory of the wedding garment is not there.*

§ 15. *Evil results of opposite practice in modern times.*

If then individual humanity be taken as the basis of our conception, its right ideal² is to be reached, we have asserted, only by the banishment of the immediate signs of sin upon the countenance and body. How, therefore, are the signs of sin[†] to be known and separated?

No intellectual operation is here of any avail. There is not any reasoning by which the evidences of depravity are to be traced in movements of muscle or forms of feature; there is not any knowledge, nor experience, nor diligence of

* The error, since this passage was written, has been reversed: we have now plenty of wayside painting, but scarcely any ideal or historical: still less religious. The paragraph itself is expanded and explained in the chapter on "Purism" in the third volume of *Modern Painters*. [1883.]

† "As separated from the evil of distress," I should have said. [1883.]

¹ [In the MS. Ruskin had added "out of empty heads"; so above, he had written "the utter want of vitality and *power of hopefulness* . . . sameness *of feature*." Every page of the MS. shows similar instances of pruning in the process of revision.]

² [Here ed. 1 has a fresh paragraph, thus:—

"So far, then, of the use of the model and the preciousness of it in all art, from the highest to the lowest. But the use of the model is not all. It must be used in a certain way, and on this choice of right or wrong way all our ends are at stake, for the art, which is of no power without the model, is of pernicious and evil power if the model be wrongly used. What the right use is, has been at least established, if not fully explained, in the argument by which we arrived at the general principle.

"The right ideal is to be reached, . . ."]

§ 16. *The right use of the model.*

comparison that can be of avail. Here, as throughout the operation of the Theoretic faculty, the perception is altogether moral, and instinctive love and clinging to the lines of light. Nothing but love can read the letters, nothing but sympathy catch the sound; there is no pure passion that can be understood or painted except by pureness of heart; the foul or blunt feeling will see itself in everything, and set down blasphemies; it will see Baalzebub in the casting out of devils; it will find its God of flies in every alabaster box of precious ointment.¹ The indignation of zeal toward God² it will take for anger against man; faith and veneration it will miss, as not comprehending; charity it will turn into lust; compassion into pride; every virtue it will go over against, like Shimei, casting dust.³ But the right Christian mind will, in like manner, find its own image wherever it exists; it will seek for what it loves, and draw it out of all dens and caves, and it will believe in its being, often when it cannot see it, and always turn away its eyes from beholding vanity;⁴ and so it will lie lovingly over all the faults and rough places of the human heart, as the snow from heaven does over the hard, and black, and broken mountain rocks, following their forms truly, and yet catching light for them to make them fair, and that must be a steep and unkindly crag indeed which it cannot cover.

Now of this spirit there will always be little enough in the world, and it cannot be given or taught by men, and so it is of little use to insist on it farther; only I may note some practical points respecting the ideal treatment of human form, which may be of some use. There is not the face, I have said, which the painter may not make ideal if he choose; but that subtle feeling which shall find out all of good that there is in any given countenance is not, except by concern for other things than art,

§ 16. *Ideal form to be reached only by Love.*

§ 17. *Practical principles deducible.*

¹ [The Bible references here are Matthew ix. 34: "But the Pharisees said, He casteth out devils through the prince of the devils." Baalzebub (2 Kings i. 2, 16) was the god of flies. Matthew xxvi. 7-14.]

² [Ed. 1 inserts "(nemesi)."]

³ [2 Samuel xvi. 13.]

⁴ [Psalms cxix. 37.]

to be acquired. But certain broad indications of evil there are which the bluntest feeling may perceive, and which the habit of distinguishing and casting out would both ennoble the schools of art, and lead, in time, to greater acuteness of perception with respect to the less explicable characters of soul beauty.

Those signs of evil which are commonly most manifest on the human features are roughly divisible into these four kinds; the signs of pride, of sensuality, of fear, and of cruelty. Any one of which will destroy the ideal character of the countenance and body.

§ 18. *Expressions chiefly destructive of ideal character. 1st. Pride.*

Now of these, the first, Pride, is perhaps the most destructive of all the four, seeing it is the undermost and original vice of all;¹ and it is base also from the necessary foolishness of it, because at its best, when grounded on a just estimation of our own elevation or superiority above certain others, it cannot but imply that our eyes look downward only, and have never been raised above our own measure; for there is not the man so lofty in his standing or capacity, but he must be humble in thinking of the cloud habitation and far sight of the angelic intelligences above him; and in perceiving what infinity there is of things he cannot know, nor even reach unto, as it stands compared with that little body of things he can reach, and of which nevertheless he can altogether understand not one; not to speak of that wicked and fond attributing of such excellency as he may have to himself, and thinking of it as his own getting, (which is the real essence and criminality of Pride:)* nor of those viler forms of it, founded on false estimation of things beneath us and irrational contemning of them; but,

* The words in parenthesis are false. The criminality of pride is a selfish pleasure in our own pre-eminence, whether it be acknowledged as God's gift or not:—"Lord, I thank Thee that I am not as other men are."² The denial of the power of God, as by Nebuchadnezzar, is impiety *added to* pride. [1883, when the words were first placed in parenthesis.]

¹ [For "vice of all," ed. 1 reads, "story of all sin," and in the next line inserts "that is" before "when grounded."]

² [Luke xviii. 11.]

taken at its best, it is still base to that degree that there is no grandeur of feature which it cannot destroy and make despicable, so that the first step towards the ennobling of any face is the ridding it of its vanity; to which aim there cannot be anything more contrary than that principle of portraiture which prevails with us in these days, whose end seems to be the expression of vanity throughout, in face and in all circumstances of accompaniment;¹ tending constantly to insolence of attitude, and levity and haughtiness of expression, and worked out farther in mean accompaniments of worldly splendour and possession; together with hints or proclamations of what the person has done or supposes himself to have done, which if known, it is gratuitous in the portrait to exhibit, and, if unknown, it is insolent in the portrait to proclaim: whence has arisen such a school of portraiture as must make the people of the nineteenth century the shame of their descendants, and the butt of all time.* To which practices are to be opposed both the glorious severity of Holbein, and the mighty and simple modesty of Raffaele, Titian, Giorgione, and Tintoret, with whom armour does not constitute the warrior, neither silk the dame. And from what feeling the dignity of that portraiture arose is best traceable at Venice, where we find their victorious doges painted neither in the toil of battle nor the triumph of return: nor set forth with thrones and curtains of state, but kneeling, always crownless, and returning thanks to God for His help; or as priests interceding for the nation in its affliction. But this feeling and its results have been so well traced by Rio,[†] that I need not speak of it farther.

* Rather strong, this! but extremely true. All the paragraph is valuable, and its sequel, to the end of the chapter, excellent in general criticism, and, with the slight exceptions noted, the basis of all my critical teaching since. [1883.]

† *De la Poésie Chrétienne. Forme de l' Art*, chap. viii.2

¹ [See *Stones of Venice*, vol. iii. ch. ii. ("Roman Renaissance") § 37, where Ruskin refers to this passage and further illustrates it.]

² [For the reference to the English edition, see note on § 14 above.]

That second destroyer of ideal form, the appearance of § 20. *Secondly,* Sensual character, though not less fatal in its *Sensuality.* operation on modern art, is more difficult to trace, owing to its peculiar subtlety.¹ For it is not possible to say by what minute differences the right conception of the human form is separated from that which is luscious and foul: for the root of all is in the love and seeking of the painter, who, if of impure and feeble mind, will cover all that he touches with clay staining, as Bandinelli puts a scent of common flesh² about his marble Christ,³ and as many, whom I will not here name, among moderns; but if of mighty mind or pure, may pass through all places of foulness, and none will stay upon him, as Michael Angelo; or he will baptize all things and wash them with pure water, as our own Stothard.⁴ Now, so far as this power is dependent on the seeking of the artist, and is only to be seen in the work of good and spiritually-minded men, it is vain to attempt to teach or illustrate it; neither is it here the place to show how⁵ it belongs to the representation of the mental image of things, instead of things themselves, of which we are to speak in treating of the imagination; but thus much may here be noted of broad, practical principle, that the purity of flesh painting depends, in very considerable measure, on the intensity and warmth of its *colour*.* For if it be opaque, and clay cold, and § 21. *How con* devoid of all the radiance and life of flesh, the *-nected with im-* lines of its true beauty, being severe and firm, *purity of colour,* will become so hard in the loss of the glow and gradation by which nature illustrates

* I am glad to see how early this great principle of colour, so contrary to the common estimate of it, was known to me, and thus strongly asserted. [1883.]⁶

¹ [Compare with this section, *Stones of Venice*, vol. ii. ch. vi. § 58.]

² [Ed. 1 reads, "a foul scent of human flesh . . ."]

³ [See below, sec. ii. ch. iii. § 27, p. 280.]

⁴ [For other references to Stothard, whom Ruskin called the Angelico of England, see *Modern Painters*, vol. iii. ch. vi. § 5; *Stones of Venice*, vol. ii. ch. vi. § 52; *Cestus of Aglaia*, § 80.]

⁵ [Ed. 1 reads less briefly, "to take note of the way in which . . ."]

⁶ [So in *The Queen of the Air*, colour is "the spiritual power of art" (§ 94 n.). Cf. *Modern Painters*, vol. iii. ch. xiv. § 42; *Stones of Venice*, vol. ii. ch. v. §§ 30–34.]

them, that the painter will be compelled to sacrifice them for a luscious fulness and roundness, in order to give the conception of flesh; which, being done, destroys ideality of form as of colour, and gives all over to lasciviousness of surface; showing also that the painter sought for this, and this only, since otherwise he had not taken a subject in which he knew himself compelled to surrender all sources of dignity. Whereas right splendour of colour both bears out a nobler severity of form, and is in itself purifying and cleansing, like fire; furnishing also to the painter an excuse for the choice of his subject,* seeing that he may be supposed as not having painted it but in the admiration of its abstract glory of colour and form, and with no unworthy seeking. But the mere power of perfect and glowing colour will, in some sort, redeem even a debased tendency of mind itself, as eminently the case with Titian, who, though¹ often treating base subjects, or elevated subjects basely, as in the disgusting Magdalen of the Pitti Palace, and that of the Barberigo at Venice,² yet redeems all by his glory of hue, so that he cannot paint altogether coarsely: and with Giorgione, who had more imaginative intellect, the sense of nudity is utterly lost, and there is no need nor desire of concealment any more, but his naked figures move among the trees like fiery pillars, and lie

§ 22. *And prevented by its splendour,*

* Nevertheless, he ought not to take subjects *needing* excuse. [1883.]

¹ [Ed. 1 reads, "though of little feeling and often . . ."; and, four lines lower, instead of "more imaginative intellect," ed. 1 reads "nobler and more serious intellect, . . ."]

² [The following is Ruskin's note in his Florentine note-book (1845) on Titian's Magdalen in the Pitti:—

"This picture may once have been fine, merely as a work of art, but it is now destroyed; a few folds of the hair, here and there, a shadow of the flesh, and the alabaster box with 'Titianus' in brown letters on it are all that remain. The rest is either picture-dealer, or ground colour with all the glazings off. In consequence the hair looks like a brown mat or like that of a rough Blenheim spaniel; the mass of it, without the slightest grouping or arrangement, is like the pictures of Circassians on the signs of Barbers in Bishopsgate Within. The fleshy and shapeless body is nearly as disgusting. The face of the grossest possible type, and the eyes turned up, as the model turned them when she was ordered to do so, are the crowning sin. The little alabaster vase and brown signature are very delicious; if I had the picture, I would cut them out and burn the rest."

Titian's pictures in the Barberigo Palace at Venice were at a later date sold to the Emperor of Russia (see *Stones of Venice*, Venetian index, s. Barberigo.)]

on the grass like flakes of sunshine.* With the religious painters, on the other hand, such nudity as they were compelled to treat is redeemed as much by severity of form and hardness of line as by colour, so that generally their draped figures are preferable.¹ But they, with Michael Angelo and most of the Venetians, form a great group, pure in sight and aim, between which and all other schools by which the nude has been treated, there is a gulf fixed, and all the rest, compared with them, seem striving how best to illustrate Spenser's stanza in its second clause—

“Of all God's works which doe this worlde adorn,
There is no one more faire, and excellent,
Than is man's body both for power and forme
Whiles it is kept in sober government.
*But none than it more foul and indecent
Distempered through misrule and passions bace.*”²

Of these last, however, with whom ideality is lost, there are some worthier than others, according to that measure of colour they reach, and power they possess.³ Much may be forgiven to Rubens; less, as I think, to Correggio, who has more of inherent sensuality wrought out with attractive and luscious refinement, and that alike in all subjects; as in the Madonna of the Incoronazione, over the high altar of San Giovanni at Parma, of which the head and upper portion of the figure, now preserved in the library, might serve as a

§ 24. *Degrees of descent in this respect; Rubens, Correggio, and Guido:*

* As in the noble Louvre picture.⁴

¹ [Ed. 1 adds, “. . . , as in the Francia of our own gallery. But these . . . ,” omitting “most of” before “the Venetians.” “The Francia of our own gallery” is the altar-piece with lunette (a Pietà), Nos. 179, 180, bought for the National Gallery in 1841.]

² [*Faerie Queene*, book ii. canto ix. st. 1. The italics were introduced in the 1883 ed.]

³ [Ed. 1 has no break here, and reads:—

“power they possess, whence much may be forgiven to Rubens, (as to our own Etty,) less, as I think to Correggio, who with less apparent and evident coarseness has more . . .”

The words “excepting always Etty” on the next page were inserted in ed. 2, which omitted the above passage.]

⁴ [The “Concert Champêtre” or “Pastoral” described by Rossetti in a sonnet.]

model of attitude and expression to a ballet figurante:* and again in the lascivious St. Catherine of the *Giorno*, and in the Charioted Diana (both at Parma), not to name any of his works of aim more definitely evil.¹ Beneath which again will fall the works devoid alike of art and decency, as that Susannah of Guido, in our own gallery;² and so we may descend to the absolute clay of the moderns, excepting always Etty;[†] only noticing in all how much of what is evil and base in subject or tendency, is redeemed by what is pure and right in hue; so that I do not assert that the purpose and object of many of the grander painters of the nude, as of

* The Madonna turns her back to Christ, and bends her head over her shoulder to receive the crown, the arms being folded with studied grace over the bosom.

† Not in the least excepting him—this sentence, I fear, is mere politeness to a painter then living; and it ought to have been explained as only meaning that his colour was not “absolute clay.”³ [1883.]

¹ [The fresco of the Coronation of the Virgin is in the Palatine Library at Parma; it is figured at p. v. of Signor Ricci’s *Correggio* (English ed., 1896). The picture called by Italian writers upon art “Il *Giorno*” (contrasting it with Correggio’s “*Notte*” at Dresden), is the “Madonna with St. Jerome”; the figure which Ruskin calls St. Catherine, is more commonly identified as the Magdalen: the picture is engraved at p. 278 of Ricci. The “Charioted Diana” is a fresco in the Camera di San Paola; see Ricci, p. 166. Ruskin had been studying Correggio at Parma in July 1845, and here fulfils the slaughter promised in a letter to his father (July 10):—

“I am off for Piacenza to-morrow, for this is without exception the dullest, ugliest town I have seen except Modena; it gives one the horrors, and I am so disgusted with Correggio that I know not what to say or do for indignation. . . . I always thought little of him, but of all vulgar, coarse, obscene, paltry desecrators of sacred subject I ever cast eyes on, his frescoes beat! They are rank blasphemy. I have had a hard scramble to-day over the tiles of the cathedral, to peep in at the little windows of the cupola, just to be sure of my game—and then, have at him.”

See also a letter to D. G. Rossetti in 1865 in which Ruskin, referring to this period, thanks Providence that he “did not then write a separate book against Correggio” (*Rossetti Papers*, 1903, p. 138). For in later books Ruskin’s estimate of Correggio was very different. For a transitional reference, see *Modern Painters*, vol. iii. ch. iii. § 8, and then for full appreciation, *ibid.* vol. iv. ch. iv. § 9; vol. v. pt. vi. ch. v. § 3; pt. ix. ch. viii. 1; *Queen of the Air*, § 163; *Lectures on Art*, § 177; *Fors Clavigera*, Letter 94; *Art of England*, § 76.]

² [No. 196. This picture with another Guido, No. 193 (“Lot and his daughter leaving Sodom”), were bought at very high prices in 1844—acquisitions which put Ruskin “into a desperate rage”; see his letters to Liddell, Vol. III. p. 670.]

³ [Etty died in 1847—the year after the publication of this volume. To his colour, Ruskin rendered another tribute in his review of Eastlake’s *History of Oil Painting* in the *Quarterly Review* for March 1848 (*On the Old Road*, ed. 1899, vol. i. § 135). In *Modern Painters*, vol. i. (Vol. III. p. 266), he was less complimentary; see note on that passage.]

Titian for instance, were always elevated, but only that we, who § 25. *And* cannot paint the lamp of fire within the earthen *modern art.* pitcher, must take other weapons in our left hands. And it is to be noted also, that, in climates where the body can be more openly and frequently visited by sun and weather, the nude both comes to be regarded in a way more grand and pure, as necessarily awakening no ideas of base kind* (as pre-eminently with the Greeks), and also from that exposure receives a firmness and sunny elasticity very different from the silky softness of the clothed nations of the north, where every model necessarily looks as if accidentally undressed; and hence, from the very fear and doubt with which we approach the nude, it becomes expressive of evil; and for that daring frankness of the old men, which seldom missed of human grandeur, even when it failed of holy feeling, we have substituted a mean, carpeted, gauzeveiled, mincing sensuality of curls and crimping-pins, out of which, I believe, nothing can come but moral enervation and mental paralysis.†

Respecting those two other vices of the human form, the expressions of Fear and Ferocity, there is less to be § 26. *Thirdly,* noted, as they only occasionally enter into the *Ferocity and* conception of character; only it is most necessary to *Fear. The latter* make careful distinction between the conception of *how to be* power, destructiveness, or majesty, in matter, *distinguished* influence, or agent, and the actual fear of any of these: for it is *from Awe.* possible to conceive of terribleness, without being in a position obnoxious to the danger of it, and so without fear; and the feeling arising from this contemplation of dreadfulness, ourselves being in safety, as of a stormy sea from the shore, is properly termed Awe, and is a most noble

* Utterly bad writing again: I ought to have said "as not of necessity awakening ideas," etc. [1883.]

† Too truly prophesied: the vile help of photography hastening the corruption.¹ [1883.]

¹ [For a discussion of the nude in art, see *Eagle's Nest*, §§ 149, 164, 167, *Ariadne Florentina*, § 254 n., and cf. a letter by Ruskin in the *Pall Mall Gazette*, June 1, 1885.]

passion;¹ whereas fear, mortal and extreme, may be felt respecting things ignoble, as the falling from a window, and without any conception of terribleness or majesty in the thing, or the accident dreaded; and even when fear is felt respecting things sublime, as thunder, or storm of battle, the tendency of it is to destroy all power of contemplation of their majesty, and to freeze and contract all the intellect into a shaking heap of clay; for absolute acute fear is of the same unworthiness and contempt from whatever source it arise, and degrades the mind and the outward bearing of the body alike, even though it be among hail of heaven and fire running along the ground. And so among² the children of God,* while there is always that fearful and bowed apprehension of His majesty, and that sacred dread of all offence to Him, which is called the Fear of God, yet of real and essential fear there is not any, but clinging of confidence to Him as their Rock, Fortress, and Deliverer; and perfect love, and casting out of fear; so that it is not possible that, while the mind is rightly bent on Him, there should be dread of anything either earthly or supernatural; and the more dreadful seems the height of His majesty, the less fear they feel that dwell in the shadow of it (“Of whom shall I be afraid?”), so that they are as David was, “devoted to His fear;”³ whereas, on the other hand, those who, if they may help it, never conceive of God, but thrust away all thought and memory of Him, and in His real terribleness and omnipresence fear Him not nor know Him, yet are by real,

§ 27. *Holy Fear, how distinct from human Terror.*

* The insolence of these abrupt and unhesitating theological assertions, now become extremely painful to me, and much repented of, yet is in this degree pardonable, that is part of the main argument of the book, taken up in different places, as the occasion serves or tempts. The words “children of God” were meant only as a short expression for those who have entered His kingdom as a little child. [1883.]

¹ [For a full treatment of the subject of Awe, see Appendix i. pp. 371–381.]

² [This passage, “Among the children . . . (‘Of whom shall I be afraid?’),” is § 78 of *Fronde Agrestes*.]

³ [The Bible references here are 2 Samuel xxii. 2; St. John iv. 18; Psalms xxvii. 1, cxix. 38.]

acute, piercing, and ignoble fear, haunted for evermore; fear inconceiving and desperate, that calls to the rocks, and hides in the dust; and hence the peculiar baseness of the expression of

§ 28. *Ferocity is joined always with Fear. Its unpardonableness.* terror, a baseness attributed to it in all times, and among all nations, as of a passion atheistical, brutal, and profane. So, also, it is always joined with ferocity,* which is of all passions the least

human; for of sensual desires there is license to men, as necessity; and of vanity there is intellectual cause, so that when seen in a brute it is pleasant, and a sign of good wit; and of fear there is at times necessity and excuse, as being allowed for prevention of harm; but of ferocity there is no excuse nor palliation, but it is pure essence of tiger and demon, and it casts on the human face the paleness alike of the horse of Death, and the ashes of Hell.

Therefore, of all subjects that can be admitted to sight, the expressions of fear and ferocity are the most foul and detestable; and so there is in them I know not what sympathetic attractiveness for minds cowardly and base, as the vulgar of most nations; and as they are easily rendered by men who can render nothing else, they are often trusted in by the herd of painters incapable and profane, as in that monstrous abortion of the first room of the Louvre, called the Deluge,¹ whose subject is pure, acute, mortal fear; and so generally in the senseless horrors of the modern French schools, spawn of the guillotine; also there is not a greater test of grandeur or meanness of mind than the expressions it will seek for and develope in the features and forms of men in fierce strife; whether determination and devotion, and all the other attributes of that unselfishness which constitutes heroism, as in the

* This is as bad as one of Gibbon's generalizations—"The timid are always cruel," and the like. It is, of course, nonsense; many of the timidest creatures being also the sweetest, and most of the fiercest ones fearless. The substance of what follows, however, is right enough. [1883.]

¹ [By Nicolas Poussin; for other references to the picture see preceding volume, p. 518; *Modern Painters*, vol. iv. ch. xvi. § 23–24; vol. v. pt. ix. ch. v. § 18.]

warrior of Agasias;¹ and distress not agitated nor unworthy, though mortal, as in the dying gladiator;² or brutal ferocity and butchered agony, of which the lowest and least palliated examples are those battles of Salvator Rosa which none but a man base-born, and thief-bred, could have conceived³ without sickening; of which I will only name that example in the Pitti Palace, wherein the chief figure in the foreground is a man with his arm cut off at the shoulder, run through the other hand into the breast with a lance.* And manifold instances of the same feeling are to be found in the repainting of the various representations of the Inferno, so common through Italy; more especially that of Orcagna's in the Campo Santo,⁴ wherein the few figures near the top that yet remain untouched are grand in their severe drawing and expressions of enduring despair, while those below, repainted by Solazzino, depend for their expressiveness upon torrents of blood; so in the Inferno of Santa Maria Novella, and of the Arena chapel,⁵ not to speak of the horrible images of the Passion, by which vulgar Romanism has always striven to excite the languid sympathies of its untaught flocks. Of

* Compare Michelet, *Du Prêtre, de la Femme, de la Famille*, chap. iii. note. He uses language too violent to be quoted; but excuses Salvator by reference to the savage character of the Thirty Years' War. That this excuse has no validity may be proved by comparing the painter's treatment of other subjects. See Sec. II. Chap. III. § 18, note [p. 265, below].

¹ [See preceding volume, p. 82.]

² [The famous piece of sculpture in the Capitoline Museum at Rome—the subject of Byron's familiar lines (*Childe Harold*, iv. 140). For another reference, see above, p. 119 n.]

³ [For "conceived" ed. 1 reads "dwelt on for an instant." The MS. has "held his breath to paint."]

⁴ [Ruskin in his note-book of 1845 wrote of this fresco as follows:—

"The Hell was probably once fine, but the whole of the lower part repainted by Solazzino, as well as the figure of Lucifer (who looks like a large unboiled crab), is execrable beyond forgiveness, and if preserved at all should immediately be reduced to outline and white plaster. The round, fat, unboned, cushiony limbs painted pink and running with blood are as disgusting as they are childish; there is more art in some of the signs at Bartholomew Fair."]

⁵ [Orcagna's Inferno in S. Maria Novella is behind the altar of the chapel at the head of the staircase leading out of the north transept. The "Inferno of the Arena Chapel" refers to Giotto's fresco of "The Last Judgment," in which Hell occupies the whole right side of the composition.]

which foulness let us reason no farther, the very image and memory of them being pollution; only noticing this, that there has always been a morbid tendency in Romanism towards the contemplation of bodily pain, owing to the attribution of saving power to it; which, like every other moral error, has been of fatal effect in art, leaving not altogether without the stain and blame of it even the highest of the Romanist painters; as Fra Angelico, for instance, who, in his Passion subjects, always insists weakly on the bodily torture, and is unsparing of blood; and Giotto, though his treatment is usually grander, as in that Crucifixion over the door of the Convent of St. Mark's, where the blood is hardly actual, but issues from the feet in a conventional form, and becomes a crimson cord which is twined strangely beneath about a skull;¹ only what these holy men did to enhance, even though in their means mistaken, the impression and power of the sufferings of Christ, or of His saints, is always in a measure noble, and to be distinguished with all reverence from the abominations of the irreligious painters following; as of Camillo Procaccini, in one of his martyrdoms in the Gallery of the Brera, at Milan,² and other such, whose names may be well spared to the reader.

¹ [This crucifix is over the principal entrance (inside) of the church, not the convent of San Marco. It is mentioned by Vasari (i. 111), and is supposed to be the work which established Giotto's fame over Cimabue's, and called forth the lines in the *Purgatorio* (*Credette Cimabue*, etc., xi. 91, quoted in *Mornings in Florence*, § 37). It is thus described by Ruskin in the 1845 note-book:—

“This . . . [crucifix], of which a copy exists in the transept of Ogni Santi, is, I doubt not, the original of Giotto, and it has served as model for a host of others, small and great, with which the Tuscan churches were filled at the period, the same bend of the body and type of countenance being used in all. The two saints on the arms are in this of Giotto's singularly poor, but the face of the Christ is exceedingly grand—Vandyke-like, the hair flowing with the greatest dignity, the light soft, graduated, and beautifully concentrated on the forehead, the brow horizontal and full of power, the nose straight, the mouth sublime, no hard lines, nor lip drawing about it. The blood gushes from the side in a flat stream, that from the feet runs down till it enters a cavity of the rock, where it turns in a most singular way about a skull. On each side of the skull is a beautiful kneeling figure.”

It appears from a further passage in the diary that from this work (as of very many others noted in it) Ruskin made a study.]

² [There is, however, no martyrdom by Camillo Procaccini in the Brera. The reference must be taken as generic, applying to pictures by the Eclectic School of the Procaccini—Ercole Procaccini, Camillo (his son), Giulio Cesare (another son), and Giovanni Battista Crespi (a scholar).]

These, then, are the four passions whose expression, in any degree, is degradation to the human form.¹ But of all passion it is to be observed, that it becomes ignoble either when entertained respecting unworthy objects, and therefore shallow or unjustifiable; or when of impious violence, and so destructive of human dignity. Thus Grief is noble or the reverse, according to the dignity and worthiness of the object lamented, and the grandeur of the mind enduring it. The sorrow of mortified vanity or avarice is simply disgusting; even that of bereaved affection may be base if selfish and unrestrained. All grief that convulses the features is ignoble because it is commonly shallow, and certainly temporary, as in children; though in the shock and shiver of a strong man's features, under sudden and violent grief, there may be something of sublime. The grief of Guercino's Hagar, in the Brera Gallery at Milan,² is partly despicable, partly disgusting, partly ridiculous; it is not the grief of the injured Egyptian, driven forth into the desert with the destiny of a nation in her heart; but of a servant of all work turned away

¹ [Ed. 1 reads:—"These, then, are the four passions whose presence, in any degree, on the human face is degradation. But of all passion it is to be generally observed . . ." The MS. reads in place of the first six lines of § 30:—

"The ignoble character of passion on the human face depends not so much on the character of the passion itself, as on the nobility and dignity of what excites it, and that which I call essentially ignoble is pure passion, *i.e.* the expression of pain, grief or fear concerning unworthy objects, or in general of pure passion as such without expression of any noble conception or worthy thought. Thus the fear which a man feels of being run over in the street, or of falling out of a window, though it may happen for an instant to be very acute, is essentially ignoble in its effect on the features. The fear which might be expressed in the same face during a violent thunderstorm, or of falling down a precipice is not ignoble, because although the pure passion is as base in itself, it is accompanied in the latter case with noble conceptions of divine power or natural sublimity."

This is one of several cases where familiar illustrations and simple language in the MS. were omitted or altered during revision, in order to preserve the uniform note of elevation at which Ruskin aimed in this volume.]

² [This is the picture which excited the admiration of Byron. "Of painting," he wrote from Milan, describing a visit to the Brera Gallery, "I know nothing; but I like a Guercino—a picture of Abraham putting away Hagar and Ishmael—which seems to be natural and godly" (*Letters and Journals*, ed. of 1899, iii. 377). And so Stendhal: "Il y a une Agar du Guercin faite, pour attendrir les cœurs les plus durs et les plus dévoués à l'argent ou aux cordons" (*Rome, Naples, et Florence*, ed. 1854, p. 45). Modern opinion follows rather that of Ruskin; see, for instance, J. A. Symonds' *Renaissance*, ed. 1898, vii. 225.]

for stealing tea and sugar.* Common painters forget that passion is not absolutely, and in itself, great or violent, but only in proportion to the weakness of the mind it has to deal with; and that, in exaggerating its outward signs, they are not exalting the passion, but lowering¹ the hero.[†] They think too much of passions as always the same in their nature: forgetting that the love of Achilles is different from the love of Paris, and of Alcestis from that of Laodamia. The use and value of passion is not as a subject of contemplation in itself, but as it breaks up the fountains of the great deep of the human mind, or displays its mightiness and ribbed majesty, as mountains are seen in their stability best among the coil of clouds; whence, in fine, I think it is to be held, that all passion which attains overwhelming power, so that it is not as resisting, but as conquered, that the creature is contemplated, is unfit for high art, and destructive of the ideal character of the countenance: and, in this respect, I cannot but hold Raffaele to have erred in his endeavour to express passion of such acuteness in the human face; as in the fragment of the Massacre of the Innocents² in our own gallery (wherein, repainted though it be, I suppose the purpose of the master is yet to

* Extremely right; and the entire contents of this paragraph, with the 31st, are of great general value. They are much illustrated and reinforced in my later writings. [1883.]

† “The fire, that mounts the liquor till it run o’er,
In seeming to augment it, wastes it.”

—Henry VIII.

¹ [For “lowering,” ed. 1 reads “evaporating.”]

² [This is a cartoon, after a design by Raphael, 9 feet 11 inches by 9 feet 3 inches. It was presented by Mr. Prince Hoare to the Foundling Hospital, and was lent by that institution to the National Gallery in 1840. It was formerly No. 184 in the catalogues of the Gallery (see e.g. “Felix Summerly’s” (Sir H. Cole’s) *Handbook*, 1852). The number was removed and allotted to another work when the cartoon was reclaimed by the Hospital in 1858 (see *Report of the Director of the National Gallery*, 1858). The Massacre of the Innocents was a subject more than once designed by Raphael; there is a well-known engraving of one design by Marc Antonio (see No. 567 in Sidney Colvin’s *Guide to an Exhibition of Drawings and Engravings* in the British Museum, 1895. There are studies for the subject in the Albertina collection at Vienna and in the Venice Academy. Raphael had intended it to form one of the series of cartoons for the Vatican tapestries.)]

be understood); for if such subjects are to be represented at all, their entire expression may be given without degrading the face, as we shall presently see done with unspeakable power by Tintoret;* and I think that all subjects of the kind, all human misery, slaughter, famine, plague, peril, and crime, are better in the main avoided, as of unprofitable and hardening influence, unless so far as out of the suffering, hinted rather than expressed, we may raise into nobler relief the eternal enduring of fortitude and affection, of mercy and self-devotion; or when, as by the threshing-floor of Ornan, and by the cave of Lazarus,¹ the angel of the Lord is to be seen in the chastisement, and his love to be manifested to the despair of men.

Thus, then, we have in some sort enumerated those evil signs which are most to be shunned in the seeking of Ideal beauty;† though it is not the knowledge of them, but the dread and hatred of them, which will effectually aid the painter; as, on the other hand, it is not by mere admission of the loveliness of good and holy expression that its subtle characters are to be traced. Raffaele himself, questioned on this subject, made doubtful answer:² he probably could not trace through what early teaching or by what dies of emotion the image had been sealed upon his heart. Our own Bacon, who well saw the impossibility of reaching it by the combination of many separate beauties, yet explains not the nature of that “kind of felicity” to which he attributes

* Sec. II. Chap. III. § 22.

† Let it be observed that it is always of beauty, not of human character in its lower and criminal modifications, that we have been speaking. That variety of character, therefore, which we have affirmed to be necessary, is the variety of Giotto and Angelico, not of Hogarth. Works concerned with the exhibition of general character are to be spoken of in the consideration of Ideas of Relation.

¹ [Chronicles xxi. 15; John xi. 38.]

² [In a letter to his friend Count Castiglione, Raphael could only explain that he painted from an idea in his mind (“Mi servo d’ una certa idea che me viene in mente.”) See below, p. 351.]

success.¹ I suppose those who have conceived and wrought the loveliest things, have done so by no theorizing, but in simple labour of love, and could not, if put to a bar of rationalism, defend all points of what they had done; but painted it in their own delight, and to the delight of all besides, only always with that respect of conscience, and “fear of swerving from that which is right, which maketh diligent observers of circumstances, the loose regard whereof is the nurse of vulgar folly; no less than Solomon’s attention thereunto was, of natural furtherances, the most effectual to make him eminent above others, for he gave good heed, and pierced everything to the very ground.”*

With which good heed, and watching of the instants when men feel warmly and rightly, as the Indians do for the diamond in their washing of sand, and that with the desire and hope of finding true good in men, and not with the ready vanity that sets itself to fiction instantly, and carries its potter’s wheel about with it always (off which there will come only clay vessels of regular shape after all), instead of the pure mirror that can show the seraph standing by the human body—standing as signal to the heavenly land:† with this heed and this charity, there are none of us that

* Hooker, book v. chap. i. § 2.

† “A man all light, a seraph man,
By every corse there stood.

This seraph band each waved his hand,
It was a heavenly sight;
They stood as signals to the land,
Each one a lovely light.”

—*Ancient Mariner*.²

¹ [*Essays*, xliii. “*Of Beauty*”: “Not but I thinke a Painter may make a better Face, than ever was; But he must doe it, by a Kinde of Felicity (as a Musician that maketh an excellent Ayre in Musicke, And not by Rule.”]

² [Ed. 1 quotes two more lines at the beginning:—

“Each corse lay flat, lifeless and flat,
And by the holy rood,
A man . . .”]

may not bring down that lamp upon his path of which Spenser sang:—

“That Beauty is not, as fond men misdeem,
An outward show of things, that only seem;
But that fair lamp, from whose celestial ray
That light proceeds which kindleth lover’s fire,
Shall never be extinguished nor decay;
But, when the vital spirits do expire,
Unto her native planet shall retire,
For it is heavenly born and cannot die,
Being a parcel of the purest sky.”¹

¹ [*An Hymne in Honour of Beautie*. Ruskin first quotes the last two lines of st. 13, and then omitting st. 14, the whole of st. 15. See above, p. 131, where the Hymn is also quoted, and Ruskin’s note thereon.]

CHAPTER XV¹

GENERAL CONCLUSIONS RESPECTING THE THEORETIC FACULTY

OF the sources of beauty open to us in the visible world, we have now obtained a view which, however scanty² in its detail, is yet general in its range. Of no other sources than these visible ones, can we, by any effort in our present condition of existence, conceive. For what revelations have been made to humanity inspired, or caught up to heaven, of things to the heavenly region belonging, have been either by unspeakable words,³ or else by their very nature incommunicable, except in types and shadows; and ineffable by words belonging to earth, for, of things different from the visible, words appropriated to the visible can convey no image. How different from earthly gold the clear pavement of the city might have seemed to the eyes of St. John, we of unreceived sight cannot know; neither of that strange jasper and sardine can we conceive the likeness which He assumed that sat on the throne above the crystal sea; neither what seeming that was of slaying that the Root of David bore in the midst of the elders; neither what change it was upon the form of the fourth of them that walked in the furnace of Dura, that even the wrath of Idolatry knew for the likeness of the Son of God. The knowing that is here permitted to us is either of things outward only, as in those it is whose eyes Faith never opened, or else of that dark

¹ [Ch. iv. of sec. iii. in the Re-arranged Edition of 1883.]

² [Ed. 1 reads “. . . which though most feeble in its grasp and scanty . . .”]

³ [Ed. 1 adds, “which it is not lawful for man to utter, . . .” In marking the revisions made after the first edition, the reader will already have observed how often Ruskin curtailed his words.]

part that her glass shows feebly, of things supernatural, that gleaming of the Divine form among the mortal crowd, which all may catch if they will climb the sycamore and wait: nor how much of God's abiding at the house may be granted to those that so seek, and how much more may be opened to them in the breaking of bread, cannot be said; but of that only we can reason which is in a measure revealed to all, of that which is by constancy and purity of affection to be found in the things and the beings around us upon earth.¹ Now among all those things whose beauty we have hitherto examined, there has been a measure of imperfection. Either inferiority of kind, as the beauty of the lower animals, or resulting from degradation, as in man himself; and although in considering the beauty of human form, we arrived at some conception of restoration, yet we found that even the restoration must be, in some respect, imperfect, as incapable of embracing all qualities, moral and intellectual, at once, neither to be freed from all signs of former evil done or suffered. Consummate beauty, therefore, is not to be found on earth, neither is it to be respecting humanity legitimately conceived. But by certain operations of the imagination upon ideas of beauty received from things around us, it is possible to conceive respecting superhuman creatures (of that which is more than creature, no creature ever conceived) a beauty in some sort greater than we see. Of this beauty, however, it is impossible to determine anything until we have traced the imaginative operations to which it owes its being, of which operations this much may be prematurely said, that they are not creative, that no new ideas are elicited by them, and that their whole function is only a certain dealing with, concentrating, or mode of regarding the impressions received from external things: that therefore, in the beauty to which they will conduct us, there will be found no new element,

§ 2. *What imperfection exists in visible things. How in a sort by imagination removable.*

§ 3. *Which however, affects not our present conclusions.*

¹ [The Bible references in § 1 are Revelations xxi. 18; iv. 3, 6; Daniel iii. 25; Luke xix. 4; Acts ii. 42.]

but only a peculiar combination or phase of those elements that we now know; and that therefore we may at present draw all the conclusions with respect to the rank of the Theoretic faculty, which the knowledge of its subject matter can warrant.

We have seen that this subject matter is referable to four general heads. It is either the record of conscience, written in things external, or it is a symbolizing of Divine attributes in matter, or it is the felicity of living things, or the perfect fulfilment of their duties and functions. In all cases it is something Divine; either the approving voice of God, the glorious symbol of Him, the evidence of His kind presence, or the obedience to His will by Him induced and supported.

All these subjects of contemplation are such as we may suppose will remain sources of pleasure to the perfected spirit throughout eternity. Divine in their nature, they are addressed to the immortal part of men.

There remain, however, two points to be noticed before I can hope that this conclusion will be frankly accepted by the reader. If it be the moral part of us to which Beauty addresses itself, how does it happen, it will be asked, that it is ever found in the works of impious men, and how is it possible for such to desire or conceive it?

On the other hand, how does it happen that men in high state of moral culture are often insensible to the influence of material beauty: and insist feebly upon it as an instrument of soul culture?

These two objections I shall endeavour briefly to answer; not that they can be satisfactorily treated without that examination of the connection between all kinds of greatness in art,¹ on which I purpose to enter in the following volume.² For

¹ [Ed. 1 reads, "without that detailed examination of the whole body of great works of art, on which . . ."]

² [See in *Modern Painters*, ch. iii., "Of the Real Nature of Greatness of Style," and the succeeding chapters on the False and True Ideals.]

the right determination of these two questions is indeed the whole end and aim of my labour (and if it could be here accomplished, I should bestow no effort farther), namely, the proving that no supreme power of art can be attained by impious men; and that the neglect of art, as an interpreter of divine things, has been of evil consequence to the Christian world.*

At present, however, I would only meet such objections as must immediately arise in the reader's mind.

And first, it will be remembered that I have, throughout the examination of Typical beauty, asserted our instinctive sense of it;¹ the moral *meaning* of it being only discoverable by reflection. Now this instinctive sense of it varies in intensity among men, being given, like the hearing ear of music, to some more than to others: and if those to whom it is given in large measure be unfortunately men of impious or unreflecting spirit, it is very possible that the perceptions of beauty should be by them cultivated on principles merely *æsthetic*,[†] and so lose their hallowing power; for though the good seed in them is altogether divine, yet, there being no blessing in the spring thereof, it brings forth wild grapes in the end. And yet these wild grapes are well discernible, like the deadly gourds of Gilgal.² There is in all works of such men a taint and stain, and jarring discord, darker³ and louder exactly in proportion to the moral deficiency; of which the best proof and measure are to be found in their treatment of the human form (since in landscape it is nearly impossible to introduce definite

§ 6. *Typical beauty may be æsthetically pursued. Instances.*

* It is extraordinary that these real motives of the book have never been asserted till now, and even here, thus hastily. I had no memory, myself, when I began the revision of the text, that it was anywise so pregnant with design of subsequent works. [1883.]

[†] I have italicised the word, that the reader may note the anticipation of the mischief which has since followed from this sect. [1883.]

¹ [Ed. 1 reads less accurately "asserted its instinctive power; . . ." The italicising of "meaning" was introduced in ed. 2.]

² [2 Kings iv. 38–40.]

³ [For "darker," ed. 1 reads unalliteratively "blacker."]

expression of evil),* of which the highest beauty has been attained only once, and then by no system-taught painter, but by a most holy Dominican monk of Fiesole: and beneath him all fall lower and lower in proportion to their inferior sanctity (though with more or less attainment of that which is noble, according to their intellectual power and earnestness), as Raffaello in his *St. Cecilia*¹ (a mere study of a passionate, dark-eyed, large-formed Italian model); and even Perugino, in that there is about his noblest faces a short-coming, indefinable; an absence of the full outpouring of the sacred spirit that there is in Angelico; traceable, I doubt not, to some deficiencies and avaricious flaws of his heart, whose consequences in his conduct were such as to give Vasari hope that his lies might stick to him (for the contradiction of which in the main, if there be not contradiction enough in every line that the hand of Perugino drew, compare Rio;^{†2} and note also what Rio has singularly missed observing, that Perugino, in his portrait of himself in the Florence Gallery, has put a scroll into the hand, with the words “*Timete Deum*,” thus surely indicating what he considered his duty and message): and so all other even of the sacred painters, not to speak of the lower body of men in whom, on the one hand, there is marked sensuality and impurity in all that they seek of beauty, as in Correggio and Guido; or, on the other, a partial want of the sense of beauty itself, as in Rubens and Titian, exhibited in the adoption of coarse types of feature and form; sometimes,

* I had not seen, at this time, and could not have conceived the darkness and distortion of the vicious French schools of landscape. [1883.]

† De la Poésie Chrétienne. Forme de l' Art.

¹ [“The image with the lifted eyes,” at Bologna, described in “The Broken Chain”; see Vol. II. p. 167 and *n.*]

² [Vasari's bias against the Umbrian master is, indeed, very marked, and there is no proof whatever that Perugino was irreligious or atheistic, as Vasari implies. The criminal records of Florence show, however, that he was of violent temper (see Symonds' *Renaissance*, iii. 218). The passage of Rio to which Ruskin refers is at p. 165 of the English ed. of 1854. The “Portrait of Perugino” in the Uffizi is inscribed on the back: “1494 D'Uglio Pietro Perugino Pinse Franco del Ope,” and is now believed to represent, not Perugino himself, but Francesco delle Opere, a Florentine artist, a brother of Giovanni Corniole. For other references by Ruskin to Perugino, see below, sec. ii. ch. v. § 20, p. 330; and *Ariadne Florentina*, App. vi.]

also (of which I could find instances in modern times), by a want of evidence of delight in what they do; so that, after they have rendered some passage of exceeding beauty, they will suffer some discordant point to interfere with it, and it will not hurt them; as if they had no pleasure in that which was best, but had done it in inspiration that was not profitable to them; as deaf men might touch an instrument with a feeling in their heart, which yet returns not outwardly upon them, and so know not when they play false: and sometimes by total want of choice, for there is a choice of love in all rightly tempered men; not that ignorant and insolent choice which rejects half nature as empty of the right, but that pure choice that fetches the right out of everything; and where this is wanting, we may see men walking up and down in dry places, finding no rest;¹ ever and anon doing something noble and yet not following it up, but dwelling the next instant on something impure or profitless with the same intensity and yet impatience, so that they are ever wondered at and never sympathized with, and while they dazzle all they lead none; and then, beneath these again, we find others on whose works there are definite signs of evil desire ill repressed, and then inability to avoid, and at last perpetual seeking for, and feeding upon, horror and ugliness, and filthiness of sin; as eminently in Salvator and Caravaggio, and the lower Dutch schools, only in these last less painfully as they lose the villainous in the brutal, and the horror of crime in its idiocy.

But secondly, it is to be noted that it is neither by us ascertainable what moments of pure feeling or aspiration may occur to men of minds apparently cold and lost, nor by us to be pronounced through what instruments, and in what strangely occurrent voices, God may choose to communicate good to men. It seems to me that much of what is great, and to all men beneficial, has been wrought by those who

§ 7. *How interrupted by false feeling.*

§ 8. *Greatness and truth are sometimes by the Deity sustained and spoken in and through evil men.*

¹ [Matthew xii. 43.]

neither intended nor knew the good they did; and that many mighty harmonies have been discoursed by instruments that had been dumb or discordant, but that God knew their stops. The Spirit of Prophecy consisted with the avarice of Balaam, and the disobedience of Saul.¹ Could we spare from its page that parable, which he said, who saw the vision of the Almighty, falling into a trance, but having his eyes open; though we know that the sword of his punishment was then sharp in its sheath beneath him in the plains of Moab? or shall we not lament with David over the shield, cast away on the Gilboa mountains, of him to whom God gave *another heart* that day, when he turned his back to go from Samuel?² It is not our part to look hardly, nor to look always, to the character or the deeds of men, but to accept from all of them, and to hold fast, that which we can prove good, and feel to be ordained for us. We know that whatever good there is in them is itself divine; and wherever we see the virtue of ardent labour and self-surrendering to a single purpose, wherever we find constant reference made to the written scripture of natural beauty, this at least we know is great and good; this we know is not granted by the counsel of God without purpose, nor maintained without result: their interpretation we may accept, into their labour we may enter, but they themselves must look to it, if what they do has no intent of good, nor any reference to the Giver of all gifts. Selfish in their industry, unchastened in their wills, ungrateful for the Spirit that is upon them, they may yet be helmed by that Spirit whithersoever the Governor listeth; involuntary instruments they may become of others' good; unwillingly they may bless Israel, doubtfully discomfit Amalek; but short-coming there will be of their glory, and sure, of their punishment.³

I believe I shall be able, incidentally, in succeeding investigations, to prove this short-coming, and to examine

¹ [Numbers xxiv. 4, 16.]

² [2 Samuel i. 21.]

³ [James iii. 4; Exodus xvii. 8-13.]

the sources of it; not absolutely indeed (seeing that all reasoning on the characters of men must be treacherous, our knowledge on this head being as corrupt as it is scanty, while even in living with them it is impossible to trace the working, or estimate the errors, of great and self-secreted minds), but at least enough to establish the general principle upon such grounds of fact as may satisfy those who not too severely demand the practical proof (often in a measure impossible) of things which can hardly be doubted in their rational consequence. At present, it would be useless to enter on an examination for which we have no materials; and I proceed, therefore,¹ shortly to reply to that other objection urged against the real moral dignity of the faculty, that many Christian men seem to be in themselves without it, and even to discountenance it in others.

§ 9. *The second objection arising from the coldness of Christian men to external beauty.*

It has been said by Schiller, in his letters on æsthetic culture, that the sense of beauty never farthered the performance of a single duty.²

Although this gross and inconceivable falsity will hardly be accepted by any one in so many words, seeing that there are few who do not receive,³ and know that they receive, at certain moments strength of some kind, or rebuke, from the appealing of outward things; and that it is not possible for a Christian man to walk across so much as a rood of the natural earth, with mind unagitated and rightly poised, without receiving strength and hope from some stone, flower, leaf, or sound, nor without a sense of a dew falling upon

¹ [Ed. 1 reads:—

“and I proceed, therefore, to notice that other and opposite error of Christian men in thinking that there is little use or value in the operation of the Theoretic faculty; not that I at present feel myself capable, or that this is the place for the discussion of that vast question of the operation of Taste (as it is called) on the minds of men, and the national value of its teaching, but I wish shortly to reply to that objection which might be urged to the real moral dignity . . .”]

² [See, for statements in that sense, Letter 10 of the “Letters upon the Æsthetic Culture of the Man” (in the book cited above, p. 122 *n.*). Such statements, taken by themselves, hardly represent Schiller’s theories.]

³ [Ed. 1 reads, “so many terms, seeing that there are few so utterly lost but that they receive . . .”]

him out of the sky; though, I say, this falsity is not wholly and in terms admitted, yet it seems to be partly and practically so in much of the doing and teaching even of holy men, who in the recommending of the love of God to us, refer but seldom to those things in which it is most abundantly and immediately shown: though they insist much on His giving of bread, and raiment, and health (which He gives to all inferior creatures), they require us not to thank Him for that glory of His works which He has permitted us alone to perceive: they tell us often to meditate in the closet, but they send us not, like Isaac, into the fields at even;¹ they dwell on the duty of self-denial, but they exhibit not the duty of delight. Now there are reasons for this, manifold, in the toil and warfare of an earnest mind, which, in its efforts at the raising of men from utter loss and misery, has often but little time or disposition to take heed of anything more than the mere life, and of those so occupied it is not for us to judge; but I think that of the weaknesses, distresses, vanities, schisms, and sins, which often, even in the holiest men, diminish their usefulness, and mar their happiness, there would be fewer if, in their struggle with nature fallen, they sought for more aid from nature undestroyed. It seems to me that the real sources of bluntness in the feelings towards the splendour of the grass and glory of the flower,² are less to be found in ardour of occupation, in seriousness of compassion, or heavenliness of desire, than in the turning of the eye at intervals of rest too selfishly within; the want of power to shake off the anxieties of actual and near interest, and to leave results in God's hands; the scorn of all that does not seem immediately apt for our purposes, or open to our understanding, and perhaps something of pride,

§ 10. *Reasons for this coldness in the anxieties of the world. These anxieties overwrought and criminal.*

¹ [Genesis xxiv. 63.]

² [Wordsworth: *Intimations of Immortality*:—

“Though nothing can bring back the hour
Of splendour in the grass, of glory in the flower;
We will grieve not, rather find
Strength in what remains behind.”]

which desires rather to investigate than to feel. (I believe that the root of almost every schism and heresy from which the Christian church has ever suffered, has been the effort of men to earn, rather than to receive, their salvation; and that the reason that preaching is so commonly ineffectual is, that it calls on men oftener to work for God, than to behold God working for them.)* If, for every¹ rebuke that we utter of men's vices, we put forth a claim upon their hearts; if, for every assertion of God's demands from them, we could substitute a display of His kindness to them; if side by side, with every warning of death, we could exhibit proofs and promises of immortality; if, in fine, instead of assuming the being of an awful Deity, which men, though they cannot and dare not deny, are always unwilling, sometimes unable, to conceive, we were to show them a near, visible, inevitable, but all beneficent Deity, whose presence makes the earth itself a heaven, I think there would be fewer deaf children sitting in the market - place.² At all events, whatever may be the inability, in this present life, to mingle the full enjoyment of the Divine works with the full discharge of every practical duty, and confessedly in many cases this must be, let us not attribute the inconsistency to any indignity of the faculty of contemplation, but to the sin and the suffering of the fallen state, and the change of order from the keeping of the garden to the tilling of the ground. We cannot say how far it is right or agreeable with God's will, while men are perishing round about us; while grief

§ 11. *Evil consequences of such coldness.*

§ 12. *Theoria the service of Heaven.*

* This eleventh paragraph, as being extremely palatable to everybody, and especially to the amiable Protestant, has been more quoted, I suppose, than any sentence I ever wrote. The first clause of it, now put as a parenthesis, should be at once cancelled, if in this reprint I cancelled anything; but becomes pardonable to me, when I see the general fervour of belief in God's goodness, and man's possible happiness, which runs throughout all the theology in this volume. The close of the paragraph is good and valuable. [1883.]

¹ [This passage, "If, for every rebuke . . . in the market-place," is § 79 of *Frondes Agrestes*.]

² [Luke vii. 32.]

and pain, and wrath, and impiety, and death, and all the powers of the air, are working wildly and evermore,¹ and the cry of blood going up to heaven, that any of us should take hand from the plough; but this we know, that there will come a time when the service of God shall be the beholding of Him; and though in these stormy seas where we are now driven up and down, His Spirit is dimly seen on the face of the waters, and we are left to cast anchors out of the stern, and wish for the day, that day will come, when, with the evangelists on the crystal and stable sea, all the creatures of God shall be full of eyes within, and there shall be “no more curse, but His servants shall serve Him, and shall see His face.”²

¹ [Here a characteristic instance may be noted, in comparing the text with the MS., of the chastening to which Ruskin subjected his words. The MS. reads, “. . . all the powers of the air are turning the heap of human dust over and over with their reeking spades.”]

² [The Bible references in § 12 are Genesis ii. 15, iii. 23, i. 2; Revelations iv. 6, 8, xxii. 3, 4.]

SECTION II

OF THE IMAGINATIVE FACULTY

INTRODUCTORY NOTE (1883)¹

1. IN revising this terminal division of my former second volume, I find less to be corrected or condemned than in the previous chapters; but far more, were it conveniently now possible, to be supplied. The treatment of this part of the subject is not only incomplete, but involves the omission of all the most important practical questions in the useless curiosity of analysis, just as a common anatomist describes the action of muscles in walking, without thereby helping anybody to walk, or those of a bird's wing in flying, without defining the angles of its stroke to the air.² I have thus examined at tedious length the various actions of human conception and memory, without helping any one to conceive, or to remember; and, at least in this part of the book, scarcely touching at all on the primary questions (both moral and intellectual) how far the will has power over the imagination. It was perhaps in reality fortunate that I should not have entered on these higher inquiries till I was older and more experienced; nor shall I now attempt to remedy such defects by hasty patching of the text or fortuitous addition of notes to it. One or two introductory observations may, however, make this imperfect essay more useful, so far as it reaches.

2. In the first place, the reader must be warned not to trouble himself with the distinctions, attempted or alluded to, between Fancy and Imagination. The subject is jaded, the matter of it insignificant, and the settlement of it practically

¹ [Inserted at the beginning of vol. ii. of the re-arranged edition (1883)].

² [Cf. *Love's Meinie*, Lecture ii.]

impossible, not merely because everybody has his own theory, but also because nobody ever states his own in terms on which other people are agreed. I am myself now entirely indifferent which word I use; and should say of a work of art that it was well “fancied,” or well “invented,” or well “imagined,” with only some shades of different meaning in the application of the terms, rather dependent on the matter treated, than the power of mind involved in the treatment. I might agree with Sir Piercie Shafton that his doublet was well fancied,¹ or that his figure of speech was well conceived, and might perhaps reserve the word “imagined” for the design of an angel’s dress by Giotto, or the choice of a simile by Dante. But such distinctions are scarcely more than varieties of courtesy or dignity in the use of words; and I could not in essential nature of faculty distinguish Sir Piercie’s designing from Giotto’s, except, as I said, with respect to the matter of it, and the fixture of his attention rather on the dress than the angel. Briefly, the power of the human mind to invent circumstances, forms, or scenes, at its pleasure, may be generally and properly called “imagination;” while the especial power of intellect required to handle the different subjects of invention varies in so many modes that it is of no use to try to find words for them. Sir Piercie (to keep to one example) is at no loss for new metaphors, or for new patterns of colour, but he is struck dumb when required to invent a story; and stands helpless by, hearing with mere amazement Mysie Happer’s flowing relation to the inquiring landlord “that Ball, her palfrey, had fallen by the way, because he had been over-wrought with carrying home the last melder of meal to the portioner of Longhope; and that she had turned in Ball to graze in the Taskers’ Park, near Cripplecross, for he had stood as still as Lot’s wife with very weariness; and that the knight had courteously insisted she should ride behind him, and that she had brought him to her kind friend’s hostelry rather than to proud Peter Peddie’s, who got his malt at the Mellerstane Mills; and that he must get the best the house

¹ [See *The Monastery*, ch. xxvii., and for the passage quoted further on, ch. xxix.]

afforded, and that he must get it ready in a moment of time, and that she was ready to help in the kitchen.” It seems to me, indeed, probable, from my general experience, and observation, that the distinction thus implied by Scott between the gifts of ornamental designs and of circumstantial invention, may be well grounded, and perhaps demonstrable by a sufficient comparison of biographies; yet these faculties are usually possessed in the same relative proportion by great painters, so that the pictures most entertaining by their incidents are usually also the richest in their ornament; and certainly if Miss Edgeworth, in that unbounded faith in the directing power of education which she learnt from Johnson, had been one of the company on any of the happy days when Scott took Turner to show him the best views of the scenery of Abbotsford,¹ she would assuredly, had the question been mooted, have maintained that Scott, had he chosen, might have been the brightest of landscape painters, and Turner, under better literary culture, have written the *Lady of the Lake*.

3. But a far more important subject of inquiry than any respecting the various kinds or powers of imagination is the degree in which all of them are subject to the control of the will, and liable to disease through the absence of direction and discipline. No attempt whatever, so far as I have observed, has yet been made by physicians to distinguish the morbid developments or disturbances of really strong intellectual powers from those which result from conditions of weakness or deficiency in them, as, for instance, the ordinary spectre seen by most persons in a state of feverish exhaustion from the visions of over-excited religious or poetical fancy. In all cases when it is involuntary, the vision or imagination may be considered as morbid (unless admitted to be supernatural); but even on the simplest principles of physical investigation the visions of St. Paul or St. Anthony are not to be classed with those of common delirium, and still less the powers

¹ [See Lockhart's *Life of Scott*, ch. lxxx., where Scott's walks with Turner are described.]

which can be summoned at will, and directed to chosen objects, with those which enslave the conscience, and resist the reason, of their possessor.¹

4. I scarcely now remember how far through a true sense of my inability at that time to deal with them adequately, or how far through imperfect sense of their importance, all these subjects of inquiry have been waived in the following essay, but I felicitate the reader on the neglect of which I am nevertheless myself ashamed; and believe that the conclusions arrived at are safer in their narrowness than they could have been in pretending to include the total field of investigation.

The reader must therefore remember throughout that the “Imagination” spoken of is meant only to include the healthy, voluntary, and necessary action of the highest powers of the human mind on subjects properly demanding and justifying their exertion;² and that, without adopting, if he think them inaccurate, the terms I have used for any special kind of them, he may yet be helped, by the analysis I have given, to follow with more pleasurable interest the various operations of constructive or inventive genius on the common material of the external world.

¹ [With the distinctions here drawn between morbid and healthy action of the imagination, should be compared *Fors Clavigera*, Letter 88 (Feb. 8, 1880), where Ruskin emphasises “the precise and sharp distinction between the state of morbid inflammation of brain which gives rise to false vision” and “the not morbid, however dangerous, states of more or less excited temper, and too much quickened thought.” Compare also, for the healthy exercise of the imagination in seeing visions and painting or describing them “from the life,” *Deucalion* (chapter entitled “Revision,” § 18) and *Lectures on Art*, §§ 45, 46. See also below, Ruskin’s remarks on Bunyan, p. 349 n.]

² [See *Pleasures of England*, “The Pleasures of Fancy,” § 89, where Ruskin quotes this passage and explains that it means “that all healthy minds possess imagination, and use it at will, under fixed laws of truthful perception and memory.” Compare *Deucalion*, ii. ch. i., where Ruskin gives an example to “show you in a moment what long chapters of *Modern Painters* were written to explain,—how the real faculty of imagination is always true, and goes straight to its mark; but people with no imagination are always false, and blunder or drivel about their mark.” Ruskin’s chapter on the Imagination may appropriately be compared with Lamb’s essay on the “Sanity of True Genius,” where many of the same points are made—*e.g.* “The true poet dreams being awake. He is not possessed by his subject but has dominion over it. . . . From beyond the scope of Nature if he summon possible existences, he subjugates them to the law of her consistency. . . . Herein the great and little wits are differenced; that if the latter wander ever so little from nature or actual existence, they lose themselves and their readers. Their phantoms are lawless; their visions nightmares.”]

CHAPTER I

OF THE THREE FORMS OF IMAGINATION

WE have hitherto been exclusively occupied with those sources of pleasure which exist in the external creation, and which in any faithful copy of it must to a certain extent exist also.

§ 1. *A partial examination only of the Imagination is to be attempted.*

These sources of beauty, however, are not presented by any very great work of art in a form of pure transcript. They invariably receive the reflection of the mind under whose influence* they have passed, and are modified or coloured by its image.

This modification is the Work of Imagination.

As, in the course of our succeeding investigation, we shall be called upon constantly to compare sources of beauty existing in nature with the images of them received by the human mind, it is very necessary for us shortly to review the conditions and limits of the Imaginative faculty, and to ascertain by what tests we may distinguish its sane, healthy, and profitable operation, from that which is erratic, diseased, and dangerous.

It is neither desirable nor possible here to examine or illustrate in full the essence of this mighty faculty. Such an examination would require a review of the whole field of literature, and would alone demand a volume.† Our present task is not to explain or exhibit full portraiture of this function of the mind in all its relations, but only to obtain some certain tests by which we may determine whether

* In the old editions, "shadow." I change to "influence," because it is not the proper work of intellect to cast shadows on what it observes. [1883.]

† "Many and many volumes," I should have said. It had, altogether, more than a volume to itself, as it was,—scattered through five of the old edition,—and was then not half analyzed. [1883.]

it be very Imagination or not, and unmask all impersonations of it; and this chiefly with respect to art, for in literature the faculty takes a thousand forms according to the matter it has to treat, and becomes like the princess of the Arabian tale, sword, eagle, or fire, according to the war it wages;¹ sometimes piercing, sometimes soaring, sometimes illumining, retaining no image of itself, except its supernatural power; so that I shall content myself with tracing that particular form of it, and unveiling those imitations of it only, which are to be found, or feared, in painting, referring to other creations of mind only for illustration.

Unfortunately, the works of metaphysicians will afford us in this most interesting inquiry, no aid whatsoever. They who are constantly endeavouring to fathom and explain the essence of the faculties of mind, are sure, in the end, to lose sight of all that cannot be explained (though it may be defined and felt); and because, as I shall presently show, the essence of the Imaginative faculty is utterly mysterious and inexplicable, and to be recognized in its results only, or in the negative results of its absence, the metaphysicians, as far as I am acquainted with their works, miss it altogether, and never reach higher than a definition of Fancy by a false name.

What I understand by fancy will presently appear: not that I contend for nomenclature, but only for distinction between two mental faculties, by whatever name they be called; one the source of all that is great in the poetic arts, the other merely decorative and entertaining; but which are often confounded together, and which have so much in common as to render strict definition of either difficult.

Dugald Stewart's meagre definition may serve us for a starting point. "Imagination," he says, "includes conception or simple apprehension, which enables us to form a notion of those former objects of perception or of knowledge, out of which we are to make a

¹ [The reference is to the story of the Second Royal Mendicant, ch. iii. of *The Arabian Nights* (Lane's edition)].

§ 2. *The works of the Metaphysicians, how nugatory with respect to this faculty.*

§ 3. *D. Stewart's definition, how inadequate.*

selection; abstraction, which separates the selected materials from the qualities and circumstances which are connected with them in nature; and judgment or taste, which selects the materials and directs their combination. To these powers we may add that particular habit of association to which I formerly gave the name of Fancy; as it is this which presents to our choice all the different materials which are subservient to the efforts of imagination, and which may therefore be considered as forming the ground-work of poetical genius.”¹

(By Fancy in this passage, we find on referring to the chapter treating of it, that nothing more is meant than the rapid occurrence of ideas of sense to the mind.)

Now, in this definition, the very point and purpose of all the inquiry is missed. We are told that judgment or taste “directs the combination.” In order that anything may be directed, an end must be previously determined; what is the faculty that determines this end? and of what frame and make, how boned and fleshed, how conceived or seen, is the end itself? Bare judgment or taste, cannot approve of what has no existence; and yet by Dugald Stewart’s definition we are left to their catering among a host of conceptions, to produce a combination which, as they work for, they must see and approve before it exists. This power of prophecy is the very essence of the whole matter, and it is just that inexplicable part which the metaphysician misses.

As might be expected from his misunderstanding of the faculty he has given an instance entirely nugatory.* § 4. *His instance nugatory*
It would be difficult to find in Milton a passage in which less power of imagination was shown, than the description of Eden, if, as I suppose, this be

* He continues thus: “To illustrate these observations, let us consider the steps by which Milton must have proceeded in creating his imaginary garden of Eden. When he first proposed to himself that subject of description, it is reasonable to suppose that a variety of the most striking scenes which he had seen, crowded into his mind. The association of ideas suggested them, and the power of conception placed each of them before him with all its beauties and imperfections. In every natural scene, if we destine

¹ [*Elements of the Philosophy of the Human Mind*, Part i. ch. viii.; ed. 1843, p. 257.]
IV. p

the passage meant, at the beginning of the fourth book, where I can find three expressions only in which this power is shown; the “*burnished* with golden rind, hung amiable,” of the Hesperian fruit, the “*lays forth* her purple grape” of the vine, and the “*fringed* bank with myrtle crowned” of the lake:* and these are not what Stewart meant, but only that accumulation of bowers, groves, lawns, and hillocks, which is not imagination at all, but composition, and that of the commonest kind. Hence if we take any passage in which there is real imagination, we shall find Stewart’s hypothesis not only inefficient and obscure, but utterly inapplicable.

Take one or two at random.

§ 5. *Various instances.*

“On the other side,
Incensed with indignation, Satan stood
Unterrified, and like a comet burned,
That fires the length of Ophiuchus huge
In the arctic sky, and from his horrid hair
Shakes pestilence and war.”

it for any particular purpose, there are defects and redundancies, which art may sometimes, but cannot always correct. But the power of Imagination is unlimited. She can create and annihilate, and dispose at pleasure, her woods, her rocks, and her rivers. Milton, accordingly, would not copy his Eden from any one scene, but would select from each the features which were most eminently beautiful. The power of abstraction enabled him to make the separation, and taste directed him in the selection.”

* I ought at once to have explained here what I meant, myself, by imagination;¹ and how these three words gave evidence of it. I meant, and always do mean by it, primarily, the power of seeing anything we describe as if it were real; so that, looking at it as we describe (or paint), points may strike us which will give a vividness to the description that would not have occurred to vague memory, or been easily borrowed from the expressions of other writers. Any ordinary author might have spoken of oranges as golden, of grapes as purple, or of a bank as crowned with myrtle; but the conception is much more distinct and forcible which catches the lustre on the luminous rind, feels the weight of cluster in bending the festooned branches to the ground, or sees, in the distance, the delicate branches becoming a fringe at the lake’s border. On the contrary, the mere collection of the most agreeable features from various scenes is in the power of ordinary industry, and is rather the folly of vulgar minds than the strength of distinguished ones. No intelligent traveller would ask a landscape-painter to gather for him into one canvas the cascade of Terni, the lake of Nemi, and the promontory of Sestri. [1883.]

¹ [Cf. Ruskin’s index to *Fors Clavigera* for 1871 and 1872, s. “Imagination.”]

(Note that the word incensed is to be taken in its literal and material sense, set on fire.) What taste or judgment was it that directed this combination? or is there nothing more than taste or judgment here?

“Ten paces huge
He back recoiled; the tenth on bended knee
His massy spear upstaid; as if on earth
Winds under ground, or waters forcing way,
Sidelong had pushed a mountain from his seat,
Half-sunk with all his pines.”

“Together both, ere the high lawns appeared
Under the opening eyelids of the morn,
We drove afield, and both together heard
What time the gray-fly winds her *sultry* horn.”

“Missing thee, I walk unseen
On the dry smooth-shaven green,
To behold the wandering moon,
Riding near her highest noon,
Like one that had been led astray
Through the heaven’s wide pathless way;
And oft, *as if her head she bowed,*
Stooping through a fleecy cloud.”¹

It is evident that Stewart’s explanation utterly fails in all these instances; for there is in them no “combination” whatsoever, but a particular mode of regarding the qualities or appearances of a single thing, illustrated and conveyed to us by the image of another; and the act of imagination, observe, is not the selection of this image, but the mode of regarding the object.

But the metaphysician’s definition fails yet more utterly, when we look at the imagination neither as regarding, nor combining, but as penetrating.

“My gracious silence, hail!
Wouldst thou have laugh’d, had I come coffin’d home,
That weep’st to see me triumph? Ah, my dear,
Such eyes the widows in Corioli wear,
And mothers that lack sons.”²

¹ [The quotations are from (1) *Paradise Lost*, ii. 707; (2) *Paradise Lost*, vi. 193; (3) *Lycidas*, 25; (4) *Il Penseroso*, 65.]

² [*Coriolanus*, Act ii. sc. i.]

How did Shakespeare *know* that Virgilia could not speak?

This knowledge, this intuitive and penetrative perception, is still one of the forms, the highest, of imagination, but there is no combination of images here.

We find, then, that the Imagination has three totally distinct functions. It combines, and by combination creates new forms; but the secret principle of this combination has not been shown by the analysts. Again, it treats, or regards, both the simple images and its own combinations in peculiar ways; and, thirdly, it penetrates, analyzes, and reaches truths by no other faculty discoverable. These its three functions, I shall endeavour to illustrate, but not in this order: the most logical mode of treatment would be to follow the order in which commonly the mind works; that is, penetrating first, combining next, and treating or regarding, finally; but this arrangement would be inconvenient, because the acts of penetration and of regard are so closely connected, and so like in their relations to other mental acts, that I wish to examine them consecutively; and the rather, because they have to do with higher subject matter than the mere act of combination, whose distinctive nature, that property which makes it imagination and not composition, it will, I think, be best to explain at setting out, as we easily may, in subjects familiar and material. I shall therefore examine the Imaginative faculty in these three forms; first, as Combining or Associative; secondly, as Analytic or Penetrative; thirdly, as Regardant or Contemplative.

§ 6. *The three operations of the Imagination: Penetrative, Associative, Contemplative.*

CHAPTER II

OF IMAGINATION ASSOCIATIVE

IN order to render our inquiry as easy as possible, we shall consider the dealing of the Associative imagination § 1. *Of simple Conception.* with the simplest possible matter,—that is, with conceptions of material things. First, therefore, we must define the nature of these conceptions themselves.

After beholding and examining any material object, our knowledge respecting it exists in two different forms. Some facts exist in the brain in a verbal form, as known, but not conceived; as, for instance, that it was heavy or light, that it was eight inches and a quarter long, etc., of which length we cannot have accurate conception, but only such a conception as might attach to a length of seven inches or nine; and which fact we may recollect without any conception of the object at all. Other facts respecting it exist in the brain in a visible form, not always visible, but visible at will, as its being of such a colour, or having such and such a complicated shape: as the form of a rose-bud for instance, which it would be difficult to express verbally, neither is it retained by the brain in a verbal form, but a visible one: that is, when we wish for knowledge of its form for immediate use, we summon up a vision or image of the thing; we do not remember it in words, as we remember the fact that it took so many days to blow, or that it was gathered at such and such a time.

The knowledge of things retained in this visible form is called Conception by the metaphysicians, which term I shall retain; it is inaccurately called Imagination by Taylor, in the passage quoted by Wordsworth in the preface to his

poems;¹ not but that the term Imagination is etymologically and rightly expressive of it, but we want that term for a higher faculty.

There are many questions respecting this faculty of conception of very great interest; such as the exact amount of aid that verbal knowledge renders to visible knowledge (as, for instance, the verbal knowledge that a flower has five, or seven, or ten petals, or that a muscle is inserted at such and such a point of the bone, aids the conception of the flower or the limb); and again, what amount of aid the visible knowledge renders to the verbal; as, for instance, whether any one, being asked a question about some animal or thing which instantly and from verbal knowledge he cannot answer, may have such power of summoning up the image of the animal or thing as to ascertain the fact by actual beholding (which I do not assert, but can conceive to be possible); and again, what is that indefinite and subtle character of the conception itself in most men, which admits not of being by themselves traced or realized, and yet is a sure test of likeness in any representation of the thing; like an intaglio, with a front light on it, whose lines cannot be seen, and yet they will fit one definite form only, and that accurately; these and many other questions it is irrelevant at present to determine,* since to forward our present purpose, it will be well to suppose the conception aided by verbal knowledge to be absolutely perfect; and we will suppose a man to retain such clear image of a large number of the material things he has seen, as to be able to set down any of them on paper, with perfect fidelity and absolute memory† of their most minute features.

In thus setting them down on paper, he works, I suppose,

* Compare Chapter IV. of this Section.

† On the distinction rightly made by the metaphysicians between conception absolute, and conception accompanied by reference to past time (or memory), it is of no use here to insist.

¹ [The reference is to the Preface to the edition of 1815. The passage there cited from W. Taylor (*British Synonyms Discriminated*) is: "A man has imagination in proportion as he can distinctly copy in idea the impressions of sense; it is the faculty which *images* within the mind the phenomena of sensation."]

exactly as he would work from nature, only copying the remembered image in his mind, instead of the real thing. He is, therefore, still nothing more than a copyist. There is no exercise of imagination in this whatsoever.

But over these images, vivid and distinct as nature herself, he has a command which over nature he has not. He can summon any that he chooses; and if, therefore, any group of them which he received from nature be not altogether to his mind, he is at liberty to remove some of the component images, and others foreign, and re-arrange the whole.

Let us suppose, for instance, that he has perfect knowledge of the forms of the Aiguilles Verte and Argentière, and of the great glacier between them at the upper extremity of the valley of Chamonix. The forms of the mountains please him, but the presence of the glacier suits not his purpose. He removes the glacier, sets the mountains further apart, and introduces between them part of the valley of the Rhone.

This is composition, and is what Dugald Stewart mistook for imagination, in the kingdom of which noble faculty it has no part nor lot.

The essential acts of Composition, properly so called, are the following. The mind which desires the new feature summons up before it those images which it supposes to be the kind wanted; of these it takes the one which it supposes to be fittest, and tries it; if it will not answer, it tries another, until it has obtained such an association as pleases it.

In this operation, if it be of little sensibility, it regards only the absolute beauty or value of the images brought before it; and takes that or those which it thinks fairest or most interesting, without any regard to their sympathy with those for whose company they are destined. Of this kind is all vulgar composition; the "Mulino" of Claude, described in the preface to the First Part, being a characteristic example.¹

¹ [See Vol. III. p. 41.]

If the mind be of higher feeling, it will look to the sympathy or contrast of the features, to their likeness or dissimilarity: it will take, as it thinks best, features resembling or discordant; and if, when it has put them together, it be not satisfied, it will repeat the process on the features themselves, cutting away one part and putting in another; so working more and more delicately down to the lowest details, until by dint of experiment, of repeated trials and shiftings, and constant reference to principles (as that two lines must not mimic one another, that one mass must not be equal to another), etc., it has mortised together a satisfactory result.

This process will be more and more rapid and effective, in proportion to the artist's powers of conception and association, these in their turn depending on his knowledge and experience. The distinctness of his powers of conception will give value, point, and truth to every fragment that he draws from memory. His powers of association, and his knowledge of nature, will pour out before him, in greater or less number and appositeness, the images from which to choose. His experience guides him to quick discernment in the combination, when made, of the parts that are offensive and require change.

The most elevated power of mind of all these is that of association, by which images apposite or resemblant, or of whatever kind wanted, are called up quickly and in multitudes. When this power is very brilliant, it is called Fancy; not that this is the only meaning of the word Fancy; but it is the meaning of it in relation to that function of the imagination which we are here considering; for fancy has three functions; one subordinate to each of the three functions of the imagination.

Great differences of power are manifested among artists in this respect; some having hosts of distinct images always at their command, and rapidly discerning resemblance or contrast; others having few images, and obscure, at their disposal, nor readily governing those they have.

§ 5. *What powers are implied by it. The first of the three functions of fancy.*

Where the powers of fancy are very brilliant, the picture becomes highly interesting; if her images are systematically and rightly combined, and truthfully rendered, it will become even impressive and instructive; if wittily and curiously combined, it will be captivating and entertaining.

But all this time the imagination has not once shown itself. All this (except the gift of fancy) may be taught; all this is easily comprehended and analyzed; but imagination is neither to be taught, nor by any efforts to be attained, nor by any acuteness of discernment dissected or analyzed.

§6. Imagination not yet manifested.

It has been said that in composition the mind can only take cognizance of likeness or dissimilarity, or of abstract beauty among the ideas it brings together. But neither likeness nor dissimilarity secures harmony. We saw in the Chapter on Unity that likeness destroyed harmony or unity of membership;¹ and that difference did not necessarily secure it, but only that particular *imperfection* in each of the harmonizing parts which can only be supplied by its fellow part. If, therefore, the combination made is to be harmonious,* the artist must induce in each of its component parts (suppose two only, for simplicity's sake), such imperfection as that the other shall put it right. If one of them be perfect by itself, the other will be an excrescence. Both must be faulty when separate, and each corrected by the presence of the other. If he can accomplish this, the result will be beautiful; it will be a whole, an organized body with dependent members;—he is an inventor. If not, let his separate features be as beautiful,

* The use of this word ought to have shown me the narrowness, and, if generalized, the fallacy of this theory of imperfection. Musicians, indeed, speak of the imperfection of chords, without certain notes required for their completion or resolution; but the separate notes in either melody or harmony are not themselves faulty or painful. The theory stated in the text applies in music only to the use of discords; and in painting applies but vaguely and doubtfully to anything. Two wrongs do, indeed, in pictures, sometimes make a right: but it is much more likely they will make a third wrong; and the several parts of a beautiful composition may often be as lovely as the whole. [1883.]

¹ [Sec. i. ch. vi. § 4, p. 95.]

as apposite, or as resemblant as they may, they form no whole. They are two members glued together. He is only a carpenter and joiner.

Now, the conceivable imperfections of any single feature are infinite. It is impossible, therefore, to fix upon a form of imperfection in the one, and try with this all the forms of imperfection of the other until one fits; but the two imperfections must be co-relatively and simultaneously conceived.

§ 7. *Imagination associative is the co-relative conception of imperfect component parts.*

This is Imagination, properly so called; imagination associative, the grandest mechanical power that the human intelligence possesses, and one which will appear more and more marvellous the longer we consider it. By its operation, two ideas are chosen out of an infinite mass (for it evidently matters not whether the imperfections be conceived out of the infinite number conceivable, or selected out of a number recollected), two ideas which are *separately wrong*, which together shall be right, and of whose unity, therefore, the idea must be formed at the instant they are seized, as it is only in that unity that either is good, and therefore only the *conception of that unity can prompt the preference*.^{*} Now, what is that prophetic action of mind, which out of an infinite mass of things that cannot be tried together, seizes, at the same instant, two that are fit for each other; together right, yet each disagreeable alone?

This operation of mind, so far as I can see, is absolutely inexplicable, but there is something like it in chemistry.¹

§ 8. *Material analogy with Imagination.*

“The action of sulphuric acid on metallic zinc affords an instance of what was once called Disposing Affinity.

^{*} This anticipatory preference or determination takes place whether the parts to be combined are beautiful or ugly. The following chemical illustration is not inapt, and the rest of the chapter, with some abatement of its hyperbole, true. [1883.]

¹ [See *Fors Clavigera*, Letter 83 (1877): “Among the other virtues of the great classic masters, this of enchanted Design is, of all, the least visible to the present apothecary mind; for although, when I first gave analysis of the inventive power in *Modern Painters*, I was best able to illustrate its combining method by showing that ‘there was something like it in chemistry,’ it is precisely what *is* like it in chemistry, that the chemist of to-day denies.”]

Zinc decomposes pure water at common temperatures with extreme slowness; but as soon as sulphuric acid is added, decomposition of the water takes place rapidly, though the acid merely unites with oxide of zinc. The former explanation was, that the affinity of the acid for oxide of zinc disposed the metal to unite with oxygen, and thus enabled it to decompose water; that is, the oxide of zinc was supposed to produce an effect previous to its existence. The obscurity of this explanation arises from regarding changes as consecutive, which are in reality simultaneous. There is no succession in the process, the oxide of zinc is not formed previously to its combination with the acid, but at the same instant. There is, as it were, but one chemical change, which consists in the combination, at one and the same moment, of zinc with oxygen, and of oxide of zinc with the acid; and this change occurs because these two affinities, acting together, overcome the attraction of oxygen and hydrogen for one another.”*

Now, if the imaginative artist will permit us, with all deference, to represent his combining intelligence under the figure of sulphuric acid; and if we suppose the fragment of zinc to be embarrassed among infinitely numerous fragments of diverse metals, and the oxygen dispersed and mingled among gases countless and indistinguishable; we shall have an excellent type, in material things, of the action of the imagination on the immaterial. Both actions are, I think, inexplicable; for, however simultaneous the chemical changes may be, yet the causing power is the affinity of the acid for what has no existence. It is neither to be explained how that affinity operates on atoms uncombined, nor how the artist’s desire for an unconceived whole prompts him to the selection of necessary divisions.

This operation would be wonderful enough, if it were concerned with two ideas only. But a powerfully imaginative mind seizes and combines

§ 9. *The grasp and dignity of Imagination.*

* *Elements of Chemistry*, by the late Edward Turner, M.D., part ii. sec. iv.

at the same instant, not only two, but all the important ideas of its poem or picture; and while it works with any one of them, it is at the same instant working with and modifying all in their relations to it, never losing sight of their bearings on each other; as the motion of a snake's body goes through all parts at once, and its volition acts at the same instant in coils that go contrary ways.

This faculty is indeed something that looks as if man were made after the image of God. It is inconceivable, admirable, altogether divine; and yet, wonderful as it may seem, it is palpably evident that no less an operation is necessary for the production of any great work: for, by the definition of Unity of Membership (the essential characteristic of greatness), not only certain couples or groups of parts, but *all* the parts of a noble work must be separately imperfect; each must imply, and ask for all the rest, and the glory of every one of them must consist in its relation to the rest; neither while so much as one is wanting can any be right. And it is evidently impossible to conceive, in each separate feature, a certain want or wrongness which can only be corrected by the other features of the picture (not by one or two merely, but by all), unless, together with the want, we conceive also of what is wanted, that is, of all the rest of the work or picture. Hence Fuseli:—

“Second thoughts are admissible in painting and poetry only as dressers of the first conception; no great idea was ever formed in fragments.”

“He alone can conceive and compose, who sees the whole at once before him.”¹

There is, however, a limit to the power of all human imagination. When the relations to be observed are § 10. *Its limits.* *absolutely* necessary, and highly complicated, the mind cannot grasp them; and the result is a total deprivation of all power of imagination associative in such matter. For this reason, no human mind has ever conceived a new

¹ [Aphorisms 71 and 72; *Life and Writings*, iii. 85.]

animal.* For as it is evident that in an animal, every part implies all the rest; that is, the form of the eye involves the form of the brow and nose, these the form of the forehead and lip, these of the head and chin, and so on, so that it is physically impossible to conceive of any one of these members, unless we conceive the relation it bears to the whole animal; and as this relation is necessary, certain, and complicated, allowing of no licence or inaccuracy, the intellect utterly fails under the load, and is reduced to mere composition; putting the bird's wing on men's shoulders, or half the human body to half the horse's, in doing which there is no action of imagination, but only of fancy; though in the treatment and contemplation of the compound form there may be much imagination, as we shall presently see. (Chap. III. § 29.)

The matter, therefore, in which associative imagination can be shown is that which admits of great licence and variety of arrangement, and in which a certain amount of relation only is required; as especially in the elements of landscape painting, in which best it may be illustrated.

§ 11. *How manifested in treatment of uncertain relations. Its deficiency illustrated.*

When an unimaginative painter is about to draw a tree, (and we will suppose him, for better illustration of the point in question, to have good feeling and correct knowledge of the nature of trees,) he probably lays on his paper such a general form as he knows to be characteristic of the tree to be drawn, and such as he believes will fall in agreeably with the other masses of his picture, which we will suppose partly prepared. When this form is set down, he assuredly finds it has done something he did not intend it to do. It has mimicked some prominent line, or overpowered some necessary mass. He begins pruning and changing, and, after several experiments, succeeds in obtaining a form which does no material mischief to any other. To this form he

* Too bold a negative; yet it is true that imagined animals are nearly always feebler or less interesting than real ones. In the "Voyage of Violet, Guy, and Lionel," the Quangle-wangle always hides its head. [1883.]¹

¹ [Edward Lear's *Nonsense Songs and Stories*.]

proceeds to attach a trunk, and, working probably on a received notion or rule (for the unimaginative¹ painter never works without a principle) that tree trunks ought to lean first one way and then the other as they go up, and ought not to stand under the middle of the tree, he sketches a serpentine form of requisite propriety; when it has gone up far enough, that is, till it looks disagreeably long, he will begin to ramify it; and if there be another tree in the picture with two large branches, he knows that this, by all laws of composition, ought to have three or four, or some different number; and because he knows that if three or four branches start from the same point they will look formal, therefore he makes them start from points one above another; and because equal distances are improper, therefore they shall start at unequal distances. When they are fairly started, he knows they must undulate or go backwards and forwards, which accordingly he makes them do at random; and because he knows that all forms ought to be contrasted, he makes one bend down while the other three go up. The three that go up he knows must not go up without interfering with each other, and so he makes two of them cross. He thinks it also proper that there should be variety of character in them; so he makes the one that bends down graceful and flexible, and, of the two that cross, he splinters one and makes a stump of it. He repeats the process among the more complicated minor boughs, until coming to the smallest, he thinks farther care unnecessary, but draws them freely, and by chance. Having to put on the foliage, he will make it flow properly in the direction of the tree's growth; he will make all the extremities graceful; but will be tormented by finding them come all alike, and at last will be obliged to spoil a number of them altogether, in order to obtain opposition. They will not, however, be united in this their spoliation, but will remain uncomfortably separate and individually ill-tempered. He consoles himself by the reflection that it is unnatural for all of them to be equally perfect.

¹ [Misprinted "imaginative" in ed. 1.]

Now, I suppose that through the whole of this process, he has been able to refer to his definite memory or conception of nature for every one of the fragments he has successively added; that the details, colour, fractures, insertions, etc., of his boughs, are all either actual recollections or based on secure knowledge of the tree (and herein I allow far more than is commonly the case with unimaginate painters). But, as far as the process of combination is concerned, it is evident that, from beginning to end, his laws have been his safety, and his plague has been his liberty. He has been compelled to work at random or under the guidance of feeling only, whenever there was anything left to his own decision. He has never been decided in anything except in what he *must* or *must not* do. He has walked as a drunken man on a broad road; his guides are the hedges; and, between these limits, the broader the way, the more difficult his progress.¹

§ 12. *Laws of art, the safeguard of the unimaginate,*

The advance of the imaginative artist is precisely the reverse of this. He owns no laws. He defies all restraint, and cuts down all hedges. There is nothing within the limits of natural possibility that he dares not do, or that he allows the necessity of doing. The laws of nature he knows; these are to him no restraint. They are his own nature. All other laws or limits he sets at utter defiance; his journey is over an untrodden and pathless plain. But he sees his end over the waste from the first, and goes straight at it; never losing sight of it, nor throwing away a step. Nothing can stop him, nothing turn him aside; falcons and lynxes are of slow and uncertain sight compared with his. He saw his tree, trunk, boughs, foliage and all, from the first moment; not only the tree, but the sky behind it; not only that tree or sky, but all the other great features of his picture: by what intense power of instantaneous selection and amalgamation cannot be explained, but by this it may be proved and tested; that, if we examine the

§ 13. *Are by the imaginative painter despised. Tests of Imagination.*

¹ [Ed. 1 reads more colloquially "the worse he gets on."]

tree of the unimaginative painter, we shall find that on removing any part or parts of it, though the rest will indeed suffer, as being deprived of the proper development of a tree, and as involving a blank space that wants occupation, yet the portions left are not made discordant or disagreeable. They are absolutely and in themselves as valuable as they can be; every stem is a perfect stem, and every twig a graceful twig, or at least as perfect and as graceful as they were before the removal of the rest. But if we try the same experiment on the imaginative painter's work, and break off the merest stem or twig of it, it all goes to pieces like a Prince Rupert's drop.¹ There is not so much as a seed of it but it lies on the tree's life, like the grain upon the tongue of Chaucer's sainted child.² Take it away, and the boughs will sing to us no longer. All is dead and cold.

This, then, is the first sign of the presence of real imagination

§ 14. *The
monotony of
unimaginative
treatment.*

as opposed to composition. But here is another not less important.

We have seen that as each part is selected and fitted by the unimaginative painter, he renders it, in itself, as beautiful as he is able. If it be ugly it remains so; he is incapable of correcting it by the *addition of another ugliness*,* and therefore he chooses all his features as fair as they may be (at least if his object be beauty). But a small proportion only of the ideas he has at his disposal will reach his standard of absolute beauty. The others will be of no use to him: and among those which he permits himself to use, there will be so marked a family likeness that he will be more and more cramped, as his picture advances, for want

* I had better have said "picturesqueness" or "individuality," than "ugliness"; yet the gist of this part of the chapter is true. [1883.]

¹ [Drops of molten glass, consolidated by falling into water; in shape resembling tadpoles. The thick end may be hammered safely; but if the smallest portion of the thin end is broken off, the whole flies into fine dust. These toys, if not invented by Prince Rupert, were introduced by him into England.]

² [*The Prioresses Tale*, l. 1852:—

"Me thoughte she leyde a greyn vp-on my tonge.
Wherefor I singe, and singe I mot certeyn
In honour of that blisful mayden free,
Til fro my tonge of-taken is the greyn."]

of material, and tormented by multiplying resemblances, unless disguised by some artifice of light and shade or other forced difference; and with all the differences he can imagine, his tree will yet show a sameness and sickening repetition in all its parts, and all his trees will be like one another, except so far as one leans east and another west, one is broadest at the top and another at the bottom: while through all this insipid repetition, the means by which he forces contrast, dark boughs opposed to light, rugged to smooth, etc., will be painfully evident, to the utter destruction of all dignity and repose. The imaginative work is necessarily the absolute opposite of all this. As § 15. *Imagination never repeats itself.* all its parts are imperfect, and as there is an unlimited supply of imperfection (for the ways in which things may be wrong are infinite), the imagination is never at a loss, nor ever likely to repeat itself; nothing comes amiss to it; but whatever rude matter it receives, it instantly so arranges that it comes right; all things fall into their place, and appear in that place perfect, useful, and evidently not to be spared; so that of its combinations there is endless variety, and every intractable and seemingly unavailable fragment that we give to it, is instantly turned to some brilliant use, and made the nucleus of a new group of glory; however poor or common the gift, it will be thankful for it, treasure it up, and pay in gold; and it has that life in it, and fire, that wherever it passes, among the dead bones and dust of things, behold! a shaking, and the bones come together bone to his bone.

And now we find what noble sympathy and unity there are between the Imaginative and Theoretic faculties. Both agree in this, that they reject nothing, and are thankful for all; but the Theoretic faculty takes out of everything that which is beautiful, while the Imaginative faculty takes hold of the very imperfections which the Theoretic rejects; and, by means of these angles and roughnesses, it joints and bolts the separate stones into a mighty temple, wherein the Theoretic faculty, in its turn, does deepest homage. Thus sympathetic in their desires,

harmoniously diverse in their operation, each working for the other with what the other needs not, all things external to man are by one or other turned to good.

Now we have hitherto, for the sake of clearness, opposed the total absence of imagination to the perfect presence of it, in order to make the difference between composition and imagination thoroughly understood. But if we are to give examples of either the want or the presence of the Power, it is necessary to note the circumstances by which both are modified. In the first place, few artists of any standing are totally devoid of this faculty: some small measure of it most of them possess, though of all the forms of intellect, this, and its sister, penetrative imagination, are the rarest and most precious; but few painters have reached eminence without some leaven of it; whether it can be increased by practice I doubt. On the other hand, fewer still are possessed of it in very high degree; and even with the men of most gigantic power in this respect, of whom, I think, Tintoret stands far the head, there are evident limits to its exercise, and portions to be found in their works that have not been included in the original grasp of them, but have been suggested and incorporated during their progress, or added in decoration; and, with the great mass of painters, there are frequent flaws and failures in the conception, so that when they intend to produce a perfect work, they throw their thought into different experimental forms, and decorate it and discipline it long before realizing it, so that there is a certain amount of mere composition in the most imaginative works; and a grain or two of imagination commonly in the most artificial. And again, whatever portions of a picture are taken honestly and without alteration from nature, have, so far as they go, the look of imagination, because all that nature does is imaginative,* that is, perfect as a whole, and made up of imperfect features; so that the painter of the meanest

* Nonsense, again. Imagination is the name of a human faculty, not of inanimate power: if we compare them on equal terms, there is plenty of natural scenery which is stupid and ugly, just as there are plenty of pictures that are so. See the note farther on at page 246. [1883.]

imaginative power may yet do grand things, if he will keep to strict portraiture; and it would be well if all artists were to endeavour to do so, for if they have imagination, it will force its way in spite of them, and show itself in their every stroke; and if not, they will not get it by leaving nature, but only sink into nothingness.

Keeping these points in view, it is interesting to observe the different degrees and relations of the imagination, as accompanied with more or less feeling or desire of harmony, vigour of conception, or constancy of reference to truth. Of men of name, perhaps Claude¹ is the best instance of a want of imagination, nearly total, borne out by painful but untaught study of nature, and much feeling for abstract beauty of form, with none whatever for harmony of expression. In Gaspar Poussin, we have the same want of imagination disguised by more masculine qualities of mind, and grander reachings after sympathy. Thus, in the Sacrifice of Isaac, in our own Gallery,² the spirit of the composition is solemn and unbroken; it would have been a grand picture if the forms of the mass of foliage on the right, and of the clouds in the centre, had not been hopelessly unimaginative. The stormy wind of the picture of Dido and Æneas blows loudly through its leaves; but the total want of invention in the cloud forms bears it down beyond redemption.³ The foreground tree of the La Riccia (compare Part II. Sec. VI. Chap. I. § 6) is another characteristic instance of absolute nullity of imagination.⁴

In Salvator, the imagination is vigorous, the composition dexterous and clever, as in the St. Jerome of the Brera Gallery, the Diogenes of the Pitti, and the pictures of the Guadagni Palace;⁵ while all are rendered valueless by coarseness of feeling and habitual non-reference to nature.

⁴ [No. 98. See Vol. III. pp. 277, 577, 588 n.]

⁵ [There is no picture of St. Jerome by Salvator Rosa in the Brera; the reference is presumably to his "St. Paul the Hermit" there. The "Diogenes of the Pitti" is

All the landscape of Nicolo Poussin is imaginative,¹ but the development of the power in Tintoret and Titian is so unapproachably intense that the mind unwillingly rests elsewhere. The four landscapes which occur to me as the most magnificently characteristic are: first, the Flight into Egypt, of the Scuola di San Rocco (Tintoret); secondly, the Titian of the Camuccini collection at Rome, with the figures by John Bellini; thirdly, Titian's St. Jerome, in the Brera Gallery at Milan; and fourthly, the S. Pietro Martire,² which I name last in spite of its importance, because there is something unmeaning and unworthy of Titian about the undulation of the trunks, and the upper part of it is destroyed by the intrusion of some dramatic clouds of that species which I have enough described in our former examination of the Central Cloud Region, § 13.³

I do not mean to set these four works above the rest of the landscape of these masters; I name them only because the landscape is in them prominent and characteristic. It would be well to compare with them the other backgrounds of Tintoret in the Scuola, especially that of the Temptation

No. 475, commonly known as "The School of Philosophers"—a landscape with Diogenes throwing away his drinking-cup. Ruskin thus describes it in his 1845 note-book:—

"Although this picture wants breadth, it would yet be an interesting and valuable one if we could get rid of the philosophers, but these would pollute the loveliest landscape. (Diogenes is a true Salvator conception: St. Giles's all over). It is, however, on the whole, perhaps the best Salvator in the Pitti; the distance is more inventive than usual—city on hill, winding lake and bold mountains—the colour glowing, and the trees well studied."

For the Salvators in the Guadagni Palace, see preceding volume, p. 582, and below, ch. iii. § 18 n.]

¹ [See Vol. III. p. 263.]

² [Tintoret's "Flight into Egypt" is described below, ch. iii. § 22, p. 274. "The Titian of the Camuccini collection, etc.," is the "Feast of the Gods" (or "Bacchanal"), now in the possession of the Duke of Northumberland at Alnwick Castle. It forms one of the series of four mythological landscapes painted for Duke Alfonso of Ferrara, of which the "Bacchus and Ariadne" in the National Gallery is another. It is supposed to have been left incomplete by Bellini and finished by Titian with a landscape borrowed from his native Cadore. The share of Bellini and Titian respectively in the work is, however, a subject of much debate (see, *e.g.*, *The Earlier Work of Titian*, by Claude Phillips, 1897, pp. 66–69). An outline of the picture will be found at vol. i. p. 313 (ed. 1887) of Kugler's *Italian Schools of Painting*. For the St. Jerome, *cf.* preceding volume, pp. 181–182; below, § 19; and *Modern Painters*, vol. iv. ch. xx. § 16, vol. v. pt. vi. ch. viii. § 13. For the S. Pietro Martire, see preceding volume, p. 28.]

³ [Vol. i. pt. ii. sec. iii. ch. iii. Vol. III, p. 379, of this edition.]

and the Agony in the Garden, and the landscape of the two large pictures in the Church of La Madonna dell' Orto.¹

But for immediate and close illustration, it is perhaps best to refer to a work more accessible, the *Cephalus and Procris* of Turner in the *Liber Studiorum*.² I know of § 20. *And Turner.* no landscape more purely or magnificently imaginative, or bearing more distinct evidence of the relative and simultaneous conception of the parts. Let the reader first cover with his hand the two trunks that rise against the sky on the right, and ask himself how any termination of the central mass so *ugly* as the straight trunk which he will then painfully see, could have been conceived or admitted without *simultaneous conception* of the trunks he has taken away on the right? Let him again conceal the whole central mass, and leave these two only, and again ask himself whether anything so ugly as that bare trunk in the shape of a Y, could have been admitted without reference to the central mass? Then let him remove from this trunk its two arms, and try the effect; let him again remove the single trunk on the extreme right; then let him try the third trunk without the excrescence at the bottom of it; finally, let him conceal the fourth trunk from the right, with the slender boughs at the top: he will find, in each case, that he has destroyed a feature on which everything else depends; and if proof be required of the vital power of still smaller features, let him remove the sunbeam that comes through beneath the faint mass of trees on the hill in the distance.*

It is useless to enter into farther particulars; the reader may be left to his own close examination of this and of the

* This ray of light, however, has an imaginative power of another kind, presently to be spoken of. Compare Chap. IV. § 18.

¹ [For the "Temptation," see below, ch. iii. § 28 *n.*, ch. v. § 7 *n.*, pp. 285, 319. The two large pictures in S. Maria dell' Orto are "The Last Judgment" (see below, ch. iii. § 23–24) and "The Worship of the Golden Calf" (see below, ch. iv. § 17, and *Modern Painters*, vol. iv. ch. iv. § 2 *n.*.) See also above, Introduction, p. xxxvi.]

² [Engraved and further discussed in *Lectures on Landscape*, §§ 94–96. See also preceding volume, pp. 586, 595 *n.*; below, ch. iv. § 18, and Epilogue, § 9; and *Modern Painters*, vol. iii. ch. xviii. § 19, vol. v. pt. ix. ch. xi. § 29.]

other works of Turner, in which he will always find the associative imagination developed in the most profuse and marvellous modes; especially in the drawing of foliage and skies, in both of which the presence or absence of the associative power may best be tested in all artists. I have, however, confined my present illustrations chiefly to foliage, because other operations of the imagination, besides the associative, interfere extensively in the treatment of sky.

There remains but one question to be determined relating to this faculty; what operation, namely, supposing it possessed in high degree, it has or ought to have in the artist's treatment of natural scenery?

§ 21. *The due function of associative imagination with respect to nature.*

I have just said that nature is always imaginative,* but it does not follow that her imagination is always of high subject, or that the imagination of all the parts is of a like and sympathetic kind; the boughs of every bramble bush are imaginatively arranged, so are those of every oak and cedar; but it does not follow that there is imaginative sympathy between bramble and cedar. There are few natural scenes whose harmonies are not conceivably improvable either by banishment of some discordant point, or by addition of some sympathetic one; it constantly happens that there is a profuseness too great to be comprehended, or an inequality in the pitch, meaning, and intensity of different parts. The imagination will banish all that is extraneous; it will seize out of the many threads of different feeling which nature has suffered to become entangled, one only; and where that seems thin and likely to break, it will spin it stouter, and in doing this, it never knots, but weaves in the new thread; so that all its work looks as pure and true as nature itself, and cannot be guessed from it but by its exceeding simplicity, (*known* from it, it cannot be); so that herein we

* What I meant by this twice repeated bit of nonsense, was a fact of some interest, had it been better explained,—namely, that almost any honest study of natural grouping will look intellectually, if not always agreeably, composed,¹ provided it be honest throughout. [1883.]

¹ [See Vol. III. p. xxi.]

find another test of the imaginative work, that it looks always as if it had been gathered straight from nature, whereas the unimaginate shows its joints and knots, and is visibly composition.

And here, then, we arrive at an important conclusion (though one somewhat contrary to the positions commonly held on the subject), namely, that if anything looks unnatural, there can be no imagination in it (at least not associative). We frequently hear works that have no truth in them justified or elevated on the score of being imaginative. Let it be understood once for all, that imagination never deigns to touch anything but truth; and though it does not follow that where there is the appearance of truth, there has been imaginative operation, of this we may be assured, that where there is appearance of falsehood, the imagination has had no hand.*

§ 22. *The sign of imaginative work is its appearance of absolute truth.*

For instance, the landscape above mentioned of Titian's St. Jerome¹ may, for aught I know, be a pure transcript of a rocky slope covered with chestnuts among his native mountains. It has all the look of a sketch from nature; if it be not, the imagination developed in it is of the highest order; if it be, the imagination has only acted in the suggestion of the dark sky, of the shape of the flakes of solemn cloud, and of the gleam of russet light along the distant ground.†

* Compare Chap. III. § 30.**

** Untrue again, in the sweeping negation: right only in the general connection of wisely inventive with closely observant faculty. [1883.]

† It is said at Venice that Titian took the trees of the S. Pietro Martire out of his garden opposite Murano.² I think this unlikely; there is something about the lower trunks that has a taint of composition: the thought of the whole, however, is thoroughly fine. The backgrounds of the frescoes at Padua are also very characteristic, and the well-known woodcut of St. Francis receiving the stigmata³ one of the mightiest of existing landscape thoughts; and yet it is pure portraiture of pine and Spanish chestnut.

¹ [§ 19 above, p. 244.]

² [See Vol. III. p. 170 n.]

³ [See Vol. III. p. 355 n.]

Again, it is impossible to tell whether the two nearest trunks of the *Æsacus* and *Hesperie* of the *Liber Studiorum*,¹ especially the large one on the right with the ivy, have been invented, or taken straight from nature; they have all the look of accurate portraiture. I can hardly imagine anything so perfect to have been obtained except from the real thing; but we know that the imagination must have begun to operate somewhere, we cannot tell where, since the multitudinous harmonies of the rest of the picture could hardly in any real scene have continued so inviolately sweet.

The final tests, therefore, of the work of associative imagination are, its intense simplicity, its perfect harmony, and its absolute truth. It may be a harmony, majestic or humble, abrupt or prolonged, but it is always a governed and perfect whole; evidencing in all its relations the weight, prevalence, and universal dominion of an awful inexplicable Power; a chastising, animating, and disposing Mind.²

¹ [Engraved and further described in *Lectures on Landscape*, § 93; and see preceding volume, pp. 240, 586, and *Modern Painters*, vol. v. pt. ix. ch. xi. § 29.]

² [The MS. reading of this last sentence may be given as an instance of Ruskin's careful revision, which was also in most cases compression: "It may be a harmony of majesty or of humility, of sorrow or of cheerfulness, but it is always a governed and perfect whole; and in its government, whether it be a work of art, or a scene of nature, there is felt the weight, prevalence, and universal dominion of an awful and inexplicable Power; a chastising, animating, and all-absorbing mind."]

Allart & Co. Sc.

The Adoration of the Magi.

CHAPTER III OF IMAGINATION PENETRATIVE

THUS far we have been defining that combining operation of the Imagination, which appears to be in a sort mechanical, yet takes place in the same inexplicable modes, whatever be the order of conception submitted to it, though I choose to illustrate it by its dealings with mere matter before taking cognizance of any nobler subjects of imagery. We must now examine the dealing of the Imagination with its separate conceptions, and endeavour to understand, not only its principles of selection, but its modes of apprehension with respect to what it selects.

§ 1. *Imagination penetrative is concerned, not with the combining, but the apprehending of things.*

When Milton's Satan first "rears from off the pool his mighty stature," the image of leviathan before suggested not being yet abandoned, the effect on the fire-wave is described as of the upheaved monster on the ocean-stream.

§ 2. *Milton's and Dante's description of flame.*

"On each hand the flames
Driven backward, slope their pointed spires, and, rolled
In billows, leave i' the midst a horrid vale."¹

And then follows a fiercely restless piece of volcanic imagery:

"As when the force
Of subterranean wind transports a hill
: such resting found the sole
Of unblest feet." Torn from Pelorus, or the shattered side
Of thundering Ætna, whose combustible
And fuelled entrails, thence conceiving fire,
Sublimed with mineral fury, aid the winds,
And leave a singèd bottom all involved
With stench and smoke

¹ [*Paradise Lost*, i. 224.]

Yet I think all this is too far detailed, and deals too much with externals: we feel rather the form of the fire-waves than their fury; we walk upon them too securely; and the fuel, sublimation, smoke, and singeing seem to me images only of partial combustion; they vary and extend the conception, but they lower the thermometer. Look back, if you will, and add to the description the glimmering of the livid flames; the sulphurous hail and red lightning; yet all together, however they overwhelm us with horror, fail of making us thoroughly, unendurably *hot*. The essence of intense flame has not been given. Now hear Dante:

“Feriami ‘l Sole in su l’ omero destro,
Che già raggiando tutto l’ Occidente
Mutava in bianco aspetto di cilestro.
Ed io facea con l’ ombra più rovente
Parer la fiamma.”¹

That is a slight touch; he has not gone to Ætna or Pelorus for fuel; but we shall not soon recover from it, he has taken our breath away, and leaves us gasping. No smoke nor cinders there. Pure white, hurtling, formless flame; very fire-crystal, we cannot make spires nor waves of it, nor divide it, nor walk on it; there is no question about singeing soles of feet. It is lambent annihilation.

Such is always the mode in which the highest imaginative faculty seizes its materials. It never stops at crusts or ashes, or outward images of any kind; it ploughs them all aside, and plunges into the very central fiery heart; nothing else will content its spirituality; whatever semblances and various outward shows and phases its subject may possess* go for nothing; it gets within all fence, cuts down to the root, and drinks

§ 3. *The Imagination seizes always by the innermost point.*

* Another exemplary course of hissing. [1883.]

¹ [*Purgatorio*, xxvi. 4. Cary translates:—

“The sun
Now all the western clime irradiate changed
From azure tinct to white; and, as I passed,
My passing shadow made the umber’d flame
Burn ruddier.”]

the very vital sap of that it deals with: once therein, it is at liberty to throw up what new shoots it will, so always that the true juice and sap be in them, and to prune and twist them at its pleasure, and bring them to fairer fruit than grew on the old tree; but all this pruning and twisting is work that it likes not, and often does ill; its function and gift are the getting at the root, its nature and dignity depend on its holding things always by the heart. Take its hand from off the beating of that, and it will prophesy no longer; it looks not in the eyes, it judges not by the voice, it describes not by outward features; all that it affirms, judges, or describes, it affirms, from within.*

It may seem to the reader that I am incorrect in calling this penetrating possession-taking faculty § 4. *It acts intuitively and without reasoning.* Imagination. Be it so; the name is of little consequence; the faculty itself, called by what name we will, I insist upon as the highest intellectual power of man. There is no reasoning in it; it works not by algebra, nor by integral calculus; it is a piercing pholas-like¹ mind's tongue, that works and tastes into the very rock heart; no matter what be the subject submitted to it, substance or spirit; all is alike divided asunder, joint and marrow, whatever utmost truth, life, principle it has, laid bare, and that which has not truth, life, nor principle, dissipated into its original smoke at a touch. The whispers at men's ears it lifts into visible angels. Vials that have lain sealed in the deep sea a thousand years it unseals, and brings out of them Genii.²

Every great conception of poet or painter is held and treated by this faculty. Every character that is so much as

* The reader will find in the 86th paper of the *Guardian* some interesting passages confirmatory of the view above given of the Imagination.³

¹ [Pholas, a sea-animal of the molluscous kind that makes holes in stone.]

² [*The Arabian Nights*, ch. ii. (Lane's edition).]

³ [Note first added in ed. 2. Johnson there cites the verses in the Book of Job, beginning "Hast thou given the horse strength? hast thou clothed his neck with thunder," and says: "Whereas the classical poets chiefly endeavour to paint the outward figure, lineaments and motions; the sacred poet makes all the beauties to flow from an inward principle in the creature he describes."]

touched by men like Æschylus, Homer, Dante, or Shakspeare, is by them held by the heart; and every circumstance or sentence of their being, speaking, or seeming, is seized by process from within, and is referred to that inner secret spring of which the hold is never lost for an instant; so that every sentence, as it has been thought out from the heart, opens for us a way down to the heart, leads us to the centre, and then leaves us to gather what more we may. It is the Open Sesame of a huge, obscure, endless cave, with inexhaustible treasure of pure gold scattered in it;¹ the wandering about and gathering the pieces may be left to any of us, all can accomplish that; but the first opening of that invisible door in the rock is of the imagination only.

Hence there is in every word set down by the imaginative mind an awful under-current of meaning, and evidence and shadow upon it of the deep places out of which it § 5. *Signs of it in language.* has come. It is often obscure, often half-told; for he who wrote it, in his clear seeing of the things beneath, may have been impatient of detailed interpretation: but, if we choose to dwell upon it and trace it, it will lead us always securely back to that metropolis of the soul's dominion from which we may follow out all the ways and tracks to its farthest coasts.

I think the "Quel giorno più non vi leggemmo avante" of Francesca di Rimini, and the "He has no children" of Macduff,² are as fine instances as can be given; but the sign and mark of it are visible on every line of the four great men above instanced.

The unimaginate writer, on the other hand, as he has never § 6. *Absence of Imagination, has shown* pierced to the heart, so he can never touch it. If he has to paint a passion, he remembers the external signs of it, he collects expressions of it from other writers, he searches for similes, he composes, exaggerates, heaps term on term, figure on figure, till we groan beneath the cold disjointed heap: but it is all faggot

¹ [Cf. *Sesame and Lilies*, § 50.]

² ["That day we read no farther," *Inferno*, v. 138; *Macbeth*, Act iv. sc. iii.]

and no fire; the life breath is not in it; his passion has the form of the leviathan, but it never makes the deep boil; he fastens us all at anchor in the scaly rind of it; our sympathies remain as idle as a painted ship upon a painted ocean.¹

And that virtue of originality that men so strain after is not *newness*, as they vainly think (there is nothing new), it is only *genuineness*;* it all depends on this single glorious faculty of getting to the spring of things and working out from that; it is the coolness, and clearness, and deliciousness of the water fresh from the fountain head, opposed to the thick, hot, unrefreshing drainage from other men's meadows.

This freshness, however, is not to be taken for an infallible sign of imagination, inasmuch as it results also from a vivid operation of fancy, whose parallel function to this division of the imaginative faculty it is here necessary to distinguish.

§ 7. *Distinction between Imagination and Fancy.*

I believe it will be found that the entirely unimagined mind *sees* nothing of the object it has to dwell upon or describe, and is therefore utterly unable, as it is blind itself, to set anything before the eyes of the reader.†

The fancy sees the outside, and is able to give a portrait of the outside, clear, brilliant, and full of detail.‡

The imagination sees the heart and inner nature, and makes them felt, but is often obscure, mysterious, and interrupted, in its giving of outer detail.

Take an instance. A writer with neither imagination nor fancy, describing a fair lip, does not see it, but thinks about it, and about what is said of it, and calls it well turned, or

* Some sense in this bit at last! The six pages of metaphor which we have just gone through mean, in all, little more than that the best authors express the mind, more than the person or manners, of men or heroes. I often wish, now, they were a little more communicative. It is pleasant to know that Pallas had blue eyes; but I think Homer might have also told us something about her lips and chin. [1883.]

† Compare Arist. *Rhet.* iii. 11.

‡ For the distinction between fancy and simple conception, see Chap. IV. § 3. [P. 290.]

¹ [*The Ancient Mariner*; the words are quoted also in the preceding volume, p. 524.]

rosy, or delicate, or lovely, or afflicts us with some other quenching and chilling epithet. Now hear Fancy speak:

“Her lips were red, and one was thin,
Compared with that was next her chin,
Some bee had stung it newly.”*¹

The real, red, bright being of the lip is there in a moment. But it is all outside; no expression yet, no mind. Let us go a step farther with Warner, of Fair Rosamond struck by Eleanor:

“With that she dashed her on the lips,
So dyed double red;
Hard was the heart that gave the blow,
Soft were those lips that bled.”²

The tenderness of mind begins to mingle with the outside colour, the Imagination is seen in its awakening. Next Shelley:

“Lamp of life, thy lips are burning
Through the veil that seems to hide them,
As the radiant lines of morning
Through thin clouds are they divide them.”³

* I take this and the next instance from Leigh Hunt’s admirable piece of criticism, “Imagination and Fancy,” which ought to be read with care, and to which, though somewhat loosely arranged, I may refer for all the filling up and illustration that the subject requires. With respect to what has just been said respecting want of imagination, compare his criticism of Addison’s *Cato*, p. 28. I cannot, however, confirm his judgment, nor admit his selection of instances, among painters: he has looked to their manner only and habitual choice of subject, without feeling their power; and has given work to the coarseness, mindlessness, and eclecticism of Guido and the Carracci, which, in its poetical demand of tenderness, might have foiled Pinturicchio, of dignity Leonardo, and of colour Giorgione.⁴

¹ [Quoted from Sir John Suckling at p. 35 of Leigh Hunt.]

² [Quoted from William Warner at p. 7 of Leigh Hunt.]

³ [Quoted from memory from Shelley’s *Prometheus Unbound*, act ii. sc. 5:—

“Child of light, thy limbs are burning
Through the vest that seems to hide them,” etc.

Mrs. Shelley’s (1839) edition reads “lips” for “limbs,” but “Lamp of life” is a confusion of the first lines of the first and last verses of the song.]

⁴ [The book referred to is *Imagination and Fancy; or Selections from the English Poets, illustrative of those First Requisites of their Art*. By Leigh Hunt. (Smith, Elder & Co., 1844.) Of Addison’s *Cato* he remarks that it is full of those commonplaces,

There dawns the entire soul in that morning; yet we may stop if we choose at the image still external, at the crimson clouds. The imagination is contemplative rather than penetrative. Last, hear Hamlet:

“Here hung those lips that I have kissed, I know not how oft. Where be your gibes now, your gambols, your songs, your flashes of merriment that were wont to set the table on a roar?”

There is the essence of lip, and the full power of the imagination.

Again, compare Milton’s flowers in *Lycidas* with *Perdita*’s. In Milton it happens, I think, generally, and in the case before us most certainly, that the imagination is mixed and broken with fancy, and so the strength of the imagery is part of iron and part of clay:

“Bring the rathe primrose, that forsaken dies,	<i>Imagination.</i>
The tufted crow-toe and pale jessamine,	<i>Nugatory.</i>
The white pink, and the pansy freaked with jet,	<i>Fancy.</i>
The glowing violet,	
<i>Imagination.</i>	
The musk rose, and the well-attired woodbine,	<i>Fancy, vulgar.</i>
With cowslips wan that hang the pensive head,	<i>Imagination.</i>
And every flower that sad embroidery wears.”	<i>Mixed.</i>

Then hear *Perdita*:

“O Proserpina,
For the flowers now, that, frighted, thou let’st fall
From Dis’s waggon! daffodils,
That come before the swallow dares, and take
The winds of March with beauty; violets, dim,
But sweeter than the lids of Juno’s eyes,
Or Cytherea’s breath; pale primroses,
That die unmarried, ere they can behold
Bright Phœbus in his strength, a malady
Most incident to maids.”

Observe how the imagination in these last lines goes into the very inmost soul of every flower, after having touched

conventional metaphors, and hackneyed images which betray the absence of imagination. Hunt in his illustrative extracts from Spenser, whom he calls “the poet of the painters,” “attached to each of the pictures in this Spenser Gallery the name of the painter of whose genius it reminded me.” Some of the most beautiful are thus connected with the names of the Caracci and Guido.]

them all at first with that heavenly timidness, the shadow of Proserpine's, and gilded them with celestial gathering, and never stops on their spots, or their bodily shape; while Milton sticks in the stains upon them, and puts us off with that unhappy freak of jet in the very flower that, without this bit of paper-staining, would have been the most precious to us of all. "There is pansies, that's for thoughts."¹

So, I believe, it will be found throughout the operation of the fancy, that it has to do with the outsides of things,*
 § 8. *Fancy, how involved with Imagination.* and is content therewith; of this there can be no doubt in such passages as that description of Mab so often given as an illustration of it,² and many other instances will be found in Leigh Hunt's work already referred to. Only some embarrassment is caused by passages in which Fancy is seizing the outward signs of emotion, understanding them as such, and yet, in pursuance of her proper function, taking for her share, and for that which she chooses to dwell upon, the outside sign rather than the emotion. Note in *Macbeth* that brilliant instance:

"Where the Norwegian banners flout the sky,
 And fan our people cold."

The outward shiver and coldness of fear is seized on, and irregularly but admirably attributed by the fancy to the drift

* As I said before [§ 7] if anybody likes to call the fancy of outsides, one faculty, and of insides, another, he may do as he pleases. But he needn't unless he please. [1883.]

¹ [*Hamlet*, iv. 5. Ruskin's close study of *Lycidas* is familiar to readers of *Sesame and Lilies*. The first lines of the quotation above from *The Winter's Tale* (iv. 4) were taken by Ruskin as the motto for his book on flowers, *Proserpina*. Cf. also Vol. I. p. 158 n.]

² [The description of Queen Mab and her equipage in *Romeo and Juliet* (Act i. sc. iv.)—

"Her waggon-spokes made of long spinners' legs,
 The cover of the wings of grasshoppers,
 The traces of the smallest spider's web,
 The collars of the moonshine's watery beams"—

is quoted by Leigh Hunt (*l.c.*, p. 33), who adds, "This is Fancy in its playful creativeness."

of the banners. Compare Solomon's Song, where the imagination stays not at the outside, but dwells on the fearful emotion itself:

"Who is she that looketh forth as the morning; fair as the moon, clear as the sun, and terrible as an army with banners?"

Now, if these be the prevailing characteristics of the two faculties, it is evident that certain other collateral differences will result from them. Fancy, as she § 9. *Fancy is never serious.* stays at the externals, can never feel. She is one of the hardest-hearted of the intellectual faculties, or rather one of the most purely and simply intellectual. She cannot be made serious,* no edge-tools but she will play with. Whereas the Imagination is in all things the reverse. She cannot be but serious; she sees too far, too darkly, too solemnly, too earnestly ever to smile. There is something in the heart of everything, if we can reach it, that we shall not be inclined to laugh at.¹ And thus there is reciprocal action between the intensity of moral feeling and the power of imagination; for, on the one hand, those who have keenest sympathy are those who look closest and pierce deepest, and hold securest; and on the other, those who have so pierced and seen the melancholy deeps of things are filled with the most intense passion and gentleness of sympathy. Hence, I suppose that the powers of the imagination may always be tested by accompanying tenderness of emotion; and thus, as Byron said,² there is no tenderness like Dante's, neither any intensity nor seriousness like his, such seriousness that it is incapable of perceiving that which is commonplace or ridiculous, but fuses all down into

* Fancy, in her third function, may, however, become serious, and gradually rise into imagination in doing so. Compare Chap. IV. § 5 [p. 292].

¹ [Ed. 1 adds:—

"The *ανηριθμον γελασμα* of the sea is on its surface, not in the deep.
And thus . . ."

See for this phrase from Æschylus, Vols. II. pp. 36, 45; III. p. 573 *n.*]

² ["Why, there is gentleness in Dante beyond all gentleness, when he is tender."—Byron's Diary, Jan. 29, 1821 (*Letters and Journals* ed. by R. E. Prothero, v. 194).]

its own white-hot fire. And, on the other hand, I suppose the chief bar to the action of imagination, and stop to all greatness in this present age of ours, is its mean and shallow love of jest; so that if there be in any good and lofty work a flaw, failing, or undipped vulnerable part, where sarcasm may stick or stay, it is caught at, and pointed at, and buzzed about, and fixed upon, and stung into, as a recent wound is by flies;¹ and nothing is ever taken seriously or as it was meant, but always, if it may be, turned the wrong way, and misunderstood; and while this is so, there is not, nor cannot be, any hope of achievement of high things; men dare not open their hearts to us, if we are to broil them on a thorn-fire.

This, then, is one essential difference between imagination and fancy; and another is like it and resultant from it, that the imagination being at the heart of things, poises herself there, and is still, quiet, and brooding, comprehending all around her with her fixed look; but the fancy staying at the outside of things cannot see them all at once; but runs hither and thither, and round and about to see more and more, bounding merrily from point to point, and glittering here and there, but necessarily always settling, if she settle at all, on a point only, never embracing the whole. And from these single points she can strike out analogies and catch resemblances, which, so far as the point she looks at is concerned, are true, but would be false, if she could see through to the other side. This, however, she cares not to do; the point of contact is enough for her, and even if there be a gap left between the two things and they do not quite touch, she will spring from one to the other like an electric spark, and be seen brightest in her leaping.

Now these differences between the imagination and the fancy hold not only in the way they lay hold of separate conceptions, but even in the points they occupy of time; for the

¹ [Here, as in so many other places, Ruskin, in revising, curtailed. The MS. adds after "flies," "that suck blood and prick the gallantest horse," and, after "misunderstood," two lines lower, "half in jest and half in malice, and altogether in folly."]

fancy loves to run hither and thither in time, and to follow long chains of circumstances from link to link; but the imagination, if it may, gets hold of a moment or link in the middle that implies all the rest, and fastens there. Hence Fuseli's aphorism: "Invention never suffers the action to expire, nor the spectator's fancy to consume itself in preparation, or stagnate into repose. It neither begins from the egg, nor coldly gathers the remains."¹

§ 12. *The detailing operation of Fancy;*

In Retsch's illustrations to Schiller's *Kampf mit dem Drachen*,² we have an instance, miserably feeble indeed, but characteristic, and suited to our present purpose, of the detailing, finishing action of the fancy. The dragon is drawn from head to tail, vulture eyes, serpent teeth, forked tongue, fiery crest, armour, claws, and coils as grisly as may be; his den is drawn, and all the dead bones in it, and all the savage forest country about it far and wide; we have him, from the beginning of his career to the end, devouring, rampant, victorious over whole armies, gorged with death; we are present at all the preparations for his attack, see him receive his death-wound, and our anxieties are finally becalmed by seeing him lie peaceably dead on his back.

All the time we have never got into the dragon heart, we have never once felt real pervading horror, nor sense of the creature's being; it is throughout nothing but an ugly composition of claw and scale. Now take up Turner's Jason, Liber Studiorum,³ and observe how the imagination can concentrate all this, and infinitely more, into one moment. No far forest country, no secret path, nor cloven hills; nothing but a gleam of pale horizontal sky, that broods over pleasant places far away, and sends in, through the wild overgrowth of the thicket, a ray of broken daylight into the hopeless pit. No flaunting plumes

§ 13. *And suggestive of the Imagination.*

¹ [Aphorism 95; *Life and Writings*, iii. 93.]

² [*The Fight with the Dragon*. . . Illustrated with sixteen engravings in outline by Henry Moses, from the designs of Retsch (the German illustrator, 1779–1857). London: 1825. Cf. p. 371 below.]

³ [The original drawing is No. 461 in the National Gallery: for other references see preceding volume, p. 240; below, ch. iv. § 6, p. 297; *Modern Painters*, vol. iii. ch. viii. § 7, ch. xviii. § 19.]

nor brandished lances, but stern purpose in the turn of the crestless helmet, visible victory in the drawing back of the prepared right arm behind the steady point. No more claws, nor teeth, nor manes, nor stinging tails. We have the dragon, like everything else, by the middle. We need see no more of him. All his horror is in that fearful, slow, griding upheaval of the single coil. Spark after spark of it, ring after ring, is sliding into the light, the slow glitter steals along him step by step, broader and broader, a lighting of funeral lamps one by one, quicker and quicker; a moment more, and he is out upon us, all crash and blaze, among those broken trunks;—but he will be nothing then to what he is now.

Now it is necessary here very carefully to distinguish between that character of the work which depends on the imagination of the beholder, and that which results from the imagination of the artist; for a work is often called imaginative when it merely leaves room for the action of the imagination; whereas though nearly all imaginative works do this, yet it may be done also by works that have in them no imagination at all. A few shapeless scratches or accidental stains on a wall, or the forms of clouds, or any other complicated accidents, will set the imagination to work to coin something out of them; and all paintings in which there is much gloom or mystery, possess therein a certain sublimity owing to the play given to the beholder's imagination, without, necessarily, being in the slightest degree imaginative themselves. The vacancy of a truly imaginative work results not from absence of ideas, or incapability of grasping and detailing them, but from the painter having told the whole pith and power of his subject and disdain to tell more; and the sign of this being the case is, that the mind of the beholder is forced to act in a certain mode, and feels itself overpowered and borne away by that of the painter, and not able to defend itself, nor go which way it will: and the value of the work depends on the truth, authority, and inevitability of this suggestiveness.¹ Now observe in this work of

¹ [Ed. 1 adds, "and on the absolute right choice of the critical moment."]

Turner that the whole value of it depends on the character of curve assumed by the serpent's body; for had it been a mere semicircle, or gone down in a series of smaller coils, it would have been in the first case, ridiculous, as unlike a serpent, or in the second, disgusting, nothing more than an exaggerated viper; but it is that *coming straight* at the right hand which suggests the drawing forth of an enormous weight, and gives the bent part its springing look, that frightens us. Again, remove the light trunk* on the left, and observe how useless all the gloom of the picture would have been, if this trunk had not given it depth and *hollowness*. Finally and chiefly, observe that the painter is not satisfied even with all the suggestiveness thus obtained, but to make sure of us, and force us, whether we will or not, to walk his way, and not ours, the trunks of the trees on the right are all cloven into yawning and writhing heads and bodies, and alive with dragon energy all about us; note especially the nearest with its gaping jaws and claw-like branch at the seeming shoulder; a kind of suggestion which in itself is not imaginative, but merely fanciful (using the term fancy in that third sense not yet explained, corresponding to the third office of imagination); but it is imaginative in its present use and application, for the painter addresses thereby that morbid and fearful condition of mind which he has endeavoured to excite in the spectator, and which in reality would have been seen in every trunk and bough, as it penetrated into the deeper thicket, the object of its terror.

It is nevertheless evident, that however suggestive the work or picture may be, it cannot have effect unless we are ourselves both watchful of its every hint, and capable of understanding and carrying it out; and although I think that this power of continuing or accepting the direction of feeling given is less a peculiar gift, like that of the original seizing, than a faculty dependent on attention and improvable by cultivation; yet,

§ 15. *Imagination addresses itself to Imagination.*

* I am describing from a proof: in bad impressions this trunk is darkened.

to a certain extent, the imaginative work will not, I think, be rightly esteemed except by a mind of some corresponding power: not but that there is an intense enjoyment in minds of feeble yet right conception in the help and food they get from those of stronger thought; but a certain imaginative susceptibility is at any rate necessary, and above all things earnestness and feeling; so that assuredly a work of high conceptive dignity will be always incomprehensible and valueless except to those who go to it in earnest and give it time; and this is peculiarly the case when the imagination acts not merely on the immediate subject, nor in giving a fanciful and peculiar character to prominent objects, as we have just seen, but busies itself throughout in expressing occult and far-sought sympathies in every minor detail; of which action the most sublime instances are found in the works of Tintoret, whose intensity of imagination is such that there is not the commonest subject to which he will not attach a range of suggestiveness almost limitless; nor a stone, leaf, or shadow, nor anything so small, but he will give it meaning and oracular voice.

Instance, from the works of Tintoret. In the centre of the gallery at Parma, there is a canvas of Tintoret's, whose sublimity of conception and grandeur of colour are seen in the highest perfection, by their opposition to the morbid and vulgar sentimentalism of Correggio. It is an Entombment of Christ, with a landscape distance, of whose technical composition and details I shall have much to say hereafter;¹ at present I speak only of the thought it is intended to convey. An ordinary or unimaginative painter would have made prominent, among his objects of landscape, such as might naturally be supposed to have been visible from the sepulchre, and shown with the crosses of Calvary, some portion of Jerusalem;² but Tintoret has a far higher aim. Dwelling on the peculiar force of the event before him, as the fulfilment of the final prophecy respecting the Passion, "He made His grave with the wicked

¹ [See next volume, ch. xviii. § 18, and plate 17.]

² [Ed. 1 adds, "or of the valley of Jehoshaphat."]

and with *rich* in His death.”¹ he desires to direct the mind of the spectator to this receiving of the body of Christ, in its contrast with the houseless birth and the desert life. And, therefore, behind the ghastly tomb grass that shakes its black and withered blades above the rocks of the sepulchre, there is seen, not the actual material distance of the spot itself (though the crosses are shown faintly), but that to which the thoughtful spirit would return in vision, a desert place, where the foxes have holes, and the birds of the air have nests, and against the barred twilight of the melancholy sky are seen the mouldering beams and shattered roofing of a ruined *cattle-shed*, the canopy of the Nativity.

Let us take another instance. No subject has been more frequently or exquisitely treated by the religious § 17. *The An-*
painters than that of the Annunciation;² though, as *nunciation.*
usual, the most perfect type of its pure ideal has been given by Angelico, and by him with the most radiant consummation (so far as I know) in a small reliquary in the sacristy of St^a. Maria Novella.³ The background there,

¹ [Isaiah liii. 9.]

² [For some other remarks on this subject, in connection with Rossetti's "Ecce Ancilla Domini," see *The Three Colours of Pre-Raphaelitism*, § 3.]

³ [This is the work from which Ruskin made the pencil sketch (see below, p. 350) engraved as the frontispiece to the last volume of *Modern Painters*, and described at pt. ix. ch. viii. § 12 of that volume. See also *Præterita*, ii. ch. vii. § 127. The following is the account of the picture in the 1845 note-book:—

“In the sacristy of Sta. Maria Novella is what I think on the whole his most *perfect* work, the small Annunciation of which I have a study. I have above noticed the exquisite jewellery of Angelico; it is here carried farther than in any other of his works, the gold deeper, and the ornaments more detailed and delicate. The glories are formed of rays indented in the gold deeper and deeper as they approach the head, so that there is always a vivid light on some portion of them, playing in the most miraculous way round the head as the spectator moves, and always brightest close to the head and graduated away so that the effect is absolutely real, and a positive light of the brightest brilliancy is obtained which throws the purest pale flesh colour out in dark relief—an advantage possessed by no other painter. The glories of the angels in the large Uffizii picture are executed with rays in the same way, but have also an outer circle of stars. The style of ornament adopted by Angelico in the dress is also very instructive. Had he made it perfectly regular and of complicated design, he would have given the dresses the appearance of having been embroidered, and the weight of the embroidery would have pulled his angels to earth in an instant. But he has used only rays or dashes of light in clusters, not joined at the roots (Note this in speaking of functional unity), and curved lines with dots at the end not particularly graceful, but varied and irregular looking like no earthly ornament,

however, is altogether decorative; but, in the fresco of the corridor of St. Mark's, the concomitant circumstances are of exceeding loveliness. The Virgin sits in an open loggia, resembling that of the Florentine church of L'Annunziata. Before her is a meadow of rich herbage, covered with daisies. Behind her is seen, through the door at the end of the loggia, a chamber with a single grated window, through which a starlike¹ beam of light falls into the silence. All is exquisite in feeling, but not inventive nor imaginative. Severe would be the shock and painful the contrast, if we could pass in an instant from that pure vision to the wild thought of Tintoret.² For not in meek reception of the adoring messenger, but startled by the rush of his horizontal and rattling wings, the Virgin sits, not in the quiet loggia, not by the green pasture of the restored soul, but houseless, under the shelter of a palace vestibule ruined and abandoned, with the noise of the axe and the hammer in her ears, and the tumult of a city round about her desolation. The spectator turns away at first, revolted, from the central object of the picture forced painfully and coarsely forward, a mass of shattered brickwork, with the plaster mildewed away from it, and the mortar mouldering from its seams; and if he look again, either at this or at the carpenter's tools beneath it, will perhaps see, in the one and the other, nothing more than such a study of scene as Tintoret could but too easily obtain among the ruins of his own Venice, chosen to give a coarse explanation of the calling and the condition of the husband of Mary. But there is more meant than this. When he looks at the

but simple and childish and therefore heavenly. The Madonna's dress is blue; the angel's, lilac-purple. No other work of the painter can be set beside this for action and expression. The Virgin's face is absolutely luminous with love."

This reliquary has now been transferred to the museum in the convent of San Marco (Cell 34). The fresco next described in the text is on the upper floor, at the head of the stairs in the corridor.]

¹ [Misprinted "star-light" in the 1873 edition.]

² [Tintoret's "Annunciation" here described is in the Lower Room of the Scuola di San Rocco; for a further discussion of it, see *Stones of Venice*, vol. iii., Venetian Index (s. "Rocco, Scuola di San," No. 1). A photographic reproduction of the picture will be found at p. 80 of J. B. Stoughton Holborn's *Tintoretto*, 1903 ("Great Masters" series.)]

composition of the picture, he will find the whole symmetry of it depending on a narrow line of light, the edge of a carpenter's square, which connects these unused tools with an object at the top of the brickwork, a white stone, four square, the corner-stone of the old edifice, the base of its supporting column. This, I think, sufficiently explains the typical character of the whole. The ruined house is the Jewish dispensation; that obscurely arising in the dawning of the sky is the Christian; but the corner-stone of the old building remains, though the builders' tools lie idle beside it, and the stone which the builders refused is become the Headstone of the Corner.¹

In this picture, however, the force of the thought hardly atones for the painfulness of the scene and the turbulence of its feeling. The power of the master is more strikingly shown in his treatment of the subject which, however important, and however deep in its meaning, supplies not to the ordinary painter material enough ever to form a picture of high interest; the Baptism of Christ. From the purity of Giotto to the intolerable, inconceivable brutality of Salvator,* every order

§ 18. *The Baptism of Christ. Its treatment by various painters.*

* The picture is in the Guadagni Palace. It is one of the most important landscapes Salvator ever painted. The figures are studied from street beggars. On the other side of the river, exactly opposite the point where the Baptism of Christ takes place, the painter, with a refinement of feeling peculiarly his own, has introduced some ruffians stripping off their shirts to bathe. He is fond of this incident. It occurs again in one of the marines of the Pitti Palace, with the additional interest of a foreshortened figure, swimming on its back, feet foremost, exactly in the stream of light to which the eye is principally directed.²

¹ [Psalm cxviii. 22.]

² [The pictures by Salvator in the Guadagni Palace were the Showing and the Baptism of Christ. Ruskin's discussion of them in his 1845 note-book is worth giving at some length, as an illustration of his careful and prolonged study in the galleries:—

“These are decidedly the best Salvators I have ever seen and perfectly genuine and undoubtable throughout. By these in fairness he ought to be judged, for he has taken pains with them and this he seldom did. The first—the Showing of Christ—consists chiefly of a huge and wild group of skeleton trees which occupy the centre of the picture, and straggle about the sky, shapeless rocks thrown about the foreground and middle distance, and

of feeling has been displayed in its treatment; but I am aware of no single case, except this of which I am about to speak, in which it has formed an impressive picture.

Giotto's, in the Academy of Florence, engraved in the series just published (*Galleria delle belle Arti*),¹ is one of

cumbrous mountains behind. The other is finer; it is a sweet passage of calm river under steep and cavernous rocks, with a well studied distance and a grand dark tree obscuring the sky on the left. The skies are the same in both, the regular sky of Salvator—dark blue above cut off from the horizon by rolling white clouds with level flaky bases in shades, which come light upon the blue above, and dark on the yellow light of the distance below.

“At the first sight of these pictures I was taken aback; their magnificent size, masterly handling and vigorous chiaroscuro (enhanced as it is by the blue of the sky having much darkened) and the skeleton branches of the trees like the limbs of the Tempting Demon of the St. Anthony [by Salvator in the Pitti] altogether are at first so impressive that if I had only looked for five minutes and come away, I might have altered my whole opinion of Salvator; and as few people ever look more than five minutes at any picture, it is no wonder that the energy of the superficial master obtains so many admirers, as it had very nearly carried me away myself.

“But on sitting down for a moment and recovering from the first effect, the truth came upon me gradually and fast. Every time I looked, the colour seemed more false, and the eye detected some erring or disagreeable form. Repetition after repetition, mannerism after mannerism, was unveiled, and I did not leave the pictures before it had become painful to look at them. . . . It is not to be doubted that Salvator used this dead colour to enhance the sublimity of his landscape, and that to ill taught minds it does so, but to all pure feeling it only furnishes another and a manifest proof that all violations of national principles for an imaginative result, recoil on the inventor's head, and are productive of nothing but ugliness and disagreeableness. Had these pictures been warmed with real sunlight, they might have approached the true sublime, whereas now they are nothing but small scene-painting and that not of the best.

“But it is not only their colour which is deficient. Their air-tones are still more so, . . . and [the shadows are] perfectly vacant and impenetrable—not black, nor, in the common sense of the term, heavy; as extreme darks they would be good, but they are extreme darks everywhere, the whole picture being made up of these necessarily in order to give value to the low, grey lights. This vulgarity is one of the chief causes of the rapid impression the pictures make, and it is also one of the chief causes of their final failure. For there is nothing to be discovered or penetrated anywhere; distant and near, all is alike—dense, formless, hopeless brown, with the lights cleverly touched over it, the same, whether in rock, trees, or water. One passage only affords an exception, and its beauty is a test of the wrong in the rest. In the Baptism of Christ, on the opposite side of the river, on the right hand, a glade runs up among scattered trunks of trees behind the rocks, and this part of the picture is refreshing and full of nature: one can walk through it, and breathe in it. . . .”

For the incident of the bathers, see above, ch. ii. § 19, and preceding volume, p. 518 n.]

¹ [*Galleria dell' I. e Reale Accademia delle Belle Arti di Firenze pubblicata con incisione in rame. . . . Firenze, 1845. Giotto's "Baptism of Christ" is the seventh plate in that work.*]

the most touching I know, especially in the reverent action of the attendant angels;¹ and Leonardo's angel in that of Andrea del Verrocchio² is very beautiful, but the event is one whose character and importance are ineffable upon the features: the descending dove hardly affects us, because its constant symbolical occurrence hardens us, and makes us look on it as a mere type or letter, instead of the actual presence of the Spirit: and by all the sacred painters the power that might be put into the landscape is lost; for though their use of foliage and distant sky or mountain is usually very admirable, as we shall see in the fifth chapter, yet they cannot deal with near water or rock; and the hexagonal and basaltic

¹ [This is one of a series of panels, removed from vestment presses at Santa Croce, representing scenes from the life of Christ. They are now attributed to Taddeo Gaddi.]

² [This is famous as one of the few certainly authentic pictures, if not the only one, by Verrocchio in existence. It was painted by commission for the monks of Vallombrosa. The kneeling angel to the extreme left is said, by a tradition of Vasari, to have been painted by Verrocchio's pupil, Leonardo. Modern critics accept the tradition, and many attribute a larger share in the picture to him (see, *e.g.*, Eugène Muntz's *Leonardo*, English ed., i. 40). Ruskin described the picture in the 1845 note-book:—

“The head painted by Leonardo in this most interesting picture is not superior to Verrocchio's work in religious or grand qualities: neither of them is indeed particularly distinguished in this way; but still, the dark eyes and unpretending simplicity of Verrocchio's angels are to me quite as agreeable and certainly more solemn than the more finished beauty of Leonardo's work. But the difference is certainly great in the attractive qualities of art. Leonardo's hair is silky and lustrous, and more refined than even Raffaello's in his finest works, and curled with the greatest grace and complexity. Verrocchio's is black, short, rough and straggly. Leonardo's features are full, round, and most purely chiselled. Verrocchio's are thin and marked like Botticelli's, and from poor models. Leonardo's complexion, fair and pure and stippled and shaded with great sweetness of colour. Verrocchio's brown and lightless; and finally, while the latter paints the iris of the eye with a dark, unvaried brown like Raphael, Leonardo has dwelt with a boyish delight on all the light he could get in it, through it and on it, making it a lustrous and transparent grey, that he might have the opportunity, and though it is a little fishy, it is still very ardent and full of feeling and exceedingly clever. The story told of Verrocchio is easily to be credited on looking at it.”

Elsewhere in the note-book Ruskin adds:—

“In the angel which Leonardo painted in Verrocchio's picture in the Accademia, the eyes are filled with moist, tender, transparent lustre and light, while Verrocchio's beside it is painted with both iris and pupil hard and dark. I almost think Verrocchio's the grandest of the two in spite of Leonardo's beautiful drawing.”

Leonardo's angel, says Vasari, “was much superior to the other parts of the picture. Perceiving this, Andrea resolved never again to take pencil in hand, since Leonardo, though still so young, had acquitted himself in that art better than he had done” (Bohn's ed. 1871, ii. 255). One of the treasures of the Ruskin Museum at Sheffield is a work attributed to Verrocchio; see notes on that collection in a later volume of this edition.]

protuberances of their river shores are, I think, too painful to be endured even by the most acceptant mind; as eminently in that of Angelico, in the *Vita di Cristo*,¹ which, as far as I can judge, is a total failure in action, expression, and all else; and in general, it is in this subject especially that the greatest painters show their weakness. For this reason, I suppose, and feeling the difficulty of it, Tintoret has thrown into it his utmost strength, and it becomes noble in his hands by his most singularly imaginative expression, not only of the immediate fact, but of the whole train of thought of which it is suggestive; and by his considering the Baptism not only as the submission of Christ to the fulfilment of all righteousness, but as the opening of the earthly struggle with the prince of the powers of the air, which instantly beginning in the temptation, ended only on the cross.

The river flows fiercely under the shadow of a great rock.*

* A farther examination of this picture has made me doubt my interpretation of some portions of it. It is nearly destroyed, and placed between two lights, and far from the eye, so as to render its details in many of the shadowed portions almost untraceable. I leave the passage unaltered, however, until I can obtain an opportunity of close access to the picture. The other works described are in fuller light and in better preservation, and the reader may accept with confidence the account given of them, which I have confirmed by re-examination.²

¹ [In the Accademia at Florence; *cf.* above, p. 100 *n.*]

² [This note was added in the second edition (1848). J. A. Symonds, in an article in the *National Observer* of August 1, 1891 ("A Morning at San Rocco"), made fun of Ruskin's description, pointing out that what appeared to Ruskin "a horizontal floor of flaky cloud, on which stand the hosts of heaven," was in fact "a set of fairly well-dressed women on the river-bank of Jordan, with trees behind them, the tops of which are clearly reflected in the stream." Symonds pointed out other particulars in which the description given above hardly accords with the picture; but the footnote shows that he had been anticipated (as is generally the case with Ruskin's critics) by Ruskin himself. See also *Stones of Venice*, s. "Rocco, Scuola di San," Upper Room, No. 11, where Ruskin says: "The river is seen far into the distance, with a piece of copse bordering it: the sky beyond is dark, but the water nevertheless receives a brilliant reflection from some unseen rent in the clouds, so brilliant, that when I was first at Venice, not being accustomed to Tintoret's slight execution, or to see pictures so much injured, I took this piece of water for a sky." In this later description of the picture, Ruskin says: "Behind the rocks on the right a single head is seen, with a collar on his shoulders; it seems to be intended for a portrait of some person connected with the picture." The *Pall Mall Gazette* (August 1, 1891), commenting on Symonds' article and Ruskin's own correction of this passage, remarked: "We doubt, however, whether even on further examination Mr. Ruskin would altogether give up his 'hosts of heaven.' On one occasion at Oxford he showed a sketch from some

From its opposite shore, thickets of close gloomy foliage rise against the rolling chasm of heaven, through which § 19. *By Tintoret.* breaks the brightness of the descending Spirit.

Across these, dividing them asunder, is stretched a horizontal floor of flaky cloud, on which stand the hosts of heaven. Christ kneels upon the water, and does not sink; the figure of St. John is indistinct, but close beside his raised right arm there is a spectre in the black shade; the Fiend, harpy-shaped, hardly seen, glares down upon Christ with eyes of fire, waiting his time. Beneath this figure there comes out of the mist a dark hand, the arm unseen, extended to a net in the river, the spars of which are in the shape of a cross. Behind this the roots and under stems of the trees are cut away by the cloud, and beneath it, and through them, is seen a vision of wild, melancholy, boundless light, the sweep of the desert; and the figure of Christ is seen therein alone, with His arms lifted as in supplication or ecstasy, borne of the Spirit into the Wilderness to be tempted of the Devil.

There are many circumstances which combine to give to this noble work a more than usually imaginative character. The symbolical use of the net, which is the cross net still used constantly in the canals of Venice, and common throughout Italy, is of the same character as that of the carpenter's tools in the Annunciation; but the introduction of the spectral figure is of bolder reach, and yet more, that vision of the after-temptation which is expressly indicated as a subject of thought rather than of sight, because it is in a part of the scene which in *fact* must have been occupied by the trunks of the trees whose tops are seen above; and another circumstance completes the mystic character of the whole, that the flaky clouds which support the angelic hosts take on the right, where the light first falls upon them, the shape of the head

picture by Tintoret which, whether by chance or design we knew not, he held out wrong side up, and began discoursing on it so. 'Ah, well,' he said, joining in the general laughter, 'what does it matter? for in Tintoret you have heaven all round you.'"]

of a fish, the well-known type both of the baptismal sacrament and of Christ.

But the most exquisite instance of this imaginative power occurs in an incident in the background of the *Crucifixion*.¹ I will not insult this marvellous picture by an effort at a verbal account of it. I would not whitewash it with praise, and I refer to it only for the sake of two thoughts peculiarly illustrative of the intellectual faculty immediately under discussion. In the common and most Catholic treatment of the subject, the mind is either painfully directed to the bodily agony, coarsely expressed by outward anatomical signs, or else it is permitted to rest on that countenance inconceivable by man at any time, but chiefly so in this its consummated humiliation. In the first case, the representation is revolting; in the second, inefficient, false, and sometimes blasphemous. None even of the greatest religious painters have ever, so far as I know, succeeded here: Giotto and Angelico were cramped by the traditional treatment, and the latter especially, as before observed, is but too apt to indulge in those points of vitiated feeling which attained their worst development among the Byzantines; Perugino fails in his Christ in almost every instance: of other men than these, after them, we need not speak. But Tintoret here, as in all other cases, penetrating into the root and deep places of his subject, despising all outward and bodily appearances of pain, and seeking for some means of expressing, not the rack of nerve or sinew, but the fainting of the deserted Son of God before His Eloi cry, and yet feeling himself utterly unequal to the expression of this by the countenance, has, on the one hand, filled his picture with such various and impetuous muscular exertion, that the body of the Crucified

¹ [Also in the Scuola di San Rocco, Upper Room. For other references to the picture, see above, sec. i. ch. viii. § 4, and below, § 25, ch. iv. § 13, and Epilogue, § 12; also *Modern Painters*, vol. v. pt. ix. ch. i. § 8, ch. iii. § 17; and *Stones of Venice*, Venetian Index, s. "Rocco, Scuola di San," No. 62. A photographic reproduction of the picture will be found between pp. 80 and 81 of J. B. Stoughton Holborn's *Tintoretto*. The notice of the picture in that book is worth looking at as an instance of the acceptance of Ruskin's estimate of the master. See also above, Introduction, p. xlv. n.]

is, by comparison, in perfect repose, and, on the other, has cast the countenance altogether into shade. But the Agony is told by this, and by this only; that, though there yet remains a chasm of light on the mountain horizon where the earthquake darkness closes upon the day, the broad and sunlike glory about the head of the Redeemer has become wan, *and of the colour of ashes*.*

But the great painter felt he had something more to do yet. Not only that Agony of the Crucified, but the tumult of the people, that rage which invoked His blood upon them and their children. Not only the brutality of the soldier, the apathy of the Centurion, or any other merely instrumental cause of the Divine suffering, but the fury of His own people, the noise against Him of those for whom He died, were to be set before the eye of the understanding, if the power of the picture was to be complete. This rage, be it remembered, was one of disappointed pride; and the disappointment dated essentially from the time when, but five days before, the King of Zion came, and was received with hosannahs, riding upon an ass, and a colt the foal of an ass. To this time, then, it was necessary to direct the thoughts, for therein are found both the cause and the character, the excitement of, and the witness against, this madness of the people. In the shadow behind the cross, a man, riding on an ass colt, looks back to the multitude, while he points with a rod to the Christ crucified. The ass is feeding on the *remnants of withered palm-leaves*.¹

With this master-stroke, I believe, I may terminate all illustration of the peculiar power of the imagination over the feelings of the spectator, by the elevation into dignity and

* This circumstance, like most that lie not at the surface, has escaped Fuseli, though his remarks on the general tone of the picture are very good, as well as his opposition of it to the treatment of Rubens. (Lecture ix.)²

¹ [For Ruskin's first note of this "master-stroke," see above, Introduction, p. xxxviii.]

² [*Life and Writings of Fuseli*, ii. 366. The picture by Rubens which Fuseli contrasts for its inappropriate "gay technic exaltation" with the solemn tone of Tintoret is in the Church of St. Walburgha at Antwerp.]

meaning of the smallest accessory circumstances. But I have not yet sufficiently dwelt on the fact from which this power arises, the absolute truth of statement of the central fact as it was, or must have been. Without this truth, this awful first moving principle, all direction of the feelings is useless. That which we cannot excite, it is of no use to know how to govern.

I have before alluded, Sec. I. Chap. XIV., to the painfulness of Raffaele's treatment of the Massacre of the Innocents. Fuseli affirms of it, that, "in dramatic gradation he disclosed all the mother through every image of pity and of terror."¹ If this be so,

§ 21. *The* I think the philosophical spirit has prevailed over
Massacre of the imaginative. The imagination never errs; it
the Innocents. sees all that is, and all the relations and bearings of
it; but it would not have confused the mortal frenzy of maternal
terror with various development of maternal character. Fear,
rage, and agony, at their utmost pitch, sweep away all character:
humanity itself would be lost in maternity, the woman would
become the mere personification of animal fury or fear. For this
reason all the ordinary representations of this subject are, I think,
false and cold: the artist has not heard the shrieks, nor mingled
with the fugitives; he has sat down in his study to convulse
features methodically, and philosophize over insanity. Not so
Tintoret.² Knowing, or feeling, that the expression of the human
face was, in such circumstances, not to be rendered, and that the
effort could only end in an ugly falsehood, he denies himself all
aid from the features, he feels that if he is to place himself or us
in the midst of that maddened multitude, there can be no time
allowed for watching expression. Still less does he depend on
details of murder and ghastliness of death; there is no blood, no
stabbing or cutting, but there is an awful substitute for these in
the chiaroscuro. The scene is the

¹ [Lecture iii., *Life and Writings*, ii. 176.]

² [For Ruskin's first note of this picture (also in the Scuola di San Rocco, Lower Room), see above, Introduction, p. xxxviii. For other references, see above, sec. i. ch. xiv. § 31, and below, § 25. A photographic reproduction of the picture is given at p. 82 of J. B. Stoughton Holborn's *Tintoretto*.]

outer vestibule of a palace, the slippery marble floor is fearfully barred across by sanguine shadows, so that our eyes seem to become bloodshot and strained with strange horror and deadly vision; a lake of life before them, like the burning seen of the doomed Moabite on the water that came by the way of Edom; a huge flight of stairs, without parapet, descends on the left; down this rush a crowd of women mixed with the murderers; the child in the arms of one has been seized by the limbs, *she hurls herself over the edge, and falls head downmost, dragging the child out of the grasp by her weight*;—she will be dashed dead in a second;¹—close to us is the great struggle; a heap of the mothers entangled in one mortal writhe with each other and the swords, one of the murderers dashed down and crushed beneath them, the sword of another caught by the blade and dragged at by a woman's naked hand; the youngest and fairest of the women, her child just torn away from a death grasp, and clasped to her breast with the grip of a steel vice, falls backwards, helplessly over the heap, right on the sword points; all knit together and hurled down in one hopeless, frenzied, furious abandonment of body and soul in the effort to save.² Far back, at the bottom of the stairs, there is something in the shadow like a heap of clothes. It is a woman, sitting quiet,—quite quiet,—still as any stone; she looks down steadfastly on her dead child, laid along on the floor before her, and her hand is pressed softly upon her brow.³

This, to my mind, is the only Imaginative, that is, the only true, real, heartfelt representation of the being and actuality of

¹ [Ed. 1 (in which the preceding words were not italicised) adds:—

“two others are farther in flight, they reach the edge of a deep river,—the water is beat into a hollow by the force of their plunge;—close to us . . .”]

² [Ed. 1 adds:—

“Their shrieks ring in our ears till the marble seems rending around us, but far back . . .”]

³ [Ruskin quoted this description a year later in *Stones of Venice*, vol. iii. (Venetian Index, s. “Rocco, Scuola di San”), adding that “there may have been some change in the colour of the shadow that crosses the pavement. . . . I formerly supposed that this was meant to give greater horror to the scene, and it is very like Tintoret if it be so; but there is a strangeness and discordance in it which make me suspect the colour may have changed.”]

the subject, in existence.* I should exhaust the patience of the reader, if I were to dwell at length on the various

§ 22. *Various works in the Scuola di San Rocco.*

stupendous developments of the imagination of Tintoret in the Scuola di San Rocco alone. I would fain join awhile in that solemn pause of the

journey into Egypt,¹ where the silver boughs of the shadowy trees lace with their tremulous lines the alternate folds of fair cloud, flushed by faint crimson light, and lie across the streams of blue between those rosy islands, like the white wakes of wandering ships; or watch beside the sleep of the disciples, among those massy leaves that lie so heavily on the dead of the night beneath the descent of the angel of the agony, and toss fearfully above the motion of the torches as the troop of the betrayer emerges out of the hollows of the olives;² or wait through the hour of accusing beside the judgment seat of Pilate, where all is unseen, unfelt, except the one figure that stands with its head bowed down, pale, like a pillar of moon light, half

§ 23. *The Last Judgment. How treated by various painters.*

bathed in the glory of the Godhead, half wrapt in the whiteness of the shroud.³ Of these, and all the other thoughts of indescribable power that are now fading from the walls of those neglected chambers, I may perhaps endeavour at a future time to preserve some image and shadow more

* Note the shallow and uncomprehending notice of this picture by Fuseli. His description of the treatment of it by other painters is, however, true, terse, and valuable.⁴

¹ [In the Lower Room of the Scuola di San Rocco. For another reference to the "Flight into Egypt," see above, ch. ii. § 19, p. 244, and Introduction, p. xxxix.; and for a fuller description of the picture, *Stones of Venice*, vol. iii. (Venetian Index, s. "Rocco, Scuola di San," No. 3).]

² ["The Agony in the Garden," in the Upper Room of the Scuola di San Rocco. For a fuller description of the picture, see *Stones of Venice*, vol. iii. (Venetian Index, s. "Rocco, Scuola di San," No. 13).]

³ ["Christ before Pilate," in the Upper Room of the Scuola di San Rocco. For a fuller description of the picture, see *Stones of Venice*, vol. iii. (Venetian Index, s. "Rocco, Scuola di San," No. 59). A photographic reproduction of the picture is given at p. 84 of J. B. Stoughton Holborn's *Tintoretto*.]

⁴ [Fuseli says of the picture: "The stormy brush of Tintoretto swept individual woe away in general masses. Two immense wings of light and shade divide the composition, and hide the want of sentiment in tumult." The other pictures of the Massacre noticed by Fuseli are by Bandinelli, Rubens, Le Brun, Poussin, and Raphael (quoted above, p. 272). See Lecture iii., *Life and Writings*, ii. 175-176.]

faithfully than by words;¹ but I shall at present terminate our series of illustrations by reference to a work of less touching, but more tremendous appeal; the Last Judgment in the Church of Santa Maria dell' Orto.² In this subject, almost all realizing or local statement had been carefully avoided by the most powerful painters, they judging it better to represent its chief circumstances as generic thoughts, and present them to the mind in a typical or abstract form. In the Judgment of Angelico the treatment is purely typical; a long Campo Santo, composed of two lines of graves, stretches away into the distance; on the left side of it rise the condemned; on the right the just.³ With Giotto and Orcagna,⁴ the conception, though less rigid, is equally typical; no effort being made at

¹ [An intention which Ruskin did not succeed in carrying out.]

² [For Ruskin's first note of this picture, see Introduction, pp. xxxvi.-xxxvii.]

³ [There are several examples of this subject by Fra Angelico. One of the best is in the Accademia at Florence (see Karl Károly's *Guide to the Paintings of Florence*, 1893, p. 133, for notices of it); another, from the Dudley collection, is now at Berlin (for a photographic reproduction, see *Fra Angelico*, by Langton Douglas, 1900, p. 132).]

⁴ [For an illustration of Giotto's Last Judgment at Padua, see *Giotto and his Works at Padua*. Orcagna's (one of a series now ascribed by some to Bernardo Daddi) is in the Campo Santo at Pisa. Ruskin gave an interesting account of the fresco in his 1845 note-book:—

“One hardly knows where to look for the first origin of the conventional mode of treating this subject, afterwards followed by all painters up to Michel Angelo. If *this* be the first idea, Orcagna should stand high in the list of truly creative painters. The origin of M. Angelo's whole plan is here. The Christ, in a singular oval glory divided by concentric lines like those on a watch case, and the resultant parallelograms thrown into rainbow zones of green and gold. The glory is just the shape of the Greek A,—Christ sitting on the cross bar. His right hand raised as in M. Angelo's. With his left he points to the wound in his side. At first, and from below, I thought the face a failure, but on close examination it gained upon me, and I have now every reason to suppose it very fine. It does not strike at first owing to a most meritorious effort of Orcagna's at rendering it perfectly tranquil and passionless. The brow is, however, slightly knit, but the eyes have no *local* direction, they seem to command all things. The Madonna in a similar glory, but lower and less, sits on the right hand. She is decidedly a failure—one of the most insipid figures in the whole work; nor is the action of the hand on the knee well explained. The hand is, however, finely drawn.

“On each side of these figures, but above, are three angels. Those on the right bear the Nails, Sponge, and Spear. Those on the left, the Cross, Scourge, and Shroud. Below them, six on each side, are the Apostles. These are by far the finest figures in the whole work. The St. John is perfectly sublime; the second and fifth, counting from right hand, also deserve careful study, the latter looking down on the condemned with bitter pity, the former partly in pity but more in indignation and disgust. The great mass of the condemned are on the whole done rather for general effect and *distant*, and there is great want of dramatic conception. There are different degrees

the suggestion of space, and only so much ground represented as is absolutely necessary to support the near figures and allow space for a few graves. Michael Angelo in no respect differs in his treatment, except that his figures are less symmetrically grouped, and a greater conception of space is given by their various perspective. No interest is attached to his background in itself. Fra Bartolomeo, never able to grapple with any species of sublimity except that of simple religious feeling, fails most signally in this mighty theme.* His group of the dead, including not more than ten or twelve figures, occupies the foreground only; behind them a vacant plain extends to the foot of a cindery volcano, about whose mouth several little black devils like spiders are skipping and crawling. The judgment of quick and dead is thus expressed as taking place in about a rood square, and on a single group; the whole of the space and horizon of the sky and land being left vacant, and the presence of the Judge of all the earth made more finite than the sweep of a whirlwind or a thunder-storm.

§ 24. *By Tintoret.* By Tintoret only has this unimaginable event been grappled with in its Verity; not typically nor symbolically, but as they may see it who shall not sleep, but be

* Fresco in an outhouse of the Ospedale St^a Maria Nuova at Florence.¹

of grief but very little attempt at expressing either different character or different *conditions* of emotion. One head only is very fine in this respect, that of a Dominican just above the queen in green, who is in the front row. This monk in the midst of the howling, struggling, and shrieking crowd is abandoned to a fixed, quiet, tearful despair, seemingly rather reviewing his past life, than intent on what is around him. The green queen too would have been fine, had the face been of a higher type; she is trying to pull back another female from the grasp of a demon, and seems rather intent on this victim than on herself. But all the kings and queens are a good deal like Sadler's Wells ones, and the mass of the figures exhibit nothing but various degrees of a mean terror, howling grief, or a despair which, except in the case of the monk above mentioned, Orcagna has failed to express except by covering the face with the hands . . ."

With this passage, *cf.* Ruskin's review of Lord Lindsay, *On the Old Road*, 1899, i. § 73.]

¹ [Painted in 1499 for the cloistered cemetery of S. Maria Novella; now in the Picture Gallery of the Hospital and greatly damaged. It was sawn from the wall and placed in an open court, where it suffered greatly from damp until it was transferred to the picture gallery. The lower part was completed by Mariotto Albertinelli. The upper part of the composition, by Fra Bartolommeo, evidently influenced the design of Raphael's "Disputa." An outline reproduction of the fresco is given at vol. ii. p. 446 of Kugler's *Handbook of Painting*, ed. 1887.]

changed. Only one traditional circumstance he has received with Dante¹ and Michael Angelo, the Boat of the Condemned; but the impetuosity of his mind bursts out even in the adoption of this image; he has not stopped at the scowling ferryman of the one, nor at the sweeping blow and demon dragging of the other, but seized Hylas-like by the limbs, and tearing up the earth in his agony, the victim is dashed into his destruction: nor is it the sluggish Lethe, nor the fiery lake that bears the cursed vessel, but the oceans of the earth and the waters of the firmament gathered into one white, ghastly cataract; the river of the wrath of God, roaring down into the gulf where the world has melted with its fervent heat,² choked with the ruin of nations, and the limbs of its corpses tossed out of its whirling, like water-wheels. Bat-like, out of the holes and caverns and shadows of the earth, the bones gather and the clay heaps heave, rattling and adhering into half-kneaded anatomies, that crawl, and startle, and struggle up among the putrid weeds, with the clay clinging to their clotted hair, and their heavy eyes sealed by the earth darkness yet, like his of old who went his way unseeing to the Siloam Pool; shaking off one by one the dreams of the prison-house, hardly hearing the clangour of the trumpets of the armies of God, blinded yet more, as they awake, by the white light of the new Heaven, until the great vortex of the four winds bears up their bodies to the judgment-seat: the Firmament is all full of them, a very dust of human souls, that drifts, and floats, and falls in the interminable, inevitable light; the bright clouds are darkened with them as with thick snow, currents of atom life in the arteries of heaven, now soaring up slowly, and higher and higher still, till the eye and the thought can follow no farther, borne up, wingless, by their inward faith and by the angel powers invisible, now hurled in countless drifts of horror before the breath of their condemnation.³

¹ [*Inferno*, iii. 89.]

² [2 Peter iii. 12.]

³ This description also was quoted in *Stones of Venice*, vol. iii. (Venetian Index, s. "Orto").]

Now, I wish the reader particularly to observe throughout all these works of Tintoret, the distinction of the Imaginative Verity from falsehood on the one hand, and from realism on the other. The power of every picture depends on the penetration of the imagination into the TRUE nature of the thing represented, and on the utter scorn of the imagination for all shackles and fetters of mere external fact that stand in the way of its suggestiveness. In the Baptism it cuts away the trunks of trees as if they were so much cloud or vapour, that it may exhibit to the thought the completed sequency of the scene;* in the Massacre it covers the marble floor with visionary light, that it may strike terror into the spectator without condescending to butchery; it defies the bare fact, but creates in him the fearful feeling; in the Crucifixion it annihilates locality, and brings the palm leaves to Calvary, so only that it may bear the mind to the Mount of Olives; as in the Entombment¹ it brings the manger to Jerusalem, that it may take the heart to Bethlehem; and all this it does in the daring consciousness of its higher and spiritual verity, and in the entire knowledge of the fact and substance of all that it touches. The imaginary boat of the demon angel expands the rush of the visible river into the descent of irresistible condemnation; but to make that rush and roar felt by the eye and heard by the ear, the rending of the pine branches above the cataract is taken directly from nature; it is an abstract of Alpine storm. Hence, while we are always placed face to face with whatever is to be told, there is in and beyond its reality a voice supernatural; and that which is doubtful in the vision has strength, sinew, and assuredness, built up in it by fact.

* The same thing is done yet more boldly in the large composition of the ceiling, the Plague of Fiery Serpents:² a part of the host, and another sky horizon, are seen through an opening in the ground.

¹ [At Parma; see above, ch. iii. § 16, p. 262; and *Modern Painters*, vol. iii. ch. xviii. § 18 (plate 17).]

² [Also in the Scuola di San Rocco, on the roof of the Upper Room; see for a full description of the picture, *Stones of Venice* (Venetian Index, s. "Rocco, Scuola di San," No. 24).]

Let us, however, still advance one step farther, and observe the imaginative power deprived of all aid from chiaroscuro, colour, or any other means of concealing the framework of its thoughts.

§ 26. *The Imagination, how manifested in sculpture.*

It was said by Michael Angelo that “non ha l’ottimo scultore alcun concetto, ch’ un marmo solo in se non circoscriva,”¹ a sentence which, though in the immediate sense intended by the writer it may remind us a little of the indignation of Boileau’s Pluto, “Il s’ensuit de-là que tout ce qui se peut dire de beau est dans les dictionnaires; il n’y a que les paroles qui sont transposées,”² yet is valuable, because it shows us that Michael Angelo held the imagination to be entirely expressible in rock, and therefore altogether independent, in its own nature, of those aids of colour and shade by which it is recommended in Tintoret, though the sphere of its operation is of course by these incalculably extended. But the presence of the imagination may be rendered in marble as deep, thrilling, and awful as in painting, so that the sculptor seek for the soul and govern the body thereby.

Of unimaginitive work, Bandinelli and Canova supply us with characteristic instances of every kind: the Hercules and Cacus of the former, and its criticism by Cellini, will occur at once to every one;³ the disgusting statue now placed so as to conceal Giotto’s important tempera picture in Santa Croce is a better

§ 27. *Bandinelli, Canova, Mino da Fiesole.*

¹ [Sonnet xv. The original reads “artista,” not “scultore.” J. A. Symonds (*Sonnets of Michael Angelo*, etc., 1878, p. 46) thus translates

“The best of artists hath no thought to show
What the rough stone in its superfluous shell
Doth not include: to break the marble spell
Is all the hand that serves the brain can do.”]

² [From “Les Héros de Roman: Dialogue a la manière de Lucien,” p. 180 in the *Oeuvres Complètes de Boileau-Despréaux*, 1861.]

³ [For Bandinelli, see above, p. 168 *n.*; for Canova, p. 121. This statue by Baccio Bandinelli (1488–1560), made in 1546, stands in the Piazza della Signoria at Florence. Cellini’s very entertaining criticism of it given to the Grand Duke, in presence of Bandinelli—who, says Cellini, “writhed and made the most ugly faces”—is in ch. lxx. of the second book of his *Autobiography* (Symonds’ translation, ed. 1888, ii. 221).]

instance;¹ but a still more impressive lesson might be received by comparing the inanity of Canova's garland grace, and ball-room sentiment,² with the intense truth, tenderness, and power of men like Mino da Fiesole, whose chisel leaves many a hard edge, and despises down and dimple, but it seems to cut light and carve breath, the marble burns beneath it, and becomes § 28. *Michael* transparent with very spirit.³ Yet Mino stopped at *Angelo*. the human nature; he saw the soul, but not the ghostly presences about it; it was reserved for Michael Angelo to pierce deeper yet, and to see the

¹ [In the Capella dei Baroncelli, in the south transept, is Bandinelli's "Dead Christ" in marble. For another reference to it, see above, p. 194. Ruskin's account of it in his note-book of 1845 is as follows:—

"It is difficult to speak of this work (marble, colossal) in terms of sufficient dispraise. It is a bad statue of a dying French duellist or gamester, and the legs of the model have been so bad that, I think in almost every point, their forms may be taken to contrast with the Elgins as pure examples of the wrong. The details and particular references are given at pages 17 and 38 of the note-book [a book of sketches, etc., in illustration of the written diary]. But the peculiarity of its general effect is not there stated. Commonly when a statue is by an inferior hand, one feels a want of vitality, or a rigidity or an imperfection of form resulting from deficient knowledge, or want of completion or badly selected position; but here there is no stoniness, no rigidity, no incompleteness; the statue has the disgusting effect of an ugly, naked body; one has the same reluctance to go near it, that one would have if it were a dirty, stripped Italian; the whole purity of the marble is destroyed by the man's vulgar conception, and this is an effect I never recollect having before perceived. Usually bad sculpture is not fleshy enough, but this is too much so."

This sculpture partially conceals Giotto's altar-piece, in five panels, of "The Coronation of the Virgin."

² [Cf. preceding volume, p. 230.]

³ [Ruskin had been specially struck by the two tombs by Mino da Fiesole in the church of the Badia. He writes in his note-book of 1845:—

"The recumbent figures have all his usual animation, but the gem of the church is the little child on the right hand side of that of Ugo, Count of Tuscany. It is the most beautiful and breathing realisation of infancy that ever sculptor struck; no fat legs, nor hands that look like stuffed gloves; no curly hair nor round cheeks nor bee-stung lips; the child is thin and somewhat hard in outline, there is no fine nor soft chiselling about it; it looks as if it had been exhausted by too much of the strong life within it, worn out with mind; and the execution is not delicate neither, but in many places hard and false or imperfect in what is commonly called *drawing*, and this is especially the case with the mouth, which hardly looks like a mouth at all when one looks close at it, but is rather like a deep chip or crack in the marble, and yet at the right distance it is a mouth all lighted up with love and child sweetness, altogether divine. Neither can I at all trace the sources of the heavenly expression in the eyes, for all is simply and even rudely cut, but the lines though apparently not refined in drawing are refined in their degree, their lightness and untraceableness being as total a defeat of all attempt to copy or imitate as nature herself."]

indwelling angels. No man's soul is alone; Laocoon or Tobit, the serpent has it by the heart or the angel by the hand; the light or the fear of the Spiritual things that move beside it may be seen on the body; and that bodily form with Buonarotti, white, solid, distinct, material, though it be, is invariably felt as the instrument or the habitation of some infinite, invisible power. The earth of the Sistine Adam that begins to burn; the woman-embodied burst of Adoration from his sleep; the twelve great torrents of the Spirit of God that pause above us there, urned in their vessels of clay; the waiting in the shadow of futurity of those through whom the Promise and Presence of God went down from the Eve to the Mary, each still and fixed, fixed in his expectation, silent, foreseeing, faithful, seated each on his stony throne, the building stones of the word of God, building on and on, tier by tier, to the Refused one the head of the corner;¹ not only these, not only the troops of terror torn up from the earth by the four-quartered winds of the Judgment, but every fragment and atom of stone that he ever touched became instantly inhabited by what makes the hair stand up and the words be few: the St. Matthew, not yet disengaged from his sepulchre, bound hand and foot by his grave clothes, it is left for us to loose him; the strange spectral wreath of the Florence Pietà, casting its pyramidal, distorted shadow, full of pain and death, among the faint purple light that cross and perish under the obscure dome of St.^a Maria del Fiore; the white lassitude of joyous limbs, panther-like, yet passive, fainting with their own delight, that gleam among

¹ [The description down to this point is of the roof of the Sistine Chapel. (1) The creation of Adam, (2) the creation of Eve, and (3) the twelve Sibyls and Prophets, heralds and pioneers of Christ. "The Last Judgment" is of course on the wall of the same chapel. The "St. Matthew not yet disengaged from his sepulchre" refers to the huge roughed-out form of the disciple, now in the courtyard of the Accademia at Florence—the perfect shape not yet unloosed. "He also began," says Vasari, "a statue in marble of S. Matteo which, though it is but roughly hewn, shows perfection of design, and teaches sculptors how to extract figures from the stone." The unfinished Pietà—the sculptor's last work in marble—stands behind the high altar in the Cathedral of Florence. For the "Bacchus" in the Uffizi, see preceding volume, p. 118. The "Day and Night" and the "Dawn and Twilight" are of course in the Sagrestia Nuova of San Lorenzo; for another reference to them, see next volume, ch. viii. § 6, and, for Ruskin's study of them, see above, Introduction, p. xxi.]

the Pagan formalisms of the Uffizii, far away, separating themselves in their lustrous lightness as the waves of an Alpine torrent do by their dancing from the dead stones, though the stones be as white as they;* and finally, and perhaps more than all, those four ineffable types, not of darkness nor of day—not of morning nor evening, but of the departure and the resurrection, the twilight and the dawn of the souls of men—together with the spectre sitting in the shadow of the niche above them; † all these, and all else that I could

* The Bacchus. There is a small statue opposite it, also unfinished; but “a spirit still.”

† I would have insisted more on the ghostly vitality of this dreadful statue; but the passage referring to it in Rogers’ *Italy* supersedes all further description. I suppose most lovers of art know it by heart.

“Nor then forget that chamber of the dead,
Where the gigantic shapes of Night and Day,
Turned into stone, rest everlastingly:
Yet still are breathing and shed round at noon
A twofold influence,—only to be felt—
A light, a darkness, mingling each with each;
Both, and yet neither. There, from age to age,
Two ghosts are sitting on their sepulchres.
That is the Duke Lorenzo. Mark him well.
He meditates, his head upon his hand.

What from beneath his helm-like bonnet scowls?
Is it a face, or but an eyeless skull?
'Tis lost in shade; yet, like the basilisk,
It fascinates, and is intolerable.
His mien is noble, most majestic!
Then most so, when the distant choir is heard
At morn or eve—nor fail thou to attend
On that thrice-hallowed day, when all are there;
When all, propitiating with solemn songs,
Visit the dead. Then wilt thou feel his power!”

It is strange that this should be the only written instance (as far as I recollect) of just and entire appreciation of Michael Angelo’s spiritual power.¹ It is perhaps owing to the very intensity of his imagination that he has been so little understood: for, as I before said, imagination can never be met by vanity, nor without earnestness. His Florentine followers saw in him an

¹ [A few years later, Elizabeth Barrett Browning (who, as we have seen, Vol. III. p. xxxviii., read Ruskin at Florence) wrote a fine commentary on these same statues in *Casa Guidi Windows*, i. 74 ff.]

name of his forming, have borne, and in themselves retain and exercise the same inexplicable power—inexplicable because proceeding from an imaginative perception almost super-human, which goes whither we cannot follow, and is where we cannot come; throwing naked the final, deepest root of the being of man, whereby he grows out of the invisible, and holds on his God home.*

anatomist and posture-master; and *art was finally destroyed by the influence over admiring idiocy* of the greatest mind that art ever inspired.**

** I italicised the earliest expression of my sense of the destructive power in Michael Angelo; my own mind was, however, still itself in the state described of “admiring idiocy” when I wrote the last words of the note. [1883.]

* I have not chosen to interrupt the argument respecting the essence of the imaginative faculty by any remarks on the execution of the imaginative hand; but we can hardly leave Tintoret and Michael Angelo without some notice of the pre-eminent power of execution exhibited by both of them, in consequence of their vigour and clearness of conception; nor without again¹ warning the lower artist from confounding this velocity of decision and impatience with the velocity of affectation or indolence. Every result of real imagination we have seen to be a truth of some sort; and it is the characteristic of truth to be in some way tangible, seizable, distinguishable, and clear, as it is of falsehood to be obscure, confused, and confusing. Not but that many, if not most truths have a dark side, a side by which they are connected with mysteries too high for us,—nay, I think it is commonly but a poor and miserable truth which the human mind can walk all round, but at all events they have one side by which we can lay hold of them, and feel that they are downright adamant, and that their form, though lost in cloud here and there, is unalterable and real, and not less real and rocky because infinite, and joined on, St. Michael’s Mount-like, to a far mainland. So then, whatever the real imagination lays hold of, as it is a truth, does not alter into anything else, as the imaginative part works at it, and feels over it, and finds out more of it, but comes out more and more continually; all that is found out pointing to and indicating still more behind, and giving additional stability and reality to that which is discovered already. But if it be fancy or any other form of pseudo-imagination which is at work, then that which it gets hold of may not be a truth, but only an idea, which will keep giving way as soon as we try to take hold of it, and turning into something else; so that, as we go on copying it, every part will be inconsistent with all that has gone before, and at intervals it will vanish altogether and leave blanks which must be filled up by any means at hand. And in these circumstances, the painter, unable to seize his thought, because it has not substance nor bone enough to bear grasping, is liable to catch at every line that he lays down, for help

¹ [See preceding volume, p. 126.]

Now, in all these instances, let it be observed—for it is to that end alone that I have been arguing all along—that the virtue of the Imagination is its reaching, by intuition and intensity of gaze (not by reasoning, but by its authoritative opening and revealing power), a more essential truth than is seen at the surface of things.¹ I repeat that it matters not whether the reader is willing to call this faculty Imagination or not; I do not care about the name; but I would be understood when I speak of imagination hereafter, to mean this,² the base of whose authority

§ 29. *Recapitulation. The perfect function of the Imagination is the intuitive perception of Ultimate Truth.*

and suggestion, and to be led away by it to something else, which the first effort to realize dissipates in like manner, placing another phantom in its stead; until, out of the fragments of these successive phantoms, he has glued together a vague, mindless involuntary whole, a mixture of all that was trite or common in each of the successive conceptions, for that is necessarily what is first caught, a heap of things with the bloom off and the chill on, laborious, unnatural, inane, with its emptiness disguised by affectation, and its deadness enlivened by extravagance.

Necessarily from these modes of conception, three vices of execution must result; and these are found in all those parts of the work where any trust has been put in conception, and only to be avoided in portions of actual portraiture, for a thoroughly unimaginative painter can make no use of a study—all his studies are guesses and experiments, all are equally wrong, and so far felt to be wrong by himself, that he will not work by any of them, but will always endeavour to improve upon them in the picture, and so lose the use of them. These three vices of execution are then—first, feebleness of handling, owing to uncertainty of intention; secondly, intentional carelessness of handling, in the hope of getting by accident something more than was meant; and, lastly, violence and haste of handling, in the effort to secure as much as possible of the obscure image of which the mind feels itself losing hold. I am throughout, it will be observed, attributing right feeling to the unimaginative painter; if he lack this, his execution may be cool and determined, as he will set down falsehood without blushing, and ugliness without suffering. Added to these various evidences of weakness, will be the various vices assumed for the sake of concealment; morbid refinements disguising feebleness,—or insolence and coarseness to cover desperation. When the imagination is powerful, the resulting execution is of course the contrary of all this: its first steps will commonly be impetuous, in clearing its

¹ [With this § compare *Stones of Venice*, vol. iii. ch. iii. § 62, and *Pleasures of England*, § 90.]

² [Ed. 1 reads:—

“to mean this, the true foundation of all art which exercises eternal authority over men’s minds; (all other imagination than this is either secondary and contemplative, or utterly spurious); the base of whose authority . . .”]

and being is its perpetual thirst for truth and purpose to be true. It has no food, no delight, no care, no perception, except of truth; it is forever looking under masks, and burning up mists; no fairness of form, no majesty of seeming will satisfy it; the first condition of its existence is incapability of being deceived; and though it sometimes dwells upon and substantiates the fictions of fancy, yet its own operation is to trace to their farthest limit the true laws and likelihoods even of the fictitious creation. This has been well explained by Fuseli, in his allusion to the Centaur of

ground and getting at its first conception—as we know of Michael Angelo in his smiting his blocks into shape (see the passage quoted by Sir Charles Bell in the *Essay on Expression*, from Blaise de Vigenere),¹ and as is visible in the handling of Tintoret always: as the work approaches completion, the stroke, while it remains certain and firm, because its end is always known, may frequently become slow and careful, both on account of the difficulty of following the pure lines of the conception, and because there is no fear felt of the conception's vanishing before it can be realized; but generally there is a certain degree of impetuosity visible in the works of all the men of high imagination, when they are not working from a study, showing itself in Michael Angelo by the number of blocks he left unfinished, and by some slight evidences in those he completed of his having worked painfully towards the close; so that, except the Duke Lorenzo, the Bacchus of the Florentine Gallery, and the Pietà of Genoa, I know not any of his finished works in which his mind is as mightily expressed as in his marble sketches; only, it is always to be observed that impetuosity or rudeness of hand is not necessarily—and, if imaginative, is never—carelessness. In the two landscapes at the end of the Scuola di San Rocco,² Tintoret has drawn several large tree trunks with two strokes of his brush—one for the dark, and another for the light side; and the large rock at the foot of the picture of the Temptation is painted with a few detached touches of grey over a flat brown ground; but the touches of the tree trunks have been followed by the mind as they went

¹ [*Anatomy of Expression*, 3rd ed., p. 207. The following is the passage: "I have seen Michael Angelo, when above sixty, and not very robust, make more fragments of the marble fly off in a quarter of an hour than three vigorous young sculptors would have done in an hour; and he worked with so much impetuosity, and put such strength into his blows, that I feared he would have broken the whole in pieces, for portions, the size of three or four fingers, were struck off so near to the contour or outline, that, if he erred by a hair's-breadth, he would have spoiled all and lost his labour, since the defect could not have been remedied as in working in clay."]

² [The pictures referred to are apparently the "Magdalen" and "St. Mary of Egypt" in the Lower Room; see *Stones of Venice*, vol. iii. (Venetian index, s. "Rocco, Scuola di San," Nos. 5 and 6). On Tintoret's rapidity of execution in this respect, see above, Introduction, p. xxxix. The "Temptation" is in the Upper Room; for a further description of it, see *Stones of Venice*, *ibid.*, No. 20. It is reproduced as the frontispiece to J. B. Stoughton Holborn's *Tintoretto*.]

Zeuxis;¹ and there is not perhaps a greater exertion of imaginative power than may be manifested in following out to their farthest limits the necessary consequences of such arbitrary combination; but let not the jests of the fancy be confounded with that after serious work of the imagination which gives them all the nervous verity and substance of which they are capable. Let not the monsters of Chinese earthenware be confounded with the Faun, Satyr, or Centaur.

How different this definition of the Imagination may be from the idea of it commonly entertained among us, I can hardly say, because I have a very indistinct idea of what is usually meant by the term. I hear modern works constantly praised as being imaginative, in which I can trace no virtue of any kind; but simple, slavish, unpalliated falsehood and exaggeration. I see

§ 30. *Imagination, how vulgarly understood.*

down with the most painful intensity through their every undulation; and the few grey strokes on the stone are so considered that a better stone could not be painted if we took a month to it: and I suppose, generally, it would be utterly impossible to give an example of execution in which less was left to accident, or in which more care was concentrated in every stroke, than the seemingly regardless and impetuous handling of this painter.

On the habit of both Tintoret and Michael Angelo to work straight forward from the block and on the canvas, without study or model, it is needless to insist; for though this is one of the most amazing proofs of their imaginative power, it is a dangerous precedent. No mode of execution ought ever to be taught to a young artist as better than another; he ought to understand the truth of what he has to do; felicitous execution will follow as a matter of course; and if he feels himself capable of getting at the right at once, he will naturally do so without reference to precedent. He ought to hold always that his duty is to attain the highest result he can—but that no one has any business with the means or time he has taken. If it can be done quickly, let it be so done; if not, let it be done at any rate. For knowing his way he is answerable, and therefore must not walk *doubtfully*; but no one can blame him for walking *cautiously*, if the way be a narrow one, with a slip on each side. He may pause, but he must not hesitate—and tremble, but must not vacillate.

¹ [True invention, says Fuseli, “discovers, selects, combines the *possible*, the *probable*, the *known*, in a mode that strikes with an air of truth and novelty, at once. Possible . . . means the representation of effects derived from causes, or forms compounded from materials, heterogeneous and incompatible among themselves, but rendered so plausible to our senses, that the transition of one part to another seems to be accounted for by an air of organisation . . . ; that this was the condition on which, and the limits within which alone the ancients permitted invention to represent what was, strictly speaking, impossible, we may with plausibility surmise from the picture of Zeuxis, described by Lucian in the memoir to which he has prefixed that painter’s name, who was probably one of the first adventurers in this species of

not what merit there can be in pure, ugly, resolute fiction; it is surely easy enough to be wrong; there are many ways of being unlike nature. I understand not what virtue that is which entitles one of these ways to be called imaginative, rather than another; and I am still further embarrassed by hearing the portions of those works called especially imaginative in which there is the most effort at minute and mechanical statement of contemptible details, and in which the artist would have been as actual and absolute in imitation as an echo, if he had known how. Against convictions which I do not understand I cannot argue; but I may warn the artist that imagination of this strange kind is not capable of bearing the time test; nothing of its doing has continued its influence over men; and if he desires to take place among the great men of older time, there is but one way for it; and one kind of imagination that will stand the immortal light: I know not how far it is by effort cultivable; but we have evidence enough before us to show in what direction that effort must be made.

We have seen (§ 10) that the Imagination is in no small degree dependent on acuteness of moral emotion; in fact, all moral truth can only thus be apprehended—and it is observable, generally, that all true and deep emotion is imaginative, both in conception and expression; and that the mental sight becomes sharper with every full beat of the heart: and, therefore, all egotism, and selfish care, or regard are, in proportion to their constancy, destructive of imagination; whose play and power depend altogether on our being able to forget ourselves and enter, like possessing spirits, into the bodies of things about us.

Again, as the Life of Imagination is in the discovering of truth, it is clear it can have no respect for sayings or opinions: knowing in itself when it has invented truly, restless and tormented except when it has this knowledge, its sense of success or failure is too acute to

imagery.” Fuseli goes on to recall the pains taken by Zeuxis “to give plausibility to a compound of heterogeneous forms, to inspire them with suitable soul, and to imitate the laws of existence.” But the Athenians admired not this artistic intention, but only the novelty of the subject, and the artist covered up his picture in disgust. (Lecture iii., in the *Life and Writings of Fuseli*, ii. 138.)]

§ 31. *How its cultivation is dependent on the moral feelings.*

§ 32. *On independence of Mind,*

be affected by praise or blame. Sympathy it desires—but can do without; of opinions it is regardless, not in pride but because it is conscious of a rule of action and object of aim in which it cannot be mistaken; partly, also, in pure energy of desire, and longing to do and to invent more and more, which suffer it not to suck the sweetness of praise—unless a little with the end of the rod in its hand, and without pausing in its march. It goes straight forward up the hill; no voices nor mutterings can turn it back, nor petrify it from its purpose.*

Finally, it is evident that, like the theoretic faculty, the imagination must be fed constantly by external nature—after the illustrations we have given this may seem mere truism, for it is clear that to the exercise of the penetrative faculty a subject of penetration is necessary; but I note it because many painters of powerful mind have been lost to the world by their suffering the restless writhing of their imagination in its cage to take place of its healthy and exulting activity in the fields of nature.¹ The most imaginative men always study the hardest, and are the most thirsty for new knowledge. Fancy plays² like a squirrel in its circular prison, and is happy: but Imagination is a pilgrim on the earth—and her home is in heaven. Shut her from the fields of the celestial mountains—bar her from breathing their lofty, sun-warmed air; and we may as well turn upon her the last bolt of the Tower of Famine, and give the keys to the keeping of the wildest surge that washes Capraja and Gorgona.^{3*} That which we know of the lives of M. Angelo and Tintoret is eminently illustrative of this temper.

§ 33. *And on
habitual
reference to
nature*

¹ [Ed. I had a note, among the Addenda, referring to this passage; the note is given below, p. 341.]

² [This passage, "Fancy plays" to the end of the chapter, is § 14 of *Fronde Agrestes*, where Ruskin added the following note:—

"I leave this passage, as my friend has chosen it; but it is unintelligible without the contexts, which show how all the emotions described in the preceding passages of this section, are founded on trust in the beneficence and rule of an Omnipotent Spirit.]

³ [For the Tower of Famine, see Vol. I. p. 115. The Tuscan islands—Capraja (the "island of goats," so called by the ancients also) and Gorgona, a yet more sterile island affording pasture to wild goats only—would often have been seen by Ruskin from the mainland.]

CHAPTER IV

OF IMAGINATION CONTEMPLATIVE

WE have, in the two preceding chapters, arrived at definite conclusions respecting the power and essence of the imaginative faculty. In these two acts of penetration and combination, its separating and characteristic attributes are entirely developed; it remains for us only to observe a certain habit or mode of operation in which it frequently delights, and by which it addresses itself to our perceptions more forcibly, and asserts its presence more distinctly than in those mighty but more secret workings wherein its life consists.

§ 1. *Imagination contemplative is not part of the essence, but only a habit of the faculty.*

In our examination of the combining imagination, we chose to assume the first or simple conception to be as clear in the absence as in the presence of the object of it. This, I suppose, is, in point of fact, never the case, nor is an approximation to such distinctness of conception always a characteristic of the imaginative mind. Many persons have thorough and felicitous power of drawing from memory, yet never originate a thought, nor excite an emotion.

The form in which Conception actually occurs to ordinary minds appears to derive value and preciousness from that indefiniteness which we alluded to in the second chapter (§ 2); for there is an unfailing charm in the memory and anticipation of things beautiful, more sunny and spiritual than attaches to their presence; for with their presence it is possible to be sated, and even wearied, but with the imagination of them never; in so far that it needs some self discipline to prevent the mind from falling into a morbid condition of dissatisfaction with all that it immediately possesses, and continual longing for things absent;

§ 2. *The ambiguity of Conception.*

and yet I think this charm is not justly to be attributed to the mere vagueness and uncertainty of the conception, except thus far, that of objects whose substantial presence was painful, the sublimity and impressiveness, if there were any, are retained in the conception, while the sensual offensiveness is withdrawn; thus circumstances of horror may be safely touched in verbal description, and for a time dwelt upon by the mind as often by Homer and Spenser (by the latter frequently with too much grossness),¹ which could not for a moment be regarded or tolerated in their reality, or on canvas; and besides this mellowing and softening operation on those it retains, the conceptive faculty has the power of letting go many of them altogether out of its groups of ideas, and retaining only those where the “*meminisse juvabit*”² will apply; and in this way the entire group of memories becomes altogether delightful. But of

those parts of anything which are in themselves beautiful, I think the indistinctness no benefit, but that the brighter they are the better; and that the peculiar charm we feel in conception results from its grasp and blending of ideas, rather than from their obscurity; for we do not usually recall, as we have seen, one part at a time only of a pleasant scene, one moment only of a happy day; but together with each single object we summon up a kind of crowded and involved shadowing forth of all the other glories with which it was associated, and into every moment we concentrate an epitome of the day; and it will happen frequently that even when the visible objects or actual circumstances are not in detail remembered, the feeling and joy of them are obtained we know not how or whence: and so, with a kind of conceptive burning-glass, we bend the sunshine of all the day, and the fulness of all the scene upon every point that we successively seize; and this together with more vivid action of Fancy, for I think that the wilful and playful seizures of

¹ [Ed. 1 reads, “. . . grossness, as in the description of the combat of the Red Cross Knight with Errour . . .),” *Faerie Queene*, book i. canto i.]

² [Virgil, *Aeneid*, i. 203.]

the points that suit her purpose, and help her springing, whereby she is distinguished from simple conception, take place more easily and actively with the memory of things than in presence of them. But, however this be, and I confess that there is much that I cannot satisfactorily to myself unravel with respect to the nature of simple conception, it is evident that this agreeableness, whatever it be, is not by art attainable, for all art is, in some sort, realization; it may be the realization of obscurity or indefiniteness, but still it must differ from the mere *conception* of obscurity and indefiniteness; so that whatever emotions depend absolutely on imperfectness of conception, as the horror of Milton's Death, cannot be rendered by art; for art can only lay hold of things which have shape, and destroys by its touch the fearfulness or pleasurable-ness of those which "shape have none."¹

But on this indistinctness of conception, itself comparatively valueless and unaffecting, is based the operation of the Imaginative faculty with which we are at present concerned, and in which its glory is consummated; whereby, depriving the subject of material and bodily shape, and regarding such of its qualities only as it chooses for particular purpose, it forges these qualities together in such groups and forms as it desires, and gives to their abstract being consistency and reality, by striking them as it were with the die of an image belonging to other matter, which stroke having once received, they pass current at once in the peculiar conjunction and for the peculiar value desired.

§ 4. But gives to the Imagination its regardant power over them.

Thus, in the description of Satan quoted in the first chapter,² "And like a comet burned," the bodily shape of the angel is destroyed, the inflaming of the formless spirit is alone regarded; and this, and his power of evil, associated in one fearful and abstract conception, are stamped to give them distinctness and permanence with the image of the

¹ [*Paradise Lost*, ii. 667.]

² [Of the second section, p. 226 above.]

comet, "That fires the length of Ophiuchus huge." Yet this could not be done, but that the image of the comet itself is in a measure indistinct, capable of awful expansion, and full of threatening and fear. Again, in his fall, the imagination gathers up the thunder, the resistance, the massy prostration, separates them from the external form, and binds them together by the help of that image of the mountain half sunk; which again would be unfit but for its own indistinctness, and for that glorious addition "with all his pines,"¹ whereby a vitality and spear-like hostility are communicated to its falling form; and the fall is marked as not utter subversion, but sinking only, the pines remaining in their uprightness and unity, and threatening of darkness upon the descended precipice; and again, in that yet more noble passage at the close of the fourth book, where almost every operation of the contemplative imagination is concentrated; the angelic squadron first gathered into one burning mass by the single expression "sharpening in mooned horns," then told out in their unity and multitude and stooped hostility, by the image of the wind upon the corn; Satan endowed with godlike strength and endurance in that mighty line, "Like Teneriff or Atlas, unremoved," with infinitude of size the next instant, and with all the vagueness and terribleness of spiritual power, by the "Horror plumed," and the "*what seemed both spear and shield.*"²

The third function of Fancy already spoken of as subordinate to this of the Imagination, is the highest of which she is capable; like the Imagination, she beholds in the things submitted to her treatment things different from the actual; but the suggestions she follows are not in their nature essential in the object contemplated; and the images resulting, instead of illustrating, may lead the mind away from it, and change the current of contemplative feeling: for, as in her operation parallel to Imagination penetrative we saw her dwelling upon

§ 5. *The third office of Fancy distinguished from Imagination contemplative.*

¹ [See above, p. 227].

² [The references here are to *Paradise Lost*, book iv., lines 978, 982, 987, 989, 990.]

external features, while the nobler sister faculty entered within; so now, when both, from what they see and know in their immediate object, are conjuring up images illustrative or elevatory of it, the Fancy necessarily summons those of mere external relationship, and therefore of unaffecting influence; while the Imagination, by every ghost she raises, tells tales about the prison house, and therefore never loses her power over the heart, nor her unity of emotion. On the other hand, the regardant or contemplative action of Fancy is in this different from, and in this nobler than, that mere seizing and likeness-catching operation we saw in her before; that, when contemplative, she verily believes in the truth of the vision she has summoned, loses sight of actuality, and beholds the new and spiritual image faithfully and even seriously; whereas, before, she summoned no spiritual image, but merely caught the vivid actuality, or the curious resemblance of the real object; not that these two operations are separate, for the Fancy passes gradually from mere vivid sight of reality, and witty suggestion of likeness, to a ghostly sight of what is unreal; and through this, in proportion as she begins to feel, she rises towards and partakes of Imagination itself; for Imagination and Fancy are continually united, and it is necessary, when they are so, carefully to distinguish the feelingless part which is Fancy's, from the sentient part, which is Imagination's. Let us take a few instances. Here is Fancy, first, very beautiful, in her simple capacity of, likeness-catching:

“To-day we purpose—ay this hour we mount,
To spur three leagues towards the Apennine.
Come down, we pray thee, ere the *hot sun count*
His dewy rosary on the eglantine.”¹

Seizing on the outside resemblances of bead form, and on the slipping from their threading bough one by one, the fancy is content to lose the heart of the thing, the solemnity

¹ [Keats: *Isabella*, xxiv. For Ruskin's intense admiration of this “glorious poet,” see *Modern Painters*, vol. v. pt. vi. ch. ix. § 9 n.]

of prayer: or perhaps I do the glorious poet wrong in saying this, for the sense of a sun worship and orison in beginning its race, may have been in his mind; and so far as it was so, the passage is imaginative and not fanciful. But that which most readers would accept from it, is the mere flash of the external image, in whose truth the Fancy herself does not yet believe, and therefore is not yet contemplative. Here, however, is Fancy believing in the images she creates:

“It feeds the quick growth of the serpent vine,
And the dark linked ivy tangling wild,
And budding, blown, or odour-faded blooms,
Which *star the winds with points of coloured light*
As they rain through them; and *bright golden globes*
Of fruit, suspended in their own green heaven.”¹

It is not, observe, a mere likeness that is caught here; but the flowers and fruit are entirely deprived by the fancy of their material existence, and contemplated by her seriously and faithfully as stars and worlds; yet it is only external likeness that she catches; she forces the resemblance, and lowers the dignity of the adopted image.

Next take two delicious stanzas of Fancy regardant (believing in her creations), followed by one of heavenly imagination, from Wordsworth’s address to the daisy:²

“A nun demure of lowly port;
Or sprightly maiden, of Love’s court,
In thy simplicity the sport
Of all temptations.
A queen in crown of rubies drest;
A starveling in a scanty vest;
Are all, as seems to suit thee best,
Thy appellations.

“I see thee glittering from afar—
And then thou art a pretty star;
Not quite so fair as many are
In heaven above thee!

¹ [Shelley: *Prometheus*, iii. 3.]

² [The poem of 1805. A stanza is omitted in the quotation after the first one. The text of the quotation has in this edition been amended, in matters of punctuation, in accordance with the original.]

Yet like a star, with glittering crest,
 Self-poised in air thou seem'st to rest;—
 May peace come never to his nest,
 Who shall reprove thee!

“Bright *Flower!* for by that name at last
 When all my reveries are past,
 I call thee, and to that cleave fast,
 Sweet silent creature!
 That breath'st with me in sun and air,
 Do thou, as thou art wont, repair
 My heart with gladness, and a share
 Of thy meek nature!”

Observe how spiritual, yet how wandering and playful, the fancy is in the first two stanzas, and how far she flies from the matter in hand; never stopping to brood on the character of any one of the images she summons, and yet for a moment truly seeing and believing in them all; while in the last stanza the imagination returns with its deep feeling to the heart of the flower, and “*cleaves fast*” to that. Compare the operation of the Imagination in Coleridge, on one of the most trifling objects that could possibly have been submitted to its action:

“The thin blue flame
 Lies on my low-burnt fire, and quivers not;
 Only that film, which fluttered on the grate,
 Still flutters there, the sole unquiet thing.
 Methinks, its motion in this hush of nature
 Gives it dim sympathies with me who live,
 Making it a companionable form,
 Whose puny flaps and freaks the idling Spirit
 By its own moods interprets, every where
 Echo or mirror seeking of itself,
 And makes a toy of Thought.”¹

Lastly, observe the sweet operation of Fancy regardant, in the following well-known passage from Scott, where both her beholding and transforming powers are seen in their simplicity:

“The rocky summits, split and rent,
 Formed turret, dome, or battlement,
 Or seemed fantastically set
 With cupola or minaret.

¹ [From the piece entitled “Frost at Midnight,” 1798.]

Nor were these earth-born castles bare,
 Nor lacked they many a banner fair,
 For, from their shivered brows displayed,
 Far o'er th' unfathomable glade,
 All twinkling with the dew-drop sheen,
 The briar-rose fell, in streamers green,
 And creeping shrubs, of thousand dyes,
 Waved in the west wind's summer sighs."¹

Let the reader refer to this passage, with its pretty tremulous conclusion—above the pine tree, “where glistening streamers waved and danced,”² and then compare with it the following, where the Imagination operates on a scene nearly similar:

“Grey rocks did peep from the spare moss, and stemmed
 The struggling brook; tall spires of windlestrae
 Threw their thin shadows down the rugged slope,
 And nought but gnarled roots of ancient pines,
 Branchless and blasted, clenched, with grasping roots,
 The unwilling soil. A gradual change was here,
 Yet ghastly. For, *as fast years flow away,*
The smooth brow gathers, and the hair grows thin
And white; and, where irradiate dewy eyes
Had shone, gleam stony orbs;—so from his steps
Bright flowers departed, and the beautiful shade
Of the green groves, with all their odorous winds
And musical motions
 Where the pass expands
 Its stony jaws, the abrupt mountain breaks,
 And seems, with its accumulated crags,
 To overhang the world; for wide expand
 Beneath the wan stars, and descending moon,
 Islanded seas, blue mountains, mighty streams,
Dim tracts and vast, robed in the lustrous gloom

¹ [*Lady of the Lake*, canto I. xi. Two lines are omitted after the fourth of the quotation.]

² [*Ibid.* xii:—

And, higher yet, the pine-tree hung
 His shatter'd trunk, and frequent flung,
 Where seem'd the cliffs to meet on high,
 His boughs athwart the narrow'd sky.
 Highest of all, where white peaks glanced,
 Where glistening streamers waved and danced,
 The wanderer's eye could barely view
 The summer heaven's delicious blue;
 So wondrous wild, the whole might seem
 The scenery of a fairy dream.]

*Of leaden-coloured even, and fiery hills
Mingling their flames with twilight, on the verge
Of the remote horizon. The near scene,
In naked and severe simplicity,
Made contrast with the universe. A pine,
Rock-rooted, stretch'd athwart the vacancy
Its swinging boughs, to each *inconstant blast*
Yielding one only response, at each pause
In most familiar cadence, with the howl,
The thunder and the hiss of *homeless* streams,
Mingling its solemn song.”¹*

In this last passage, the mind never departs from its solemn possession of the solitary scene, the Imagination only giving weight, meaning, and strange human sympathies to all its sights and sounds.

In that from Scott* the Fancy, led away by the outside resemblance of floating form and hue to the banners, loses the feeling and possession of the scene, and places herself in circumstances of character completely opposite to the quietness and grandeur of the natural objects; this would have been unjustifiable, but that the resemblance occurs to the mind of the monarch, rather than to that of the poet; and it is that which, of all others, would have been the most likely to occur at the time; from this point of view it has high imaginative propriety. Of the same fanciful character is that transformation of the tree trunks into dragons noticed before in Turner's Jason;² and in the same way this becomes imaginative,

* Let it not be supposed that I mean to compare the sickly dreaming of Shelley³ over clouds and waves, with the masculine and magnificent grasp of men and things which we find in Scott; it only happens that these two passages are more illustrative, by the likeness of the scenery they treat, than any others I could have opposed, and that Shelley is peculiarly distinguished by the faculty of Contemplative imagination. Scott's healthy and truthful feeling would not allow him to represent the benighted hunter, provoked by loss of game, horse, and way at once, as indulging in any more exalted flights of imagination than those naturally consequent on the contrast between the night's lodging he expected, and that which befitted him.

¹ [Shelley: *Alastor*, 527 ff. In the fourteenth line of the quotation, “extends” (in all previous eds.) has been corrected, in accordance with Shelley's text, to “expands.” A few corrections of punctuation have also been made.]

² [Above, p. 261.]

³ [For Ruskin's waning enthusiasm for Shelley, see Vol. I. pp. 253–254 n.]

native, as it exhibits the effect of Fear in disposing to morbid perception. Compare with it the real and high action of the Imagination on the same matter in Wordsworth's Yew trees¹ (perhaps the most vigorous and solemn bit of forest landscape ever painted):—

“Each particular trunk a growth
Of intertwined fibres serpentine
Up-coiling and inveterately convolved;
*Nor uninformed with Phantasy, and looks
That threaten the profane.*”

It is too long to quote, but the reader should refer to it: let him note especially, if painter, that pure touch of colour, “By sheddings from the pining umbrage tinged.”

In the same way the blasted trunk on the left, in Turner's drawing of the spot where Harold fell at the Battle of Hastings,² takes, where its boughs first separate, the shape of the head of an arrow; this, which is mere fancy in itself, is imagination as it supposes in the spectator an excited condition of feeling dependent on the history of the spot.

I have been led perhaps into too great detail in illustrating these points; but I think it is of no small importance to prove how in all cases the Imagination is based upon, and appeals to, a deep heart feeling; and how faithful and earnest it is in contemplation of the subject-matter, never losing sight of it, nor disguising it, but depriving it of extraneous and material accidents, and regarding it in its disembodied essence. I have not, however, sufficiently noted, in opposition to it, that diseased action of the fancy which depends more on nervous temperament than intellectual power; and which, as in dreaming, fever, insanity, and other morbid conditions of mind, is frequently a source of daring and inventive conception; and so the visionary appearances resulting from disturbances of the frame by passion, and from the rapid tendency of the mind to invest with shape and intelligence the active influences about it, as in the various demons, spirits, and fairies of all imaginative

¹ [The poem of 1803 so entitled.]

² [Engraved by W. Cooke in R. R. Reinagle's *Views in Sussex*, 1819.]

nations; which, however, I consider are no more to be ranked as right creations of fancy or imagination than things actually seen and heard; for the action of the nerves is, I suppose, the same, whether externally caused, or from within, although very grand imagination may be shown by the intellectual anticipation and realization of such impressions, as in that glorious vignette of Turner's to the voyage of Columbus, "Slowly along the evening sky they went."¹ Note especially how admirably true to the natural form, and yet how suggestive of the battlement, he has rendered the level flake of evening cloud.

I believe that it is unnecessary for me to enter into farther detail of illustration respecting these points; for fuller explanation of the operations of the contemplative faculty of things verbally expressible, the reader may be referred to Wordsworth's preface to his poems;² it only remains for us, here, to examine how far this imaginative or abstract conception is to be conveyed by the material art of the sculptor or the painter.

§ 8. *The action of Contemplative imagination is not to be expressed by Art.*

Now, it is evident that the bold action of either the fancy or the imagination, dependent on a bodiless and spiritual image of the object, is not to be by lines or colours represented. We cannot, in the painting of Satan fallen, suggest any image of pines or crags; neither can we assimilate the briar and the banner, nor give human sympathy to the motion of the film, nor voice to the swinging of the pines.

Yet certain powers there are, within due limits, of marking the thing represented with an ideal character; and it was to these powers that I alluded in defining the meaning of the term Ideal, in the thirteenth chapter of the preceding section.³ For it is by this operation that the productions of high art are separated from those of the Realist.

§ 9. *Except under narrow limits.—First Abstract rendering of form without colour;*

¹ [Illustration to canto ii. of "The Voyage of Columbus" in Rogers' *Poems*; the drawing is No. 395 in the National Gallery. Cf. *Modern Painters*, vol. iii. pt. iv. ch. viii. § 7.]

² [See above, p. 230.]

³ [See above, p. 164.]

And, first, there is evidently capability of separating colour and form, and considering either separately. Form we find abstractedly considered by the sculptor; how far it would be possible to advantage a statue by the addition of colour, I venture not to affirm; the question is too extensive to be here discussed.¹ High authorities, and ancient practice, are in favour of colour; so the sculpture of the middle ages. The two statues of Mino da Fiesole² in the church of St^a. Caterina at Pisa have been coloured, the irises of the eyes painted dark, and the hair gilded, as also I think the Madonna in St^a. Maria della Spina; the eyes have been painted in the sculptures of Orcagna in Or San Michele. But it looks like a remnant of barbarism (compare the pulpit of Guido da Como, in the church of San Bartolomeo at Pistoja); and I have never seen colour on any solid forms, that did not, to my mind, neutralize all other power: the porcelains of Luca della Robbia are painful examples;³ and, in lower art, Florentine mosaic in relief. Gilding is more admissible, and tells sometimes sweetly

¹ [On the subject of colour in ancient sculpture, the reader may consult the authorities cited in E. T. Cook's *Popular Handbook to the Greek and Roman Antiquities in the British Museum*, 1903, p. 107.]

² [This was a slip of the pen. The statues in question are not by Mino da Fiesole, but by Nino Pisano. Ruskin's account of them in his 1845 note-book is as follows:—

“In a chapel . . . [on the left of the high altar] are two statues by Nino Pisano. They call them Faith and Charity, but they seem to me like Faith and Hope; the doubtful one on the left is a little too smiling and French, but still fine; she has a roll in her hand, and a diadem on her brow. Faith has the right hand on her bosom and a book in her left, and looks down in meditation. These statues have been painted, the irises of the eyes dark, the inside of the dresses blue, the fringes of the dresses and their decorations richly gilt, and apparently the hair also; the marble seems to have been left for the face and body or dress. Be this as it may, they are now not injured by the remaining gold of the fringes, and they are certainly two examples of as much exquisite and living grace, chaste, pure, and yet full of blood and life as ever were warmed out of marble. All that I have seen of Nino's work is quite inimitable for grace, chastity, and animation.”

In the chapel of S. Maria della Spina there is a statue over the altar, by Nino, of the Madonna offering a flower to the infant Saviour; and at the west end, a Madonna with Child, partly gilt, by Nino or Ugolino da Pisa. The sculptures of Orcagna in Or San Michele are on the shrine built and sculptured by him.]

³ [In a letter to his father from Florence (May 29, 1845), Ruskin writes:—

“It is curious that at Pistoja they have a complete series of marble pulpits of all dates, richer than any to be met with elsewhere; the best of them beating the celebrated one in the Pisan Baptistery all to shivers. I have no doubt it is the finest pulpit in the world. There is a singular thing on the Hospital front, a series of bas-reliefs in coloured porcelain by Luca della Robbia, which have of course the most vulgar effect conceivable, looking like the commonest

J. H. H. H.

Allen & Co. Inc.

Casa Loredan, Venice.

(1845)

upon figures of quaint design, as on the pulpit of St^a. Maria Novella, while it spoils the classical ornaments of the mouldings.¹ But the truest grandeur of sculpture I believe to be in the white form; something of this feeling may be owing to the difficulty, or rather the impossibility, of obtaining truly noble colour upon it; but if we could colour the Elgin marbles with the flesh tint of Giorgione, I had rather not have it done.

Colour, without form, is less frequently obtainable; and it may be doubted whether it be desirable; yet I think § 10. *Of colour without form*; that to the full enjoyment of it a certain sacrifice of form is necessary; sometimes by reducing it to the shapeless glitter of the gem, as often Tintoret and Bassano; sometimes by loss of outline and blending of parts, as Turner; sometimes by flatness of mass, as often Giorgione and Titian. How far it is possible for the painter to represent those mountains of Shelley as the poet sees them, “mingling *their flames* with twilight,”² I cannot say; but my impression is, that there is no true abstract mode of considering colour; and that all the loss of form in the works of Titian or Turner is not ideal, but the representation of the natural conditions under which bright colour is seen; for form is always in a measure lost by Nature herself when colour is very vivid.

sign-post barbarisms. And yet if you struggle with yourself, and look into them, forgetting the colour, you find them magnificent works of the very highest merit—full of the purest sculptural feeling, and abundant in expression, grace of conception, and anatomical knowledge.”]

¹ [The pulpit is by Maestro Lazzaro. Ruskin’s account of it in his note-book of 1845 is as follows:—

“The pulpit is of marble gilt. It gives the usual series of the life of the Madonna, bearing this subtle inscription in which the omission of the single word ‘rather’ makes *rather* a difference: ‘Beatus venter qui te portavit et ubera quæ suxisti. Beati qui verbum Dei audiunt et custodiunt.’ The gilding of the flower work and meaningless parts hurts their effect dreadfully, but on the figures it is agreeable, adding to their quaint and missal-like character. (This is important for after consideration.) The figure designs are very sweet and Giottesque; the Madonna rising in an oval glory with St. Thomas at her feet reminds one of Nino Pisano, and is very fine. The angels are all draped simply and severely, some so angular in line as to look like grasshoppers. Oppose this to the nasty fluttering of later times.”

The “subtle inscription” is from Luke xi. 27, 28, and omits the words “quin imo” (“yea rather”) before “Beati.”]

² [See the passage quoted above, on p. 297.]

Again, there is capability of representing the essential character, form, and colour of an object, without external texture. On this point much has been said by Reynolds and others,¹ and it is, indeed, perhaps the most unfailing characteristic of great manner in painting. Compare a dog of Edwin Landseer with a dog of Paul Veronese. In the first, the outward texture is wrought out with exquisite dexterity of handling, and minute attention to all the accidents of curl and gloss which can give appearance of reality; while the hue and power of the sunshine, and the truth of the shadow, on all these forms are neglected, and the large relations of the animal, as a mass of colour, to the sky or ground, or other parts of the picture, utterly lost. This is realism at the expense of ideality; it is treatment essentially unimaginative.* With Veronese, there is no curling nor crisping, nor glossiness nor sparkle, hardly even hair; a mere type of hide, laid on with a few scene-painter's touches; but the essence of dog is there; the entire, magnificent, generic animal type, muscular and living, and with broad, pure, sunny daylight upon him, and bearing his true and harmonious

* I do not mean to withdraw the praise I have given, and shall always be willing to give, to pictures, such as the Shepherd's Chief Mourner, and many others, in which the soul, if we may so call it, of animals, has been explained to us in modes hitherto unfelt and unexampled.

But Mr. Landseer is much more a natural historian than a painter; and the power of his works depends more on his knowledge and love of animals—on his understanding of their minds and ways—on his unerring notice and memory of their gestures and expressions, than on artistical or technical excellence. He never aims at colour—his composition is always weak, and sometimes unskilful; and his execution, though partially dexterous, and admirably adapted to the imitation of certain textures and surfaces, is far from being that of a great Painter attained by the mastery of every various difficulty, and changefully adapted to the treatment of every object. Compare the Addenda to this volume [p. 334.]²

¹ [See, for instance, the eleventh *Discourse* of Reynolds.]

² [Ed. 1 does not contain the last twelve lines of this note, and reads instead:—

“Shepherd's Chief Mourner, and to all in which the character and inner life of animals are developed. But all lovers of art must regret to find Mr. Landseer wasting his energies on such inanities as the ‘Shoeing,’ and sacrificing colour, expression, and action to an imitation of a glossy hide.”

“Shoeing” is No. 606 in the National Gallery. For other references to Landseer, see p. 334 *n.*]

relation of colour to all colour about him. This is ideal treatment.¹

The same treatment is found in the works of all the greatest men; they all paint the lion more than his mane, and the horse rather than his hide; and I think also they are often more careful to obtain the right expression of large and universal light and colour, than accuracy of features;² for the warmth of sunshine, and the force of sunlighted hue, are always sublime on whatever subject they may be exhibited; and so also are light and shade, if grandly arranged, as may be well seen in an etching of Rembrandt's of a spotted shell, which he has made altogether sublime by broad truth and large ideality of light and shade:³ and so we find frequent instances of very grand ideality in treatment of the most commonplace still life, by our own Hunt, where the petty glosses, and delicacies, and minor forms, are all merged in a broad glow of suffused colour;⁴ so also in pieces of the same kind by Etty,⁵ where, however, though the richness and play of colour are greater and the arrangement grander, there is less expression of light; neither is there anything in modern art that can be set beside some choice passages of Hunt in this respect.

Again, it is possible to represent objects capable of various accidents in a generic or symbolical form.

How far this may be done with things having necessary form, as animals, I am not prepared to say. The Lions of the Egyptian room in the British Museum, and the Fish beside Michael Angelo's Jonah,⁶ are instances; and there is imaginative power about both which we find not in the more perfectly realized Florentine

§ 12. *Abstraction or typical representation of animal form;*

¹ [For another discussion of Veronese's dogs, see *Modern Painters*, vol. v. pt. ix. ch. vi. § 14 ff.]

² [For "accuracy of features," ed. 1 reads "local tints."]

³ [The etching is signed and dated 1650. Fine impressions of it are in the British Museum; see No. 242 in Sidney Colvin's *Guide to an Exhibition of Drawings and Etchings by Rembrandt*, 1899.]

⁴ [See preface to *Notes on Prout and Hunt*.]

⁵ [For Etty, see above, sec. i. ch. xiv. § 24, p. 197.]

⁶ [In the Sistine Chapel; see preceding volume, p. 117 n.]

boar, nor in Raffaelle's fish of the Draught.¹ And yet the propriety and nobility of these types depend on the architectural use and character of the one, and on the typical meaning of the other; we should be grieved to see the forms of the Egyptian lion substituted for those of Raffaelle's in its struggle with Samson,² nor would the whale of Michael Angelo be tolerated in the nets of Gennesaret. So that I think it is only when the figure of the creature stands, not for any representation of vitality, but merely for a letter or type of certain symbolical meaning, or else is adopted as a form of decoration or support in architecture, that such generalization is allowable; and in such circumstances it is perhaps necessary to adopt a typical form.³ The evil consequences of the opposite treatment are ludicrously exhibited in the St. Peter of Carlo Dolci in the Pitti Palace, which owing to the prominent, glossy-plumed, and crimson-combed cock, is liable to be taken for the portrait of a poulterer; only let it be observed that the treatment of the animal form here is offensive, not only from its realization, but from the pettiness and meanness of its realization; for it might, in other hands than Carlo Dolci's, have been a sublime cock, though a real one; but, in his, it is fit for nothing but the spit. Compare, as an example partly of symbolical treatment, partly of magnificent realization, that supernatural lion of Tintoret (in the picture of the Doge Loredano before the Madonna)⁴

¹ [The cartoon, in the Victoria and Albert (South Kensington) Museum; *cf.* preceding volume, p. 29.]

² [The drawing of this subject by Raphael is in the collection at Oxford: see J. C. Robinson's *Critical Account of the Drawings by Michel Angelo and Raffaello in the University Galleries, Oxford, 1870, p. 179.*]

³ [Ed. 1 reads:—

“in such circumstances I think it necessary, always provided it be based, as in the instances given above I conceive it to be, upon thorough knowledge of the creature symbolised, and wrought out by a master hand, and these conditions being observed, I believe it to be right and necessary in architecture to modify all animal forms by a severe architectural stamp, and in symbolical use of them to adopt a typical form, to which practice the contrary and its evil consequences are ludicrously exhibited. . . .”]

⁴ [In the Ducal Palace (Collegio). Ruskin in his notes at Venice (1845) mentions particularly:—

“the painting of the blue and crimson carpet, and of the glorious plumed wings of the lion. Both these are delicious in the extreme. The lion is

with the plumes of his mighty wings clashed together in cloudlike repose, and the strength of the sea winds shut within their folding. And note, farther, the difference between the typical use of the animal, as in this case, and that of the fish of Jonah (and again the fish before mentioned¹ whose form is indicated in the clouds of the Baptism), and the actual occurrence of the creature itself, with concealed meaning, as the ass colt of the Crucifixion,² which it was necessary to paint as such, and not as an ideal form.

I cannot enter here into the question of the exact degree of severity and abstraction necessary in the forms of living things architecturally employed: my own feeling on the subject is, though I dare not lay it down as a principle (with the Parthenon pediment standing against me like the shield of Ajax), that no perfect representation of animal form is right in architectural decoration. For my own part, I had much rather see the metopes in the Elgin room of the British Museum, and the Parthenon without them, than have them together; and I would not surrender, from an architectural point of view, one mighty line of the colossal, quiet, life-in-death statue mountains of Egypt with their narrow fixed eyes and hands on their rocky limbs, nor one Romanesque façade with its porphyry mosaic of indefinable monsters,³ nor one Gothic moulding of rigid saints and grinning goblins, for ten Parthenons. And, I believe, I could show some rational ground for this seeming barbarity, if this were the place to do so; but at present I can only ask the reader to compare the effect of the so-called barbarous ancient

as grand in conception as in execution—broad dashes of crumbling white cast like flashes of lightning along the gloomy edge of the wing. The carpet is, on the other hand, a wonderful instance of the dignity which may be given to the most prosaic details by treatment at once manly, thoughtful, and truthful. (Consider, however, if this could be the case without the great element of colour—which is ennobling to all things, and is an abstract quality, equally great wherever it occurs.”)

With what Ruskin here says of colour, *cf.* above, p. 195. For another reference to the picture, see *Stones of Venice* (s. “Ducal Palace,” No. 7).]

¹ [Ch. iii. § 19, p. 270.]

² [See above, ch. iii. § 20, p. 271.]

³ [As at Lucca; see preceding volume, p. 206 *n.*]

mosaics on the front of St. Mark's (as they have been recorded, happily, by the faithfulness of the good Gentile Bellini, in one of his pictures now in the Venice Gallery)¹ with the veritably barbarous pictorial substitutions of the seventeenth century (one only of the old mosaics remains, or did remain till lately, over the northern door, but it is probably by this time torn down by some of the Venetian committees of taste);² and also I would have the old portions of the interior ceiling, or of the mosaics of Murano and Torcello,³ and the glorious Cimabue mosaic of Pisa,⁴ and the roof of the Baptistery at Parma⁵ (that of the Florence Baptistery is a bad example, owing to its crude whites and complicated mosaic of small forms), all of which are as barbarous as they can well be, in a certain sense, but mighty in their barbarism, compared with any architectural decorations whatsoever, consisting of professedly perfect animal forms, from the vile frescoes of Federigo Zuccaro at Florence⁶ to the ceiling of the Sistine; and, again, compare the professedly perfect sculpture of Milan Cathedral with the statues of the porches of Chartres; only be it always observed that it is not rudeness and ignorance of art, but intellectually awful abstraction that I would uphold: and also be it noted that in all ornament which takes place in the general effect merely as so much fretted stone, in capitals and other pieces of minute detail, the forms may be, and perhaps ought to be, elaborately imitative: and in this respect again the capitals of St. Mark's church, and at the Doge's palace at Venice, may be an example to the architects of all

§ 15. *Exception in delicate and superimposed ornament.*

The Ducal Palace, Venice.

(1845)

the world, in their boundless inventiveness, unfailing elegance, and elaborate finish.¹ There is more mind poured out in turning a single angle of that church than would serve to build a modern cathedral.*²

So far, then, of the abstraction proper to architecture, and to symbolical uses, of which I shall have occasion to speak hereafter at length,³ referring to it only at present as one of the operations of imagination contemplative; other abstractions there are which are necessarily consequent on the imperfection of materials, as of the hair in sculpture, which is necessarily treated in masses that are in no sort imitative, but only stand for hair, and have the grace, flow, and feeling of it without the texture or division; and other abstractions there are in which the form of one thing is fancifully indicated in the matter of another;

§ 16. *Abstraction necessary from imperfection of materials.*

* I have not brought forward any instances of the Imaginative power in architecture, as my object is not at present to exhibit its operation in all matter, but only to define its essence; but it may be well to note, in our New Houses of Parliament, how far a building approved by a committee of Taste may proceed without manifesting either imagination or composition. It remains to be seen how far the towers may redeem it;⁴ and I allude to it at present unwillingly, and only in the desire of influencing, so far as I may, those who have the power to prevent the adoption of a design for a bridge to take the place of that of Westminster, which was exhibited in 1844 at the Royal Academy, professing to be in harmony with the new building, but which was fit only to carry a railroad over a canal.**

** The existing bridge, to wit. [1883.]

¹ [It was in this spirit of enthusiasm that Ruskin was to return to study and describe these capitals: see *Stones of Venice*, vol. ii. ch. viii.]

² [Ed. 1 adds here:—

“modern cathedral; and of the careful finish of the work this may serve for example, that one of the capitals of the Doge’s palace is formed of eight heads of different animals, of which one is a bear’s with a honeycomb in the mouth whose carved *cells* are *hexagonal*.”

This is the twentieth capital in the description of them in *Stones of Venice*, vol. ii. ch. viii. § 118.]

³ [In *Modern Painters* the subject was again touched, though not at length, in vol. iii. ch. viii. § 6. The fuller treatment was given in the *Stones of Venice*, vol. i. ch. xxi.]

⁴ [Ruskin did not modify his first opinion of the new Houses of Parliament. “The absurdest and emptiest piece of filigree,” he called it, “and as it were eternal foolscap in freestone” (*Eagle’s Nest*, § 201); see also *Fors Clavigera*, Letter 6; *Stones of Venice*, vol. ii. ch. vi. § 220, ch. viii. § 23; and *Modern Painters*, vol. v. pt. ix. ch. xii. § 9.]

as in phantoms and cloud shapes, the use of which, in mighty hands, is often most impressive, as in the cloudy-charioted Apollo of Nicolo Poussin in our own Gallery, which the reader may oppose to the substantial Apollo, in Wilson's Niobe;¹ and again in the phantom vignette of Turner already noticed;² only such operations of the imagination are to be held of lower kind, and dangerous consequence if frequently trusted in; for those painters only have the right imaginative power who can set the supernatural form before us, fleshed and boned like ourselves.*

§ 17. *Abstractions of things capable of varied accident are not imaginative;*

Other abstractions occur, frequently, of things which have much accidental variety of form; as of waves, on Greek sculptures in successive volutes,³ and of clouds often in supporting volumes in the sacred pictures: but these I do not look upon as results of imagination at all, but mere signs and letters; and whenever a very highly imaginative mind touches them, it always realizes as far as may be. Even Titian is content to use, at the top of his S. Pietro Martire,⁴ the conventional, round, opaque cloud, which cuts his trees open like an axe;⁵ but Tintoret, in his picture of the Golden Calf,⁶ though compelled to represent the Sinai under conventional form, in order that the receiving of the tables might be seen at the top of it, yet so soon as it is possible to give more truth, he takes a grand fold of horizontal cloud straight from the flanks of the Alps, and shows the forests of the mountains through its misty volume, like

* Comp. Ch. V. § 4 [p. 315].

¹ [Poussin's Apollo is in his "Cephalus and Aurora," No. 65; Wilson's, in "The Destruction of Niobe's Children," No. 110.]

² [Above, § 7, p. 299. See also *Modern Painters*, vol. iii. ch. viii. § 7.]

³ [See on this subject *Stones of Venice*, vol. i. ch. xx. § 25, and Appendix 21.]

⁴ [See Vol. III. p. 28.]

⁵ [For "an axe," ed. 1 reads "a gouge."]

⁶ [In S. Maria dell' Orto, Venice. In his Venetian notes of 1845 (see above, p. xxxvi.) Ruskin thus describes the picture:—

"The chief point of interest in it to me is the simple treatment of the cloud-covered Sinai, which is reduced to a rock of size so comparatively small, that Moses on the top of it is half the size of life; and yet it is kept—by its gloom and by rejecting all mean detail—in the highest degree sublime. The clouds cover it in horizontal, massy, transparent, sombre flakes."

For another reference, see *Modern Painters*, vol. iv. ch. iv. § 2 n.]

seaweed through deep sea.* Nevertheless, when the realization is impossible, bold symbolism is of the highest value, and in religious art, as we shall presently see, even necessary, as of the rays of light in the Titian woodcut of St. Francis;¹ and sometimes the attention is directed by some such strange form to the meaning of the image, which may be missed if it remains in its natural purity (as, I suppose few, in looking at the Cephalus and Procris of Turner, note the sympathy of those faint rays that are just drawing back and dying between the trunks of the far-off forest, with the ebbing life of the nymph, unless, indeed, they happen to recollect the same sympathy marked by Shelley in the *Alastor*²); but the imagination is not shown in any such modifications; however, in some cases they may be valuable,³ and I note them merely in consequence of their peculiar use in religious art, presently to be examined.

The last mode we have here to note in which the Imagination regardant may be expressed in art is Exaggeration, of which, as it is the vice of all bad artists, and may be constantly resorted to without any warrant of imagination, it is necessary to note strictly the admissible limits.

§ 19. *Exaggeration. Its laws and limits. First, In scale of representation.*

In the first place a colossal statue is not necessarily any

* All the clouds of Tintoret are sublime; the worst that I know in art are Correggio's, especially in the Madonna della Scudella, and Duomo of Parma.⁴

¹ [Ed. 1 adds, "before noticed." See Vol. III. p. 355 *n.*]

² [For Turner's "Cephalus and Procris," see above, ch. ii. § 20; for another comparison of Shelley and Turner, see Vol. III. pp. 364, 652. The reference here is to the death of the Poet in *Alastor*:—

"Now upon the jagged hills
It rests, and still as the divided frame
Of the vast meteor sunk, the Poet's blood,
That ever beat in mystic sympathy
With nature's ebb and flow, grew feebler still;
And when two lessening points of light alone
Gleamed through the darkness, the alternate gasp
Of his faint respiration scarce did stir
The stagnate night . . ."]

³ [Ed. 1 adds, "(in the Cephalus they would be utterly destructive)."]

⁴ [The "Madonna della Scodella" (Virgin with the cup) is in the Royal Gallery at Parma; it is engraved at p. 286 of Ricci's *Correggio* (English ed. 1896).]

more an exaggeration of what it represents, than a miniature is a diminution; it need not be a representation of a giant, but a representation, on a large scale, of a man: only it is to be observed, that as any plane intersecting the cone of rays between us and the object must receive an image smaller than the object, a small image is rationally and completely expressive of a larger one; but not a large of a small one. Hence I think that all statues above the Elgin standard, or that of Michael Angelo's *Night and Morning*, are, in a measure, taken by the eye for representations of giants, and I think them always disagreeable. The amount of exaggeration admitted by Michael Angelo is valuable, because it separates the emblematic from the human form, and gives greater freedom to the grand lines of the frame; for notice of his scientific system of increase of size I may refer the reader to Sir Charles Bell's remarks on the statues of the Medici chapel.¹ But there is one circumstance which Sir Charles has not noticed, and in the interpretation of which, therefore, it is likely I may be myself wrong, that the extremities are singularly small in proportion to the limbs; by which means there is an expression given of strength and activity greater than in the ordinary human type: which appears to me to be an allowance for that alteration in proportion necessitated by increase of size, which has been spoken of in Chap. VI. of the first Section, § 10, note; not but that Michael Angelo always makes the extremities comparatively small, but smallest comparatively, in his largest works: so I think, from the size of the head, it may be conjectured respecting the *Theseus* of the Elgins. Such adaptations are not necessary when the exaggerated image is spectral; for, as the laws of matter in that case can have no operation, we may expand the form as far as we choose, only let careful distinction be made between the size of the thing represented, and the scale of the representation. The canvas on which Sir T. Lawrence has stretched

¹ [See Essay ix. in the *Anatomy and Philosophy of Expression*, p. 205, 3rd ed. Bell points out that in these statues no one part is exaggerated: "all is magnified with so perfect a knowledge that it is just as a whole, the bone and the muscle corresponding in their proportions."]

his Satan in the schools of the Royal Academy¹ is a mere concession to inability. He might have made him look more gigantic in one of a foot square.

Another kind of Exaggeration is of things whose size is variable to a size or degree greater than that usual with them, as in waves and mountains; and there are hardly any limits to this exaggeration, so long as the laws which Nature observes in her increase be observed. Thus, for instance, the form and polished surface of a breaking ripple three inches high, are not representative of either the form or the surface of the surf of a storm, nodding ten feet above the beach; neither would the cutting ripple of a breeze upon a lake, if simply exaggerated, represent the forms of Atlantic surges: but as Nature increases her bulk, she diminishes the angles of ascent, and increases her divisions; and if we would represent surges of size greater than ever existed, which it is lawful to do, we must carry out these operations to still greater extent. Thus Turner, in his picture of the *Slave Ship*,² divides the whole sea into two masses of enormous swell, and conceals the horizon by a gradual slope of only two or three degrees. This is intellectual exaggeration. In the Academy exhibition of 1843, there was, in one of the smaller rooms, a black picture of a storm,³ in which there appeared on the near sea, just about to be overwhelmed by a⁴ breaker curling right over it, an object at first sight liable to be taken for a walnut shell, but which, on close examination, proved to be a ship with mast and sail. This is childish exaggeration, because it is impossible, by the laws of matter and motion, that such a breaker should ever exist. Again, in mountains, we have repeatedly observed the necessary building up and multitudinous division of the higher peaks, and the smallness of the slopes by which they

¹ ["Satan Calling his Legions (from the first book of Milton)," No. 170 in the Academy of 1797. Sold at the artist's sale, 1831, and now in the Diploma Gallery at Burlington House.]

² [See Vol. III. pp. 571–572, and Plate 12.]

³ [No. 541: "Christ stilleth the Tempest," by J. Martin.]

⁴ [Ed. 1 reads, "an enormous," and at the end of the sentence adds, "with Christ and his twelve disciples in it."]

§ 20. *Secondly, Of things capable of variety of scale.*

usually rise.¹ We may, therefore, build up the mountain as high as we please, but we must do it in nature's way, and not in impossible peaks and precipices: not but that a daring feature is admissible here and there, as the Matterhorn² is admitted by nature; but we must not compose a picture out of such exceptions; we may use them, but they must be as exceptions exhibited. I shall have much to say, when we come to treat of the sublime,³ of the various modes of treating mountain form; so that at present I shall only point to an unfortunate instance of inexcusable and effectless exaggeration* in the distance of Turner's vignette to Milton (the Temptation on the Mountain), and desire the reader to compare it with legitimate exaggeration, in his vignette to the second part of *Jacqueline*, in Rogers's poems.⁴

Another kind of Exaggeration is necessary to retain the characteristic impressions of nature on reduced scale. It is not possible, for instance, to give the leafage of trees in its proper proportion, on a small scale, without entirely losing their grace of form and curvature; of this the best proof is found in the calotype or daguerrotype,⁵ which fail in foliage, not only because the green rays are ineffective, but because, on the small scale of the image, the reduced leaves lose their organization, and look like moss attached to sticks. In order to retain, therefore, their character of flexibility, the painter is often compelled to increase the proportionate size of the leaves, and to arrange them in generic masses. Of this treatment compare the grand examples throughout the *Liber*

§ 21. *Thirdly, Necessary in expression of characteristic features on diminished scale.*

* See in Addenda, the note on my courtesies of criticism (p. 333). [1883.]

¹ [See Vol. III. p. 463.]

² [Ruskin had been for a day to Zermatt, for the first time, in 1844. He notes in his diary (July 19):—

“Clouds on the Matterhorn all day except at sunset, when there were playing crimson lights over the sky, and the Matterhorn appeared in full ruby—with a wreath of fiery cloud drifting from its top—as Gordon said, like incense from a large altar.”]

³ [See Appendix i., p. 368.]

⁴ [At p. 147; the drawing is No. 241 in the National Gallery. For another reference, see Vol. III. p. 434.]

⁵ [See Vol. III. pp. 169, 210.]

Studiosum. That it is by such means only that the ideal character of objects is to be preserved, has been observed in the 13th chapter of the first Section.¹ In all these cases exaggeration is only lawful as the sole means of arriving at truth of impression when strict fidelity is out of the question.

Other modes of Exaggeration there are, on which I shall not at present farther insist, the proper place for their discussion being in treating of the sublime; and these which I have at present instanced are enough to establish the point at issue, respecting imaginative verity, inasmuch as we find that exaggeration itself, if imaginative is referred to principles of truth, and of actual being.

We have now, I think, reviewed the various modes in which Imagination contemplative may be exhibited in § 22. *Recapitulation*. and arrived at all necessary certainties respecting the essence of the faculty: which we have found in its three functions, Associative of Truth, Penetrative of Truth, and Contemplative of Truth; and having no dealings nor relations with any kind of falsity. One task, however, remains to us, namely, to observe the operation of the Theoretic and Imaginative faculties together, in the attempt at realization to the bodily sense of Beauty supernatural and divine.

¹ [§ 13, p. 173 above.]

CHAPTER V

OF THE SUPERHUMAN IDEAL

IN our investigation, in the first Section, of the laws of beauty, we confined ourselves to the observation of lower nature, or of humanity. We were prevented from proceeding to deduce conclusions respecting Divine ideality by our not having then established any principles respecting the Imaginative faculty, by which, under the discipline of the Theoretic, such ideality is conceived.¹ I had purposed to conclude the present Section by a careful examination of this subject; but as this is evidently foreign to the matter immediately under discussion, and involves questions of great intricacy respecting the development of mind among those Pagan nations who are supposed to have produced high examples of spiritual ideality, I believe it will be better to delay such inquiries until we have concluded our detailed observation of the beauty of visible nature; and I shall therefore at present take notice only of one or two principles, which were referred to, or implied, in the chapter respecting the Human ideal, and without the enunciation of which that chapter might lead to false conclusions.

§ 1. *The subject is not to be here treated in detail.*

§ 2. *The conceivable modes of manifestation of Spiritual Beings are four.*

There are four ways in which Beings supernatural may be conceived as manifesting themselves to human sense. The first, by external types, signs, or influences; as God to Moses in the flames of the bush, and to Elijah in the voice of Horeb. The second, by the assuming of a form not properly belonging to them; as the Holy Spirit of that of a Dove; the second person of the Trinity of that of a Lamb; and so such manifestations, under Angelic or other form, of

¹ [See above, sec. i. ch. xv. § 3, p. 209.]

the first person of the Trinity, as seem to have been made to Abraham, Moses, and Ezekiel.

The third, by the manifestation of a form properly belonging to them, but not necessarily seen; as of the Risen Christ to His disciples when the doors were shut. And the fourth, by their operation on the human form which they influence or inspire; as in the shining of the face of Moses.¹

It is evident that in all these cases, wherever there is form at all, it is the form of some creature to us known. It is no new form peculiar to spirit, nor can it be. We can conceive of none. Our inquiry is simply therefore, by what modifications those creature forms to us known, as of a lamb, a bird, or a human creature, may be explained as signs or habitations of Divinity, or of angelic essence, and not creatures such as they seem.

§ 3. *And these are in or through creature forms familiar to us.*

This may be done in two ways. First, by effecting some change in the appearance of the creature inconsistent with its actual nature; as by giving it colossal size, or unnatural colour or material, as of gold, or silver, or flame, instead of flesh; or taking away its property of matter altogether, and forming it of light or shade, or in an intermediate step, of cloud or vapour; or explaining it by terrible concomitant circumstances, as of wounds in the body, or strange lights and seemings round about it; or joining of two bodies together, as in angels' wings. Of all which means of attaining supernatural character (which, though in their nature ordinary and vulgar, are yet effective and very glorious in mighty hands) we have already seen the limits in speaking of the Imagination.

§ 4. *Supernatural character may be impressed on these either by phenomena inconsistent with their common nature (compare Chap. IV. § 16),*

But the second means of obtaining supernatural character is that with which we are now concerned, namely, retaining the actual form in its full and material presence, and, without aid from any external interpretation whatsoever, to raise that form by mere inherent dignity to

§ 5. *Or by inherent dignity.*

¹ [The Bible references in § 2 are Exodus iii. 2; 1 Kings xix. 18, 19; Matthew iii. 16; John i. 29; Genesis xxii. 11; Ezekiel i. 1; John xx. 19; Exodus xxxiv. 29.]

such pitch of power and impressiveness as cannot but assert and stamp it for superhuman.

On the north side of the Campo Santo at Pisa, are a series of paintings from the Old Testament history by Benozzo Gozzoli. In the earlier of these, angelic presences, mingled with human, occur frequently, illustrated by no awfulness of light, nor incorporeal tracing. Clear revealed they move, in human forms, in the broad daylight and on the open earth, side by side, and hand in hand with men. But they never miss of the angel.¹

He who can do this, has reached the last pinnacle and utmost power of ideal, or any other art. He stands in no need, thenceforward, of cloud, or lightning, or tempest, or terror of mystery. His sublime is independent of the elements. It is of that which shall stand when they shall melt with fervent heat, and light the firmament when the sun is as sackcloth of hair.²

Let us consider by what means this has been effected, so far as they are by analysis traceable; and that is not far, for here, as always, we find that the greater part of what has been rightly accomplished has been done by faith and intense feeling, and cannot, by aid of any rules or teaching, be either tried, estimated, or imitated.

And first, of the expression of supernatural influence on forms actually human, as of Sibyl or Prophet. It is evident that not only here is it unnecessary, but we are not altogether at liberty to trust for expression to the utmost ennobling of the human form; for we cannot do more than this, when that form is to be the actual representation, and not the recipient of Divine presence. Hence, in order to retain the actual humanity definitely we must leave upon it such signs of the operation of Sin and the liability to Death as are consistent with human ideality; and often more than these, definite signs of immediate and active evil, when the prophetic spirit is to be expressed in men such as were Saul and Balaam; neither may we ever, with just discrimination, touch the

¹ [See the passage from a letter of Ruskin cited in the Introduction above, p. xxx., where the fresco, drawn by Ruskin in the plate, is described.]

² [2 Peter iii. 10; Revelations vi. 12.]

Abraham parting from the Angels.

utmost limits of beauty in human form when inspiration only is to be expressed, and not angelic or divine being; of which reserve and subjection the most instructive instances are found in the works of Angelico, who invariably uses inferior types for the features of humanity, even glorified (excepting always the Madonna), nor ever exerts his full power of beauty, either in feature or expression, except in angels, or in the Madonna, or in Christ. Now the expression of spiritual influence without supreme elevation of the bodily type we have seen to be a work of Penetrative imagination, and we found it accomplished by Michael Angelo;¹ but I think by him only. I am aware of no one else who, to my mind, has expressed the inspiration of Prophet or Sibyl;² this, however, I affirm not, but shall leave to the determination of the reader, as the principles at present to be noted refer entirely to that elevation of the creature form necessary when it is actually representative of a Spiritual being.

I have affirmed, in the conclusion of the first Section, that “of that which is more than Creature no Creature ever conceived.”³ I think this almost self-evident, for it is clear that the illimitableness of Divine attributes cannot be by matter represented (though it may be typified); and I believe that all who are acquainted with the range of sacred art will admit, not only that no representation of Christ has ever been even partially successful, but that the greatest painters fall therein below their accustomed level; Perugino and Fra Angelico especially: Leonardo has, I think, done best; but perhaps the beauty of the fragment left at Milan (for in spite of all that is said of repainting and destruction, that Cenacolo is still the finest in existence⁴) is as

§ 7. *No representation of that which is more than creature is possible.*

¹ [Above, ch. iii. § 28, p. 281.]

² [Ruskin had not at this time fallen under the spell of Botticelli, whose Sibyls he was afterwards to praise: “He it was who gave the conception of that great choir of the prophets and sibyls, of which Michael Angelo, more or less ignorantly borrowing it in the Sistine Chapel, in great part lost the meaning, while he magnified the aspect” (see *Ariadne Florentina*, ch. vi.).]

³ [Above, sec. i. ch. xv. § 2, p. 209.]

⁴ [The Cenacolo has in recent years faded away almost fatally. In the Brera Gallery there is a beautiful design in black and red chalk, believed to be a study for the head of our Lord.]

much dependent on the very untraceableness resulting from injury as on its original perfection. Of more daring attempts at representation of Divinity we need not speak; only this is to be noted respecting them, that though by the ignorant Romanists many such efforts were made under the idea of actual representation (note the way in which Cellini speaks of the seal made for the Pope),¹ by the nobler among them I suppose they were intended, and by us at any rate they may always be received, as mere symbols, the noblest that could be employed, but as much symbols still as a triangle, or the Alpha and Omega, nor do I think that the most scrupulous amongst Christians ought to desire to exchange the power obtained by the use of this symbol in Michael Angelo's creation of Adam and of Eve, for the effect which would be produced by the substitution of any other sign in place of it. Of these efforts, then, we need reason no farther, but may limit ourselves to considering the purest modes of giving a conception of superhuman but still creature form, as of angels; in equal rank with whom, perhaps, we may without offence place the mother of Christ; at least we must so regard the type of the Madonna in receiving it from Romanist painters.*

And first, much is to be done by right modification of

* I take no note of the representation of *Evil Spirits*, since throughout we have been occupied in the pursuit of Beauty; but it may be observed generally, that there is great difficulty to be overcome in attempts of this kind, because the elevation of the form necessary to give it spirituality destroys the appearance of evil; hence even the greatest painters have been reduced to receive aid from the fancy, and to eke out all they could conceive of malignity by help of horns, hoofs, and claws. Giotto's Satan in the Campo Santo,² with the

¹ [The reference seems to be to book i. ch. xliv. of Cellini's *Autobiography*, where he describes how some of his clumsy competitors had stuck a certain jewel in the middle of the heart of God the Father. He, on the other hand, had arranged it differently, and had "shown God the Father seated, leaning nobly in a sideways attitude which made a perfect composition."]

² [This is one of the frescoes of the life of Job: Satan accusing Job to God. Ruskin's account of it in his note-book (1845) is as follows:—

"The Standing of Satan before God.—This I think almost the grandest thing in the Campo Santo, the conception of Satan is indubitably the finest. The eyes of the holy figures are little arched, singularly flat in the hair of the brow, and the brow itself not finely pencilled but thick; still this gives them greater repose and grandeur, and removes them farther from mean prettiness. The principal figure is most perfect in serenity of power; no expression of indignation or passion of any kind in the look given to the

accessary circumstances, so as to express miraculous power exercised over them by the Spiritual creature. There is a beautiful instance of this in John Bellini's picture of St. Jerome at Venice.¹ The Saint sits upon a rock, his grand form defined against clear green open sky; he is reading; a noble tree springs out of a cleft in the rock, bends itself suddenly back to form a rest for the volume, then shoots up into the sky. There is something very beautiful in this obedient ministry of the lower creature; but be it observed that the sweet feeling of the whole depends upon the service being such as is consistent with its nature. It is not animated, it does not *listen* to the saint, nor bend itself towards him as if in affection; this would have been mere fancy, illegitimate and effectless. But the simple bend of the trunk to receive the book is miraculous subjection of the true nature of the tree; it is therefore imaginative, and very touching.

§ 8. *Supernatural character expressed by modification of accessories.*

Serpent gnawing the heart, is fine; so many of the fiends of Orcagna, and always those of Michael Angelo. Tintoret, in the Temptation, with his usual truth of invention, has represented the Evil Spirit under the form of a fair angel, the wings burning with crimson and silver, the face sensual and treacherous.² It is instructive to compare the results of imagination associated with powerful fancy in the demons of these great painters, or even in such nightmares as that of Salvator already spoken of (Sec. I. Chap. V. § 12 note), with the simple ugliness of idiotic distortion in the meaningless, terrorless monsters of Bronzino in the large picture of the Uffizii;³ where the painter, utterly uninventive, having assembled all that is abominable of hanging flesh, bony limbs, crane necks, staring eyes, and stragglng hair, cannot yet, by the sum and substance of all, obtain as much real fearfulness as an imaginative painter could throw into the turn of a lip or the knitting of a brow.

Evil Spirit. The position of the latter is perfect; his triple wings still expanded, his arms folded tight over his breast, holding each other above the elbow, the claws fixed deep in the flesh, as with jealousy or pain; a serpent coiled round his neck buries its head in a cleft in his bosom. The right hoof lifted as if to stamp."

This series of frescoes is now commonly attributed to Francesco da Volterra; but see Ruskin's review of Lord Lindsay, *On the Old Road*, 1899, vol. i. § 61, where also the description of Satan, just quoted, is given with some revision.]

¹ [See above, sec. i. ch. xiv. § 14, p. 189. A picture of St. Jerome in the National Gallery, by Bono of Ferrara, No. 771, shows similar modifications of accessories to express supernatural character.]

² [See *Stones of Venice* (Venetian Index, s. "Rocco, Scuola di San," No. 20) for a further description of the Evil Spirit in this picture.]

³ [Cf. above, sec. i. ch. vi. § 8, p. 101.]

It is not often, however, that the religious painters even go this length: they content themselves usually with impressing on the landscape perfect symmetry and order, such as may seem consistent with, or induced by, the spiritual nature they would represent. All signs of decay, disturbance, and imperfection are also banished; and in doing this it is evident that some unnaturalness and singularity must result, inasmuch as there are no veritable forms of landscape but express or imply a state of progression or of imperfection. All mountain forms are seen to be produced by convulsion and modelled by decay; the finer forms of cloud have threatenings in them of storm; all forest grouping is wrought out with varieties of strength and growth among its several members, and bears evidences of struggle with unkind influences. All such appearances are banished in the supernatural landscape; the trees grow straight, equally branched on each side, and of such slight and feathery frame as shows them never to have encountered blight, or frost, or tempest. The mountains stand up in fantastic pinnacles; there is on them no trace of torrent, no scathe of lightning; no fallen fragments encumber their foundations, no worn ravines divide their flanks; the seas are always waveless, the skies always calm, crossed only by fair, horizontal, lightly wreathed, white clouds.

In some cases these conditions result partly from feeling, partly from ignorance of the facts of nature, or incapability of representing them, as in the first type of the treatment found in Giotto and his school; in others they are observed on principle, as by Benozzo Gozzoli, Perugino, and Raffaello. There is a beautiful instance by the former in the frescoes of the Ricardi Palace, where, behind the adoring angel groups, the landscape is governed by the most absolute symmetry; roses, and pomegranates, their leaves drawn to the last rib and vein, twine themselves in fair and perfect order about delicate trellises; broad stone pines and tall cypresses overshadow them, bright birds hover here and there in the serene sky, and groups of

§ 9. *Landscape of the religious painters. Its character is eminently symmetrical.*

§ 10. *Landscape of Benozzo Gozzoli.*

angels, hand joined with hand, and wing with wing, glide and float through the glades of the unentangled forest. But behind the human figures, behind the pomp and turbulence of the kingly procession descending from the distant hills, the spirit of the landscape is changed. Severer mountains rise in the distance, ruder prominences and less flowery vary the nearer ground, and gloomy shadows remain unbroken beneath the forest branches.¹

The landscape of Perugino, for grace, purity, and as much of nature as is consistent with the above-named conditions, is unrivalled; and the more interesting because in him, certainly, whatever limits are set to the rendering of nature proceed not from incapability. The sea is in the distance almost always, then some blue promontories and undulating dewy park ground, studded with glittering trees. In the landscape of the fresco in St^a. Maria Maddalena at Florence there is more variety than is usual with him: a gentle river winds round the bases of rocky hills, a river like our own Wye or Tees in their

§ 11. *Landscape of Perugino and Raffaele.*

¹ [The following is a portion of Ruskin's account of these frescoes in the note-book (1845) so frequently quoted. The frescoes, which are especially well preserved, represent the journey of the Magi to Jerusalem:—

"All the angels have broad golden glories with "Gloria in excelsis" written on them, their wings are superbly gilded, and are, allowing for the deadness of the fresco colour, nearly as beautiful as Angelico's. The landscape in which they are placed is nearly the model of a pure ideal. The grasses in the foreground are rich to excess, but all drawn completely and symmetrically, with scarlet and other flowers occurring among them, all drawn with botanical accuracy. Behind the angels come hedges of roses (one supported by a cross trellis work), of which every leaf and flower is drawn with the most perfect accuracy and symmetry; there is no confusion, no interrupting of one leaf by another, no obscurity nor incompleteness, all is in angelic order, the only variety being obtained by the various positions into which the five-leaved spray of the rose is thrown, its foreshortened curves given with great precision. The rays of all the leaves are drawn. Then come winding paths among clipped hedges, and rich meadows, and tall trees, chiefly palm and cypress, scattered among them, and red-roofed houses and cities with multitudinous machicolated towers. The way in which the shadows are given is very arbitrary, the trees in the middle distance cast them from their trunks very forcibly, but the tufts of grass in the foreground cast none, and the figures little, while again a pergola in the distance casts its full broad shadow clearly down the walls, and the towers of the city have all their light and shade fairly marked. Among the fields rise brown rocks, of the type seen in my study of Abraham, and high green Fiesole-like hills, and lakes, and in the distance. Note particularly *blue* mountains, though these become suddenly so, and there is no gradual difference or retiring in the green. In this respect it is like a wall paper."

loveliest reaches; level meadows stretch away on its opposite side; mounds set with slender-stemmed foliage occupy the nearer ground, and a small village with its simple spire peeps from the forest at the bend of the valley; it is remarkable that, in architecture thus employed, neither Perugino, nor any other of the ideal painters, ever use Italian forms, but always Transalpine, both of church and castle.¹ The little landscape which forms the background of his own portrait in the Uffizii² is another highly finished and characteristic example. The landscape of Raffaele was learned from his father, and continued for some time little modified, though expressed with greater refinement. It became afterwards conventional and poor, and in some cases altogether meaningless. The haystacks and vulgar trees behind the St. Cecilia at Bologna form a painful contrast to the pure space of mountain country in the Perugino opposite.*³

* I have not thought it necessary to give farther instances at present, since I purpose hereafter to give numerous examples of this kind of ideal

¹ [The following is part of the account of this fresco in the note-book. The fresco, often considered the finest by the master, is in the former chapter-house of the monastery attached to the church. It is in three compartments: in the centre, Christ on the Cross; on the right, SS. John and Benedict; on the left, the Virgin and St. Bernard. It is the centre which is here described:—

“The distance of this compartment is exquisite. First a grassy knoll, covered with park trees of the most lovely grace, tall as ship-masts, their trunks as straight as arrows, and then softly rounded, their leaved branches mixing with each other, horizontally. Beyond this a river winds between low pastures on one side, and steep German-like rocks on the other, crowned with a hermitage, the woods richly scattered at their feet, and among them a steep roofed white village with a Gothic spire. In fact, this landscape altogether is anything but Italian; it is a fine ideal of English woods in Herefordshire or Yorkshire, with the Wye or the Greta winding in the distance, and the simple pointed spire in the distance instead of any rich architecture or palace lines, adds singularly to the sweetness and simplicity of the effect. It is a landscape that must go to any English or German heart at once. The distant hills too are less peaked and precipitous, and are the very counterpart of those that terminate the view at Bolton Abbey. The soft knolls of the grassy ground are most delicate, the grouping of the trees like Nature’s own, their retiring in the distance as true and aerial as Turner; the river winds sweetly among them, their reflections falling on it while it keeps under the bases of the rocks. The reflections usually indicated only by a rapid zig-zag stroke of the brush.”

For the circumstances of Ruskin obtaining permission to study the fresco, see *Præterita*, ii. ch. vii. § 129.]

² [See above, p. 212 *n.*]

³ [“The Virgin in Glory” : figured at p. 64 of G. C. Williamson’s *Perugino*, 1900. For Raphael’s St. Cecilia, see above, p. 212, and Vol. II. p. 167.]

In all these cases, while I would uphold the landscape thus employed and treated, as worthy of all admiration, I should be sorry to advance it for imitation. What is right in its mannerism arose from keen feeling in the painter: imitated without the same feeling it would be painful; the only safe mode of following in such steps is to attain perfect knowledge of Nature herself, and then to suffer our own feelings to guide us in the selection of what is fitting for any particular purpose. Every painter ought to paint what he himself loves, not what others have loved; if his mind be pure and sweetly toned, what he loves will be lovely; if otherwise, no example can guide his selection, no precept govern his hand; and farther, let it be distinctly observed, that all this mannered landscape is only right under the supposition of its being a background to some supernatural presence; behind mortal beings it would be wrong, and by itself, as landscape, ridiculous; and farther, the chief virtue of it results from the exquisite refinement of those natural details consistent with its character; from the botanical drawing of the flowers, and the clearness and brightness of the sky.¹

§ 12. *Such landscape is not to be imitated.*

Another mode of attaining supernatural character is by purity of colour almost shadowless, no more darkness being allowed than is absolutely necessary for the explanation of the forms and the vividness of the effect, enhanced, as far as may be, by use of gilding, enamel, and other jewellery. I think the

§ 13. *Colour and decoration, their use in representations of the Supernatural.*

landscape.² Of true and noble landscape, as such, I am aware of no instances except where least they might have been expected, among the sea-bred Venetians.³ Ghirlandajo shows keen, though prosaic, sense of nature in that view of Venice behind an adoration of the Magi in the Uffizii, but he at last walled himself up among gilded entablatures. Masaccio indeed has given one grand example in the fresco of the Tribute Money, but its colour is now nearly lost.

¹ [With §§ 9–12 here, compare what is said, in partial correction, in the next volume, ch. xviii. §§ 11, 12.]

² [See vol. iii. of *Modern Painters*, ch. xviii. §§ 10 *seq.*, and Plate 11, “Latest Purism.”]

³ [See Vol. III. p. 181, and above, p. 126. For Masaccio’s “Tribute Money” *cf.* Vol. III. pp. 179, 192; and next volume, ch. xviii. § 14.]

smaller works of Angelico are perfect models in this respect; the glories about the heads being of beaten rays of gold, on which the light plays and changes as the spectator moves¹ (and which therefore throw the purest flesh colour out in dark relief); and such colour and light being obtained by the enamelling of the angel wings as, of course, is utterly unattainable by any other expedient of art; the colours of the draperies always pure and pale, blue, rose, or tender green, or brown, but never dark or gloomy; the faces of the most celestial fairness, brightly flushed; the height and glow of this flush are noticed by Constantin² as reserved by the older painters for spiritual beings, as if expressive of light seen through the body.

I cannot think it necessary, while I insist on the value of all these seemingly childish means when in the hands of a noble painter, to assert also their futility, and even absurdity, if employed by no exalted power. I think the error has commonly been on the side of scorn, and that we reject much in our foolish vanity, which, if wiser and more earnest, we should delight in. But two points it is very necessary to note in the use of such accessories.

The first, that the ornaments used by Angelico, Giotto, and Perugino, but especially by Angelico, are always of a *generic* and *abstract* character. They are not diamonds, nor brocades, nor velvets, nor gold embroideries; they are mere spots of gold or of colour, simple patterns upon *textureless* draperies; the angel wings burn with transparent crimson and purple and amber, but they are not set forth with peacocks' plumes; the golden circlets gleam with changeful light, but they are not beaded with pearls, nor set with sapphires.

In the works of Filippino Lippi, Mantegna, and many other painters following, interesting examples may be found of the opposite treatment; and as in Lippi the heads are usually very sweet, and the composition severe, the degrading

§ 14. *Decorations so used must be Generic,*

¹ [Cf. the description of Angelico's "Annunciation," above, p. 263 n.]

² [Perhaps Costantino Costantini, the author of a local guide to Perugia frequently quoted by Rio in his *Poetry of Christian Art*.]

effect of the realized decorations and imitated dress may be seen in him simply, and without any addition of painfulness from other deficiencies of feeling. The larger of the two pictures in the Tuscan room of the Uffizii,¹ but for this defect, would have been a very noble ideal work.

The second point to be observed is that brightness of colour is altogether inadmissible without purity and § 15. *And* harmony; and that the sacred painters must not be *Colour pure.* followed in their frankness of unshadowed colour, unless we can also follow them in its clearness. As far as I am acquainted with the modern schools of Germany,² they seem to be entirely ignorant of the value of colour as an assistant of feeling, and to think that hardness, dryness, and opacity are its virtues as employed in religious art; whereas I hesitate not to affirm that in such art, more than in any other, clearness, luminousness, and intensity of hue are essential to right impression; and from the walls of the Arena chapel in their rainbow play of brilliant harmonies, to the solemn purple tones of Perugino's fresco in the Albizzi Palace,³ I know not

¹ [In the second of the Tuscan rooms: No. 1268, "Madonna and Saints."]

² [Cf. preceding volume, p. 351.]

³ [This fresco, which is not now known to be accessible, is described at length in Ruskin's note-book of 1845, where, in dealing with Perugino's pictures in the Uffizi, he notes "a kind of thus-far-shalt-thou-go-and-no-further expression that in some degree checks and chills me":—

"And this I felt also in a most heavenly work which I saw to-day, June 18th, in the palace of the Albizzi, a fresco of the Entombment. The Madonna on the left, wearing, as in the convent one, a purple robe, with white veil over forehead, but in this picture a most heavenly type, the eyes soft, clear, and full of pensive under-light, the face of fine type, the very ideal of a lovely countenance at the age, subdued and resigned in habitual suffering, and the stamp of pain on the face without emaciation, paleness or contortion. The colour should be especially noticed as singularly glowing. The Christ is very beautiful and simple in type of features; it did not enrapture me, but I liked it better every time I looked. The mouth looks out of drawing from the want of the touch of light on the upper lip. The body and limbs are beautifully shaded, but the latter are much too small and give great meanness and unpleasantness to the composition. Note this in speaking of Elgins and Bandinelli.

"The Christ is supported by a St. Joseph of the very highest perfection; as a study of a head grand, and simple, and tender, and manly, full of gentle emotion, but without passion; the red cap, with its triple projection, is a beautiful bit of costume. The hair is exquisite, touched with perfect freedom and mastery and yet not curled nor heavy in flow, but restrained and light. The rich russet complexion comes dark against the sky.

"The last figure is the Magdalen, which has suffered grievously but is still very fine. The figures are all awkwardly foreshortened or cut off at the

any great work of sacred art which is not as precious in colour as in all other qualities (unless indeed it be a Crucifixion of Fra Angelico in the Florence Academy, which has just been glazed, and pumiced, and painted, and varnished by the picture cleaners until it glares from one end of the gallery to the other); only the pure white light and delicate hue of the idealists, whose colours are by preference such as we have seen to be the most beautiful in the chapter on Purity, are carefully to be distinguished from the golden light and deep-pitched hue of the school of Titian, whose virtue is the grandeur of earthly solemnity, not the glory of heavenly rejoicing.

But leaving these accessory circumstances, and touching the treatment of the bodily form, it is evident, in the first place, that whatever typical beauty the human body is capable of possessing must be bestowed upon it when it is to be understood as spiritual. And therefore those general proportions and types

§ 16. *Ideal form of the body itself; of what variety susceptible.*

bottom. The drawing of the faces is most delicate, all stippled and cross-hatched rapidly and freely, not flat painted; the dark sunk eyes of the Madonna, are all painted with strokes that run round them, apparently without much drawing; the effect comes out on retiring.

“The colour of the whole far richer and deeper than Raffaele, almost worthy of Titian. All come dark against sky. The distance peculiarly simple, level, and quiet, one cross only seen on the top of a knoll, and a few trees nearer. Still, as in the avoidance of all violent grief or passion, there is infinite grandeur on the one hand, so on the other, there is a certain degree of coldness, and in these three pictures of Perugino I feel it especially. They say here that the one in the Tribune is of his first manner and this of the Albizzi in his very finest. Raffaele has seldom done anything so fine as the St. Joseph for grace and purity, going beyond it only in intenseness of expression.”

This fresco was originally painted for a church in Florence, and is thus referred to by Vasari (ii. 316, Bohn's ed. 1871):—

“Pietro likewise received a commission to paint a figure representing the Dead Saviour, with the Madonna and San Giovanni, above the steps leading to the side door of San Pietro Maggiore, and this he executed in such a manner that, exposed as it is to wind and weather, it has nevertheless maintained such freshness as to have the appearance of being but just finished by the hand of the master.”

The Florentine editor of Vasari (1832–1838) states that “when the Church, which had shown symptoms of decay from the year 1784, was entirely demolished, the fresco was placed by the Senator Albizzi in a small chapel of his palace, where it still remains.” Eastlake, in his *Materials for a History of Oil Painting*, 1847 (ii. 126), adds that “from a document obligingly communicated by the present inheritor of the picture, it appears that the artist received a hundred gold crowns for it from Luca degl' Albizzi.” As that individual was exiled in 1478, Eastlake gives 1476–1477 as the date of the work. The fresco is mentioned in guide-books of some years later than 1847 as being still to be seen in the Casa Albizzi.]

which are deducible from comparison of the nobler individuals of the race, must be adopted and adhered to; admitting among them not, as in the human ideal, such varieties as result from past suffering, or contest with sin, but such only as are consistent with sinless nature, or are the signs of instantly or continually operative affections; for though it is conceivable that spirit should suffer, it is inconceivable that spiritual frame should retain, like the stamped inelastic human clay, the brand of sorrow past, unless fallen:

“His face
Deep scars of thunder had intrenched, and care
Sat on his faded cheek.”¹

Yet so far forth the Angelic idea is diminished, nor could this be suffered in pictorial representation.

Again, such muscular development as is necessary to the perfect beauty of the body is to be rendered. But that which is necessary to strength, or which appears to have been the result of laborious exercise, is inadmissible. No herculean form is spiritual, for it is degrading the spiritual creature to suppose it operative through impulse of bone and sinew; its power is immaterial and constant, neither dependent on, nor developed by, exertion. Generally it is well to conceal anatomical development as far as may be; even Michael Angelo’s anatomy interferes with his divinity; in the hands of lower men the angel becomes a preparation. How far it is possible to subdue or generalize the naked form I venture not to affirm; but I believe that it is best to conceal it, as far as may be, not with light and undulating draperies, that fall in with and exhibit its principal lines, but with severe and linear draperies, such as were constantly employed before the time of Raffaello. I recollect no single instance of a naked angel that does not look boylike or childlike, and unspiritualized; even Fra Bartolomeo’s might with advantage be spared from the pictures at Lucca: and, afterwards, the sky is merely encumbered with sprawling infants; those of Domenichino in

§ 17. Anatomical development, how far admissible.

¹ [*Paradise Lost*, i. 600.]

the Madonna del Rosario, and Martyrdom of St. Agnes,¹ are peculiarly offensive, studies of bare-legged children howling and kicking in volumes of smoke. Confusion seems to exist in the minds of subsequent painters between angels and Cupids.

Farther, the qualities of symmetry and repose are of peculiar value in spiritual form. We find the former most earnestly sought by all the great painters in the arrangement of the hair,² wherein no loosely flowing nor varied form is admitted, but all restrained in undisturbed and equal ringlets; often, as in the infant Christ of Fra Angelico, supported on the forehead in forms of sculpturesque severity. The angel of Masaccio, in the Deliverance of Peter,³ grand both in countenance and motion, loses much of his spirituality because the painter has put a little too much of his own character into the hair, and left it disordered.

Of repose, and its exalting power, I have already said enough for our present purpose, though I have not insisted on the peculiar manifestation of it in the Christian ideal as opposed to the Pagan. But this, as well as all other questions relating to the particular development of the Greek mind, is foreign to the immediate inquiry, which therefore I shall here conclude, in the hope of resuming it in detail after examining the laws of beauty in the inanimate creation⁴; always, however, holding this for certain, that of whatever kind or degree the short-coming may be, it is not possible but that shortcoming should be visible in every Pagan conception, when set beside Christian: and believing, for my own part, that there is not only deficiency, but such difference in kind as must make all Greek

¹ [See Vol. III. p. 184.]

² [On the subject of the treatment of hair in art, see *Ariadne Florentina*, § 219; and *Catalogue of the Educational Series*, note on No. 50.]

³ [One of the frescoes in the Brancacci chapel in the Church of Santa Maria del Carmine, where also is the "Tribute Money" referred to at p. 323 n.; the "Liberation of Peter" is now generally attributed to Filippino Lippi.]

⁴ [An intention not carried out in *Modern Painters*, nor very systematically elsewhere, but see next note.]

conception full of danger to the student in proportion to his admiration of it; as I think has been fatally seen in its effects on the Italian schools, when its pernicious element first mingled with their solemn purity, and recently in its influence on the French historical painters; neither can I, from my present knowledge, fix upon an ancient statue which expresses by the countenance any one elevated character of soul,¹ or any single enthusiastic self-abandoning affection, much less any such majesty of feeling as might mark the features for supernatural. The Greek could not conceive a spirit; he could do nothing without limbs; his God is a finite God, talking, pursuing, and going journeys;* if at any time he was touched with a true feeling of the unseen powers around him, it was in the field of poised battle; for there is something in the near coming of the shadow of death, something in the devoted fulfilment of mortal duty, that reveals the real God, though darkly. That pause on the field of Plataea was not one of vain superstition;² the two white figures that blazed along the Delphic plain, when the earthquake and the fire led the charge from Olympus, were more than sunbeams

* I know not anything in the range of art more unspiritual than the Apollo Belvedere; the raising of the fingers of the right hand in surprise at the truth of the arrow is altogether human, and would be vulgar in a prince, much more in a deity. The sandals destroy the divinity of the foot, and the lip is curled with mortal passion.³

¹ ["I have not loved the arts of Greece," said Ruskin, "as others have" (*Lectures on Art*, § 111). He devoted, however, a good deal of study to them, as may be seen more especially in *The Queen of the Air* and *Aratra Pentelici*, and in scattered references elsewhere in his writing. He always held, however—a view which some other students are not likely to share, at least without large exceptions—that "Greek sculpture was essentially *απροσωπος*;—independent, not only of the expression, but even of the beauty of the face. Nay, independent of its being so much as seen" (*Relation between Michael Angelo and Tintoret*). So again, "The Greek, as such, never expresses personal character" (*Aratra Pentelici*, § 193); and cf. *Queen of the Air*, §§ 161–177.]

² [See Plutarch: *Aristides*, c. 17 *ad fin.*; Herodotus, 9, 60. The Lacedæmonians finding themselves alone and fiercely attacked offered sacrifice. For a while the sacrifices were not favourable, and many fell or were wounded during the interval. At last Pausanias, looking towards the temple of Hera of the Plataeans, invoked the goddess, praying that they might not be disappointed of their hopes, and the omens changed.]

³ [For other references to the Apollo Belvedere, see preceding volume, pp. 118, 608, 627.]

on the battle dust;¹ the sacred cloud, with its lance light and triumph singing, that went down to brood over the masts of Salamis, was more than morning mist among the olives:² and yet what were the Greek's thoughts of his God of Battle? No spirit power was in the vision:* it was a being of clay strength, and human passion, foul, fierce, and changeful; of penetrable arms, and vulnerable flesh. Gather what we may of great from Pagan chisel or Pagan dream, and set it beside the orderer of Christian warfare, Michael the Archangel: not Milton's "with hostile brow and visage all inflamed;" not even Milton's in kingly treading of the hills of Paradise;³ not Raffaele's with the expanded wings and brandished spear;⁴ but Perugino's⁵ with his triple crest of traceless plume unshaken in heaven, his hand fallen on his crossleted sword, the truth girdle binding his undinted armour; God has put His power upon him, resistless radiance is on his limbs; no lines are there of earthly strength, no trace on the divine features of earthly anger; trustful, and thoughtful, fearless, but full of love, incapable except of the repose of eternal conquest, vessel and instrument of Omnipotence, filled like a cloud with the victor light, the dust of principalities and powers

* This sentence of course refers to Mars, not Pallas. The false bias of the general statement is enough corrected in the "Queen of the Air." [1883.]

¹ [Olympus is here apparently a slip for Parnassus, unless it is meant only for heaven. See Herodotus, 8, 37: "When the Persians had advanced near the temple of Athena at Delphi, at that moment thunder fell on them from heaven, and two crags, broken away from Parnassus, bore down upon them with a loud crash, and killed many of them, and a loud cry and a war-shout issued from the temple. . . . Those of the barbarians who returned, as I am informed, declared that besides these they saw other miraculous things, for that two heavy-armed men, of more than human stature, followed them slaying and pursuing them."]

² [See Herodotus, 8, 65. A few days before the battle a phantom procession was seen going to Eleusis. A cloud of dust was seen, and a voice arose from it—the voice of the mystic Bacchus. Then the dust arose in a cloud, which was raised aloft and was borne towards Salamis to the encampment of the Greeks.]

³ [*Paradise Lost*, vi. 260, and see xi. 238–250.]

⁴ [In the Louvre.]

⁵ [The description seems to have been written from the figure of Michael in the "Assumption of the Virgin" in the Accademia at Florence (for a photographic reproduction, see p. 82 of G. C. Williamson's *Perugino*). For another reference to the picture, see above, p. 84 *n*. The National Gallery Perugino (No. 288)—with a similar figure (except that there is no triple crest)—was not acquired till 1856.]

beneath his feet, the murmur of hell against him heard by his spiritual ear like the winding of a shell on the far off sea shore.

It is vain to attempt to pursue the comparison; the two orders of art have in them nothing common, and the field of sacred history, the intent and scope of Christian feeling, are too wide and exalted to admit of the juxtaposition of any other sphere or order of conception; they embrace all other fields like the dome of heaven. With what comparison shall we compare the types of the martyr saints;* the St. Stephen of Fra Bartolomeo,¹ with his calm forehead crowned by the stony diadem, or the St. Catherine of Raffaele² looking up to heaven in the dawn of the eternal day, with her lips parted in the resting from her pain; or with what the Madonnas of Francia and Pinturicchio,³ in whom the hues of the morning and the solemnity of eve, the gladness in accomplished promise, and sorrow of the sword-pierced heart, are gathered into one human Lamp of

* I will put no depreciatory comments under the honest canticle with which a book I was so happy in writing is brought to a close;⁴ though I have long ceased to care for the Madonnas of Francia, and much prefer the St. Catherine of Luini⁵ to that of Raffaele, and feel the whole passage to read more like a piece of Mrs. Jameson⁶ than of me. Perhaps I am none the better, if the wiser, in these changes of temperament: but they enable me, at all events, fully to ratify the useful censures in the following Addenda, given with the second edition of the old book, and which I conclude my editorial duty by commenting upon, at some length, in the "Epilogue." [1883.]

¹ [As in the picture in the Cappella del Santuario of the cathedral at Lucca.]

² [See above, sec. i. ch. xii. § 10, p. 159.]

³ [Ruskin may have been thinking especially of the Francia in the National Gallery: see above, p. 196 *n*. He had especially admired the Madonna by Pinturicchio in the Louvre, which he had noted in his 1844 diary as "exquisite and pure."]

⁴ [See *Ethics of the Dust*, § 87, where "Dora" asks the "Lecturer" to "read the end of the second volume of *Modern Painters*," and he replies that he has changed his mind between 27 and 40; "but," he adds, "that second volume is very good for you as far as it goes. It is a great advance and a thoroughly straight and swift one, to be led, as it is the main business of that second volume to lead you, from Dutch cattle-pieces, and ruffian-pieces, to Fra Angelico."]

⁵ [A favourite saint with Luini; see, for instance, the frescoes of the Monastero Maggiore (San Maurizio), Milan, the "Body of St. Catherine borne across the Sea to its Sepulchre" in the Brera, and the "St. Catherine of the Hermitage" (frontispiece to G. C. Williamson's *Luini*, 1899). For Ruskin's general estimate of Luini, see below, p. 355.]

⁶ [For Mrs. Jameson, see *Præterita*, ii. ch. vii. § 143.]

ineffable love? or with what the angel choirs of Angelico, with the flames on their white foreheads waving brighter as they move, and the sparkles streaming from their purple wings like the glitter of many suns upon a sounding sea, listening in the pauses of alternate song, for the prolonging of the trumpet blast, and the answering of psaltery and cymbal, throughout the endless deep, and from all the star shores of heaven?¹

¹ [It is interesting to compare this passage with the first impression for it, which is given by Ruskin in a letter to his father:—

“FLORENCE, *June 5*.— . . . I spent an hour and a half before a Fra Angelico [in the Uffizi], and hadn’t enough of it neither. I learnt how *ladies* dance from Simone Memmi [in the Campo Santo at Pisa]; and I saw *angels* dancing to-day, and so I know how *they* do it. I wish you could see one of Angelico’s, either dancing or singing. One that I saw to-day had just taken the trumpet from his lips, and—with his hand lifted—listens to the blast of it passing away into heaven. And then to see another bending down to clash the cymbals, and yet looking up at the same instant all full of love. And their wings are of ruby colour and pure gold, and covered with stars, and each has a tongue of fire on his forehead, waving as he moves.”

With this “canticle” in praise of Fra Angelico, compare Ruskin’s review of Lord Lindsay, *On the Old Road*, 1899, i. §§ 90–94.]

J. Huskm after Tintoret.

Cherubs from "The Adoration of the Magi."

ADDENDA (1848)¹

§ 1. ALTHOUGH the plan of the present portion of this work does not admit of particular criticism, it will neither be useless nor irrelevant to refer to one or two works, lately before the public in the Exhibitions of the Royal Academy, which either illustrate, or present exceptions to, any of the preceding statements. I would first mention, with reference to what has been advanced respecting the functions of Associative Imagination, the very important work of Mr. Linnell, the “Eve of the Deluge;”² a picture upheld by its admirers (and these were some of the most intelligent judges of the day) for a work of consummate imaginative power; while it was pronounced by the public journals to be “a chaos of unconcocted colour.”* If the writers for the press had been aware of the kind of study pursued by Mr. Linnell through many laborious years, characterized by an observance of nature scrupulously and minutely patient, directed by the deepest sensibility, and aided by a power of drawing almost too refined for landscape subjects, and only to be understood by reference to his engravings after Michael Angelo, they

* The usual style of journalist criticism in those days, on any picture which had true colour in it at all. Neither Turner, nor Linnell, however, entrusted their fame to legal advocacy or defence. [1883.]

¹ [These Addenda are not contained in ed. 1, which has, instead, two pages of other Addenda consisting of four notes:—

(a) The note on “Railways in the Lake District” now at the end of sec. i. ch. i., p. 36;

(b) A note afterwards omitted on sec. i. ch. iv. § 6, see now p. 69 *n.* ;

(c) The latter portion of the note on the “Laocoon,” afterwards given in sec. i. ch. vii. § 6 *n.*, see now p. 121 *n.*;

(d) A long note, afterwards omitted, referring to sec. ii. ch. iii. § 33, p. 288.

This note is here printed at the end of the Addenda of 1848, see p. 341.

The numbering of the paragraphs is here introduced for convenience of reference.]

² [No 620 in the Academy of 1848. Sold at Mr. Gillott’s sale (1872) for £1099; afterwards in the collection of Mr. Angus Holden; No. 8 in the Old Masters’ Exhibition of 1883. For another reference to Linnell, see Vol. III. pp. 604–605 *n.*]

would have felt it to be unlikely that the work of such a man should be entirely undeserving of respect. On the other hand, the grounds of its praise were unfortunately chosen; for, though possessing many merits, it had no claim whatever to be ranked among productions of Creative art. It would perhaps be difficult to point to a work so exalted in feeling, and so deficient in invention. The sky had been strictly taken from nature, this was evident at a glance; and as a study of sky it was every way noble. To the purpose of the picture it hardly contributed: its sublimity was that of splendour, not of terror; and its darkness that of retreating, not of gathering, storm. The features of the landscape were devoid alike of variety and probability; the division of the scene by the central valley and winding river at once theatrical and commonplace; and the foreground, on which the light was intense, alike devoid of dignity in arrangement, and of interest in detail.*

§ 2. The falseness or deficiency of colour in the works of Mr. Landseer has been remarked above, p. 302.¹ The writer has much pleasure in noticing a very beautiful exception in the picture of the “Random Shot,”² certainly the most successful rendering he has ever seen of the hue of snow

* The literary student will recognise the change of style in these notes, and the imitation of Johnson instead of Hooker. Johnson had been a much earlier model to me, and a far better and healthier tutor.³ [1883.]

¹ [It may be convenient to bring together here Ruskin’s references to Landseer. The first notice is at the beginning of the first volume of *Modern Painters*, where he describes the “Old Shepherd’s Chief Mourner” as “one of the most perfect poems or pictures which modern times have seen” (Vol. III. p. 88). By the time of the second volume Ruskin had come to see Landseer’s defects, and retracted his “implied over-praise” (Vol. III. p. xlvi. n.). Landseer, he said, was “much more a natural historian than a painter” (above, p. 302 n.). His colour was defective, and his treatment of animals, as compared with Veronese’s, was “unimaginative” (above, p. 302; sec. ii. ch. iv. § 11). In *Pre-Raphaelitism* (1851), § 29, Landseer’s early “watchfulness of nature” is commended. His later works were not so highly praised; cf. *Academy Notes*, 1856, No. 147, where also his “clay-colouring” is mentioned; other minor references occur in *Academy Notes*, 1857, No. 597; and 1858, No. 854. In *Modern Painters*, vol. v., Ruskin again compares Landseer’s treatment of animals with that of the Venetians and Velasquez, and criticises the trivial sentiment of the English painter (pt. ix. ch. vi. § 20). Cf. also *Academy Notes*, 1859 (s. “French Exhibition,” No. 91 a.) For another reference in this volume, see sec. i. ch. xii. § 2 n., p. 149.]

² [No. 403 in the Academy of 1848; afterwards in the collection of Mr. T. Wrigley.]

³ [See *Præterita*, i. ch. xii. § 151; and *Proserpina*, ii. ch. ii.]

under warm but subdued light. The subtlety of gradation from the portions of the wreath fully illumined, to those which, feebly tinged by the horizontal rays, swelled into a dome of dim purple, dark against the green evening sky; the truth of the blue shadows, with which this dome was barred, and the depth of delicate colour out of which the lights upon the footprints were raised, deserved the most earnest and serious admiration; proving, at the same time, that the errors in colour, so frequently to be regretted in the works of the painter, are the result rather of inattention than of feeble perception. A curious proof of this inattention occurs in the disposition of the shadows in the background of the "Old Cover Hack," No. 229.¹ One of its points of light is on the rusty iron handle of a pump, in the shape of an S. The sun strikes the greater part of its length, illuminating the perpendicular portion of the curve; yet shadow is only cast on the wall behind by the returning portion of the lower extremity. A smile may be excited by the notice of so trivial a circumstance; but the simplicity of the error renders it the more remarkable, and the great masters of chiaroscuro are accurate in all such minor points; a vague sense of greater truth results from this correctness, even when it is not in particulars analyzed or noted by the observer. In the small but very valuable Paul Potter in Lord West-minster's collection,² the body of one of the sheep under the hedge is for the most part in shadow, but the sunlight touches the extremity of the back. The sun is low, and the shadows feeble and distorted; yet that of the sunlighted fleece is cast exactly in its true place and proportion beyond that of the hedge. The spectator may not observe this; yet, unobserved, it is one of the circumstances which make him feel the picture to be full of sunshine.*

* I beg the reader to observe that *I could* be just, even to the Dutch school! [1883.]

¹ [Afterwards in the collection of Mr. R. Heathcote.]

² [At Grosvenor House. Painted in 1647. For details about the picture, see Mrs. Jameson's *Handbook to the Private Galleries of London*, 1844, pp. 266–267.]

§ 3. As an example of perfect colour, and of the most refined handling ever perhaps exhibited in animal painting, the Butcher's Dog in the corner of Mr. Mulready's¹ "Butt," No. 160, deserved a whole room of the Academy to himself. This, with the spaniel in the "Choosing the Wedding Gown," and the two dogs in the hay-field subject (Burchell and Sophia), displays perhaps the most wonderful, because the most dignified, finish in the expression of anatomy and covering—of muscle and hide at once,* and assuredly the most perfect unity of drawing and colour, which the entire range of ancient and modern art can exhibit. Albert Durer is indeed the only rival who might be suggested; and, though greater far in imagination, and equal in draughtsmanship, Albert Durer was less true and less delicate in hue. In sculpturesque arrangement both masters show the same degree of feeling: any of these dogs of Mulready might be taken out of the canvas and cut in alabaster, or, perhaps better, struck upon a coin. Every lock and line of the hair has been grouped as it is on a Greek die; and if this not always without some loss of ease and of action, yet this very loss is ennobling, in a period when all is generally sacrificed to the great coxcombrity of art, the affectation of ease.

§ 4. Yet Mr. Mulready himself is not always free from

* I forget these dogs now: but if they showed their muscles under their hide, they had no business to, and I should greatly prefer, now, Punch's Skye terrier with the street boys disputing over him which end was his head, and which his tail. [1883.]

¹ [Of Mulready's work on the technical side Ruskin always expressed a high opinion. In the first words of *The Seven Lamps of Architecture* (1849) Ruskin refers to him as "an artist whose works, perhaps, alone, in the present day, unite perfection of drawing with resplendence of colour." See also *Modern Painters*, vol. i., Vol. III. p. 598 in this edition. He threw away, however, says Ruskin, "a consummate method of execution" on "subjects either altogether uninteresting, or above his powers, or unfit for pictorial representation" (*Pre-Raphaelitism*, 1851, § 28). For criticisms of particular pictures in this sense, see *Academy Notes*, 1857, No. 138; 1858, No. 167. In *The Eagle's Nest* (§ 166), Ruskin condemns Mulready's life studies as vulgar. For another favourable reference to "Choosing the Wedding Dress" and "Burchell and Sophia," see *Academy Notes*, 1875, No. 265. The former picture, exhibited 1846, is now in the Victoria and Albert (South Kensington) Museum (Sheepshanks Collection); the latter was exhibited in 1847. Mulready was on friendly terms with Ruskin's father; see Epilogue, § 14, below, p. 357.]

affectation of some kind; mannerism, at least, there is in his treatment of tree trunks. There is a ghastliness about his laboured anatomies of them, as well as a want of specific character. Why need they be always flayed?* The hide of a beech tree, or of a birch, or fir, is nearly as fair a thing as an animal's; glossy as a dove's neck, barred with black like a zebra, or glowing in purple grey and velvet brown like furry cattle in sunset. Why not paint these as Mr. Mulready paints other things, as they are? that simplest, that deepest of all secrets, which gives such majesty to the ragged leaves about the edges of the pond in the "Gravel-pit" (No. 125), and imparts a strange interest to the grey ragged urchins disappearing behind the bank, that bank so low, so familiar, so sublime! What a contrast between the deep sentiment of that commonest of all common, homeliest of all homely, subjects, and the lost sentiment of Mr. Stanfield's¹ "Amalfi," the chief landscape of the year, full of exalted material, and mighty crags, and massy seas, grottoes, precipices and convents, fortress-towers and cloud-capped mountains, and all in vain, merely because that same simple secret has been despised; because nothing there is painted as it is! The picture was a most singular example of the scenic assemblage of contradictory theme which is characteristic of Picturesque, as opposed to Poetical, composition. The lines chosen from Rogers for a titular legend were

* Very properly asked. Compare "Tale of a Tub," Section IX., which settled the question as early as 1704.² But modern scientific artists wouldn't draw the prophet Isaiah, if they could help it, till they had got him sawn asunder. [1883.]

¹ [For Clarkson Stanfield, see Vol. III. p. 226 *n.* "Amalfi" was No. 217 in the Academy of 1848.]

² [The passage referred to is as follows: "In the proportion that credulity is a more peaceful possession of the mind than curiosity, so far preferable is that wisdom, which converses about the surface, to that pretended philosophy, which enters into the depth of things, and then comes gravely back with informations and discoveries that in the inside they are good for nothing. The two senses, to which all objects first address themselves, are the sight and the touch; these never examine further than the colour, the shape, the size, and whatever other qualities dwell, or are drawn by art upon the outward of bodies; and then comes reason officiously with tools for cutting, and opening, and mangling, and piercing, offering to demonstrate that they are not of the same consistence quite through."]

full of summer, glowing with golden light, and toned with quiet melancholy:

“To him who sails
Under the shore, a few white villages,
Scattered above, below, some in the clouds,
Some on the margin of the dark blue sea,
And glittering thro’ their lemon groves, announce
The region of Amalfi. Then, half-fallen,
A lonely watch-tower on the precipice,
Their ancient landmark, comes—long may it last!
And to the seaman, in a distant age,
Though now he little thinks how large his debt,
Serve for their monument.”

§ 5. Prepared by these lines for a dream upon deep calm waters, under the shadow and scent of the close lemon leaves, the spectator found himself placed by the painter, wet through, in a noisy fishing boat, on a splashing sea, with just as much on his hands as he could manage, to keep her gunwale from being stove in against a black rock; and with a heavy grey squall to windward. (This squall, by-the-bye, was the very same which appeared in the picture of the Magra of 1847,¹ and so were the

¹ [No. 74 in the Academy of 1847: “French troops (1796) fording the Magra; Sarzana and the Carrara Mountains in the distance.” The following letter from Ruskin to the painter (contributed by his son, Mr. F. D. Stanfield) refers to the picture:—

MY DEAR SIR,—Could you favour us with your company at dinner at half-past six on Thursday next—the third?

I have had great pleasure—a very large portion of the sum-total received from the Exhibition—in looking quietly over the details of your Carrara picture—it is marvellously careful throughout—how carefully you have marked even the gleam of the bayonets when they come together as the regiment turns over the ridge of the hill. But I never saw an exhibition more execrably arranged. If the hangers had had a mustard-seed-full of sense—would they not have put two dark pictures on the right of yours—so as to join your dark sky and enclose your light. They have treated your howling storm like a naughty child, when its mother bids it look at the window and be quiet. They have served Turner worse, however; there is nothing in his picture but even colour, and they must needs put Maclise’s rainbow side by side with it—which takes part—and a very awkward and conclusive part too in its best melody. To Harding’s picture they have given its quietus too—but that, I suppose, they didn’t care about. There are two fine things in the rooms—Mulready’s couple. I hardly know which to admire most—the painting or drawing.—Ever, my dear sir, most truly yours,

J. RUSKIN.

The picture by Turner (No. 180) was “The Hero of a Hundred Fights,” or “Tapping the Furnace;” now No. 551 in the National Gallery. Beside it was hung Maclise’s “Noah’s Sacrifice; the Bow is set in the Cloud” (No. 178). Harding had two pictures hung: No. 489 (“Hastings, from under the East Cliffs”) and No. 516 (“Lago Maggiore”). “Mulready’s couple” was No. 134 (“Burchell and Sophia”).]

snowy mountains above; only the squall at Amalfi entered on the left, and at the Magra on the right.) Now the scenery of Amalfi¹ is impressive alike in storm or calm, and the writer has seen the Mediterranean as majestic and as southern-looking in its rage as in its rest. But it is treating both the green water and woods unfairly to destroy their peace without expressing their power; and withdraw from them their sadness and their sun, without the substitution of any effect more terrific than that of a squall at the Nore. The snow on the distant mountains chilled what it could not elevate, and was untrue to the scene besides; there is no snow on the Monte St. Angelo in summer except what is kept for the Neapolitan confectioners. The great merit of the picture was its rock-painting; too good to have required the aid of the exaggeration of forms which satiated the eye throughout the composition.

§ 6. Mr. F. R. Pickersgill's² "Contest of Beauty" (No. 515), and Mr. Uwins's³ "Vineyard Scene in the South of France," were, after Mr. Mulready's works, among the most interesting pieces of colour in the Exhibition. The former, very rich and sweet in its harmonies, and especially happy in its contrasts of light and dark armour; nor less in the fancy of the little Love who, losing his hold of the orange boughs, was falling ignominiously without having time to open his wings. The latter was a curious example of what I have described as abstraction

¹ [Ruskin was at Amalfi in 1841. The following is his note of the place in his diary for that year:—

(NAPLES, *March* 11).—... Saw no more of Amalfi—than I sketched, but that was glorious. Far above all I ever hoped, when I first leaped off the mule—in the burning sun of the afternoon, with the light behind the mountains in the evening mist doubling their height. I never saw anything, in its way, at all comparable. Moonlight in the terrace before the inn very full of feeling—smooth sea, and white convent above, with the keen shadows of the rocks far above and sea dashing all bright in my ears—low, but impatiently and quick; I never heard waves follow each other so fast.]

² [Frederick Richard Pickersgill (1820–1890) began to exhibit at the Academy in 1839. In 1847 he was elected A.R.A., and in 1857 R.A. He was Keeper, 1873–1887. For another favourable notice of his work, see *Academy Notes*, 1856, No. 17.]

³ [Thomas Uwins (1782–1857) after being for some years a member of the Water-Colour Society, was elected A.R.A. in 1833, R.A. in 1838. From 1847 to 1855 he was Keeper of the National Gallery. The picture referred to above—No. 36: "The Vintage in the Claret Vineyards of the South of France on the banks of the Gironde"—was bought by Mr. Vernon, and passed with his collection to the National Gallery (No. 387): it is now transferred to the Dundee Gallery.]

of colour.¹ Strictly true or possible it was not; a vintage is usually a dusty and dim-looking procedure;* but there were poetry and feeling in Mr. Uwins's idealization of the sombre black of the veritable grape into a luscious ultra-marine purple, glowing among the green leaves like so much painted glass. The figures were bright and graceful in the extreme, and most happily grouped. Little else that could be called colour was to be seen upon the walls of the Exhibition with the exception of the smaller works of Mr. Etty.² Of these, the single head, "Morning Prayer" (No. 25), and the "Still Life" (No. 73), deserved, allowing for their peculiar aim, the highest praise. The larger subjects, more especially the St. John,³ were wanting in the merits peculiar to the painter; and in other respects it is alike painful and useless to allude to them. A very important and valuable work of Mr. Harding⁴ was placed, as usual, where its merits could be but ill seen, and where its chief fault, a feebleness of colour in the principal light on the distant hills, was apparent. It was one of the very few views of the year which were transcripts, nearly without exaggeration, of the features of the localities.†

§ 7. Among the less conspicuous landscapes, Mr. W. E. Dighton's "Hay-Meadow Corner"⁵ deserved especial notice; it was at once vigorous, fresh, faithful, and unpretending; the

* Nonsense. I had never seen a vintage except in the Pays de Vaud, or Burgundy, when I had been impressed by the quantity of white dust on the branches close to the ground.

It is a curious proof, to me, of the incalculable advance in the standard of painting since these notes were written, that I could find then no better pictures to praise in the whole Academy exhibition, than those here noticed. [1883.]

† See general notice of Mr. Harding's work, in the Epilogue [§ 12, p. 353 below.] [1883.]

¹ [See above, ch. iv. § 10, p. 301.]

³ [No. 404: "Him that crieth from the wilderness, Repent ye!"]

⁴ [No. 494: "The high Alps as seen from between Como and Lecco: the town and lake of Como at their base. The snowy mountain in the centre is the Monte Rosa; to the left of it are the Mont St. Bernard and Mont Blanc; to the right are the Mont Simplon, and the Grimsel and the St. Gothard." The picture was perhaps painted from sketches made during Ruskin's drive with Harding from Como to Lecco in 1845.]

⁵ [No. 165 in the Academy of 1848.]

management of the distance most ingenious, and the painting of the foreground, with the single exception of Mr. Mulready's, above noticed, unquestionably the best in the room. I have before had occasion¹ to notice a picture by this artist, "A Hayfield in a Shower," exhibited in the British Institution in 1847, and this year (1848) in the Scottish Academy, whose sky, in qualities of rainy, shattered, transparent grey, I have seldom seen equalled; nor the mist of its distance, expressive alike of previous heat and present beat of rain. I look with much interest for other works by this painter.²

§ 8. A hurried visit to Scotland in the spring of this year, while it enables the writer to acknowledge the ardour and genius manifested in very many of the works exhibited in the Scottish Academy, cannot be considered as furnishing him with sufficient grounds for specific criticism. He cannot, however, err in testifying his concurrence in the opinion expressed to him by several of the most distinguished members of that Academy, respecting the singular merit of the works of Mr. H. Drummond.³ A cabinet picture of "Banditti on the Watch" appeared to him one of the most masterly, unaffected, and sterling pieces of quiet painting he has ever seen from the hand of a living artist; and the other works of Mr. Drummond were alike remarkable for their manly and earnest finish, and their sweetness of feeling.

[The following is the note of 1846 referred to above (p. 333 *n.*) which appeared in ed. 1:—]

"It is painful to trace upon the walls of the Exhibitions lately opened in London, the universal evidence of the mode of study deprecated in this passage;⁴ and to observe the various kinds of wreck which are taking place in consequence with many of our most promising artists. In the British Institution I saw only three pictures in which there was evidence of desire and effort to render a loved passage of Nature faithfully. These were, first,

¹ [*i.e.* in the Addenda of ed. 1; see below, p. 342.]

² [William Edward Dighton did not live to fulfil his early promise; he died in 1853 at the age of 31. He was a pupil of William Müller and afterwards of Frederick Goodall.]

³ [So in all eds.; but "H. Drummond" should be "James Drummond" (1816–1877), Academician, and afterwards curator of the Scottish National Gallery. The picture referred to above was exhibited under the title "A Mountain Pass."]

⁴ [*i.e.*, sec. ii. ch. iii. § 33, p. 288 above.]

a hayfield in a shower (I cannot, at this moment, refer to the painter's name);¹ with a wooden bridge and a single figure in the foreground, whose sky, in rainy, shattered, transparent grey, I have seldom seen equalled, and whose distance and foreground were alike carefully studied, the one obscure with the dusty vapour rising out of the heat of the shower, the other rich in broad and luxuriant leafage; (the foaming water on the left was, however, too cold and false in its reflections). The second was a sky of Lauder's,² evidently taken straight from nature (which, with the peculiar judgment frequent in hanging committees, was placed at the top of the central room), but which was in great measure destroyed by the intrusion of a lay figure and dramatic sea; the third a forest study by Linnell.³ Among the various failures, I am sorry to have to note the prominent one of Turner's;⁴ a strange example of the way in which the greatest men may at times lose themselves, from causes it is impossible to trace. Happily, this picture cannot be construed into a sign of generally declining power, for I have seen three drawings executed at the same period, in which the artist's mind appears at its full force. Nothing, however, could be more unfortunate than the central portion of the picture in the Institution, a heavy mass of hot colour being employed in the principal shade, and a strange meaningless green spread over the delicate hues of the distance, while the shadows on the right were executed with pure and crude blue, such as I believe cannot be shown in any other work whatsoever of the great painter. I am also sorry to have to warn so good a painter as Mr. Goodall of his being altogether on a wrong road; the false chiaroscuro, exaggerated and impossible aerial perspective, and morbid prettiness and polish of complexions, in his large picture, are means of attracting vulgar notice which he certainly does not need, and which, if he continues to employ them, must end, and that speedily, in his sinking irrecoverably beneath the rank which it was the hope of all lovers of English art to see him attain and hold.⁵

"One more picture I must mention, as a refreshing and earnest study of truth, yet unexhibited, but which will appear in the Royal Academy; a seashore by Collins,⁶ where the sun, just risen and struggling through gaps of threatening cloud, is answered by the green, dark, transparent sea, with a broad flake of expanding fire. I have never seen the oppression of sunlight in clear, lurid, rainy atmosphere more perfectly or faithfully rendered, and the various portions of reflected and scattered light are all studied with equal truth and solemn feeling."

¹ [By W. E. Dighton; see above, § 7, p. 340.]

² [James Eckford Lauder (1812–1869), a member of the Royal Scottish Academy.]

³ ["A Spring Wood Scene," exhibited at the Old Masters in 1883 as "The Fallen Monarch" (No. 57). For Linnell, see above, p. 333.]

⁴ [Turner's picture in the British Institution of 1847 was "Queen Mab's Cave," now No. 548 in the National Gallery; for notes on it, see *Popular Handbook*, 6th ed., ii. 221.]

⁵ [Mr. F. Goodall's principal picture in the British Institution of 1846 was "The Brittany Conscript Leaving Home." For another reference to Mr. Goodall's work at this time, see preceding vol., p. 326 *n.*; for later references, see *Academy Notes*, 1859 and 1875.]

⁶ [In the Academy of 1846 Collins exhibited "Hall Sands, Devon" (now in the Victoria and Albert Museum), and "Early Morning."]

EPILOGUE (1883)

§ 1. THE above short pieces of criticism on contemporary art, first given, I believe, only in the second edition of *Modern Painters*,¹ have become now extremely curious to myself, in connection with points of my personal history, of which some account may perhaps lead to a more indulgent retrospect of this book; and further illustrate others written at or near this time, as well as some of my drawings and manuscripts which may be thought worth preservation hereafter.

1841. I must set down a few fastening dates. In the winter of 1840, and spring of 1841, I was at Rome, Naples, and Venice,² making a series of pencil sketches, partly in imitation of Prout, partly of David Roberts. I had not the smallest notion of *writing* about art at that time³ (many people, myself included, thought I was dying, and should never write about anything). These sketches, though full of weaknesses and vulgarities, have also much good in them; two are placed at Oxford as records of Venice,⁴ of which one was used to paint from by Prout himself; and all of them are of historical interest in their accuracy of representation. Sketching only in this way from nature, I was trying to make water-colour drawings and vignettes in imitation of Turner;⁵ which were extremely absurd and weak.

¹ [Not so. They were reprinted in all the subsequent editions.]

² [For the winter of 1840–1841, see Vol. I. pp. xxxviii.–xli., and *Præterita*, ii. ch. iii.]

³ [But see the *Letter to a College Friend* of Feb. 12, 1841: Vol. I. p. 434.]

⁴ [The two drawings are Nos. 64 and 65 in the Reference Series. No. 65 (“Casa Contarini Fasan”) is given opposite p. 212 in Vol. III. No. 64 (“Court of the Ducal Palace”) is given here in this volume, facing p. 40. For other drawings made on the same tour see Plates 13–19 in Vol. I.]

⁵ [As, for instance, the drawing of Amboise: in Vol. II. between pp. 170–171.]

§ 2. 1842. In the spring of this year, I made, by mere accident, my first drawing of leafage in natural growth—a few ivy leaves round a stump in the hedge of the Norwood road, under Tulse Hill: there is a brick built terrace of fashionable dwelling-houses now, where the hedge used to be. I never (in my drawings, however much in my writings) *imitated* anybody any more after that one sketch was made; but entered at once on the course of study which enabled me afterwards to understand Pre-Raphaelitism.¹

Few drawings, however, made in that year, now remain in my possession. A book of plant studies, given to Mr. C. E. Norton, represents the usual manner of them very perfectly. One or two studies of light and shade, and a few of trees, I still possess, and may have occasion to engrave.²

§ 3. In the same spring, Turner first showed his Swiss sketches, and offered to realize ten of them. The Splügen drawing, of which the story is told at page 74 of my Turner notes,* and which was bought for me by my friends on my recovery from illness in 1878, was made at that time, and shown with the sketches. My admiration of it afterwards directed mainly all my mountain - studies † and geological researches. I obtained in the same year the drawings of Coblenz and Lucerne town,³ which directed me into new lines of thought with respect to colour; so that it was a kind of birth-year to me, in all ways at once. In its autumn I was again on the Continent — chiefly at Chamouni;—then, returning in the full enthusiasm and rush of sap in the too

* Published by the Fine Art Society, 1878.⁴

† Not into imitation of the drawing itself, but to investigation of the mountain forms which it illustrated.

¹ [For this incident, see Vol. III. p. xxi.; and *Præterita*, ii. ch. iv. §§ 74, 77, and see the Plate, No. 25, in Vol. II.]

² [See, for drawings of 1842, Plate 25 and the frontispiece in Vol. II.]

³ [See the Epilogue to the "Turner notes" of 1878; and for the Coblenz, No. 62 in the "Notes." The drawing is published in vol. ii. of *Turner and Ruskin*; the Lucerne Town in vol. i. of that work.]

⁴ [P. 74 in the later editions of that pamphlet. The reference is to the Epilogue.]

literally sapling and stripling mind of me, wrote the first volume of *Modern Painters*.¹

Next year (1843) Turner painted for me the Goldau and Dazio Grande;² drawings which have become to me, now, very curious symbols of his life, and of mine.

§ 4. In 1844 I went back to Chamouni, and worked in entirely right and profitable ways.³ A drawing of Mont Blanc with the aiguilles (Charmoz to Midi), from above Les Tines, mostly pencil, on dark grey, but with a piece of rock coloured in the foreground,* represents my power at this time sufficiently.⁴

In 1845, the first volume of *Modern Painters* having already begun to make its mark, I thought it necessary to look more carefully at some of the pictures at Florence and Venice before proceeding with the essay. My father could not spare time to go with me; so he asked me to take my Chamouni guide, Joseph Couttet, by way of pro-papa.⁵ He was a tutor, and domestic Pope's legate, of perfect fidelity and good sense: a good practical physician also; I never had occasion to call in any other; and he always after that time travelled with me when my father and mother could not, (my mother never left my father,) until Couttet's death in 1875. He was nearly fifty when, in 1845, he met me at Geneva in early April; and we travelled leisurely through Lower Savoy and Provence to Fréjus. It was starlight, after a long day's drive, as we came down towards the sea over the southern moors of wild myrtle; and I recollect teasing old Joseph considerably by humming "com' è gentil"⁶ all the way.⁷

* Now in the possession of Mrs. John Simon.

¹ [See Vol. III. p. xxvii.]

² [Nos. 65 and 58 in the *Notes on his Drawings by Turner*. Goldau was engraved for the fourth volume of *Modern Painters*, Plate 50.]

³ [For extracts from his diary at Chamouni in 1844, see Vol. III. pp. xxv.-xxvii.]

⁴ [This is the drawing reproduced as the frontispiece to the present volume. Its date, however, is 1842.]

⁵ [For Couttet, see above, Introduction, p. xxv.]

⁶ ["Com' è gentil la notte," serenade in Donizetti's *Don Pasquale*.]

⁷ [For the itinerary, see above, Introduction, p. xxiv. Ruskin made the stage from Digne to Draguignan in a day, which was prolonged owing to a break down in his

From Fréjus we went along the two Rivas, *slowly*, always. There must be a drawing of Albenga somewhere—I have lost it—made then; now of some importance as an historical document of the glorious old town. A study of stone pine, at Sestri, is placed in my school at Oxford.¹

The road usually taken, at that time, by travellers entering Italy from the Riviera, left the coast at Massa to avoid the Pisan Maremma, and passed through the southern valleys of the Carrara hills to Lucca.

§ 5. Where, with all my new knowledge and freshness of acceptancy, I found, as if never seen before, the inlaid architecture of San Michele,—Fra Bartolomeo's picture of the Magdalen with St. Catherine of Siena, (then in the church of San Romano, now in the Academy of Lucca,)—and the statue, by Quercia, of Ilaria di Caretto.

The inlaying of San Michele, as opposed to Gothic *pierced* lace-work, (which was all I cared for in Gothic at that time,) and the pure and severe arcades of finely proportioned columns at San Frediano, doing stern duty under vertical walls, as opposed to Gothic shafts with no end, and buttresses with no bearing,* struck me dumb with admiration and

* As in any small English late Gothic towers, and our modern British imitations of them caricatured by me afterwards in Plate VI. of the first

carriage. He gives the following account of the last part of the drive in a letter to his father (Mentone, 23rd April):—

“It grew dark as soon as we had sent back our third horse, and I shut up the carriage. Soon, however, we began to go rapidly down, and it grew warmer and warmer still, as the evening wind dropped into the night, and I was obliged to open first one pane, then another, then all, and finally to throw the carriage back and open, just as the moon rose above the olive woods of Draguignan. The road was now hard and good; the olives, mixed with stone pine, threw their twisted shadows across it, and the ruined towers of an old fortress and town, four miles on the north side of Draguignan, began to rise against the moony sky, now soft and deep and full of Italian air. The last four miles were perfectly exquisite, all the light so clear and calm, and the white clouds so soft and warm, the frogs croaking merrily and loud, and a bird—I cannot tell what it is, that shrieks and wails all the night long—heard far off among the olives. We got into Draguignan at last, about ten o'clock, and a couple of fried trout, followed by some sweet bread and asparagus, terminated very agreeably the hardest day's travelling I recollect, putting bad roads, etc., all together. I don't know what I should have done without Couttet, not being able to understand a word the people said, but he was hail fellow with them all. They took him for a Marseillaise.”]

¹ [The drawing here given: see Introduction, p. 1.]

Drawn by J. Ruskin.

Allen & Co. Sc.

Study of Stone Pine, at Sestri .

(1845.)

amazement; and then and there on the instant, I began, in the nave of San Frediano, the course of architectural study which reduced under accurate law the vague enthusiasm of my childish taste, and has been ever since a method with me, guardian of all my other work in natural and moral philosophy.

§ 6. Fra Bartolomeo's Magdalen was the first example of accomplished sacred art I had seen, since my initiation, by the later Turner drawings, into the truths of deep colour and tone. It is a picture of no original power (none of Fra Bartolomeo's are), but it sums the principles of great Italian religious art in its finest period,—serenely luminous sky,—full light on the faces; local colour the dominant power over a chiaroscuro more perfect because subordinate; absolute serenity of emotion and gesture; and rigid symmetry in composition. These technical principles, never to be forgotten (and leaving very few to be added), that single picture taught me in the course of a day's work upon it; and remains accordingly, without being the subject of special admiration, extremely dear to me.

The statue of Ilaria became at once, and has ever since remained, my ideal of Christian sculpture. It is, I will venture to say, after these forty years of further study, the most beautiful extant marble-work of the middle ages,—faultless, as far as human skill and feeling can or may be so.¹

volume of the *Stones of Venice*, by placing the elevation of one of the towers of the college at Edinburgh beside that of the campanile of St. Mark's. The college tower is not kindly represented; the St. Mark's also, unintentionally, maligned; for no photography existed at that period, and my own careless sketch omitted the entasis of the tower. But the piece of the text, explaining the points of opposition alluded to above, is worth quoting. "The Venetian tower rises 350 feet, and has no buttresses, though built of brick; the British tower rises 121 feet, and is built of stone, but is supposed to be incapable of standing without two huge buttresses on each angle. The St. Mark's tower has a high sloping roof, but carries it simply, requiring no pinnacles at its angles; the British tower has no visible roof, but has four pinnacles for ornament" (*Stones of Venice*, vol. i. ch. xix. § 15.)

¹ [See above, p. 122.]

And beside it, I partly then felt, partly vowed, that my life must no more be spent only in the study of rocks and clouds.¹

The lesson was presently to be driven home. Arriving next at Pisa, and finding the system of twelfth century shaft and mosaic architecture typically represented there, I settled down instantly to work on the Duomo and Baptistery, little thinking, or caring, what the low building was, beyond them, across the field.

§ 7. I had scarcely read a word, then, of Italian history. Knew of the Gulf of Spezzia, only that Shelley had been drowned in it; and little more of Pisa than that Byron had lived in it. Of Dante I had never read a line, except the story of Ugolino. And of Christian art, but for the volumes of Lord Lindsay in my portmanteau,² should have known nothing whatsoever.

But though I knew nothing of Christian art, I knew much of the theory, and something of the truth, of Christianity. Account is given in *Fors*, Letters XLII.³ and LIII., of the way my mother trained me in the Bible, and in the Puritan faith; something also has been told of the way my Scottish aunt showed me its beauty. My own faults or follies only heightened my respect for the virtue and simplicity of the Scottish border race, as I then had known it; nor did either Byron or Shelley for an instant disturb my belief in John Bunyan,⁴ or my trust in the presence of an aiding God, in

¹ [Cf. *Fors Clavigera*, Letter 45, where Ruskin says that this statue turned him "from the study of landscape to that of life."]

² [Here Ruskin must be mistaken: see above, Introduction, p. xxiii. *n. Progression by Antagonism* (1846) and *Sketches of the History of Christian Art* (1847), by Alexander William Crawford, 25th Earl of Crawford, were reviewed by Ruskin in the *Quarterly Review* for June 1847, reprinted in *On the Old Road*, eds. 1888, 1899, vol. i.]

³ [And afterwards in *Præterita*, i., ch. ii.]

⁴ [This statement requires some modification in view of the following extracts from Ruskin's letters to his mother in 1845:—

ANNECY, Sunday evening (*April 13*).— . . . What made you put that funny book of John Bunyan's in the bag. You know it is not at all in my way. It is very curious as an example of the way in which the Deity works on certain minds, but as a type of his general dealings it is a miserable one indeed. For it is physically impossible that such working should take place except in a mind of extreme ignorance and ill training, as well as of undisciplined and vigorous imagination. A man who has general knowledge has always too many subjects of thought and interest to admit of his noticing every time that a text comes jingling into his head, and a man of disciplined mind would

this world, and in the justice of His judgments in that to come. What formal obedience to my parents, and steady carrying out of my mother's way of reading, did for me, as

not suffer any such morbid fancies as Bunyan describes to take possession of him or occupy his attention for a moment. Much of Bunyan's feeling amounts to pure insanity, *i.e.* the unreined state of a strong imagination, watched and dwelt and acted upon as if its promptings were truth. His lying in bed in the morning to listen to the devil saying—Sell him, sell him (of Christ), is of this character. No man in his right senses, but would have got out of his bed and gone to work, and no man of common power of self-discipline but would have employed his mind at once in a reasonable way had he been even obliged to lie still.

Now the imagination of George Herbert is just as vigorous, and his communings with God as immediate, but they are the imagination and communings of a well bridled and disciplined mind, and therefore though he feels himself to have sold Christ over and over again for definite pieces of silver, for pleasures or promises of this world—he repents and does penance for such actual sin—he does not plague himself about a singing in his ears. There is as much difference between the writings and feelings of the two men as between the high-bred, keen, severe, thoughtful countenance of the one, and the fat, vacant, vulgar, boy's face of the other. Both are equally Christians, equally taught of God, but taught through different channels; Herbert through his brains, Bunyan through his liver.

DIGNE, Sunday, *20th April*.— . . . I have been more and more struck on re-thinking and re-reading with the singular differences between Bunyan and Herbert. Bunyan, humble and contrite enough, but always dwelling painfully and exclusively on the relations of the Deity to his own little self, not contemplating God as the God of all the earth nor loving him as such, nor so occupied with the consideration of His attributes as to forget himself in an extended gratitude, but always looking to his own interests or his own state; loving or fearing or doubting, just as he happened to fancy God was dealing with him. Herbert, on the contrary, full of faith and love, regardless of himself, outpouring his affection in all circumstances and at all times, and never *fearing*, though often weeping. Hear him speaking of such changes of feeling as Bunyan complains of:

“Whether I fly with angels, fall with dust,
Thy hands made both, and I am there;
Thy power and love, my love and trust,
Make one place everywhere.”

Vide the three last lovely stanzas of ‘The Temper.’ I think Bunyan's a most dangerous book in many ways; first, because to people who do not allow for his ignorance, low birth, and sinful and idle youth, the workings of his diseased mind would give a most false impression of God's dealings; secondly, because it encourages in ill-taught religious people, such idle, fanciful, selfish, profitless modes of employing the mind as not only to bring discredit on religion generally, but give rise to all sorts of schisms, heresies, insanities, and animosities; and again, because to people of a turn of mind like mine, but who have less stability of opinion, it would at once suggest the idea of all religion being nothing more than a particular phase of indigestion, coupled with a good imagination and bad conscience.

The “funny book of John Bunyan's” was *Grace Abounding to the Chief of Sinners*. For the passage about “Sell him, sell him,” see §§ 135, 136. The stanza of Herbert quoted above is the last one of the poem beginning (for there are two called “The Temper”) “How should I praise Thee, Lord?” With what Ruskin says in these letters about the undisciplined imagination, *cf.* above, p. 222.]

farther safeguards, I cannot estimate;—but the steady reading of a chapter of the Bible in the morning and evening, and at least the deliberate *utterance* of appointed prayer, with endeavour to fix my thoughts upon it (often successful—and always sincere), gave me a continually increasing knowledge of the meaning both of the Old and New Testaments, and of what prayer meant for Christians of old time: farther than this, all my love of the beauty, or sense of the majesty, of natural things was in direct ratio to conditions of devotional feeling; and I never climbed any mountain, alone, without kneeling down, by instinct, on its summit to pray. In this temper of mind, which also in that particular year was at once gloomy with penitence and ardent in purpose, the Campo Santo of Pisa was to me a veritable Palestine. Benozzo's angels of Life, and Orcagna's of Death, were at once living presences to me, and I began before the fresco, then attributed to Giotto, of the sacrifice of Job, the series of religious studies which led me steadily forward to those of the life of Moses in the Sistine Chapel, thirty years afterwards.¹

§ 8. The drawings which I made at that time in the Campo Santo, of the Sacrifice of Job; the three angels with Abraham; the three beggars praying to Death; and the conversion of St. Ranieri; are fortunately still in my possession.² That of the small Madonna, by Angelico, then in the sacristy of St^a. Maria Novella at Florence, was engraved as the frontispiece to the fifth volume of *Modern Painters*, and the engraving (by Mr. Holl) gives a perfect rendering of my power and manner at that time. The original drawing was given away, but I am thankful to be able to place in my school at Oxford that of the Sacrifice of Job.³

§ 9. Very solemnly I wish it had been my fate to follow out such a series of outline drawings, from the now lost frescoes of Italy; but I had come to Italy for a given

¹ [Ruskin was at Rome in 1872, and in the following autumn delivered his course of lectures, *Ariadne Florentina*, in the sixth of which he discussed Botticelli's work in the Sistine Chapel.]

² [Of these drawings only "The Three Angels with Abraham" is now available; it is here reproduced (Plate 10, p. 316; see Introduction, p. xxx).]

³ [This drawing is not, however, at Oxford; but the "Three Angels" is.]

purpose:—nobody wanted, or cared for, outlines from the Campo Santo; and only making these few memoranda for my own instruction, I went on with the work necessary for the second volume of *Modern Painters*.

I had been obliged, in order to obtain permission to draw in the Campo Santo, to present myself to the Abbé Rosini, then the Professor of the *Belli Arti* in Pisa.¹ He was a quite zealous and honest Professor, very accessible, kind, and talkative. As, of course, he had never heard the name of any artist in England, I took with me one day when I went to call, the two Liber plates of *Cephalus* and the *Grande Chartreuse*. But the Professor happened that afternoon to be very eager that I should come to hear his own lecture “*del bello*,” and he threw the Turner engravings contemptuously aside, with a “Yes—yes. I see,—è un imitatore di Salvator,—we have plenty such.” I went to the lecture, nevertheless; and heard with the rest of the students, as I had more than once heard before, how Apelles painted a perfect girl by putting the head of one on the shoulders of another, and the legs of a third; and how the inimitable Raphael painted from the exquisite ideal in his divine mind;² and came away with a complacent conviction that I knew a good deal more about the ‘*Bello*’ than the Abbé Rosini.

In this impression I was certainly right: but the circumstance was extremely unfortunate, in adding to the conceit, and sense of self-importance, which were already much too intimately colouring and stimulating the zeal with which I pursued my new discoveries.

§ 10. These presently became more absorbing in themselves. From Pisa I went to Florence, and fortunately got lodgings in the south-east angle of the square of the *Duomo*, looking straight on Giotto’s tower,³ with the south transept

¹ [For whom, and for these events generally, see *Præterita*, ii., ch. vi.]

² [See above, p. 205.]

³ [Ruskin, being dissatisfied at the inn, “went away and got me lodgings (as he writes to his father, June 2) in the Cathedral square, looking bolt on Giotto’s campanile, facing east, so that I have the morning sun and no other. . . . The great advantage is that I have Giotto’s tower and Brunelleschi’s dome always before me.” “It really was most fortunate for me,” he writes five days later, “that the landlord of the——

and dome beyond; so that for two months, I had it to look at by daylight and moonlight. The Dominicans at Santa Maria Novella had still their spice garden,¹—I made hay, that June, with the Franciscans, in their orchard at the “top of Fésolo,”² and San Miniato, the loveliest of lovely ruins, was yet encircled by a wilderness of wild rose. It was still possible, in these quiet places, to conceive what Florence had been, in the year of Victories.³

My main work, for those two months, was in the apse of Santa Maria Novella, on Ghirlandajo; in the Brancacci Chapel, on Masaccio and Lippi; and in St. Mark’s convent, on Angelico. And very solemnly I wish that I had gone straight home that summer, and never seen Venice,* or Tintoret! Perhaps I might have been the Catholic Archbishop of York, by this time—who knows! building my

* Seen her, that is to say, with man’s eyes. My boyhood’s first sight of her, when I was fourteen, could not have been brighter, and would not have been forgotten.⁴

was an overcharging scamp—(though we may just as well remember the fact)—for otherwise I should not have got into this very nice quarter; it is really a great luxury to see the form of the cathedral against the night sky, and to be able to saunter in the great square in the twilight without having a riverside walk home.”]

¹ [See *Præterita*, ii., ch. vii. § 127. In a letter to his mother, Ruskin gives an account of the spice-garden (June 9):—

“ . . . By-the-bye you needn’t have sent me a medicine chest. I never saw such a pretty thing in my life as the ‘spezieria’ of Santa M. Novella. The monks are the apothecaries of Florence, and there is room after room opening off the cloisters in the most exquisite order and taste,—a very toy of bottles and shelves, and a lovely garden in the middle buried in rose leaves, where they grow all they want. It is very curious to see the shelves and drawers and jars of an apothecary’s shop exactly under, and touching the bottom of—frescoes by Taddeo Gaddi, and with a vaulted roof above, and monks behind the counter.”

For another description of the Spezieria, see Ruskin’s review of Eastlake’s *History of Oil-Painting*, in *On the Old Road*, 1899, i. § 98.]

² [*Paradise Lost*, i. 289. Ruskin gives an account of his hay-making in a letter to his father (June 22):—

“ . . . I had some good exercise too last night, making hay up at Fiesole in the Franciscan convent with the monks. I assure you—when the Franciscans do work—they work to purpose. Then I rested in the garden under the cypresses of ‘the top of Fésolo’ waiting for the moon rise, ‘to descry new lands, rivers or island in her spotty globe,’ and so walked back into Florence with the fire-flies flitting about all the way.”

Ruskin quotes from memory. Milton has “Rivers, or mountains, in her spotty globe.”]

³ [1254; see *Val d’Arno*, § 121.]

⁴ [Ruskin was, however, sixteen when he first saw Venice (1835). For his impressions of that visit, see Vol. I. p. 543.]

cathedral there, in emulation of the Cardinal's at Westminster—instead of a tiny Sheffield museum.¹

§ 11. Fate, and the unlucky task of book-writing, ordered otherwise. For *Modern Painters* could not be finished with a study of ecclesiastical history; and, as the stress of summer came on in Florence, having gained some initiatory conception of her art, with the nature that taught it, and learned to love even the yellow sand of Arno scarcely less than the white sand of Arve, I went north to my special work again, and spent the early autumn, nearly alone, in Val Anzasca. There was little more than a ch[^]let for inn, at Macugnaga, in those days.

§ 12. In September, Mr. J. D. Harding, who, after Copley Fielding, had been my master in water-colour, wrote to ask if he could join me in his autumn tour. I went down to meet him at Baveno; and thence we drove quietly in an open carriage by Como and the spurs of the Italian Alps to Venice, walking up all the hills, stopping at all the river sides, sleeping a night or two at Como, Bergamo, Brescia, and Padua,—with a week at Verona. A most happy time, for me; and, I believe, for us both.

Harding had vivid, healthy, and unerring artistic faculty, but no depth of science, and scarcely any of sentiment. I saw him once impressed by the desolation of the great hall of the Casa Foscari; but in general, if the forms of the subject were picturesque, it was all he cared for, nor would he with any patience analyze even those. So far as his art and aim went, I was able entirely to sympathize with him; and we both liked, in one way or another, exactly the same sorts of things; so that he didn't want to go and draw the marshes at Mantua when I wanted to draw Monte Monterone—but we could always sit down to work within a dozen

¹ [The Roman Catholic Cathedral at Westminster (for which Cardinal Manning began to collect funds in 1865), now approaching completion, was not destined to be begun till a much later date (1895). The "tiny Sheffield museum" refers to the cottage at Walkley, near Sheffield, in which the museum of the St. George's Guild was at that time housed. In 1890 the museum was transferred to the more spacious house in Meersbrook Park provided by the Sheffield Corporation.]

yards of each other, both pleased. I did not mind his laughing at me for poring into the foreground weeds, which he thought sufficiently expressed by a zigzag, and heartily admired in him the brilliancy of easy skill, which secured, and with emphasis, in an hour or two, the effect of scenes I could never have attempted.

His time in travelling was of course professionally too valuable to him to admit of much study in galleries, (which, for the rest, when a painter's manner is once fixed, usually does him more hurt than good). But he generally went with me on my exploring days in Venice, and we saw the Scuola di San Rocco together, and both of us for the first time. My companion, though by no means modest as to his own powers, was (partly for that very reason, his confidence in them being well grounded) quite frank and candid in his admiration of stronger painters; and when we had got through the upper gallery, and into the room of the Crucifixion, we both sate down and looked—not at it—but at each other,—literally the strength so taken out of us that we couldn't stand!¹

When we came away, Harding said that he felt like a whipped schoolboy. I, not having been at school so long as he, felt only that a new world was opened to me, that I had seen that day the Art of Man in its full majesty for the first time; and that there was also a strange and precious gift in myself enabling me to recognize it, and therein ennobling, not crushing me. That sense of my own gift and function as an interpreter² strengthened as I grew older; and supports, and I believe justifies me now in accepting in this last cycle of life, the responsibilities lately once more offered to me in Oxford.³

§ 13. The public estimate of me, so far as it is wise at all, and not grounded merely on my manner of writing, is, I think, chiefly as an illustrator of natural beauty. They

¹ [See above, Introduction, p. xxxvii.]

² [So in *Love's Meinie*, Lecture iii.: "My own special function . . . is, and always has been, that of the Interpreter only, in the *Pilgrim's Progress*."]

³ [Ruskin was re-appointed to the Slade Professorship in January 1883.]

had as much illustration of it before as they needed, one would have thought, and if not enough to their taste in Chaucer or Spenser, in Byron or Scott, at all events in their own contemporary poets. Tennyson's "Brook" is far beyond anything I ever did, or could have done, in beauty of description;¹ and the entire power of natural scenes on the constant feelings of the human heart is taught, (and perfectly,) by Longfellow in "Hiawatha."² But I say with pride, which it has become my duty to express openly, that it was left to me, and to me alone, first to discern, and then to teach, so far as in this hurried century any such thing *can* be taught, the excellency and supermacy of five great painters, despised until I spoke of them,—Turner, Tintoret, Luini, Botticelli, and Carpaccio.³ Despised,—nay, scarcely in any true sense

¹ [Cf. Vol. II. p. xxviii. n.]

² [For other passages showing Ruskin's admiration of Longfellow, see *Modern Painters*, vol. iii. ch. xiii. § 10 n., vol. iv. ch. xix. § 20, vol. v. pt. vii. ch. iv. § 5 n.]

³ [Cf. what Ruskin says in *Præterita*, i. ch. ix. § 180: "Tintoret was virtually unseen, Veronese unfelt, Carpaccio not so much as named, when I began to study them." His claim in the case of Turner and Tintoret needs no comment. With regard to Luini among painters—as to Chartres among cathedrals (see Vol. I. p. 377 n.)—it is noticeable that he did not write all that was in his mind or so much as might have been expected to justify the very high rank he accorded to that painter. In *Modern Painters* Luini was not mentioned: see note from *Frondees Agrestes* to *Modern Painters*, vol. iii. ch. iv. § 21. Ruskin's principal references to him are in *Queen of the Air*, § 157, and *Catalogue of the Educational Series*, No. 49.

The modern cult of Botticelli owes much to Ruskin's enthusiasm; but something must be allowed also to the essay of Pater (first published in the *Fortnightly Review* of August 1870, reprinted in *Studies in the Renaissance*, 1873). Reference should be made also to Mr. Swinburne's "Notes on Designs of the Old Masters at Florence" (first published in the *Fortnightly Review* for July 1868), in which he speaks of "the faint and almost painful grace which gives a distinct value and curious charm to all the works of Botticelli." At an auction in 1867 D. G. Rossetti picked up a Botticelli for £20. "If he had not something to do," writes his brother, "with the vogue which soon afterwards began to attach to that fascinating master, I am under a misapprehension." Pater's essay first appeared in the *Fortnightly Review* of August 1870. Ruskin's first mention of Botticelli was in a lecture delivered at Oxford during the Lent Term, 1871. Carpaccio had been proclaimed in a lecture of the preceding year, and it became a standing joke among the profane to ask who was Ruskin's last "greatest painter." It was in answer thereto that Mr. Bourdillon wrote:—

"To us this star or that seems bright,
And oft some headlong meteor's flight
Holds for awhile our raptured sight.
But he discerns each noble star;
The least is only the most far,
Whose worlds, may be, the mightiest are."

Ruskin's principal references to Botticelli are in *Ariadne Florentina* and *Fors Olavigera*, Letter 22. For the previous eclipse of Botticelli's reputation, see J. P. Richter's

of the word, known. I think, before the year 1874,¹ in which I began work on the frescoes of Botticelli and Perugino in the Sistine Chapel, there will scarcely be found so much as a notice of their existence in the diary of any traveller, and there was no consciousness of their existence in the entire mind of modern Rome. They are little enough noticed *now*; and yet, in London, Turner's most precious drawings are kept in the cellar of the National Gallery:—nevertheless, my work is done; and so far as the English nation studies the Arts at all, will tell, in its due time.

§ 14. The reader who has had patience with these personal details, thus far, will understand now the temper in which, on my return to England, I wrote the second volume of *Modern Painters*, and the extreme prominence given to Tintoret, in the closing sections of it. The short Addenda which provoked this garrulous Epilogue will also, I think,

Lectures on the National Gallery, p. 46. The first picture by Botticelli bought for the National Gallery (No. 275 in 1865) cost only £159, 11s. 6d. "The Nativity" (No. 1034) cost in 1878 £1500.

The praise of Carpaccio is principally in *Guide to the Venetian Academy* and *St. Mark's Rest*. His earliest reference to Carpaccio as "faultless" and "consummate" was in 1870 (*Verona and its Rivers*, § 22; *Lectures on Art*, § 73). In *Stones of Venice* Carpaccio is referred to only for his interesting pieces of Venetian architecture. It was in revisiting Venice in 1869 that Ruskin fell under Carpaccio's sway. His "discovery" of the painter had been anticipated by Sir Edward Burne-Jones; as the following letter shows:—

VENICE, *May 13th*, 1869. MY DEAREST NED,—There's nothing here like Carpaccio! There's a little bit of humble-pie for you! Well, the fact was, I had never once looked at him, having classed him in glance and thought with Gentile Bellini, and other men of the more or less incipient and hard schools,—and Tintoret went better with clouds and hills. I don't give up my Tintoret, but his dissolution of expression into drapery and shadow is too licentious for me now. But this Carpaccio is a new world to me; only *you* have no right to be so fond of him, for he is merely what you would have been if you had been born here, and rightly trained from the beginning—and one shouldn't like oneself so much. I've only seen the Academy ones yet, and am going this morning (cloudless light) to your St. George of the Schiavoni; and I must send this word first to catch post.—Ever your loving, J. R.

This letter was first printed in its entirety in a privately printed volume (1894), *Letters on Art and Literature by John Ruskin*, edited by Thomas J. Wise, p. 41. It had previously been published, in an incomplete form, by Mrs. Richmond Ritchie in an essay on "John Ruskin" in *Harper's Magazine* for March 1890, and reprinted in her *Records of Tennyson, Ruskin, and Browning*, 1892, p. 135. Carpaccio's pictures had, however, been highly esteemed before Burne-Jones and Ruskin "discovered" him; his picture in the National Gallery (No. 750) cost £3400 in 1865.]

¹ [This is a mistake for 1872; see above, p. 350 n.]

become of more interest to him, not only as indicating my earliest assumption of the office of censor to the Royal Academy! but as marking very notably the honest and frank tone of criticism itself in that day. The anonymous character of the author of *Modern Painters* was, by the time those Addenda were published, entirely waived to the general body of artists: but, whatever I chose to say of them, Prout, Stanfield, and Turner used to dine with my father on my birthday; the two first were always at home to me, and I had a happy little talk with Stanfield one day when he was at work on his last picture. Charles Robert Leslie, Mulready, and David Roberts used to come sometimes on the birthday also, and it was certainly not the Academy Notes of after years, but the Pre-Raphaelite schism, and most of all Turner's death, which broke my relations with the Royal Academy. I hope they may in future be kinder; its President¹ has just lent me two lovely drawings for the Oxford schools, and, I think, feels with me as to all the main principles of Art education.

¹ [Frederic, Lord Leighton. For the two drawings—one of them the famous “Study of a Lemon Tree”—see *Art of England*, § 76.]

APPENDIX

- I. THE MSS. OF "MODERN PAINTERS," VOL. II., WITH ADDITIONAL PASSAGES:—
 - I. IMPRESSIONS OF BEAUTY: AT "THE FOUNTAIN OF THE BREVENT," CHAMOUNI
 2. SENSUAL BEAUTY DEFINED
 3. "NATURAL ASSOCIATION" OF IDEAS IN COLOURS
 4. ASSOCIATION AND BEAUTY: AN ARGUMENT FROM THE CAMPAGNA AND THE LAKE OF BRIENZ
 5. SUBLIMITY
 6. OF THE SUPERNATURAL AS AN ELEMENT IN THE SUBLIME
 7. THE MORBID LOVE OF HORROR
 8. THE FEELING OF AWE IN RELATION TO INDIVIDUAL CHARACTER
 9. THE NOBLE CAPACITY OF TERROR
 10. "SUPPLEMENTARY NOTES ON TERROR ARISING FROM WEAKNESS OF HEALTH"
 11. HISTORIC ART
- II. AN ADDITIONAL CHAPTER, BEING "NOTES ON A PAINTER'S PROFESSION AS ENDING IRRELIGIOUSLY"
- III. LETTERS ILLUSTRATIVE OF "MODERN PAINTERS," VOL. II.
 - I. TO THE REV. W. L. BROWN (DEC. 20, 1843) ON COLERIDGE AND WORDSWORTH
 2. TO JOSEPH SEVERN (SEPT. 21, 1845) ON THE PROSPECTS OF ART IN ENGLAND
- IV. MINOR "VARIÆ LECTIONES"

I

THE MSS. OF "MODERN PAINTERS," VOL. II., WITH ADDITIONAL PASSAGES

THERE are two sets of MSS. of this volume, or connected with it:—(I.) the Allen (now Morgan MS.: see Vol. III. p. 682). This consists of various notes and materials for the book. (II.) The Hilliard MS., given by Ruskin to the late Mrs. Hilliard, and now in the possession of Mr. Frederick Hilliard, her son. This is the MS. followed, with alterations made in revision, in the printed text. (III.) Some notes, belonging to the same set as some of (I.) above, are included in the Brantwood MSS.

(I.) The Allen MSS. include the first draft of a considerable portion of the volume, differing very largely from the text. These MSS. are loose sheets, roughly stitched together; the order is not consecutive, and the intended arrangement is not always easy to make out. Ruskin seems to have written pieces at different times for different portions of his intended volume. The whole of this portion of the MSS. appears to belong to 1843–1844, when, as we have seen (above, pp. xx.–xxi.), he was already at work on the volume. The scheme of the book is not the same as he ultimately adopted; though the leading idea was clearly seized from the first, and the style is easier and more flowing than that which he afterwards adopted, in imitation of Hooker, for this volume.

Among these sheets is the following first plan for the volume:—

Sec. I. General.

- Ch. 1. Introductory.
- 2. Observations on Typical, Functional, and Sensual Beauty.
- 3. Attack on Association.
- 4. Attack on Custom.
- 5. Attack on Fitness.
- 6. Of Functional Beauty.

Sec. II. Typical Beauty.

- Ch. 1. Infinity.
- 2. Unity.
- 3. Repose.
- 4. Simplicity.
- 5. Symmetry.

Sec. III. Beauty of Colour.

- Ch. 1. Of the Effect of Expression on Beauty.
2. Of Light.
3. Of Purity.
4. Of Expression of Divers Colours.¹

Sec. IV. Of the Sublime.

- Ch. 1. Of the Sublime generally.
2. Of Truth in its effect on the Sublime.
3. Of Size in its effect on the Sublime.
4. Of Breadth and of Colour.²
5. Of Energy.
6. Of Mystery.
7. Of Supernatural Character.

Sec. V. Of Beauty and Sublimity as they exist in nature, and should be sought in Art.³

Sec. VI. Of the Imaginative Faculty, or Creation and its abuses.

The reader will perceive, by turning back to the Synopsis of Contents of the volume in its printed form (pp. 11–21), that some of this arrangement survived, and that most of its subjects were, in one place or another, discussed. The most important variation is that in this first draft Ruskin takes count of a third division of Beauty—Sensual—which he afterwards discarded. He discarded it, no doubt, in order to emphasize his central proposition of the spiritual, as opposed to the “æsthetic,” nature of Ideas of Beauty. But in revising the volume in 1882–1883, he noted that the question of colour required more discussion than he had given to it (see above, author’s note on p. 134); in his first draft he had begun an examination of the subject, but carried it a very little way (see below, p. 368).

The leading principle of the volume appears in the first page which he seems to have written of it. This is the beginning of an introductory chapter, in which he lays it down that in the perfect state *qewria* (see above, p. 7) “may be the fulfilment of our existence.” Man’s delight in the Beauty of God’s creation will then be fulfilled. “There will be but one expression—that of Joy; one character—that of Love.” This introduction was not finished. On some later sheets, however, there is another chapter, or the peroration of a chapter, in which he again explains the theory of the Beautiful, which is the subject of the volume. This chapter contains a characteristic piece of

¹ [Here Ruskin adds, “and on this subject Field’s Chromatography”—a reference to George Field’s *Chromotography; or a Treatise on Colours and Pigments and of their Powers in Painting*: London, 1835.]

² [Here he adds, “showing the mistake of Raffaele in watered robes.”]

³ [The several chapters of sections v. and vi. are not mapped out in this initial plan. He notes, however, that “in chap. ii. of sec. v.” he is to “show especially that in Ideal Subject the giving of knowledge is injurious by occupying the attention; and that its accessories should be such as naturally rise and are conceived in the imagination of all, without effort, and generally tracing the effects of greatness, singularity,” etc.]

description, and is additionally interesting as giving the personal impressions in which the volume received its inspiration:—

[1.]¹ "It is now—no matter how long—since I was lying, one dark July evening, on a mossy rock beside the fountain of the Brevent, in the valley of Chamonix. It is not every one who has been at Chamonix—nor every one who, in the travellers' phrase, has "done" Chamonix—who will know what I mean by "the fountain of the Brevent"; for the road to it has not yet become one of the beaten ways of the valley. The access to it is too easy to be boasted of as an achievement, and the thing itself too beautiful to be sought for as a show. There is here no point de vue—no peril of approach—nothing by which the guide can justify his charge, or the guided their enthusiasm; there are here no vendors of spas or spoons, no ranges of nicknackers or costume—no miniature farms to let—with the agricultural economy of Switzerland typified by a cock at the door and a cat on the window sill. And therefore are there here no apparitions of shawl or knapsack—basket or bottle—ringlet—or moustachio—no combinations of appetite and sentiment—of poetry and perspiration.² Here only the sobbing of the fountain from beneath its arch of rock is interrupted by the less audible tread of the goats as they stoop to drink; and sometimes a single peasant girl, with a rough garment of skins thrown across her shoulders,—and the wind and sun playing about her braided hair and open forehead, may be seen plying her knitting needles, as she watches and follows the wandering of her flock.

"The fountain of the Brevent lies half way between the Prieuré³ and the hamlet of Les Tines—nearly opposite the foot of the Tapia. Its waters rise with a murmur scarcely audible, from the foot of a crag of grey mica slate, whose splintered surfaces gleam like sheets of silver about the bright and circular pool. Only the dancing domes upon its silent surface indicate the young life of the stream—only those and the rippling sound of its motion over the lip of the basin as it threads its way among white pebbles, and through nets of verdant moss. It winds glittering down the valley, through a grove of birch and alder, catching—on a hundred pools, through the shuddering of their leaves, the quiet image of the frozen mountains, and is lost—too soon—in the gigantic turbulence of the Arve.

"I was lying by this fountain—on a dark evening of July, dark not with night, but with storm. The precipice above me lost itself in the air within fifty feet of my head—not in cloud—but in the dark, motionless atmosphere. The lower boughs of its pines shook like black plumes against the shade; their pointed tops faded into its body—faint as if woven of gossamer—spectral shadows of colossal strength. The valley lay for leagues on either side—roofed with the impenetrable gloom—walled with the steep bases of its hill—one boundless chamber—lighted only as it seemed, by the white foam of the forked Arve—cast like a stream of lightning along its floor. Through the veil of

¹ [The passages given in this Appendix are numbered for convenience of reference.]

² [Cf. the passage from the MS. of *The Poetry of Architecture*, given at Vol. I. p. 31.]

³ [*i.e.* the modern village of Chamouni itself.]

cloud, the presence of the great mountains was indicated only by the sound of their forests, by the sharp, sudden stroke—like a human cry,—the wail of the glacier upon its path of pain, and the gust—rising by fits and falling—of the wind, or the waves, the ear knew not which—among their chasms.

“So it had been throughout the day—no rain—no motion—no light. One roof—one level veil, as of God’s Holy Place, and the voices of the mountains from behind it and above.

“I lay beside the fountain—watching the motion of its soundless domes, and the entangling within its depth of the green blades with their own shadows. From the rock above, a single oozy drop fell at intervals into the pool, with a sound like that of a passing bell far away. Among the thick herbage at its edge the grasshoppers, heavy and faint in the chill and darkness, climbed freely up the jointed stalks, staring about them with their black beaded eyes, and fell, rustling,—unable to lift their scarlet wings. It was as if the sun had been taken away from the world, and the life of the earth were ebbing away, groan by groan.

“Suddenly, there came in the direction of Dome du Goûter a crash—of prolonged thunder; and when I looked up, I saw the cloud cloven, as it were by the avalanche itself, whose white stream came bounding down the eastern slope of the mountain, like slow lightning. The vapour parted before its fall, pierced by the whirlwind of its motion; the gap widened, the dark shade melted away on either side; and, like a risen spirit casting off its garment of corruption, and flushed with eternity of life, the Aiguilles of the south broke through the black foam of the storm clouds. One by one, pyramid above pyramid, the mighty range of its companions shot off their shrouds, and took to themselves their glory—all fire—no shade—no dimness. Spire of ice—dome of snow—wedge of rock—*all* fire in the light of the sunset, sank into the hollows of the crags—and pierced through the prisms of the glaciers, and dwelt within them—as it does in clouds. The ponderous storm writhed and moaned beneath them, the forests wailed and waved in the evening wind, the steep river flashed and leaped along the valley; but the mighty pyramids stood calmly—in the very heart of the high heaven—a celestial city with walls of amethyst and gates of gold—filled with the light and clothed with the Peace of God. And then I learned—what till then I had not known—the real meaning of the word Beautiful. With all that I had ever seen before—there had come mingled the associations of humanity—the exertion of human power—the action of human mind. The image of self had not been effaced in that of God. It was then only beneath those glorious hills that I learned how thought itself may become ignoble and energy itself become base—when compared with the absorption of soul and spirit—the prostration of all power—and the cessation of all will—before, and in the Presence of, the manifested Deity. It was then only that I understood that to become nothing might be to become more than Man;—how without desire—without memory—without sense even of existence—the very sense of its own lost in the perception of a mightier—the immortal soul might be held for ever—impotent as a leaf—yet greater than

suddenly, then came ^{in the direction} from the ~~the~~ ^{Thunder} Gorge a crash - as of prolonged
 thunder - and when I looked up - I saw the cloud close - as it were
 by the avalanche itself - and whose white ^{can} ~~was~~ lightning-like stream
 fell bounding down the eastern slope of the mountain - like slow lightning
~~out of~~ The vapour parted before its fall - pierced by the
~~whirlwind of its motion~~ - the gap widened - the dark shade
 melted away on either side - and like a risen spirit casting off its
 garment of corruption - and flushed with eternity of life - The aiguille
~~of the South~~ ^{was} ~~offered~~ through the black foam of the storm cloud
 one by one - pyramidal above pyramidal - the mighty range of its
 companions - shook off their ~~coiled~~ shrouds & took to themselves their
 glory - all fire - no shade - no dunnets - ~~all was ice~~ - thin pier
 down of snow - wedges of rock - all burning - fire to the height of
 the mist sank into the hollows of the creeps - and pierced through
 the ~~very~~ fissures of the glaciers - and dwelt within them - as it does
 in clouds - The ponderous storm withered and swayed beneath
 them - the forest wailed & waned in the evening wind - the
 steep river flashed & leaped along the valley - but the mighty
 pyramids stood calmly - in the very heart of the high heaven -
~~as great as its base~~ - a celestial city with walls of emeralds
 & gates of gold - ^{filled} with the light & clothed with the Peace of God
 And then I learned - what ^{nothing} I had not known before - the real
 meaning of the B word Beautiful. With all that I had ever seen
 before - there had come amongst the associations of humanity - the
~~sense of reason~~ ^{erection} of human power - the action of human mind.
 The image of self had not been effaced in that of God. It was
 then ^{beauty} ~~only~~ that I learned how - thought itself may become ignoble
 and energy itself become low - when compared with the
 absorption of soul & spirit - the prostration of all power - & the
 cessation of all will - before & in the Presence of the manifested
 Deity. It was then only that I understood ^{that} how to become nothing

tongue can tell—wrapt in the one contemplation of the Infinite God. It was then that I understood that all which is the type of God's attributes—which in any way or in any degree—can turn the human soul from gazing upon itself—can quench in it pride—and fear—and annihilate—be it in ever so small a degree, the thoughts and feelings which have to do with this present world, and fix the spirit—in all humility—on the types of that which is to be its food for eternity;—this and this only is in the pure and right sense of the word

BEAUTIFUL."

In ch. ii. the nature of Typical and of Functional ("Vital") beauty is explained to the same effect as in the text; and the following preliminary account is given of what the author meant by "Sensual Beauty":—

[2.] "(It is) that quality or group of qualities in objects by which they become pleasant to the eye, considered merely as a sense. Pure and vivid colours, for instance, are to the eye precisely what musical sounds are to the ear, capable of intense expression, but also pleasant in themselves, and although wearisome if too long continued, possessing for a time a real charm, of which no account whatever can be rendered, but that the bodily sense is therein gratified. This is the first notion of beauty in the human mind. The child stretches its hands towards the lustre of the window and the scarlet of the coal, before it can appreciate even the light of a kind look or the melody of a tender voice. All pure colours and multitudinous harmonies which may be produced by their association,—light as such, provided it be not oppressively light, and perhaps smoothness and signs of softness, in form—may be considered as producing, by their various combinations, a certain beauty in objects, pleasing to the eye only, and in no way addressing itself to the mind, which I shall hereafter characterize by the term Sensual Beauty."

Ruskin then passed to discuss in detail various false opinions with regard to Beauty. In the text as it now stands these criticisms were condensed into a single chapter (iv., pp. 68–71), and it seems unnecessary to print his longer version *in extenso*. One or two passages, however, are worth giving.

[3.] The following passage is in illustration of "Natural or General Association," (*cf.* sec. i. ch. iv. § 8, p. 71) "being [that which must]

necessarily take place in the minds of all men, and all nations, between certain colours and forms and those qualities of which they are the usual signs in material objects. Thus blue—from its being the colour of open sky—cannot fail of suggesting ideas of purity and repose. Red, from its being the colour of fire and blood, has invariably a certain degree of fear associated with it. Purple, of purity and power. Green, being the colour of vegetation, is suggestive of freshness, vigour, coolness. Brown, of sterility and poverty. Black, of melancholy. White, of innocence. Yellow, of cheerfulness. It has been well remarked by Alison¹ that these natural or general associations may be partially interrupted by local customs; that black, for instance,

¹ [*Essays on Taste*, essay ii. ch. iii. sec. i.]

loses in the mind of a Venetian much of its sadness, and yellow in China is as suggestive of regal pride as purple in Rome. But it is nearly impossible that the natural associations should by any local habits be altogether eradicated. In a kingdom, indeed, if such can be supposed, in which funerals should be conducted in robes of scarlet and gold—in which bridal robes should be black—the dress of soldiers blue, the robes of the King brown, and those of condemned criminals white—it is evident that natural association might in process of time be destroyed.¹ But the very difficulty of conceiving such institutions may show us how strongly the natural associations are grafted into the heart, and we think we shall not be charged with too much boldness in asserting that while the world remains under the same physical laws by which it is at present governed—such institutions are morally impossible. Even in the case given by Alison—that of black as it becomes familiar to the mind of the Venetian—the natural association has not been destroyed. The veil which fills the place of the portrait of Maximo Fabrio is Black, nor is the meaning of the colour one whit destroyed because the cheerful lagoon on which the window of the palace looks, is covered with the black forms of darting gondolas.

“And therefore these natural associations become, in the hands of the artist, instruments of enormous power; and judiciously used, may impress the mind of the generality of men perhaps more than any other. Some artists are dependent on little else. If black and red were not productive of the sublime, what would become of the pictures of Martin?² But none of these associations have any power of *producing* beauty. They only give to beauty, when otherwise produced, its *character*. They make it melancholy beauty—tender beauty—or brilliant beauty, but they do not produce the beauty itself. Thus the beauty of the morning or of the night is dependent on precisely the same circumstances, the expression of infinity—repose—unity, etc., but the light and gold colours of the morning make its beauty cheerful and brilliant, and the gloom and sad colours of the night make its beauty melancholy and quiet. According to the temper of mind in which we may happen to be, one or other class of beauty will be preferred. If we are indifferent, each kind of beauty will put the mind in the state fittest for enjoying it; but it is always to be remembered that the character of the beauty does not constitute the beauty itself. The morning might be brilliant and cheerful, the night might be grey and gloomy, without either being beautiful. The beauty of both is dependent, as I shall show hereafter, on the same qualities; and they differ only by the character of those associations by which each is fitted to have its proper operation on the human mind; and to summon it, the one to energy and exertion—the other to reflection and repose.”

The following argument on the erroneous use of the term “beauty”—

¹ [In this connection see what Ruskin says, in *Val d'Arno* (§ 112), about the mistake and stupidity of men in dressing “soldiers in red clothes, and monks, or pacific persons, in black, white, or grey ones.”]

² [For Martin, see Vol. I. p. 243, and Vol. III. pp. 36, 38 *n.*]

to which error the supposed dependence of beauty upon association is traced (see above, sec. i. ch. v. § 2, p. 77)—is interesting for its descriptive passages:—

[4.] "Around us is a waste of rank, knotted, sluggish grass—not green, but of a dull, neutral tint, which looks as if it had once been brown, and had become green by putrefaction. It is tossed into rude irregular mounds and ridges, which expose at intervals white patches of a strange, calcined, porous soil—different from every other variety of earth that we have ever seen, and resembling nothing so much as fragments of burned bones. Between these ridges lie circular spaces of rushy morass, variegated about their edges with wide stains of blistry yellow—partly the iron ochre iridescence on stagnant and putrescent water, partly a sulphureous deposit from the fumes of sulphuretted hydrogen which for a league or two have flavoured the whole atmosphere of rotten eggs. A few shapeless and mouldering fragments of tufa occur at intervals in irregular heaps, among which a scattered tile or brick sometimes suggests the possibility of their having been brought there by the hand of man. A dull, purple haze hangs in the air, and the sunshine rests on the foul earth luridly, and like candle-light. Before us, emerging above a swell of this poisonous desert, is seen a single dome—which we know to be that of St. Peter's.

"So much for our first situation. Let us take a second. We are lying on the shore of the little island in the centre of the Lake of Brienz. The clear water floats in to our feet in gentle swells; each of which bears with it the image of the sun, which breaks, as the wave falls, into a shower of light. Through the clear water the white pebbles shine like pearls, and a single group of quiet water-lilies heave and fall upon its flow, in a hollow of the rocky shore. The crags [tower?] up above our head with purple clusters of violets nestling in their crannies, and starry moss gleaming upon their sides. The white stems of the tall birches glisten against the blue sky, and soft glades of turf recede from the shore under the dark boughs of aged pines.

"Now in both these situations, the mind would receive very high pleasure; in both the pleasure received would come under Mr. Alison's¹ general expression—"sublime delight," and yet there is not one single point of resemblance of parallelism, much less of a common nature, between the two kinds of pleasure respectively received. No man in his senses would dream of calling the first scene "beautiful." It would be the first word on the lips of any man, how stoical soever, who was suddenly brought before the second. In the first scene our pleasure depends on extent of knowledge, in the second on keenness of perception. In the first every sense is in pain, and our pleasure is of the intellect; in the second every sense is gratified, and our pleasure is of the heart. The emotions excited by the first scene are those of fear and pity, keen sense of human weakness, depravity, transitoriness, and fearful apprehension of Divine justice, awful approbation of the manifested judgment. The emotions excited by the second scene are those of joy, hope, trust in the Divine Love, and reverent admiration of its perpetual working for glory and for beauty. The intellectual pleasures resultant from the first scene are in a great degree based on

¹ [See *Essays on Taste*, essay i.]

the very circumstance of its not being beautiful, and yet merely because intellectual perceptions are pleasurable, as well as the emotions arising from beauty, we find Mr. Alison¹ and other such reasoners mixing up the two pleasures together in inextricable disorder, and repeating page after page, in various disguises, the bold syllogism:—Beauty causes some kind of emotion, therefore everything that causes any kind of emotion is beautiful. It might at first sight appear extraordinary that such fallacies could be maintained against the strong sentiment of nature, whatever might be the weakness of the reasoning powers. But the fact is that the power of perceiving beauty is like that of an ear for music, totally wanting in many individuals from their cradle, nor will all the advantages of education ever bestow it; while on the other hand in those who naturally possess it, it may be totally destroyed, and is usually blunted and injured in a very great degree by disadvantageous education, so that it is no wonder if, hearing others talking about qualities in objects of which they themselves have no perception, they attach to the terms such meanings as their own pleasures may suggest or supply, and take it for granted that there can be no qualities whatever in material things, but those intellectual relations which alone they themselves are capable of perceiving.”²

The next chapters in the draft (ch. vi. of its sec. i. and chs. i.–v. of its sec. ii.) correspond more nearly to the ultimate text of the book. They contain not additional matter, but a different and earlier version of chapters which appear in the book. There is, however, a good deal of matter under this head which was ultimately discarded by the author, though he used some of it in later volumes. In this original draft he illustrated his various qualities of Typical Beauty—infinity, unity, and the rest—by a long, though incomplete, chapter or chapters in which the qualities of curves and “lines of beauty” were discussed. This discussion, however, would hardly be intelligible without the diagrams and other illustrations, which are too rough for reproduction.

Of the proposed section iii. (“Beauty of Colour”) little appears to have been written. There is an unfinished chapter on “The Effect of Expression of Beauty.” This does not seem worth giving, because the author treated the subject differently and more deliberately in sec. i. ch. xiv. of the printed text (§§ 4 *seq.*). There are also some memoranda for the chapter on “The Expression of Divers Colours,” but these are rough and incomplete.

For the proposed section iv. of the original draft (“Of the Sublime”) a good deal of unpublished matter exists; but it is, for the most part, in an incomplete form. A few interesting passages may however be given. The following are from ch. i. (“Of the Sublime Generally”)³:—

[5.]“We have now explained, and in some degree illustrated, the various sources to which we think the idea of beauty may be owing. But

¹ [See above, sec. i. ch. iv. § 7, p. 70.]

² [With the latter part of this passage, *cf.* sec. i. ch. xv. § 5, p. 210.]

³ [The chapters were, however, subsequently recast, and this appears in the MS. as “Chap. 10: Of the Connection of the Beautiful with the Sublime.” For the sake of clearness, we adhere above to the original draft Synopsis. *Cf.* ch. iii. of vol. i. of *Modern Painters* (“Of the Sublime”).]

there is another idea—Sublimity—with which that of beauty is so often associated that it is impossible to enter upon any criticism without examination of it. It will readily, I believe, be admitted that many things are sublime in the highest degree, which are not in the highest degree beautiful, and *vice versa*; *i.e.* that the two ideas are distinct, and one is not merely a particular form or state of the other. It will also, I believe, be admitted on reflection that nothing can be perfectly sublime without being in some degree or way beautiful, and nothing perfectly beautiful, without being in some degree sublime; *i.e.* that the two ideas, though distinct, have yet something in common, and are not altogether separable.

"For instance. By adding to the beauty of an evil angel, we add to the sublimity of his power and crime. By taking away his beauty, and giving him the attributes of a monster, we may add to his detestableness but we destroy his sublimity.

"In the same way the sublimity of the vast forms of Egyptian sculpture is enhanced, or diminished, in proportion as the lines approach the standards of that peculiar beauty which is characteristic of them. A mere monster, however vast in size, could scarcely ever induce an impression of sublimity.

"Again, the Madonna di St. Sisto¹ which may, I think, be taken as the standard of beauty, cannot be contemplated for an instant without exciting sensations in the highest degree sublime. The same may be said, though in less degree, of the beauty of all Greek Divinities. And in every instance which can be given, I believe it will be found that the highest beauty is sublime, and the highest Sublimity beautiful, and yet the Beautiful and Sublime are totally distinct ideas. . . .

"I have already defined Sublimity to be that attribute of any object by which it expands or raises the feelings, so as to prevent them from dwelling on subjects little or momentary—the effect, in short, upon the mind of anything above it. Anything which disposes us to the contemplation of things great or generalized, of large effects of fate and spaces of time,—anything which banishes paltry interests and agitations, and gives the feelings a repose in which they are at liberty to look far and broadly and calmly into or over the great laws and masses of being—anything which being itself great makes us great by the sympathy we have with it is sublime.

"As all greatness is comparative, that greatness only is sublime which is above ordinary humanity, whether bodily or spiritual. Thus: no unusual size of a thing commonly small or less than ourselves is sublime. A butterfly cannot become sublime by any increase of size; it only becomes monstrous. A large example of a small species of lizard cannot be sublime. The crocodile or the megalosaurus become so in proportion as they pass the standard of human strength. A diamond may be colossal compared with other diamonds, but it is only the mountain which is sublime. Human power or size is the first step at which the scale of the sublime begins."

Ruskin then passes on to jot down rough notes of the different elements in the sublime—size, energy, etc., as shown in the original Synopsis. For the

¹ [Cf. Vol. III. p. 13 *n.*; and in this volume, p. 127 *n.*]
IV.

proposed chs. ii. and iii. of this section (“Of Truth” and “Of Size in its effect on the Sublime”) no materials have been found. It appears that he afterwards meant to omit ch. ii., or to run the subject into ch. i., for the chapter treating “Of Breadth in its influence on the Sublime” begins with referring to Breadth as “the first of the qualities of form which we mentioned as productive of the Sublime.” The question of Size was included in the discussion of Breadth, but this chapter is not in a sufficiently complete form for citation. A similar remark applies to the notes for the next chapter, “Of Energy as an element of the Sublime,” and “Of Mystery as productive of the Sublime.” In the chapter “Of the Supernatural as an element of the Sublime,” there is this passage on plants and flowers:—

[6.] “The wildness and worn colour of their decayed masses,—the living curves of their healthy growth,—the singular sympathies with human life and human suffering which they seem to show, are instruments by which the imagination may be strongly struck. Their shudder at the approach of storm,—their apparent rejoicing in the light and colour of heaven,—their contorted and writhing struggles in decay, are all suggestive of supernatural influence—supernatural because though, as before shown, we constantly endow plants with an inherent felicity or suffering, we endow them not with a knowledge of, or sympathy with, any external events. All appearance, therefore, of such sympathy is a sign to us of some superior power—influencing and binding together under its own mighty operation, essences the most different and apathetic. The sympathy therefore of landscape with the event represented as taking place in it, is not merely—as is commonly said, in good taste; it is not the representation of an agreeable accident, but of that which we all imagine, if not believe—the address of supernatural powers to us through insentient things; and the working together of landscape element to excite some strong ruling emotion in the human mind is always as distinctly suggestive, according to its degree, of supernatural power, as the Darkness until the ninth hour during the Crucifixion. It is not merely a demand of art, that all objects in the picture should be so harmonized as to enhance each other’s expression. If this be done throughout, a sense of more than mere harmony is obtained; a sense that such harmony could not result, among insentient beings, unless by the appearance of superior sympathies and over-ruling powers; and that the scene represented is one in which more than human energies and authorities are present.

“Nor is this feeling perhaps even wanting under the ordinary changes of skies and seasons. All the necessary effects, beneficial or destructive, of storm, might be produced—so far as we know—without those circumstances of terror which touch the feelings so strongly. Rain might be given without gloom, the tempest might be guided to its work without giving to the wind that fitful action—that wailing cry—which sways and awakes by quick sympathy human passion and human fear. The lightning might be pointed to its work without the luridness* of the heaven or the spectral building and accumulated horror of the thunder-cloud. But it is not so ordained, and with every

* “Luridness is the *minor* key of light; it has the same melancholy or awful effect on the mind which is found in the minor scale of music” (note in author’s MS.).

manifestation of destruction or overwhelming power, there are addressed to the senses such accompanying phenomena of sublime form and sound and colour that the mind instantly traces some ruling sympathy that conquers the apathy of the elements, and feels through the inanimation of nature the supernatural unity of God."

Notes follow for the further contents of this proposed chapter. Some of the points were afterwards made in the printed chapters on Imagination.

Of the proposed sections v. and vi. in the original Synopsis, only some few fragmentary passages appear to have been written.

A large quantity of interesting matter exists on the subject of Awe. Much of it is in finished form, though connecting links are sometimes missing. It is difficult to say what the author's intention here was. Several pages in the MS. give different headings. It seems from one of these¹ that the chapter or chapters were first intended for the section on the Sublime in the original Synopsis. But some at least of this discussion must have been written at a much later date, for there is a reference in it to vol. iii. of *Modern Painters*. Whether this chapter on Awe was intended for some revised version of vol. ii., or for a later volume, does not appear. Some of the points and phrases were afterwards used in vols. ii., iv., and v.; compare, for instance, on Awe, as here discussed, vol. ii. sec. i. ch. xiv. § 26; and with the love of horror, vol. iv. ch. xix. ("The Mountain Gloom") §§ 15, 16. In this unpublished chapter Ruskin appears to have begun by describing cases of morbid love of horror—such as delight in diseased conditions of living bodies:—

[7.] "The painters and writers who desire to excite horror do it (more frequently and easily than by any other expedient) by imagining life to exist in forms and states of body more or less subjected to visible decay: as in the skeleton dances of Retsch² and other such works. A 'horrible' death is one in which the laws of life are violently and unnaturally interrupted with such infliction of pain as nature usually forbids: as in the body's being torn or dashed to pieces—or burnt; the protraction of the pain and of the unnatural conditions increasing the horror. And 'horrible' places are those which give the idea of, or which more or less threaten, such unnatural death or pain—as gulphs of water among jagged rocks;—pits full of foulness and without hope of escape; and such like, of which more presently. (Then afterwards all foulness, properly so called, is nothing more than a condition of corruption; and is disgusting to us in proportion to the manifestation of its nature—the presence of it adds greatly to other forms of horribleness; and the entire absence of it, and of darkness, render horror almost impossible. A mountain torrent flows into the Lago Maggiore about six miles above Locarno,³ between rocks of the hardest white gneiss, which it has worn into broad concave surfaces as smooth as silk. The rocks rise seventy or eighty feet above the stream, which flows beneath the concave wall in narrow gulphs of green, touching the rocks with slight, hardly visible eddies, entirely without sound, and

¹ [The sheet is headed "Fear and Horror: of the elements of the Sublime."]

² [For another reference to Retsch, see above, sec. ii. ch. iii. § 12, p. 259.]

³ [Ruskin probably refers to the passage of the Maggia at Ponte Brolla, which however is not more than three miles from Locarno.]

thirty or forty feet deep;—just like so much deep green glass of perfect purity flowing between upright walls of agate. Though the stream issues from the chasm below with no very violent fall, and I suppose a good swimmer might easily extricate himself from the place, or even take delight in bathing there; any more hopeless pools for a person to fall into who could not swim, it would be difficult to imagine; yet the perfect purity of the water, and smooth whiteness of the rocks, take away from them nearly all horror; a dark mill stream under a large wheel is far more terrific.

“The violation of natural law, most horrible when it is supposed to be continuous, for then it is of course the profoundest and intensest violation; corruption tending to its own proper end and close, being in the present state of the world itself natural, is less horrible than a maintained and enduring corruption. Hence it is not merely the idea of life given to the spectre or monster, but the idea of its continuance in the monstrous state, which makes it peculiarly horrible; and when to this idea of continuance is added that of power for evil, the horror reaches its climax: as in the Frankenstein monster; and in the conception of ghouls, vampires, and other such beings.

“Disgust, properly so-called, is a minor degree of horror felt respecting things ignobly painful or offensive; it is much concerned with minor conditions of corruption affecting the touch, taste, and smell; and with the conceptions of each. It passes gradually into higher forms of horror.

“Both horror and disgust are felt occasionally towards creatures which in reality violate no natural law; but which violate in a striking degree the laws of our own human nature. It is to be noted, that when the animal seems to have no resemblance or relation to humanity, but has a nature which cannot be conceived of by us, we are not disgusted with it; but when it has members, of which the service is like the service of our own, yet arranged in some very inhuman way, it disgusts us. We have no objection to an oyster for having no legs at all, but great objection to a centipede for having more legs than we think it ought. Foulness, either of body or habit, as in flies, beetles, and caterpillars; undue and deathlike sluggishness, as in some lizards; unnatural and as it were mechanical animation, as in serpents (of which the most horrible by far is the cerastes which goes *sideways*); and power of doing strange and painful harm are the other principal elements of disgust or horror in animals, as the reader may easily discover by a little careful thought.”

Is there then—the author seems to have gone on to inquire—no legitimate place for the horrible? has the sublime no connection with the terrible? He pursues the inquiry by statements of the effect of various sensations of horror upon the individual character:—

[8.] “The first broad aspect of the matter appears to be that terrible images have *no* attractive power whatever over persons leading pure, benevolent, and wise lives; occupied as such lives must be with frequent and happy thoughts of another world. Thus throughout the works of the best religious painters, of whom Fra Angelico may be taken as the type, there cannot be found the smallest trace of sympathy with terror: there are *no* grand forms of clouds or crags—no effects

of gloom—no conceptions of ghastly form. When the nature of the subject compels them to make an effort in that direction of terror, they are so incapable of feeling it that they always end in a kind of burlesque. Angelico seems utterly unable to conceive a disagreeable expression; his demons are simply ludicrous; and his flames of the Inferno, like pretty patterns in flame-coloured taffeta. Orcagna, and the other more general and naturalistic painters of the religious schools, reach the length of being able to express rage—malice, pride, and other demoniacal passions, by firm, intellectual drawing: they arrange the teeth of their demons in good order for biting, give grisly sweep to their wings, and good holding to their claws;¹ but of real awfulness or horror involved with mystery they never give the slightest hint or passage. Then the great naturalist painters, able to do and to conceive everything, touch chords of terror here and there; just enough to show that they could do more if they liked;—but none of the greatest ones ever give anything entirely terrible—entirely disagreeable as Titian in his anatomies they become sometimes—but no quantity of the disagreeable ever frightens them—or makes them seem to think that others will be frightened. And then, thirdly, the base and vicious painters, of whom Salvator stands far ahead the basest—unapproachably and inexpressibly detestable—a very abyss of abomination²—these as a class—and Salvator chiefly as representative of them, are attracted by terror—and skilful in arousing it in others.

“That I say is the first aspect of the thing, leading us to suppose that enjoyment of terrible things must be wholly wrong. Next:—let us take the second aspect of it: Observing the conduct and tastes of men in the living world—we shall see thoughtless and frivolous persons for the most part enjoying a trim, well ordered, and entirely unfrightful kind of scenery or abode;—and thoughtful, sensitive, or capacious people apt to like wild and terrible scenes:—at least for a certain time. We shall find the common kind of people content with Cheltenham or Brighton—on the whole happiest there—while Walter Scott rejoices in Loch Coriskin—Wordsworth in Borrowdale—Byron in all imaginable kinds of wild places; and most of our more powerful literary or scientific men—more or less in scenery of the same kind. Among boys, young people especially, it is a promising sign if they like to haunt lonely or wild places, and an unpromising one if they only like fine rooms and gay gardens. I believe the solution of the difficulty is to be found in the following general principles, which I shall first briefly state and then expand:—

“1. A thoughtful and sensitive person is originally capable of a pleasure in terrible objects, which a thoughtless and dull one is incapable of.

“2. If these persons are uninfluenced by moral principles, and yield to their love of excitement, they may continue to indulge in such pleasurable sensations at wrong times; to the general disturbance of their intellect and degradation of their character.

“And if at the same time they conduct themselves viciously they will become both more capable of horror, and gradually infected with a

¹ [See above, pp. 159, 201, 319 *n.*]

² [See above, pp. 213, 265.]

morbid love of it; and may, in proportion to the abuse of their gifts, sink far below persons originally of less capacity.

“3. If such persons devote themselves to active, healthy, and honest life, without any special religious principles their sense of terror will occupy a duly subordinate place, among other natural and human sensations: but will, as they advance in life, generally diminish, and yield much of its place to a pure love of facts and of beauty.

“4. But if they devote themselves to a life of specially religious sentiment or exertion, such a life generally interfering with many worldly—or in religious language—carnal—sensations—and checking the pursuit of knowledge in various directions, will ultimately in most cases utterly quench the delight in terror, as well as in the more sensual forms of beauty, and leave the person narrowly minded but finely tempered: incapable of much that others can do and feel; but capable also of some things which few could do but themselves.

“5. Throughout all these phases of change the person originally capable of delight in terror remains for ever distinct from the common-place person, originally incapable of it. The work of such common-place persons may often be good in other directions, but the absence of the capacity of awe marks them as everlastingly of an inferior caste.”

The author then passed to discuss and elaborate these five propositions in order, but the inquiry was not carried further, in this draft, than proposition (2):—

[9.] “A thoughtful and sensitive person is originally capable of a pleasure in terrible objects which inferior persons are incapable of.

“And this is by reason of the general nature of Awe, properly so-called. It is the apprehension of power superior to our own, and of the great perpetual operations of death and pain in the system of the universe—both which perceptions (*i.e.* of greater power than our own, and of the offices of death and sorrow) are either impossible, or so far as possible, repulsive to a mean mind; but both possible, and in a certain kind attractive, to a great one. The mere capacity of estimate and of measurement is the first quality of the man necessary to such a sensation;—a thoughtless and commonly-minded person can form no idea of the strength of a sea wave, and no estimate of the bulk of a rock; still less of the multitudes of waves that are necessarily connected with the existence of the first or of the forces necessary to place or maintain the rock in its visible form. The universe manifests itself to them in general merely as it affects their sensations; they are drenched by the wave, or run against the rock, and apprehend in consequence, the moisture of the one, and the hardness of the other; they conceive nothing more concerning them, so far as they can go beyond this, and apprehend the power or nature of things; they dislike the resultant humiliation and sense of their own powerlessness or littleness, and shrink from the objects causing it to those over which they have greater power, and which will not make them feel themselves little people. But your noble person particularly enjoys being made to feel himself little; the sense of diminution is to him one of great ecstasy; he laughs with delight as he apprehends his own atomical character, and begins to feel what a mighty system is all about him, and what a

glorious space there is quite outside of the evolutions of such microscopical animals as himself.

"And the intensity and pleasure of the feeling is dependent not only on capacity of estimate, but on the serene and habitual action of the reflective powers upon any object submitted to them. The various feeling with which different people regard a distant chain of mountains is mainly dependent upon this. The actually visible thing is a mere film of grey, with a jagged outline by no means so large as a piece of torn grey paper near the eye, nor, most commonly, presenting half so much beauty of colour as a cluster of mosses at the wayside. And to some people the distant mountain chain is literally nothing more than the piece of torn grey paper would be; it is simply a grey film with a ragged edge, exciting no more emotion than a piece of tinder fluttering from the bars of a grate; that is what the chain of the Alps is to the modern Italian mind. To another person the same grey film excites the most sublime sensations, merely because he entirely apprehends it for what it is. This part of our subject has been examined already in vol. iii. ch. 10, § 8, and ch. xvii. §§ 3 and 4.

"But a still greater distinction exists between the minds of the two classes of persons as regards their susceptibility to emotions of terror and sorrow. It is difficult to say whether the temper of mind which makes men despise or neglect distress is dependent most on selfishness properly so called, or on defect of intellect and incapability of conceiving the distress. Of course the two causes act and react on each other; the man who pays no attention to the sorrow of others loses daily more and more the power of comprehending it, and sympathising with it, while the increasing stupidity and want of understanding render the inattention easier and the selfish acts less painful to conscience. Without troubling ourselves to disentangle those causes we may generally characterize as at once dull and cruel the persons who are never depressed by the sense of sorrow which they cannot help, surrounding them everywhere in the world, and separate them as a class from those who are depressed and horror-struck by it. It is indeed most difficult to distinguish this so noble despondency from the common and base sadness of selfishness, since before we find one person who is sad for the sake of others, we shall find hundreds sad by their own faults in unwise covetousness, or regret, or for want of compliance with the commonest laws of health. And it is this sadness which I have had occasion to speak of often before as that so justly condemned by Dante.¹ For I believe that if the laws of health and the promptings of conscience are strictly and promptly obeyed by us, the mere strength of life in the veins and the consciousness of clear standing with God and man force cheerfulness on us, whether we will or no, and render all kinds of despondency and dread impossible; but seeing that many of us are compelled by the very conditions of our lives to break the laws of health, and more of us are always breaking for our fancies' sake, laws both of health and of conscience, despondency of all kinds must needs fasten upon us; and thus it becomes a telling distinction between one class of men and another, that these are sorrowful only for themselves, and those for others. In

¹ [See in this connection *Modern Painters*, vol. iii. ch. xiv. § 38.]

times of weariness and faithlessness, and various disease of mind, it just makes all the difference whether the things that fasten their truth into us are only our own disappointments and losses; or whether the valley of the shadow be dark with other death than that of our own losses.

“I pause as I write—long and resultless. Unless one were oneself all that one should be, how can one say, or imagine, what the thoughts of others should be? I cannot tell, of any pain that I have felt, of any delight that I have enjoyed, how far I grieved or rejoiced rightly. But this at least I know,—that whether we rejoice or grieve, we ought all of us to strive more and more to gain insight into the facts of the life around us; and that those facts are, to our human sight, more than terrible. Assume what theory you will about the world;—and still, so far as the vision of the world so constituted is granted to *you*, it must be a frightful one:—the best that you can believe is that in compensation for the evil of it, there shall one day be greater good; but believing this, still the good is unseen, evil is seen. Try at least to see it. Whatever is to be the final issue for us there ought surely to be times when we feel its bitterness, and perceive this awful globe of ours as it is indeed, one pallid charnel house,—a ball strewed bright with human ashes, glaring in its poised sway to and fro beneath the sun that warms it, all blinding white with death from pole to pole.”¹

Here there is a page missing in the MS. The author apparently paused to consider the contrary, or modifying, state of cheerfulness which faith, experience, or reflection may suggest. He then proceeds:—

“It is almost certain that in early youth, such courage and good cheer, if continual, proceeds from narrowness of mind and selfishness only;—they cannot be founded on faith which life has yet done little to confirm. It is a good sign of a youth, so far as kindness of heart is concerned, if he likes to get away into desolate and terrible places; for the fascination which these exercise over him is assuredly connected with the great consciousness of human sorrow in his heart; and even as he advances in life, if his work—as in the case of a painter, leads him frequently into such scenes, it is entirely significant of goodness and greatness in him that he feels their gloom to the utmost, and that when others would see nothing more than material, for a picturesque or bold arrangement of subject, *he* is affected by an almost superstitious fear, and affects the spectator with the same fear by his treatment of the scene.

“So that you cannot ask a more significant question respecting a young landscape painter than this—‘Is any of his work terrible?’ Indeed though this should be answered favourably, we have afterwards to ask whether the terror is just morbid, true or caricatured; but in the first place we must be assured that it is there; and we shall know, if it is absent, that the man is narrow and insensitive. Nor is anything more curious than the completeness of its absence from the work of inferior painters—how black they may make their clouds, how ruinous their buildings, and how colossal their cliffs, without being able to produce—since they have not themselves felt—a single thrill of true terror.”

¹ [These words occur in *Modern Painters*, vol. v. pt. ix. ch. ix. § 24.]

The contrary case—the impression of awe in the painter's mind conveyed in his work—was then, as appears from a note, to have been illustrated from Turner's *Liber Studiorum*; the MS. continues:—

"2.¹ The love of gloom, which thus far we have been considering, appears at first to differ root and branch from the desire of horror which is felt by vulgar persons . . . merely for the sake of strong sensation. The one is compassionate; the other seems merely cruel. Both are, however, as I think, the same in origin and meaning; only the bluntness of soul requires, in the one case, violent aspects of terror to stimulate it; while the tenderness of the other is touched by more subdued images. But as I believe this difference in the structure of the soul to be native and unchangeable, I do not think that the degeneracy which I have stated generally may take place in the mode of pursuing sublime images, can take place except in spirits of a grave make. When the sublime emotion has ever been truly or entirely felt in youth, I do not think it is possible for it to degenerate as life advances; it will always purify and raise itself in the manner to be examined under our third head. But if the mind be natively coarse, so as in images of terror to trace none of the collateral or consolatory elements; if on this native coarseness be superadded any definitely vicious or cruel moral tendency, so that the terrible object is contemplated not only with pleasure in the absolute strength, but even with actual enjoyment of the idea of pain,—the indulgence in the dark imageries becomes gradually more constant and more gross; and as this tendency of mind implies also necessarily irregularities and degradations of conduct, the alarmed conscience and discomfited heart begin to cast a gloom of their own over the imagination, besides that which it voluntarily seeks:—farther, in seeking for frightful things, the mind comes gradually to accustom itself also to ugly ones:—rendering all its tastes coarse, facilitating companionship with persons of ignoble features, and the endurance of unsightliness and disorder in outward circumstances. Once the downward course fairly begins there is no probability of its being checked—the life gradually becomes more reckless and wretched: the imagination more sickly and gloomy; while a bitter cynicism mingles with the debauched cruelty of the heart. A certain degree of animal courage, and a superior intellect, are necessary in order to enable the person to persist in habits of mind which must always involve much pain to themselves; the courage gives them a certain joy in enduring what is painful: while the intellect prevents them from being entirely humiliated in the state to which they reduce themselves; their pride often provoking them to exhibit their artistical power in the way most immediately striking to the multitude:—that is to say, in general, in a gross or frightful subject various conditions of slight insanity or hypochondria and dyspepsia mingle with the forms of merely overexcited imagination: and give risr to a similitude of characters which it is not worth our while to trace out even in leading type—much less in detail;—the only conclusion which we need to establish being that all melancholy or terrible forms of art, whose production has been persisted in by given painters as their especial work or trade, imply some

¹ [This number refers to Proposition 2 on p. 373 above.]

degradation or weakness in painter, and are sure to be themselves of an inferior order as works of art. There is no exception whatever to this rule. All gloomy painters are bad painters; and nearly always wicked men; if not wicked they must be in some degree insane."

The following passages, clearly from the same chapter, are taken from the Brantwood MSS. described below (III.), p. 383. The passages are headed "Supplementary Notes on Terror arising from Weakness of Health":—

[10.] "But if the mind be originally of firm make, whatever may have been its gloomy tones in youth (and, as we have seen, such tones are for the most part indicative of power), they are sure to be corrected by advancing years. True sensibility compels the man to notice all that is beautiful even in the darkest or most terrible scenes, and because in nature, there are always beautiful things in all places, no sensation of horror is ever, in a sensitive mind, untempered by joy in beauty; this joy, aided by affection and curiosity, leads the man perpetually further in the pursuit of it; and because the horror is found for the most part in what of each object is indefinite or passing away—but the beauty in what is definite and enduring (the lightning passes, shapeless—the rainbow rests in its arch) he perpetually gets full grasp of what is lovely—but only feeble hold and transient sight of what is frightful; so that, led always into longer companionship with the fair and perfect things, at last he has but little time or mind for the terrible ones; and though his sensation of them is as vivid as ever, he has recourse to them only to oppose his vision of Peace—or at all events so far only as is necessary for the full expression of the system of nature and the history of man.

"It is a certain principle therefore that all the greatest painters will in middle and advanced life, represent beautiful rather than terrible things; and the quantity of true beauty which they represent is generally a very just standard of their artistical rank. I say generally, because it is evident that we cannot make any trenchant distinctions between man and man, in the more subtle phases of character; since the outward circumstances of life must materially modify the character, whatever original perfectness of heart we may presume in the painter.

"Unhappiness of life, or unworthy treatment of him by his contemporaries, or distress, though not his own, brought frequently before him, may increase the hold of painful imagery on his mind, while a full and calm felicity of life, cheerfulness of companionship and the honour of acknowledged genius, and the wellbeing of his state or city, may lead him gradually to forget many sorrowful things, which it would have been better to have remembered. And if he is a figure painter, his power of representing must be materially dependent on the examples of it with which he is surrounded. And while these external matters may make a notable difference in the man, even supposing his own conduct virtuous, and his faith firm, much more is he certain to be affected gravely by the consequences of his vices or errors. Although I am bold to separate wicked—that is to say—cruel and basely minded men, whom I have described under the second head of this chapter—from good—that is kind, and nobly minded men, whom I am considering now, yet the good are liable to all sorts of decline and stain. I call

them good, merely because there is the material of goodness in them, however little they shape it. In those whom I call wicked, there is no substance of good, no ray of it. All apparent shape in them is of clay without bones, or breath—"clouds are they without water"—having only the darkness—not the dew:—"raging waves of the sea foaming out their own shame"¹—that which springing from the passions of other men would be beautiful as Aphrodite, is with them nothing but shame—this is the Salvatorian mind. But with those whom I call good, the true light is always in the heart; and if evil be there also, then the light, playing upon this, shows it in all its horror—and thus we get some of the intensest expressions of horror which the human heart produces—horror rising within itself. It may perhaps be also providentially appointed that a mind of fine make, having no fixed faith nor power of self-command, and plunging therefore into sin, shall not be able to turn away from the dreams of terror which sin will summon, but rather throw its whole power into the examination and expression of them so as to manifest its state thoroughly to others, as well as itself. Hence the perpetual passages in Shelley and Keats of extreme horror—the description of the decay of the Garden in the 'Sensitive Plant' for instance: and the whole of the treatment as well as the choice of subject in 'Isabella,' with the gloom of 'Hyperion' and despair of 'The Eve of St. Agnes.' Evidently also mere weakness of physical health, especially if resulting from over exertion of mind, and irregular habits of life, will tend to produce painful visions, just as fever does, literally visions, not merely gloomy thoughts, but frightful spectra. In certain states of weakness of body, a painful feeling will almost always give rise to visionary appearances of a frightful kind, to unimaginative persons in dreams, to highly imaginative ones in waking vision translating itself into them, so to speak, even mere bodily discomfort giving rise to such spectra as may account to the imagination for such discomfort: oppression of breathing causing a dream of rocks being heaped upon the body; the sickness and loathing of a disordered system, sights of serpents, and caterpillars, and loathsome places; a sharp, local pain in any part of the body, the vision of an animal tearing it, or a fire consuming it, and so on: the distinctness and dreadfulness of such imagery increasing in proportion to the weakness of body and mind, and appearing, as already noticed in the fourth volume, to be especially attendant on certain states of palsy or dotage.

"Although, however—thus invariably traceable to some flaw or decay in the intellectual constitution, such conditions of emotion, when the original make of the mind has been thoroughly pure and strong, are frequently the most expressive of all its moods when declared to others; as the 'Christabel' and 'Ancient Mariner' are the most touching though the most [*sic*] of Coleridge's works;² and enable it, even by the very bitterness of its own state to convey to persons otherwise cold and un [*sic*] the truest impression of the things that are terrible in the earth. A healthy and practical farmer, meeting a viper in his field, regards it simply as one of the creatures ranged under the general term of 'vermin'—kills it—throws it over the hedge out of his way, and

¹ [Jude 12, 13.]

² [See below, p. 392.]

proceeds in his walk—whistling. A sick and sorrowful poet, meeting the same creature, pauses—watches, follows, irritates it—takes a strange pleasure in looking into its eyes, and hearing it hiss; and measuring the concentric circles of its prepared coil. Presently it uncoils itself and glides away. The youth watches the waving of the long grass over its body—proceeds to wade through said long grass for half an hour after it, half fascinated and wishing to be bitten. Goes home, and dreams of it, intensified into a fiery serpent by his mistress's last frown—rises utterly ill and miserable, and writes 'Lamia.'¹ Perhaps a thing as much worth doing as all that the farmer did in his cheerful walk—besides that the poet knows thenceforward more about vipers than the farmer ever did, or ever will. Much good may it do to the poet! whether really do good either to him or to us, I leave, not ironically, but as myself unable to form judgment in the matter, to my reader's consideration; being certain only of this, that such a question can only be raised, and poetry at all brought into questionable balance with turnips, when said poetry is of the best kind, and the mind thus spent in visions of first-rate power. Unless the resulting work, 'Lamia,' or 'Christabel' or what else it may be, be well finished in its own way, the young or old visionary had far better have concurred at once in the farmer's views on the subject of vipers, thrown the beast over the hedge, and set himself to plough, or thresh, for the rest of the day.

"It will follow from these general considerations, that so far as a mind of pure make, and powerful imagination is either (1) affected by a noble, but doubtful and faithless compassion for the agony of the world—or (2) by remorse for carnal sin, and by weakness of body, it will be liable to fits of fear, and correspondent visions of terrible things, which will also probably be intense, animated and acute, in proportion both to the vigour of its invention, and to its own intrinsic hatred of all death and evil; the things which have the nature of either, or 'the body of this death'² appearing more ghastly and vivid to the man in proportion to the separation of his own noble nature from them; and thus, unless we could find great men with no moral failing, and subject to no bodily distress, we must be prepared to find them occasionally creating pieces of horror in their work, which at first sight it will be difficult to distinguish from the perpetual and base horror of wicked men. If we do not find them doing this, unless as I said, we supposed them perfect and like the angels, we may be sure they are disguising something from us—hiding their fear, and not speaking from their hearts—in other words, that they are verily not great men, though we thought them so.

"Thus Correggio and Reynolds, both as great, considered with respect to the absolute pictorial faculty, as Titian, or Veronese, are yet subject to certain affections and insufficiencies in their modes of perceiving objects. Correggio sees too exclusively its softness—Reynolds too exclusively its grace and breadth, both of them exaggerate shadows and curves, and in other modes into which I need not enter, seek wilfully something other than the fact. Hence we find, as far as I know, no true terror in any of their designs. Still less in any of those of Raphael

¹ [Cf. *Modern Painters*, vol. iii. ch. xvi. § 34, where Keats is spoken of as "sad because sickly."]

² [Romans vii. 24.]

or Poussin, who were still more wilfully conventional. Attempts at the representation of terrible things may sometimes be forced upon such men, as in Raphael's Satan, in the St. Michael of the Louvre, and Poussin's Dragon in his St. Margaret.¹ It will be the main object of this section to show how inferior all such artificial terrors are to the true work of the Naturalist. We come then, so far as we see at present, to the conclusion that while a continual delight in terrible subjects is an infallible sign of a man's being weak and wicked, the occasional dwelling upon ghastliness is an essential characteristic of great naturalist painters, at certain times of their lives, caused in them first by their compassion—secondly, by their sin; and thirdly, by their search for facts."

There are other MSS. given by Ruskin to Mr. Allen in the same bundle that contained the material for vol. ii. already described. The sheets for the most part contain mere notes and memoranda, though they include the first drafts of discussions on Mountain Sculpture—a subject afterwards treated in the fourth volume of *Modern Painters*. The notes include jottings made on reading Byron's *Childe Harold* and the *Clouds* of Aristophanes; notes on Abstraction and on Chiaroscuro; the beginning of a paper on the Fall of Man; and some memoranda of sunsets and reflections in water; several other sheets are taken up with notes on Sir Charles Bell's *Essays on the Anatomy of Expression in Painting*, a work first published in 1806. Bell died in 1842, and Murray had asked Ruskin to write a notice of his works on their artistic side for the *Quarterly Review*. He accordingly took the book with him on his foreign tour in 1845. "I stipulated for a back seat," he writes to his father in describing the journey from Tonbridge to Dover (April 2), "and got one—opposite a very fine specimen of a blackguard, with his cap over one eye, and a bandage for a shirt collar. I studied him very carefully, and at last sketched him on the margin of Bell's Expressions, while we stopped at Ashford, thus obtaining a valuable addition to the illustrations of the work." The notes show that Ruskin studied the work very carefully, but after some weeks he gave up the idea of writing the article for the *Quarterly*. "I enclose a letter," he writes to his father from Florence (June 15), "which you will not like to forward, but I can't help it. It explains itself: there is, however, another reason which I cannot give Murray, that on reading Sir C. again and again, I find it loose in plan and often to my notions wrong, and Murray told me he wanted as favourable a review as possible to serve the widow, and I can't write what I don't think." One result of this abandoned *Quarterly* article remains in vol. ii. of *Modern Painters*, in the shape of frequent references (seven in all) to Bell's works.

(II.) The Hilliard MS. This is the MS. of the volume in its penultimate form, and is followed by the text, apart from the author's final corrections. Parts of it are wanting; viz., sec. i. chs. i.—vi. (§ 1); ch. xv. §§ 5–7; sec. ii. §§ 9–11, and from § 18 of ch. iv. to the end. The MS. is of 1846, and contains none of the later matter.

This MS. bears evidence similar to that in the case of the previous volume, of the great and minute care taken by the author in revision. The instances of alterations given in footnotes to the text (e.g. pp. 190, 248, 258) are typical of similar revision throughout the volume.

¹ [In the Royal Gallery at Turin.]

With this MS. are a few other sheets containing material for chapters or portions of chapters afterwards discarded. One of these appears to have been an amplification of §§ 8–11 of the present ch. i. of the volume, dividing that form and those activities of art which are the subject of the theoretic faculty from the art which is “subservient” and “useful” (see § 8, p. 33). In this connection there is an interesting passage on Historical Art—“art historically useful, the preserver of things lost and found”:

[11.] “And here we have to make a distinction between two functions of historical art commonly so called. Once, some time ago, when I was rashly using the word historical in the way it is so frequently applied to the higher branches of theoretic art, an intelligent amateur asked me suddenly for an instance of a good truth-telling, practically useful historical picture of some important fact, not taken from the Scripture histories. I have a most acute recollection of the puzzled pause that followed. Vague images swimming before me of quaint, tapestry-like, nameless panoramas of impossible fortifications, with people in blue coats and silver lace and cocked hats capering on the top of a round hill in the foreground, and when these faded away, nothing left but a black, ignoble, inevitable well of vacancy, with the names of Benjamin West and Horace Vernet¹ in phosphoric horror at the bottom of it. It is indeed singular to reflect how little historical *information* we owe to painting,—for that which is commonly called historical is little more than realization of some isolated fact of what is known and conceived from books, and even of this, there is but little by great hands, except from the Scripture histories. Allegorical representations, triumphal processions, general types of victory or peace,—the time and costume often utterly neglected by the painter, or episodes which exhibit the human emotions under circumstances peculiar to no *time*, though peculiar in themselves, and for the understanding of which we must refer to written history,—this is all that art of any standing or dignity has done with respect to the past actions of men. Of informative art we have next to nothing, for the simple reason that artists are too apt to paint the things of past time, which they must invent, instead of things of present time which they might know. They hardly call the latter historical, and yet it is the only historical painting worth having. Is Thucydides a worse historian than Mitford, fresh from his command in——?² What would we give now for the roughest sketch of the battle of Platea—done on the instant, and on the spot. It would be worth rather more than the ideals of David in the Louvre.

“Besides the delight of exercising the imagination which brings the painter constantly back to the past, there is a reason³ in the nature of his art itself. Informative historical art must be of a low kind—to map out the divisions of an army in motion, to clear away the smoke of the battle and let the eye perceive the relations of its troops,—relations which in the battle itself could not be discerned—to labour

¹ [For a reference to Vernet in this connection, see *Modern Painters*, vol. iii. ch. vii. § 18.]

² [Left blank in the MS. The missing word is Thrace (Thuc. iv. 104).]

³ [*i.e.*, for the preference of past to present history, or for the avoidance of informative historical art altogether.]

out details of costume, and dwell on the features of mean faces, this is not work for a great painter; he cannot submit to it, nor ought he, for this may be done by inferior hands. His business is to seize the moments of mightier interest, to dwell on the passion and the powers which are the roots and movers of all history, and which are common to all time. A picture of the battle of Austerlitz gives no idea, no information whatever about the battle; it is a picture of Napoleon and [? (word indecipherable)], both agitated by noble emotion—it is the conception of an instant which may perhaps be as well conceived and rendered a thousand years hence as now; it is not historical but theoretic.

"Art, therefore, as the recorder of *events* has hitherto done almost nothing, and can never do much. To be valuable at all, it must be true in everything—true in those passing, finite, contemptible circumstances which, as contrary to the great general truths of nature, the good artist *must* reject, and even supposing this painful truth attained, a model and a map are better story-tellers still. The model of the battle of Waterloo gave a clearer knowledge of it than all the pictures ever painted.

"But art as the recorder of character, as the exhibition of the root and moving powers of history, has done everything. More history may be written on a forehead than on sixty feet of canvas. Every earnest and loving statement of what is leading, influential, foundational in the men and things immediately present and about the artist, of their heart and inner nature, as it manifests itself in instructive, not assumed, peculiarity, is historical in the highest sense, and invaluable to future ages."

With these remarks on historical art, may be compared passages in *Modern Painters*, vol. iii. ch. iii. § 21, and ch. vii. §§ 17–19.

Another additional chapter in the Hilliard MS. discusses the question of ideal character in landscape, and makes reference to the point of specific realisation "already explained in the preface," *i.e.* in the preface to the second edition of vol. i. The chapter seems to have been intended for insertion in that volume; it forestalls the enumeration, and begins the examination, of the six qualities of "typical beauty" discussed in the present volume (chs. v.–x.).

(III.) The Brantwood MS.

There are preserved at Brantwood some unpublished portions of *Modern Painters* contained in two small blue copy-books, not in Ruskin's hand. One of these is noted by him (in his later hand) on the cover thus:—"Part of unpublished old *Modern Painters*; very valuable." This note-book contains (i.) some notes on Ideas of Relation. These will be printed in Vol. VII., (vol. v. of *Modern Painters*). (ii.) Some notes on Terror. These are printed above, pp. 378–381. (iii.) The other copy-book (in the same hand) contains "Notes on a Painter's Profession as ending Irreligiously." These are printed in the next Appendix.

II

AN ADDITIONAL CHAPTER

BEING “NOTES ON A PAINTER’S PROFESSION AS ENDING IRRELIGIOUSLY”

[THIS chapter, as it now stands, is much later in date than the second volume of *Modern Painters*, for it refers to the fourth volume of that book, and also to the *Stones of Venice* (see § 11). It appears, however, to be contribution to the discussion of questions raised in the second volume (sec. i. ch. xv. § 5, p. 210), and there reserved for subsequent treatment. The additional chapter is, therefore, appropriate in this place, and its inclusion here is convenient owing to the greater thickness of the later volumes. The MS. from which it is printed is described above, p. 383. The paragraphs are here numbered for convenience of reference.]

1. The first point which I would wish the reader to mark in this review is the inseparable connection of beauty with truth. We have seen that exactly in proportion as painters thirsted for truth, and were stern, laborious, undivided, and untempted in the pursuit of it—just in that proportion their sense of beauty was quickened, and their power over it confirmed. We have also seen that all beauty is typical of divine attributes, and of moral principles: it might therefore seem that no eagerness in its pursuit was blameable.

But here we are met by grave facts and difficult questions. It is, indeed, simply to be stated, and easily comprehended, that when the truth is sought first and beauty afterwards, all is wrong: when *vice versâ*, all is right. But there is more.

2. And first let us consider the bearing of the pursuit of beauty, as intensely followed out by a great painter, on what is commonly called “religion.”

Taking a broad view of the religions of the world, they may be mostly defined under these two heads. (1) Efforts to propitiate a supernatural being, either beloved for the nobleness of its own nature, or supposed to possess power over the events of our own lives; and this effort at propitiation is generally accompanied (but not necessarily so) with the other form of religion. (2) Efforts of the human mind, when discontented with its state of existence here, or with the shortness of that state, to assure itself of a better or more enduring state of existence hereafter.

The efforts at propitiation (1) with an uncertain and feeble attempt at realization at futurity (2), constitutes most heathen religions:—the attempt at realization of futurity, with uncertain and feeble efforts at propitiation, constitutes most of the spurious forms of Christianity—the two conditions of mind

united form the purest conditions of Christianity which have hitherto manifested themselves. For our present purpose, however, it is necessary to examine mainly the nature of the second form of religion—the desire of another world.

3. This desire, and the belief dependent upon it, of course arise naturally in the minds of persons who are guiltlessly unhappy in this life. Whether this unhappiness arise from external poverty, ill health, loss of friends, failure of cherished hopes, or persecution, the mind naturally has recourse to the only consolation open to it—the hope of a compensating state of future life. It hangs upon the hope of such a state; eagerly seizes every evidence which may confirm such hope—shrinks with terror and hatred from every piece of counter-evidence—and fixes its affections, with its gratitude, on the Being to whose promise it trusts for the fulfilment of its expectations. Most people are brought to God by Gratitude; not for what He has given, but what He has promised. Nearly all the purest exhibitions of religious feeling and faith have been made by persons in such circumstances.

And that such religion is wise and true, appears to be established by the words of Christ and the testimony of His disciples. Throughout the New Testament, riches and fortune and felicity are spoken of as temptations or snares:—poverty always as a blessing, and guiltless misery as a state of temporary probation, to be abundantly recompensed hereafter.

So that in times of great intensity of feeling (questionable, perhaps, times also of ignorance—we shall consider of this presently), earnest men, desirous of making themselves increasingly religious, have frequently given up their wealth, and voluntarily inflicted suffering on themselves in the form of penances and restrictions, in order to further their religious interests, or purify their religious emotions. 2 Thess. i. 6, 7.

4. In cases when no suffering of this visible kind has been experienced (either voluntarily or otherwise), we find sometimes a nobler discontent with the world than can arise from any personal calamity; a discontent arising from an inner sense of sin, and from a contemplative conviction that all is not as God would have it, round about us, and that a less sinful and painful, or perhaps wholly painless and sinless state is to be desired with all our soul and pursued with all our strength—in the striving for which men are led gradually to cast aside the thoughts and treasures of the world, not by way of doing penance, but with contempt, as being impediments and hindrances to a life of labour towards Heaven.

5. A third state of religious life, in which this world is fully enjoyed, and yet the next mainly looked for, is conceivable, and may have been led by one or two religious persons out of a thousand; perhaps by more, for as it is almost impossible to distinguish it from the commonest of all states of mind of persons concerned with religion,—the state in which this world is nominally second and actually first,—it is unsafe to assert with any definiteness either its rarity or frequency. Since however it cannot be held by very ardent persons, nor by very imaginative ones (such being sure to “sell that they have” and *all* that they have as soon as they catch sight of Christ or of eternity—never keeping back any of the Price of the Pearl), and as the persons of whom we are at present speaking, painters and others concerned with the arts, are necessarily ardent and imaginative, we need not reason about this third form of the religious life, with any regard to them.

6. Finally, there is yet a fourth form of the religious life conceivable, in which this world may be enjoyed and laboured in, without any regard to the Next. That is to say, in which a man may consider it his duty to concern himself at present about the place which God has for the present put him in; being quite ready—if God should ever see good to put him into another place, to concern himself then about that;—as though a man’s servant should say to himself, My master has at present put me in the kitchen, I presume therefore he means me to attend to the kitchen stuff;—if afterwards he promote me to be his treasurer, or receive me as his guest, I will then do my best to keep his accounts clear, or look to be entertained in a goodly manner at his high table; for the present my business is clearly in the kitchen, and I may as well make myself comfortable there. This form of religious life has also, as far as I can see, been a notably rare one hitherto; we will return to it presently; in the meantime let us consider the relations to the artist of the two first and commonest forms of religious life, which arise mainly out of Discontent with the world.¹

7. Observe first that a great painter must necessarily be a man of strong and perfect physical constitution. He must be intensely sensitive, active, and vigorous in all powers whatever; gifted especially with a redundant nervous energy, able to sustain his eye and hand in unbroken continuousness of perception and effort. I do not stay to prove this. It will be found a fact by those who care to enquire into the matter. And this being so, your great painter can only under the most extraordinary circumstances be liable to fits of physical exhaustion or depression, and assuredly he is never liable to any morbid conditions of either; he may be healthily tired when he has worked hard, and will be all right again after he has rationally rested; he may be profoundly vexed, or thrown into fierce passion, but he will never mistake his own vexation for a gloomy state of the universe, nor expect to find consolation or calm by any supernatural help; he will set himself to forget his vexation, and conquer his passion, as small irksome pieces of entirely his own business, precisely in the way he would set himself to mend a hole in his canvass, or cool a pan of dangerously hot varnish. Farther, he is gifted by his exquisite sensibility with continual power of pleasure in eye, ear, and fancy; and his business consists, one half of it, in the pursuit of that pleasure, and the other half in the pursuit of facts, which pursuit is another kind of pleasure, as great, and besides sharp and refreshing when the other is at all deadened by repetition.

8. Farther, it not only is his business to seek this pleasure, but he has no trouble in seeking it, it is everywhere ready to his hand, as ever fruit was in Paradise. Nothing exists in the world about him that is not beautiful in his eyes, in one degree or another; so far as not beautiful it is serviceable to set off beauty; nothing can possibly present itself to him that is not either lovely, or tractable, and shapeable into loveliness; there is no Evil in his eyes;—only Good, and that which displays good. Light is lovely to him; but not a whit more precious than shadow—white is pleasant to him, as it is to you and me; but he differs from you and me in having no less delight in black, when black is where black should be. Graceful and soft forms are indeed a luxury to him;

¹ [With this passage on religion contrast *Crown of Wild Olive*, Introduction, § 12 *seq.* Here Ruskin does not conceive the “non-religious” life; there he states that life may be well-ordered on either basis.]

but he would not thank you for them unless you allowed him also rugged ones. Feasting is consolatory to his system, as to yours and mine, but he differs from us in feeling also an exquisite complacency in Fasting, and taking infinite satisfaction in Emptiness. You can excite his intense gratitude by the gift of Anything, and if you have Nothing to give him, you will find that Nothing is exactly the thing he most wants, and that he will immediately proceed to make half a picture out of it. How can you make such a man as this Discontented with the world? There are Three colours in it—he wants no fourth—finds three quite as much as he can manage. There's good firm ground to set easels on in it—he is not sure that they would stand so firm upon clouds, or that he could paint flying. But the world is a passing, dreamy, visionary state of things! Do you then want them to be always the same—how could one vary one's picture if that were so? But people lose their beauty and get old in the world! Then they have long beards, nothing can be more picturesque. But people die out of the world! How else would there be room for the Children in it, and how could one paint without children? But how unhappy people are in the world. It must be their own fault surely, I'm not. But how thin and ugly their grief makes them—don't you mourn for the departure of the bloom of youth? Not at all—I like painting thin people as well as fat ones—one can see their skulls better. But how wicked people are in the world! is it not dreadful to see such wickedness? Not at all—it varies the expression of their faces; there would be no pleasure in painting if they all looked alike. Besides, if there were no wicked people there would be no fighting—no heroes—no armour—no triumphs—one might as well not be a painter at all. But don't you want to mend the world then? No—I don't see that it wants mending—unless, perhaps, it might be better with fewer fogs in it; but I don't know, and I daresay fogs are all our own fault for not draining better; at all events—the best you can do for me at present is to stand out of the light, and let me go on painting.

9. What can be done with such a man? How are you to make him care about future things? Even if misfortunes fall upon him, such as would make other people religious, he will not seek for consolation in Heaven. He will seek it in his painting-room. So long as he can paint, nothing will crush him. Nothing short of blindness—nothing, that is, but his ceasing to be a painter, will enable him to contemplate futurity.

10. Nay;—it may be replied—may he not be led, without suffering, but in his own work and his own way to that happy religion which you have admitted to be possible, in which this world may be enjoyed without forgetting the next? No; by no manner of means—at least of means hitherto brought to bear in this world's history. As far as we have seen, hitherto, all happy religious life has consisted in the fulfilment of direct social duty—in pure and calm domestic relations—in active charity, or in simply useful occupations, trades, husbandry, such as leave the mind free to dwell on matters connected with the spiritual life. You may have religious shepherds, labourers, farmers, merchants, shopmen, manufacturers—and Religious painters, so far as they make themselves manufacturers—so far as they remain painter—no.

11. For consider the first business of a painter; half, as I said, of his business in this world must consist in simply seeking his own pleasure, and that, in the main, a sensual pleasure. I don't mean a degrading one, but a bodily, not a spiritual pleasure. Seeing a fine red, or a beautiful line is a bodily and

selfish pleasure, at least as compared with Gratitude or Love—or the other feelings called into play by social action. And moreover, this bodily pleasure must be sought for Itself and Himself. Not for anybody else's sake. Unless a painter works wholly to please himself, he will please nobody;—he must not be thinking while he is at work of any human creature's likings, but his own. He must not benevolently desire to please any more than ambitiously—neither in kindness, nor in pride, may he defer to other people's sensations. "I alone here, on my inch of earth, paint his thing for my own sole joy, and according to my own sole mind. So I should paint it, if no other human being existed but myself. Let who will get good or ill from this—I am not concerned therewith. Thus I must do it, for thus I see it, and thus I like it, woe be to me if I paint as other people see or like." This is the first law of the painter's being; ruthless and selfish—cutting him entirely away from all love of his fellow-creatures, till the work is done. When done he may open the door to them, saying calmly "If you like this—well, I am glad. If you like it not, away with you, I've nothing for you." No great exertion of benevolence, even in this. But farther. In order to the pursuit of this beauty rightly, our great painter must not shrink in a timid way from any form of vice or ugliness. He must know them to the full, or he cannot understand the relations of beauty and virtue to them. I have written enough in other places to explain the perceptive function of a great naturalist in this respect—the reader should compare especially what is said of Shakespeare, vol. iv., and *Stones of Venice*.¹

12. And this being so, as the great painter is not allowed to be indignant or exclusive, it is not possible for him to nourish his (so called) spiritual desires, as it is to an ordinarily virtuous person. Your ordinarily good man absolutely avoids, either for fear of getting harm, or because he has no pleasure in such places or people, all scenes that foster vice, and all companies that delight in it. He spends his summer evenings on his own quiet lawn, listening to the blackbirds or singing hymns with his children. But you can't learn to paint of blackbirds, nor by singing hymns. You must be in the wildness of the midnight masque—in the misery of the dark street at dawn—in the crowd when it rages fiercest against law—in the council-chamber when it devises worst² against the people—on the moor with the wanderer, or the robber—in the boudoir with the delicate recklessness of female guilt—and all this, without being angry at any of these things—without ever losing your temper so much as to make your hand shake, or getting so much of the mist of sorrow in your eyes, as will at all interfere with your matching of colours; never even allowing yourself to disapprove of anything that anybody enjoys, so far as not to enter into their enjoyment. Does a man get drunk, you must be ready to pledge him. Is he preparing to cut purses—you must go to Gadshill with him³—nothing doubting—no wise thinking yourself bound to play the Justice, yet always cool yourself as you either look on, or take any necessary part in the play. Cool, and strong-willed—moveless in observant soul. Does a man die at your feet—your business is not to help him, but to note the colour of his lips; does a woman embrace her destruction before you, your business is

¹ [*Modern Painters*, vol. iv. ch. xx. § 28 seq.; *Stones of Venice*, vol. ii. ch. vi. § 53 seq.]

² [A word is left blank in the MS. here.]

³ [*1 Henry the Fourth*, i. 2.]

not to save her, but to watch how she bends her arms. Not a specially religious or spiritual business this, it might appear.

13. And then, lastly. Not only is your painter thus concerned wholly and indiscriminately with the affairs of this world, but the mechanism of his own business is one which must occupy nearly all the thoughts of his leisure or seclusion. Whatever time others give to meditation, or other beneficial mental exercise, he must give to mere practice of touch, and study of hue. Painting cannot be learned in any other way. So many hours a day of steady practice—all your mind and nervous energy put into it—or no good painting. No genius will exempt you from this law of toil; a painter's genius especially signifies the love of beauty which will never let him rest in the effort to realize it. A man of science may, if he choose, rest content at any moment with the knowledge he has attained, for however much more he learns, he will be as far from knowing All, as ever he was; but to a painter, absolute perfectness of skill is an approachable, though not an attainable goal: every hour that he gives to his work, brings him nearer a conceivable faculty of laying on the exact colour he wants in the exact shape he wants; he feels himself every day able to do more and more as he would; and though he knows he can never be absolutely perfect, any more than a continually enlarging circle can become an infinite straight line, still, the straight line is before his eyes, and forces him for ever to strive to reach it more and more nearly. This continual mechanical toil, this fixed physical aim, occupies his intellect and energy at every spare moment—blunts his sorrows, restrains his enthusiasms, limits his speculations, takes away all common chances of his being affected by the feelings or imaginations which lead other men to religion.

III

LETTERS ILLUSTRATIVE OF “MODERN PAINTERS,” VOL. II

1. TO THE REV. W. L. BROWN

ON COLERIDGE AND WORDSWORTH

[It will have been observed how closely Ruskin had read Wordsworth before writing this volume; there are references also showing his familiarity with Coleridge. The following letter, belonging to the period, seems, therefore, appropriate here. It is of further interest for its protest against inversions in diction—a practice into which, on writing his volume two years later, Ruskin himself fell, and for which in later years he criticised himself severely: see his note of 1883 on p. 50, above. For the Rev. W. L. Brown, Ruskin's college tutor, see Vol. I. p. 464, and II. p. 223. The letter is here printed for the first time from a copy preserved at Brantwood: it is in the volume of 1827–1844, No. xi. of the Poetical MSS. (see Vol. II. p. 534).]

Dec. 20th, 1843.

MY DEAR SIR,—I ought before to have thanked you for the valuable information contained in your condescending answers to my impudent animadversions: they are of course entirely satisfactory except that I must take the liberty of still falling foul of transposition. The line of Shakespeare you quote¹ I always considered a *bad* line—because an obscure one—because although there is a great deal of the uninteresting, there is nothing of the *impossible* in the man's knowing his horse; and since any thought which becomes ditchwater by being *clearly* expressed, must be something worse by being *muddily* expressed, I think nothing can be worth saying which will not stand on its own legs, and which requires to be bolstered up by unnatural expression;—not that I would alter Shakespeare, because the words used are the shortest possible, melodiously arranged and perfectly clear in all points but this one unavoidable transposition; and because also in a description of that which is pompous and artificial, artificial language is not only admissible but even agreeable. But look how much finer the following speech of York

¹ [See *King Richard II.*, Act v. Sc. 2:—
“Then, as I said, the duke, great Bolingbroke,
Mounted upon a hot and fiery steed
Which his aspiring rider seem'd to know.”]

is—in which there is not *one* transposition from beginning to end, and just try the effect of a few—

“So—or with more contemning did men’s eyes
On Richard scowl. No man God save him cried,
No joyful tongue him home his welcome gave;
But dust upon his sacred head was thrown,” etc.¹

You see in a passage like this where there is deep feeling, Shakespeare prefers writing a line which will not scan (Did scowl on Richard, etc.) to using the least transposition. Neither is it any excuse for transposition to say that such in a *perfect* language would be the natural order of the words. The imperfection of our language compels us to express the government by the order of the words, and in an English poem that order of words is natural which is suited to the genius of the language, and which a person not thinking about his words would use, and that is *unnatural* which a person thinking about the philosophy of language instead of its meaning would use. If it is my habit to say “I want an apple” it is vain to tell me that apple is the principal idea in my mind and that it would be natural to say “Apple I want.” It is natural in every language to use the customary forms, and philosophical language never could be the language of passion, unless it became fragmentary. The unruly child at the dessert does indeed roar Apple, but the *want* is wanting altogether.

I never heard of the Coleridge and Wordsworth dispute (where can I find an account of it?²) but I should think from the character of the two poets that their dispute was not about the *expression*, but about the proper *matter* of poetry;—the one requiring elevated and imaginative subject, the other nothing more than sticks and wallets; for, so far as I can see, both act on precisely the same principles of language; neither of them can use a long word when a short one will do, nor a *recherché* word where a simple one will do, nor a philosophical transposition where plain English will do. What can possibly be simpler than every word of the “Ancient Mariner”? It is a short difficult stanza and sometimes the poet is compelled to allow himself so much transposition as “out of the sea came he,” a simple and everyday structure; but in general he will rather end a line with a contemptible word than transpose—just write him out straight and it is all plain prose—“And every tongue through utter drought was withered at the root—We could not speak, no more than if we had been choked with soot”—surely this is natural enough? I think nothing can be more perfect than all the versification of this poem—for the very reason that it *is* absolute pure—common English. There is only one bad line in it and that is a transposed one—“Eftsoons his hand dropped he.”

But when you say that you would rather have written this than all Wordsworth ever perpetrated, I begin to be surprised. I love Coleridge, and I believe I know nearly every line of both the “Ancient Mariner” and “Christabel”—not to speak

¹ [The original lines are:—

“Even so, or with much more contempt, men’s eyes
Did scowl on gentle Richard; no man cried ‘God save him!’
No joyful tongue gave him his welcome home:
But dust was thrown upon his sacred head.”]

² [Coleridge’s *Biographia Literaria* (1817); see especially ch. xvii. Coleridge’s objections to Wordsworth’s theory (which, however, he distinguished from his friend’s practice) were somewhat wider in their scope than Ruskin supposed.]

of the “Three Graves” and the “Hymn in Chamouni,” and the “Dejection,” and I am very willing to allow that he has more imagination than Wordsworth, and more of the real poet. But after all Coleridge is nothing more than an intellectual opium-eater—a man of many crude though lovely thoughts—of confused though brilliant imagination, liable to much error—error even of the heart, very sensual in many of his ideas of pleasure—indolent to a degree, and evidently and always thinking without discipline; letting the fine brains which God gave him work themselves irregularly and without end or object—and carry him whither they will. Wordsworth has a grand, consistent, perfectly disciplined, all grasping, intellect—for which nothing is too small, nothing too great, arranging everything in due relations, divinely pure in its conceptions of pleasure, majestic in the equanimity of its benevolence—intense as white fire with chastised feeling. Coleridge may be the greater poet, but surely it admits of no question which is the greatest *man*. Wordsworth often appears to want *energy* because he has so much *judgment*, and because he never enunciates any truth but with full views of many points which diminish the extent of its application, while Coleridge and others say more boldly what they see more partially. I believe Coleridge has very little moral influence on the world; his writings are those of a benevolent man in a fever. Wordsworth may be trusted as a guide in everything, he feels nothing but what we ought all to feel—what every mind in pure moral health *must* feel, he says nothing but what we all ought to believe—what all strong intellects *must* believe. He has written some things trifling, some verses which might be omitted—but none to be *regretted*. He could not by any possibility—have entertained even for an instant such feelings as are shown in Coleridge’s “Fire, Famine and Slaughter”—not that he would not have pitied the sufferers equally but he would have looked on the inflictor with a judging charity—and if we compare poem with poem, which is the greatest—truest, and most beautiful statement of God’s Providence? “The Ancient Mariner” or the “Hartleap Well”?¹ Both are written with precisely the same intent. In the one poem the crime is a mere piece of inconsiderateness, and is followed by the most preposterous chain of ghostly consequences; in the other the crime is a deliberate basing of man’s pleasure on the pain of God’s creatures, and the consequences are gradual, natural, not necessarily or indisputably connected with the crime, but yet sufficiently so to be felt a lesson and a revelation by a believing mind. This is absolute, perfect truth; it is the law of God’s daily providence, no diseased dream of a heated imagination. The “Christabel” again is a mere rhapsody—a poetical clothing of an old superstition. There is no moral truth, no system or meaning in it from beginning to end. A lady dreams something unpleasant—she must go to a *wood* at *midnight* to pray. What is the use of this? Hadn’t she better have gone to Chapel in the *morning*? In the wood she meets the devil dressed as a lady, she brings him home “for love and charitie”—and in return is mesmerized all night. What sense or good is there to be got out of this? How different is Wordsworth’s “White Doe of Rylstone,” a poem of equal grace and imagination; but how pure, how just, how chaste in its *truth*, how high in its end, showing “how anguish—wild as dreams of restless sleep, is tempered and allayed by sympathies aloft ascending and descending deep.” Coleridge’s finest poem—to me—is the “Three Graves.”²

¹ [The two pieces are quoted together in this volume; see above, p. 149.]

² [Written in 1805–1806.]

The first stanzas of its fourth part are, I think, entirely the consequence of Coleridge's acquaintance with Wordsworth. They are very exquisite and indeed nothing can be finer than the whole poem. But what impression does it leave? The miserable sense that people may be reduced to the utmost limit of agony without crime, while the *Holiness* of the Mother is shown not by the influence of her love but by her hatred. Just compare with this the noble notion of parental love which is given by the story of "Michael," one equally deep in tragedy—but a true, real, everyday character of Tragedy—and teaching us throughout the noble lesson that "There is a comfort in the strength of *love* 'twill make a thing endurable—which else would overset the brain—or break the heart." Or if you want pure pathos take "The Brothers," the most really affecting, most perfect piece of natural feeling in the English language. The two last lines of it are, to my mind, the most exquisite close that ever poet wrote. And then read the "Affliction of Margaret," and the "Female Vagrant," and "Lucie Gray," and "She dwelt among the untrodden ways,"—and then with the magnificent comprehension—faultless majesty of the "Excursion," to crown all—my dear sir—how *could* you say what you did? It is very late, I haven't time to write more—pray excuse me if I have been too presuming. We hope Mrs. Brown continues better, all join in kindest regards to her and you

Ever, my dear Sir,
etc., etc., etc.

2. TO JOSEPH SEVERN

ON THE PROSPECTS OF ART IN ENGLAND

[THE following letter was written by Ruskin from Venice in September 1845, and shows some of the enthusiasms, interests, and concerns which were to be expressed in his second volume. In a letter to his father from Venice (September 30, 1845) Ruskin writes:—

"I send you a scrawled and sulky letter to Mr. Severn—I am half ashamed to send it, but cannot delay longer. I don't want to damp him, but it is monstrously absurd in him to speak of inoculating England with the love of *Fresco* as if that were all she wanted, and men could be sublime on a wall who were idiots on canvas. Fresco does indeed afford glorious *room* for a man who wants it; it is a splendid sea for the strong swimmer, but you might as well throw a covey of chickens into the Atlantic as our R. A.'s into fresco. . . ."

For Joseph Severn, whom he had come to know through George Richmond, see *Præterita*, ii. ch. ii.; Severn had gained a prize in the cartoon competition for the Westminster frescoes (for which see Vol. III. p. 230). The letter is here reprinted from *The Life and Letters of Joseph Severn*, by William Sharp, 1892, pp. 205–207; the date is there wrongly given as 1843.]

VENICE, *September 21st*, 1845.

MY DEAR SIR,—I am sure you will excuse my not having answered your kind letter before, when I tell you that I have been altogether unhinged by the condition in which I have found Venice,¹ and that every time I stir out

¹ [See above, p. 41 *n.*]

of doors I return too insensible to write or almost to speak to any one. But I cannot longer defer expressing my sincere gladness at your well deserved success, and my sympathy in all the enthusiasm of your hopes, so far as regards your own aims and prospects, and I am also glad for the sake of our national honour, that you are to be one of its supporters. But with your hopes for the elevation of English art by means of fresco, I cannot sympathise. I have not the remotest hope of anything of the kind. It is not the material nor the space that can give us thoughts, passions, or powers. I see on our Academy walls nothing but what is ignoble in small pictures, and would be disgusting in large ones. I never hear one word of genuine feeling issue from any one's mouth but yours, and the two Richmonds', and if it did, I don't believe the public of the present day would understand it. It is not the love of *fresco* that we want: it is the love of God and his creatures; it is humility, and charity, and self-denial, and fasting, and prayer; it is a total change of character. We want more faith and less reasoning; less strength and more trust. You, neither want walls, nor plaster nor colours—*ça ne fait rien à l'affaire*¹—it is Giotto and Ghirlandajo and Angelico that you want, and that you will and must want, until this disgusting nineteenth century has, I can't say breathed, but steamed, its last. You want a serious love of art in the people, and a faithful love of art in the artist, not a desire to be a R. A., and to dine with the Queen; and you want something like decent teaching in the Academy itself, good training of the thoughts, not of the fingers, and good inpouring of knowledge not of knocks. Never tell, or think to tell, your lank-cockney, leaden-headed pupil what great art is, but make a great man of him, and he'll find out. And a pretty way, by-the-bye, Mr. Eastlake takes to teach our British public a love of the right thing, going and buying a disgusting, rubbishy, good-for-nothing, bad-for-everything Rubens,² and two brutal Guidos, when we haven't got a Perugino to bless ourselves with. But it don't matter, not a straw's balance. I see what the world is coming to. We shall put it into a chain-armour of railroad, and then everybody will go everywhere every day, until every place is like every other place, and then when they are tired of changing stations and police, they will congregate in knots in great cities, which will consist of club-houses, coffee-houses, and newspaper-offices; the churches will be turned into assembly rooms; and people will eat, sleep, and gamble to their graves.

It isn't of any use to try and do anything for such an age as this. We are a different race altogether from the men of old time; we live in drawing-rooms instead of deserts; and work by the light of chandeliers instead of volcanoes. I have been perfectly prostrated these two or three days back by my first acquaintance with Tintoret;³ but then I feel as if I had got introduced to a being from a planet a million of miles nearer the sun, not to a mere earthly painter. As for our little bits of R. A.'s, calling themselves painters, it ought to be stopped directly. One might make a mosaic of R. A.'s, perhaps; with a good magnifying glass, big enough for Tintoret to stand with one leg upon . . . (Sept. 29th), if he balanced himself like a gondolier.

¹ [For the quotation from Molière, see Vol. III. p. 122.]

² ["The Judgment of Paris," No. 194; Ruskin attacked this purchase in a later letter to the *Times*; see *Arrows of the Chace*, 1880, i. 65. For the Guidos, see Vol. III. p. 670.]

³ [See above, Introduction, p. xxxvii., and Epilogue, § 12, p. 354.]

I thought the mischief was chiefly confined to the architecture here, but Tintoret is going quite as fast. The Emperor of Austria is his George Robins.¹ I went to the Scuola di San Rocco the other day, in heavy rain, and found the floor half under water, from large pools from droppings *through* the *pictures* on the ceiling, not through the sides or mouldings, but the pictures themselves.² They won't take care of them, nor sell them, nor let anybody take care of them.

I am glad to hear that the subjects of our frescoes are to be selected from poets instead of historians; but I don't like the selection of poets. I think in a national work one ought not to allow any appearance of acknowledgment of irreligious principle, and we ought to select those poets chiefly who have best illustrated English character or have contributed to form the prevailing tones of the English mind. Byron and Shelley I think inadmissible. I should substitute Wordsworth, and Keats or Coleridge, and put Scott instead of Pope, whom one doesn't want with Dryden. I think the "Ancient Mariner" would afford the highest and most imaginative method of touching on England's sea character. From Wordsworth you get her pastoral and patriarchal character; from Scott her chivalresque; I don't know what you would get from either Dryden or Pope, but I suppose you must have *one* of them. However, anything is better than history, the most insipid of subjects. One often talks of *historical* painting, but I mean *religious* always, for how often does one see a picture of history worth a straw? I declare I cannot at this instant think of any one historical work that ever interested me.³

I beg your pardon very much for this hurried sulky scrawl, but conceive how little one is fit for when one finds them covering the marble palaces with stucco, and painting them in *stripes*!

Allow me again to thank you exceedingly for your kind letter, and to express my delight at the good news it contains, and believe me, with compliments to Mrs. Severn,

Ever most truly yours,

J. RUSKIN.

¹ [George Henry Robins (1778–1847), the famous crier of "going, going, gone" of the day. His most notable sale, that of Horace Walpole's collections at Strawberry Hill, had taken place in 1842.]

² [See above, p. 40.]

³ [See above, p. 382.]

IV

MINOR “VARIE LECTIONES”

ALL the more important and substantial variations between the various editions of *Modern Painters*, vol. ii., have already been given as footnotes to the text or otherwise. For the sake of completeness, the remaining variations are here given. Differences of capitals for small letters, small changes of punctuation and of spelling (such as “canvass” for “canvas,” “Raphael” for “Raffaelle,” etc.), are not, however, always noted; nor are some obvious misprints (transposition of letters, etc.), included. See also p. liii. above for list of errata noted in the first edition; they are not included in the following collation.

Preface to the Re-arranged edition (1883).—§ 6, third line from end, “the conception of any invisible one” was misprinted “the conception of any visible one” in the small complete edition. § 7, the reference to “the untranslated quotation from Aristotle” was wrongly given in the 1883 ed. as pp. 83 and 218, instead of pp. 85 and 225.

Sec. i. ch. i. § 3, line 1. Ed. 1 reads “Only as” instead of “Because that”; ed. 2, “Only that I fear that . . .” § 4, line 12, eds. 1 and 2 had a full point after “us.” § 5, eds. 1–3 and 1873, did not capitalise “His,” “He.” § 6, line 9, ed. 1, reads “the” before “endurance,” “fortitude,” “deliverance,” and “faith.” § 7, “He,” “His,” “Him,” not capitalised in eds. 1–3. § 7 (author’s footnote, now at pp. 37–41), “Beauvais” misprinted “Beauvois” in eds. 1 and 2, which did not contain “at the corner of the market-place.” In the paragraph on Pisa, the words “to some private person” came after “the lower part of the wall,” and “Giotto” was misspelt “Giott” (so also lower down in the note). Towards the end of the note, for “taking the place of” eds. 1 and 2 read “replacing.” There were also some minor differences in punctuation. § 8, line 24, for “whatever,” ed. 1 reads “whatsoever”; line 31, eds. 1 and 2 have a semicolon instead of a full point before “only”; in ed. 3 the long sentence was broken up (see Ruskin’s notes on pp. 49, 53). § 10, last line but 2, the words “in considering” inserted in ed. 3. In the note eds. 1 and 2 read “St.” for “San Lorenzo.”

Ch. ii. § 4, line 5, for “and therefore” ed. 1 reads “and so are actually *akolastoi*,” and in line 6, for “do not lower,” “lower not”; line 8, “its own” italicised in 1883 ed.; lines 15, 16, “though . . . feebleness” bracketed in eds. 1 and 2; line 20, after “passion” ed. 1 adds “and impulse”; last line but 3, after “intemperate” ed. 1 inserts “or *akolastoV*,” and in the next line omits the words “for the time.” There are also some differences of punctuation in this §. § 8, line 17, for “or” eds. 1 and 2 read “nor.” § 9, line 2, no inverted commas to ‘taste’ till 1883; line 4, all eds. before 1883 read “and” before “plant groves”; line 11, eds. 1 and 2 had a semicolon after “they had,” and ed. 1 reads “for I know not” instead of “I do not know.” The word “heart” in the last line was not italicised till 1883 ed. § 10, line 6, eds. 1 and 2 omit “in” before “what is kind.”

Ch. iii. § 1, lines 25, 26, the inverted commas and brackets introduced in 1883 ed. § 2, line 2, eds. 1 and 2 read right, ed. 3 “right,” § 2, the italics (*deceptive*, *will*, and *ultimate*) introduced in the 1883 ed.; line 13, eds. 1 and 2 insert “either” before “that which he himself”; § 5, the italics (*variation and unity*) introduced in the 1883 ed.; line 8, eds. 1 and 2 begin a new sentence after “the experienced”; § 6, the numerals (1), (2), (3) introduced in the 1883 ed.; § 6, line 14, “coexistent” is “co-existent” in eds. 1 and 2. § 8, line 3, eds. 1 and 2 insert “many” between “for” and “beneficent”; § 9, line 2, for “better” eds. 1 and 2 read “best”; § 11, line 17, for “all things. The complaint so often heard from . . .” ed. 1 reads “all things, and

therefore the complaint so often made by . . .” § 14, line 6, eds. 1 and 2 bracket the words “and they . . . God.” § 15, last line but 1, eds. 1 and 2 read “and” for “or.” § 16, lines 17, 18, eds. 1 and 2 read “. . . in men. And this kind . . . the word ‘beautiful’ to other . . .”

Ch. iv. § 1 (A), line 3, for “giving” eds. 1 and 2 read “allowing” (the lettering A, B, C, and D added in 1883); § 4, lines 1 and 3, for “the one to deaden . . . the other to endear,” ed. 2 reads “it deadens, . . . while it endears”; line 6, for “last” ed. 2 reads “latter”; § 5, line 8, for “flavours together; but” eds. 1 and 2 read “flavours together. But”; § 6, note 2 on p. 69, last line but one, for “remembered,” ed. 1 reads “held in mind”; § 7, the italics (*overcoming that very other power*) introduced in the 1883 ed.; § 9, last line but 8, the 1873 ed. (only) reads “had” for “has.”

Ch. v. § 2, last line but 2, for “has” ed. 1 reads “have.” § 6, the italics (*heaven light* and *object light*) introduced in 1883 ed.; § 8, line 8, for “venture” eds. 1–3 read “ventures”; § 11, line 2, for “the Venetians did through love” ed. 1 reads “was done by the Venetians through intense love”; § 16, line 11, for “For instance,” ed. 1 reads “Hence for instances,” and 6 lines lower, for “veins” “veining”; § 17, lines 2 and 3, for “refuses in painting to understand a shadow which . . .”; ed. 1 reads “refuses in art to understand anything as either which . . .”; line 12, for “most observable character,” ed. 1 reads “most observable and characteristic part”; § 17, last line, for “strong” ed. 1 reads “high”; § 19, line 3, eds. 1 and 2 omit “by” before “their distinctness”; line 9, for “not” ed. 1 reads “no.”

Ch. vi. § 1, line 1, eds. 1 and 2 bracket “God only excepted”; line 11, “or” was misprinted “of” in 1873 ed.; § 2, three lines from end, all eds. to 1873 have a full stop after “appear”; § 3, line 11, for “impulse” ed. 1 reads “inspiration”; line 24, eds. 1 and 2 have a full stop after “times”; § 5, line 3, for “surface” eds. 1–3 read “surfaces”; line 5, eds. 1 and 2 omit “by”; § 5 (author’s footnote †), the italics (*various*) introduced in 1883 ed., as also (*Uniformity*) in the next note; § 6, line 20, ed. 1 reads “becomes” for “become”; § 8, 9 lines from end, “offensiveness” was “offensivenesses”; in eds. 1, 2, 3, and 1873, and in the line above eds. 1, 2, and 3 read “nothingnesses”; § 8, author’s footnote, after “Santa Maria Novella” ed. 1 added “(Chapelle des Espagnols)”; § 10 (A), line 3, for “amongst” eds. 1 and 2 read “between”; (B), line 3, “(necessarily)” inserted in 1883 ed., as also the lettering “(A)” and “(B)”; § 10, author’s footnote, the italics (*is, large, small*) introduced in the 1883 ed.; the italics (*bulk, strength, constant must*) introduced in ed. 2; § 10, fourth line from end, for “takes” ed. 1 reads “take”; in the next line, the ed. of 1883 altered “The third, denial,” etc., to “And the third, the denial,” etc.; § 12, line 6, ed. 1 inserts “gradual” before “acceleration”; sixth line from end, eds. 1 and 2 insert “both” before “on its age”; § 14, the italics (*infinitely variable*) introduced in 1883 ed.; § 14, last line, eds. 1, 2, 3 read “animals” for “animal.”

Ch. vii. § 1, lines 4 and 5, ed. 1 inserts “and” before “yet” and “mere” before “matter”; § 2, line 16, ed. 1 inserts “under” before “fern”; line 22, ed. 1 reads “Hence Wordsworth of the cloud, which in itself having too much of changefulness for his purpose is spoken of as one,” etc. § 2, in ed. 1 the three quotations appear in the ordinary text; in ed. 2 the first one is set out, and in ed. 3 the other two also; § 6, author’s footnote, line 12, for “the” eds. 1 and 2 read “a.”

Ch. viii. § 3, third line from end, ed. 1 omits “and” before “constant.”

Ch. ix. § 2, line 9, the italics (*puerer*) introduced in ed. 2; § 7, line 8, ed. 1 inserts “the” before “rock,” and “I say” after “singularly”; § 8, line 3, ed. 1 reads “whereof” for “of which”; line 12, ed. 1 reads “of the Deity in matter through which,” etc.; § 9, fifth line from end, ed. 1 reads “Thus in the description of the Apocalypse, it is its purity that fits it,” etc.; § 9, author’s first footnote, all eds. before 1883 read “for all melodies are not,” etc.

Ch. x. § 3, author’s second footnote, lines 16–19, eds. 1 and 2 bracket “although . . . chiselling” and have no stop there; line 28, eds. 1 and 2 read “large” for “wide”; the italics (*indolent, intellectual, and more to do*) introduced in ed. 2; line 30, eds. 1 and 2 read “or” for “and”; line 33, eds. 1 and 2 read “new built” for “newly-built”; § 7, line 5, “least” in eds. 1–3 and 1883; other eds. read “less”; § 8, last word printed in small caps. in ed. 1.

Ch. xi. § 4, line 14, ed. 1 omits “higher”; line 23, for “may we not see” ed. 1 reads “it cannot be but that there is.”

Ch. xii. § 1, line 25, ed. 1 inserts “besides” before “is”; § 2, line 12, for “But even” ed. 1, beginning a new paragraph, reads “Wherefore it is evident that even”; § 2, ed. 1 has the two quotations in the ordinary text; § 6, line 1, for “clearer” ed. 1 reads “more distinct”; line 15, the italics (*animal*) introduced in 1883 ed.; § 7, line 15, for “consistent” ed. 1 reads “uniform”; § 8, the italics (*happiness* and *moral functions*) introduced in ed. 2; line 8, for “will” ed. 1 read “it shall”; § 9, the italics (*there is . . . animal*) introduced in 1883 ed., though *slothful* was italicised in ed. 2; § 9, line 8, eds. 1–3 and 1873 read “but” for “while”; line 20, ed. 1 omits “sometimes”; § 9, last line but one, ed. 1 inserts “of” before “love”; § 10, line 5, ed. 1 reads “eye” for “eyes”; line 15, for “in” ed. 1 reads “by means of”; line 16, ed. 1 inserts “to these” after “next”; line 33, for “much” ed. 1 reads “more,” adding after “mandibles” the words “than is commonly supposed”; line 36, for “their beauty” ed. 1 reads “that beauty they have,” the brackets being added in ed. 2; line 39, for “the principle is less traceable,” ed. 1 reads “there is less traceableness of the principle”; ninth line from end, the italics (*virtue*) introduced in ed. 2.

Ch. xiii. § 1, the italics introduced in ed. 2; § 2, last line, for “Second Section of the present Part,” 1883 ed. read “next volume” and added the footnote “(Of this edition; being the close of the second volume of the original work)”; § 3, line 3, for “apply the word” ed. 1 reads “use the word to signify”; § 5, line 1, for “It is well” ed. 1 reads “Now it is better”; § 6, line 4, for “its” ed. 1 reads “their”; § 10, line 5, for “idea,” eds. 1–3 read “ideal”; line 22, ed. 1 inserts “unequalled” after “endurance”; line 23, ed. 1 misreads “feeling” for “feeding”; line 28, ed. 1 reads “it” for “He”; § 13, lines 3 and 4, for “peculiar virtues, duties and characters” ed. 1 reads “characters, habits and peculiar virtues and duties”; § 13, last line, ed. 1 reads “it” for “their”; § 14, line 5, ed. 1 begins a new paragraph with “The pursuit.”

Ch. xiv. § 1, line 14, 1873 ed. misprints “their” for “there”; line 16, for “by” ed. 1 reads “with”; § 2, six lines from end of first paragraph, for “the ideal of the good and perfect soul, as it is seen in the features” ed. 1 reads “so the ideal of the features, as the good and perfect soul is seen in them”; next line, for “so sunk as not . . . to feel,” ed. 1 reads “but that it shall feel”; § 3, line 8, ed. 1 inserts “twists and” before “straining dexterities”; § 4, first two lines, ed. 1 reads “The visible operation of the mind upon the body, and evidence of it thereon, may be considered under the following three general heads”; line 12, for “described” ed. 1 reads “noted”; § 5, line 24, ed. 1 reads “exercise of both is in a sort impossible, for which cause we occasionally,” etc.; line 26, for “expansion” ed. 1 reads “expanding”; the quotation from Wordsworth, ed. 1 printed as one line, and did not italicise “thought”; next line, ed. 1 omitted “perhaps” and read “only, I think that if,” etc.; three lines lower, ed. 1 inserts, “that” before “though,” and in the next line does not italicise “reason”; seven lines lower, ed. 1 reads “that speaks” for “speaking”; § 6 is misprinted 5 in 1873 ed.; § 11, first three lines, ed. 1 reads “Hence, then, be it observed, that what we must determinedly banish . . . our seeking of its ideal, is not everything,” etc.; line 10, ed. 1 inserts “ever” before “that of Paradise”; § 12, line 11, for “since” ed. 1 reads “because”; lower down, ed. 1 italicises only the word “every”; § 13, line 4, for “general” ed. 1 reads “usual”; § 14, eleven lines from end, for “among” ed. 1 reads “for”; seven lines from end, ed. 1 omits “has done”; § 18, line 21, the brackets introduced in 1883 ed.; § 20, last word, not italicised in ed. 1; § 21, line 1, ed. 1 adds “and colourless” after “clay cold,” and for “life of flesh” reads “value of flesh”; § 23, last line before quotation, ed. 1 reads “to illustrate that of Spencer” (*sic*); § 29, first word, “Wherefore” in ed. 1; line 6, for “as” ed. 1 reads “for as much as”; § 30, first three lines in ed. 1 read “. . . passions whose presence, in any degree on the human face is degradation. But of all passion it is to be generally observed,” etc.

Ch. xv. § 1, line 4, ed. 1 omits “ones”; line 13, for “the” ed. 1 reads “that”; § 6, line 12, for “spring” ed. 1–3 read “springing”; line 18, for “are” eds. 1 and 2 read “is”; line 23, for “fall” ed. 1 reads “stoop”; last lines, for “partial want”

ed. 1 reads "want in measure," and for "exhibited," "showing itself"; § 10, at the beginning, for "mere" ed. 1 reads "bare."

Introductory Note (1883) to *Sec. ii.*—§ 2, line 24, small complete ed. reads "special" for "especial."

Sec. ii. ch. i. § 1, line 13, for "received" ed. 1 reads "presented"; line 26, for "not" ed. 1 reads "no"; § 4, line 6, for "where" ed. 1 reads "in which."

Ch. ii. § 1, line 15, ed. 1 reads "but voluntarily visible, as it being white, or having," etc.; § 2, lines 3 and 4, for "renders to visible knowledge" ed. 1 reads "renders so visible"; § 2, author's second footnote, third line, for "use" ed. 1 reads "necessity"; § 3, line 6, ed. 1–3 misprint "add" for "and"; § 4, line 4, ed. 1 inserts "of" before "the kind"; § 6, line 7, for "It has been said" ed. 1 reads "We have seen"; line 10, for "secures" eds. 1 and 2 read "secure"; line 14, no italics in ed. 1; § 7, line 14, "separately wrong" not italicised in ed. 1; § 7, line 17, for "is" eds. 1 and 2 reads "are"; § 9, line 1, for "This" ed. 1 reads "Now, this"; § 10, line 3, "absolutely" not italicised in ed. 1; § 21, line 4, 1873 ed. reads "artist" for "artists."

Ch. iii. § 1, line 5, for "choose" ed. 1 reads "chose"; § 2, seventh line from end, for "or" eds. 1 and 2 read "nor"; § 3, line 9, for "therein" ed. 1 reads "there"; § 6, lines 13 and 14, italics introduced in 1883 ed.; § 10, line 5, ed. 1 inserts "or" before "failing"; § 14, line 19, for "mind" ed. 1 reads "imagination"; line 25, ed. 1 reads "Turner's" for "Turner"; line 28, ed. 1 inserts "false and" before "unlike," and in the next line reads, "and in" for "or in"; line 38, ed. 1 reads "no" for "not"; § 17, line 14, ed. 1 reads "her chamber with its" for "a chamber with a"; § 18, 12 lines from end, eds. 1 and 2 read "Christo" for "Cristo"; § 23, fourth line from end, for "single group" ed. 1 reads "dozen people at a time"; § 24, fifth line from end, ed. 1 inserts "farther" before "and higher"; § 28, fourteen lines from end, for "from" ed. 1 reads "among."

Ch. iv. § 2, line 19, "Spenser" misprinted "Spencer" in ed. 1; seventh line from end, no italics in ed. 1; § 6, tenth line from end, for "perhaps the most" ed. 1 reads "which I consider the most"; § 7, line 14, ed. 1 inserts "various" before "disturbances"; § 11, line 11, for "are" ed. 1 reads "is necessarily"; § 14, fourth line from end, "compared" omitted by error in ed. 1; § 15, author's footnote, line 5, for "manifesting either" ed. 1 reads "manifestation either of"; § 17, author's note, eds. 1 and 2 read "dome" for "Duomo"; § 19, line 7, for "not necessarily any" ed. 1 reads "necessarily no"; § 21, lines 15 and 16, ed. 1 reads "It is by such means . . . preserved, as we before observed," etc.

Ch. v. § 3, last line, "as" omitted by error in eds. 1 and 2; § 11, line 8, eds. 1 and 2 have a semicolon only after "trees"; § 21, author's note, 1883 ed. misreads "Mr. Jamieson" for "Mrs."

Headings.—In the Synopsis, eds. 1 and 2 read:—

Chapter XII. Of Vital Beauty.—First, as Relative.

Chapter XIII. Of Vital Beauty.—Secondly, as Generic.

Chapter XIV. Of Vital Beauty.—Thirdly, in Man.

Ed. 3 reads:—

Chapter XII. Of Vital Beauty.—I. Of Relative Vital Beauty.

Chapter XIII. II. Of Generic Vital Beauty.

Chapter XIV. III. Of Vital Beauty in Man.

In the headings of the chapters Ed. 2 follows Ed. 3 above, and not Ed. 1.

CONTAINING

PART IV

OF MANY THINGS

BY

JOHN RUSKIN

*“Accuse me not
Of arrogance,
If, having walked with Nature,
And offered, far as frailty would allow,
My heart a daily sacrifice to Truth,
I now affirm of Nature and of Truth,
Whom I have served, that their Divinity
Revolts, offended at the ways of men,
Philosophers, who, though the human soul
Be of a thousand faculties composed,
And twice ten thousand interests, do yet prize
This soul, and the transcendent universe,
No more than as a mirror that reflects
To proud Self-love her own intelligence.”*

WORDSWORTH

FACSIMILES

TWO PAGES OF THE MS. OF "MODERN PAINTERS," VOL. III. (Ch. iv

.§ 16, and Ch. xiv. § 53)

pp.80 and 292-293

Note.—The frontispiece and the numbered plates (1–17) appeared in the original editions. In eds. 1–3 Plate 7 was chromo-lithographed by Henry Shaw; in the edition of 1888 by Messrs. Hanhart; in the small complete edition (on reduced scale) by Messrs. Maclagan & Cumming, who have also executed the present plate. In the edition of 1888 and later, Plate 12 was reproduced in photogravure by Messrs. Bousod, Valadon & Co.; in this edition, it is reproduced in the same process by Messrs. Allen & Co. In eds. 1–3 Plates 14 and 15 were printed from mezzotints by Thomas Lupton; in the edition of 1888 and later from mezzotints by George Allen; in the present edition Lupton's mezzotints are reproduced by photogravure. With regard to the remaining plates, Nos. 6, 9, and 13 are here printed from the original plates; the others are reduced (by about one quarter) in photogravure from early impressions of the originals. The lettered Plates (A to H) and Plate 17A. are added in this edition.

The drawing of Plate A was reproduced by half-tone process in *The Artist* for July 1897, and again, March 1900; that of Plate B, on a somewhat larger scale than here, in *Studies in Both Arts* (Plate ix.), where a passage from *Modern Painters*, vol. iv. ch. xiii., was given with it, under the title of "The Aiguilles and their Pedestal"; and that of Plate F, by autotype, in the large paper edition of *Studies in Ruskin* (1890), Plate 5, and again, by half-tone process, in *The Artist* for July 1897.

The following drawings were exhibited at the Ruskin Exhibition at the Royal Society of Painters in Water Colours in 1901: Plate 12, No. 243; Plate 13, No. 114; Plate 14, No. 310; Plate 15, No. 205. The drawings of Plates 12 and 13 were also exhibited at the Coniston Exhibition in 1900 (Nos. 102 and 54); and that of Plate G at Manchester in 1904 (No. 371).

INTRODUCTION TO VOL. V

(In the chronological order, Vol. IV. is followed in succession by Vols. VIII.- XII.; the present Introduction should thus be read after that to Vol. XII.)

THE second volume of *Modern Painters* was published in April, 1846; the third and fourth volumes appeared in the early part of 1856. The story of Ruskin's life and work during the intervening decade is told in the Introductions to Vols. VIII. to XII. We have now to pick up the thread of the interrupted book, and as the third and fourth volumes were written and published much at the same time, it will be convenient to treat them together here.

We left Ruskin, with *The Stones of Venice* and much occasional work well off his hands, setting out once more with his parents for Switzerland (Vol. XII. p. xxxvii.). His father, as we have said (*ibid.*, p. xxvii.), was impatient to see the great book continued. The good-humoured chaff of friends pointed the author in the same direction. "*Modern Painters*, I tell him," wrote Rossetti, "will be old masters before the work is ended."¹ He needed change of thought and scene, and amid the stillness of the Alpine meadows, and the solemn silence of the hills, he resumed his interrupted work.

In his final epilogue to *Modern Painters*, Ruskin (as already mentioned) speaks of the whole book as inspired by the beauty and guided by the strength of the snows of Chamouni. We have seen that this was the case with the first volume (Vol. III. p. xxv.), which was written after a Swiss tour in 1842. The second volume similarly followed upon his foreign tour in 1845. He was in Switzerland again in 1846 and 1849, and for a shorter time in 1851. On all these occasions he was collecting impressions, observations, and memories which were to be utilised in the later volumes of the book. To these earlier tours we must, therefore, revert, before we can take up the

¹ *Letters of Dante Gabriel Rossetti to William Allingham*, p. 171.

thread in 1854. The book, though interrupted by other tasks, was never out of the author's mind, and in every sojourn among the mountains he was preparing himself, by "walking with Nature" and "offering his heart a daily sacrifice to Truth," to affirm the lessons which he had learnt. Even amidst his work at Venice, his mind was set on his earlier task, and we have seen his satisfaction in finding a point of contact between *Modern Painters* and his architectural work.¹ The study of the Renaissance suggested to him the thought that the formalism of the classical architecture had killed the love of nature which had been conspicuous in the earlier Gothic art, and that the romantic movement, making the landscape of Turner possible, was a revolt against the imprisonment of the spirit within the Five Orders. So, too, when at Venice the news of Turner's death had reached him, he went on indeed with his immediate task, but registered a vow to use his increased knowledge to the greater honour of the Master. "I will make *Modern Painters*," he wrote to his father (January 1, 1852), "so complete a monument of him, *D. V.*, that there will be nothing left for the Life but when he was born, and where he lived, and whom he dined with on this or that occasion. All which may be stated by anybody."

Already in 1845 Ruskin had commenced the studies necessary for the later volumes. He returned home in that year by the St. Gothard, as already related (Vol. IV. p. xxxv.), in order to find the sites or scenes of some of Turner's later drawings. He described his studies in letters to his father:—

"FAIDO, *Friday, August 15.*—I have found his [Turner's] subject² or the materials of it here; and I shall devote to-morrow to examining them, and seeing how he has put them together. The stones, road, and bridge are all true; but the mountains, compared with Turner's colossal conception, look pigmy and poor. Nevertheless, Turner has given their actual, not their apparent size. . . . I have got two sketches to-day (Saturday) of Mr. Turner's subject, and a specimen of the stones of the torrent—gneiss coloured by iron ochre proceeding from decomposing garnets. The road on the left is the old one, which has been carried away in the pass, and that on the right is the new one, which crosses the stream by the shabby temporary bridge. It has been carried away twice, so that there are

¹ See Vol. X. pp. xlvi., 207 *n.*

² That is, for the drawing in Ruskin's possession of "The Pass of Faido," engraved as the frontispiece to *Modern Painters*, vol. iv. ("The Gates of the Hills"), and analysed in that volume, ch. ii. and Plates 20 and 21.

the remains of two roads and two bridges, and three new bridges of wood, which Turner has cut out, keeping the one he wanted. The gallery on the left is nearly destroyed—it protected the road from a cataract which has now taken another line, and has left the worn channel you see.”

“FAIDO, *Sunday, 17th.*— . . . On looking at my two sketches, made yesterday, I find them wonderfully like the picture, but it is beautiful to see the way Turner has arranged and cut out. I never could have dreamed of taking such a subject.”¹

These were the studies and drawings used in the chapter (ii.) of the fourth volume on “Turnerian Topography.”

In the following year Ruskin was again in Switzerland, and he has described in *Præterita* (ii. §§ 189, 190), with illustrative extracts from his diary, how he occupied himself with watching phases of the sunset, and the forms and colours of trees, rocks, and clouds. But it was in the Swiss tour of 1849, partly with his parents and partly by himself, that the principal studies for the third and fourth volumes of *Modern Painters* were made; for that reason, an account of the tour was reserved (Vol. IX. p. xxiii.) for the present place.² His diaries and letters of the period are indeed on almost every page a commentary on the book. The scenes which left the deepest impress were Vevay, Chamouni, the Rhone Valley, and Zermatt. Nearly all the most beautiful and the most important passages in the third and fourth volumes embody impressions received or observations recorded at one or other of those places. They went first to Vevay, and it was there, among the narcissus meadows, then scarce touched by villas and railways,

¹ See also Vol. IV. p. xxiv. *n.*

² The itinerary of the tour of 1849 was as follows: Folkestone (April 15–18), Boulogne, by rail to Paris (April 24), Sens (April 25), Mont Bard (April 26), Dijon, Champagnole (April 29), Geneva (April 30), Chambéry (May 2), the Grande Chartreuse, St. Laurent (May 4), Chambéry (May 5), and thence to Geneva and Vevay. Leaving his parents there, Ruskin went on a short tour with Richard Fall (for whom see Vol. II. p. 429) to Chamouni (May 12) and Martigny (May 17), returning to Vevay (May 18). Thence to St. Martin’s; a month later, he went with his parents, by Sallenches (June 10), to Chamouni (June 13). There they stayed a month, returning to Geneva (July 18). Leaving it again after a brief stay, they spent some days at St. Martin’s and went on to St. Gervais, whence Ruskin started off by himself, beginning with the Tour of Mont Blanc from Chamouni over the Col de Bonhomme to Chapiu (July 27), and thence over the Col de la Seigne to Courmayeur (July 28). Crossing the Col de Ferret to Martigny he went next to Zermatt (Aug. 2), and after a few days there, returned by St. Nicholas (Aug. 10) to Chamouni (Aug. 15). He spent three nights at the inn on the Montenvers (Aug. 22) and returned to Chamouni (Aug. 25), thence proceeding by Sion and Martigny to Visp and Leuk (whence he ascended the Gemmi Pass), and so to Geneva (Aug. 30), where he rejoined his parents, and Dijon (Sept. 4) to Paris (Sept. 8), Amiens (Sept. 14) and Calais (Sept. 16).

that Ruskin stored up the impressions which he cast into his prose poem to the grass of the field. Everybody knows the passage; it is the one which Matthew Arnold cited as an example of Ruskin's genius in its best and most original exercise.¹ The first thought of the passage occurs in his diary of 1849:—

“VEVAY, *Sunday, June 3.*—... Such grass, for strength, and height, and loveliness, I never saw—all blue too with masses of salvia, and flamed with gold, yet quiet and solemn in its own green depth; the air was full of the scent of the living grass and new-mown hay, the sweet breathing of the honeysuckle and narcissus shed upon it at intervals, mixed with the sound of streams, and the clear thrill of birds' voices far away. The sun's rays (as it fell from behind a western cloud) rose gradually up towards the cottage Pleiades,² casting the shadows of the pines far across its avenue of turf—that indescribable turf, soft like some rich, smooth fur, running in bays and inlets and bright straits and shadowy creeks and gulphs, in among the forest, calm, upright, unentangled forest, itself scattered in groups like a happy crowd—with isolated tufted trees here and there, and then two or three together, and then many; graceful as clouds in summer sky—no wildness, nor crowding; no withering; each serene in his place and quiet pride. I looked at the slope of distant grass on the hill; and then at the waving heads near me. What a gift of God that is, I thought. Who could have dreamed of such a soft, green, continual, tender clothing for the dark earth—the food of cattle, and of man. Think what poetry has come of its pastoral influence, what happiness from its everyday ministering, what life from its sustenance. Bread that strengtheneth man's heart—ah, well may the Psalmist number among God's excellencies, ‘He maketh grass to grow upon the mountains.’ ”

It was on the same walk that another thought came to him, which finds expression in a passage of the present volume,³ and elsewhere in his writings:—

“VEVAY, *Sunday, June 3.*—I walked up this afternoon to Blonay,⁴ very happy, and yet full of some sad thoughts; how perhaps I should not be again among those lovely scenes; as I was now and had ever been, a youth with his parents—it seemed that the sunset

Vevay in Spring

of to-day sunk upon me like the departure of youth. First I had a hot march among the vines, and between their dead stone walls; once or twice I flagged a little, and began to think it tiresome; then I put my *mind* into the scene, instead of suffering the body only to make report of it; and looked at it with the possession-taking grasp of the imagination—the true one; it gilded all the dead walls, and I felt a charm in every vine tendril that hung over them. It required an effort to maintain the feeling: it was poetry while it lasted, and I felt that it was only while under it that one could draw, or invent, or give glory to, any part of such a landscape. I repeated ‘I am in *Switzerland*’ over and over again, till the name brought back the true group of associations, and I felt I had a soul, like my boy’s soul, once again. I have not insisted enough on this source of all great contemplative art. The whole scene without it was but sticks and stones and steep dusty road.

“I tried the same experiment again on a group of old cottage and tower near Blonay, in coming down; the tower, as I found afterwards, dated 1609 on a stone forming the top of one of its quaint windows, as opposite [reference to a sketch], but, seen in the distance, remarkable only for its upper open window, letting a bit of the far-off blue mountains of Meillerie clear through it, and its conical roof mingling with their peaks. All this I longed to draw, but said to myself that ‘the bit of fence and field underneath would not do.’ A minute after I corrected myself, and by throwing my mind full into the fence and field, as if I had nothing else but them to deal with, I found light and power, and loveliness, a Rogers vignette character put into them directly. I felt that the human soul was all—the subject nothing.

“Not so, when I passed ‘a little further on’¹ past the low chapel that I drew last time I was here, with its neighbouring gate, inscribed ‘pense a ta fin’; and came down among the meadows, covered half a fathom deep with the emblem by which God suggests that thought.”²

A little later, on the way to Chamouni, the same experience came to him:—

“SALLENCHES, *June* 1849.—I had a pleasant walk up the hill towards St. Gervais this afternoon. . . . I felt in this walk, being somewhat tired, very forcibly again how much the power of nature depended upon the quantity of mind which one could give to her. I had an exquisite winding path—a road—with bits of rocky bank,

¹ Milton: *Samson Agonistes*, line 2.

² Here, in the diary, follows the passage on the grass just given.

and flowery pasture, and cottages and chapels. I had the whole valley of the Arve, from the Grotte de Balme to St. Gervais. I had the Doron and its range behind me, the mighty cliffs of the Varens beside me, the Nant d'Arpenaz like a pillar of cloud at their feet; Mont Blanc and all its aiguilles with the Verte and Argentière in front of me; marvellous blocks of granite and pines beside me, and yet with all this I enjoyed it no more than a walk on Denmark Hill. Setting myself to find out the reason of this, I discovered that when I confined myself to one thing—as to the grass or stones, or the Doron, or the Nant d'Arpenaz, or the Mont Blanc—I began to enjoy directly; because then I had mind enough to put into the thing, and my enjoyment arose from the quantity of mental and imaginative energy which I could give it; but when I looked at all together, I had not, in my then state of weariness, mind enough to give to all, and none were therefore of any value. I thought this a most instructive lesson; both showing how the majesty of nature depends upon the force of human spirit, and how each spirit can only embrace at a time so much of what has been appointed for its food, and may therefore rest contented with little, knowing that if it throw its full energy into that little, it will be more than enough; and that an over-supply of food would only be an over-tax upon its energies. This crushing of the mind by overweight is finely given by Forbes.”¹

This experience was utilised, and some of the notes from the diary embodied, in the present volume (p. 183, below). A month at Chamouni followed, and this, for *Modern Painters*, was among the most fruitful times in Ruskin's life. With the faithful Couttet for his guide, he rambled during long days among the glaciers, or sauntered in the valley, examining, observing, sketching.² And at evening time we may see him leaning, as he says in his diary (July 8), “on the blocks of lichen wall beside the road, exchanging good-nights with the passers-by, and listening as their voices left me to the filling of the valley by, the sound of the waves of the Arve, mixed with cattle bells and many strange and dim mountain sounds, mingled in confusion like the grey stones of the wall I leaned upon.” Thus did “beauty born of murmuring sound” pass into his thoughts and words. But in company with the hours of restful thought came strenuous labours.

He worked upon the stones of Chamouni as diligently as upon

¹ *Travels through the Alps*, ch. iv., pp. 56–57 in Coolidge's reprint of 1900.

² For an extract from his diary at this time, see *Modern Painters*, vol. iv. ch. xvii. § 30 (author's note); for his measurements of mountain angles, *ibid.* ch. xviii. § 15 (author's note).

Chamouni

View from the Hotel de l'Union

the *Stones of Venice*. He noted all the angles of the Aiguilles, observed every fleeting effect of cloud, examined the rocks, collected the minerals, gathered the flowers, and weighed the sand in the streams.¹ His observations were entered up in his diaries and notebooks as carefully as were his architectural studies at Venice (Vol. IX. p. xxiv.). His industry in drawing was as great. Two characteristic drawings of Chamouni are here given. At a later time, when he was examining his materials for the composition of the fourth volume of *Modern Painters*, he made a catalogue of his sketches at Chamouni. This is given below as showing the amount of work he did; it will be seen that no less than forty-seven drawings belong to the period of study which we are now describing.² An extract from his diary will show how his days were spent:—

“CHAMOUNI, 28th day (and for this year, last,—unless I return from Zermatt): *Evening, July 10.*—It has been a glorious one; I was working from Mont Blanc before breakfast, out immediately afterwards; made some notes of Aiguille Bouchard, went on to the

¹ See Vol. XI. p. 237.

² The following “Catalogue of Sketches in neighbourhood of Mont Blanc” is from his diary of 1854. “1849 B” refers to a second and shorter stay at Chamouni when he was on his way to Venice in the autumn of that year (see Vol. IX. p. xxiv.):—

1.	Mont Blanc and its aiguilles, from Geneva	1849
2.	Same sketch continued, with the Buet and Sixt mountains, and camera lucida outlines of Mole below; on the back, camera lucida of Salève	1849
3.	The Brezon, from inn window, Bonneville	1849 B
4.	End of Bonneville on the other side of the bridge	1849
5.	Limestone promontories of the Brezon, a little beyond last sketch; on the back an elaborate sketch of Mont Blanc de St. Gervais, and an oven at St. Martin’s	1849
6.	Valley of Cluse, and Aiguille de Varens	1849
7.	Ravine near Maglans	1849
8.	Cottage at Maglans; on the back, limestone cliffs at entrance of Valley of Cluse	1849
9.	Top of Mont du Reposoir, above Sallenches	1849
10.	Valley of Cluse, looking back from Sallenches	1846
11.	Mont Blanc, from St. Martin’s	1849
12.	Mont Blanc, from St. Martin’s, in storm	1849
13.	Aiguille Sans Nom, from Les Montets	1844
14.	Aiguilles of Chamouni, from Les Ouches	1842
15.	Aiguilles of Chamouni, from near Bossons	1844
16.	Camera lucida outlines of Mont Blanc, from Chamouni	1849
17.	Montagne de la Côte, from Chamouni	1849
18.	Montagne de la Côte, from Chamouni; on the back, a little bit of Petit Charmoz and Blaitière in cloud	1849
19.	Montagne de la Côte, from Chamouni; on the back, a little bit of Petit Charmoz and Blaitière in cloud	1849
20.	Montagne de la Côte, from Chamouni; on the back, a little bit of Petit Charmoz and Blaitière in cloud	1849
21.	Top of Mont Blanc, from Chamouni	1849
22.	Autumn on the bases of the Aiguilles	1849 B
23.	The Aiguilles of Chamouni, from the village	1849
24.	Camera lucida outline of the same; on the back, camera lucida of Jorasses and Aiguille Dru, and most important sketch of Blaitière	1849
25.	Large eye-sketch of Aiguilles of Chamouni, from Chamouni	1849
26.	Aiguille Dru, from Chamouni	1849

Source beside the Arveron, somewhat closer than usual, it having changed its bed entirely within the last three days, and running four feet deep where I used to walk; took slopes of Dru, from just beside the Arveron bridge; then climbed the avalanche with Couttet to foot of rocks near Montanvert; could not get upon them; awkward chasm between the ice and them; and at the only place where we could get upon them, another at the other side which made it a risk to pass the ridge. Got on them at last, however, higher up, and took from them specimens 27, 28 . . . [notes on these, and on the geology of the rocks]. After examining the rocks here—note that the one under the cascade is called the Rocher du Chataigne—we climbed to one almost isolated promontory of pines immediately on the right of the bare rocks. At the top of it the glacier was seen against the sky through the most fantastic pines, and the grand rocks falling to the Source, nodding forwards (like a wave about to break¹), and the great cascade bounding from its narrow way, with the look of a wildly revolving wheel—I was irresistibly reminded by its action of the gesture of the leapers into

27.	Shoulders of Charmoz, from Chamouni	1849
28.	Aiguille du Plan, from foot of Breven, half a mile beyond village of Chamouni	1849
29.	Aiguille Charmoz, from bottom of valley, beneath it	1849
30.	Angles of Aiguille Dru; and on back, reflections in Lake of Geneva	1849
31.	Aiguille Bouchard, from valley	1849
32.	Aiguille Bouchard and Glacier du Bois	1849
33.	Aiguilles of Chamouni, from foot of Flegère	1849
34.	General contours of the same	1849
35.	The same, from ascent beyond Glacier des Bois	1844
36.	Aiguille Charmoz, from window of the "Union"	1849
37.	Outlines of Aiguille du Plan	1849
38.	Aiguille du Plan, from its base	1849
39.	Continuation of the same sketch	1849
40.	Aiguille Blaitière, from near its base	1849
41–43.	Views of the spur of Aiguille Blaitière	1849
44.	Aiguille Blaitière, from the foot of its glacier	1849
45.	Details of Aiguille Charmoz	1849
46.	Aiguille Charmoz, from Montanvert	1849
47.	Cleavage of Petit Charmoz	1849
48.	Aiguille Verte, from near Flegère	1844
49.	Shadow of Aiguille Dru on cloud, from Montanvert	1849
50.	Aiguilles with Mont Blanc, from Aiguille Bouchard	1844
51.	Col du Géant, from Aiguille Bouchard	1844
52.	Aiguille d'Argentière, from flank of Buet	1844
53.	Top of Montagne de la Côte, from the flank of Mont Blanc	1844
54.	Pines close to Glacier des Bois	1849
55.	Pines at foot of Montanvert	1849
56.	Rocks near Les Ouches (above Les Montets)	1844
57.	Aiguilles Rouges, from window of "Union"	1849
58.	Side of the Breven	1849
59.	Aiguilles Rouges, from Source of Arveron	1844
60.	Limestones of the Valley of Sixt	1844
61.	The same, better drawn (at head of valley)	1849
62.	View from my window at Chapiu; on the back, Aiguille de Varens in cloud	1849
63.	View from the top of the Col de la Seigne	1849
64.	Mont Blanc, from the Allée Blanche	1849

La Cascade de la Folie, Chamouni

From the drawing in the possession of Sir John Simon, K.C.B.

the lake, especially the man waving his hat in Cruikshank's illustrations to Pee-wit.¹ There is something in its great weight of water which makes it differ in its fling from all other cascades I have ever seen—its waves bound like masses of stone, and nearly all the way down, the solid water is seen yellowish among the small clouds of blue spray which beat down with it. . . . [References follow to diagrams of the curves of the falling water and of the angles of the rocks.] I never saw a more wonderful scene than the glen at this point with its small, but steep torrent, its mighty stones cast down from the moraine above, and its vertical walls, shutting us in to the glacier and the awful cataract beneath it. Nor have I yet seen a more noble and burning sunset than was on the Charmoz and lower Verte to-night—a hot, almost sanguine, but solemn crimson. . . . I have much to thank God for, now and ever.”

Laborare est orare. Ruskin's thankfulness found its expression in those careful and loving studies, in words and drawings, of the Chamouni aiguilles which fill so large a portion of the fourth volume of *Modern Painters*.

His first month at Chamouni was now over, and his parents returned from the Alps to Geneva. He, meanwhile, attended by Couttet and George, was permitted to have another month to pursue his mountain-studies. First, he made the familiar Tour of Mont Blanc, proceeding by St. Gervais and Contamines over the Col du Bonhomme to Chapiu, and thence over the Col de la Seigne to Courmayeur. The first two days are described in a letter to his father:²—

“COURMAYEUR, *Sunday afternoon.*
“[*July 29th, 1849*].

“MY DEAREST FATHER,—(Put the three sheets in order first, 1, 2, 3; then read this front and *back*, and then 2, and then 3, front and back.)

“You and my mother were doubtless very happy when you saw the day clear up as you left St. Martin's. Truly it was impossible that any day could be more perfect towards its close; we reached Nant Borrant at twelve o'clock—or a little before; and, Couttet having given his sanction to my wish to get on, we started again soon after one, and reached the top of the Col de Bonhomme about five.

¹ The frontispiece to the second volume (1826) of *German Popular Stories*, with etchings by Cruikshank. In J. C. Hotten's edition (1869), for which Ruskin wrote an introduction (reprinted in a later volume of this edition), the illustration referred to faces p. 202.

² Portions of this letter are printed in W. G. Collingwood's *Life of Ruskin*, 1900, pp. 113–115.

You would have been delighted with that view—it is one of those lovely seas of blue mountain, one behind the other, of which one never tires—this, fortunately, westward, so that all the blue ridges and ranges above Conflans and Beaufort were dark against the afternoon sky, though misty with its light; while eastward, a range of snowy crests, of which the most important was the Mont Iseran, caught the sunlight full upon them. The sun was as warm, and the air as mild on the place where the English travellers sank and perished,¹ as in our garden at Denmark Hill on the summer evenings.

“There is, however, no small excuse for a man’s losing courage on that pass, if the weather were foul. I never saw one so literally pathless—so void of all guide and help from the lie of the ground—so embarrassing from the distance which one has to wind round mere brows of craggy precipice without knowing the direction in which one is moving, while the path is perpetually lost in heaps of shale or among clusters of crags, even when it is free of snow. All however when I passed was serene, and even beautiful, owing to the glow which the red rocks had in the sun. We got down to Chapiu about seven, itself one of the most desolately placed villages I ever saw in the Alps. Scotland is in no place that I have seen so barren or so lonely. Ever since I passed Shap Fells, when a child,² I have had an excessive love for this kind of desolation, and I enjoyed my little square châlet window and my châlet supper exceedingly (mutton with garlic). I fell asleep the moment I lay down, in spite of sheep bells and mule scents beneath me, and was never more surprised in my life than at waking at midnight with a very sharp and well-defined sore throat. I thought I must be dreaming of sore throat at first, but it wouldn’t go away, and when I woke in the morning it was worse.”

He consulted his symptoms, however, and determined to press on to Courmayeur:—

“So we started at half-past six up the wildest Scottish-looking valley, with a glacier in front of us, not at all the sort of thing which one would especially select for the morning ride of a patient with a sore throat. It was too cold to sit on the mule, so I got off and walked until we got into the sun, and then rode up to the

¹ The higher slopes of the Col du Bonhomme are occasionally swept by violent winds and snow-eddies; this was the case on September 13, 1830, when two Englishmen, with guides, perished from cold and exhaustion on the Pass. In fine weather guides delight to point out the scene of the disaster, to give their charges a pleasing sense of adventure.

² See *Modern Painters*, vol. iii. ch. xvii. § 13, and Vol. XII. p. xxi.

Col. When we got up, the last cloud—except a small group on the Monts Combin and Velan far away—had melted; Mont Blanc and his whole company of hills were clear, and after again consulting my feelings and pulse, I unpacked my sketch-book, sat down under a stone, and made a memorandum which I do not intend to touch hereafter—as I fancy few artists can show a careful sketch in colour, made at 8000 feet above the sea when suffering under violent sore throat.”

The view from the Col de la Seigne sadly disappointed the artist with the sore throat:—

“I made this memorandum (he continues) because I never want to pass that Col again; it is without exception the ugliest and most barren Alpine view, and the most degrading to all the noble objects it encloses, I have ever seen; and, even if I did pass it again, I might pass it twenty times without having the hills so perfectly clear, or the sun so exactly in the right place to show their structure.

“I was still more disappointed for some time as I descended; a glorious white stream of ice at last appeared on the left, and I began to recover my good humour. I walked down the greatest part of the first descent of the Col—like that from the Col de la Blame to Tour.”

The traveller halted to refresh himself, and then:—

“We pushed on towards and past the Lac de Combal—a lake of which you will instantly form a strong opinion when I tell you that it is banked up by a heap of débris at one end and choked up by a valleyful of débris at the other. The moraine of the great glacier¹ of the Allée Blanche after this chokes up the valley altogether for a length of at least two miles: I never saw such a mighty heap of stones and dust; the glacier itself is quite invisible from the road (and I had no mind for extra work or scrambling) except just at the bottom, where the ice appears in one or two places; being exactly of the colour of the heaps of waste coal at the Newcastle pits; and admirably adapted therefore to realise one’s brightest anticipations of the character and style of the Allée *Blanche*.

“The heap of its moraine conceals, for the two miles of its extent, the entire range of Mont Blanc from the eye. At last you weather the mighty promontory, cross the torrent which issues from its base, and find yourself suddenly at the very foot of the vast

¹ See *Modern Painters*, vol. iv. ch. xv. § 16.

slope of torn granite, which, from a point not two hundred feet lower than the summit of Mont Blanc, sweeps down into the valley of Courmayeur.

“I am quite unable to speak with justice, or think with clearness, of this marvellous view. One is so unused to see a mass like that of Mont Blanc without any snow, that all my ideas and modes of estimating size were at fault. I only felt overpowered by it, and that, as with the porch of Rouen Cathedral, look as I would, I could not *see it*. I had not mind enough to grasp it or meet it; I tried in vain to fix some of its main features on my memory; then set the mules to graze again, and took my sketch-book and marked the outlines; but where is the use of marking contours of a mass of endless, countless, fantastic rock, twelve thousand feet sheer above the eye? Besides, one cannot have sharp sore throat for twelve hours without its bringing on some slight feverishness; and the searching Alpine sun, to which we had been exposed without an instant’s cessation from the height of the Col till now—*i.e.*, from half-past ten to three—had not mended the matter; my pulse was now beginning slightly to quicken, and my head slightly to ache, and my impression of the scene is feverish and somewhat painful; I should think like yours of the valley of Sixt.”

At Courmayeur Ruskin rested for a day, being physicked by the faithful Couttet, and consoling himself “with the view from my window, not a bad one, of an old Lombard Tower and the range of the Col du Géant.” The sketch then made is given in Vol. XII. (Plate vi.). From Courmayeur he went over the Col Ferret to Martigny. The Val Ferret pleased and interested him far more than his walk through the Allée Blanche and the Val de Vény. The following passages are from his diary (Courmayeur, July 28):—

“The most magnificent piece of ruin I have yet seen in the Alps is that opposite the embouchure of the lower glacier of the Val de Ferret, near Courmayeur; the pines are small indeed, but they are hurled hither and thither; twisted and mingled in all conditions of form and all phases of expiring life, with the chaos of massy rocks which the glacier has quashed down or the opposite mountain hurled. And yet, further on, at the head of the valley, there is another in its way as wonderful, less picturesque, but wilder still, the remains of the *éboulement* of the Glacier de Triolet, caused by a fall of an aiguille near the Petites Jorasses—the most phrenzied accumulation of moraines I have ever seen, not dropped one by one into a heap and pushed forward by the ice ploughshare, but evidently borne down by some mingled torrent of ice and rock and flood, with the

swiftness of water, and the weight of stone, and thrown along the mountain sides like pebbles from a stormy sea, but the ruins of an Alp instead of the powder of a flint bed.”

Ruskin had been unfortunate in coming down from the Col de la Seigne tired and ill, for there are few walks in the Alps more lovely than that through the pastures and pine woods of the lower valley, with the snows of the Mont Blanc sparkling through the branches; but many travellers will find it hard to dispute the superiority which he attributes to the Col Ferret over the Col de la Seigne:—

“The view from the Col de Ferret I think finer, although I did not see the best of it, *i.e.*, the Grandes Jorasses, nor the top of the Combin. It is very desolate towards the Great St. Bernard; but the forms of mountain under the Grandes Jorasses are so bold and sweeping, and the distant Col de Seigne with the mountains beyond the Crammont so immeasurably superior to the Col de Ferret itself as a distant object, that I have no hesitation in saying it would be much wiser to cross the Col de Ferret from Martigny and go up as far as the Lac de Combal, or perhaps the Glacier de l’Allée Blanche from Courmayeur, and so return by Val d’Aosta, than to make the tour of Mont Blanc.”

Ruskin passed through the Val Ferret in the morning; in evening light the walk in the reverse direction offers some of the sublimest aspects in the Alps; there is none which illustrates more effectively Ruskin’s comparison of mountains to cathedrals¹ than the spectacle of the huge shoulder of the Aiguille de Péteret as seen from this point.

From Martigny Ruskin went up to Zermatt for some days, and there made the studies on the cliffs of the Matterhorn which occupy several pages in his fourth volume. One of his numerous drawings of the mountain is here given (Plate D). It is curious, as a contrast with present times, to find that, though it was August, Ruskin had the inn pretty much to himself. “No one has been here,” he writes (August 6), “but a party of French and Germans going over the Cervin, and various German botanists and students.” He writes his first impressions to his father; possibly we must read a little diplomacy between the lines, for Ruskin, it will be seen, wanted his leave of absence somewhat extended:—

“[ZERMATT, August 6.]— . . . I have had glorious weather, and on Friday I had such a day as I have only once or twice had the like of among the Alps. I got up to a promontory projecting from

¹ *Modern Painters*, vol. iv. ch. xx. § 9.

the foot of the Matterhorn, and lay on the rocks and drew it at my ease. I was about three hours at work, as quietly as if in my study at Denmark Hill, though on a peak of barren crag above a glacier, and at least 9000 feet above sea; but the Matterhorn, after all, is not so fine a thing as the Aiguille Dru, nor as any of the aiguilles of Chamouni. For one thing, it is all of secondary rock . . . [a tear in the paper here]; quite rotten and shaly; but there are other causes for the difference in impressiveness which I am endeavouring to analyse. I find considerable embarrassment in doing so; there seems no sufficient reason why an isolated obelisk, one fourth higher than any of them, should not be at least as sublime as they in their dependent grouping; but it assuredly is not. For this reason, as well as because I have not found here the near studies of primitive rock I expected—for to my great surprise, I find the whole group of mountains, mighty as they are, except the inaccessible Monte Rosa, of secondary limestones or slates—I should like, if it were possible, to spend a couple of days more on the Montanvert, and at the bases of the Chamouni aiguilles—sleeping at the Montanvert. My month from the time I left you at St. Martin's, 26th July, is only up this day three weeks; so that I hope it will do if I am with you at Geneva on Monday evening the 27th. . . .”

Ruskin obtained an extension of time, but not without some alarm on the part of his parents on account of his illness at Courmayeur, and some remonstrances on the score of a temporary interruption of communications.¹ He made good use of his leave in continuing his work among the aiguilles:—

Monday evening [August 20].

“MY DEAREST FATHER,—I have to-night a packet of back letters from Viège . . . but I have hardly time to read them to-night, I had so many notes to secure when I came from the hills. I walk up every day to the bases of the aiguilles without the slightest sense of fatigue (just as I used to walk to [the] Source of Arveron); work there all day, hammering and sketching, and walk down in the evening. As far as days by myself can be happy, they are so; for

¹ Mr. Collingwood (*Life*, p. 115) has printed a portion of a letter from Ruskin to his father bearing on this subject. Pfister was a courier who had been sent by the elder Ruskin to meet his son at Martigny: “(Zermatt, *August* 8), I have your three letters, with pleasant accounts of critiques, etc., and painful accounts of your anxieties. I certainly never thought of putting in a letter at Sion, as I arrived there about three hours after Pfister left me, it being only two stages from Martigny; and besides, I had enough to do that morning in thinking what I should want at Zermatt, and was engaged at Sion, while we changed horses, in buying wax candles and rice. It was unlucky that I lost post at Visp,” etc.

The Matterhorn

(1849)

From the drawing in the possession of Sir John Simon, K.C.B.

I love the places with all my heart—I have no over-fatigue or labour, and plenty of time. By-the-bye, though in most respects they are incapable of improvement, I recollect that I thought to-day, as I was breaking last night's ice away from the rocks of which I wanted a specimen, with a sharpish wind and small pepper-and-salt-like sleet beating in my face, that a hot chop and a glass of sherry, if they were to be had round the corner, would make the thing more perfect. There was, however, nothing to be had round the corner but some Iceland moss which belonged to the chamois; and an extra allowance of north wind."¹

One of Ruskin's haunts was the glacier at the foot of the Aiguille Blaitière (see vol. iv. ch. xiv. § 16; and Plate 31); from there he scribbled a note:—

“GLACIER OF GREPPOND [*August 21*].]

“MY DEAREST FATHER,—I am sitting on a grey stone in the middle of the glacier, waiting till the fog goes away. I believe I *may* wait. I write this line in my pocket-book to thank my mother for hers which I did not acknowledge last night. I am glad and sorry that she depends so much on my letters for her comfort. I am sending them now every day by the people who go down, for the diligence is stopped. You may run the chance of missing one or two therefore. I am quite well and very comfortable—sitting on Joseph's knapsack laid on the stone. The fog is about as thick as that of London in November—only white, and I see nothing near me but fields of dampish snow with black stones in it.”

Three days at the inn on the Montanvert² especially pleased him. He had never yet seen anything, he says in his book (vol. iv. ch. xiv. § 6), to equal the view from that spot. The following are extracts from his diary:—

“*August 22*.—I think I never enjoyed any evening so much as this in my life, unless it were one at Champagnole in 1845.³ I had no idea what this place was, until I sat at the window quietly to-day watching the sunset and the vast flow of the ice, welling down the gorge—a dark and billowy river—yet with the mountainous swell

¹ W. G. Collingwood's *Life of Ruskin*, p. 116.

² This was the old inn, built in 1840, at the expense of the Commune of Chamouni, replacing the previous cabin (known as the “Temple de la Nature”) itself replaced in 1879 by the present hotel. At Chamouni, Ruskin always stayed at the Union: see Vol. II. p. 426.

³ Described in a letter, given in Vol. IV. p. xxvii.

INTRODUCTION

and lifted crests that the iron rocks have round it. I have been nearly all day drawing at the Aiguille Blaitière.”

“*August 25.*—I have certainly not lately, nor often in old times, felt stronger emotion than in watching the dawn from the Montanvert these three mornings past. Yesterday I saw it when it was still very dark, and Orion burning beyond the Grandes Jorasses; and the whole river of heaven between the hills full of stars; and again, later, when I was watching the increase of the serene clear cold morning light, a beacon intensely bright flashed out on the summit of the Dru; it was the morning star.”

And so, too, he writes to his father:—

“MONTANVERT (*August 22*).

“MY DEAREST FATHER,—I have been of late taking the same walk regularly every day, to a point a little higher than the top of the Breven and down again—yesterday for very nearly nothing. I shortened the descent to-day by coming here, and I do not know that I ever enjoyed any coming so much in my life. I had no idea what the place was, until I sat at the window quietly to-night, and saw the ice-waves grow dark in the twilight, and the wild ranges of the Aiguilles Rouges relieved against the western sky. Nor have you any idea of it either—in daylight it is white and fragmentary, but the peaks of the Aiguilles Rouges in the sunset and the glow on the Grandes Jorasses would be after your own heart. I am going to stay here till Saturday; I shall send George down to-morrow with this letter, and after that, guides. Dearest love to my mother. I am quite well and have had a most prosperous day, though I cannot say that on the whole the aiguilles have treated me well. I went up Saturday, Monday, and Tuesday to their feet, and never obtained audience until to-day, and then they retired at twelve o’clock, but I have got a most valuable memorandum.

“Ever my dearest Father,

“Your most affectionate son,

“J. RUSKIN.”

He spent some more happy and busy days at Chamouni—“with a ghost-hunt to-day and a crystal hunt to-morrow;”¹ but at last it was time to leave:—

“CHAMOUNI, *Tuesday evening (August 28)*.

“MY DEAREST FATHER,—It was too cloudy to do for aiguilles to-day, but I have been as busy as an ant, and have done a great

¹ W. G. Collingwood’s *Life of Ruskin*, p. 118.

deal. But how fast the time does go. I have taken my place in diligence for Thursday, and hope to be with you in good time. But I quite feel as if I were leaving home to go on a journey. I shall not be melancholy however, for I have really had a good spell of it; and, this last week, I have tried to get enough of it to last me for some time to come; and I think I have. I had nearly a little too much yesterday. I don't know whether it was hot at Geneva, but I was on a high glacier where there was no wind, and the sun scorched me till I was forced to turn back, and to carry an umbrella besides whenever I had a hand free, to which I was never reduced even in Italy. I don't know anything more wonderful in the Alps than the feeling of this insufferable sunshine, with all the crevices in the snow about one filled with icicles. I am quite well, however. Dearest love to my mother. I don't intend to write again."

"As busy as an ant": that is a true description of Ruskin's life; and if it be the case that an ant's mode of progression is not always direct from point to point, of Ruskin also it is true that he took his arduous divagations.

With the summer tour of 1849 Ruskin's direct studies for *Modern Painters* were intermitted until 1854, though he was at Chamouni again for a few days later in 1849. In the winter of 1849–1850, he was at work in Venice; in 1850–1851 he was writing the first volume of *The Stones*; in 1851–1852 he was again at work in Venice; in 1852–1853 he was writing the second and third volumes of *The Stones*, and in 1853–1854 he was engaged in the miscellaneous occupations described in the Introduction to Vol. XII. The early summer of 1854 saw him setting out once more for Switzerland,¹ and the moment he was in sight of Calais—the port of entry to his Alpine paradise, the studies for *Modern Painters* were resumed. It was on the steampacket that he made the study of its job which is reproduced in *Præterita*; nothing, in his diary, the beauty of its curves; and this too was the last of his approaches to Calais before he wrote the "glorious thing"² on the old tower with which the fourth volume of *Modern Painters*

¹ Ruskin's itinerary on this tour was as follows: Calais (May 10), Amiens (May 11), Beauvais (May 13), Gisors (May 16), Chartres (May 24), Champagnole (June 2), Geneva (June 4), Vevay through the Simmenthal to Thun (June 18), Interlachen (June 20), Thun (June 24), Lucerne (July 2), St. Martin's (July 9), Chamouni (July 10), St. Martin's (July 26), Geneva (July 28), Chamouni (August 15), Sion (September 5), Martigny (September 12), Champagnole (September 17), Paris (September 28), Dover (October 2). At some point in the earlier part of the tour Ruskin was at the Swiss Fribourg, but there is no entry in the diary fixing the date.

² *D. G. Rossetti's Letters to William Allingham*, p. 181.

opens. On the road from Calais to Amiens he notes the beauty of the tree-scenery, and this also was the foundation of a passage in the third volume.¹ A passage from his diary at Amiens, describing a walk “among the branching currents of the Somme,” was given in the fourth volume.² Then he revisited some of his favourite cathedrals, afterwards making his way, by Champagnole, as always, to Geneva. At Vevay they stopped some days, and here he was already at work on *Modern Painters*. “I am writing,” he says in the first chapter of the third volume, “at a window which commands a view of the head of the Lake of Geneva,”³ and it was there that he penned his definition of poetry⁴ and his analysis of “the grand style.” From Vevay he proceeded through the Simmenthal to Thun, and on the journey wrote the pamphlet on the Opening of the Crystal Palace (see Vol. XII. p. 417). The Simmenthal and the country about Fribourg inspired a passage in the fourth volume.⁵ Beautiful in itself, it exerts, he says, an added charm as containing “far-away promise” of scenery yet greater and more impressive, and is thus peculiarly calculated to excite “the expectant imagination.” Something of the same idea was expressed by a later poet in describing the same scenery:—

“Far off the old snows ever new
With silver edges cleft the blue
Aloft, alone, divine;
The sunny meadows silent slept,
Silence the sombre armies kept,
The vanguard of the pine.”⁶

At Fribourg he spent some time in sketching its walls and towers, for one of his purposes on this foreign tour was to study Swiss history, and in connexion therewith “to engrave a series of drawings of the following Swiss towns: Geneva, Fribourg, Basle, Thun, Baden, and Schaffhausen.”⁷ This work was never completed, but many such drawings are made, some of which are reproduced in this edition. A drawing of the Towers of Fribourg made at this time is engraved as Plate 24 in the fourth volume. Next, Ruskin spent two or three weeks in the Bernese Oberland, and at Lucerne. Some sketches at Lucerne were utilised to

The Head of the Lake of Geneva

From the drawing in the possession of Sir John Simon, K.C.B.

illustrate “The Law of Evanescence” in the fourth volume.¹ A drawing of the valley of Lauterbrunnen is here given (Plate H); he notes his observations in that valley in the fourth volume (ch. xii. § 18). His diary at this time shows once more the spirit of religious solemnity in which he approached his task. He was “Nature’s Priest,” appointed by a direct call to testify to the Divinity of Nature and of Truth; a steward of the mysteries, bound in duty and in gratitude to reveal the holiness and the beauty which he was privileged to see:—

“*June 24.*—My father called me at half-past four this morning at Interlachen. I was out as the clock struck five, and climbed as steadily as I could among the woods north of the valley, for an hour and a half, then emerging on the pure green pasture of the upper mountains. The Jungfrau and two Eigers were clear and soft in the intense mountain light; a field of silver cloud filled the valley above the lake of Brienz; the eastern hills fused in mist, splendid in the white warmth of morning. I stood long, praying that these happy hours and holy sights might be of more use to me than they have been, and might be remembered by me in hours of temptation or mortification.”²

“LUCERNE, *July 2, 1854.*—Third Sunday after Trinity. I hope to keep this day a festival for ever, having received my third call from God,³ in answer to much distressful prayer. May He give grace, to walk hereafter with Him in newness of life, to whom be glory for ever. Amen.”

In the same spirit is his first entry on finding himself once more in his happy valley:—

“CHAMOUNI, *July 10.*—Thank God, here once more, and feeling it more deeply than ever. I have been up to my stone upon the Breven,⁴ all unchanged and happy. It is curious that the first book I took up here, after my New Testament, was the ‘*Christian Year*, and it opened at the poem for the 20th Sunday after Trinity, which I had never read before.”

“*18th July.*—Every day here I seem to see further into nature, and into myself—and into futurity.”

¹ Plate 26, illustrating ch. v., “Of Turnerian Mystery.”

² The reader will recall Ruskin’s saying in the Epilogue to vol. ii. (Vol. IV. p. 350), that he “never climbed any mountain, alone, without kneeling down, by instinct, on its summit to pray.”

³ For Ruskin’s first call, see probably Vol. IV. p. 348 (Lucca, 1845); for his second (at Venice in 1852), Vol. X. p. xxxix.

⁴ For his description of this “mossy rock beside the fountain of the Brevent,” see Vol. IV. p. 363.

The reader will remember the poem which harmonises so perfectly with Ruskin's mood and mission:—

“Where is Thy favour'd haunt, eternal Voice,
The region of thy choice,
Where, undisturb'd by sin and earth, the soul
Owns Thine entire control?—
'Tis on the mountain's summit dark and high,
When storms are hurrying by:
'Tis mid the strong foundations of the earth,
Where torrents have their birth.”

It was amid such scenes—and “such sounds as make deep silence in the heart, For Thought to do her part”—that, during a busy and happy fortnight at Chamouni, Ruskin revived the impressions and completed the studies which informed the greater portion of his fourth volume. It was during this visit to Chamouni that he made, in particular, the experiments in light which are explained in its third chapter. His diary shows also that he was very busy in collecting and studying the Alpine flowers. It is significant of the mood in which these studies were made that the portions of the Bible now selected for his daily annotation were the Beatitudes and the Revelation.

Another entry in the diary shows the peace and health which he found in these pursuits:—

“SALLENCHES, 13th August.—How little I thought God would bring me here again just now; and I am here, stronger in health, higher in hope, deeper in peace, than I have been for years. The green pastures and pine forests of the Varens softly seen through the light of my window. I cannot be thankful enough, nor happy enough. Psalm lxvi. 8–20.”

From the “Mountain Glory” Ruskin passed to the “Mountain Gloom.” It was at Sion, as appears from a long entry in his diary for September 5, 1854, that he made the notes afterwards expanded in the nineteenth chapter of the fourth volume (§§ 31–33). But his impressions of the Rhone valley were not all of gloom. Here is an impression of a morning effect (Martigny, September 12):—

“Remember effect of tufted valley of Rhone, seen in the morning from Martigny; an infinite space of rounded spots [sketch] dying away into inconceivable faintness of bloomy distance—the Gemmi and the Alps gleaming pure in the distant dawn, and soft dark outlines of side hills coming nearer and nearer, relieved against intense silver flakes of

J. Ruskin

Allen & Co. Sc.

Fribourg, Switzerland

horizontal cloud. I cannot find words to express the grandeur and delicacy united of the great dying blue space of wooded plain, and the white mist that absorbed it—and the noble crested castle, half-way between Martigny and Sion on the left.”

He was now on his way home, and after spending a day or two in Paris to make some further studies in the Louvre,¹ reached Dover on October 2. The contrast between the primness of England and the picturesqueness of the Continent struck him once more very strongly:—

“DOVER, *2nd October, Monday*.—Dover to Canterbury, and very happy—a heavenly day of warm sunshine. It is impossible to describe the singular effect of the minuteness of the English town after the Continent, especially Chamouni and the Valais. The Doll’s house look of the principal street almost ridiculous; the peculiar red-bricked, smooth-shaven, yet old-fashioned simplicity of smallness; the perfection of establishment on a scale of six feet wide by fifteen high—the entirely organized houses—parlour, kitchen, and all (with knockers and bells, as if people were to be summoned from the other end of the world), and roof with garret windows in it; and a bow, perhaps, in the second story, and all so minute that three such houses would go into the space of one of the cottages of Unterseen as opposite [reference to a sketch]. All so neat and homely and happy, and yet so utterly vulgar—such an air of ale and tobacco and sanded floors about it all (first-rate ale, and sweet tobacco in pipes—no segars). And tea and pleasant homely talk, moral and narrow, to the uttermost. One cannot conceive anybody living in Canterbury to have any ideas of advance, or change, or anything in the world out of Canterbury.”

“READING, *October 11*.—There is one thing very noticeable in England as compared with France. In France one never sees such an inscription as ‘To let, a Genteel house up this road.’ There is no gentility in France. One sees ‘Une belle maison,’ ‘Une jolie chambre commode,’ ‘propre,’ but never anything corresponding to our ‘genteel.’ I think they try to rise in France; but not to appear to have risen. They have ambition, not pretension. Neither is there anything, in the small cottage dwellings, of nomenclature such as with us—‘Balmoral Cottage,’ ‘Saxe-Coburg’—Villas, etc., to places ten feet square. The French have a gloomy dignity quite beyond this—a self-assertion probably in truth founded on a greater pride and selfishness. There was sympathy with, and regard for, the Queen, as well as conceit of himself, in the man who named his cottage ‘Balmoral.’ ”

¹ Printed in Vol. XII. pp. 471–473.

And so forth; the reader will already have recognised here the notes for the opening passage in the fourth volume.

It will thus be seen that by the time Ruskin reached home at the beginning of October 1854, his mind, his note-books, and his sketch-books were well filled with materials for the forthcoming volumes of *Modern Painters*; but he had a long row to hoe before those materials could be planted in their proper places, and everything fitted into a connected scheme. He had made a beginning on the work in Scotland in 1853. He writes to his father on November 23, in that year, that he had “really and truly *begun*” the first chapter; but it was not till a year later that he made much way. The work of writing the third and fourth volumes took him from fifteen to eighteen months—by no means a long time considering their bulk, and the care with which he always composed, and the fifty plates with which the volumes were illustrated. But now, as always, he had many other interests and some diversions.

Ruskin was never entirely a recluse or a student. He wanted to do, as well as to write. He would have agreed with that fine saying by Edward Fitzgerald on the beauty of good action—“even as a matter of Art”—out of which Tennyson made his poem “Romney’s Remorse”; and Ruskin himself felt increasingly the desire to supplement writing by personal effort. “One may do more with a man,” he says, “by getting ten words spoken with him face to face, than by the black lettering of a whole life’s thought.”¹ We have seen how the æsthetic and the moral sides of his nature were already beginning to be at strife,² and how, too, his studies among books and in nature were coming to be mingled with urgent thoughts of political and personal benevolence. He could not thus be entirely satisfied with quiet work in his study at Denmark Hill; he wanted his actions, as well as his written words, to advance the Kingdom. One scope for practical work he found, as already related, in lectures and classes to artisans at the Architectural Museum; another, and a more continuously absorbing, in the Working Men’s College. The College was one of many institutions which owe their origin to the co-operative movement, promoted by a small group of men inspired by the leadership of Frederick Denison Maurice. “There was then, it must be remembered, no means by which a working man or a poor man could get, in a systematic way, any education going beyond the bare elements of knowledge.”³ School Boards had not been heard of. The churches and chapels did

¹ *Fors Clavigera*, Letter 17.

² Vol. XII. p. lxix.

³ R. B. Litchfield: *The Beginnings of the Working Men’s College*.

much for elementary education, but their efforts touched only a fraction of the people. The masses were agitating for political rights, but they were as yet ill-equipped for their exercise. "Mechanics' Institutes" had existed for some years, but, said Dickens, "I have never seen with these eyes of mine a mechanic in any recognised position on the platform of a Mechanics' Institute." Here and there, too, Evening Classes had been established, but they aimed at nothing higher than the three R's. The Working Men's College was a pioneer in a different kind of work. It aimed at bringing within the reach of the working-classes the same *kind* of education that the upper classes enjoyed. It saw in education a means of life, as well as of livelihood. It sought not to help working-men to "get on" and "rise out of their class," but to improve themselves by satisfying the needs of their mental and spiritual natures. It was to provide, too, something more than lectures; it was to give teaching and also personal contact between the teacher and the taught. All this sounds like a commonplace to-day, but at the time it was new and revolutionary. It precisely fitted in with the ideas at which Ruskin had been arriving, and it was his chapter "On the Nature of Gothic" that was distributed, as we have seen, as a sort of manifesto at the opening of the College on October 31, 1854. Its habitat was then, and until 1857, at No. 31 Red Lion Square; Maurice himself lived close by in Queen Square. Dr. Furnivall had sent Ruskin a copy of the circulars about the College; Ruskin's sympathy went out to the scheme at once, and he wrote to Maurice offering to take charge of the art-teaching. "His volunteered adhesion," writes an historian of the College, "was of immense service. It not only gave a splendid start to the Art teaching, but helped the enterprise as a whole by letting the world know that one of the greatest Englishmen of the time was in active sympathy with it. It was through him that not long afterwards we had the help in the Art School of Burne-Jones, Rossetti, Ford Madox Brown, and other artists. Mr. Lowes Dickinson, who continued to teach for some sixteen years, was one of our original founders."¹ Of Ruskin's teaching at the College we shall often hear in later volumes, and especially in that containing his correspondence with D. G. Rossetti, Mr. William Ward, and others; but some general account must here be given, as the work occupied a considerable part of his time and thoughts during the years in which he was writing the third and fourth volumes of *Modern Painters*.

¹ R. B. Litchfield. The first announcement of the classes contained this item:—
"Thursday, 7-9. . . Drawing. . . Mr. Ruskin."

At first Ruskin, Rossetti, and Mr. Lowes Dickinson worked together every Thursday evening. "There is no fear about teaching," wrote Ruskin to Rossetti in enlisting his services; "all that the men want is to *see* a few touches done, and to be told where and why they are wrong in their work, in the simplest possible way."¹ In the Easter term, 1855, the class was subdivided; Rossetti teaching the figure, Ruskin and Mr. Dickinson taking the elementary and landscape class, which in turn was afterwards subdivided, Ruskin taking a class by himself. "There were four terms," Mr. Collingwood explains, "in the Working Men's College year; the only vacation, except for the fortnight at Christmas, being from the beginning of August to the end of October. Mr. Ruskin did not always attend throughout the Summer term, though sometimes his class came down to him into the country to sketch."² He kept up the work without other intermission until May 1858. . . . In the spring of 1860, he was back at his old post for a term; but after that he discontinued regular attendance, and went to the Working Men's College only at intervals, to give addresses or informal lectures to students and friends."³ It will thus be seen that Ruskin's help to the Working Men's College was much more than a spasm of sympathy or an indulgence in the presently fashionable occupation of "East-ending."

To the man who came within range of him there, his teaching was a revelation and an inspiration. He never did anything by halves. Whatever he had, he shared; and he threw into his classes all the wealth of his enthusiasm. Among his first pupils was Mr. George Allen, who now contributes the following reminiscences:—

"My first meeting with Mr. Ruskin was in the Art class-room at Red Lion Square in 1854, shortly after the College was opened. At first Mr. Ruskin only spoke to me as a student, in turn with the others—he used to

¹ *Ruskin, Rossetti, and Pre-Raphaelitism*, p. 52.

² The following letter refers to these sketching-parties:—

"DENMARK HILL, *September 9th*, 1855.

"DEAR FURNIVALL,—How long it is since we have seen each other! I think you would like to come out with one of my sketching-parties. I am only going to have two more, the next, *D.V.*, on Saturday next. Cabs at Camberwell Green, at half-past three. Tea at the Greyhound Inn, Dulwich, at seven. Come early or late as you find convenient, if you can come at all. At all events I hope to see you soon.

"Ever affectionately yours,
"J. RUSKIN."

(*Letters from John Ruskin to F.J. Furnivall; privately printed*, 1897, p. 58.)

³ *Life of Ruskin*, 1900, p. 153.

come round to each one to correct their drawings. Some time during the early part of 1856 I made a copy in sepia of the Mildmay sea-piece (one of the *Liber Studiorum*) which pleased Mr. Ruskin greatly, and his father—by way of encouragement to me—afterwards bought the copy. Later on, I became Mr. Ruskin's assistant drawing-master in connexion with the classes. This was a year or two before I joined him definitely as his own assistant.

“Mr. Ruskin did not confine his work with the men to mere teaching. He gave the easels for them to work at, and from time to time furnished them with examples for drawing—always trying their powers at first with a round plaster ball pendent from a string, then going on to plaster casts of natural leaves (all of which were paid for by him). Also, he frequently brought drawings by various artists, belonging to him, for the purpose of showing how certain effects were got, *e.g.*, the rounding of a pear by William Hunt. (This drawing was eventually spoilt by being exposed to the fumes of the gas in the class-room.) Mr. Ruskin was always pleased to bring anything associated with any work of his in progress, if he thought it would interest the men. I remember, one evening, his showing proofs of ‘The Lombard Apennine’ and ‘St. George of the Seaweed,’ then just engraved by Thomas Lupton for vol. iii. of *Modern Painters*. Another time, when he wanted the men, for a change of subject, to draw cordage, he sent me down to a shipbreaker's at Rotherhithe to buy some old ships' hempen cable.

“Mr. Ruskin was always ready to encourage those of the students who showed some talent, but always discouraged them from working there with a view of becoming artists, and was severe on any kind of conceit. On one occasion a new student—who fancied himself and a drawing of foliage (very badly done) which he had brought for Mr. Ruskin to see—had placed this where it should catch Mr. Ruskin's eye on entering the room. Not content with this, he laid hold of Mr. Ruskin's arm, observing, ‘Does it not have a beautiful effect from here, sir?’ to which Mr. Ruskin simply replied ‘Not to my mind,’ and passed on.”

Another pupil, from the first, was the late Mr. Thomas Sulman;¹ he too has recorded his grateful memories:—

“Never without an afterglow of grateful memory will the first art-class of the Working Men's College be remembered by those few living who were privileged to belong to it. . . . It was a foggy November night when three friends presented themselves at the dingy old rooms in Red Lion Square. One of the three was the late too little known artist and thinker, James Smetham.² We sat upon a school bench and matriculated. The

¹ An engraver; he cut the woodblocks for Augustus Hare's works.

² Compare Vol. III. p. 231 *n.*, and Vol. IV. p. xlvi. *n.*

examination was not rigorous. We read a paragraph from a newspaper, wrote a few sentences from dictation, and worked a short division sum. But simple as it was, Smetham, who read Horace and Aristotle in the original, broke down three times in the arithmetic. We then went up to the studio. On the third floor two small rooms had been broken into one; they were so closely packed with easels as to deny elbow-room. Our master had most generously provided materials and copies. We began to work. I cannot hope to describe the delights of those evenings. He taught each of us separately, studying the capacities of each student. . . . For one pupil he would put a cairngorm pebble or fluor-spar into a tumbler of water, and set him to trace their tangled veins of crimson and amethyst. For another he would bring lichen and fungi from Anerley Woods. Once, to fill us with despair of colour, he bought a case of West Indian birds unstuffed, as the collector had stored them, all rubies and emeralds. Sometimes it was a fifteenth-century [more probably, thirteenth-century] Gothic missal, when he set us counting the order of the coloured leaves in each spray of the MS. At other times it was a splendid Albert Dürer woodcut, that we might copy a square inch or two of herbage, and identify the columbines and cyclamens. He talked much to the class, discursively but radiantly. . . .

“The pole-star of his artistic heaven was Turner. One by one, he brought for us to examine his marvels of water-colour art from Denmark Hill. He would point out the subtleties and felicities in their composition, analysing on a blackboard their line schemes. Sometimes he would make us copy minute portions of a ‘Liber,’ some line of footsteps or the handle of a plough. . . . How generous he was! He had reams of the best stout drawing-paper made specially for us, supplying every convenience the little rooms would hold. He commissioned William Hunt of the Old Water-Colour Society to paint two subjects for the class, and both were masterpieces. One was a golden, metallic, dried herring and some open mussel-shells; and the other, some eggs and yellow onions; to show how brilliant the humblest subjects might become in a master’s hands. He used to say, if you gave one man the pigments of every tint of the rainbow, he would paint you a dull picture; but give another little whitening, or a little slate and brick-dust, and he will produce a brilliant and harmonious one. . . . His face would light up when he saw a piece of honest or delicate work; it was, perhaps, his greatest fault as a teacher that he was sometimes too lavish of his praise. . . . Ruskin never knew himself how much he did for many of us. It is not too much to say that the whole of our following lives have been enriched by these hours we spent with him.”¹

¹ “A Memorable Art Class,” in *Good Words* for August 1897. The same article contains interesting reminiscences of Rossetti. Some reminiscences by Mr. E. Cooke of Ruskin’s teaching at the College are given in Mr. Collingwood’s *Life*, p. 153

It was “a memorable art class.” indeed, in which the students were thus privileged to sit at the feet of Ruskin, Rossetti, and Burne-Jones.

To the National Gallery Site Commission in 1857—in the course of evidence reprinted in Vol. XIII.—Ruskin described his object in thus teaching at the Working Men’s College. “My efforts are directed,” he said, “not to making a carpenter an artist, but to making him happier as a carpenter.” But the native bent was sometimes too strong to be denied, while on the other hand, Ruskin’s encouragement may in other cases have led a man to over-rate his powers, or to abuse his master’s generosity. The record of his classes is, however, a worthy one. “George Allen as a mezzotint engraver, Arthur Burgess as a draughtsman and wood-cutter, John Bunney as a painter of architectural detail, W. Jeffrey as an artistic photographer, E. Cooke as a teacher, William Ward as a facsimile copyist, have all done work whose value deserves acknowledgment, all the more because it was not aimed at popular effect.”¹

Ruskin’s weekly class at the Working Men’s College, with the incidental correspondence and good offices on his part which it entailed, did not exhaust his unselfish activities at this time. He had conceived a great admiration for Rossetti’s genius, as well as a warm affection for him personally. As he had befriended Millais and Holman Hunt, so now he devoted himself to assisting Rossetti. He had already done the painter a useful service by commending his work to M’Cracken,² who thereupon bought the water-colour (now at Oxford) of “Dante drawing an angel in memory of Beatrice.” This led to Ruskin’s personal acquaintance with Rossetti, as appears from a letter of the latter to Madox Brown, dated April 14, 1854:—

“M’Cracken of course sent my drawing to Ruskin, who the other day wrote me an incredible letter about it, remaining mine respectfully (! !), and wanting to call. I of course stroked him down in my answer, and yesterday he called. His manner was more agreeable than I had always expected. . . . He seems in a mood to make my fortune.”³

Immediately after this, Ruskin went abroad; there was correspondence between him and Rossetti, as will be seen in a later volume; on

¹ W. G. Collingwood’s *Life of Ruskin*, p. 155.

² See Vol. IV. p. 38 *n*.

³ *Dante Gabriel Rossetti: his Family Letters, with a Memoir*, by William Michael Rossetti, 1895, i. 180. In a later letter to Brown, Rossetti wrote (May 13, 1854): “Millais has written to me that Gambart wants me to paint something, so I imagine Ruskin is beginning to bear fruit” (*Ruskin, Rossetti, and Pre-Raphaelitism*, p. 9).

his return, he set about, if not making Rossetti's fortune, at any rate relieving him from financial anxiety. "He undertook to buy," says Mr. W. M. Rossetti, "if he happened to like it, whatever Rossetti produced, at a range of prices, such as the latter would have asked from any other purchaser, and up to a certain maximum of expenditure on his own part. If he did not relish a work, Rossetti could offer it to any one else. I cannot imagine any arrangement more convenient to my brother, who thus secured a safe market for his performances, and could even rely upon not being teased to do on the nail, work for which he received payment in whole or in part."¹ Ruskin's considerate generosity did not end there. Rossetti was at this time engaged to Miss Siddal, called familiarly "Guggum" by him and his circle, and "Ida" by Ruskin, who took the name no doubt from Tennyson's *Princess*. She had been down to spend a day with Ruskin and his parents at Denmark Hill. "All the Ruskins," wrote Rossetti to Madox Brown (April 13, 1855), "were most delighted with Guggum. John Ruskin said she was a noble, glorious creature, and his father said, by her look and manner, she might have been a Countess." Miss Siddal also was a designer, and Ruskin was greatly struck with her talent. He arranged to settle on her an annual sum of £150, "taking in exchange her various works up to that value and retaining them, or (if preferred) selling some of them, and handing over to her any extra proceeds."² In a later volume, Ruskin's letters to Rossetti and Miss Siddal are collected, but one of the earliest of the series must here be given for its autobiographical interest. It is undated, but must have been written late in 1854 or early in 1855:—

"DEAR ROSSETTI,—I daresay you do not quite like to answer my somewhat blunt question in my last letter; I was somewhat too brief in putting it; I was unwell, and could not write at length. My motive in asking you was simply that I did not know how best to act for you, and what to propose about sending Miss S[iddal] to Wales or Jersey, or anywhere else that might not in some way be disagreeable to you; and also because I thought that the whole thing might perhaps be much better managed in another way, and your own powers of art more healthily developed, and your own life made happier.

"I daresay our letters may now cross; but it does not matter,

¹ *Dante Gabriel Rossetti*, i. 181.

² *Ibid.*, i. 184.

for, whatever may be the contents of yours, I am sure there will be one feeling apparent in it, and that will be a dislike of putting yourself under obligation to any one in carrying out any main purpose of your life.

“I think it well, therefore, to tell you something about myself, and what you really ought to feel about me in this matter.

“You constantly hear a great many people saying I am very bad, and perhaps you have been yourself disposed lately to think me very good. I am neither the one nor the other. I am very self-indulgent, very proud, very obstinate, and *very* resentful; on the other side, I am very upright—nearly as just as I suppose it is possible for man to be in this world—exceedingly fond of making people happy, and devotedly reverent to all true mental or moral power. I never betrayed a trust—never wilfully did an unkind thing—and never, in little or large matters, depreciated another that I might raise myself. I believe I once had affections as warm as most people; but partly from evil chance, and partly from foolish misplacing of them, they have got tumbled down and broken to pieces. It is a very great, in the long-run the greatest, misfortune of my life that, on the whole, my relations, cousins and so forth, are persons with whom I can have no sympathy, and that circumstances have always somehow or another kept me out of the way of the people of whom I could have made friends. So that I have no friendships, and no loves.

“Now you know the best and worst of me; and you may rely upon it it is the truth. If you hear people say I am utterly hard and cold, depend upon it it is untrue. Though I have no friendships and no loves, I cannot read the epitaph of the Spartans at Thermopylæ with a steady voice to the end; and there is an old glove in one of my drawers that has lain there these eighteen years, which is worth something to me yet. If, on the other hand, you ever feel disposed to think me particularly good, you will be just as wrong as most people are on the other side. My pleasures are in seeing, thinking, reading, and making people happy (if I can, consistently with my own comfort). And I *take* these pleasures. And I suppose, if my pleasures were in smoking, betting, dicing, and giving pain, I should take *those* pleasures. It seems to me that one man is made one way, and one another—the measure of effort and self-denial can never be known, except by each conscience to itself. Mine is small enough.

“But, besides taking pleasure thus where I happen to find it, I have a theory of life which it seems to me impossible as a rational being to be altogether without—namely, that we are all sent into the world to be of such use to each other as we can, and also that

my particular use is likely to be in the things that I know something about—that is to say, in matters connected with painting.

“Thus then it stands. It seems to me that, amongst all the painters I know, you on the whole have the greatest genius, and you appear to me also to be—as far as I can make out—a very good sort of person. I see that you are unhappy, and that you can’t bring out your genius as you should. It seems to me then the proper and *necessary* thing, if I can, to make you more happy, and that I should be more really useful in enabling you to paint properly and keep your room in order than in any other way.

“If it were necessary for me to deny myself, or to make any mighty exertion to do this, of course it might to you be a subject of gratitude, or a question if you should accept it or not. But, as I don’t happen to have any other objects in life, and as I have a comfortable room and all I want in it (and more), it seems to me just as natural I should try to be of use to you as that I should offer you a cup of tea if I saw you were thirsty, and there was plenty in the teapot, and I had got all I wanted.

“I am not going to make you any offer till you tell me, if you are willing to do so, what your wishes and circumstances really are. What I meant was to ask if an agreement to paint for me regularly, up to a certain value, would put you more at your ease; but I will not enter into more particulars at present, for I hardly know, till I have settled some business with my father, what my circumstances really are. It provokingly happens that, although I have three times as much as is really necessary to enable me to carry out my¹ purposes, I have all this winter been launching out in a very heedless way, buying missals and Albert Dürers—not expecting any call upon me—so that it may be a month or two yet before I can send you what I should like; but after that all will go on quite smoothly. Meantime I hope this letter will put you more at your ease, and that you will believe me

“Always affectionately yours,

“J. RUSKIN.

“One thing, by-the-bye, I hope you will not permit even for a moment to slide into your head. That anything I am doing for workmen, or for anybody, is in any wise an endeavour to *regain* position in public opinion. I *am* what I always was; I am doing what I always proposed to do, and what I have been hindered by untoward circumstances from doing hitherto; and the only temptation which is brought upon me by calumny is, not to fawn for

¹ Printed “any” hitherto.

public favour, but to give up trying to do the public any good, and enjoy myself misanthropically.

“I forgot to say also that I really do *covet* your drawings as much as I covet Turner’s; only it is useless self-indulgence to buy Turner’s, and useful self-indulgence to buy yours. Only I won’t have them after they have been more than nine times rubbed entirely out, remember that.”¹

Ruskin was also, it may be added, a great admirer of Rossetti’s poetry, and paid for the publication of his translations from *Early Italian Poets*. Their friendship continued for some years, but gradually cooled: the part of disciple was not one which Rossetti was fitted to play, even to a master so delicate in his patronage as Ruskin.

Another young artist whose acquaintance Ruskin made at this time, was Frederic Leighton. In 1855 Ruskin issued the first of an annual series of *Notes on some of the Principal Pictures exhibited in the Rooms of the Royal Academy* (see Vol. XIV.). By this time his repute as a critic stood almost at its highest point; friends, and even amateurs personally unknown to him, were in the habit of seeking his opinion and advice on the pictures of the year; and he began the publication of these *Notes* as a sort of open “circular letter.” Among the pictures of 1855 was Leighton’s “Cimabue’s Madonna carried in Procession through the Streets of Florence.” Ruskin was greatly struck by it and praised it warmly in the *Notes*, and the picture was bought by Queen Victoria. The painter was at this time little known in art circles in London, for he studied and worked abroad. He had become acquainted with Robert Browning, and the poet asked leave to bring his young friend to Denmark Hill. “We spent an evening with Mr. Ruskin,” wrote Mrs. Browning to a friend, “who was gracious and generous, and strengthened all my good impressions. Robert took our young friend Leighton’s to see him afterwards, and was as kindly received.”² Leighton’s art was to develop along lines with which, in some respects, Ruskin had imperfect sympathy, but in later years he paid graceful compliments to the President’s gifts and achievements.³

Browning’s intercourse with Ruskin at this period may not have been without effect on the studies in poetry, which were to occupy some space in the third and fourth volumes of *Modern Painters*. In the latter volume Ruskin refers to the poet’s “unerring” insight into the mind of the Middle Ages, and notices his “seemingly careless and

² *Letters of Elizabeth Barrett Browning*, vol. ii. p. 210.

³ *The Art of England*, Lecture iii.

too rugged lines." In 1855 Browning had published his *Men and Women*, which found an appreciative reader in Ruskin. The poet writes to Rossetti of having received "a dear, too dear, and good letter from Mr. Ruskin."¹ But Ruskin had confessed his occasional bewilderment, and in particular had criticised, it seems, the poem entitled "Popularity," and beginning "Stand still, true poet that you are!" The substance of Ruskin's criticism can be gathered from Browning's reply:—

"We don't read poetry by the same way, by the same law; it is too clear. I cannot begin writing poetry till my imaginary reader has conceded licences to me which you demur at altogether. . . . You ought, I think, to keep pace with the thought tripping from ledge to ledge of my 'glaciers,' as you call them; not stand poking your alpenstock into the holes, and demonstrating that no foot could have stood there;—suppose it sprang over there? . . . Why, you look at my little song as if it were Hobbs' or Nobbs' lease of his house, a testament of his devising, wherein, I grant you, not a 'then and there,' 'to him and his heirs,' 'to have and to hold,' and so on, would be superfluous; and so you begin: 'Stand still,—why?' For the reason indicated in the verse, to be sure,—*to let me draw him*. . . . The last charge I cannot answer, for you may be right in preferring it, however unwitting I am of the fact. I *may* put Robert Browning into Pippa and other men and maids. If so, *peccavi*; but I don't see myself in them, at all events.

"Do you think poetry was ever generally understood—or can be? Is the business of it to tell people what they know already, as they know it, and so precisely that they shall be able to cry out—'Here you should supply *this—that*, you evidently pass over, and I'll help you from my own stock?' It is all teaching, on the contrary, and the people hate to be taught. They say otherwise,—make foolish fables about Orpheus enchanting stocks and stones, poets standing up and being worshipped,—all nonsense and impossible dreaming. A poet's affair is with God,—to whom he is accountable, and of whom is his reward; look elsewhere, and you find misery enough. Do you believe people understand *Hamlet*? . . ."²

It may be recalled that Ruskin, in an early letter, makes on his own behalf much of the same defence as is here adduced by Browning, and in later essays he often refers to the enigmatic character of the greatest poets.³

"We went to Denmark Hill yesterday," wrote Mrs. Browning of

¹ *Letters from Robert Browning to Various Correspondents*. Edited by Thomas J. Wise. Privately printed, 1895, vol. i. p. 21.

² The whole letter is printed by Mr. Collingwood in his *Life of Ruskin*, pp. 163–167. See also Vol. I. p. 444 n.

³ See Vol. I. pp. 443, 444, and the references given in the note there.

an earlier visit (September 1852), “to have luncheon with the Ruskins, and see the Turners, which, by the way, are divine. I like Mr. Ruskin much, and so does Robert. Very gentle, yet earnest,—refined and truthful. We count him among the valuable acquaintances made this year in England.”¹ Another poet whose personal acquaintance Ruskin made at this time was Tennyson, who also desired to see the famous collection at Denmark Hill. Kingsley also was among his visitors (see p. 429). The following is Ruskin’s letter of invitation to Tennyson:—

“DENMARK HILL, CAMBERWELL,
21st March, 1855.

“DEAR MR. TENNYSON,—I venture to write to you, because as I was talking about you with Mr. Woolner yesterday, he gave me more pleasure than I can express by telling me that you wished to see my Turners.

“By several untoward chances I have been too long hindered from telling you face to face how much I owe you. So you see at last I seize the wheel of fortune by its nearest spoke, begging you, with the heartiest entreaty I can, to tell me when you are likely to be in London, and to fix a day if possible that I may keep it wholly for you, and prepare my Turners to look their rosiest and best. Capricious they are as enchanted opals, but they must surely shine for you.

“Any day will do for me if you give me notice two or three days before; but please come soon, for I have much to say to you, and am eager to say it, above all to tell you how for a thousand things I am gratefully and respectfully yours,

“J. RUSKIN.”²

Of Ruskin’s charm on occasions such as these, no better account has been written than that by James Smetham. He was, as we have seen, a pupil at the Working Men’s College, and was asked to dine at Denmark Hill. He describes the visit in a letter to a friend:—

“5th February, 1855.

“I walked there through the wintry weather and got in about dusk. One or two gossiping details will interest you before I give you what I care for; and so I will tell you that he has a large house with a lodge, and a valet and a footman and coachman, and grand rooms glittering with pictures, chiefly Turner’s, and that his father and mother live with him, or he with them. . . .

“His father is a fine old gentleman, who has a lot of bushy grey hair, and eyebrows sticking up all rough and knowing, with a comfortable

¹ *Letters of Elizabeth Barrett Browning*, vol. ii. p. 87.

² *Alfred Lord Tennyson: a Memoir*, by his Son, 1897, vol. i. p. 383.

way of coming up to you with his hands in his pockets, and making *you* comfortable, and saying, in answer to your remark, that ‘John’s’ prose works are pretty good. His mother is a ruddy, dignified, richly-dressed old gentlewoman of seventy-five, who knows Chamouni better than Camberwell: evidently a *good* old lady, with the *Christian Treasury* tossing about on the table.

“She puts ‘John’ down and holds her own opinions, and flatly contradicts him; and he receives all her opinions with a soft reverence and gentleness that is pleasant to witness.

“The old gentleman amused me twice during the evening by standing over me and enlightening me on the subject of my own merits, with the air of a man who thought that I had not the remotest conception of my own abilities, and had therefore come to ‘threat me down about them.’ . . .

“The old lady was as quaintly kind. ‘Has John showed this?’ ‘Has he showed you the other?’ ‘John, fetch Couttet’s for Mr. Smetham to see:’ and to all her sudden injunctions he replied by waiting on me in a way to make one ashamed. ‘You must come in the daylight, John has heaps of things to show you, and—can you get away when you please?’ etc. As these are in reality traits in ‘John’s’ character, I have given you them at length. I wish I could reproduce a good impression of John for you, to give you the notion of his ‘perfect gentleness and lowliness.’

“He certainly bursts out with a remark, and in a contradictory way, but only because he believes it, with no air of dogmatism or conceit. He is different at home from that which he is in a lecture before a mixed audience, and there is a spiritual sweetness in the half-timid expression of his eyes, and in bowing to you, as in taking wine, with (if I heard aright) ‘I drink to thee,’ he had a look that has followed me, a look bordering on tearful.

“He spent some time in this way. Unhanging a Turner from the wall of a distant room, he brought it to the table and put it into my hands; then we talked; then he went up into his study to fetch down some illustrative print or drawing; in one case, a literal view which he had travelled fifty miles to make, in order to compare with the picture. And so he kept on gliding all over the house, hanging and unhanging, and stopping a few minutes to talk. There would have been, if I had not seen from the first moment that he *knew* me well, something embarrassing in the chivalrous, hovering, way he had; as it was, I felt much otherwise, quite as free and open as with you in your little study. . . . I was in a sort of soft dream all the way home; nor has the fragrance, which, like the June sunset,

‘Dwells in heaven half the night,’
left my spirit yet.”¹

Allen & Co. Sc.

The Walls of Lucerne

From the drawing in the possession of Fritchard Gordon, Esq.

What with entertaining friends and pupils, and writing his *Notes* on the exhibitions of the year, Ruskin found that *Modern Painters* was again getting into arrears. Rossetti towards the end of the summer suggested that they should take a holiday together; Ruskin could not spare the time:—

“DEAR ROSSETTI,—I am truly sorry to hear of your illness, and all your vexations. *Nothing* would give me more pleasure than to take a little holiday with you, and ramble about sketching and talking. You know I do not say this, or anything else, without meaning it. But this pleasure I must at present deny myself. I am deep in difficult chapters of *Modern Painters*. I cannot be disturbed even by my best friends or greatest pleasures. When I have to work out a chapter on a difficult subject, it is precisely the same to me as a mathematical calculation—to break into it is to throw it all down—back to the beginning. I do as much in dreamy and solitary lanes as I do at home. I could not have a companion.

“I want you next year to take a little run to Switzerland. I will either go with you or meet you, if our times should not suit for starting. And then we will do some Alpine roses and other things which the World has no notion of. Will you come? . . .”

That expedition was never to be made, and Ruskin meanwhile continued at his task. The multifariousness of his interests—reflected in the very title of the third volume, “Of Many Things”—is well hit off in a letter of vivacity and humour to Mrs. Carlyle:—

“Not that I have not been busy—and very busy, too. I have written, since May, good 600 pages, had them rewritten, cut up, corrected, and got fairly ready for press—and am going to press with the first of them on Gunpowder Plot Day; with a great hope of disturbing the Public Peace in various directions. Also, I have prepared above thirty drawings for engravers this year, retouched the engravings (generally the worst part of the business), and etched some on steel myself. In the course of the 600 pages I have had to make various remarks on German Metaphysics, on Poetry, Political Economy, Cookery, Music, Geology, Dress, Agriculture, Horticulture, and Navigation, all which subjects I have had to ‘read up’ accordingly, and this takes time. Moreover, I have had my class of workmen out sketching every week in the fields, during the summer; and have been studying Spanish proverbs with my father’s partner, who came over from Spain to see the great Exhibition. I have also designed and drawn a window for the Museum

at Oxford; and have every now and then had to look over a parcel of five or six new designs for fronts and backs to the said Museum. During my above mentioned studies of Horticulture I became dissatisfied with the Linnæan, Jussieuan, and Everybody-elsian arrangement of plants, and have accordingly arranged a system of my own; and unbound my botanical book, and rebound it in brighter green, with all the pages through other, and backside foremost—so as to cut off the old paging numerals; and am now printing my new arrangement in a legible manner, on interleaved foolscap. I consider this arrangement one of my great achievements of the year. My studies of political economy have induced me to think also that nobody knows anything about that, and I am at present engaged in an investigation, on independent principles, of the Natures of Money, Rent, and Taxes, in an abstract form, which sometimes keeps me awake all night. My studies of German metaphysics have also induced me to think that the Germans don't know anything about *them*; and to engage in a serious inquiry into the meaning of Bunsen's great sentence in the beginning of the second volume of Hippolytus, about the Finite realization of the Infinity;¹ which has given me some trouble. The course of my studies of navigation necessitated my going to Deal to look at the Deal boats; and those of Geology to rearrange all my minerals (and wash a good many, which, I am sorry to say, I found wanted it). I have also several pupils, far and near, in the art of illumination, an American young lady to direct in the study of landscape painting, and a Yorkshire young lady to direct in the purchase of Turners²—and various little bye things besides.

“But I am coming to see you.”³

The letter gives “a striking picture,” as Professor Norton says, “of the astonishing activity of his intelligence, and the medley of his occupations.” It is not surprising that his health was unequal to the strain, and we are now in a position to understand the entry in *Præterita*, referring to the year 1855:—

“I get cough which lasts for two months, till I go down to Tunbridge Wells, to my doctor cousin, William Richardson, who puts me to bed, gives me some syrup, cures me in three days, and calls me a fool for not coming to him before, with some rather angry

¹ See below, p. 424.

² Miss Heaton, of Leeds, with whom we shall meet in Ruskin's letters to Rossetti of this period; Ruskin encouraged her to buy Rossettis also.

³ Printed by Professor Charles Eliot Norton in his Introduction to the American “Brantwood Edition” of *Aratra Pentelici*—“true not alone,” he says, “of the year in which the letter was written [1855], but as well of year after year down as late as the time of these Oxford lectures.”

warnings that I had better not keep a cough for two months again.”¹

This visit to Tunbridge Wells, and the other above spoken of to Deal, where he made the studies of ships, presently to be used in his Preface to *The Harbours of England*, were his only holidays in 1855; and thus was the third volume completed. It was published on January 15, 1856. A further spell of hard work during the winter of 1855–1856, disposed of the fourth volume, which appeared three months later, on April 14.

The structure of a book thus resumed after an interval of ten years—and ten years, be it remembered, which had seen the author pass almost from boyhood to manhood—naturally showed differences and developments. Naturally, too, the later part of the book was not at all what the author had intended. To begin with, the conclusion of the book was to have been one volume; it became three. An idea of Ruskin’s earliest design may be gathered from a review of the second volume, by a friendly critic (probably Dr. Croly or W. H. Harrison): “This volume,” he wrote, “is to be followed by a third, detailing the merits of the great schools of foreign painting. From so acute an observer who, though not an artist by profession, is obviously an artist by nature, we expect a highly valuable and intelligent work. It is proposed to give pictorial illustrations of the various styles, and it is to be hoped that it will be accompanied by the author’s ‘Tour.’”² There were many tours in it, as we have seen, and the scheme grew and grew, though even in 1853 Ruskin imagined that a single volume would suffice.³ Again, in resuming his book, Ruskin adopted, as he here says (p. 18), a less systematic method. He discarded the elaborate synopsis of contents, and did not force his chapters into a rigidly consecutive scheme. He had begun, as he adds, to distrust systems and system-mongers. He had already expressed this feeling in his Review of Lord Lindsay (see Vol. XII. p. 175), and he presently dwelt upon it more fully.⁴

The fact is that though there is throughout *Modern Painters* an underlying unity of purpose and consistency of thought, yet if it is to be understood aright, it must be regarded as five different books, the division into which does not entirely correspond either with the division into volumes or with the framework mapped out at the

⁴ See *A Joy for Ever*, § 128.

beginning of the book. (1) The First Volume is a defence of Turner, against the charge that his later pictures were “unnatural.” This volume was, as Ruskin says,¹ the expansion of a magazine article, and was written in all the heat and haste of youthful enthusiasm. (2) Then came a pause, during which the author’s principal study was among the early Italian painters and Tintoretto. Both alike commanded his passionate admiration. The Second Volume thus became in part a hymn of praise, inspired by the religious ideal of Giotto and his circle; and in part an essay upon the Imagination, inspired by Tintoret’s works in the Scuola di San Rocco. (3) Ten years now intervened—years of widened and deepened study in many directions. The earlier chapters of the Third Volume are an interlude, necessary in order to establish a harmony between what had preceded and what was to follow. (4) The Fourth Volume and the first two Parts of the Fifth (vi. and vii., in the arrangement of the whole book) are an essay on the Beauty of Mountains, Trees, and Clouds; while, lastly, (5) the remainder of that final volume, written four years later,² is a treatise on “the relations of Art to God and man.”

We are first concerned here with what we have called the interlude. In looking back over his first two volumes, and forward to what he had yet to say, Ruskin was struck with obvious difficulties and apparent contradictions. He had started with defining the greatest art as that which contained the greatest ideas; he had thus insisted on the spiritual side of art. Then he had turned to his defence of Turner; and there, owing to the nature of the attacks he had to meet, his principal object was to prove that Turner had given more material and actual truth than other painters. Then why did not his pictures convey the same impression of truth to ordinary spectators? But, again, in his second volume, he had been led to praise in terms hardly less enthusiastic than those applied to Turner, the frescoes of the Italian “primitives,” so *naifs*, so limited in imitative resources, though representing so beautifully a religious ideal. Then what are the true limits of idealism in art? Sometimes in defending Turner, Ruskin seemed to be pleading for idealism as against the material imitation of the Dutch painters; at other times, to be pleading for realism as against the ideal compositions of the school of Claude. He perceived the difficulties which all this presents to careless readers, and the appearance of contradiction to which it exposed him. He

¹ Preface to *Modern Painters*, vol. v. § 7.

² It is probable that Parts vi. and vii. in the Fifth Volume were written, at any rate in the first draft, at about the same time as the Fourth Volume, but were held over, owing to the bulk of that volume.

states the case very clearly in the hitherto unpublished piece, which is now given in the Introduction to Volume XI., and to which the reader will do well to turn at this point. And yet, once more: since the Second Volume of *Modern Painters* appeared, Ruskin had been prominently before the public as the champion of the Pre-Raphaelites, whose early work was distinguished among other characteristics by its elaborate finish and minuteness of detail. The critics with one consent fell upon Ruskin for his inconsistency in admiring at once the closely manipulated foregrounds of Millais in his early works and the misty distances of Turner. What, then, was it, in final analysis, in which the greatness of Turner consisted—in truths that he recorded, or in visions that he invented? Is it—as we have already asked (Vol. III. p. xix.)—the material, numberable beauties of nature that he puts before us, or is he great for adding

“the gleam,
The light that never was on land or sea,
The consecration and the poet’s dream?”

It was to resolve such questions, to clear up these ambiguities, that was Ruskin’s first object in resuming *Modern Painters*. The reader will observe throughout the earlier chapters of the present volume a recurring refrain of allusion to hostile criticisms and apparent contradictions.¹ To some extent Ruskin never sought to deny the existence of self-contradictions in his work. He confessed, and even gloried, in them: for two reasons. First, as we have already said, and as must constantly be borne in mind in reading Ruskin, his principal book was written at intervals during seventeen years; he was twenty-four when he began it, and forty-one when he ended it. It is idle to seek in a book thus composed for the same fixity of standpoint or consistency of view that is expected in a single treatise. “All true opinions,” he says, “are living, and show their life by being capable of nourishment; therefore of change.”² And, secondly, though Truth is one, yet since Error is various, the statements of the truth must be as many-sided as the faults which it has to correct. Ruskin illustrates this thought in his diary of 1849 from his supreme arbiter—the text of the Bible:—

“It will be found that throughout the Scriptures there are on every subject two opposite groups of texts; and a middle group, which contains the truth that rests between the two others. The opposite texts are guards against the abuse of the central texts—guards set in opposite directions; and if these guards are considered

¹ See Vol. XII. p. li.

² Preface to *Modern Painters*, vol. v. § 8; and compare *Ethics of the Dust*, § 87.

as themselves containing the truth, instead of being a mere fence against some form of error, all manner of falsehood may be supported in scriptural language. But on the other hand, this complicated structure, while it betrays the careless, rewards the faithful reader; and when it is fully understood presents a form of security against error such as could not in any otherwise have been attained (like the Mont Blanc set between opponent fan-shaped strata)—a security which every thoughtful and earnest reader has felt. For instance, ‘Rejoice evermore’ and ‘Blessed are they that mourn’ are two guarding and contradictory texts; and the truth they guard is the central text ‘But and if ye suffer for righteousness’ sake, happy are ye.’¹

Fortified by these reflections, Ruskin often gloried in the charge that he was apt to contradict himself. “I hope,” he says, “I am exceedingly apt to do so. . . . I am never satisfied that I have handled a subject properly till I have contradicted myself at least three times.”² “I shall endeavour for the future,” he writes elsewhere, “to put my self-contradictions in short sentences and direct terms, in order to save sagacious persons the trouble of looking for them.”³ It is possible by taking passages from their context, and isolating them from the statements to which they are severally opposed, to represent Ruskin in turn as preaching distinctness and indistinctness in art, finish and incompleteness, idealism and realism, minuteness and breadth. But, having in the first two volumes of *Modern Painters* stated at different places different sides of the polygon of truth as he conceived it, he now set himself in this third volume—not, as he says,⁴ methodically, but yet with a steady aim—to define his central position on many of the vexed questions which have been indicated above. “In the main aim and principle” of *Modern Painters*, as he says elsewhere,⁵ “there is no variation from its first syllable to its last. It declares the perfectness and eternal beauty of the work of God; and tests all work of man by concurrence with, or subjection to that.” In the application of this general principle to particular questions, Ruskin’s central position, as defined in the earlier chapters of this volume, may perhaps be stated somewhat as follows: That art is the greatest which expresses the

⁵ Preface to *Modern Painters*, vol. v. § 8.

greatest number of the noblest ideas. Art is the expression of an artist's soul. A man may have soul and not be able to paint, in which case he ought not to be a painter. But be his manipulation never so perfect, he is not a great artist unless he is also capable of receiving and imparting noble impressions. In this third volume, "nominally treating of 'Many Things,' will be found," says Ruskin himself, "the full expression of what I knew best; namely, that all 'things,' many or few, which we ought to paint, must be first distinguished boldly from the nothings which we ought not."¹ The business of the landscape-painter is to paint his impressions. The noblest impressions derivable from natural scenery are not those which lend themselves most easily to deceptive imitation. The way to receive noble impressions from Nature is first to study her with unquestioning fidelity. Imagination is a form of vision; it is idle and unprofitable unless it is of things seen by the mind's eye as truthfully, as precisely, as much in accordance with ideal truths as if seen by the corporeal eye. Finish in art is relative to the object pursued. It may be wasted on unworthy objects and thrown away on secondary matters; it is never right unless it is the means of giving an additional truth. Such are some of the leading propositions which may be gathered from the earlier chapters of this volume. "There is nothing that can be labelled in any of this," perhaps some may say; "this body of doctrine is not exactly realism, nor idealism, nor impressionism, and Ruskinism cannot be identified with any of them." That is true, and is perhaps what Ruskin meant when he said that no true disciple of his would ever be a Ruskinian,² for what he taught was only what he had learnt from the good and great of many different ages and many diverse schools.

The first few chapters of the Fourth Volume (i.-v.) follow, according to the analysis here suggested, upon the earlier chapters in the Third; for their purpose is to clear up other difficulties connected with the practice of Turner; marking the proper meaning and sphere of the picturesque; contrasting topographical accuracy with essential truth of impression; explaining Turner's principles of light, and the truths which are revealed in "Turnerian mystery."

The second portion of the Third Volume (chapter xi. onwards) has a somewhat different purpose, and Ruskin here adopts a different treatment. His method now becomes historical, and the subject-matter of the chapters is the History of Landscape as deducible from art and literature—the History, that is, of men's feelings towards natural

¹ *The Three Colours of Pre-Raphaelitism* (1878), § 16.

² *St. Mark's Rest*, § 209.

scenery—a subject which is resumed at the end of the Fourth Volume, in the chapters on “The Mountain Gloom” and “The Mountain Glory,” wherein Ruskin discusses the influence of mountains on the life and character of peoples. These ten chapters (the last eight of the Third, and the last two of the Fourth) form, in subject-matter, a separate treatise; they have a most attractive theme, which Ruskin was the first to treat. The subject is a very large one; its proper discussion would require, says Ruskin, “knowledge of the entire history of two great ages of the world,” and he does not claim for his chapters more than helpfulness in suggestion.¹ At a later time he admitted that the logic of his conclusions had not entirely satisfied himself. What is the cause or nature of love of mountains? If it is all that Ruskin claimed for it, why does it not affect all noble minds alike, and why must the account between Gloom and Glory be so evenly balanced? “The more I analysed,” he says, “the less I could either understand or justify,” and “the less I felt able to deny the claim of prosaic and ignobly-minded persons to be allowed to like the land level.” “In the end,” he adds, “I found there was nothing for it but simply to assure those recusant and grovelling persons that they were perfectly wrong, and that nothing could be expected, either in art or literature, from people who liked to live among snipes and widgeons.”² But if Ruskin’s historical and literary sketch of the Influence of Landscape cannot claim to have said the last word on the subject of which it treats, it abounds in suggestive thoughts; it has attracted many inquirers on to the same field,³ and the title of one of the chapters—“Of the Pathetic Fallacy”—has become a stock phrase in subsequent literary criticism. The analyses of poetry, incidentally contained in this volume, together with those in the Second Volume, form, indeed, a singularly stimulating and suggestive essay in literary criticism. His particular judgments are indeed open to question; what judgments which are individual and genuine are not? Thus Rossetti

¹ See below, Preface, § 4, p. 7.

² *The Art of England* (1883), § 174. At this one point, then, at least, Ruskin may be held to have confirmed a criticism which Matthew Arnold made, upon reading the book in 1856—“full of excellent *aperçus*,” he called it, but wanting in “the *ordo concatenatioque veri*” (*Letters of Matthew Arnold*, i. 51).

³ As, for instance, Philip Gilbert Hamerton’s *Landscape* (1885) and *Imagination in Landscape Painting* (1887); Josiah Gilbert’s *Landscape in Art* (1885); and F. T. Palgrave’s *Landscape in Poetry* (1897). On the subject of Classical Landscape, Ruskin’s chapter has been followed by numerous essays; see, for instance, the chapter “Music and Painting” in J. P. Mahaffy’s *Rambles and Studies in Greece* (1876), and W. R. Hardie’s *Lectures on Classical Subjects* (1903). In German the great work on the subject is L. Friedländer’s *Sittengeschichte Roms*, vol. ii. pp. 95–291; published in 1862. (6th ed. 1889.)

quarrelled with Ruskin's praise of Longfellow's *Golden Legend*, as also with the extracts from Browning, in the Fourth Volume (ch. xx. §§ 32, 33). "Really," he wrote, "the omissions in Browning's passage are awful, and the union with Longfellow worse. How I loathe *Wishi-washi*,—of course without reading it."¹ So, again, Matthew Arnold in his Oxford lectures *On Translating Homer* found fault with Ruskin for reading into the *Iliad* more sentiment than in fact exists there.² Other critics at the time objected to this or that judgment.³ Yet Ruskin's sense of the excellent was so keen and so strong, and his analysis of his individual impressions so subtle, that few men can read these chapters without stimulus. "I never read anything," says Sir Leslie Stephen, of Ruskin's analysis of the imaginative faculty, "which seemed to me to do more to make clear the true characteristics of good poetry."⁴

Whether or not Ruskin succeeded in establishing a logical basis for mountain-lovers, he certainly did much to increase their number and supply noble grounds for their love. The chapters on "Mountain Beauty" which occupy the greater part of the Fourth Volume were the result, as we have seen, of studies and observations carried on during many years; and if, as he somewhere says, the greatest service in art or literature is to see accurately and report faithfully, these records of what he had seen among the mountains must be accounted among the most important portions of his work. This was Ruskin's own opinion. "The subject of the sculpture of mountains into the forms of perpetual beauty which they miraculously receive from God was," he says, "first taken up by me in the fourth volume of *Modern Painters*, and the elementary principles of it, there stated, form the most valuable and least faultful part of the book."⁵ And the reader will remember that these mountain chapters were to have been republished by Ruskin—a design, however, which he only partially fulfilled.⁶ "His power of seeing the phenomena vividly was as remarkable," says Sir Leslie Stephen, "as his power, not always shared by scientific writers, of making description interesting. I owe him a personal debt. Many people had tried their hands upon Alpine descriptions since Saussure; but Ruskin's chapters seemed to have the freshness of a new revelation.

⁵ Introduction to W. G. Collingwood's *Limestone Alps of Savoy*, 1884.

⁶ See the account of *In Montibus Sanctis*, Vol. III. p. 678.

The fourth volume of *Modern Painters* infected me and other early members of the Alpine Club with an enthusiasm for which, I hope, we are still grateful. Our prophet indeed ridiculed his disciples for treating Mont Blanc as a greased pole. We might well forgive our satirist, for he had revealed a new pleasure which we might mix with ingredients which he did not fully appreciate.”¹ The Alpine Club, it should be stated, was not yet in existence, nor had any attempt as yet been made to scale the Matterhorn. Ruskin was not a climber in the Alpine Club’s sense of the word, but he knew and loved the mountains as few other men have done, and in one respect at least he was an Alpine pioneer. He was the first to draw the Matterhorn accurately—the first, too, he says, to photograph it,² and the plates, no less than the descriptive chapters, in the fourth volume, may well have acted as a revelation and an incitement to the original founders of the Alpine Club—men who, as Sir Leslie Stephen says, had learnt, in part from Ruskin, to find in climbing scientific and artistic interests as well as athletic exercise. Another past President of the Club, Mr. Douglas Freshfield, has borne testimony to Ruskin’s services in this respect. Ruskin, he says, “saw and understood mountains, and taught our generation to understand them in a way no one—none even of those who had been born under their shadow—had ever understood them before. To begin with, he had a faculty of precise observation, the basis of all scientific research, which made him the most formidable of critics to any man of science whose eyesight might be temporarily affected by some preconceived theory. But this appreciation of detail in no way interfered with Ruskin’s romantic delight in the whole, in the sentiment and spirit of mountain landscapes. In some minds mountains take the place of cathedrals as a source of an emotion that may be called—in the wide sense of the word—religious. Ruskin was so happily constituted that he drew equal delight and inspiration both from architecture and scenery. No writer has added so much to our enjoyment of Alpine scenery as Ruskin.”³ His own emotions amid the mountains were, as we have seen in many a passage from his diaries, intensely religious. The verse which he quotes from the Psalms in the Fourth Volume (ch. xx. § 45) was the expression of personal experience: “I will lift up mine eyes unto the hills, from whence cometh mine help.”

Allen & Co. DC.

The Valley of Lauterbrunnen
from the Castle of Manfred.

In Ruskin's mind, however, there was a deeper object in view than to arouse interest in Alpine scenery. The human interest was never long absent from his thoughts when contemplating scenes of natural beauty or grandeur. It was not only that he moralised the mountains. Matthew Arnold says of the nature-poetry of Wordsworth that it enables us, not so much to front "the cloud of mortal destiny," as to "put it by."¹ To Ruskin, the study of nature was a call to action. It has been suggested above that, from one point of view, the chapters of the fourth volume on "The Mountain Glory" and "The Mountain Gloom" belong to the analysis of landscape-sentiment which is given in the third volume; and that is true, but their actual place was essential in Ruskin's scheme: they contained the practical gist, as he intended it, of his mountain-studies. "All the investigations undertaken by me at this time were connected in my own mind," he says, "with the practical hope of arousing the attention of the Swiss and Italian mountain peasantry to an intelligent administration of the natural treasures of their woods and streams."² He refers in this connexion to the Letters (given in a later volume of this edition) on the subject of Inundations, and, as we shall see in a subsequent Introduction, he formed schemes a few years afterwards for coming himself to live among the Alps, and trying his hand at relieving the Mountain Gloom. And here, in these volumes, he begs his readers, if they condemn the seclusion of the anchorites, to show themselves worthier by seeking inspiration for practical benevolence from the mountain solitudes; he desires to interest them in the hard struggles of the peasant-life, and bids them remember how much might be done by well-devised charity "to fill a whole Alpine valley with happiness."³

The attractiveness of his themes, the addition of the illustrations, and the splendour of his style—chastened in these later volumes, and freed from the affectations of the second, assured them an appreciative welcome. He found, too, that his words on other subjects were beginning to be listened to. His appendices in *Stones of Venice* and *Modern Painters* on Education attracted far more attention, he says, because part of his architectural and pictorial work, than ever afterwards his exclusively commercial and social analyses. He found interested listeners even in official circles, and a year or two later Royal Commissions and Select Committees called him before them.⁴ Meanwhile reviews in the press were numerous, and, on the whole,

¹ *Memorial Verses*.

⁴ See his account of a visit to Lord Palmerston in *Præterita*, iii. ch. ii. § 29.

very complimentary; his increasing popularity brought, on the other hand, some of the heavier organs into the field against him. But Ruskin's literary reputation was by this time so well established that it would not be of interest any longer to cite passages from the reviews whether favourable or the reverse.¹ One of the attacks upon him, however—that in the *Quarterly Review* for March 1856—requires mention as having called forth in reply one of the few productions of Burne-Jones's pen. This was an article entitled "Ruskin and the *Quarterly*," which he contributed to the *Oxford and Cambridge Magazine* for June 1856, and which represented the joint feelings and views of himself and William Morris.² They repudiate with scorn the counterassertion of the *Quarterly* "that the function of art is not to express thought but to make pretty things," and describe how from the dead-level of criticism given over to worship of the conventional and the merely pretty, "this man John Ruskin rose, seeming to us like a Luther of the arts." An earlier article in the same magazine had referred to Ruskin as "speaking, if ever man spoke, by the spirit and approval of heaven."³ These volumes, said George Eliot a little later, of the third and fourth volumes of *Modern Painters*, "contain, I think, some of the finest writing of the age. He is strongly akin to the sublimest part of Wordsworth."⁴ "I gave him my grateful thanks," wrote Edward Thring in after years; "it is a noble book, and did noble work at the time, and will continue to do so. It did what I should

¹ The following list of reviews, additional to those mentioned in the text (which, however, does not claim to be exhaustive), will show how widely and fully the Third and Fourth Volumes of *Modern Painters* were noticed in the press:—

Volume iii.—*Athenæum*, January 26, 1856; *Critic*, February 15; *London Literary Journal*, February 15; *Weekly Despatch*, February 17; *Leader*, February 23; *Saturday Review*, February 23, March 8, March 29; *Economist*, March 1; *Idler* (edited by E. Wilberforce), May 1856 (pp. 229–235); *British Quarterly Review*, April 1856, vol. 23, pp. 442–467; *Nonconformist*, April 16; *Putnam's Monthly Magazine*, May 1856, vol. 7, pp. 490–500; *Eclectic Review*, June 1856, vol. 11, N. S., pp. 545–563; *The Press*, June 14; *Blackwood's Magazine*, November 1856, vol. 80, pp. 503–527 ("Mr. Ruskin and his Theories—Sublime and Ridiculous"); *North American Review*, January 1857, vol. 84, pp. 379–406 (by Charles C. Everett).

Volume iv.—*Daily News*, April 21, 1856; *Literary Gazette*, April 26; *Athenæum*, May 10; *Critic*, May 15, June 2; *Leader*, May 31, June 14, June 17; *The Press*, June 28; *Eclectic Review*, August 1856, vol. 12, N. S., pp. 107–130.

Both volumes together.—*Quarterly Review*, March 1856, vol. 98, pp. 384–433; *Edinburgh Review*, April 1856, vol. 103, pp. 535–557 (by G. F. Chorley); *Examiner*, May 31, 1856; *Fraser's Magazine*, June 1857, vol. 55, pp. 619–635 (by "Shirley," i.e., J. Skelton); *New Quarterly Review*, July 1856, vol. 5, pp. 257–262.

² The article is attributed to Morris in Mr. H. Buxton Forman's *The Books of William Morris* (1897, p. 27); but Mr. Mackail informs me that, while representing the opinions of both Morris and Burne-Jones, it was for the most part written by the latter.

³ April 1856, pp. 212–225.

⁴ Letter to Miss Sara Hennell, Jan. 17, 1858, in *George Eliot's Life*, ii. 7.

have thought impossible; it smashed up for ever the narrow technicalities of artists, and altered the point of view not only for them, but for the whole world, and gave the seeing eye, and thought, and feeling a practical reality which they will never lose but never had before. . . . I am grateful to him for having put me into a new world of observation, beauty, power, and progressive thought which amounted to what I have called it—a new world; and every day adds to the obligation.”¹

The *text* of the Third Volume of *Modern Painters* does not present the same variations as in the case of the two earlier volumes. It was never revised by the author in any of the published editions, and for the most part such variations as occur are of the nature only of press corrections or misprints.

In this edition, however, a few alterations have either been made in the text, or are noted beneath it; these alterations are in accordance with the author’s markings in his own copy of the volume which he read for revision, about the year 1884, when he had some thought of re-casting the whole book. Several notes by the author of a later date than the original publication of the volume are, also, here given below the text; these were added by him to passages selected for publication in *Fronde Agrestes* in 1875. References to *Fronde* are only given where such notes occur; a general collation of the passages included in that volume having been already supplied (Vol. III. p. lxi.).

The *manuscripts* of the Third Volume to which the editors have had access, are described below (Appendix V., p. 433). They afford the same evidence as the MSS. of earlier volumes, of re-writing and revision. *Facsimiles* of two pages are given (pp. 80, 292–293). The MSS. include also several unpublished passages or discarded drafts. Extracts from these have occasionally been given in notes below the text (see, *e.g.*, pp. 21, 43, 44, 124, 149, 213); and two longer passages of some interest are printed in an Appendix (pp. 433–439).

The *illustrations* call for some notice. The third volume of *Modern Painters* (1856) was the first of that work to be illustrated, and the introduction of engravings had caused an enlargement of the page.² Some general remarks on the engravers employed by Ruskin are made in the Introduction to *The Stones of Venice*, vol. i. (1851), the earliest of his volumes in which he utilised their services. The engravers principally employed for that work—Lupton, Cuff, Armytage, and Boys—were again employed on *Modern Painters*; for a notice of them the

¹ *Life and Letters of Edward Thring*, by G. R. Parkin, 1898, vol. ii. pp. 245–246.

² See Vol. IV. p. xi.

reader is referred to the Introduction just mentioned (Vol. IX. p. 1.). Additional engravers were also employed. First among them was John Henry Le Keux,¹ who executed some of the most beautiful plates in Ruskin's book, and to whom, in conjunction with J. C. Armytage, the author pays a particular tribute in the Preface to this volume.² Le Keux (1812–1896) came of a family of engravers, and in his turn was employed by Ruskin to instruct Mr. Allen in the art.³ Shortly after the publication of *Modern Painters* he became connected by marriage with a firm of booksellers at Durham, where he resided for the remainder of his life; interesting himself further in archæology and floriculture, and being for many years secretary of the Durham School of Art. In the Preface to this volume, Ruskin mentions as his "assistant," Mr. J. J. Laing. He was at the time when Ruskin made his acquaintance an assistant in an architect's office, and had taken many prizes in schools of art. Many of Ruskin's letters to him have been published; these are collected in a later volume, and form an interesting series, as showing the trouble Ruskin took in acting as guide, philosopher, and friend to those who sought his counsel, and in whom he detected genuine ability. Mr. Laing was employed to draw figures and designs from illuminated manuscripts for the illustration of the present volume. Ruskin also utilised his services in various ways in connexion with the drawing-class at the Working Men's college. A few years later (1861) he revised and enlarged Bradley and Goodwin's *Manual of Illumination*, adding "Practical Notes" and a new series of illustrations on wood from illuminated MSS. in the British Museum and elsewhere. Some of Laing's drawings for this volume were cut on wood by Miss Byfield, who also did much work of the same kind for the later volumes; the same skilful wood-cutter engraved the ornament for the *Oxford and Cambridge Magazine*. Ruskin pays his tribute to her skill both here (p. 12, below) and in the Fifth Volume (Preface, § 6 n.). Another helper, whose services Ruskin here acknowledges (p. 12), was Mr. Henry Shaw (1800–1873), antiquary and draughtsman, and author of a *Handbook of the Art of Illumination*.

It remains to describe the illustrations as given in the present volume. In some cases (Plates 6, 9, 13) the original steel plates have been used; for Plate 7 a new chromo-lithograph has been prepared; the rest of the original illustrations it has been necessary to reduce by photogravure, in order to suit the page of this edition. One steel plate,

¹ Le Keux engraved also six plates in *The Stones of Venice*, vol. ii., and two in vol. iii.

² See below, p. 10.

³ See Ruskin's letters to Le Keux, reprinted in a later volume from pp. 38–41 of the privately-printed (1892) *Letters from John Ruskin to Various Correspondents*.

engraved by Le Keux and not hitherto published, which Ruskin entrusted some years ago to Mr. Allen, has been added as further illustrating the author's comparisons between mediæval and modern landscape (p. 406). The subject of the frontispiece, and the place of Plates 14 and 15 are, it should be noted, explained by Ruskin in the Preface to the next volume (Vol. VI. p. 4).

Besides the engraving just referred to, eight additional illustrations are given, all of them being photogravures from Ruskin's drawings made during the years when he was writing the volume.

Plate A is a drawing of "Vevay in Spring," where some of this volume was written. The drawing, which is at Oxford (Educational Series, No. 298), is in water-colour on tinted paper ($6\frac{3}{4} \times 9\frac{7}{8}$).

Plate B is a general view of the mountain side at Chamouni. The drawing, which is deservedly ranked among the best of Ruskin's mountain studies, is at Brantwood. It is in pen and colour ($14\frac{1}{2} \times 12$).

Plate C shows in more detail the central portion of the same scene. The drawing, which is in pencil, pen, and wash ($14\frac{1}{2} \times 12$), is in the collection of Sir John Simon, K.C.B. It is of one of Ruskin's favourite haunts—"La Cascade de la Folie and its Uplands," he calls it, "as seen from the old Hotel de l'Union, Chamouni."

Plate D is one of Ruskin's studies for the analysis of the forms of the Matterhorn, given in the Fourth Volume; compare the engravings, Plates 38 and 39. The drawing, which is in water-colour ($13\frac{1}{2} \times 9\frac{1}{4}$), is also in Sir John Simon's collection.

Plate E is a view of the mountains at the head of the Lake of Geneva, looking into the valley of the Rhone; the view is referred to in this volume (see p. 24). The drawing, which is in water-colour ($18\frac{1}{2} \times 8$), is in the same collection.

Plate F is a sketch at Fribourg (see above, p. xxxii.); the drawing, which is at Oxford (Educational Series, No. 114), is in pen ($5\frac{1}{4} \times 9\frac{7}{8}$).

Plate G is a drawing of the Walls of Lucerne (see above, p. xxxiii.); it is in water-colour ($19\frac{1}{2} \times 13\frac{1}{2}$), and is in the collection of Mr. Pritchard Gordon.

Plate H is from a drawing of the Valley of Lauterbrunnen—"between the village and Interlaken," is Ruskin's description, "a bit of the view from the Castle of Manfred." The reference is of course to Byron's poem. The castle is situated about a mile from Interlaken, a little beyond Matten on the direct road to Zweilütschinen and Lauterbrunnen. Its owners were the barons of Unspunnen, and it is supposed to have been the building which Byron had in his eye as the Castle of Manfred. The drawing, which is in pen and colour ($7\frac{1}{2} \times 9\frac{1}{2}$), is at Brantwood.

E. T. C.

[*Bibliographical Note*.—Enumeration is here made of the separate editions of *Modern Painters*, vol. iii. For the bibliography of the complete work, and of selections from it, see Vol. III. pp. lviii.-lxiii.

First Edition (1856).—The title-page was as follows:—

Modern Painters. | Volume III. | Containing | Part IV. | Of Many
Things. | By John Ruskin, M.A. | Author of “The Stones of Venice,” “The
Seven Lamps of Architecture,” etc. etc. | [Quotation from Wordsworth, as in
vols. i. and ii.] | London: | Smith, Elder, & Co., 65, Cornhill. | 1856
| [The Author reserves the right of translation.]

Imperial 8vo, pp. xix. +348. The Dedication printed in the former volumes was omitted. The Preface occupied pp. v.-xvi.; Contents, pp. xvii.-xviii.; List of Plates, p. xix.; Text, pp. 1–339; Appendix, pp. 341–348. The imprint at the foot of the last page, and of the reverse of the half-title, is “London: Printed by Spottiswoode & Co., New Street Square.” Issued on January 15, 1856, in green ornamental cloth boards, uniform with vol. ii. Price, 38s.

Second Edition (1867).—This was an exact reprint of the First (although there were two or three misprints), except for the alteration of the date, and the addition of the words “Second Edition,” on the title-page. No other editions of the volume were issued separately. “Edition 3” below means the first edition of the volume in the complete book (1873).

Variæ Lectiones.—As this volume was not revised for the press by the author after its first appearance, the various readings are of very small moment; but the usual collation of all the editions is given for the sake of completeness.

List of Plates—called “List of Plates to Vol. III.” in previous editions. The list here, p. xiii., is modelled on that in the original editions; but in No. 7 eds. 1 and 2 give, in the “engraved by” column, the names “Cuff; H. Swan”; and the 1888 edition “Messrs. Hanhart,” which also in No. 12 has “Boussod, Valadon & Co.,” and in Nos. 14 and 15 “George Allen.” The small complete edition has in No. 7 “Maclagan & Cumming,” and in Nos. 12, 14, 15, the same as in 1888. The list of woodcuts is here added.

Ch. ii. § 5, line 14 (see p. 38); quotation from Dante, eds. 1–3 read “Carey” for “Cary.”

Ch. iii. § 2, author’s note, the line of Dante has hitherto been incorrectly printed “Del ‘nò,’ per li danar, vi ‘si’ far ita”; § 4, line 12, ed. 3 reads “principle” for “principal”; § 12, note, second paragraph, line 6, eds. 1–3 read “line or colour” for “lines or colours.”

Ch. iv. § 9, line 7, “the next” altered to “this” in the present edition; § 16, line 33, “that” misprinted “what” in small complete edition; last words (see p. 90).

Ch. v. § 4, last line, ed. 3 reads “Corregio” for “Correggio”; § 6, eight lines from end, eds. 1–3 read “or grief” for “and grief.”

Ch. vii. § 8, first line of the Shakespeare quotation, eds. 1–3 read “invoke”; in *Frondes Agrestes* (1875), and all later editions, the correct word “awake” is substituted.

Ch. viii. § 3, line 1, ed. 3 reads “former” for “form”; § 6, last line but three, “Medici” hitherto printed “Medicis”; § 7, line 28, “Tanto” hitherto printed “Tanta.”

Ch. ix. § 7, line 20, eds. 1–3 read “Dolce” for “Dolci”; § 9, line 25, ed. 3 reads “place” for “plate”; § 13, line 9, the word “opposite” is omitted in this edition after “Plate 5”; § 17, line 18, eds. 1–3 read “muscle-shells” for “mussel-shells.”

Ch. xii. § 4, second note, eds. 1–3 read “Wendel” for “Wendell”; § 13 (quotation from Delavigne), see p. 213 *n.*; § 15 *n.*, eds. 1–3 read “Maude” for “Maud.”

Ch. xiii. § 25, eight lines from end, all editions hitherto give wrongly the reference to “Od. ii.”; it should be “Od. xi.”; § 28, twenty-one lines from the end eds. 2 and 3 read “Scot” for “Scot”; in the third line of the terminal quotation from Shenstone, the MS. and eds. 1 and 2, 1873, 1888, read correctly “herds”; misprinted “herbs” in 1892 and subsequent editions.

Ch. xiv. § 10, line 13, ed. 2 reads “mediation” for “meditation”; § 26, in the small complete edition, Plate 9 was by mistake duplicated.

Ch. xvi. § 42, line 2, eds. 1–3 read “except” for “expect.”

Ch. xvii. §§ 7, 27, “Mrs. Radcliffe” hitherto printed “Mrs. Radclyffe”; § 9 *n.*, line 16, the second “with” is omitted in eds. 1–3.

Ch. xviii. §§ 33–39: these paragraphs are not numbered in eds. 1–3.]

MODERN PAINTERS

VOLUME III

v.

A

PREFACE

1. As this preface is nearly all about myself, no one need take the trouble of reading it, unless he happens to be desirous of knowing—what I, at least, am bound to state—the circumstances which have caused the long delay of the work, as well as the alterations which will be noticed in its form.

The first and second volumes were written to check, as far as I could, the attacks upon Turner which prevented the public from honouring his genius, at the time when his power was greatest. The check was partially given, but too late; Turner was seized by painful illness not long after the second volume appeared; his works, towards the close of the year 1845, showed a conclusive failure of power; and I saw that nothing remained for me to write, but his epitaph.¹

The critics had done their proper and appointed work; they had embittered, more than those who did not know Turner intimately could have believed possible, the closing years of his life;² and had blinded the world in general (as it appears ordained by Fate that the world always *shall* be blinded) to the presence of a great spirit among them, till the hour of its departure. With them, and their successful work, I had nothing more to do; the account of gain and loss, of gifts and gratitude, between Turner and his

¹ [The second volume appeared in 1846. In the Academy of that year Turner had several pictures; in 1847, only one; in 1848, none; in 1849, two; and in 1850, four; but all these latest works showed clear signs of failing powers: in 1846 both his mind and his sight partially failed—see Ruskin's outline of Turner's period in the *Notes on the Turner Collection*, 1856 (Vol. XIII.).]

² [See, again, the *Notes on the Turner Collection* (No. 530), where Ruskin gives a personal reminiscence to this effect.]

countrymen, was for ever closed. *He* could only be left to his quiet death at Chelsea,—the sun upon his face;¹ *they* to dispose a length of funeral through Ludgate, and bury, with threefold honour, his body in St. Paul's, his pictures at Charing Cross, and his purposes in Chancery. But with respect to the illustration and preservation of those of his works which remained unburied, I felt that much might yet be done, if I could at all succeed in proving that these works had some nobleness in them, and were worth preservation. I pursued my task, therefore, as I had at first proposed, with this only difference in method,—that instead of writing in continued haste, such as I had been forced into at first by the urgency of the occasion, I set myself to do the work as well as I could, and to collect materials for the complete examination of the canons of art received among us.

2. I have now given ten years of my life² to the single purpose of enabling myself to judge rightly of art, and spent them in labour as earnest and continuous as men usually undertake to gain position, or accumulate fortune. It is true, that the public still call me an “amateur”; nor have I ever been able to persuade them that it was possible to work steadily and hard with any other motive than that of gaining bread, or to give up a fixed number of hours every day to the furtherance of an object unconnected with personal interests. I have, however, given up so much of life to this object; earnestly desiring to ascertain, and be able to teach, the truth respecting art; and also knowing that this truth was, by time and labour, definitely ascertainable.

It is an idea too frequently entertained, by persons who

¹ [See *Lectures on Architecture and Painting*, § 106 (Vol. XII. p. 133). For particulars of the controversy which arose on Turner's will, see Introduction to Vol. XIII.]

² [*i.e.*, from 1845; from the study of Italian art during his tour of that year Ruskin dated the beginning of his “man's work”: see Vol. IV. p. xxxiv. With § 2 here compare a similar passage in “The Mystery of Life and its Arts” in *Sesame and Lilies*, § 101.]

are not much interested in art, that there are no laws of right or wrong concerning it; and that the best art is that which pleases most widely. Hence the constant allegation of “dogmatism” against any one who states unhesitatingly either preference or principle, respecting pictures. There are, however, laws of truth and right in painting, just as fixed as those of harmony in music, or of affinity in chemistry. Those laws are perfectly ascertainable by labour, and ascertainable no otherwise. It is as ridiculous for any one to speak positively about painting who has not given a great part of his life to its study, as it would be for a person who had never studied chemistry to give a lecture on affinities of elements; but it is also as ridiculous for a person to speak hesitatingly about laws of painting who has conscientiously given his time to their ascertainment, as it would be for Mr. Faraday to announce in a dubious manner that iron had an affinity for oxygen, and to put the question to the vote of his audience whether it had or not.¹ Of course there are many things, in all stages of knowledge, which cannot be dogmatically stated; and it will be found, by any candid reader, either of what I have before written, or of this book, that, in many cases, I am *not* dogmatic. The phrase, “I think so,” or, “it seems so to me,” will be met with continually; and I pray the reader to believe that I use such expression always in seriousness, never as matter of form.

3. It may perhaps be thought that, considering the not very elaborate structure of the following volumes, they

¹ [So in a letter to Dr. Furnivall, Ruskin writes:—

“VEVAY, *June 9th*, 1854.— . . . I don’t say I wouldn’t care for reputation if I had it, but until people are ready to receive all I say about art as ‘unquestionable,’ just as they receive what Faraday tells them about chemistry, I don’t consider myself to have any reputation at all worth caring about.”

The letter, from which this is an extract, is among (pp. 30–33) the privately-printed (1897) *Letters from John Ruskin to Frederick J. Furnivall*, and is reprinted in a later volume of this edition. For the respect in which Ruskin held “good Professor Faraday” (1791–1867), see *Deucalion*, ch. iii.; and *Mornings in Florence*, § 33. Faraday was on the National Gallery Commission of 1857, before which Ruskin gave evidence (see Vol. XIII.).]

might have been finished sooner. But it will be found, on reflection, that the ranges of inquiry engaged in demanded, even for their slight investigation, time and pains which are quite unrepresented in the result. It often required a week or two's hard walking to determine some geological problem, now dismissed in an unnoticed sentence; and it constantly needed examination and thought, prolonged during many days in the picture gallery, to form opinions which the reader may suppose to be dictated by caprice, and will hear only to dispute.¹

A more serious disadvantage, resulting from the necessary breadth of subject, was the chance of making mistakes in minor and accessory points. For the labour of a critic who sincerely desires to be just, extends into more fields than it is possible for any single hand to furrow straightly. He has to take *some* note of many physical sciences; of optics, geometry, geology, botany, and anatomy; he must acquaint himself with the works of all great artists, and with the temper and history of the times in which they lived; he must be a fair metaphysician, and a careful observer of the phenomena of natural scenery.² It is not possible to extend the range of work thus widely, without running the chance of occasionally making mistakes; and if I carefully guarded against that chance, I should be compelled both to shorten my powers of usefulness in many directions, and to lose much time over what work I undertook. All that I can secure, therefore, is rightness in main points and main tendencies; for it is perfectly possible to protect oneself against small errors, and yet to make great and final error in the sum of work: on the other hand, it is equally possible to fall into many small errors, and yet be right in tendency all the while, and entirely

¹ [See the "Notes on the Louvre," given in Vol. XII. pp. 448–473, in order to exemplify the detailed studies of pictures on their technical side which Ruskin was in the habit of making.]

² [See in this connexion Ruskin's letter to Mrs. Carlyle, given in the Introduction, above, p. xlix.]

right in the end. In this respect, some men may be compared to careful travellers, who neither stumble at stones, nor slip in sloughs, but have, from the beginning of their journey to its close, chosen the wrong road; and others to those who, however slipping or stumbling at the wayside, have yet their eyes fixed on the true gate and goal (stumbling, perhaps, even the more because they have), and will not fail of reaching them. Such are assuredly the safer guides: he who follows them may avoid their slips, and be their companion in attainment.

Although, therefore, it is not possible but that, in the discussion of so many subjects as are necessarily introduced in the following pages, here and there a chance should arise of minor mistake or misconception, the reader need not be disturbed by the detection of any such. He will find always that they do not affect the matter mainly in hand.

4. I refer especially in these remarks to the chapters on Classical and Mediæval Landscape. It is certain, that in many respects, the views there stated must be inaccurate or incomplete; for how should it be otherwise when the subject is one whose proper discussion would require knowledge of the entire history of two great ages of the world? But I am well assured that the suggestions in those chapters are useful; and that even if, after farther study of the subject, the reader should find cause to differ from me in this or the other speciality, he will yet thank me for helping him to a certain length in the investigation, and confess, perhaps, that he could not at last have been right, if I had not first ventured to be wrong.

And of one thing he may be certified, that any error I fall into will not be in an illogical deduction: I may mistake the meaning of a symbol, or the angle of a rockcleavage, but not draw an inconsequent conclusion. I state this, because it has often been said that I am not logical, by persons who do not so much as know what logic means. Next to imagination, the power of perceiving logical relation

is one of the rarest among men: certainly, of those with whom I have conversed, I have found always ten who had deep feeling, quick wit, or extended knowledge, for one who could set down a syllogism without a flaw; and for ten who could set down a syllogism, only one who could *entirely* understand that a square has four sides. Even as I am sending these sheets to press, a work is put into my hand, written to prove (I would, from the depth of my heart, it could prove) that there was no ground for what I said in *The Stones of Venice* respecting the logical probability of the continuity of evil. It seems learned, temperate, thoughtful, everything in feeling and aim that a book should be, and yet it begins with this sentence:—

“The question cited in our preface, ‘Why not infinite good out of infinite evil?’ must be taken to imply—for it else can have no weight,—that in order to the production of infinite good, the existence of infinite evil is indispensable.”¹

So, if I had said that there was no reason why honey should not be sucked out of a rock, and oil out of a flinty rock, the writer would have told me this sentence must be taken to imply—for it else could have no weight,—that in order to the production of honey, the existence of rocks is indispensable. No less intense and marvellous are the logical errors into which our best writers are continually falling, owing to the notion that laws of logic will help them better than common sense. Whereas any man who can reason at all, does it instinctively, and takes leaps over intermediate syllogisms by the score, yet never misses his footing at the end of the leap; but he who cannot instinctively argue, might as well, with the gout in both feet, try to follow a chamois hunter by the help of crutches, as to follow, by

¹ [*On the Duration of Evil: an Essay*, 1855. The writer states in his preface (pp. iii., iv.) that among the reasons inducing him to restate the arguments for the finiteness of evil “is the circumstance—noticed by several friends—that a layman of admired ability, in whose cordial respect for religion they truly rejoice, has stepped aside, when treating of other topics, to cast a weapon at those opinions.” He then quotes from *The Stones of Venice* the last words of vol. iii. ch. iii. § 42 and the author’s footnote thereto (Vol. XI. p. 165).]

the help of syllogism, a person who has the right use of his reason. I should not, however, have thought it necessary to allude to this common charge against my writings,¹ but that it happens to confirm some views I have long entertained, and which the reader will find glanced at in their proper place,² respecting the necessity of a more *practically* logical education for our youth. Of other various charges I need take no note, because they are always answered the one by the other. The complaint made against me to-day for being narrow and exclusive, is met to-morrow by indignation that I should admire schools whose characters cannot be reconciled;³ and the assertion of one critic, that I am always contradicting myself, is balanced by the vexation of another, at my ten years' obstinacies in error.

5. I once intended the illustrations to these volumes to be more numerous and elaborate, but the art of photography now enables any reader to obtain as many memoranda of the facts of nature as he needs; and, in the course of my ten years' pause, I have formed plans for the representation of some of the works of Turner on their own scale; so that it would have been quite useless to spend time in reducing drawings to the size of this page, which were afterwards to be engraved of their own size.* I have therefore here only given illustrations enough to enable the reader,

* I should be very grateful to proprietors of pictures or drawings by Turner, if they would send me lists of the works in their possession; as I am desirous of forming a systematic catalogue of all his works.⁴

¹ [See above, Introduction, pp. liii.–liv.]

² [See Appendix iii. in the fourth volume of *Modern Painters*.]

³ [See below, ch. x. § 5 *n.*, p. 173.]

⁴ [This scheme has been already referred to: see Vol. XII. p. 370 *n.* The systematic catalogue was never made by Ruskin, though in various places he cast typical works by Turner into various groups: see *Modern Painters*, vol. v. pt. ix. ch. xi. (where the *Liber Studiorum* is thus classified); *Notes on the Turner Gallery*, 1856; *Notes on his Drawings by Turner*, 1878. The plans for the representation of some of Turner's works "on their own scale" were not carried out either; though, a few years later, Ruskin made a beginning towards its realisation, with the assistance of Mr. George Allen: see the reproductions (on a reduced scale) of some of the drawings thus treated in Vol. XIII.]

who has not access to the works of Turner, to understand the principles laid down in the text, and apply them to such art as may be within his reach. And I owe sincere thanks to the various engravers who have worked with me, for the zeal and care with which they have carried out the requirements in each case, and overcome difficulties of a nature often widely differing from those involved by their habitual practice. I would not make invidious distinction, where all have done well; but may perhaps be permitted to point, as examples of what I mean, to the 3rd and 6th Plates in this volume (the 6th being left unlettered in order not to injure the effect of its ground), in which Mr. Le Keux and Mr. Armytage have exactly facsimiled, in line engraving, drawings of mine made on a grey ground touched with white, and have given even the *loaded* look of the body colour. The power of thus imitating actual touches of colour with pure lines will be, I believe, of great future importance in rendering Turner's work on a large scale. As for the merit or demerit of these or other drawings of my own, which I am obliged now for the sake of illustration often to engrave, I believe I could speak of it impartially, and should unreluctantly do so; but I leave, as most readers will think I ought, such judgment to them, merely begging them to remember that there are two general principles to be kept in mind in examining the drawings of any writer on art: the first, that they ought at least to show such ordinary skill in draughtsmanship, as to prove that the writer knows *what* the good qualities of drawing *are*;¹ the second, that they are never to be expected to equal, in either execution or conception, the work of accomplished artists—for the simple reason that in order to do *anything* thoroughly well, the whole mind, and the whole available time, must be given to that single art. It is probable, for reasons which will be noted in the following pages, that the critical and executive faculties are

¹ [On this matter compare *Inaugural Address* at the Cambridge School of Art, § 7: "no man ever was a thorough judge of painting who could not draw."]

in great part independent of each other; so that it is nearly as great an absurdity to require of any critic that he should equal in execution even the work which he condemns, as to require of the audience which hisses a piece of vocal music that they should instantly chant it in truer harmony themselves. But whether this be true or not (it is at least untrue to this extent, that a certain power of drawing is *indispensable* to the critic of art), and supposing that the executive and critical powers always exist in some correspondent degree in the same person, still they cannot be cultivated to the same extent. The attention required for the development of a theory is necessarily withdrawn from the design of a drawing, and the time devoted to the realization of a form is lost to the solution of a problem. Choice *must* at last be made between one and the other power, as the principal aim of life; and if the painter should find it necessary sometimes to explain one of his pictures in words, or the writer to illustrate his meaning with a drawing, the skill of the one need not be doubted because his logic is feeble, nor the sense of the other because his pencil is listless.

6. As, however, it is sometimes alleged by the opponents of my principles, that I have never *done anything*, it is proper that the reader should know exactly the amount of work for which I am answerable in these illustrations. When an example is given from any of the works of Turner, it is either etched by myself from the original drawing, or engraved from a drawing of mine, translating Turner's work out of colour into black and white, as, for instance, the frontispiece to the fourth volume. When a Plate is inscribed as "*after*" such and such a master, I have always myself made the drawing, in black and white, from the original picture; as, for instance, Plate 11 in this volume. If it has been made from a previously existing engraving, it is inscribed with the name of the first engraver at the left-hand lowest corner; as, for instance, Plate 18 in vol. iv. Outline etchings are either by my

own hand on the steel, as Plate 12 here,¹ and 20, 21 in vol. iv.; or copies from my pen drawings, etched by Mr. Boys, with a fidelity for which I sincerely thank him; one, Plate 22, vol. iv., is both drawn and etched by Mr. Boys from an old engraving. Most of the other illustrations are engraved from my own studies from nature. The coloured Plate (7 in this volume) is from a drawing executed with great skill by my assistant, Mr. J. J. Laing, from MSS. in the British Museum; and the lithography of it has been kindly superintended by Mr. Henry Shaw, whose renderings of mediæval ornaments stand, as far as I know, quite unrivalled in modern art.² The two woodcuts of mediæval design, Figs. 1 and 3, are also from drawings by Mr. Laing, admirably cut by Miss Byfield.³ I use this word “admirably,” not with reference to mere delicacy of execution, which can usually be had for money, but to the perfect fidelity of facsimile, which is in general *not* to be had for money, and by which Miss Byfield has saved me all trouble with respect to the numerous woodcuts in the fourth volume; first, by her excellent renderings of various portions of Albert Dürer’s woodcuts; and, secondly, by reproducing, to their last dot or scratch, my own pen diagrams, drawn in general so roughly that few wood-engravers would have condescended to cut them with care, and yet always involving some points in which care was indispensable. One or two changes have been permitted in the arrangement of the book, which make the text in these volumes not altogether a symmetrical continuation of that in former ones. Thus, I thought it better to put the numbers of paragraphs always at the left-hand side of the page;⁴ and as the summaries, in small type, appeared to

¹ [In this edition reduced by photogravure. For a later reference to these and some other plates, as enabling the reader “to ascertain how far I can draw or not,” see *Two Paths*, Appendix v. (reprinted in this edition from the first edition of that book).]

² [In this edition reproduced by Messrs. Maclagan & Cumming.]

³ [See also Preface to *Modern Painters*, vol. v., and pt. vi. ch. x. § 9. For other notes on Ruskin’s engravers, see above, Introduction, p. lxii.]

⁴ [In this edition at the beginning of each paragraph.]

me for the most part cumbrous and useless, I have banished them, except where there were complicated divisions of subject which it seemed convenient to indicate at the margin. I am not sorry thus to carry out my own principle of the sacrifice of architectural or constructive symmetry to practical service.¹ The Plates are, in a somewhat unusual way, numbered consecutively through the two volumes, as I intend them to be also through the fifth. This plan saves much trouble in references.

I have only to express, in conclusion, my regret that it has been impossible to finish the work within the limits first proposed. Having, of late, found my designs always requiring enlargement in process of execution, I will take care, in future, to set no limits whatsoever to any good intentions. In the present instance I trust the reader will pardon me, as the later efforts of our schools of art have necessarily introduced many new topics of discussion.

And so I wish him heartily a happy New Year.

DENMARK HILL, *Jan.* 1856.

¹ [For a similar remark in connexion with another rearrangement, see Explanatory Note to the "Venetian Index" in *The Stones of Venice* (Vol. XI. pp. 355–356).]

PART IV
OF MANY THINGS

CHAPTER I

OF THE RECEIVED OPINIONS TOUCHING THE "GRAND STYLE"

§ 1. IN taking up the clue of an inquiry, now intermitted for nearly ten years,¹ it may be well to do as a traveller would, who had to recommence an interrupted journey in a guideless country; and, ascending, as it were, some little hill beside our road, note how far we have already advanced, and what pleasantest ways we may choose for farther progress.

I endeavoured, in the beginning of the first volume, to divide the sources of pleasure open to us in Art into certain groups, which might conveniently be studied in succession. After some preliminary discussion, it was concluded (Part I. Sec. II. Chap. III. § 6,) that these groups were, in the main, three; consisting, first, of the pleasures taken in perceiving simple resemblance to Nature (Ideas of Truth); secondly, of the pleasures taken in the beauty of the things chosen to be painted (Ideas of Beauty); and, lastly, of pleasures taken in the meanings and relations of these things (Ideas of Relation).

The first volume, treating of the Ideas of Truth, was chiefly occupied with an inquiry into the various success with which different artists had represented the facts of Nature,—an inquiry necessarily conducted very imperfectly, owing to the want of pictorial illustration.

The second volume merely opened the inquiry into the nature of ideas of Beauty and Relation, by analysing (as far as I was able to do so) the two faculties of the human

¹ [The second volume of *Modern Painters* was published in April 1846; the third in January 1856.]

mind which mainly seized such ideas; namely, the contemplative and imaginative faculties.

It remains for us to examine the various success of artists, especially of the great landscape-painter whose works have been throughout our principal subject, in addressing these faculties of the human mind, and to consider who among them has conveyed the noblest ideas of beauty, and touched the deepest sources of thought.

§ 2. I do not intend, however, now to pursue the inquiry in a method so laboriously systematic; for the subject may, it seems to me, be more usefully treated by pursuing the different questions which arise out of it just as they occur to us, without too great scrupulousness in marking connections, or insisting on sequences. Much time is wasted by human beings, in general, on establishment of systems;¹ and it often takes more labour to master the intricacies of an artificial connection, than to remember the separate facts which are so carefully connected. I suspect that system-makers, in general, are not of much more use, each in his own domain, than, in that of Pomona, the old women who tie cherries upon sticks, for the more convenient portableness of the same. To cultivate well, and choose well, your cherries, is of some importance; but if they can be had in their own wild way of clustering about their crabbed stalk, it is a better connection for them than any other; and, if they cannot, then, so that they be not bruised, it makes to a boy of a practical disposition not much difference whether he gets them by handfuls, or in beaded symmetry on the exalting stick. I purpose, therefore, henceforward to trouble myself little with sticks or twine, but to arrange my chapters with a view to convenient reference, rather than to any careful division of subjects, and to follow out, in any by-ways that may open, on right hand or left, whatever question it seems useful at any moment to settle.

§ 3. And, in the outset, I find myself met by one which I ought to have touched upon before—one of especial

¹ [Compare the Introduction, above, p. li., and below, p. 385 *n.*]

interest in the present state of the Arts. I have said that the art is greatest which includes the greatest ideas;¹ but I have not endeavoured to define the nature of this greatness in the ideas themselves. We speak of great truths, of great beauties, great thoughts. What is it which makes one truth greater than another, one thought greater than another? This question is, I repeat, of peculiar importance at the present time; for, during a period now of some hundred and fifty years, all writers on Art who have pretended to eminence, have insisted much on a supposed distinction between what they call the Great and the Low Schools; using the terms "High Art,"² "Great or Ideal Style," and other such, as descriptive of a certain noble manner of painting, which it was desirable that all students of Art should be early led to reverence and adopt; and characterising as "vulgar," or "low," or "realist," another manner of painting and conceiving, which it was equally necessary that all students should be taught to avoid.

But lately this established teaching, never very intelligible, has been gravely called in question. The advocates and self-supposed practisers of "High Art" are beginning to be looked upon with doubt, and their peculiar phraseology to be treated with even a certain degree of ridicule. And other forms of Art are partly developed among us, which do not pretend to be high, but rather to be strong, healthy, and humble. This matter of "highness" in Art, therefore, deserves our most careful consideration. Has it been, or is it, a true highness, a true princeliness, or only a show of it, consisting in courtly manners and robes of

¹ [See *Modern Painters*, vol. i., last words of ch. ii. (Vol. III. p. 92).]

² [The earliest use of the phrase "high art" given in Murray's *New English Dictionary on Historical Principles* is in Kingsley's *Plays and Puritans* (1856, p. 31); but the phrase was certainly a current jest in 1846, when Wyatt's huge equestrian statue of the Duke of Wellington was hoisted on to the arch at the top of Constitution Hill, from which it was removed in 1883. See also C. R. Leslie's *Handbook for Young Painters* (1855, p. 60): "Latterly, the term 'High' has generally been exchanged for 'Religious,' which means Art of which the subjects are from the Bible or the legends of the Church. I should make no objection to the definition as a matter of convenience, and if understood no otherwise than of Art of which the theme is religious. But, I fear, it is too much received, and intended as defining a style necessarily differing from other styles."]

state? Is it rocky height or cloudy height, adamant or vapour, on which the sun of praise so long has risen and set? It will be well at once to consider this.

§ 4. And first, let us get, as quickly as may be, at the exact meaning with which the advocates of “High Art” use that somewhat obscure and figurative term.

I do not know that the principles in question are anywhere more distinctly expressed than in two papers in the *Idler*, written by Sir Joshua Reynolds, of course under the immediate sanction of Johnson; and which may thus be considered as the utterance of the views then held upon the subject by the artists of chief skill, and critics of most sense, arranged in a form so brief and clear, as to admit of their being brought before the public for a morning’s entertainment. I cannot, therefore, it seems to me, do better than quote these two letters, or at least the important parts of them, examining the exact meaning of each passage as it occurs. There are, in all, in the *Idler* three letters on painting, Nos. 76, 79, and 82; of these, the first is directed only against the impertinences of pretended connoisseurs, and is as notable for its faithfulness, as for its wit, in the description of the several modes of criticism in an artificial and ignorant state of society: it is only, therefore, in the two last papers that we find the expression of the doctrines which it is our business to examine.

No. 79 (Saturday, Oct. 20th, 1759) begins, after a short preamble, with the following passage:—

“Amongst the Painters, and the writers on Painting, there is one maxim universally admitted and continually inculcated. *Imitate nature* is the invariable rule; but I know none who have explained in what manner this rule is to be understood; the consequence of which is, that every one takes it in the most obvious sense—that objects are represented naturally, when they have such relief that they seem real. It may appear strange, perhaps, to hear this sense of the rule disputed; but it must be considered, that,

if the excellency of a Painter consisted only in this kind of imitation, Painting must lose its rank, and be no longer considered as a liberal art, and sister to Poetry: this imitation being merely mechanical, in which the slowest intellect is always sure to succeed best; for the Painter of genius cannot stoop to drudgery, in which the understanding has no part; and what pretence has the Art to claim kindred with Poetry, but by its power over the imagination? To this power the Painter of genius directs him; in this sense he studies Nature, and often arrives at his end, even by being unnatural in the confined sense of the word.

“The grand style of Painting requires this minute attention to be carefully avoided, and must be kept as separate from it as the style of Poetry from that of History. (Poetical ornaments destroy that air of truth and plainness which ought to characterise History; but the very being of Poetry consists in departing from this plain narrative, and adopting every ornament that will warm the imagination.*) To desire to see the excellences of each style united—to mingle the Dutch with the Italian school, is to join contrarieties which cannot subsist together, and which destroy the efficacy of each other.”¹

§ 5. We find, first, from this interesting passage, that the writer considers the Dutch and Italian masters as severally

* I have put this sentence in a parenthesis, because it is inconsistent with the rest of the statement, and with the general teaching of the paper; since that which “attends only to the invariable,” cannot certainly adopt “every ornament that will warm the imagination.”

¹ [In one draft of the chapter Ruskin here pauses to point out at once “a dangerous obscurity in the author’s language. There are two kinds of imitative art: one, clumsy and coarse, which nevertheless attains very easily nearly a deceptive resemblance of reality, as in the common instances of game painted hanging up on boards, figures leaning over picture-frames, common scene-painting, and such like. The other kind of imitative art represents a great deal more of the details of the object, but by no means reaches a deceptive resemblance of it; as, for instance, a striking engraving by Albert Dürer, which no one would actually mistake for the scene or object represented. On the relations and possible unity of these two branches of imitative art, I shall have much to say presently; meanwhile I only wish to point out that Reynolds, or whoever this writer is,

representative of the low and high schools; next, that he considers the Dutch painters as excelling in a mechanical imitation, "in which the slowest intellect is always sure to succeed best;" and, thirdly, that he considers the Italian painters as excelling in a style which corresponds to that of imaginative poetry in literature, and which has an exclusive right to be called the grand style.

I wish that it were in my power entirely to concur with the writer, and to enforce this opinion thus distinctly stated. I have never been a zealous partisan of the Dutch school, and should rejoice in claiming Reynolds's authority for the assertion, that their manner was one "in which the slowest intellect is always sure to succeed best." But before his authority can be so claimed, we must observe exactly the meaning of the assertion itself, and separate it from the company of some others not perhaps so admissible. First, I say, we must observe Reynolds's exact meaning, for (though the assertion may at first appear singular) a man who uses accurate language is always more liable to misinterpretation than one who is careless in his expressions. We may assume that the latter means very nearly what we at first suppose him to mean, for words which have been uttered without thought may be received without examination. But when a writer or speaker may be fairly supposed to have considered his expressions carefully, and, after having revolved a number of terms in his mind, to have chosen the one which *exactly* means the thing he intends to say, we may be assured that what costs him time to select, will require from us time to understand; and that we shall do him wrong, unless we pause to reflect how the word which he has actually employed differs from other words which it seems he *might* have employed. It thus constantly happens that persons themselves unaccustomed to think clearly, or

carelessly confuses the two; that he, in so doing, does injustice to many members of the imitative schools by speaking of them as if they all had no other aim than that of imitative relief; and he does too much honour to other members, who had indeed no other aim than this, by talking of them as on a level with writers of history, thus putting Paul Potter and . . . [name indecipherable] in the same rank with Thucydides."]

speak correctly, misunderstand a logical and careful writer, and are actually in more danger of being misled by language which is measured and precise, than by that which is loose and inaccurate.¹

§ 6. Now, in the instance before us, a person not accustomed to good writing might very rashly conclude that when Reynolds spoke of the Dutch School as one "in which the slowest intellect was sure to succeed best," he meant to say that every successful Dutch painter was a fool. We have no right to take his assertion in that sense. He says, the *slowest* intellect. We have no right to assume that he meant the *weakest*. For it is true, that in order to succeed in the Dutch style, a man has need of qualities of mind eminently deliberate and sustained. He must be possessed of patience rather than of power; and must feel no weariness in contemplating the expression of a single thought for several months together. As opposed to the changeful energies of the imagination, these mental characters may be properly spoken of as under the general term—slowness of intellect. But it by no means follows that they are necessarily those of weak or foolish men.

We observe, however, farther, that the imitation which Reynolds supposes to be characteristic of the Dutch School is that which gives to objects such relief that they seem real, and that he then speaks of this art of realistic imitation as corresponding to *history* in literature.

§ 7. Reynolds, therefore, seems to class these dull works of the Dutch School under a general head, to which they are not commonly referred—that of *Historical* painting; while he speaks of the works of the Italian School not as historical, but as *poetical* painting. His next sentence will farther manifest his meaning.

"The Italian attends only to the invariable, the great and general ideas which are fixed and inherent in universal

¹ [On this subject, in connexion with Ruskin himself, see *A Joy for Ever*, § 140.]

Nature; the Dutch, on the contrary, to literal truth, and a minute exactness in the detail, as I may say, of Nature modified by accident. The attention to these petty peculiarities is the very cause of this naturalness so much admired in the Dutch pictures, which, if we suppose it to be a beauty, is certainly of a lower order, which ought to give place to a beauty of a superior kind, since one cannot be obtained but by departing from the other.

“If my opinion were asked concerning the works of Michael Angelo, whether they would receive any advantage from possessing this mechanical merit, I should not scruple to say, they would not only receive no advantage, but would lose, in a great measure, the effect which they now have on every mind susceptible of great and noble ideas. His works may be said to be all genius and soul; and why should they be loaded with heavy matter, which can only counteract his purpose by retarding the progress of the imagination?”

Examining carefully this and the preceding passage, we find the author’s unmistakable meaning to be, that Dutch painting is *history*; attending to literal truth and “minute exactness in the details of nature modified by accident.” That Italian painting is *poetry*, attending only to the invariable; and that works which attend only to the invariable are full of genius and soul; but that literal truth and exact detail are “heavy matter which retards the progress of the imagination.”

§ 8. This being then indisputably what Reynolds means to tell us, let us think a little whether he is in all respects right. And first, as he compares his two kinds of painting to history and poetry, let us see how poetry and history themselves differ, in their use of *variable* and *invariable* details. I am writing at a window which commands a view of the head of the Lake of Geneva; and as I look up from my paper, to consider this point, I see, beyond it, a blue breadth of softly moving water, and the outline of the

mountains above Chillon, bathed in morning mist. The first verses which naturally come into my mind are—

“A thousand feet in depth below
The massy waters meet and flow;
So far the fathom line was sent
From Chillon’s snow-white battlement.”¹

Let us see in what manner this poetical statement is distinguished from a historical one.

It is distinguished from a truly historical statement, first, in being simply false. The water under the Castle of Chillon is not a thousand feet deep, nor anything like it.* Herein, certainly, these lines fulfil Reynolds’s first requirement in poetry, “that it should be inattentive to literal truth and minute exactness in detail.” In order, however, to make our comparison more closely in other points, let us assume that what is stated is indeed a fact, and that it was to be recorded, first historically, and then poetically.

Historically stating it, then, we should say: “The lake was sounded from the walls of the Castle of Chillon, and found to be a thousand feet deep.”

Now, if Reynolds be right in his idea of the difference between history and poetry, we shall find that Byron leaves out of this statement certain *unnecessary* details, and retains only the invariable,—that is to say, the points which the Lake of Geneva and Castle of Chillon have in common with all other lakes and castles.

Let us hear, therefore.

“A thousand feet in depth below.”

“Below?” Here is, at all events, a word added (instead

* “MM. Mallet et Pictet, se trouvant sur le lac auprès du château de Chillon, le 6 Août, 1774, plongèrent à la profondeur de 312 pieds un thermomètre,” etc.—SAUSSURE, *Voyages dans les Alpes*, chap. ii. § 33. It appears from the next paragraph that the thermometer was “au fond du lac.”

¹ [“The Prisoner of Chillon,” stanza vi. Ruskin quotes from memory; in the second line Byron wrote, “*Its massy waters,*” and in the next, “*Thus much the fathom-line.*”]

of anything being taken away); invariable, certainly in the case of lakes, but not absolutely necessary.

“The massy waters meet and flow.”

“Massy!” why massy? Because deep water is heavy. The word is a good word, but it is assuredly an added detail, and expresses a character, not which the Lake of Geneva has in common with all other lakes, but which it has in distinction from those which are narrow, or shallow.

§ 9. “Meet and flow.” Why meet and flow? Partly to make up a rhyme; partly to tell us that the waters are forceful as well as massy, and changeful as well as deep. Observe, a farther addition of details, and of details more or less peculiar to the spot, or, according to Reynolds’s definition, of “heavy matter, retarding the progress of the imagination.”

“So far the fathom line was sent.”

Why fathom line? All lines for sounding are not fathom lines. If the lake was ever sounded from Chillon, it was probably sounded in mètres, not fathoms. This is an addition of another particular detail, in which the only compliance with Reynolds’s requirement is, that there is some chance of its being an inaccurate one.

“From Chillon’s snow-white battlement.”

Why snow-white? Because castle battlements are not usually snow-white. This is another added detail, and a detail quite peculiar to Chillon, and therefore exactly the most striking word in the whole passage.

“Battlement!” Why battlement? Because all walls have not battlements, and the addition of the term marks the castle to be not merely a prison, but a fortress.

This is a curious result. Instead of finding, as we expected, the poetry distinguished from the history by the omission of details, we find it consist entirely in the *addition* of details; and instead of being characterised by regard only

of the invariable, we find its whole power to consist in the clear expression of what is singular and particular!

§ 10. The reader may pursue the investigation for himself in other instances. He will find in every case that a poetical is distinguished from a merely historical statement, not by being more vague, but more specific; and it might, therefore, at first appear that our author's comparison should be simply reversed, and that the Dutch School should be called poetical, and the Italian historical. But the term poetical does not appear very applicable to the generality of Dutch painting; and a little reflection will show us, that if the Italians represent only the invariable, they cannot be properly compared even to historians. For that which is incapable of change has no history, and records which state only the invariable need not be written, and could not be read.

§ 11. It is evident, therefore, that our author has entangled himself in some grave fallacy, by introducing this idea of invariableness as forming a distinction between poetical and historical art. What the fallacy is, we shall discover as we proceed; but as an invading army should not leave an untaken fortress in its rear, we must not go on with our inquiry into the views of Reynolds until we have settled satisfactorily the question already suggested to us, in what the essence of poetical treatment really consists. For though, as we have seen, it certainly involves the addition of specific details, it cannot be simply that addition which turns the history into poetry. For it is perfectly possible to add any number of details to a historical statement, and to make it more prosaic with every added word. As, for instance, "The lake was sounded out of a flat-bottomed boat, near the crab-tree at the corner of the kitchen-garden, and was found to be a thousand feet nine inches deep, with a muddy bottom." It thus appears that it is not the multiplication of details which constitutes poetry; nor their subtraction which constitutes history, but that there must be something either in the nature of the

details themselves, or the method of using them, which invests them with poetical power or historical propriety.

§ 12. It seems to me, and may seem to the reader, strange that we should need to ask the question, "What is poetry?" Here is a word we have been using all our lives, and, I suppose, with a very distinct idea attached to it; and when I am now called upon to give a definition of this idea, I find myself at a pause. What is more singular, I do not at present recollect hearing the question often asked, though surely it is a very natural one; and I never recollect hearing it answered, or even attempted to be answered. In general, people shelter themselves under metaphors, and while we hear poetry described as an utterance of the soul, an effusion of Divinity, or voice of nature, or in other terms equally elevated and obscure, we never attain anything like a definite explanation of the character which actually distinguishes it from prose.

§ 13. I come, after some embarrassment, to the conclusion, that poetry is "the suggestion, by the imagination, of noble grounds for the noble emotions."¹ I mean, by the noble emotions, those four principal sacred passions—Love, Veneration, Admiration, and Joy (this latter especially, if unselfish);² and their opposites—Hatred, Indignation (or Scorn), Horror, and Grief,—this last, when unselfish, becoming Compassion. These passions in their various combinations constitute what is called "poetical feeling," when they are felt on noble grounds, that is, on great and true grounds. Indignation, for instance, is a poetical feeling, if excited by serious injury; but it is not a poetical feeling if entertained on being cheated out of a small sum of money.³ It is very possible the manner of the cheat may have been

¹ ["1854 . . . Definition of Poetry, written at Vevay, looking across lake to Chillon. It leaves out rhythm, which I now consider a defect in said definition; otherwise good": see *Præterita*, iii. ch. i. § 10.]

² [Compare the line from Wordsworth—one of Ruskin's favourite lines from that poet—quoted in *Modern Painters*, vol. ii. (Vol. IV. p. 29), in *Fors Clavigera*, Letter 5, in *The Art of England*, § 38; see also *Unto this Last*, § 77.]

³ [On Righteous Anger, see also *Modern Painters*, vol. ii. (Vol. IV. p. 45); *Stones of Venice*, vol. ii. (Vol. X. p. 226); *Lectures on Art*, § 89.]

such as to justify considerable indignation; but the feeling is nevertheless not poetical unless the grounds of it be large as well as just. In like manner, energetic admiration may be excited in certain minds by a display of fireworks, or a street of handsome shops; but the feeling is not poetical, because the grounds of it are false, and therefore ignoble. There is in reality nothing to deserve admiration either in the firing of packets of gunpowder, or in the display of the stocks of warehouses. But admiration excited by the budding of a flower is a poetical feeling, because it is impossible that this manifestation of spiritual power and vital beauty can ever be enough admired.

§ 14. Farther, it is necessary to the existence of poetry that the grounds of these feelings should be *furnished by the imagination*. Poetical feeling, that is to say, mere noble emotion, is not poetry. It is happily inherent in all human nature deserving the name, and is found often to be purest in the least sophisticated. But the power of assembling, by *the help of the imagination*, such images as will excite these feelings, is the power of the poet or literally of the "Maker."*

* Take, for instance, the beautiful stanza in the "Affliction of Margaret":

"I look for ghosts, but none will force
Their way to me. 'Tis falsely said
That ever there was intercourse
Between the living and the dead;
For, surely, then, I should have sight
Of him I wait for, day and night,
With love and longing infinite."

This we call Poetry, because it is invented or *made* by the writer, entering into the mind of a supposed person. Next, take an instance of the actual feeling truly experienced and simply expressed by a real person.

"Nothing surprised me more than a woman of Argentière, whose cottage I went into to ask for milk, as I came down from the glacier of Argentière, in the month of March, 1764. An epidemic dysentery had prevailed in the village, and, a few months before, had taken away from her, her father, her husband, and her brothers, so that she was left alone, with three children in the cradle. Her face had something noble in it, and its expression bore the seal of a calm and profound sorrow. After having given me milk, she asked me whence I came, and what I came there to do, so early

Now this power of exciting the emotions depends of course on the richness of the imagination, and on its choice of those images which, in combination, will be most effective, or, for the particular work to be done, most fit. And it is altogether impossible for a writer not endowed with invention to conceive what tools a true poet will make use of, or in what way he will apply them, or what unexpected results he will bring out by them; so that it is vain to say that the details of poetry ought to possess, or ever do possess, any *definite* character. Generally speaking, poetry runs into finer and more delicate details than prose; but the details are not poetical because they are more delicate, but because they are employed so as to bring out an affecting result. For instance, no one but a true poet would have thought of exciting our pity for a bereaved father by describing his way of locking the door of his house:

“Perhaps to himself at that moment he said,
 ‘The key I must take, for my Ellen is dead.’
 But of this in my ears not a word did he speak;
 And he went to the chase with a tear on his cheek.”¹

In like manner, in painting, it is altogether impossible

in the year. When she knew that I was of Geneva, she said to me, ‘she could not believe that all Protestants were lost souls; that there were many honest people among us, and that God was too good and too great to condemn all without distinction.’ Then, after a moment of reflection, she added, in shaking her head, ‘But that which is very strange is that of so many who have gone away, none have ever returned. I,’ she added, with an expression of grief, ‘who have so mourned my husband and my brothers, who have never ceased to think of them, who every night conjure them with beseechings to tell me where they are, and in what state they are! Ah, surely, if they lived anywhere, they would not leave me thus! But, perhaps,’ she added, ‘I am not worthy of this kindness, perhaps the pure and innocent spirits of these children,’ and she looked at the cradle, ‘may have their presence, and the joy which is denied to me.’”—SAUSSURE, *Voyages dans les Alpes*, chap. xxiv.

This we do not call Poetry, merely because it is not invented, but the true utterance of a real person.

¹ [Wordsworth: the last lines of “The Childless Father.”]

to say beforehand what details a great painter may make poetical by his use of them to excite noble emotions: and we shall, therefore, find presently that a painting is to be classed in the great or inferior schools, not according to the kind of details which it represents, but according to the uses for which it employs them.

§ 15. It is only farther to be noticed, that infinite confusion has been introduced into this subject by the careless and illogical custom of opposing painting to poetry, instead of regarding poetry as consisting in a noble use, whether of colours or words. Painting is properly to be opposed to *speaking* or *writing*, but not to *poetry*. Both painting and speaking are methods of expression. Poetry is the employment of either for the noblest purposes.

§ 16. This question being thus far determined, we may proceed with our paper in the *Idler*.

"It is very difficult to determine the exact degree of enthusiasm that the arts of Painting and Poetry may admit. There may, perhaps, be too great an indulgence as well as too great a restraint of imagination; if the one produces incoherent monsters, the other produces what is full as bad, lifeless insipidity. An intimate knowledge of the passions, and good sense, but not common sense, must at last determine its limits. It has been thought, and I believe with reason, that Michael Angelo sometimes transgressed those limits; and, I think, I have seen figures of him of which it was very difficult to determine whether they were in the highest degree sublime or extremely ridiculous. Such faults may be said to be the ebullitions of genius; but at least he had this merit, that he never was insipid; and whatever passion his works may excite, they will always escape contempt.

"What I have had under consideration is the sublimest style, particularly that of Michael Angelo, the Homer of painting. Other kinds may admit of this naturalness, which of the lowest kind is the chief merit; but in painting,

as in poetry, the highest style has the least of common nature.”

From this passage we gather three important indications of the supposed nature of the Great Style. That it is the work of men in a state of enthusiasm. That it is like the writing of Homer; and that it has as little as possible of “common nature” in it.

§ 17. First, it is produced by men in a state of enthusiasm. That is, by men who feel *strongly* and *nobly*; for we do not call a strong feeling of envy, jealousy, or ambition, enthusiasm. That is, therefore, by men who feel poetically. This much we may admit, I think, with perfect safety. Great art is produced by men who feel acutely and nobly; and it is in some sort an expression of this personal feeling. We can easily conceive that there may be a sufficiently marked distinction between such art, and that which is produced by men who do not feel at all, but who reproduce, though ever so accurately, yet coldly, like human mirrors, the scenes which pass before their eyes.

§ 18. Secondly, Great Art is like the writing of Homer, and this chiefly because it has little of “common nature” in it. We are not clearly informed what is meant by common nature in this passage. Homer seems to describe a great deal of what is common:—cookery, for instance, very carefully in all its processes.¹ I suppose the passage in the *Iliad* which, on the whole, has excited most admiration, is that which describes a wife’s sorrow at parting from her husband, and a child’s fright at its father’s helmet;² and I hope, at least, the former feeling may be considered “common nature.” But the true greatness of Homer’s style is, doubtless, held by our author to consist in his imaginations of things not only uncommon but impossible (such as spirits in brazen armour, or monsters with heads of men and bodies of beasts), and in his occasional delineations of

¹ [See, for instance, *Iliad*, i. 463 *seq.*]

² [*Iliad*, vi. 468.]

the human character and form in their utmost, or heroic, strength and beauty. We gather then on the whole, that a painter in the Great Style must be enthusiastic, or full of emotion, and must paint the human form in its utmost strength and beauty, and perhaps certain impossible forms besides, liable by persons not in an equally enthusiastic state of mind to be looked upon as in some degree absurd. This I presume to be Reynolds’s meaning, and to be all that he intends us to gather from his comparison of the Great Style with the writings of Homer. But if that comparison be a just one in all respects, surely two other corollaries ought to be drawn from it, namely,—first, that these Heroic or Impossible images are to be mingled with others very unheroic and very possible; and, secondly, that in the representation of the Heroic or Impossible forms, the greatest care must be taken in *finishing the details*, so that a painter must not be satisfied with painting well the countenance and the body of his hero, but ought to spend the greatest part of his time (as Homer the greatest number of verses) in elaborating the sculptured pattern on his shield.

§ 19. Let us, however, proceed with our paper.

“One may very safely recommend a little more enthusiasm to the modern Painters; too much is certainly not the vice of the present age. The Italians seem to have been continually declining in this respect from the time of Michael Angelo to that of Carlo Maratti,¹ and from thence to the very bathos of insipidity to which they are now sunk; so that there is no need of remarking, that where I mentioned the Italian painters in opposition to the Dutch, I mean not the moderns, but the heads of the old Roman and Bolognian Schools; nor did I mean to include, in my idea of an Italian painter, the Venetian school, *which may be said to be the Dutch part of the Italian genius*.

¹ [Called also Carlo delle Madonne, 1625–1713. There is a portrait by him in the National Gallery, No. 174.]

I have only to add a word of advice to the Painters,—that, however excellent they may be in painting naturally, they would not flatter themselves very much upon it; and to the Connoisseurs, that when they see a cat or a fiddle painted so finely, that, as the phrase is, it looks as if you could take it up, they would not for that reason immediately compare the Painter to Raffaele and Michael Angelo.”

In this passage there are four points chiefly to be remarked. The first, that in the year 1759 the Italian painters were, in our author’s opinion, sunk in the very bathos of insipidity. The second, that the Venetian painters, *i.e.*, Titian, Tintoret, and Veronese, are, in our author’s opinion, to be classed with the Dutch; that is to say, are painters in a style “in which the slowest intellect is always sure to succeed best.” Thirdly, that painting naturally is not a difficult thing, nor one on which a painter should pride himself. And, finally, that connoisseurs, seeing a cat or a fiddle successfully painted, ought not therefore immediately to compare the painter to Raphael or Michael Angelo.

Yet Raphael painted fiddles very carefully in the foreground of his St. Cecilia,—so carefully, that they quite look as if they might be taken up. So carefully, that I never yet looked at the picture without wishing that somebody *would* take them up, and out of the way.¹ And I am under a very strong persuasion that Raphael did not think painting “naturally” an easy thing. It will be well to examine into this point a little; and for the present, with the reader’s permission, we will pass over the first two statements in this passage (touching the character of Italian art in 1759, and of Venetian art in general), and immediately examine some of the evidence existing as to the real dignity of “natural” painting—that is to say, of painting carried to the point at which it reaches a deceptive appearance of reality.

¹ [See again, below, ch. ii. § 1; and for other references to the picture, Vol. IV. p. 212.]

CHAPTER II

OF REALIZATION

§ 1. IN the outset of this inquiry, the reader must thoroughly understand that we are not now considering *what* is to be painted, but *how far* it is to be painted. Not whether Raphael does right in representing angels playing upon violins, or whether Veronese does right in allowing cats and monkeys to join the company of kings:¹ but whether, supposing the subjects rightly chosen, they ought on the canvas to look like real angels with real violins, and substantial cats looking at veritable kings; or only like imaginary angels with soundless violins, ideal cats, and unsubstantial kings.

Now, from the first moment when painting began to be a subject of literary inquiry and general criticism, I cannot remember any writer, not professedly artistical, who has not, more or less, in one part of his book or another, countenanced the idea that the great end of art is to produce a deceptive resemblance of reality. It may be, indeed, that we shall find the writers, through many pages, explaining principles of ideal beauty, and professing great delight in the evidences of imagination. But whenever a picture is to be definitely described,—whenever the writer desires to convey to others some impression of an extraordinary excellence, all praise is wound up with some such statements as these: “It was so exquisitely painted that you expected the figures to move and speak; you approached the flowers to enjoy their smell, and stretched your hand towards the fruit which had fallen from the branches. You shrunk back lest

¹ [For Veronese’s own view of this matter, see the passage quoted by Ruskin in an appendix to his *Guide to the Academy at Venice*.]

the sword of the warrior should indeed descend, and turned away your head that you might not witness the agonies of the expiring martyr.”

§ 2. In a large number of instances, language such as this will be found to be merely a clumsy effort to convey to others a sense of the admiration, of which the writer does not understand the real cause in himself. A person is attracted to a picture by the beauty of its colour, interested by the liveliness of its story, and touched by certain countenances or details which remind him of friends whom he loved, or scenes in which he delighted. He naturally supposes that what gives him so much pleasure must be a notable example of the painter's skill; but he is ashamed to confess, or perhaps does not know, that he is so much a child as to be fond of bright colours and amusing incidents; and he is quite unconscious of the associations which have so secret and inevitable a power over his heart. He casts about for the cause of his delight, and can discover no other than that he thought the picture like reality.

§ 3. In another, perhaps, a still larger number of cases, such language will be found to be that of simple ignorance—the ignorance of persons whose position in life compels them to speak of art, without having any real enjoyment of it. It is inexcusably required from people of the world that they should see merit in Claudes and Titians; and the only merit which many persons can either see or conceive in them is, that they must be “like nature.”

§ 4. In other cases, the deceptive power of the art is really felt to be a source of interest and amusement. This is the case with a large number of the collectors of Dutch pictures. They enjoy seeing what is flat made to look round, exactly as a child enjoys a trick of legerdemain: they rejoice in flies which the spectator vainly attempts to brush away,¹ and in dew which he endeavours to dry by

¹ [See Ruskin's remarks on Vasari's anecdote of the fly supposed to have been painted by Giotto upon the nose of one of Cimabue's pictures, “Review of Lord Lindsay,” § 45 (Vol. XII. p. 213). On the subject of pictures as windows, see

putting the picture in the sun. They take it for the greatest compliment to their treasures that they should be mistaken for windows; and think the parting of Abraham and Hagar adequately represented if Hagar seems to be really crying.

It is against critics and connoisseurs of this latter stamp (of whom in the year 1759, the juries of art were for the most part composed) that the essay of Reynolds, which we have been examining, was justly directed. But Reynolds had not sufficiently considered that neither the men of this class, nor of the two other classes above described, constitute the entire body of those who praise Art for its realization; and that the holding of this apparently shallow and vulgar opinion cannot, in all cases, be attributed to the want either of penetration, sincerity, or sense. The collector of Gerard Dows and Hobbimas may be passed by with a smile; and the affectations of Walpole and simplicities of Vasari¹ dismissed with contempt or with compassion. But very different men from these have held precisely the same language; and one, amongst the rest, whose authority is absolutely, and in all points, overwhelming.

§ 5. There was probably never a period in which the influence of art over the minds of men seemed to depend less on its merely *imitative* power, than the close of the thirteenth century. No painting or sculpture at that time reached more than a rude resemblance of reality. Its despised perspective, imperfect chiaroscuro, and unrestrained flights of fantastic imagination, separated the artist's work from nature by an interval which there was no attempt to disguise, and little to diminish. And yet, at this very period, the greatest poet of that, or perhaps of any other age, and the attached friend of its greatest painter,² who

below, ch. x., pp. 171–173. The picture of Abraham and Hagar, often praised for its accurate delineation of a tear-drop, is the one by Guercino in the Brera at Milan: see *Modern Painters*, vol. ii. (Vol. IV. p. 203 n.).]

¹ [For Ruskin's opinion of Vasari, see note on Vol. XII. p. 258 n.]

² [So in the *Stones of Venice*, Ruskin calls Dante "the central man of all the world": see Vol. XI. p. 187, and compare Vol. XII. p. 477. For the relations of Dante and Giotto, see *Modern Painters*, Vol. ii. (Vol. IV. p. 188), and in this volume, ch. xviii. § 2; *Stones of Venice*, vol. ii. (Vol. X. p. 400); *Ariadne Florentina*, § 58; and *Mornings in Florence*, §§ 2, 6, 26, 48, 53.]

must over and over again have held full and free conversation with him respecting the objects of his art, speaks in the following terms of painting and sculpture,¹ supposed to be carried to its highest perfection:—

“Qual di pannel fu maestro, e di stile,
 Che ritraesse l’ ombre e i tratti, ch’ ivi
 Mirar farieno uno ingegno sottile?
 Morti li morti, e i vivi parean vivi:
 Non vide me’ di me, chi vide il vero,
 Quant’ io calcai, fin che chinato givi.”
 —DANTE, *Purgatorio*, canto xii. l. 64.

“What master of the pencil, or the style,
 Had traced the shades and lines that might have made
 The subtlest workman wonder? *Dead, the dead,*
The living seemed alive; with clearer view,
His eye beheld not, who beheld the truth,
 Than mine what I did tread on, while I went
 Low bending.” —CARY.

Dante has here clearly no other idea of the highest art than that it should bring back, as a mirror or vision, the aspect of things passed or absent.² The scenes of which he speaks are, on the pavement, for ever represented by angelic power, so that the souls which traverse this circle of the rock may see them, as if the years of the world had been rolled back, and they again stood beside the actors in the moment of action. Nor do I think that Dante’s authority is absolutely necessary to compel us to admit that such art as this *might*, indeed, be the highest possible. Whatever delight we may have been in the habit of taking in pictures, if it were but truly offered to us, to remove at our will the canvas from the frame, and in lieu of it to behold, fixed for ever, the image of some of those mighty scenes which it has been our way to make mere themes for the artist’s fancy; if, for instance, we could again behold the Magdalene receiving her pardon at Christ’s feet, or the disciples sitting with Him at the table of Emmaus; and this,

¹ [The words “and sculpture” are here inserted in accordance with Ruskin’s copy for revision. He no doubt remembered that in the passage quoted Dante is describing not paintings but sculpture, or rather “graffiti.” In the first line of the quotation “o di stile” is now the accepted reading.]

² [See, for example, *Purgatorio*, x. 31 *seq.*]

not feebly nor fancifully, but as if some silver mirror that had leaned against the wall of the chamber, had been miraculously commanded to retain for ever the colours that had flashed upon it for an instant,—would we not part with our picture—Titian’s or Veronese’s though it might be?¹

§ 6. Yes, the reader answers, in the instance of such scenes as these, but not if the scene represented were uninteresting. Not, indeed, if it were utterly vulgar or painful; but we are not yet certain that the art which represents what is vulgar or painful is itself of much value; and with respect to the art whose aim is beauty, even of an inferior order, it seems that Dante’s idea of its perfection has still much evidence in its favour. For among persons of native good sense, and courage enough to speak their minds, we shall often find a considerable degree of doubt as to the use of art, in consequence of their habitual comparison of it with reality. “What is the use, to me, of the painted landscape?” they will ask: “I see more beautiful and perfect landscapes every day of my life in my forenoon walk.” “What is the use, to me, of the painted effigy of hero or beauty? I can see a stamp of higher heroism, and light of purer beauty, on the faces round me, utterly inexpressible by the highest human skill.”² Now, it is evident that to persons of this temper the only valuable pictures would, indeed, be *mirrors*, reflecting permanently the images of the things in which they took delight, and of the faces that they loved.³ “Nay,” but the reader interrupts

¹ [For the particular works by Veronese referred to, see § 10 of the next chapter; for Titian’s “Emmaus” see “Notes on the Louvre” in Vol. XII. p. 451, and *Modern Painters*, vol. v. pt. ix. ch. vi. § 13.]

² [In one draft of the chapter Ruskin here continued:—

“And, indeed, I think these persons much in the right. They know little of rural nature, who cannot see, in every hundred yards of her wild roads, landscapes more fair than were ever painted by human hand. They know little of humanity, whose only conceptions of heroism are formed from statues, and whose sympathy or reverence is excitable only by arched eyebrows and well turned limbs.”]

³ [In his copy for revision Ruskin notes here, “Quote Carlyle on Frederick picture.” The reference is to *Friedrich*, book iv. ch. vi.: “Why it is, probably, that Pictures exist in this world, and to what end the divine art of Painting was bestowed, by the earnest gods, upon poor mankind? I could advise it, once, for

(if he is of the Idealist school), “I deny that more beautiful things are to be seen in nature than in art; on the contrary, everything in nature is faulty, and art represents nature as perfected.” Be it so. Must, therefore, this perfected nature be imperfectly represented? Is it absolutely required of the painter, who has conceived perfection, that he should so paint it as to look only like a picture? Or is not Dante’s view of the matter right even here, and would it not be well that the perfect conception of Pallas should be so given as to look like Pallas herself, rather than merely like a picture of Pallas?¹

§ 7. It is not easy for us to answer this question rightly, owing to the difficulty of imagining any art which should reach the perfection supposed. Our actual powers of imitation are so feeble that wherever deception is attempted, a subject of a comparatively low or confined order must be chosen. I do not enter at present into the inquiry how far the powers of imitation extend; but assuredly up to the present period they have been so limited that it is hardly possible for us to conceive a deceptive art embracing a high range of subject. But let the reader make the effort, and consider seriously what he would give at any moment to have the power of arresting the fairest scenes, those which so often rise before him only to vanish; to stay the cloud in its fading, the leaf in its trembling, and the shadows in their changing; to bid the fitful foam be fixed upon the river, and the ripples be everlasting upon the lake; and then to bear away with him no darkened or feeble sun-stain (though even that is beautiful), but a counterfeit which should seem no counterfeit—the true and perfect image of life indeed.² Or rather (for the full majesty of such a power is not thus sufficiently expressed) let him consider that it

a little! . . . I say, Here withal is one not phantasmal; of indisputable certainty. . . . Welcome, like one tiny islet of Reality amid the shoreless sea of Phantasms, to the reflective mind, seriously loving and seeking what is worthy and memorable, seriously hating and avoiding what is the reverse, and intent not to play the dilettante in this world.”]

¹ [See *Purgatorio*, xii. 31.]

² [Compare *Lectures on Art*, § 187, where Ruskin quotes and applies this passage.]

would be in effect nothing else than a capacity of transporting himself at any moment into any scene—a gift as great as can be possessed by a disembodied spirit: and suppose, also, this necromancy embracing not only the present but the past, and enabling us seemingly to enter into the very bodily presence of men long since gathered to the dust; to behold them in act as they lived, but—with greater privilege than ever was granted to the companions of those transient acts of life—to see them fastened at our will in the gesture and expression of an instant, and stayed, on the eve of some great deed, in immortality of burning purpose. Conceive, so far as it is possible, such power as this, and then say whether the art which conferred it is to be spoken lightly of, or whether we should not rather reverence, as half divine, a gift which would go so far as to raise us into the rank, and invest us with the felicities, of angels?¹

Yet such would imitative art be in its perfection. Not by any means an easy thing, as Reynolds supposes it. Far from being easy, it is so utterly beyond all human power that we have difficulty even in conceiving its nature or results—the best art we as yet possess comes so far short of it.

§ 8. But we must not rashly come to the conclusion that such art would, indeed, be the highest possible. There is much to be considered hereafter on the other side; the only conclusion we are as yet warranted in forming is, that Reynolds had no right to speak lightly or contemptuously of imitative art; that in fact, when he did so, he had not conceived its entire nature, but was thinking of some vulgar conditions of it, which were the only ones known to him,

¹ [In *Fronde Agrestes*, Section ii., “Power and Office of Imagination,” a passage from chapter iv. (§ 5, below, p. 72) is first given (§ 9 in *Fronde*); then (at the beginning of § 10) the following words are inserted as a connecting link: “Yet because we thus reverence the power and art of imagination, let none of us despise the power and art of memory;” and then the passage here follows: “Let the reader consider seriously what he would give . . .” down to “felicities of angels,” at which latter point Ruskin adds in *Fronde* (1875), the following note:—

“Passage written in opposition to the vulgar notion that the ‘mere imitation’ of nature is easy, and useless.”]

and that, therefore, his whole endeavour to explain the difference between great and mean art has been disappointed; that he has involved himself in a crowd of theories, whose issue he had not foreseen, and committed himself to conclusions which he never intended. There is an instinctive consciousness in his own mind of the difference between high and low art; but he is utterly incapable of explaining it, and every effort which he makes to do so involves him in unexpected fallacy and absurdity. It is *not* true that Poetry does not concern herself with minute details. It is *not* true that high art seeks only the Invariable. It is *not* true that imitative art is an easy thing. It is *not* true that the faithful rendering of nature is an employment in which "the slowest intellect is likely to succeed best." All these successive assertions are utterly false and untenable, while the plain truth, a truth lying at the very door, has all the while escaped him,—that which was incidentally stated in the preceding chapter,—namely, that the difference between great and mean art lies, not in definable methods of handling, or styles of representation, or choices of subjects, but wholly in the nobleness of the end to which the effort of the painter is addressed. We cannot say that a painter is great because he paints boldly, or paints delicately; because he generalizes or particularizes; because he loves detail, or because he disdains it. He is great if, by any of these means, he has laid open noble truths, or aroused noble emotions. It does not matter whether he paint the petal of a rose, or the chasms of a precipice, so that Love and Admiration attend him as he labours, and wait for ever upon his work. It does not matter whether he toil for months upon a few inches of his canvas, or cover a palace front with colour in a day, so only that it be with a solemn purpose that he has filled his heart with patience, or urged his hand to haste. And it does not matter whether he seek for his subjects among peasants or nobles, among the heroic or the simple, in courts or in fields, so only that he behold all things with a thirst for beauty, and a hatred

of meanness and vice. There are, indeed, certain methods of representation which are usually adopted by the most active minds, and certain characters of subject usually delighted in by the noblest hearts; but it is quite possible, quite easy, to adopt the manner of painting without sharing the activity of mind, and to imitate the choice of subject without possessing the nobility of spirit; while, on the other hand, it is altogether impossible to foretell on what strange objects the strength of a great man will sometimes be concentrated, or by what strange means he will sometimes express himself. So that true criticism of art never can consist in the mere application of rules; it can be just only when it is founded on quick sympathy with the innumerable instincts and changeful efforts of human nature, chastened and guided by unchanging love of all things that God has created to be beautiful, and pronounced to be good.¹

¹ [An earlier draft of the concluding portion of this chapter is different:—

“Let either the artist base his efforts, or the critic his opinion, on a *desire to be great*, and they are as sure to fall into a spurious art, and a false judgment, as if they had deliberately chosen the paths of Darkness. Both of them must love what is beautiful and right for its own sake, and must follow it, and judge of it, by instinct. . . . They may rest assured that they are never right but when they were working for enjoyment, or judging by enjoyment; if they enjoy what is wrong, they may discipline themselves, so as to enjoy something else, but if they once pretend that they enjoy what they do not, it is all over with them. One honest question, therefore, will always keep both artists and critics right: ‘Do I heartily love this? Am I doing it for love of it? Am I praising it for love of it? If not, I will not do it, I will not praise it.’ ”

This earlier draft much resembles a passage in *The Two Paths*, § 49.]

CHAPTER III

OF THE REAL NATURE OF GREATNESS OF STYLE

§ 1. I DOUBT not that the reader was ill-satisfied with the conclusion arrived at in the last chapter. That “great art” is art which represents what is beautiful and good, may not seem a very profound discovery; and the main question may be thought to have been all the time lost sight of, namely, “What is beautiful, and what is good?” No; those are not the main, at least not the first questions; on the contrary, our subject becomes at once opened and simplified as soon as we have left those the *only* questions.¹ For observe, our present task, according to our old plan, is merely to investigate the relative degrees of the *beautiful* in the art of different masters; and it is an encouragement to be convinced, first of all, that what is lovely will also be great, and what is pleasing, noble. Nor is the conclusion so much a matter of course as it at first appears, for, surprising as the statement may seem, all the confusion into which Reynolds has plunged both himself and his readers, in the essay we have been examining, results primarily from a doubt in his own mind *as to the existence of beauty*

¹ [In a previous draft of the chapter Ruskin here says that the conclusion already reached at any rate had the advantage of widening our scope of admiration:—

“If it was determined to hold with the writer whose opinion we have been examining that Michael Angelo’s was the great manner, we should have been compelled to pass by Angelico and Rembrandt with contempt. If we allowed ourselves to be convinced by any of the arguments adduced in favour of merely imitative art, and assumed realization to be the test of powers, a few cabinet pictures of Mieris might have been constituted the types, and fixed the limits of our admiration. But our present conclusion, though somewhat vague, is at least liberal; and though it may seem to multiply the chances of mistake, multiplies also the permissions of enjoyment. It is curious how much mankind stand in need of such permission:—how they ask one another’s leave to follow their own instincts.”]

at all. In the next paper I alluded to, No. 82 (which needs not, however, to be examined at so great length), he calmly attributes the whole influence of beauty to custom, saying, that “he has no doubt, if we were more used to deformity than to beauty, deformity would then lose the idea now annexed to it, and take that of beauty; as if the whole world should agree that Yes and No should change their meanings; Yes would then deny, and No would affirm!”

§ 2. The world does, indeed, succeed—oftener than is, perhaps, altogether well for the world—in making Yes mean No, and No mean Yes.* But the world has never succeeded, nor ever will, in making itself delight in black clouds more than in blue sky, or love the dark earth better than the rose that grows from it. Happily for mankind, beauty and ugliness are as positive in their nature as physical pain and pleasure, as light and darkness, or as life and death; and though they may be denied or misunderstood in many fantastic ways, the most subtle reasoner will at last find that colour and sweetness are still attractive to him, and that no logic will enable him to think the rainbow sombre, or the violet scentless. But the theory that beauty was merely a result of custom was very common in Johnson’s time. Goldsmith has, I think, expressed it with more force and wit than any other writer, in various passages of the *Citizen of the World*.¹ And it was, indeed, a curious retribution of the folly of the world of art, which for some three centuries had given itself recklessly to the

* De no per li denar vi si far “ita.”²

¹ [Compare *Modern Painters*, vol. ii. (Vol. IV. p. 67), where (in a note of 1883) *The Citizen of the World* is again referred to in this connexion. See especially Letter 3 *ad fin.*: “To speak my secret sentiments, most reverend Fum, the ladies here are horribly ugly; I can hardly endure the sight of them; they no way resemble the beauties of China; the Europeans have a quite different idea of beauty from us. When I reflect on the small-footed perfections of an Eastern beauty, how is it possible I should have eyes for a woman whose feet are ten inches long . . . and teeth of a most odious whiteness.”]

² [Dante: *Inferno*, xxi. 42: “Of ‘no’ for lucre there an ‘ay’ is quickly made” (Cary).]

pursuit of beauty, that at last it should be led to deny the very existence of what it had so morbidly and passionately sought. It was as if a child should leave its home to pursue the rainbow, and then, breathless and hopeless, declare that it did not exist. Nor is the lesson less useful which may be gained in observing the adoption of such a theory by Reynolds himself. It shows how completely an artist may be unconscious of the principles of his own work, and how he may be led by instinct to *do* all that is right, while he is misled by false logic to *say* all that is wrong. For nearly every word that Reynolds wrote was contrary to his own practice; he seems to have been born to teach all error by his precept, and all excellence by his example;¹ he enforced with his lips generalization and idealism, while with his pencil he was tracing the patterns of the dresses of the belles of his day; he exhorted his pupils to attend only to the invariable, while he himself was occupied in distinguishing every variation of womanly temper; and he denied the existence of the beautiful, at the same instant that he arrested it as it passed, and perpetuated it for ever.

§ 3. But we must not quit the subject here. However inconsistently or dimly expressed, there is, indeed, some truth in that commonly accepted, distinction between high and low art.² That a thing should be beautiful is not enough; there is, as we said in the outset, a higher and lower range of beauty, and some ground for separating into various and unequal ranks painters who have, nevertheless, each in his several way, represented something that was beautiful or good.

Nor, if we would, can we get rid of this conviction.

¹ [In his Oxford lectures (1875) on “The *Discourses* of Sir Joshua Reynolds”—of which the MS. notes are printed in a later volume of this edition—Ruskin cited this passage at once to confirm and to correct it. Reynolds, he said, “seems to have been born to teach all error by his example; but that is because the only errors that were to be found in his precept were seized upon as its essence by scholars determined to err.”]

² [See Appendix v., below, p. 433, for some additional matter on the subject of “greatness.”]

We have at all times some instinctive sense that the function of one painter is greater than of another, even supposing each equally successful in his own way; and we feel that, if it were possible to conquer prejudice, and do away with the iniquities of personal feeling, and the insufficiencies of limited knowledge, we should all agree in this estimate, and be able to place each painter in his right rank, measuring them by a true scale of nobleness. We feel that the men in the higher classes of the scale would be, in the full sense of the word, Great,—men whom one would give much to see the faces of but for an instant; and that those in the lower classes of the scale (though none were admitted but who had true merit of some kind) would be very small men, not greatly exciting either reverence or curiosity. And with this fixed instinct in our minds, we permit our teachers daily to exhort their pupils to the cultivation of “great art,”—neither they nor we having any very clear notion as to what the greatness consists in: but sometimes inclining to think it must depend on the space of the canvas, and that art on a scale of six feet by ten is something spiritually separated from that on a scale of three feet by five;—sometimes holding it to consist in painting the nude body, rather than the body decently clothed;—sometimes being convinced that it is connected with the study of past history, and that the art is only great which represents what the painter never saw, and about which he knows nothing;—and sometimes being firmly persuaded that it consists in generally finding fault with, and endeavouring to mend, whatsoever the Divine wisdom has made. All which various errors, having yet some notes and atoms of truth in the make of each of them, deserve some attentive analysis, for they come under that general law,—that “the corruption of the best is the worst.”¹ There are not *worse* errors going than these four; and yet the truth they contain, and the instinct which urges

¹ [For other passages in which Ruskin dwells (in various relations) on this proverbial saying, see *Time and Tide*, §§ 52, 53, 139; and *Munera Pulveris*, § 100.]

many to preach them, are at the root of all healthy growth in art. We ruin one young painter after another by telling him to follow great art, without knowing ourselves what greatness is; and yet the feeling that it verily *is* something, and that there are depths and breadths, shallows and narrows, in the matter, is all that we have to look to, if we would ever make our art serviceable to ourselves or others. To follow art for the sake of being a great man, and therefore to cast about continually for some means of achieving position or attracting admiration, is the surest way of ending in total extinction.¹ And yet it is only by honest reverence for art itself, and by great self-respect in the practice of it, that it can be rescued from dilettanteism, raised to approved honourableness, and brought to the proper work it has to accomplish in the service of man.

§ 4. Let us therefore look into the facts of the thing, not with any metaphysical, or otherwise vain and troublesome effort at acuteness, but in a plain way; for the facts themselves are plain enough, and may be plainly stated, only the difficulty is, that out of these facts, right and left, the different forms of misapprehension branch into grievous complexity, and branch so far and wide, that if once we try to follow them, they will lead us quite from our mark into other separate, though not less interesting discussions. The best way will be, therefore, I think, to sketch out at once in this chapter, the different characters which really constitute “greatness” of style, and to indicate the principal directions of the outbranching misapprehensions of them; then, in the succeeding chapters, to take up in succession those which need more talk about them, and follow out at leisure whatever inquiries they may suggest.

§ 5. I. CHOICE OF NOBLE SUBJECT.—Greatness of style consists, then: first, in the habitual choice of subjects of thought which involve wide interests and profound passions,

¹ [Compare *Pre-Raphaelitism*, § 55, where Ruskin says that when Turner fails, it is because he “set himself to excel himself” (Vol. XII. p. 385).]

as opposed to those which involve narrow interests and slight passions. The style is greater or less in exact proportion to the nobleness of the interests and passions involved in the subject. The habitual choice of sacred subjects, such as the Nativity, Transfiguration, Crucifixion (if the choice be sincere), implies that the painter has a natural disposition to dwell on the highest thoughts of which humanity is capable; it constitutes him so far forth a painter of the highest order, as, for instance, Leonardo, in his painting of the Last Supper: he who delights in representing the acts or meditations of great men, as, for instance, Raphael painting the School of Athens, is, so far forth, a painter of the second order: he who represents the passions and events of ordinary life, of the third. And in this ordinary life, he who represents deep thoughts and sorrows, as, for instance, Hunt, in his *Claudio and Isabella*,¹ and such other works, is of the highest rank in his sphere; and he who represents the slight malignities and passions of the drawing-room, as, for instance, Leslie, of the second rank; he who represents the sports of boys, or simplicities of clowns, as Webster or Teniers, of the third rank; and he who represents brutalities and vices (for delight in them, and not for rebuke of them), of no rank at all, or rather of a negative rank, holding a certain order in the abyss.

§ 6. The reader will, I hope, understand how much importance is to be attached to the sentence in the first parenthesis, “if the choice be sincere;” for choice of subject is, of course, only available as a criterion of the rank of the painter, when it is made from the heart. Indeed, in the lower orders of painting, the choice is always made from such a heart as the painter has; for his selection of the brawls of peasants or sports of children can, of course,

¹ [For Ruskin’s notices of this picture by Holman Hunt (exhibited at the Royal Academy in 1853), see Vol. XII. p. 160; for his appreciation of C. R. Leslie’s mastery “of the phases of such delicate expression on the human face as may be excited by the slight passions and humours of the drawing-room,” *Academy Notes*, 1855 (supplement); and for a notice of Webster, *Academy Notes*, 1858 (No. 119). For Teniers, see General Index.]

proceed only from the fact that he has more sympathy with such brawls or pastimes than with nobler subjects. But the choice of the higher kind of subjects is often insincere; and may, therefore, afford no real criterion of the painter's rank. The greater number of men who have lately painted religious or heroic subjects have done so in mere ambition, because they had been taught that it was a good thing to be a "high art" painter; and the fact is that in nine cases out of ten, the so-called historical or "high art" painter is a person infinitely inferior to the painter of flowers or still life. He is, in modern times, nearly always a man who has great vanity without pictorial capacity, and differs from the landscape or fruit painter merely in misunderstanding and over-estimating his own powers. He mistakes his vanity for inspiration, his ambition for greatness of soul, and takes pleasure in what he calls "the ideal," merely because he has neither humility nor capacity enough to comprehend the real.

§ 7. But also observe, it is not enough even that the choice be sincere. It must also be wise. It happens very often that a man of weak intellect, sincerely desiring to do what is good and useful, will devote himself to high art subjects because he thinks them the only ones on which time and toil can be usefully spent, or, sometimes, because they are really the only ones he has pleasure in contemplating. But not having intellect enough to enter into the minds of truly great men, or to imagine great events as they really happened, he cannot become a great painter; he degrades the subjects he intended to honour, and his work is more utterly thrown away, and his rank as an artist in reality lower, than if he had devoted himself to the imitation of the simplest objects of natural history. The works of Overbeck are a most notable instance of this form of error.¹

¹ [For a further criticism of Johann Friedrich Overbeck (1789–1869), the leader of the modern religious movement in German art, see *Lectures on Landscape* (1871), § 83.]

§ 8. It must also be remembered, that in nearly all the great periods of art the choice of subject has not been left to the painter. His employer,—abbot, baron, or monarch,—determined for him whether he should earn his bread by making cloisters bright with choirs of saints, painting coats of arms on leaves of romances, or decorating presence chambers with complimentary mythology; and his own personal feelings are ascertainable only by watching, in the themes assigned to him, what are the points in which he seems to take most pleasure. Thus, in the prolonged ranges of varied subjects with which Benozzo Gozzoli decorated the cloisters of Pisa, it is easy to see that love of simple domestic incident, sweet landscape, and glittering ornament, prevails slightly over the solemn elements of religious feeling, which, nevertheless, the spirit of the age instilled into him in such measure as to form a very lovely and noble mind, though still one of the second order. In the work of Orcagna, an intense solemnity and energy in the sublimest groups of his figures, fading away as he touches inferior subjects, indicates that his home was among the archangels,¹ and his rank among the first of the sons of men; while Correggio, in the sidelong grace, artificial smiles, and purple languors of his saints, indicates the inferior instinct which would have guided his choice in quite other directions, had it not been for the fashion of the age, and the need of the day.²

§ 9. It will follow, of course, from the above considerations, that the choice which characterizes the school of high art is seen as much in the treatment of a subject as in its selection, and that the expression of the thoughts of the persons represented will always be the first thing considered by the painter who worthily enters that highest school.

¹ [For "Orcagna" ("archangel") see "Review of Lord Lindsay," § 53 (Vol. XII. p. 223).]

² [For the work of Gozzoli and Orcagna, see *Modern Painters*, vol. ii. *passim*, and the "Review of Lord Lindsay," Vol. XII, pp. 227, 229. For the place in the hierarchy of painters allotted by Ruskin to Correggio, see below, § 12, and Ruskin's letter to his father, in Vol. IV. pp. xxxiv.—xxxv.]

For the artist who sincerely chooses the noblest subject will also choose chiefly to represent what makes that subject noble, namely, the various heroism or other noble emotions of the persons represented. If, instead of this, the artist seeks only to make his picture agreeable by the composition of its masses and colours, or by any other merely pictorial merit, as fine drawing of limbs, it is evident, not only that any other subject would have answered his purpose as well, but that he is unfit to approach the subject he has chosen, because he cannot enter into its deepest meaning, and therefore cannot in reality have chosen it for that meaning. Nevertheless, while the expression is always to be the first thing considered, all other merits must be added to the utmost of the painter's power; for until he can both colour and draw beautifully he has no business to consider himself a painter at all, far less to attempt the noblest subjects of painting;¹ and, when he has once possessed himself of these powers, he will naturally and fitly employ them to deepen and perfect the impression made by the sentiment of his subject.

The perfect unison of expression, as the painter's main purpose, with the full and natural exertion of his pictorial power in the details of the work, is found only in the old Pre-Raphaelite periods, and in the modern Pre-Raphaelite school. In the works of Giotto, Angelico, Orcagna, John Bellini, and one or two more, these two conditions of high art are entirely fulfilled, so far the knowledge of those days enabled them to be fulfilled; and in the modern Pre-Raphaelite school they are fulfilled nearly to the uttermost. Hunt's *Light of the World*, is, I believe, the most perfect instance of expressional purpose with technical power, which the world has yet produced.²

§ 10. Now in the Post-Raphaelite period of ancient art,

¹ [This is a point frequently enforced by Ruskin (see, *e.g.*, *Modern Painters*, vol. iv. ch. iii. § 24), but also frequently ignored in criticisms of him and sometimes (as he says) by disciples (see *Cestus of Aglaia*, § 59).]

² [For Ruskin's detailed notice of this picture, see Vol. XII. pp. 328–331; see also below, Appendix iii., p. 429.]

and in the spurious high art of modern times, two broad forms of error divide the schools; the one consisting in (A) the superseding of expression by technical excellence, and the other in (B) the superseding of technical excellence by expression.

(A.) Superseding expression by technical excellence.—This takes place most frankly, and therefore most innocently, in the work of the Venetians. They very nearly ignore expression altogether, directing their aim exclusively to the rendering of external truths of colour and form. Paul Veronese will make the Magdalene wash the feet of Christ with a countenance as absolutely unmoved as that of any ordinary servant bringing a ewer to her master, and will introduce the supper at Emmaus as a background to the portraits of two children playing with a dog. Of the wrongness or rightness of such a proceeding we shall reason in another place;¹ at present we have to note it merely as displacing the Venetian work from the highest or expressional rank of art. But the error is generally made in a more subtle and dangerous way. The artist deceives himself into the idea that he is doing all he can to elevate his subject by treating it under rules of art, introducing into it accurate science, and collecting for it the beauties of (so called) ideal form; whereas he may, in reality, be all the while sacrificing his subject to his own vanity or pleasure, and losing truth, nobleness, and impressiveness for the sake of delightful lines or creditable pedantries.

§ 11. (B.) Superseding technical excellence by expression.—This is usually done under the influence of another kind of vanity. The artist desires that men should think he has an elevated soul, affects to despise the ordinary excellence of art, contemplates with separated egotism the course of his own imaginations or sensations, and refuses to look at the real facts round about him, in order that he may adore at

¹ [See *Modern Painters*, vol. v. pt. ix. ch. vi. § 18; and for the two pictures by Veronese above referred to, see the "Notes on the Louvre," Vol. XII. pp. 451, 452; and compare ch. ii. § 5, above, p. 38; and below, ch. iv. § 24, p. 89.]

leisure the shadow of himself. He lives in an element of what he calls tender emotions and lofty aspirations; which are, in fact, nothing more than very ordinary weaknesses or instincts, contemplated through a mist of pride. A large range of modern German art comes under this head.¹

A more interesting and respectable form of this error is fallen into by some truly earnest men, who, finding their powers not adequate to the attainment of great artistical excellence, but adequate to rendering, up to a certain point, the expression of the human countenance, devote themselves to that object alone, abandoning effort in other directions, and executing the accessories of their pictures feebly or carelessly. With these are associated another group of philosophical painters, who suppose the artistical merits of other parts *adverse* to the expression, as drawing the spectator's attention away from it, and who paint in grey colour, and imperfect light and shade, by way of enforcing the purity of their conceptions. Both these classes of conscientious but narrow-minded artists labour under the same grievous mistake of imagining that wilful fallacy can ever be either pardonable or helpful. They forget that colour, if used at all, must be either true or false, and that what *they* call chastity, dignity, and reserve is, to the eye of any person accustomed to nature, pure, bold, and impertinent falsehood. It does not in the eyes of any soundly minded man, exalt the expression of a female face that the cheeks should be painted of the colour of clay, nor does it in the least enhance his reverence for a saint to find the scenery around him deprived, by his presence, of sunshine. It is an important consolation, however, to reflect that no artist ever fell into any of these last three errors (under head B) who had really the capacity of becoming a great painter. No man ever despised colour who could produce it; and the error of these sentimentalists and philosophers is not so much in the choice of their manner of painting, as in supposing themselves capable of painting at all. Some of them might have

¹ [For Ruskin on German art, see below, Appendix ii., p. 424.]

made efficient sculptors, but the greater number had their mission in some other sphere than that of art, and would have found, in works of practical charity, better employment for their gentleness and sentimentalism, than in denying to human beauty its colour, and to natural scenery its light; in depriving heaven of its blue, and earth of its bloom, valour of its glow, and modesty of its blush.

§ 12. II. LOVE OF BEAUTY.¹—The second characteristic of the great school of art is, that it introduces in the conception of its subject as much beauty as is possible, consistently with truth.*

* As here, for the first time, I am obliged to use the terms Truth and Beauty in a kind of opposition, I must therefore stop for a moment to state clearly the relation of these two qualities of art; and to protest against the vulgar and foolish habit of confusing truth and beauty with each other. People with shallow powers of thought, desiring to flatter themselves with the sensation of having attained profundity, are continually doing the most serious mischief by introducing confusion into plain matters, and then valuing themselves on being confounded.² Nothing is more common than to hear people who desire to be thought philosophical, declare that “beauty is truth,” and “truth is beauty.” I would most earnestly beg every sensible person who hears such an assertion made, to nip the germinating philosopher in his ambiguous bud; and beg him, if he really believes his own assertion, never henceforward to use two words for the same thing. The fact is, truth and beauty are entirely distinct, though often related, things. One is a property of statements, the other of objects. The statement that “two and two make four” is true, but it is neither beautiful nor ugly, for it is invisible; a rose is lovely, but it is neither true nor false, for it is silent. That which shows nothing cannot be fair, and that which asserts nothing cannot be false. Even the ordinary use of the words false and true, as applied to artificial and real things, is inaccurate. An artificial rose is not a “false” rose, it is not a rose at all. The falseness is in the person who states, or induces the belief, that it *is* a rose.

Now, therefore, in things concerning art, the words true and false are only to be rightly used while the picture is considered as a statement of facts. The painter asserts that this which he has painted is the form of a dog, a man, or a tree. If it be *not* the form of a dog, a man, or a tree, the painter’s statement is false; and, therefore, we justly speak of a false line, or false colour; not that any lines or colours can in themselves be

¹ [In his copy for revision, Ruskin marked the following passage with special approval, making the note “Greatly valuable. Insist on.” So, again, he marked § 17 as “Essential”; § 19 “Magnitude—most valuable”; § 20 was also marked as specially important.]

² [Compare Vol. IV. p. 66.]

For instance, in any subject consisting of a number of figures, it will make as many of those figures beautiful as the faithful representation of humanity will admit. It will not deny the facts of ugliness or decrepitude, or relative inferiority and superiority of feature as necessarily manifested in a crowd, but it will, so far as it is in its power, seek for and dwell upon the fairest forms, and in all things insist on the beauty that is in them, not on the ugliness. In this respect, schools of art become higher in exact proportion to the degree in which they apprehend and love the beautiful. Thus, Angelico, intensely loving all spiritual beauty, will be of the highest rank;¹ and Paul Veronese and Correggio, intensely loving physical and corporeal beauty, of the second rank; and Albert Dürer, Rubens, and in general the Northern artists, apparently insensible to beauty, and caring only for truth, whether shapely or not, of the third rank; and Teniers and Salvator, Caravaggio, and other such worshippers of the depraved, of no rank, or as we said before,² of a certain order in the abyss.

§ 13. The corruption of the schools of high art, so far as

false, but they become so when they convey a statement that they resemble something which they do *not* resemble. But the beauty of the lines or colours is wholly independent of any such statement. They may be beautiful lines, though quite inaccurate, and ugly lines though quite faithful. A picture may be frightfully ugly, which represents with fidelity some base circumstance of daily life; and a painted window may be exquisitely beautiful, which represents men with eagles' faces, and dogs with blue heads and crimson tails (though, by the way, this is not in the strict sense *false* art, as we shall see hereafter, inasmuch as it means no assertion that men ever *had* eagles' faces). If this were not so, it would be impossible to sacrifice truth to beauty; for to attain the one would always be to attain the other. But, unfortunately, this sacrifice is exceedingly possible, and it is chiefly this which characterizes the false schools of high art, so far as high art consists in the pursuit of beauty. For although truth and beauty are independent of each other, it does not follow that we are at liberty to pursue whichever we please. They are indeed separable, but it is wrong to separate them; they are to be sought together in the order of their worthiness; that is to say, truth first, and beauty afterwards. High art differs from low art in possessing an excess of beauty in addition to its truth, not in possessing excess of beauty inconsistent with truth.

¹ [See the "Review of Lord Lindsay," §§ 44, 66 (Vol. XII. pp. 212, 236).]

² [Above, § 5, p. 49.]

this particular quality is concerned, consists in the sacrifice of truth to beauty. Great art dwells on all that is beautiful; but false art omits or changes all that is ugly. Great art accepts Nature as she is, but directs the eyes and thoughts to what is most perfect in her; false art saves itself the trouble of direction by removing or altering whatever it thinks objectionable. The evil results of which proceeding are twofold.

§ 14. First. That beauty deprived of its proper foils and adjuncts ceases to be enjoyed as beauty, just as light deprived of all shadow ceases to be enjoyed as light. A white canvas cannot produce an effect of sunshine; the painter must darken it in some places before he can make it look luminous in others; nor can an uninterrupted succession of beauty produce the true effect of beauty; it must be foiled by inferiority before its own power can be developed. Nature has for the most part mingled her inferior and noble elements as she mingles sunshine with shade, giving due use and influence to both, and the painter who chooses to remove the shadow, perishes in the burning desert he has created. The truly high and beautiful art of Angelico is continually refreshed and strengthened by his frank portraiture of the most ordinary features of his brother monks and of the recorded peculiarities of ungainly sanctity; but the modern German and Raphaelesque schools lose all honour and nobleness in barber-like admiration of handsome faces, and have, in fact, no real faith except in straight noses, and curled hair. Paul Veronese opposes the dwarf to the soldier,¹ and the negress to the queen; Shakspeare places Caliban beside Miranda, and Autolycus beside Perdita;² but the vulgar idealist withdraws his beauty to the safety of the saloon, and his innocence to the seclusion of the cloister; he pretends that he does this in delicacy of choice and purity of sentiment,

¹ [In his picture of "The Family of Darius" in the National Gallery; compare ch. vii. § 2, below, p. 112.]

² [On Caliban and Miranda, see also *Lectures on Art*, § 81, and *Munera Pulveris*, §§ 133–134. For Ruskin's analysis of the *Tempest*, see *Munera, l.c.*, and *Time and Tide*, § 167.]

while in truth he has neither courage to front the monster, nor wit enough to furnish the knave.

§ 15. It is only by the habit of representing faithfully all things, that we can truly learn what is beautiful, and what is not. The ugliest objects contain some element of beauty; and in all it is an element peculiar to themselves, which cannot be separated from their ugliness, but must either be enjoyed together with it or not at all. The more a painter accepts nature as he finds it, the more unexpected beauty he discovers in what he at first despised; but once let him arrogate the right of rejection, and he will gradually contract his circle of enjoyment, until what he supposed to be nobleness of selection ends in narrowness of perception. Dwelling perpetually upon one class of ideas, his art becomes at once monstrous and morbid; until at last he cannot faithfully represent even what he chooses to retain; his discrimination contracts into darkness, and his fastidiousness fades into fatuity.

High art, therefore, consists neither in altering, nor in improving nature; but in seeking throughout nature for “whatsoever things are lovely, and whatsoever things are pure”;¹ in loving these, in displaying to the utmost of the painter’s power such loveliness as is in them, and directing the thoughts of others to them by winning art or gentle emphasis. Of the degree in which this can be done, and in which it may be permitted to gather together, without falsifying, the finest forms or thoughts, so as to create a sort of perfect vision, we shall have to speak hereafter: at present, it is enough to remember that art (*cæteris paribus*) is great in exact proportion to the love of beauty shown by the painter, provided that love of beauty forfeit no atom of truth.

§ 16. III. SINCERITY.—The next* characteristic of great

* I name them in order of *increasing*, not decreasing importance.

¹ [Philippians iv. 8.]

art is that it includes the largest possible quantity of Truth in the most perfect possible harmony. If it were possible for art to give all the truths of nature it ought to do it. But this is not possible. Choice must always be made of some facts which *can* be represented, from among others which must be passed by in silence, or even, in some respects, misrepresented. The inferior artist chooses unimportant and scattered truths; the great artist chooses the most necessary first, and afterwards the most consistent with these, so as to obtain the greatest possible and most harmonious *sum*. For instance, Rembrandt always chooses to represent the exact force with which the light on the most illumined part of an object is opposed to its obscurer portions. In order to obtain this, in most cases, not very important truth, he sacrifices the light and colour of five-sixths of his picture, and the expression of every character of objects which depends on tenderness of shape or tint. But he obtains his single truth, and what picturesque and forcible expression is dependent upon it, with magnificent skill and subtlety. Veronese, on the contrary, chooses to represent the great relations of visible things to each others, to the heaven above, and to the earth beneath¹ them. He holds it more important to show how a figure stands relieved from delicate air, or marble wall; how as a red, or purple, or white figure, it separates itself, in clear discernibility, from things not red, nor purple, nor white; how infinite daylight shines round it; how innumerable veils of faint shadow invest it; how its blackness and darkness are, in the excess of their nature, just as limited and local as its intensity of light; all this, I say, he feels to be more important than showing merely the exact *measure* of the spark of sunshine that gleams on a dagger-hilt, or glows on a jewel. All this, moreover, he feels to be harmonious,—capable of being joined in one great system of spacious truth. And with inevitable watchfulness, inestimable subtlety, he unites all this in tenderest balance, noting in each

¹ [Exodus xx. 4.]

hair's-breadth of colour, not merely what its rightness or wrongness is in itself, but what its relation is to every other on his canvas; restraining, for truth's sake, his exhaustless energy, reining back, for truth's sake, his fiery strength; veiling, before truth, the vanity of brightness; penetrating, for truth, the discouragement of gloom; ruling his restless invention with a rod of iron; pardoning no error; no thoughtlessness, no forgetfulness; and subduing all his powers, impulses, and imaginations, to the arbitrament of a merciless justice, and the obedience of an incorruptible verity.

I give this instance with respect to colour and shade: but, in the whole field of art, the difference between the great and inferior artists is of the same kind, and may be determined at once by the question, which of them conveys the largest sum of truth?

§ 17. It follows from this principle, that in general all *great drawing is distinct* drawing; for truths which are rendered indistinctly might, for the most part, as well not be rendered at all. There are, indeed, certain facts of mystery, and facts of indistinctness, in all objects, which must have their proper place in the general harmony, and the reader will presently find me, when we come to that part of our investigation, telling him that all good drawing must in some sort be *in-distinct*.¹ We may, however, understand this apparent contradiction, by reflecting that the highest knowledge always involves a more advanced perception of the fields of the unknown; and, therefore, it may most truly be said, that to know anything well involves a profound sensation of ignorance, while yet it is equally true that good and noble knowledge is distinguished from vain and useless knowledge chiefly by its clearness and distinctness, and by the vigorous consciousness of what is known and what is not.

So in art. The best drawing involves a wonderful perception and expression of indistinctness; and yet all noble drawing is separated from the ignoble by its distinctness,

¹ [See *Modern Painters*, vol. iv. ch. iv. § 1 ("Of Turnerian Mystery").]

by its fine expression and firm assertion of *Something*; whereas the bad drawing, without either firmness or fineness, expresses and asserts *Nothing*. The first thing, therefore, to be looked for as a sign of noble art, is a clear consciousness of what is drawn and what is not; the bold statement, and frank confession—“*This I know,*” “*that I know not*”; and, generally speaking, all haste, slurring, obscurity, indecision, are signs of low art, and all calmness, distinctness, luminousness, and positiveness, of high art.

§ 18. It follows, secondly, from this principle, that as the great painter is always attending to the sum and harmony of his truths rather than to one or the other of any group, a quality of Grasp is visible in his work, like the power of a great reasoner over his subject, or a great poet over his conception, manifesting itself very often in missing out certain details or less truths (which, though good in themselves, he finds are in the way of others), and in a sweeping manner of getting the beginnings and ends of things shown at once, and the squares and depths rather than the surfaces: hence, on the whole, a habit of looking at large masses rather than small ones; and even a physical largeness of handling, and love of working, if possible, on a large scale;¹ and various other qualities, more or less imperfectly expressed by such technical terms as breadth, massing, unity, boldness, etc., all of which are, indeed, great qualities, when they mean breadth of truth, weight of truth, unity of truth, and courageous assertion of truth; but which have all their correlative errors and mockeries, almost universally mistaken for them,—the breadth which has no contents, the weight which has no value, the unity which plots deception, and the boldness which faces out fallacy.

Corollary 2nd:
Great art is
generally large
in masses and in
scale.

§ 19. And it is to be noted especially respecting largeness of scale, that though for the most part it is characteristic of the more powerful masters, they having both more invention wherewith to fill space (as Ghirlandajo wished

¹ [See further on this subject, Appendix v., pp. 433–436.]

that he might paint all the walls of Florence),¹ and, often, an impetuosity of mind which makes them like free play for hand and arm (besides that they usually desire to paint everything in the foreground of their picture of the natural size), yet, as this largeness of scale involves the placing of the picture at a considerable distance from the eye, and this distance involves the loss of many delicate details, and especially of the subtle lines of expression in features, it follows that the masters of refined detail and human expression are apt to prefer a small scale to work upon; so that the chief masterpieces of expression which the world possesses are small pictures by Angelico, in which the figures are rarely more than six or seven inches high;² in the best works of Raphael and Leonardo the figures are almost always less than life, and the best works of Turner do not exceed the size of 18 inches by 12.

§ 20. As its greatness depends on the sum of truth, and this sum of truth can always be increased by delicacy of handling, it follows that all great art must have this delicacy to the utmost possible degree. This rule is infallible and inflexible. All coarse work is the sign of low art. Only, it is to be remembered, that coarseness must be estimated by the distance from the eye; it being necessary to consult this distance, when great, by laying on touches which appear coarse when seen near; but which, so far from being coarse, are, in reality, more delicate in a master's work than the finest close handling, for they involve a calculation of result, and are laid on with a subtlety of sense precisely correspondent to that with which a good archer draws his bow; the spectator seeing in the

Corollary 3rd:
Great art is
always delicate.

¹ ["When household cares were laid upon him, he complained bitterly, and committed the charge of all expenditure to his brother David, saying to him, 'Leave me to work, and do thou provide, for now that I have begun to get into the spirit and comprehend the method of this art, I grudge that they do not commission me to paint the whole circuit of the walls of Florence with stories" (Vasari's *Lives*, ii. 215, Bohn's ed., 1855).]

² [For the comparative failure of Angelico's larger works, see the "Review of Lord Lindsay," Vol. XII. p. 235; the following statement in the text here expresses the opinion often given by Ruskin that Turner's greatest works are his water-colours (see, for instance, *Notes on the Turner Gallery*, 1856).]

action nothing but the strain of the strong arm, while there is in reality, in the finger and eye, an ineffably delicate estimate of distance, and touch on the arrow plume. And, indeed, this delicacy is generally quite perceptible to those who know what the truth is, for strokes by Tintoret or Paul Veronese, which were done in an instant, and look to an ignorant spectator merely like a violent dash of loaded colour (and are, as such, imitated by blundering artists), are, in fact, modulated by the brush and finger to that degree of delicacy that no single grain of the colour could be taken from the touch without injury; and little golden particles of it, not the size of a gnat's head, have important share and function in the balances of light in a picture perhaps fifty feet long.¹ Nearly *every* other rule applicable to art has some exception but this. This has absolutely none. All great art is delicate art, and all coarse art is bad art.² Nay, even, to a certain extent, all *bold* art is bad art; for boldness is not the proper word to apply to the courage and swiftness of a great master, based on knowledge, and coupled with fear and love. There is as much difference between the boldness of the true and the false masters, as there is between the courage of a sure woman and the shamelessness of a lost one.

§ 21. IV. INVENTION.—The last characteristic of great art is that it must be inventive, that is, be produced by the imagination. In this respect, it must precisely fulfil the definition already given of poetry;³ and not only present grounds for noble emotion, but furnish these grounds by *imaginative power*. Hence there is at once a great bar fixed between the two schools of Lower and Higher art. The lower merely copies what is set before it, whether in portrait, landscape, or still-life; the higher either entirely imagines its subject, or arranges the materials presented to it, so as to manifest the imaginative power in all the three phases which have been already explained in the second volume.

¹ [On this subject, compare *The Two Paths*, Appendix iv. ("Subtlety of Hand").]

² [Compare *Elements of Drawing*, preface, § 7, where this rule is again enforced.]

³ [Above, p. 28.]

And this was the truth which was confusedly present in Reynolds's mind when he spoke, as above quoted,¹ of the difference between Historical and Poetical Painting. *Every relation of the plain facts which the painter saw is proper historical painting.** If those facts are unimportant (as that he saw a gambler quarrel with another gambler, or a sot enjoying himself with another sot), then the history is trivial; if the facts are important (as that he saw such and such a great man look thus, or act thus, at such a time), then the history is noble: in each case perfect truth of narrative being supposed, otherwise the whole thing is worthless, being neither history nor poetry, but plain falsehood. And farther, as greater or less elegance and precision are manifested in the relation or painting of the incidents, the merit of the work varies; so that, what with difference of subject, and what with difference of treatment, historical painting falls or rises in changeful eminence, from Dutch trivialities to a Velasquez portrait, just as historical talking or writing varies in eminence, from an old woman's story-telling up to Herodotus. Besides which, certain operations of the imagination come into play inevitably, here and there, so as to touch the history with some light of poetry, that is, with some light shot forth of the narrator's mind, or brought out by the way he has put the accidents together: and wherever the imagination has thus had anything to do with the matter at all (and it must be somewhat cold work where it has not), then, the confines of the lower and higher schools touching each other, the work is coloured by both; but there is no reason why, therefore, we should in the least confuse the historical and poetical characters, any more than that we should confuse blue with crimson, because they may overlap each other, and produce purple.

§ 22. Now, historical or simply narrative art is very

* Compare my Edinburgh Lectures, lecture iv. p. 218 *et seq.* (2nd edition).²

¹ [Above, p. 21.]

² [In this edition, Vol. XII. pp. 151–153.]

precious in its proper place and way, but it is never *great* art until the poetical or imaginative power touches it; and in proportion to the stronger manifestation of this power, it becomes greater and greater, while the highest art is purely imaginative, all its materials being wrought into their form by invention; and it differs, therefore, from the simple historical painting, exactly as Wordsworth's stanza, above quoted,¹ differs from Saussure's plain narrative of the parallel fact; and the imaginative painter differs from the historical painter in the manner that Wordsworth differs from Saussure.

§ 23. Farther, imaginative art always *includes* historical art; so that, strictly speaking, according to the analogy above used, we meet with the pure blue, and with the crimson ruling the blue and changing it into kingly purple, but not with the pure crimson: for all imagination must deal with the knowledge it has before accumulated; it never produces anything but by combination or contemplation. Creation, in the full sense, is impossible to it. And the mode in which the historical faculties are included by it is often quite simple, and easily seen. Thus, in Hunt's great poetical picture of the Light of the World, the whole thought and arrangement of the picture being imaginative, the several details of it are wrought out with simple portraiture; the ivy, the jewels, the creeping plants, and the moonlight being calmly studied or remembered from the things themselves. But of all these special ways in which the invention works with plain facts, we shall have to treat farther afterwards.²

§ 24. And now, finally, since this poetical power includes the historical, if we glance back to the other qualities required in great art, and put all together, we find that the sum of them is simply the sum of all the powers of man. For as (1) the choice of the high subject involves all conditions of right moral choice, and as (2) the love of beauty

¹ [Above, p. 29.]

² [See below, ch. vii.]

involves all conditions of right admiration, and as (3) the grasp of truth involves all strength of sense, evenness of judgment, and honesty of purpose, and as (4) the poetical power involves all swiftness of invention, and accuracy of historical memory, the sum of all these powers is the sum of the human soul. Hence we see why the word "Great" is used of this art. It is literally great. It compasses and calls forth the entire human spirit, whereas any other kind of art, being more or less small or narrow, compasses and calls forth only *part* of the human spirit. Hence the idea of its magnitude is a literal and just one, the art being simply less or greater in proportion to the number of faculties it exercises and addresses.* And this is the ultimate meaning of the definition I gave of it long ago, as containing the "greatest number of the greatest ideas."¹

§ 25. Such, then, being the characters required in order to constitute high art, if the reader will think over them a little, and over the various ways in which they may be falsely assumed, he will easily perceive how spacious and dangerous a field of discussion they open to the ambitious critic, and of error to the ambitious artist; he will see how difficult it must be, either to distinguish what is truly great art from the mockeries of it, or to rank the real artists in anything like a progressive system of greater and less. For it will have been observed that the various qualities which form greatness are partly inconsistent with each other (as some virtues are, docility and firmness for instance), and partly independent of each other; and the fact is, that artists differ not more by mere capacity, than by the component *elements* of their capacity, each possessing in very different proportions the several attributes of greatness; so that, classed by one kind of merit, as, for instance, purity of expression, Angelico will stand highest;

* Compare *Stones of Venice*, vol. iii. chap. iv. § 7 and § 21.²

¹ [*Modern Painters*, vol. i. (Vol. III. p. 92).]

² [Vol. XI. pp. 203, 213.]

classed by another, sincerity of manner, Veronese will stand highest; classed by another, love of beauty, Leonardo¹ will stand highest; and so on:² hence arise continual disputes and misunderstandings among those who think that high art must always be one and the same, and that great artists ought to unite all great attributes in an equal degree.

§ 26. In one of the exquisitely finished tales of Marmontel, a company of critics are received at dinner by the hero of the story, an old gentleman, somewhat vain of his *acquired* taste, and his niece, by whose incorrigible *natural* taste he is seriously disturbed and tormented. During the entertainment, “On parcourut tous les genres de littérature, et pour donner plus d’essor à l’érudition et à la critique, on mit sur le tapis cette question toute neuve, sçavoir, lequel méritoit la préférence de Corneille ou de Racine. L’on disoit même là-dessus les plus belles choses du monde, lorsque la petite nièce, qui n’avoit pas dit un mot, s’avisa de demander naïvement lequel des deux fruits, de l’orange ou de la pêche, avoit le goût le plus exquis et méritoit le plus d’éloges. Son oncle rougit de sa simplicité, et les convives baissèrent tous les yeux sans daigner répondre à cette bêtise. Ma nièce, dit Fintac, à votre âge, il faut sçavoir écouter, et se taire.”³

I cannot close this chapter with shorter or better advice to the reader, than merely, whenever he hears discussions about the relative merits of great masters, to remember the young lady’s question. It is, indeed, true that there *is* a relative merit, that a peach is nobler than a hawthorn berry, and still more a hawthorn berry than a bead of the nightshade; but in each rank of fruits, as in each rank of

¹ [In his copy for revision, Ruskin in later years struck out “Leonardo” and wrote “Luini.” Luini was one of his later favourites: see below, p. 87 *n.*]

² [For one other such classification, see the letter of Ruskin quoted in Vol. IV. p. xxxv.]

³ [This passage from “The Connoisseur” will be found at p. 213 of Mr. G. Saintsbury’s edition of *Marmontel’s Moral Tales* (1895). For an earlier quotation from Marmontel, see Vol. III. p. 166 and *n.*]

masters, one is endowed with one virtue, and another with another; their glory is their dissimilarity, and they who propose to themselves in the training of an artist that he should unite the colouring of Tintoret, the finish of Albert Dürer, and the tenderness of Correggio, are no wiser than a horticulturist would be, who made it the object of his labour to produce a fruit which should unite in itself the lusciousness of the grape, the crispness of the nut, and the fragrance of the pine.

§ 27. And from these considerations one most important practical corollary is to be deduced, with the good help of Mademoiselle Agathe's simile, namely, that the greatness or smallness of a man is, in the most conclusive sense, determined for him at his birth, as strictly as it is determined for a fruit whether it is to be a currant or an apricot. Education, favourable circumstances, resolution, and industry can do much; in a certain sense they do *everything*; that is to say, they determine whether the poor apricot shall fall in the form of a green bead, blighted by the east wind, and be trodden under foot, or whether it shall expand into tender pride, and sweet brightness of golden velvet.¹ But apricot out of currant,—great man out of small,—did never yet art or effort make; and, in a general way, men have their excellence nearly fixed for them when they are born; a little cramped and frost-bitten on one side, a little sun-burnt and fortune-spotted on the other, they reach, between good and evil chances, such size and taste as generally belong to the men of their calibre, and, the small in their serviceable bunches, the great in their golden isolation, have, these no cause for regret, nor those for disdain.

§ 28. Therefore it is, that every system of teaching is false which holds forth "great art" as in any wise to be taught to students, or even to be aimed at by them.

¹ [The MS. here supplies a good instance of the felicities which often occurred to Ruskin in revising. He had first written "expand into tender pride, and win prizes at garden shows."]

Great art is precisely that which never was, nor will be taught,¹ it is pre-eminently and finally the expression of the spirits of great men; so that the only wholesome teaching is that which simply endeavours to fix those characters of nobleness in the pupil's mind, of which it seems easily susceptible; and without holding out to him, as a possible or even probable result, that he should ever paint like Titian, or carve like Michael Angelo, enforces upon him the manifest possibility, and assured duty, of endeavouring to draw in a manner at least honest and intelligible; and cultivates in him those general charities of heart, sincerities of thought, and graces of habit which are likely to lead him, throughout life, to prefer openness to affectation, realities to shadows, and beauty to corruption.

¹ [Compare what is said in *Pre-Raphaelitism*, § 16, about imagination and invention being unteachable (Vol. XII. p. 352.)]

CHAPTER IV

OF THE FALSE IDEAL:—FIRST, RELIGIOUS¹

§ 1. HAVING now gained some general notion of the meaning of “great art,” we may, without risk of confusing ourselves, take up the questions suggested incidentally in the preceding chapter, and pursue them at leisure. Of these, two principal ones are closely connected with each other, to wit, that put in the 12th paragraph—How may beauty be sought in defiance of truth? and that in the 23rd paragraph—How does the imagination show itself in dealing with truth? These two, therefore, which are, besides, the most important of all, and, if well answered, will answer many others inclusively, we shall find it most convenient to deal with at once.

§ 2. The pursuit, by the imagination, of beautiful and strange thoughts or subjects, to the exclusion of painful or common ones, is called among us, in these modern days, the pursuit of “*the ideal*”; nor does any subject deserve more attentive examination than the manner in which this pursuit is entered upon by the modern mind. The reader must pardon me for making in the outset one or two statements which may appear to him somewhat wide of the matter, but which, (if he admits their truth,) he will, I think, presently perceive to reach to the root of it. Namely,

That men’s proper business in this world falls mainly into three divisions:²

¹ [In his copy for revision, Ruskin wrote here “Give all this chapter as root of Pre-Raphaelitism.”]

² [Compare Vol. XI. p. 258, for a similar statement in connexion with principles of education.]

First, to know themselves, and the existing state of the things they have to do with.

Secondly, to be happy in themselves, and in the existing state of things.

Thirdly, to mend themselves, and the existing state of things, as far as either are marred and mendable.

These, I say, are the three plain divisions of proper human business on this earth. For these three, the following are usually substituted and adopted by human creatures:

First, to be totally ignorant of themselves, and the existing state of things.

Secondly, to be miserable in themselves, and in the existing state of things.

Thirdly, to let themselves, and the existing state of things, alone (at least, in the way of correction).

§ 3. The dispositions which induce us to manage, thus wisely, the affairs of this life seem to be:

First, a fear of disagreeable facts, and conscious shrinking from clearness of light, which keep us from examining ourselves, and increase gradually into a species of instinctive terror at all truth, and love of glosses, veils, and decorative lies of every sort.

Secondly, a general readiness to take delight in anything past, future, far off, or somewhere else, rather than in things now, near, and here; leading us gradually to place our pleasure principally in the exercise of the imagination, and to build all our satisfaction on things as they are *not*. Which power being one not accorded to the lower animals, and having indeed, when disciplined, a very noble use, we pride ourselves upon it, whether disciplined or not, and pass our lives complacently, in substantial discontent, and visionary satisfaction.

§ 4. Now *nearly* all artistical and poetical seeking after the ideal is only one branch of this base habit—the abuse of the imagination in allowing it to find its whole delight in the impossible and untrue; while the faithful pursuit of

the ideal is an honest use of the imagination, giving full power and presence to the possible and true.

It is the difference between these two uses of it which we have to examine.

§ 5. And, first, consider what are the legitimate uses of the imagination, that is to say, of the power of perceiving, or conceiving with the mind, things which cannot be perceived by the senses.

Its first and noblest use is,¹ to enable us to bring sensibly to our sight the things which are recorded as belonging to our future state, or as invisibly surrounding us in this.² It is given us, that we may imagine the cloud of witnesses³ in heaven and earth, and see, as if they were now present, the souls of the righteous waiting for us; that we may conceive the great army of the inhabitants of heaven, and discover among them those whom we most desire to be with for ever; that we may be able to vision forth the ministry of angels beside us, and see the chariots of fire on the mountains that gird us round; but, above all, to call up the scenes and facts in which we are commanded to believe, and be present, as if in the body, at every recorded event of the history of the Redeemer. Its second and ordinary use is to empower us to traverse the scenes of all other history, and force the facts to become again visible, so as to make upon us the same impression which they would have made if we had witnessed them: and in the minor necessities of life, to enable us, out of any present good, to gather the utmost measure of enjoyment by investing it with happy associations, and, in any present evil, to lighten

¹ [In his copy for revision, Ruskin alters this to "has hitherto been."]

² [As already stated (above, p. 41 *n*), § 5 here is § 9 in *Fronde Agrestes* (1875), where at this point Ruskin added the following note:—

"I should be glad if the reader who is interested in the question here raised, would read, as illustrative of the subsequent statement, the account of Tintoret's 'Paradise,' in the close of my Oxford lecture on Michael Angelo and Tintoret, which I have printed separately to make it generally accessible."

The lecture was afterwards incorporated in *Aratra Pentelici*: see §§ 241–243.]

³ [Hebrews xii. 1. Other expressions in § 5 are from Wisdom iii. 1; Isaiah lxvi. 15.]

it, by summoning back the images of other hours; and, also, to give to all mental truths some visible type in allegory, simile, or personification, which shall more deeply enforce them; and finally, when the mind is utterly outwearied, to refresh it with such innocent play as shall be most in harmony with the suggestive voices of natural things, permitting it to possess living companionship instead of silent beauty, and create for itself fairies in the grass and naiads in the wave.

§ 6. These being the uses of imagination, its abuses are either in creating, for mere pleasure, false images, where it is its *duty* to create true ones; or in turning what was intended for the mere refreshment of the heart into its daily food, and changing the innocent pastime of an hour into the guilty occupation of a life.

Let us examine the principal forms of this misuse, one by one.

§ 7. First, then, the imagination is chiefly warped and dishonoured by being allowed to create false images, where it is its duty to create true ones. And this most dangerously in matters of religion. For a long time when art was in its infancy, it remained unexposed to this danger, because it could not, with any power, realize or create *any* thing. It consisted merely in simple outlines and pleasant colours, which were understood to be nothing more than signs of the thing thought of, a sort of pictorial letter for it, no more pretending to represent it than the written characters of its name. Such art excited the imagination, while it pleased the eye. But it *asserted* nothing, for it could realize nothing. The reader glanced at it as a glittering symbol, and went on to form truer images for himself. This act of the mind may be still seen in daily operation in children, as they look at brightly coloured pictures in their story-books. Such pictures neither deceive them nor satisfy them; they only set their own inventive powers to work in the directions required.

§ 8. But as soon as art obtained the power of realization,

it obtained also that of *assertion*. As fast as the painter advanced in skill he gained also in credibility, and that which he perfectly represented was perfectly believed, or could be disbelieved only by an actual effort of the beholder to escape from the fascinating deception. What had been faintly declared, might be painlessly denied; but it was difficult to discredit things forcibly alleged; and representations, which had been innocent

in discrepancy, became guilty in consistency

.§ 9. For instance, when in the thirteenth century, the Nativity was habitually represented by such a symbol as that on this page, Fig. 1, there was not the smallest possibility that such a picture could disturb, in

the mind of the reader of the New Testament, the simple meaning of the words¹ “wrapped Him in swaddling clothes, and laid Him in a manger.”

That this manger was typified by a trefoil arch* would no more prevent his distinct understanding of the narrative, than the grotesque heads introduced above it would interfere with his firm comprehension of the words “ox” or “ass”; while if there were anything in the action of the principal

* The curious inequality of the little trefoil is not a mistake; it is faithfully copied by the draughtsman from the MS. Perhaps the actual date of the

¹ [Luke ii. 7.]

figures suggestive of real feeling, that suggestion he would accept, together with the general pleasantness of the lines and colours in the decorative letter; but without having his faith in the unrepresented and actual scene obscured for a moment. But it was far otherwise when Francia or Perugino, with exquisite power of representing the human form, and high knowledge of the mysteries of art, devoted all their skill to the delineation of an impossible scene; and painted, for their subjects of the Nativity, a beautiful and queenly lady, her dress embroidered with gold, and with a crown of jewels upon her hair, kneeling, on a floor of inlaid and precious marble, before a crowned child, laid under a portico of Lombardic* architecture; with a sweet, verdurous, and vivid landscape in the distance, full of winding rivers, village spires, and baronial towers.† It is quite true that the frank absurdity of the thought prevented its being received as a deliberate contradiction of the truths of Scripture; but it is no less certain, that the continual presentment to the mind of this beautiful and fully realized imagery more and more chilled its power of apprehending the real truth; and that when pictures of this description met the eye in every corner of every chapel, it was physically impossible to dwell distinctly upon facts the direct reverse of those represented. The word “Virgin” or “Madonna,” instead of calling up the vision of a simple Jewish girl, bearing the calamities of poverty, and the dishonours of inferior station, summoned instantly the idea of a graceful princess, crowned with gems, and surrounded by obsequious ministry of kings and saints. The fallacy which was presented to the imagination was

illumination may be a year or two past the thirteenth century, *i.e.*, 1300–1310; but it is quite characteristic of the thirteenth century treatment in the figures.¹

* Lombardic, *i.e.* in the style of Pietro and Tullio Lombardo,² in the fifteenth century (not *Lombard*).

† All this, it will be observed, is that seeking for beauty at the cost of truth which we have generally noted in the last chapter.

¹ [This illustration is from folio 76 of the Book of Hours noted at Vol. XI. p. 9.]

² [Compare *Stones of Venice*, vol. ii. (Vol. X. p. 354).]

indeed discredited, but also the fact which was *not* presented to the imagination was forgotten; all true grounds of faith were gradually undermined, and the beholder was either enticed into mere luxury of fanciful enjoyment, believing nothing; or left, in his confusion of mind, the prey of vain tales and traditions; while in his best feelings he was unconsciously subject to the power of the fallacious picture, and, with no sense of the real cause of his error, bowed himself, in prayer or adoration, to the lovely lady on her golden throne, when he would never have dreamed of doing so to the Jewish girl in her outcast poverty, or, in her simple household, to the carpenter's wife.

§ 10. But a shadow of increasing darkness fell upon the human mind as art proceeded to still more perfect realization. These fantasies of the earlier painters, though they darkened faith, never hardened *feeling*; on the contrary, the frankness of their unlikelihood proceeded mainly from the endeavour on the part of the painter to express, not the actual fact, but the enthusiastic state of his own feelings about the fact; he covers the Virgin's dress with gold, not with any idea of representing the Virgin as she ever was, or ever will be seen, but with a burning desire to show what his love and reverence would think fittest for her. He erects for the stable a Lombardic portico, not because he supposes the Lombardi to have built stables in Palestine in the days of Tiberius, but to show that the manger in which Christ was laid is, in his eyes, nobler than the greatest architecture in the world. He fills his landscape with church spires and silver streams, not because he supposes that either were in sight at Bethlehem, but to remind the beholder of the peaceful course and succeeding power of Christianity. And, regarded with due sympathy and clear understanding of these thoughts of the artist, such pictures remain most impressive and touching, even to this day. I shall refer to them in future,¹ in general terms,

¹ [As, for instance, in § 20 below.]

as the pictures of the “Angelican Ideal”—Angelico being the central master of the school.

§ 11. It was far otherwise in the next step of the Realistic progress. The greater his powers became, the more the mind of the painter was absorbed in their attainment, and complacent in their display. The early arts of laying on bright colours smoothly, of burnishing golden ornaments, or tracing, leaf by leaf, the outlines of flowers, were not so difficult as that they should materially occupy the thoughts of the artist, or furnish foundation for his conceit; he learned these rudiments of his work without pain, and employed them without pride, his spirit being left free to express, so far as it was capable of them, the reaches of higher thought. But when accurate shade, and subtle colour, and perfect anatomy, and complicated perspective, became necessary to the work, the artist’s whole energy was employed in learning the laws of these, and his whole pleasure consisted in exhibiting them. His life was devoted, not to the objects of art, but to the cunning of it; and the sciences of composition and light and shade were pursued as if there were abstract good in them;—as if, like astronomy or mathematics, they were ends in themselves, irrespective of anything to be effected by them. And without perception, on the part of any one, of the abyss to which all were hastening, a fatal change of aim took place throughout the whole world of art. In early times *art was employed for the display of religious facts*; now, *religious facts were employed for the display of art*. The transition, though imperceptible, was consummate; it involved the entire destiny of painting. It was passing from the paths of life to the paths of death.¹

§ 12. And this change was all the more fatal, because at first veiled by an appearance of greater dignity and sincerity than were possessed by the older art. One of the earliest results of the new knowledge was the putting away the

¹ [Compare *Lectures on Architecture and Painting*, §§ 125–127 (Vol. XII. pp. 148–150).]

greater part of the *unlikelihoods* and fineries of the ancient pictures, and an apparently closer following of nature and probability. All the fantasy which I have just been blaming as disturbant of the simplicity of faith, was first subdued,—then despised and cast aside. The appearances of nature were more closely followed in everything; and the crowned Queen—Virgin of Perugino sank into a simple Italian mother in Raphael's Madonna of the Chair.¹

§ 13. Was not this, then, a healthy change? No. It *would* have been healthy if it had been effected with a pure motive, and the new truths would have been precious if they had been sought for truth's sake. But they were not sought for truth's sake, but for pride's; and truth which is sought for display may be just as harmful as truth which is spoken in malice. The glittering childishness of the old art was rejected, not because it was false, but because it was easy; and, still more, because the painter had no longer any religious passion to express. He could think of the Madonna now very calmly, with no desire to pour out the treasures of earth at her feet, or crown her brows with the golden shafts of heaven. He could think of her as an available subject for the display of transparent shadows, skilful tints, and scientific foreshortenings,—as a fair woman, forming, if well painted, a pleasant piece of furniture for the corner of a boudoir, and best imagined by combination of the beauties of the prettiest contadinas. He could think of her, in her last maternal agony, with academical discrimination; sketch in first her skeleton, invest her, in serene science, with the muscles of misery and the fibres of sorrow; then cast the grace of antique drapery over the nakedness of her desolation, and fulfil, with studious lustre of tears and delicately painted pallor, the perfect type of the “Mater Dolorosa.”

§ 14. It was thus that Raphael thought of the Madonna.*

* This is one form of the sacrifice of expression to technical merit, generally noted at the end of the 10th paragraph of the last chapter.

¹ [For another reference to the Madonna della Seggiola, see Vol. IV. p. 85 and *n.*]

Now observe, when the subject was thus scientifically completed, it became necessary, as we have just said, to the full display of all the power of the artist, that it should in many respects be more faithfully imagined than it had been hitherto. "Keeping,"¹ "Expression," "Historical Unity," and such other requirements, were enforced on the painter, in the same tone, and with the same purpose, as the purity of his oil and the accuracy of his perspective. He was told that the figure of Christ should be "dignified," those of the Apostles "expressive," that of the Virgin "modest," and those of children "innocent." All this was perfectly true; and in obedience to such directions, the painter proceeded to manufacture certain arrangements of apostolic sublimity, virginal mildness, and infantine innocence, which, being free from the quaint imperfection and contradictoriness of the early art, were looked upon by the European public as true things, and trustworthy representations of the events of religious history. The pictures of Francia and Bellini had been received as pleasant visions. But the cartoons of Raphael were received as representations of historical fact.

§ 15. Now, neither they, nor any other work of the period, were representations either of historical or of possible fact. They were, in the strictest sense of the word, "compositions,"—cold arrangements of propriety and agreeableness, according to academical formulas, the painter never in any case making the slightest effort to conceive the thing as it really must have happened, but only to gather together graceful lines and beautiful faces, in such compliance with commonplace ideas of the subject as might obtain for the whole an "epic unity," or some such other form of scholastic perfectness.

§ 16. Take a very important instance.

¹ [A term very common in the art-criticism of the eighteenth century, meaning the maintenance of the proper relations between nearer and more distant objects. Thus Goldsmith, parodying the art-slang of his day: "What do you think, sir, of that head in the corner, done in the manner of Grisoni? There's the true keeping in it" (*Citizen of the World*, lv.).]

I suppose there is no event in the whole life of Christ to which, in hours of doubt or fear, men turn with more anxious thirst to know the close facts of it, or with more earnest and passionate dwelling upon every syllable of its recorded narrative, than Christ's showing Himself to His disciples at the lake of Galilee. There is something pre-eminently open, natural, full fronting our disbelief, in this manifestation. The others, recorded after the resurrection, were sudden, phantom-like, occurring to men in profound sorrow and wearied agitation of heart; not, it might seem, safe judges of what they saw. But the agitation was now over. They had gone back to their daily work, thinking still their business lay net-wards, unmeshed from the literal rope and drag. "Simon Peter saith unto them, 'I go a fishing.' They say unto him, 'We also go with thee.'" True words enough, and having far echo beyond those Galilean hills. That night they caught nothing; but when the morning came, in the clear light of it, behold, a figure stood on the shore. They were not thinking of anything but their fruitless hauls. They had no guess who it was. It asked them simply if they had caught anything. They said No; and it tells them to cast yet again. And John shades his eyes from the morning sun with his hand, to look who it is; and though the glinting of the sea, too, dazzles him, he makes out who it is, at last; and poor Simon, not to be outrun this time, tightens his fisher's coat about him, and dashes in, over the nets. One would have liked to see him swim those hundred yards, and stagger to his knees on the beach.

Well, the others get to the beach, too, in time, in such slow way as men in general do get, in this world, to its true shore, much impeded by that wonderful "dragging the net with fishes"; but they get there—seven of them in all;—first the Denier, and then the slowest believer, and then the quickest believer, and then the two throne-seekers, and two more, we know not who.

They sit down on the shore face to face with Him,

§ 16 Take a ~~single~~ ^{single} but very important instance.

I suppose there is no event in the whole life of Christ to which in hours of doubt, or fear, ~~we~~ ^{men} turn with more anxious ~~and~~ thirst to know the close facts of it - with more earnest and passionate dwelling upon every recorded ~~word~~ ^{syllable} of its recorded ~~description~~ ^{narrative} - than that showing of himself to his disciples at the lake of Galilee - there is something preeminently open - natural - full pointing ^{on} ~~disbelief~~ in this manifestation - The other recorded, after the resurrection, were sudden - phantom-like - occurring ^{to men} in profound sorrow and unceasing agitation of heart. But the agitation was now passed. They had gone back to their daily work. - thinking still their business lay ^{networks} ~~in the~~. not yet unweaved from the literal ~~cord~~ rope and drag. Simon Peter saith unto them: I go a fishing. They say unto him, We also go with thee. True words enough: and having for a while done down the deep beyond their Galilean hills.

That night they caught nothing - But when the morning came, in the clear light of it: behold, a figure stood on the shore. They were not thinking of anything but their fruitless hauls: they had no guess who it was. It asked them simply if they had caught anything - they said No - and it tells them to cast net again. - And John ^{raises} ~~shakes~~ his eyes from the morning sun with his hand ^{to look who it is:} ~~to see who it is:~~ ^{and} ~~though~~ ^{the} ~~glinting~~ ^{of} ~~the~~ ^{sun} ~~glazes~~ ^{him,} ~~off,~~ ^{he} ~~spite~~ ^{of} ~~the~~ ^{glinting} ~~of~~ ^{the} ~~sun~~ ~~and~~ ^{makes} ~~out~~ ^{who} ~~it~~ ^{is,} ~~at~~ ~~last.~~ - and for Simon, ^{sat} ~~not~~ ^{to} ~~be~~ ^{out} ~~near~~ ^{at} ~~this~~ ^{time,} ~~at~~ ~~he~~ ~~was~~ ~~on~~ ~~the~~ ~~morning~~ ~~at~~ ~~the~~ ~~beach.~~ tightens his fishes coat and dashes in over the nets: One would have liked to have seen him swim those hundred yards to stagger upon his knees on the beach. Well; the others get to the beach too in time - in much slower way as men in general do ^{get} ~~in~~ this world. to the true shore of it - much

and eat their broiled fish as He bids. And then, to Peter, all dripping still, shivering and amazed, staring at Christ in the sun,¹ on the other side of the coal fire,—thinking a little, perhaps, of what happened by another coal fire, when it was colder, and having had no word once changed with him by his Master since that look of His,—to him, so amazed, comes the question, “Simon, lovest thou Me?” Try to feel that a little, and think of it till it is true to you; and then, take up that infinite monstrosity and hypocrisy—Raphael’s cartoon of the Charge to Peter.² Note, first, the bold fallacy—the putting *all* the Apostles there, a mere lie to serve the Papal heresy of the Petric supremacy, by putting them all in the background while Peter receives the charge, and making them all witnesses to it. Note the handsomely curled hair and neatly tied sandals of the men who had been out all night in the sea-mists and on the slimy decks. Note their convenient dresses for going a-fishing, with trains that lie a yard along the ground, and goodly fringes,—all made to match, an apostolic fishing costume.* Note how Peter especially (whose chief glory was in his wet coat *girt* about him, and naked limbs) is enveloped in folds and fringes, so as to kneel and hold his keys with grace. No fire of coals at all, nor lonely mountain shore, but a pleasant Italian landscape, full of villas and churches, and a flock of sheep to be pointed at; and the whole group of Apostles, not round Christ, as they would have been naturally, but straggling away in a line, that they may all be shown.

* I suppose Raphael intended a reference to Numbers xv. 38; but if he did, the *blue* riband, or “vitta,” as it is in the Vulgate, should have been on the borders too.

¹ [In the second of his lectures on *The Art of England* (1883), Ruskin referred to this passage as a study in “literal and close realization”—“not in the least intending any symbolism either in the coat or the dripping water, or the morning sunshine; but merely and straitly striving to put the facts before the reader’s eyes as positively as if he had seen the thing come to pass on Brighton beach” (§ 32) See also Introduction above, p. lx. The Bible references are to John xxi.]

² [In the Victoria and Albert (South Kensington) Museum.]

The simple truth is, that the moment we look at the picture we feel our belief of the whole thing taken away. There is, visibly, no possibility of that group ever having existed, in any place, or on any occasion. It is all a mere mythic absurdity, and faded concoction of fringes, muscular arms, and curly heads of Greek philosophers.

§ 17. Now, the evil consequences of the acceptance of this kind of religious idealism for true, were instant and manifold.¹ So far as it was received and trusted in by thoughtful persons, it only served to chill all the conceptions of sacred history which they might otherwise have obtained. Whatever they could have fancied for themselves about the wild, strange, infinitely stern, infinitely tender, infinitely varied veracities of the life of Christ, was blotted out by the vapid fineries of Raphael: the rough Galilean pilot, the orderly custom receiver, and all the questioning wonder and fire of uneducated apostleship, were obscured under an antique mask of philosophical faces and long robes. The feeble, subtle, suffering, ceaseless energy and humiliation of St. Paul were confused with an idea of a meditative Hercules leaning on a sweeping sword;* and the mighty presences of Moses and Elias were softened by introductions of delicate grace, adopted from dancing nymphs and rising Auroras.†

Now, no vigorously minded religious person could possibly receive pleasure or help from such art as this; and the necessary result was the instant rejection of it by the healthy religion of the world. Raphael ministered, with

* In the St. Cecilia of Bologna.²

† In the Transfiguration. Do but try to believe that Moses and Elias are really there talking with Christ. Moses in the loveliest heart and midst of the land which once it had been denied him to behold,—Elijah treading the earth again, from which he had been swept to heaven in fire; both now with a mightier message than ever they had given in life,—mightier,

¹[Ruskin quoted §§ 17, 18, with some further comments, in the second of his papers (1878) entitled *The Three Colours of Pre-Raphaelitism* (§ 15).]

² [In the Accademia; St. Cecilia in ecstasy; the figure of St. Paul fills one corner of the picture. For references to the figure of Cecilia, see Vol. II. p. 167, Vol. IV. p. 212.]

applause, to the impious luxury of the Vatican, but was trampled under foot at once by every believing and advancing Christian of his own and subsequent times; and thenceforward pure Christianity and “high art” took separate roads, and fared on, as best they might, independently of each other.

§ 18. But although Calvin, and Knox, and Luther, and their flocks, with all the hardest-headed and truest-hearted faithful left in Christendom, thus spurned away the spurious art, and all art with it, (not without harm to themselves, such as a man must needs sustain in cutting off a decayed limb,*) certain conditions of weaker Christianity suffered the false system to retain influence over them; and to this day, the clear and tasteless poison of the art of Raphael infects with sleep of infidelity the hearts of millions of Christians. It is the first cause of all that pre-eminent *dulness* which characterises what Protestants call sacred art; a dulness not merely baneful in making religion distasteful to the young, but in sickening, as we have seen, all vital belief of religion in the old. A dim sense of impossibility attaches itself always to the graceful emptiness of the representation; we feel instinctively that the painted Christ and painted apostle are not beings that ever did or could exist; and this fatal sense of fair fabulousness, and well-composed impossibility, steals gradually from the picture into the history, until we find ourselves reading St. Mark

in closing their own mission,—mightier, in speaking to Christ “of His decease, which He should accomplish at Jerusalem.”¹ They, men of like passions once with us, appointed to speak to the Redeemer of His death.

And, then, look at Raphael’s kicking gracefulnesses.²

* Luther had no dislike of religious art on principle. Even the stove in his chamber was wrought with sacred subjects. See Mrs. Stowe’s *Sunny Memories*.³

¹ [Luke ix. 21.]

² [See, again, *The Three Colours of Pre-Raphaelitism* for a further criticism of the figures of Moses and Elias, and for another reference to Raphael’s “Transfiguration” (in the Vatican Gallery), see *Modern Painters*, vol. iv. ch. iii. § 23.]

or St. Luke with the same admiring, but uninterested, incredulity, with which we contemplate Raphael.

§ 19. On a certain class of minds, however, these Raphaellesque and other sacred paintings of high order, have had, of late years, another kind of influence, much resembling that which they had at first on the most pious Romanists. They are used to excite certain conditions of religious dream or reverie; being again, as in earliest times, regarded not as representations of fact, but as expressions of sentiment respecting the fact. In this way the best of them have unquestionably much purifying and enchanting power; and they are helpful opponents to sinful passion and weakness of every kind. A fit of unjust anger, petty malice, unreasonable vexation, or dark passion, cannot certainly, in a mind of ordinary sensibility, hold its own in the presence of a good engraving from any work of Angelico, Memling, or Perugino. But I nevertheless believe, that he who trusts much to such helps will find them fail him at his need; and that the dependence, in any great degree, on the presence or power of a picture, indicates a wonderfully feeble sense of the presence and power of God. I do not think that any man, who is thoroughly certain that Christ is in the room, will care what sort of pictures of Christ he has on its walls; and, in the plurality of cases, the delight taken in art of this kind is, in reality, nothing more than a form of graceful indulgence of those sensibilities which the habits of a disciplined life restrain in other directions. Such art is, in a word, the opera and drama of the monk. Sometimes it is worse than this, and the love of it is the mask under which a general thirst for morbid excitement will pass itself for religion. The young lady who rises in the middle of the day, jaded by her last night's ball, and utterly incapable of any simple or wholesome religious exercise, can still gaze into the dark eyes of the Madonna di San Sisto, or dream over the whiteness of an ivory crucifix, and returns to the course of her daily life in full persuasion that her morning's feverishness has atoned for

her evening's folly. And all the while, the art which possesses these very doubtful advantages is acting for undoubted detriment, in the various ways above examined, on the inmost fastnesses of faith; it is throwing subtle endearments round foolish traditions, confusing sweet fancies with sound doctrines, obscuring real events with unlikely semblances, and enforcing false assertions with pleasant circumstantiality, until, to the usual, and assuredly sufficient, difficulties standing in the way of belief, its votaries have added a habit of sentimentally changing what they know to be true, and of dearly loving what they confess to be false.

§ 20. Has there, then (the reader asks emphatically), been *no* true religious ideal? Has religious art never been of any service to mankind? I fear, on the whole, not. Of true religious ideal, representing events historically recorded, with solemn effort at a sincere and unartificial conception, there exist, as yet, hardly any examples. Nearly all good religious pictures fall into one or other branch of the false ideal already examined, either into the Angelican (passionate ideal) or the Raphaelesque (philosophical ideal). But there is one true form of religious art, nevertheless, in the pictures of the passionate ideal which represent imaginary beings of another world. Since it is evidently right that we should try to imagine the glories of the next world, and as this imagination must be, in each separate mind, more or less different, and unconfined by any laws of material fact, the passionate ideal has not only full scope here, but it becomes our duty to urge its powers to its utmost, so that every condition of beautiful form and colour may be employed to invest these scenes with greater delightfulness (the whole being, of course, received as an assertion of possibility, not of absolute fact). All the paradises imagined by the religious painters—the choirs of glorified saints, angels, and spiritual powers, when painted with full belief in this possibility of their existence, are true ideals; and so far from our having dwelt on these too much, I believe, rather, we have not trusted them enough,

nor accepted them enough, as possible statements of most precious truth. Nothing but unmixed good can accrue to any mind from the contemplation of Orcagna's Last Judgment or his Triumph of Death, or Angelico's Last Judgment and Paradise,¹ or any of the scenes laid in heaven by the other faithful religious masters; and the more they are considered, not as works of art, but as real visions of real things, more or less imperfectly set down, the more good will be got by dwelling upon them. The same is true of all representations of Christ as a living presence among us now, as in Hunt's Light of the World.²

§ 21. For the rest, there is a reality of conception in some of the works of Benozzo Gozzoli, Ghirlandajo, and Giotto, which approaches to a true ideal, even of recorded facts. But the examination of the various degrees in which sacred art has reached its proper power is not to our present purpose; still less, to investigate the infinitely difficult question of its past operation on the Christian mind. I hope to prosecute my inquiry into this subject in another work; it being enough here to mark the forms of ideal error, without historically tracing their extent, and to state generally that my impression is, up to the present moment, that the best religious art has been *hitherto* rather a fruit, and attendant sign, of sincere Christianity than a promoter of or help to it. More, I think, has always been done for God by few words than many pictures, and more by few acts than many words.

§ 22. I must not, however, quit the subject without insisting on the chief practical consequence of what we have observed, namely, that sacred art, so far from being exhausted, has yet to attain the development of its highest branches; and the task, or privilege, yet remains for mankind, to produce an art which shall be at once entirely

¹ [For Orcagna's "Last Judgment," see Vol. IV. p. 275 *n.*, and for his "Triumph of Death," Lord Lindsay's description quoted in Ruskin's Review, Vol. XII. p. 224 (§ 53), and compare below, ch. viii. § 6, p. 134. For Angelico's "Last Judgment" and "Paradise," Vol. IV. p. 275.]

² [See above, pp. 52, 65.]

skilful and entirely *sincere*. All the histories of the Bible are, in my judgment, yet waiting to be painted. Moses has never been painted; Elijah never; David never (except as a mere ruddy stripling); Deborah never; Gideon never; Isaiah never.¹ What single example does the reader remember of painting which suggested so much as the faintest shadow of these people, or of their deeds? Strong men in armour, or aged men with flowing beards, he *may* remember, who, when he looked at his Louvre or Uffizii catalogue, he found were intended to stand for David or for Moses. But does he suppose that, if these pictures had suggested to him the feeblest image of the presence of such men, he would have passed on, as he assuredly did, to the next picture,—representing, doubtless, Diana and Actæon, or Cupid and the Graces, or a gambling quarrel in a pothouse,—with no sense of pain, or surprise? Let him meditate over the matter, and he will find ultimately that what I say is true, and that religious art, at once complete and sincere, never yet has existed.

§ 23. It will exist: nay, I believe the era of its birth has come, and that those bright Turnerian imageries, which the European public declared to be “dotage,” and those calm Pre-Raphaelite studies which, in like manner, it pronounced “puerility,” form the first foundation that has been ever laid for true sacred art. Of this we shall presently reason farther. But, be it as it may, if we would cherish the hope that sacred art may, indeed, arise for *us*, two separate cautions are to be addressed to the two opposed

¹ [The passage from “All the histories of the Bible . . .” down to the end of § 22 is § 8 in *Fronde Agrestes* (1875), where, at this point, Ruskin added the following note:—

“I knew nothing, when I wrote this passage, of Luini, Filippo Lippi, or Sandro Botticelli; and had not capacity to enter into the deeper feelings even of the men whom I was chiefly studying,—Tintoret and Fra Angelico. But the British public is at present as little acquainted with the greater Florentines as I was then, and the passage, for *them*, remains true.”

In connexion with the remarks in the text on paintings of religious subjects, compare the criticism of Millais’ “Joshua” (exhibited 1871) in *Ariadne Florentina*, § 152, and the subsequent remarks on Botticelli’s Life of Moses. For Ruskin’s discovery of Luini, see Vol. IV. p. 355 and *n.*]

classes of religionists whose influence will chiefly retard that hope's accomplishment. The group calling themselves Evangelical ought no longer to render their religion an offence to men of the world by associating it only with the most vulgar forms of art. It is not necessary that they should admit either music or painting into religious service; but, if they admit either the one or the other, let it not be bad music nor bad painting: it is certainly in nowise more for Christ's honour that His praise should be sung discordantly, or His miracles painted discreditably, than that His word should be preached ungrammatically. Some Evangelicals, however, seem to take a morbid pride in the triple degradation.*

§ 24. The opposite class of men, whose natural instincts lead them to mingle the refinements of art with all the offices and practices of religion, are to be warned, on the contrary, how they mistake their enjoyments for their duties, or confound poetry with faith. I admit that it is impossible for one man to judge another in this matter, and that it can never be said with certainty how far what seems frivolity may be force, and what seems the indulgence of the heart may be, indeed, its dedication. I am ready to believe that Metastasio, expiring in a canzonet, may have died better than if his prayer had been in unmeasured

* I do not know anything more humiliating to a man of common sense, than to open what is called an "Illustrated Bible" of modern days. See, for instance, the plates in Brown's Bible (octavo: Edinburgh, 1840), a standard evangelical edition. Our habit of reducing the Psalms to doggerel before we will condescend to sing them, is a parallel abuse. It is marvellous to think that human creatures with tongues and souls should refuse to chant the verse: "Before Ephraim, Benjamin, and Manasseh, stir up Thy strength, and come and help us;" preferring this:—

"Behold how Benjamin expects,
With Ephraim and Manasseh join'd,
In their deliverance, the effects
Of Thy resistless strength to find!"¹

¹ [Tate and Brady, Psalm 80.]

syllables.* But, for the most part, it is assuredly much to be feared lest we mistake a surrender to the charms of art for one to the service of God; and, in the art which we permit, lest we substitute sentiment for sense, grace for utility. And for us all there is in this matter even a deeper danger than that of indulgence. There is the danger of Artistical Pharisaism. Of all the forms of pride and vanity, as there are none more subtle, so I believe there are none more sinful, than those which are manifested by the Pharisees of art. To be proud of birth, of place, of wit, of bodily beauty, is comparatively innocent, just because such pride is more natural, and more easily detected. But to be proud of our sanctities; to pour contempt upon our fellows, because, forsooth, we like to look at Madonnas in bowers of roses, better than at plain pictures of plain things; and to make this religious art of ours the expression of our own perpetual self-complacency,—congratulating ourselves, day by day, on our purities, proprieties, elevations, and inspirations, as above the reach of common mortals,—this I believe to be one of the wickedest and foolishest forms of human egotism; and, truly, I had rather, with great, thoughtless, humble Paul Veronese, make the Supper at Emmaus a background for two children playing with a dog¹

* “En 1780, âgé de quatre-vingt-deux ans, au moment de recevoir le viatique, il rassembla ses forces, et chanta à son Créateur:

‘Eterno Genitor,
Io t’ offro il proprio figlio
Che in pegno del tuo amor
Si vuole a me donar.
A lui rivolgi il eiglio,
Mira chi t’ offro; e poi,
Niega, Signor, se puoi,
Niega di perdonar.’ ”

—DE STENDHAL, *Vie de Metastasio*.²

² [On page 308 of the book cited on p. 120.]

(as, God knows, men do usually put it in the background to everything, if not out of sight altogether), than join that school of modern Germanism which wears its pieties for decoration as women wear their diamonds, and spreads the dry fleeces of its sanctities between its dust and the dew of heaven.¹

¹ [The concluding words have hitherto been “. . . and flaunts the dry fleeces of its phylacteries . . .” Ruskin altered as above in his copy for revision.]

CHAPTER V

OF THE FALSE IDEAL:—SECONDLY, PROFANE

§ 1. SUCH having been the effects of the pursuit of ideal beauty on the religious mind of Europe, we might be tempted next to consider in what way the same movement affected the art which concerned itself with profane subject, and, through that art, the whole temper of modern civilization.

I shall, however, merely glance at this question. It is a very painful and a very wide one. Its discussion cannot come properly within the limits, or even within the aim, of a work like this; it ought to be made the subject of a separate essay, and that essay should be written by some one who had passed less of his life than I have among mountains, and more of it among men. But one or two points may be suggested for the reader to reflect upon at his leisure.

§ 2. I said just now that we might be tempted to consider how this pursuit of the ideal *affected* profane art. Strictly speaking, it brought that art into existence. As long as men sought for truth first, and beauty secondarily, they cared chiefly, of course, for the *chief* truth, and all art was instinctively religious. But as soon as they sought for beauty first, and truth secondarily, they were punished by losing sight of spiritual truth altogether, and the profane (properly so called) schools of art were instantly developed.

The perfect human beauty, which, to a large part of the community, was by far the most interesting feature in the work of the rising school, might indeed be in some degree consistent with the agony of Madonnas, and the repentance of Magdalenes; but could not be exhibited in fulness, when

the subjects, however irreverently treated, nevertheless demanded some decency in the artist, and some gravity in the spectator. The newly acquired powers of rounding limbs, and tinting lips, had too little scope in the sanctities even of the softest womanhood; and the newly acquired conceptions of the nobility of nakedness, could in no wise be expressed beneath the robes of the prelate or the sackcloth of the recluse. But the source from which these ideas had been received afforded also full field for their expression; the heathen mythology, which had furnished the examples of these heights of art, might again become the subject of the inspirations it had kindled;—with the additional advantage that it could now be delighted in, without being believed; that its errors might be indulged, unrepressed by its awe; and those of its deities whose function was temptation might be worshipped, in scorn of those whose hands were charged with chastisement.

So, at least, men dreamed in their foolishness,—to find, as the ages wore on, that the returning Apollo bore not only his lyre, but his arrows; and that at the instant of Cytherea's resurrection to the sunshine, Persephone had reascended her throne in the deep.

§ 3. Little thinking this, they gave themselves up fearlessly to the chase of the new delight, and exhausted themselves in the pursuit of an ideal now doubly false. Formerly, though they attempted to reach an unnatural beauty, it was yet in representing historical facts and real persons; *now* they sought for the same unnatural beauty in representing tales which they knew to be fictitious, and personages who, they knew, had never existed. Such a state of things had never before been found in any nation. Every people till then had painted the acts of their kings, the triumphs of their armies, the beauty of their race, or the glory of their gods. They showed the things they had seen or done; the beings they truly loved or faithfully adored. But the ideal art of modern Europe was the shadow of a shadow; and, with mechanism substituted for perception, and bodily

beauty for spiritual life, it set itself to represent men it had never seen, customs it had never practised, and gods in whom it had never believed.

§ 4. Such art could, of course, have no help from the virtues, nor claim on the energies of men. It necessarily rooted itself in their vices and their idleness; and of their vices principally in two, pride and sensuality. To the pride was attached eminently the art of architecture; to the sensuality, those of painting and sculpture. Of the fall of architecture, as resultant from the formalist pride of its patrons and designers, I have spoken elsewhere.¹ The sensualist ideal, as seen in painting and sculpture, remains to be examined here. But one interesting circumstance is to be observed with respect to the manner of the separation of these arts. Pride, being wholly a vice, and in every phase inexcusable, wholly betrayed and destroyed the art which was founded on it. But passion, having some root and use in healthy nature, and only becoming guilty in excess, did not altogether destroy the art founded upon it. The architecture of Palladio is wholly virtueless and despicable. Not so the Venus of Titian, nor the Antiope of Correggio.²

§ 5. We find, then, at the close of the sixteenth century, the arts of painting and sculpture wholly devoted to entertain the indolent and satiate the luxurious. To effect these noble ends, they took a thousand different forms; painting, however, of course being the most complying, aiming sometimes at mere amusement by deception in landscapes, or minute imitation of natural objects; sometimes giving more piquant excitement in battle-pieces full of slaughter, or revels deep in drunkenness; sometimes entering upon serious subject, for the sake of grotesque fiends and picturesque infernos, or that it might introduce pretty

¹ [*Stones of Venice*, vol. iii. ch. ii. §§ 6–86.]

² [For the architecture of Palladio, see *Modern Painters*, vol. iv. ch. xix. § 31, *Stones of Venice*, *passim*: see General Index. For Titian's Venus and Correggio's Antiope, compare Vol. XII. p. 145; and for the latter, see also *Stones of Venice*, vol. ii. (Vol. X. p. 227).]

children as cherubs, and handsome women as Magdalenes, and Maries of Egypt, or portraits of patrons in the character of the more decorous saints: but more frequently, for direct flatteries of this kind, recurring to pagan mythology, and painting frail ladies as goddesses or graces, and foolish kings in radiant apotheosis; while, for the earthly delight of the persons whom it honoured as divine, it ransacked the records of luscious fable, and brought back in fullest depth of dye and flame of fancy, the impurest dreams of the un-Christian ages.

§ 6. Meanwhile, the art of sculpture, less capable of ministering to mere amusement, was more or less reserved for the affectations of taste; and the study of the classical statues introduced various ideas on the subjects of “purity,” “chastity,” and “dignity,” such as it was possible for people to entertain who were themselves impure, luxurious, and ridiculous. It is a matter of extreme difficulty to explain the exact character of this modern sculpturesque ideal; but its relation to the true ideal may be best understood by considering it as in exact parallelism with the relation of the word “taste” to the word “love.” Wherever the word “taste” is used with respect to matters of art, it indicates either that the thing spoken of belongs to some inferior class of objects, or that the person speaking has a false conception of its nature. For, consider the exact sense in which a work of art is said to be “in good or bad taste.” It does not mean that it is true or false; that it is beautiful or ugly: but that it does or does not comply either with the laws of choice, which are enforced by certain modes of life, or the habits of mind produced by a particular sort of education. It does not mean merely fashionable, that is, complying with a momentary caprice of the upper classes; but it means agreeing with the habitual sense which the most refined education, common to those upper classes at the period, gives to their whole mind. Now, therefore, so far as that education does indeed tend to make the senses delicate, and the perceptions accurate, and thus

enables people to be pleased with quiet instead of gaudy colour, and with graceful instead of coarse form; and, by long acquaintance with the best things, to discern quickly what is fine from what is common;—so far, acquired taste is an honourable faculty, and it is true praise of anything to say it is “in good taste.” But¹ so far as this higher education has a tendency to narrow the sympathies and harden the heart, diminishing the interest of all beautiful things by familiarity, until even what is best can hardly please, and what is brightest hardly entertain;—so far as it fosters pride, and leads men to find the pleasure they take in anything, not on the worthiness of the thing, but on the degree in which it indicates some greatness of their own (as people build marble porticoes, and inlay marble floors, not so much because they like the colours of marble, or find it pleasant to the foot, as because such porches and floors are costly, and separated in all human eyes from plain entrances of stone and timber);—so far as it leads people to prefer gracefulness of dress, manner, and aspect, to value of substance and heart, liking a well *said* thing better than a true thing, and a well-trained manner better than a sincere one, and a delicately formed face better than a good-natured one, and in all other ways and things setting custom and semblance above everlasting truth;—so far, finally, as it induces a sense of inherent distinction between class and class, and causes everything to be more or less despised which has no social rank, so that the affection, pleasure, and grief of a clown are looked upon as of no interest compared with the affection and grief of a

¹ [The passage—beginning a few lines above “So far as education does indeed tend . . .” down to nearly the end of § 6 “. . . to the understanding of noble art”—is § 6 in *Fronde Agrestes*, where Ruskin, ante-dating it, put the following footnote:—

“Nobody need begin this second volume sentence unless they are breathed like the Graeme:—

‘Right up Ben Ledi could be press,
And not a sob his toil confess.’ ”

The quotation is from *The Lady of the Lake*, canto ii. 25 (“Right up Ben Lomond,” etc.)]

well-bred man;—just so far, in all these several ways, the feeling induced by what is called a “liberal education” is utterly adverse to the understanding of noble art; and the name which is given to the feeling,—Taste, Goût, Gusto,—in all languages indicates the baseness of it, for it implies that art gives only a kind of pleasure analogous to that derived from eating by the palate.

§ 7. Modern education, not in art only, but in all other things referable to the same standard, has invariably given taste in this bad sense; it has given fastidiousness of choice without judgment, superciliousness of manner without dignity, refinement of habit without purity, grace of expression without sincerity, and desire of loveliness without love; and the modern “ideal” of high art is a curious mingling of the gracefulness and reserve of the drawing-room with a certain measure of classical sensuality. Of this last element, and the singular artifices by which vice succeeds in combining it with what appears to be pure and severe, it would take us long to reason fully: I would rather leave the reader to follow out for himself the consideration of the influence, in this direction, of statues, bronzes, and paintings, as at present employed by the upper circles of London, and (especially) Paris; and this is not so much in the works which are really fine, as in the multiplied coarse copies of them; taking the widest range, from Dannaeker’s Ariadne¹ down to the amorous shepherd and shepherdess in china on the drawing-room time-piece, rigidly questioning, in each case, how far the charm of the art does indeed depend on some appeal to the inferior passions. Let it be considered, for instance, exactly how far the value of a picture of a girl’s head by Greuze would be lowered in the market if the dress, which now leaves the bosom bare, were raised to the neck; and how far, in the commonest lithograph of some utterly popular subject,—for instance, the

¹ [This much-copied marble of Ariadne on the Panther is in the Ariadneum, or Bethmann’s Museum, at Frankfort. It is the chief work (1813) of Dannaeker (1758–1836), a sculptor of Stuttgart.]

teaching of Uncle Tom by Eva,¹—the sentiment which is supposed to be excited by the exhibition of Christianity in youth is complicated with that which depends upon Eva's having a dainty foot and a well-made satin slipper;—and then, having completely determined for himself how far the element exists, consider farther whether, when art is thus frequent (for frequent he will assuredly find it to be) in its appeal to the lower passions, it is likely to attain the highest order of merit, or be judged by the truest standards of judgment. For, of all the causes which have combined, in modern times, to lower the rank of art, I believe this to be one of the most fatal; while, reciprocally, it may be questioned how far society suffers, in its turn, from the influences possessed over it by the arts it has degraded. It seems to me a subject of the very deepest interest to determine what has been the effect upon the European nations of the great change by which art became again capable of ministering delicately to the lower passions, as it had in the worst days of Rome; how far, indeed, in all ages, the fall of nations may be attributed to art's arriving at this particular stage among them. I do not mean that, in any of its stages, it is incapable of being employed for evil, but that assuredly an Egyptian, Spartan, or Norman was unexposed to the kind of temptation which is continually offered by the delicate painting and sculpture of modern days; and, although the diseased imagination might complete the imperfect image of beauty from the coloured image on the wall,* or the most revolting thoughts be suggested by the mocking barbarism of the Gothic sculpture, their hard outline and rude execution were free from all the subtle treachery which now fills the flushed canvas and the rounded marble.

§ 8. I cannot, however, pursue this inquiry here. For our present purpose it is enough to note that the feeling,

* Ezek. xxiii. 14.

¹ [The scene of "Tom and Eva in the arbour": see p. 223 of the edition of *Uncle Tom's Cabin* illustrated by Cruikshank, 1852.]

in itself so debased, branches upwards into that of which, while no one has cause to be ashamed, no one, on the other hand, has cause to be proud, namely, the admiration of physical beauty in the human form as distinguished from expression of character. Every one can easily appreciate the merit of regular features and well-formed limbs, but it requires some attention, sympathy, and sense, to detect the charm of passing expression, or life-disciplined character. The beauty of the Apollo Belvidere,¹ or Venus de' Medici, is perfectly palpable to any shallow fine lady or fine gentleman, though they would have perceived none in the face of an old weather-beaten St. Peter, or a grey-haired "Grand-mother Lois."² The knowledge that long study is necessary to produce these regular types of the human form renders the facile admiration matter of eager self-complacency; the shallow spectator, delighted that he can really, and without hypocrisy, admire what required much thought to produce, supposes himself endowed with the highest critical faculties, and easily lets himself be carried into rhapsodies about the "ideal," which, when all is said, if they be accurately examined, will be found literally to mean nothing more than that the figure has got handsome calves to its legs, and a straight nose.

§ 9. That they do mean, in reality, nothing more than this may be easily ascertained by watching the taste of the same persons in other things. The fashionable lady who will write five or six pages in her diary respecting the effect upon her mind of such and such an "ideal" in marble, will have her drawing-room table covered with Books of Beauty, in which the engravings represent the human form in every possible aspect of distortion and affectation; and the connoisseur who, in the morning, pretends to the most exquisite taste in the antique, will be seen, in the evening, in his opera-stall, applauding the least graceful gestures of the least modest figurante.

¹ [For the Apollo Belvidere, see Vol. III. pp. 118, 608, 627; Vol. IV. p. 329 *n.*]

² [2 Timothy i. 5.]

§ 10. But even this vulgar pursuit of physical beauty (vulgar in the profoundest sense, for there is no vulgarity like the vulgarity of education) would be less contemptible if it really succeeded in its object; but, like all pursuits carried to inordinate lengths, it defeats itself. Physical beauty *is* a noble thing when it is seen in perfectness; but the manner in which the moderns pursue their ideal prevents their ever really seeing what they are always seeking; for, requiring that all forms should be regular and faultless, they permit, or even compel, their painters and sculptors to work chiefly by rule, altering their models to fit their preconceived notions of what is right. When such artists look at a face, they do not give it the attention necessary to discern what beauty is already in its peculiar features; but only to see how best it may be altered into something for which they have themselves laid down the laws. Nature never unveils her beauty to such a gaze. She keeps whatever she has done best, close sealed, until it is regarded with reverence. To the painter who honours her, she will open a revelation in the face of a street mendicant; but in the work of a painter who alters her, she will make Portia become ignoble, and Perdita graceless.

§ 11. Nor is the effect less for evil on the mind of the general observer. The lover of ideal beauty, with all his conceptions narrowed by rule, never looks carefully enough upon the features which do not come under his law (or any others), to discern the inner beauty in them. The strange intricacies about the lines of the lips, and marvellous shadows and watchfires of the eye, and wavering trceries of the eyelash, and infinite modulations of the brow, wherein high humanity is embodied, are all invisible to him. He finds himself driven back at last, with all his idealism, to the lionne of the ball-room, whom youth and passion can as easily distinguish as his utmost critical science; whereas, the observer who has accustomed himself to take human faces as God made them, will often find as much beauty on a village green as in the proudest room of state, and as much

in the free seats of a church aisle, as in all the sacred paintings of the Vatican or the Pitti.

§ 12. Then, farther, the habit of disdainful ordinary truth, and seeking to alter it so as to fit the fancy of the beholder, gradually infects the mind in all its other operations; so that it begins to propose to itself an ideal in history, an ideal in general narration, an ideal in portraiture and description, and in everything else where truth may be painful or uninteresting; with the necessary result of more or less weakness, wickedness, and uselessness in all that is done or said, with the desire of concealing this painful truth. And, finally, even when truth is not intentionally concealed, the pursuer of idealism will pass his days in false and useless trains of thought, pluming himself, all the while, upon his superiority therein to the rest of mankind. A modern German, without either invention or sense, seeing a rapid in a river, will immediately devote the remainder of the day to the composition of dialogues between amorous water nymphs and unhappy mariners; while the man of true invention, power, and sense will, instead, set himself to consider whether the rocks in the river could have their points knocked off, or the boats upon it be made with stronger bottoms.

§ 13. Of this final baseness of the false ideal, its miserable waste of the time, strength, and available intellect of man, by turning, as I have said above, innocence of pastime into seriousness of occupation, it is, of course, hardly possible to sketch out even so much as the leading manifestations. The vain and haughty projects of youth for future life; the giddy reveries of insatiable self-exaltation; the discontented dreams of what might have been or should be, instead of the thankful understanding of what is; the casting about for sources of interest in senseless fiction, instead of the real human histories of the people round us; the prolongation from age to age of romantic historical deceptions instead of sifted truth; the pleasures taken in fanciful portraits of rural or romantic life in poetry and on

the stage, without the smallest effort to rescue the living rural population of the world from its ignorance or misery; the excitement of the feelings by laboured imagination of spirits, fairies, monsters, and demons, issuing in total blindness of heart and sight to the true presences of beneficent or destructive spiritual powers around us; in fine, the constant abandonment of all the straightforward paths of sense and duty, for fear of losing some of the enticement of ghostly joys, or trampling somewhat “sopra lor vanità, che par persona;”¹ all these various forms of false idealism have so entangled the modern mind, often called, I suppose ironically, practical, that truly I believe there never yet was idolatry of stock or staff so utterly unholy as this our idolatry of shadows; nor can I think that, of those who burnt incense under oaks, and poplars, and elms, because “the shadow thereof was good,” it could in any wise be more justly or sternly declared than of us—“The wind hath bound them up in her wings, and they shall be ashamed because of their sacrifices.”*

* Hosea, chap. iv. 12, 13, and 19.

¹ [*Inferno*, vi. 36; quoted also in “Review of Lord Lindsay,” Vol. XII. p. 170.]

CHAPTER VI

OF THE TRUE IDEAL:—FIRST, PURIST¹

§ 1. HAVING thus glanced at the principal modes in which the imagination works for evil, we must rapidly note also the principal directions in which its operation is admissible, even in changing or strangely combining what is brought within its sphere.

For hitherto we have spoken as if every change wilfully wrought by the imagination was an error; apparently implying that its only proper work was to summon up the memories of past events, and the anticipations of future ones, under aspects which would bear the sternest tests of historical investigation, or abstract reasoning. And in general this is, indeed, its noblest work. Nevertheless, it has also permissible functions peculiarly its own, and certain rights of feigning, adorning, and fancifully arranging, inalienable from its nature. Everything that is natural is, within certain limits, right; and we must take care not, in over-severity, to deprive ourselves of any refreshing or animating power ordained to be in us for our help.

§ 2. (A.) It was noted in speaking above of the Angelican or passionate ideal, that there was a certain virtue in it dependent on the expression of its loving enthusiasm. (Chap. IV. § 10.)

(B.) In speaking of the pursuit of beauty as one of the characteristics of the highest art, it was also said that there were certain ways of showing this beauty by gathering together, without altering, the finest forms, and marking them by gentle emphasis. (Chap. III. § 15.)

¹ [For a note by Ruskin on this chapter, see Vol. IV. p. 190 *n.*]

(C.) And in speaking of the true uses of imagination, it was said, that we might be allowed to create for ourselves, in innocent play, fairies and naiads, and other such fictitious creatures. (Chap. IV. § 5.)

Now this loving enthusiasm, which seeks for a beauty fit to be the object of eternal love; this inventive skill, which kindly displays what exists around us in the world; and this playful energy of thought which delights in various conditions of the impossible, are three forms of idealism more or less connected with the three tendencies of the artistical mind which I had occasion to explain in the chapter on the Nature of Gothic, in the *Stones of Venice*.¹ It was there pointed out, that, the things around us containing mixed good and evil, certain men chose the good and left the evil (thence properly called Purists); others received both good and evil together (thence properly called Naturalists); and others had a tendency to choose the evil and leave the good, whom, for convenience' sake, I termed Sensualists. I do not mean to say that painters of fairies and naiads must belong to this last and lowest class, or habitually choose the evil and leave the good; but there is, nevertheless a strange connection between the reinless play of the imagination, and a sense of the presence of evil, which is usually more or less developed in those creations of the imagination to which we properly attach the word *Grotesque*.

For this reason, we shall find it convenient to arrange what we have to note respecting true idealism under the three heads—

- A. Purist Idealism.
- B. Naturalist Idealism.
- C. Grotesque Idealism.

§ 3. A. Purist Idealism.—It results from the unwillingness of men whose dispositions are more than ordinarily tender and holy, to contemplate the various forms of definite

¹ [Vol. X. ch. vi. § 56.]

evil which necessarily occur in the daily aspects of the world around them. They shrink from them as from pollution, and endeavour to create for themselves an imaginary state, in which pain and imperfection either do not exist, or exist in some edgeless and enfeebled condition.

As, however, pain and imperfection are, by eternal laws, bound up with existence, so far as it is visible to us, the endeavour to cast them away invariably indicates a comparative childishness of mind, and produces a childish form of art. In general, the effort is most successful when it is most naïve, and when the ignorance of the draughtsman is in some frank proportion to his innocence. For instance, one of the modes of treatment, the most conducive to this ideal expression, is simply drawing everything without shadows, as if the sun were everywhere at once. This, in the present state of our knowledge, we could not do with grace, because we could not do it without fear or shame. But an artist of the thirteenth century did it with no disturbance of conscience,—knowing no better, or rather, in some sense, we might say, knowing no worse. It is, however, evident, at the first thought, that all representations of nature without evil must either be ideals of a future world, or be false ideals, if they are understood to be representations of facts. They can only be classed among the branches of the true ideal, in so far as they are understood to be nothing more than expressions of the painter's personal affections or hopes.

§ 4. Let us take one or two instances in order clearly to explain our meaning.

The life of Angelico was almost entirely spent in the endeavour to imagine the beings belonging to another world. By purity of life, habitual elevation of thought, and natural sweetness of disposition, he was enabled to express the sacred affections upon the human countenance as no one ever did before or since. In order to effect clearer distinction between heavenly beings and those of this world, he represents the former as clothed in draperies of the

purest colour, crowned with glories of burnished gold, and entirely shadowless. With exquisite choice of gesture, and disposition of folds of drapery, this mode of treatment gives, perhaps, the best idea of spiritual beings which the human mind is capable of forming. It is, therefore, a true ideal;* but the mode in which it is arrived at (being so far mechanical and contradictory of the appearances of nature) necessarily precludes those who practise it from being complete masters of their art. It is always childish, but beautiful in its childishness.¹

§ 5. The works of our own Stothard are examples of the operation of another mind, singular in gentleness and purity, upon mere worldly subject. It seems as if Stothard could not conceive wickedness, coarseness, or baseness; every one of his figures looks as if it had been copied from some creature who had never harboured an unkind thought, or permitted itself in an ignoble action. With this intense love of mental purity is joined, in Stothard, a love of mere physical smoothness and softness, so that he lived in a universe of soft grass and stainless fountains, tender trees, and stones at which no foot could stumble.

All this is very beautiful, and may sometimes urge us to an endeavour to make the world itself more like the conception of the painter. At least, in the midst of its malice, misery, and baseness, it is often a relief to glance at the graceful shadows, and take, for momentary companionship, creatures full only of love, gladness, and honour. But the perfect truth will at last vindicate itself against the partial truth; the help which we can gain from the unsubstantial vision will be only like that which we may sometimes receive, in weariness, from the scent of a flower or the passing of a breeze. For all firm aid, and steady use, we must look

* As noted above in chap. iv. § 20.

¹ [For other references to the "purism" of Fra Angelico and Stothard, see Vol. X. p. 222 *n.*]

to harder realities; and as far as the painter himself is regarded, we can only receive such work as the sign of an amiable imbecility. It is indeed ideal; but ideal as a fair dream is in the dawn of morning, before the faculties are astir. The apparent completeness of grace can never be attained without much definite falsification as well as omission; stones over which we cannot stumble, must be illdrawn stones; trees, which are all gentleness and softness, cannot be trees of wood; nor companies without evil in them, companies of flesh and blood. The habit of falsification (with whatever aim) begins always in dulness and ends always in incapacity: nothing can be more pitiable than any endeavour by Stothard to express facts beyond his own sphere of soft pathos or graceful mirth, and nothing more unwise than the aim at a similar ideality by any painter who has power to render a sincerer truth.

§ 6. I remember another interesting example of ideality on this same root, but belonging to another branch of it, in the works of a young German painter, which I saw some time ago in a London drawing-room. He had been travelling in Italy, and had brought home a portfolio of sketches remarkable alike for their fidelity and purity. Every one was a laborious and accurate study of some particular spot. Every cottage, every cliff, every tree, at the site chosen, had been drawn, and drawn with palpable sincerity of portraiture, and yet in such a spirit that it was impossible to conceive that any sin or misery had ever entered into one of the scenes he had represented; and the volcanic horrors of Radicofani,¹ the pestilent gloom of the Pontines, and the boundless despondency of the Campagna, became, under his hand, only various appearances of Paradise.

It was very interesting to observe the minute emendations or omissions by which this was effected. To set the tiles the slightest degree more in order upon a cottage

¹ [To Ruskin, who was there in 1840, "a terrific memory": see *Præterita*, ii. § 30.]

roof; to insist upon the vine-leaves at the window, and let the shadow which fell from them naturally conceal the rent in the wall; to draw all the flowers in the foreground, and miss the weeds; to draw all the folds of the white clouds, and miss those of the black ones; to mark the graceful branches of the trees, and, in one way or another, beguile the eye from those which were ungainly; to give every peasant-girl whose face was visible the expression of an angel, and every one whose back was turned the bearing of a princess; finally, to give a general look of light, clear organization and serene vitality to every feature in the landscape;—such were his artifices, and such his delights. It was impossible not to sympathise deeply with the spirit of such a painter; and it was just cause for gratitude to be permitted to travel, as it were, through Italy with such a friend. But his work had, nevertheless, its stern limitations and marks of everlasting inferiority. Always soothing and pathetic, it could never be sublime, never perfectly nor entrancingly beautiful; for the narrow spirit of correction could not cast itself fully into any scene; the calm cheerfulness which shrank from the shadow of the cypress and the distortion of the olive, could not enter into the brightness of the sky that they pierced, nor the softness of the bloom that they bore: for every sorrow that his heart turned from, he lost a consolation; for every fear which he dared not confront, he lost a portion of his hardness; the unscathed sweep of the storm-clouds, the fair freedom of glancing shower and flickering sunbeam, sank into sweet rectitudes and decent formalisms; and, before eyes that refused to be dazzled or darkened, the hours of sunset wreathed their rays unheeded, and the mists of the Apennines spread their blue veils in vain.

§ 7. To this inherent shortcoming and narrowness of reach the farther defect was added, that this work gave no useful representation of the state of facts in the country which it pretended to contemplate. It was not only wanting in all the higher elements of beauty, but wholly

unavailable for instruction of any kind beyond that which exists in pleasureableness of pure emotion. And considering what cost of labour was devoted to the series of drawings, it could not but be matter for grave blame, as well as for partial contempt, that a man of amiable feeling and considerable intellectual power should thus expend his life in the declaration of his own petty pieties and pleasant reveries, leaving the burden of human sorrow unwitnessed, and the power of God's judgments unconfessed; and, while poor Italy lay wounded and moaning at his feet, pass by, in priestly calm, lest the whiteness of his decent vesture should be spotted with unhallowed blood.

§ 8. Of several other forms of Purism I shall have to speak hereafter, more especially of that exhibited in the landscapes of the early religious painters;¹ but these examples are enough, for the present, to show the general principle that the purist ideal, though in some measure true, in so far as it springs from the true longings of an earnest mind, is yet necessarily in many things deficient or blameable, and *always* an indication of some degree of weakness in the mind pursuing it. But, on the other hand, it is to be noted that entire scorn of this purist ideal is the sign of a far greater weakness. Multitudes of petty artists, incapable of any noble sensation whatever, but acquainted, in a dim way, with the technicalities of the schools, mock at the art whose depths they cannot fathom, and whose motives they cannot comprehend, but of which they can easily detect the imperfections, and deride the simplicities. Thus poor fumigatory Fuseli, with an art composed of the tinsel of the stage and the panics of the nursery, speaks contemptuously of the name of Angelico as "dearer to sanctity than to art."² And a large portion of the resistance to the noble Pre-Raphaelite movement of our own days has been offered by men who suppose the

¹ [See below, ch. xviii. §§ 11, 12, pp. 393–394.]

² [The reference is apparently to Pilkington's *Dictionary of Painters*, new edition by Fuseli, 1805, where Fra Angelico is dismissed as "as much (if not more) respected for his piety as for his painting."]

entire function of the artist in this world to consist in laying on colour with a large brush, and surrounding dashes of flake white with bituminous brown; men whose entire capacities of brain, soul, and sympathy, applied industriously to the end of their lives, would not enable them, at last, to paint so much as one of the leaves of the nettles at the bottom of Hunt's picture of the Light of the World.*

§ 9. It is finally to be remembered, therefore, that Purism is always noble when it is *instinctive*. It is not the greatest thing that can be done, but it is probably the greatest thing that the man who does it can do, provided it comes from his heart. True, it is a sign of weakness, but it is not in our choice whether we will be weak or strong; and there is a certain strength which can only be made perfect in weakness. If he is working in humility, fear of evil, desire of beauty, and sincere purity of purpose and thought, he will produce good and helpful things; but he must be much on his guard against supposing himself to be greater than his fellows, because he has shut himself into this calm and cloistered sphere. His only safety lies in knowing himself to be, on the contrary, *less* than his fellows, and in always striving, so far as he can find it in his heart, to extend his delicate narrowness towards the great naturalist ideal. The whole group of modern German purists have lost themselves, because they founded their work not on humility, nor on religion, but on small self-conceit. Incapable of understanding the great Venetians, or any other masters of true imaginative power, and having fed what mind they had with weak poetry and false philosophy, they thought themselves the best and greatest of artistic mankind, and expected to found a new school of painting in pious plagiarism and delicate pride. It is difficult at first to

* Not that the Pre-Raphaelite is a purist movement, it is stern naturalist; but its unfortunate opposers, who neither know what nature is nor what purism is, have mistaken the simple nature for morbid purism, and therefore cried out against it.

decide which is the more worthless, the spiritual affectation of the petty German, or the composition and chiaroscuro of the petty Englishman; on the whole, however, the latter have lightest weight, for the pseudo-religious painter must, at all events, pass much of his time in meditation upon solemn subjects, and in examining venerable models; and may sometimes even cast a little useful reflected light, or touch the heart with a pleasant echo.

CHAPTER VII

OF THE TRUE IDEAL:—SECONDLY, NATURALIST

§ 1. WE now enter on the consideration of that central and highest branch of ideal art which concerns itself simply with things as they ARE, and accepts, in all of them, alike the evil and the good. The question is, therefore, how the art which represents things simply as they are, can be called ideal at all. How does it meet that requirement stated in Chap. III. § 24, as imperative on all great art, that it shall be inventive, and a product of the imagination? It meets it pre-eminently by that power of arrangement which I have endeavoured, at great length and with great pains, to define accurately in the chapter on Imagination associative in the second volume.¹ That is to say, accepting the weaknesses, faults, and wrongnesses in all things that it sees, it so places and harmonizes them that they form a noble whole, in which the imperfection of each several part is not only harmless, but absolutely essential, and yet in which whatever is good in each several part shall be completely displayed.

§ 2. This operation of true idealism holds, from the least things to the greatest. For instance, in the arrangement of the smallest masses of colour, the false idealist, or even the purist, depends upon perfecting each separate hue, and raises them all, as far as he can, into costly brilliancy; but the naturalist takes the coarsest and feeblest colours of the things around him, and so interweaves and opposes them that they become more lovely than if they had all been bright. So in the treatment of the human form. The naturalist will take it as he finds it; but, with such examples as his picture may rationally admit of more or less

¹ [In this edition, Vol. IV. pp. 229–248.]

exalted beauty, he will associate inferior forms, so as not only to set off those which are most beautiful, but to bring out clearly what good there is in the inferior forms themselves; finally using such measure of absolute evil as there is commonly in nature, both for teaching and for contrast.

In Tintoret's Adoration of the Magi,¹ the Madonna is not an enthroned queen, but a fair girl, full of simplicity and almost childish sweetness. To her are opposed (as Magi) two of the noblest and most thoughtful of the Venetian senators in extreme old age,—the utmost manly dignity, in its decline, being set beside the utmost feminine simplicity, in its dawn. The steep foreheads and refined features of the nobles are, again, opposed to the head of a negro servant, and of an Indian; both, however, noble of their kind. On the other side of the picture, the delicacy of the Madonna is farther enhanced by contrast with a largely made farm-servant, leaning on a basket. All these figures are in repose; outside, the troop of the attendants of the Magi is seen coming up at the gallop.

§ 3. I bring forward this picture, observe, not as an example of the ideal in conception of religious subject, but of the general ideal treatment of the human form; in which the peculiarity is, that the beauty of each figure is displayed to the utmost, while yet, taken separately, the Madonna is an unaltered portrait of a Venetian girl, the Magi are unaltered Venetian senators, and the figure with the basket, an unaltered market-woman of Mestre.

And the greater the master of the ideal, the more perfectly true in *portraiture* will his individual figures be always found, the more subtle and bold his arts of harmony and contrast. This is a universal principle, common to all great art. Consider, in Shakspeare, how Prince Henry is opposed to Falstaff, Falstaff to Shallow, Titania to Bottom, Cordelia to Regan, Imogen to Cloten, and so on;² while all

¹ [In the Scuola di San Rocco: see Vol. XI. p. 406; see also below, ch. ix. § 18, and vol. iv. ch. ii. § 9 *n.*, ch. iv. § 15. Ruskin's copies and studies from this picture are in Vol. IV., opposite pp. 248, 288, 332.]

² [Compare the other instances given above, p. 57.]

the meaner idealists disdain the naturalism, and are shocked at the contrasts. The fact is, a man who can see truth at all, sees it wholly, and neither desires nor dares to mutilate it.

§ 4. It is evident that *within* this faithful idealism, and as one branch of it only, will arrange itself the representation of the human form and mind in perfection, when this perfection is rationally to be supposed or introduced,—that is to say, in the highest personages of the story. The careless habit of confining the term “ideal” to such representations, and not understanding the imperfect ones to be *equally* ideal in their place, has greatly added to the embarrassment and multiplied the errors of artists.* Thersites is just as ideal as Achilles, and Alecto as Helen; and, what is more, all the nobleness of the beautiful ideal depends upon its being just as probable and natural as the ugly one, and having in itself, occasionally or partially, both faults and familiarities. If the next painter who desires to illustrate the character of Homer’s Achilles, would represent him cutting pork chops for Ulysses,† he would enable the public to understand the Homeric ideal better than they have done for several centuries. For it is to be kept in mind that the *naturalist ideal* has always in it, to the full, the power expressed by those two words. It is naturalist, because studied from nature, and ideal, because it is mentally arranged in a certain manner. Achilles must be represented cutting pork chops, because that was one of the things which the nature of Achilles involved his doing: he could not be shown wholly as Achilles, if he were not shown doing that. But he shall do it at such time and place as Homer chooses.

§ 5. Now, therefore, observe the main conclusions which follow from these two conditions, attached always to art of

* The word “ideal” is used in this limited sense in the chapter on Generic Beauty in the second volume, but under protest. See § 4 in that chapter.

† *Il.* ix. 209.

v.

this kind. First, it is to be taken straight from nature: it is to be the plain narration of something the painter or writer saw. Herein is the chief practical difference between the higher and lower artists; a difference which I feel more and more every day that I give to the study of art. All the great men *see* what they paint before they paint it,—see it in a perfectly passive manner,—cannot help seeing it if they would; whether in their mind's eye, or in bodily fact, does not matter; very often the mental vision is, I believe, in men of imagination, clearer than the bodily one; but vision it is, of one kind or another,—the whole scene, character, or incident passing before them as in second sight, whether they will or no, and requiring them to paint it as they see it; they not daring, under the might of its presence, to alter* one jot or tittle of it as they write it down or paint it down; it being to them in its own kind and degree always a true vision or Apocalypse, and invariably accompanied in their hearts by a feeling correspondent to the words,—“Write the things *which thou hast seen*, and the things which *are*.”¹

And the whole power, whether of painter or poet, to describe rightly what we call an ideal thing, depends upon its being thus, to him, not an ideal, but a *real* thing. No man ever did or ever will work well, but either from actual sight or sight of faith; and all that we call ideal in Greek or any other art, because to us it is false and visionary, was, to the makers of it, true and existent. The heroes of Phidias are simply representations of such noble human persons as he every day saw, and the gods of Phidias simply representations of such noble divine persons as he thoroughly believed to exist, and did in mental vision truly behold. Hence I said in the second preface to the *Seven Lamps of*

* “And yet you have just said it shall be at such time and place as Homer chooses. Is not this *altering*?” No; wait a little, and read on.

¹ [Revelation i. 19.]

Architecture: "All great art represents something that it sees or believes in;—nothing unseen or uncredited."¹

§ 6. And just because it is always something that it sees or believes in, there is the peculiar character above noted, almost unmistakable, in all high and true ideals, of having been as it were studied from the life, and involving pieces of sudden familiarity, and close *specific* painting which never would have been admitted or even thought of, had not the painter drawn either from the bodily life or from the life of faith. For instance, Dante's centaur, Chiron, dividing his beard with his arrow before he can speak,² is a thing that no mortal would ever have thought of, if he had not actually seen the centaur do it. They might have composed handsome bodies of men and horses in all possible ways, through a whole life of pseudo-idealism, and yet never dreamed of any such thing. But the real living centaur actually trotted across Dante's brain, and he saw him do it.

§ 7. And on account of this reality it is, that the great idealists venture into all kinds of what, to the pseudo-idealists, are "vulgarities." Nay, *venturing* is the wrong word; the great men have no choice in the matter; they do not know or care whether the things they describe are vulgarities or not. They *saw* them; they are the facts of the case. If they had merely composed what they describe, they would have had it at their will to refuse this circumstance or add that. But they did not compose it. It came to them ready fashioned; they were too much impressed by it to think what was vulgar or not vulgar in it. It might be a very wrong thing in a centaur to have so much beard; but so it was. And, therefore, among the various ready tests of true greatness there is not any more certain than this daring reference to, or use of, mean and little things—mean and little, that is, to mean and little minds; but, when used by the great men, evidently part of the noble whole which is authoritatively present before them.

¹ [Vol. VIII. p. 11.]

² [*Inferno*, xii. 77–80. With what is said here, compare Vol. VI. p. 42.]

Thus, in the highest poetry, as partly above noted in the first chapter,¹ there is no word so familiar but a great man will bring good out of it, or rather, it will bring good to him, and answer some end for which no other word would have done equally well.²

§ 8. A common person, for instance, would be mightily puzzled to apply the word “whelp” to any one, with a view of flattering him. There is a certain freshness and energy in the term, which gives it agreeableness; but it seems difficult, at first hearing, to use it complimentarily. If the person spoken of be a prince, the difficulty seems increased; and when, farther, he is at one and the same moment to be called a “whelp” and contemplated as a hero, it seems that a common idealist might well be brought to a pause. But hear Shakspeare do it:—

“Awake his warlike spirit,
And your great uncle’s, Edward the Black Prince,
Who on the French ground play’d a tragedy,
Making defeat on the full power of France,
While his most mighty father on a hill
Stood smiling, to behold his lion’s whelp
Forge in blood of French nobility.”³

So a common idealist would have been rather alarmed at the thought of introducing the name of a street in Paris—Straw Street—Rue de Fouarre—into the midst of a description of the highest heavens. Not so Dante,—

“Beyond thou mayst the flaming lustre scan
Of Isidore, of Bede, and that Richart
Who was in contemplation more than man.

¹ [See especially p. 30.]

² [With § 7 here, on the involuntariness of true vision, compare *Queen of the Air*, § 17, where Ruskin uses the word “involuntary,” more in the sense, however, of “inevitable”; the exercise of the imagination, that is to say, is voluntary, but the imagination then records passively what it sees. See *Modern Painters*, vol. ii. (Vol. IV. pp. 221–222), where Ruskin distinguishes between the morbid (and “involuntary”) action of the imagination and its healthy use. On the involuntariness of true imagination in the sense here meant, see again below, §§ 10, 12. The point is made clear by a passage in *Ethics of the Dust* (Preface to ed. 2, § 3), where Ruskin distinguishes between deliberately composed metaphors and “the real powers of vision” (inevitable and involuntary) of true poets. Compare also *Modern Painters*, vol. iv. (Vol. VI. p. 42).]

³ [*Henry V.*, i. 2.]

And he, from whom thy looks returning are
 To me, a spirit was, that in austere
 Deep musings often thought death kept too far.
 That is the light eternal of Sigier,
 Who while in Rue de Fouarre his days he wore,
 Has argued hateful truths in haughtiest ear."¹—CAYLEY.

What did it matter to Dante, up in heaven there, whether the mob below thought him vulgar or not? Sigier *had* read in Straw Street; that was the fact, and he had to say so, and there an end.

§ 9. There is, indeed, perhaps, no greater sign of innate and *real* vulgarity of mind or defective education than the want of power to understand the universality of the ideal truth; the absence of sympathy with the colossal grasp of those intellects, which have in them so much of divine, that nothing is small to them, and nothing large; but with equal and unoffended vision they take in the sum of the world,—Straw Street and the seventh heaven,—in the same instant. A certain portion of this divine spirit is visible even in the lower examples of all the true men; it is, indeed, perhaps, the clearest test of their belonging to the true and great group, that they are continually touching what to the multitude appear vulgarities. The higher a man stands, the more the word “vulgar” becomes unintelligible to him. Vulgar? what, that poor farmer’s girl of William Hunt’s, bred in the stable, putting on her Sunday gown, and pinning her best cap out of the green and red pin-cushion!² Not so; she may be straight on the road to those high heavens, and may shine hereafter as one of the stars in the firmament for ever. Nay, even that lady in the satin bodice with her arm laid over a balustrade to show it, and her eyes turned up to heaven to show them; and the sportsman waving his rifle for the terror of beasts, and displaying his perfect dress for the delight of men, are kept, by the very misery and vanity of them, in the thoughts

¹ [*Paradiso*, x. 125–134.]

² [For another notice of this drawing—known as “Sunday Morning”—see *Notes on Prout and Hunt*, Preface, § 12.]

of a great painter, at a sorrowful level, somewhat above vulgarity. It is only when the minor painter takes them on his easel, that they become things for the universe to be ashamed of.

We may dismiss this matter of vulgarity in plain and few words, at least as far as regards art. There is never vulgarity in a *whole* truth, however commonplace. It may be unimportant or painful. It cannot be vulgar. Vulgarity is only in concealment of truth, or in affectation.¹

§ 10. “Well, but,” (at this point the reader asks doubtfully,) “if then your great central idealist is to show all truth, low as well as lovely, receiving it in this passive way, what becomes of all your principles of selection, and of setting in the right place, which you were talking about up to the end of your fourth paragraph? How is Homer to enforce upon Achilles the cutting of the pork chops ‘only at such time as Homer chooses,’ if Homer is to have *no* choice, but merely to see the thing done, and sing it as he sees it?” Why, the choice, as well as the vision, is *manifested* to Homer. The vision comes to him in its chosen order. Chosen *for* him, not *by* him, but yet full of visible and exquisite choice, just as a sweet and perfect dream will come to a sweet and perfect person, so that, in some sense, they may be said to have chosen their dream, or composed it; and yet they could not help dreaming it so, and in no otherwise. Thus, exactly thus, in all results of true inventive power, the whole harmony of the thing done seems as if it had been wrought by the most exquisite rules. But to him who did it, it presented itself so, and his will, and knowledge, and personality, for the moment went for nothing; he became simply a scribe, and wrote what he heard and saw.

And all efforts to do things of a similar kind by rule or by thought, and all efforts to mend or rearrange the first order of the vision, are not inventive; on the contrary,

¹ [For a fuller discussion of vulgarity, see *Modern Painters*, vol. v. pt. ix. ch. vii.; and compare the definition of it in *Sesame and Lilies*, § 28, as “want of sensation”; and in *Academy Notes*, 1859, as a combination of “insensibility with insincerity.”]

they ignore and deny invention. If any man, seeing certain forms laid on the canvas, does by his reasoning power determine that certain changes wrought in them would mend or enforce them, that is not only uninventive, but contrary to invention, which must be the involuntary occurrence of certain forms or fancies to the mind in the order they are to be portrayed. Thus the knowing of rules and the exertion of judgment have a tendency to check and confuse the fancy in its flow; so that it will follow, that, in exact proportion as a master knows anything about rules of right and wrong, he is likely to be uninventive; and, in exact proportion as he holds higher rank and has nobler inventive power, he will know less of rules; not despising them, but simply feeling that between him and them there is nothing in common,—that dreams cannot be ruled—that as they come, so they must be caught, and they cannot be caught in any other shape than that they come in; and that he might as well attempt to rule a rainbow into rectitude, or cut notches in a moth's wing to hold it by, as in any wise attempt to modify, by rule, the forms of the involuntary vision.

§ 11. And this, which by reason we have thus anticipated, is in reality universally so. There is no exception. The great men never know how or why they do things. They have no rules; cannot comprehend the nature of rules;—do not, usually, even know, in what they do, what is best or what is worst: to them it is all the same; something they cannot help saying or doing,—one piece of it as good as another, and none of it (it seems to *them*) worth much. The moment any man begins to talk about rules, in whatsoever art, you may know him for a second-rate man; and, if he talks about them *much*, he is a third-rate, or not an artist at all. To *this* rule there is no exception in any art; but it is perhaps better to be illustrated in the art of music than in that of painting. I fell by chance the other day upon a work of De Stendhal's, *Vies de Haydn, de Mozart, et de Metastase*, fuller of common sense than any

book I ever read on the arts;¹ though I see by the slight references made occasionally to painting, that the author's knowledge therein is warped and limited by the elements of general teaching in the schools around him; and I have not yet, therefore, looked at what he has separately written on painting. But one or two passages out of this book on music are closely to our present purpose.

“Counterpoint is related to mathematics: a fool, with patience, becomes a respectable savant in that; but for the part of genius, melody, it has no rules. No art is so utterly deprived of precepts for the production of the beautiful. So much the better for it and for us. Cimarosa, when first at Prague his air was executed, *Pria che spunti in ciel l'Aurora*, never heard the pedants say to him, ‘Your air is fine, because you have followed such and such a rule established by Pergolesi in such an one of his airs; but it would be finer still if you had conformed yourself to such another rule from which Galuppi never deviated.’”

Yes: “so much the better for it, and for us;” but I trust the time will soon come when melody in painting will be understood, no less than in music, and when people will find that, there also, the great melodists have no rules, and cannot have any, and that there are in this, as in sound, “no precepts for the production of the beautiful.”

§ 12. Again. “Behold, my friend, an example of that simple way of answering which embarrasses much. One asked him (Haydn) the *reason* for a harmony—for a passage's being assigned to one instrument rather than another; but all he ever answered was, ‘I have done it, because it does well.’” Farther on, De Stendhal relates an anecdote of

¹ [The book by De Stendhal (pseudonym of Henri Beyle, 1783–1842) was first published in 1814, under a different title and pseudonym, and was translated into English in 1817—*The Life of Haydn in a series of Letters written at Vienna, followed by a Life of Mozart, with Observations on Metastasio*, translated (by W. Gardiner) from the French of L. A. C. Bombet. Another edition, under the title given in the text, was included in a complete edition of De Stendhal's works in 1854. Ruskin read the book at Geneva in 1854, and made many notes on it in his diary; compare the “Lectures on Colour,” Vol. XII. pp. 500–501, where the last of the passages here given (§ 12, below) is again cited. The quotations here (translated by Ruskin from the 1854 edition) are at pp. 168, 74, and 122–123 (in the 1817 English edition, pp. 273–274, 108, 187–188.)

Haydn; I believe one well known, but so much to our purpose that I repeat it. Haydn had agreed to give some lessons in counterpoint to an English nobleman. “‘For our first lesson,’ said the pupil, already learned in the art—drawing at the same time a quatuor of Haydn’s from his pocket, ‘for our first lesson may we examine this quatuor; and will you tell me the reasons of certain modulations, which I cannot entirely approve because they are contrary to the principles?’ Haydn, a little surprised, declared himself ready to answer. The nobleman began; and at the very first measures found matter for objection. Haydn, *who invented habitually*, and who was the contrary of a pedant, found himself much embarrassed, and answered always, ‘I have done that because it has a good effect. I put that passage there because it does well.’ The Englishman, who judged that these answers proved nothing, recommenced his proofs, and demonstrated to him, by very good reasons, that this quatuor was good for nothing. ‘But, my lord, arrange this quatuor then to your fancy,—play it so, and you will see which of the two ways is the best.’ ‘But why is yours the best which is contrary to the rules?’ ‘Because it is the pleasantest.’ The nobleman replied. Haydn at last lost patience, and said, ‘I see, my lord, it is you who have the goodness to give lessons to me, and truly I am forced to confess to you that I do not deserve the honour.’ The partizan of the rules departed, still astonished that in following the rules to the letter one cannot infallibly produce a ‘*Matrimonio Segreto*.’ ”

This anecdote, whether in all points true or not, is in its tendency most instructive, except only in that it makes *one* false inference or admission, namely, that a good composition can be *contrary* to the rules. It may be contrary to certain principles, supposed in ignorance to be general; but every great composition is in perfect harmony with all true rules, and involves thousands too delicate for ear, or eye, or thought, to trace; still it is possible to reason, with infinite pleasure and profit, about these principles, when the

thing is once done; only, all our reasoning will not enable any one to do another thing like it, because all reasoning falls infinitely short of the divine instinct. Thus we may reason wisely over the way a bee builds its comb, and be profited by finding out certain things about the angles of it. But the bee knows nothing about those matters. It builds its comb in a far more inevitable way. And, from a bee to Paul Veronese, all master-workers work with this awful, this inspired unconsciousness.

§ 13. I said just now that there was no exception to *this* law, that the great men never knew how or why they did things. It is, of course, only with caution that such a broad statement should be made; but I have seen much of different kinds of artists, and I have always found the knowledge of, and attention to, rules so *accurately* in the inverse ratio to the power of the painter, that I have myself no doubt that the law is constant, and that men's smallness may be trigonometrically estimated by the attention which, in their work, they pay to principles, especially principles of composition. The general way in which the great men speak is of "*trying* to do" this or that, just as a child would tell of something he had seen and could not utter. Thus, in speaking of the drawing of which I have given an etching farther on (a scene on the St. Gothard*), Turner asked if I had been to see "that litter of stones which I *endeavoured* to represent;" and William Hunt, when I asked him one day as he was painting, why he put on such and such a colour, answered, "I don't know; I am just *aiming* at it;"¹ and Turner, and he, and all the other men I have known who could paint, always spoke

* See Plate 21, in chap. iii. vol. iv.

¹ [In his diary of 1854, referring to Haydn's definition of harmony without melody as "bruit bien travaillé," Ruskin records this conversation a little more fully:—

"Compare Hunt's answers to my questions why he did this or that, 'Well, I don't know'—(and saying so, he lifted his head, and looked at the thing, as if the idea had just struck him that there might be a reason)—'I don't know, I'm just aimin' at it; and again: 'Well, I think a little burnt sienna would be very *desirable* there.'"

Compare Vol. XII. p. 500.]

and speak in the same way; not in any selfish restraint of their knowledge, but in pure simplicity. While all the men whom I know, who *cannot* paint, are ready with admirable reasons for everything they have done; and can show, in the most conclusive way, that Turner is wrong, and how he might be improved.

§ 14. And this is the reason for the somewhat singular, but very palpable truth that the Chinese, and Indians, and other semi-civilized nations, can colour better than we do,¹ and that an Indian shawl and China vase are still, in invention of colour, inimitable by us. It is their glorious ignorance of all rules that does it; the pure and true instincts have play, and do their work,—instincts so subtle, that the least warping or compression breaks or blunts them; and the moment we begin teaching people any rules about colour, and make them do this or that, we crush the instinct, generally for ever. Hence, hitherto, it has been an actual necessity, in order to obtain power of colouring, that a nation should be half savage: everybody could colour in the twelfth and thirteenth centuries; but we were ruled and legalized into grey in the fifteenth;—only a little salt simplicity of their sea natures at Venice still keeping their precious, shell-fishy purpleness and power; and now that is gone; and nobody can colour anywhere, except the Hindoos and Chinese; but that need not be so, and will not be so long; for, in a little while, people will find out their mistake, and give up talking about rules of colour, and then everybody will colour again, as easily as they now talk.

§ 15. Such, then, being the generally passive or instinctive character of right invention,² it may be asked how these unmanageable instincts are to be rendered practically serviceable in historical or poetical painting,—especially historical, in which given facts are to be represented. Simply by the sense and self-control of the whole

¹ [Compare on this subject *The Two Paths*, § 3 *seq.*]

² [On the place of invention in art, see, among other passages, ch. xvi. § 26; *Modern Painters*, vol. v. pt. viii. ch. i. § 20, ch. iv. § 16; and *Eagle's Nest*, § 140.]

man; not by control of the particular fancy or vision. He who habituates himself, in his daily life, to seek for the stern facts in whatever he hears or sees, will have these facts again brought before him by the involuntary imaginative power in their noblest associations; and he who seeks for frivolities and fallacies, will have frivolities and fallacies again presented to him in his dreams.¹ Thus if, in reading history for the purpose of painting from it, the painter severely seeks for the accurate circumstances of every event; as, for instance, determining the exact spot of ground on which his hero fell, the way he must have been looking at the moment, the height the sun was at (by the hour of the day), and the way in which the light must have fallen upon his face, the actual number and individuality of the persons by him at the moment, and such other veritable details, ascertaining and dwelling upon them without the slightest care for any desirableness or poetic propriety in them, but for their own truth's sake; then these truths will afterwards rise up and form the body of his imaginative vision, perfected and united as his inspiration may teach. But if, in reading the history, he does not regard these facts, but thinks only how it might all most prettily, and properly, and impressively have happened, then there is nothing but prettiness and propriety to form the body of his future imagination, and his whole ideal becomes false.² So, in the

¹ [The passage "He who habituates himself . . ." down to ". . . in his dreams" is § 7 in *Frondees Agrestes*, where Ruskin adds the following note:—

"Very good. Few people have any idea how much more important the government of the mind is, than the force of its exertion. Nearly all the world flog their horses, without ever looking where they are going."

² [In an earlier draft of this chapter Ruskin gives some particular instances:—

"The only valuable historical painting is the sincere effort of good painters to paint the great men and interesting events of their own time, or of a time so little distant as to enable them thoroughly to conceive it. Paul Delaroche's 'Napoleon crossing the St. Bernard' comes nearer in conception to the ideal of a true historical picture than anything done in art yet; but then it is ill-painted—ill-coloured, that is (which, strictly speaking, deprives it of the rank of a picture at all). So also some of Horace Vernet's scenes in the French African campaigns; only these, it appeared to me, were of subjects with no interest or nobleness in them—chosen to display the painter's power of throwing the body into different positions—egotism still defeating itself, as in old times, and lowering the rank of the

higher or expressive part of the work, the whole virtue of it depends on his being able to quit his own personality, and enter successively into the hearts and thoughts of each person; and in all this he is still passive: in gathering the truth he is passive, not determining what the truth to be gathered shall be, and in the after vision he is passive, not determining, but as his dreams will have it, what the truth to be represented shall be; only according to his own nobleness is his power of entering into the hearts of noble persons, and the general character of his dream of them.*

§ 16. It follows from all this, evidently, that a great idealist never can be egotistic. The whole of his power depends upon his losing sight and feeling of his own existence, and becoming a mere witness and mirror of truth, and a scribe of visions,—always passive in sight, passive in utterance,—lamenting continually that he cannot completely reflect nor clearly utter all he has seen—not by any means a proud state for a man to be in. But the man who has no invention is always setting things in order, and putting the world to rights, and mending, and beautifying, and pluming himself on his doings as supreme in all ways.¹

§ 17. There is still the question open. What are the principal directions in which this ideal faculty is to exercise itself most usefully for mankind?

* The reader should, of course, refer for fuller details on this subject to the chapters on Imagination in vol. ii., of which I am only glancing now at the practical results.

whole work. English art, as far as I know, has never yet produced an historical picture; West is too feeble an artist to permit his designs to be mentioned as pictures at all—otherwise his 'Death of General Wolfe' might have been named as an approximation of the thing needed."

Delaroche's picture was exhibited in 1848, in which year Ruskin was in Paris. Horace Vernet's are at Versailles. West's "Death of Wolfe" is at Grosvenor House.]

¹ [§ 16 here is § 5 in *Frondees Agristes* (1875), where Ruskin adds the following note:—

"I am now a comic illustration of this sentence myself. I have not a ray of invention in all my brains; but am intensely rational and orderly, and have resolutely begun to set the world to rights."]

This question, however, is not to the purpose of our present work, which respects landscape-painting only; it must be one of those left open to the reader's thoughts, and for future inquiry in another place.¹ One or two essential points I briefly notice.

In Chap. VI. § 5 it was said, that one of the first functions of imagination was traversing the scenes of history, and forcing the facts to become again visible. But there is so little of such force in written history, that it is no marvel there should be none hitherto in painting. There does not exist, as far as I know, in the world a single example of a good historical picture (that is to say, of one which, allowing for necessary dimness in art as compared with nature, yet answers nearly the same ends in our minds as the sight of the real event would have answered); the reason being, the universal endeavour to get *effects* instead of facts, already shown as the root of false idealism. True historical ideal, founded on sense, correctness of knowledge, and purpose of usefulness, does not yet exist; the production of it is a task which the closing nineteenth century may propose to itself.²

§ 18. Another point is to be observed. I do not, as the reader may have lately perceived, insist on the distinction between historical and poetical painting, because, as noted in the 22nd paragraph of the third chapter, all great painting must be both.

Nevertheless, a certain distinction must generally exist between men who, like Horace Vernet, David, or Domenico Tintoret,³ would employ themselves in painting, more or less graphically, the outward verities of passing events—battles, councils, etc.—of their day (who, supposing them to work worthily of their mission, would become, properly so called, historical or narrative painters); and

¹ [See, for instance, *Modern Painters*, vol. iv. ch. xix. § 6; *Lectures on Art*, § 30.]

² [On this subject compare Vol. IV. p. 382.]

³ [For this painter, to be distinguished from his illustrious father, see Vol. XI. p. 373. For Vernet (1789–1863), see above, p. 124 *n.*; for David, Vol. XII. p. 398.]

men who sought, in scenes of perhaps less outward importance, “noble grounds for noble emotions;”¹—who would be, in a certain separate sense, *poetical* painters, some of them taking for subjects events which had actually happened, and others themes from the poets; or, better still, becoming poets themselves in the entire sense, and inventing the story as they painted it. Painting seems to me only just to be beginning, in this sense also, to take its proper position beside literature, and the pictures of the “Awakening Conscience,” “Huguenot,” and such others, to be the first fruits of its new effort.²

§ 19. Finally, as far as I can observe, it is a constant law that the greatest men, whether poets or historians, live entirely in their own age, and that the greatest fruits of their work are gathered out of their own age. Dante paints Italy in the thirteenth century; Chaucer, England in the fourteenth; Masaccio, Florence in the fifteenth; Tintoret, Venice in the sixteenth; all of them utterly regardless of anachronism and minor error of every kind, but getting always vital truth out of the vital present.³

§ 20. If it be said that Shakspeare wrote perfect historical plays on subjects belonging to the preceding centuries, I answer that they *are* perfect plays just because there is no care about centuries in them, but a life which all men recognize for the human life of all time; and this it is, not because Shakspeare sought to give universal truth, but because, painting honestly and completely from the men about him, he painted that human nature which is indeed constant enough,—a rogue in the fifteenth century being, *at heart*, what a rogue is in the nineteenth and was in the twelfth; and an honest or a knightly man being, in like manner, very similar to other such at any other time. And the work of these great idealists is, therefore, always universal; not because it is *not portrait*, but because it is

¹ [See above, p. 28.]

² [For these pictures, see Vol. XII. p. 333; Vol. XI. p. 59.]

³ [On this subject compare *Lectures on Architecture and Painting*, Vol. XII. p. 153.]

complete portrait down to the heart, which is the same in all ages; and the work of the mean idealists is *not* universal, not because it is portrait, but because it is *half* portrait,—of the outside, the manners and the dress, not of the heart. Thus Tintoret and Shakspeare paint, both of them, simply Venetian and English nature as they saw it in their time, down to the root; and it does for *all* time; but as for any care to cast themselves into the particular ways and tones of thought, or custom, of past time in their historical work, you will find it in neither of them,¹ nor in any other perfectly great man that I know of.

§ 21. If there had been no vital truth in their present, it is hard to say what these men could have done. I suppose, primarily, they would not have existed; that they, and the matter they have to treat of, are given together, and that the strength of the nation and its historians correlatively rise and fall—Herodotus springing out of the dust of Marathon. It is also hard to say how far our better general acquaintance with minor details of past history may make us able to turn the shadow on the imaginative dial backwards, and naturally to live, and even live strongly if we choose, in past periods; but this main truth will always be unshaken, that the only historical painting deserving the name is portraiture of our own living men and our own passing times,* and that all efforts to summon up the events of bygone periods, though often useful and touching, must come under an inferior class of poetical painting; nor will it, I believe, ever be much followed as their main work by the strongest

* See Edinburgh *Lectures on Architecture and Painting*, p. 217. [In this edition, Vol. XII. p. 151.]

¹ [§§ 19, 20 here are § 12 in *Fronde Agrestes* (1875), where at this point Ruskin added the following footnote:—

“What vestige of Egyptian character is there, for instance, in Cleopatra?—of Athenian in Theseus or Timon?—of old British in Imogen or Cordelia?—of old Scottish in Macbeth?—or even of mediæval Italian in Petruccio, the Merchant of Venice, or Desdemona? And the Roman plays appear definitely Roman only because the strength of Rome was the eternal strength of the world,—pure family life, sustained by agriculture, and defended by simple and fearless manhood.”

See also *Modern Painters*, vol. iv. ch. xx. § 30.]

men, but only by the weaker and comparatively sentimental (rather than imaginative) groups. This marvellous first half of the nineteenth century has in this matter, as in nearly all others, been making a double blunder. It has, under the name of improvement, done all it could to EFFACE THE RECORDS which departed ages have left of themselves, while it has declared the FORGERY OF FALSE RECORDS of these same ages to be the great work of its historical painters! I trust that in a few years more we shall come somewhat to our senses in the matter, and begin to perceive that our duty is to preserve what the past has had to say for itself, and to say for ourselves also what shall be true for the future. Let us strive with just veneration for that future, first to do what is worthy to be spoken, and then to speak it faithfully; and, with veneration for the past, recognize that it is indeed in the power of love to preserve the monument, but not of incantation to raise the dead.¹

¹ [On this subject compare "The Opening of the Crystal Palace," Vol. XII. p. 432.]
v. I

CHAPTER VIII

OF THE TRUE IDEAL:—THIRDLY, GROTESQUE

§ 1. I HAVE already, in the *Stones of Venice*, had occasion to analyze, as far as I was able, the noble nature and power of grotesque conception: I am not sorry occasionally to refer the reader to that work, the fact being that it and this are parts of one whole, divided merely as I had occasion to follow out one or other of its branches;¹ for I have always considered architecture as an essential part of land-scape; and I think the study of its best styles and real meaning one of the necessary functions of the landscape-painter; as, in like manner, the architect cannot be a master-workman until all his designs are guided by understanding of the wilder beauty of pure nature.² But, be this as it may, the discussion of the grotesque element belonged most properly to the essay on architecture, in which that element must always find its fullest development.

§ 2. The Grotesque is in that chapter* divided principally into three kinds:

(A.) Art arising from healthful but irrational play of the imagination in times of rest.

(B.) Art arising from irregular and accidental contemplation of terrible things; or evil in general.

(C.) Art arising from the confusion of the imagination by the presence of truths which it cannot wholly grasp.

* On the Grotesque Renaissance, vol. iii.³

¹ [See in this connexion the Introduction to Vol. X. p. xlvii.]

² [And so, as Ruskin says elsewhere, an architect "should live as little in cities as a painter" (*Seven Lamps*, Vol. VIII. p. 136), and be an all-round artist like Giotto (*Lectures on Architecture and Painting*, Preface and § 61, Vol. XII. pp. 8, 85).]

³ [Ch. iii. In this edition, Vol. XI. pp. 135 *seq.*]

It is the central form of this art, arising from contemplation of evil, which forms the link of connection between it and the sensualist ideals, as pointed out above in the second paragraph of the sixth chapter, the fact being that the imagination, when at play, is curiously like bad children, and likes to play with fire: in its entirely serious moods it dwells by preference on beautiful and sacred images, but in its mocking or playful moods it is apt to jest, sometimes bitterly, with under-current of sternest pathos, sometimes waywardly, sometimes slightly and wickedly, with death and sin; hence an enormous mass of grotesque art, some most noble and useful, as Holbein's Dance of Death,¹ and Albert Dürer's Knight and Death,* going down gradually through various conditions of less and less seriousness into an art whose only end is that of mere excitement, or amusement by terror, like a child making mouths at another, more or less redeemed by the degree of wit or fancy in the grimace it makes, as in the demons of Teniers and such others; and, lower still, in the demonology of the stage.

§ 3. The form arising from an entirely healthful and open play of the imagination, as in Shakspeare's Ariel and Titania, and in Scott's White Lady,² is comparatively rare. It hardly ever is free from some slight taint of the inclination to evil; still more rarely is it, when so free, natural to the mind; for the moment we begin to contemplate sinless beauty we are apt to get serious; and moral fairy tales, and such other innocent work, are hardly ever truly, that is to say, naturally, imaginative; but for the most part laborious inductions and compositions. The moment any real vitality enters them, they are nearly sure to become

* See Appendix i. vol. iv.: "Modern Grotesque."

¹ [Holbein's "Dance of Death" is again referred to, and is in part described, in *Fors Clavigera*, Letters 53 and 63; for Dürer's "Knight and Death," see *Stones of Venice*, vol. iii. (Vol. XI. p. 172); *Modern Painters*, vol. v. pt. ix. ch. iv. §§ 10, 16; *Lectures on Art*, § 47; *Catalogue of the Standard Series*, No. 9; *Ariadne Florentina*, § 37, and General Index, under "Dürer."]

² [For references to the *Tempest*, see above, p. 57 n.; *Time and Tide*, § 68, and *Fors Clavigera*, Letters 51, 65. For other references to *Midsummer Night's Dream*, and for the White Lady of Avenel (*The Monastery*), see General Index.]

satirical, or slightly gloomy, and so connect themselves with the evil-enjoying branch.

§ 4. The third form of the Grotesque is a thoroughly noble one. It is that which arises out of the use or fancy of tangible signs to set forth an otherwise less expressible truth; including nearly the whole range of symbolical and allegorical art and poetry. Its nobleness has been sufficiently insisted upon in the place before referred to. (Chapter on Grotesque Renaissance, §§ LXIII. LXIV., etc.) Of its practical use, especially in painting, deeply despised among us, because grossly misunderstood, a few words must be added here.

A fine grotesque is the expression, in a moment, by a series of symbols thrown together in bold and fearless connection, of truths which it would have taken a long time to express in any verbal way, and of which the connection is left for the beholder to work out for himself; the gaps, left or overleaped by the haste of the imagination, forming the grotesque character.

§ 5. For instance, Spenser desires to tell us, (1) that envy is the most untamable and unappeasable of the passions, not to be soothed by any kindness; (2) that with continual labour it invents evil thoughts out of its own heart; (3) that even in this, its power of doing harm is partly hindered by the decaying and corrupting nature of the evil it lives in; (4) that it looks every way, and that whatever it sees is altered and discoloured by its own nature; (5) which discolouring, however, is to it a veil, or disgraceful dress, in the sight of others; (6) and that it never is free from the most bitter suffering, (7) which cramps all its acts and movements, enfolding and crushing it while it torments. All this it has required a somewhat long and languid sentence for me to say in unsymbolical terms,—not, by the way, that they *are* unsymbolical altogether, for I have been forced, whether I would or not, to use *some* figurative words; but even with this help the sentence is long and tiresome, and does not with any vigour represent the truth.

It would take some prolonged enforcement of each sentence to make it felt, in ordinary ways of talking. But Spenser puts it all into a grotesque, and it is done shortly and at once, so that we feel it fully, and see it, and never forget it.¹ I have numbered above the statements which had to be made. I now number them with the same numbers, as they occur in the several pieces of the grotesque:—

- “And next to him malicious Envy rode
- (1) Upon a ravenous wolfe, and (2, 3) still did chaw
Between his cankred* teeth a venemous tode,
That all the poison ran about his jaw.
- (4, 5) All in a kirtle of discoloured say
He clothed was, y-paynted full of eies;
- (6) And in his bosome secretly there lay
An hateful snake, the which his taile uptyes
- (7) In many folds, and mortall sting implyes.”²

There is the whole thing in nine lines; or, rather in one image, which will hardly occupy any room at all on the mind's shelves, but can be lifted out, whole, whenever we want it. All noble grotesques are concentrations of this kind, and the noblest convey truths which nothing else could convey; and not only so, but convey them, in minor cases with a delightfulness,—in the higher instances with an awfulness,—which no mere utterance of the symbolised truth would have possessed, but which belongs to the effort of the mind to unweave the riddle, or to the sense it has of there being an infinite power and meaning in the thing seen, beyond all that is apparent therein, giving the highest sublimity even to the most trivial object so presented and so contemplated.

“ ‘Jeremiah, what seest thou?’

‘I see a seething pot; and the face thereof is toward the north.’

‘Out of the north an evil shall break forth upon all the inhabitants of the land.’ ”³

* Cankred—because he cannot then bite hard.

¹ [Compare the “Lectures on Colour,” § 23 (Vol. XII. p. 496), where other examples of the grotesque in Spenser are cited.]

² [*Faerie Queene*, book i. canto iv. 30, 31. Compare Vol. X. p. 406, where the lines are again quoted.]

³ [Jeremiah i. 13, 14.]

And thus in all ages and among all nations, grotesque idealism has been the element through which the most appalling and eventful truth has been wisely conveyed, from the most sublime words of true Revelation, to the “*all ot an hmionoV basileuV*,” etc., of the oracles,¹ and the more or less doubtful teaching of dreams; and so down to ordinary poetry. No element of imagination has a wider range, a more magnificent use, or so colossal a grasp of sacred truth.

§ 6. How, then, is this noble power best to be employed in the art of painting?

We hear it not unfrequently asserted that symbolism or personification should not be introduced in painting at all. Such assertions are in their grounds unintelligible, and in their substance absurd. Whatever is in words described as visible, may with all logical fitness* be rendered so by colours, and not only is this a legitimate branch of ideal art, but I believe there is hardly any other so widely useful and instructive; and I heartily wish that every great allegory which the poets ever invented were powerfully put on canvas, and easily accessible by all men, and that our artists were perpetually exciting themselves to invent more. And as far as authority bears on the question, the simple fact is that allegorical painting has been the delight of the greatest men and of the wisest multitudes, from the beginning of art, and will be till art expires. Orcagna’s Triumph of Death; Simon Memmi’s frescoes in the Spanish Chapel; Giotto’s principal works at Assisi, and partly at the Arena; Michael Angelo’s two best statues, the Night and Day; Albert Dürer’s noble Melancholy, and hundreds more of his best works; a full third, I should think, of the works of Tintoret and Veronese, and nearly as large a portion of those of Raphael and Rubens, are entirely symbolical or personifant; and, except in the case of the last-named

* Though, perhaps, only in a subordinate degree. See farther on, § 8.

¹ [Herodotus, i. 55.]

painter, are always among the most interesting works the painters executed.¹ The greater and more thoughtful the artists, the more they delight in symbolism, and the more fearlessly they employ it. Dead symbolism, second-hand symbolism, pointless symbolism, are indeed objectionable enough; but so are most other things that are dead, second-hand, and pointless. It is also true that both symbolism and personification are somewhat more apt than most things to have their edges taken off by too much handling; and what with our modern Fames, Justices, and various metaphorical ideals largely used for signs and other such purposes, there is some excuse for our not well knowing what the real power of personification is. But that power is gigantic and inexhaustible, and ever to be grasped with peculiar joy by the painter, because it permits him to introduce picturesque elements and flights of fancy into his work, which otherwise would be utterly inadmissible;—to bring the wild beasts of the desert into the room of state, fill the air with inhabitants as well as the earth, and render the least (visibly) interesting incidents themes for the most thrilling drama. Even Tintoret might sometimes have been hard put to it, when he had to fill a large panel in the Ducal Palace with the portrait of a nowise interesting Doge, unless he had been able to lay a winged lion beside him, ten feet long from the nose to the tail, asleep upon the Turkey carpet;² and Rubens could certainly have made his flatteries of Mary of Medici palatable to no one but herself, without the help of rosy-cheeked goddesses of abundance, and seven-headed hydras of rebellion.

§ 7. For observe, not only does the introduction of these imaginary beings permit greater fantasticism of *incident*, but also infinite fantasticism of *treatment*; and, I

¹ [On the subject of symbolism and personification in art, compare *Stones of Venice*, vol. ii. (Vol. X. p. 377).]

² [See Vol. XI. p. 375, and for the Medici Series by Rubens, in the Louvre, Vol. XII. p. 473, and *Harbours of England*, § 30 n.]

believe, so far from the pursuit of the false ideal having in any wise exhausted the realms of fantastic imagination, those realms have hardly yet been entered, and that a universe of noble dream-land lies before us, yet to be conquered. For, hitherto, when fantastic creatures have been introduced, either the masters have been so realistic in temper that they made the spirits as substantial as their figures of flesh and blood,—as Rubens, and, for the most part, Tintoret; or else they have been weak and unpractised in realization, and have painted transparent or cloudy spirits because they had no power of painting grand ones. But if a really great painter, thoroughly capable of giving substantial truth, and master of the elements of pictorial effect which have been developed by modern art, would solemnly, and yet fearlessly, cast his fancy free in the spiritual world, and faithfully follow out such masters of that world as Dante and Spenser, there seems no limit to the splendour of thought which painting might express. Consider, for instance, how the ordinary personifications of Charity oscillate between the mere nurse of many children, of Reynolds, and the somewhat painfully conceived figure with flames issuing from the heart, of Giotto;¹ and how much more significance might be given to the representative of Love, by amplifying with tenderness the thought of Dante, “Tanto rossa, Che a pena fora dentro al foco nota,”* that is to say, by representing the loveliness of her face and form as all flushed with glow of crimson light, and, as she descended through heaven, all its clouds coloured by her presence as they are by sunset. In the hands of a feeble painter, such an attempt would end in mere caricature; but suppose it taken up by Correggio,

* “So red, that in the midst of the fire she could hardly have been seen.”²

¹ [Compare *Stones of Venice*, vol. ii. (Vol. X. p. 397); Reynolds’ “Charity” is in the window of New College, Oxford; the study for it is in the University Gallery. For another reference to it see Vol. X. p. 378.]

² [*Purgatorio*, xxix. 122–123; quoted again at Vol. X. p. 378.]

adding to his power of flesh-painting the (not inconsistent) feeling of Angelico in design, and a portion of Turner's knowledge of the clouds. There is nothing impossible in such a conjunction as this. Correggio, trained in another school, might have even himself shown some such extent of grasp; and in Turner's picture of the Dragon of the Hesperides, Jason, vignette to Voyage of Columbus ("slowly along the evening sky they went"),¹ and such others, as well as in many of the works of Watts and Rossetti,² is already visible, as I trust, the dawn of a new era of art, in a true unison of the grotesque with the realistic power.

§ 8. There is, however, unquestionably, a severe limit, in the case of all inferior masters, to the degree in which they may venture to realize grotesque conception, and partly, also, a limit in the nature of the thing itself; there being many grotesque ideas which may be with safety suggested dimly by words or slight lines, but which will hardly bear being painted into perfect definiteness. It is very difficult, in reasoning on this matter, to divest ourselves of the prejudices which have been forced upon us by the base grotesque of men like Bronzino, who, having no true imagination, are apt, more than others, to try by startling realism to enforce the monstrosity that has no terror in itself. But it is nevertheless true, that, unless in the hands of the very greatest men, the grotesque seems better to be expressed merely in line, or light and shade, or mere abstract colour, so as to mark it for a thought rather than a substantial fact. Even if Albert Dürer had perfectly painted his Knight and Death, I question if we should feel it so great a thought as we do in the dark engraving. Blake, perfectly powerful in the etched grotesque

¹ [For Turner's "Hesperides" (National Gallery, No. 477), see *Notes on the Turner Gallery; Modern Painters*, vol. v. pt. ix. ch. x. ("The Nereids' Guard"); and *Lectures on Landscape*, §§ 69–71. For "Jason" (National Gallery, No. 471), and (drawing) No. 461, see *Modern Painters*, vol. ii. (Vol. IV. pp. 259–261). For the Vignette (National Gallery, drawing No. 395)—illustrating the line quoted above from Rogers' *Voyage of Columbus—ibid.*, p. 299.]

² [For an earlier reference to Watts, see Vol. XI. p. 30 *n.*; and for earlier references to Rossetti, Vol. XI. p. 36 *n.*, Vol. XII. p. 162.]

of the book of Job, fails always more or less as soon as he adds colour; not merely for want of power (his eye for colour being naturally good), but because his subjects seem, in a sort, insusceptible of completion:¹ and the two inexpressibly noble and pathetic woodcut grotesques of Alfred Rethel's, *Death the Avenger*, and *Death the Friend*, could not, I think, but with disadvantage, be advanced into pictorial colour.

And what is thus doubtfully true of the pathetic grotesque, is assuredly and always true of the jesting grotesque. So far as it expresses any transient flash of wit or satire, the less labour of line, or colour, given to its expression the better; elaborate jesting being always intensely painful.

§ 9. For these several reasons, it seems not only permissible, but even desirable, that the art by which the grotesque is expressed should be more or less imperfect, and this seems a most beneficial ordinance, as respects the human race in general. For the grotesque being not only a most forceful instrument of teaching, but a most natural manner of expression, springing as it does at once from any tendency to playfulness in minds highly comprehensive of truth; and being also one of the readiest ways in which such satire or wit as may be possessed by men of any inferior rank of mind can be for perpetuity expressed, it becomes on all grounds desirable that what is suggested in times of play should be rightly sayable without toil; and what occurs to men of inferior power or knowledge, sayable without any high degree of skill. Hence it is an infinite good to mankind when there is full acceptance of the grotesque, slightly sketched or expressed; and, if field for such expression be frankly granted, an enormous mass of intellectual power is turned to everlasting use, which, in

¹ [For Blake, see also below, ch. xvi. § 10 *n.*, p. 323; for his Book of Job, *Art of England*, § 101; and for other references see Vol. VIII. p. 256 *n.* The drawings for a "Dance of Death" by the German artist, Alfred Rethel (1816–1859), are often referred to by Ruskin: see "Lectures on Colour," § 15 (Vol. XII. p. 489); *Modern Painters*, vol. iv. App. 1, § 5; *Elements of Drawing*, App. 2 ("Things to be Studied," 4); and *Art of England*, § 100.]

this present century of ours, evaporates in street gibing or vain revelling; all the good wit and satire expiring in daily talk, (like foam on wine,) which in the thirteenth and fourteenth centuries had a permitted and useful expression in the arts of sculpture and illumination, like foam fixed into chalcedony. It is with a view (not the least important among many others bearing upon art) to the reopening of this great field of human intelligence, long entirely closed, that I am striving to introduce Gothic architecture into daily domestic use; and to revive the art of illumination, properly so called;¹ not the art of miniature-painting in books, or on vellum, which has ridiculously been confused with it; but of making *writing*, simple writing, beautiful to the eye, by investing it with the great chord of perfect colour, blue, purple, scarlet, white, and gold, and in that chord of colour, permitting the continual play of the fancy of the writer in every species of grotesque imagination, carefully excluding shadow; the distinctive difference between illumination and painting proper, being, that illumination admits *no* shadows, but only gradations of pure colour. And it is in this respect that illumination is specially fitted for grotesque expression; for, when I used the term "*pictorial* colour," just now, in speaking of the completion of the grotesque of Death the Avenger, I meant to distinguish such colour from the abstract shadeless hues which are eminently fitted for grotesque thought. The requirement, respecting the slighter grotesque, is only that it shall be *incompletely* expressed. It may have light and shade without colour (as in etching and sculpture), or colour without light and shade (illumination), but must not, except in the hands of the greatest masters, have both. And for some conditions of the playful grotesque, the abstract colour is a much more delightful element of expression than the abstract light and shade.

§ 10. Such being the manifold and precious uses of the

¹ [See Vol. XII. p. 483.]

true grotesque, it only remains for us to note carefully how it is to be distinguished from the false and vicious grotesque which results from idleness, instead of noble rest; from malice, instead of the solemn contemplation of necessary evil; and from general degradation of the human spirit, instead of its subjection, or confusion, by thoughts too high for it. It is easy for the reader to conceive how different the fruits of two such different states of mind *must* be; and yet how like in many respects, and apt to be mistaken, one for the other;—how the jest which springs from mere fatuity, and vacant want of penetration or purpose, is everlastingly, infinitely separated from, and yet may sometimes be mistaken for, the bright, playful, fond, farsighted jest of Plato, or the bitter, purposeful, sorrowing jest of Aristophanes;—how, again, the horror which springs from guilty love of foulness and sin, may be often mistaken for the inevitable horror which a great mind must sometimes feel in the full and penetrative sense of their presence;—how, finally, the vague and foolish inconsistencies of undisciplined dream or reverie may be mistaken for the compelled inconsistencies of thoughts too great to be well sustained, or clearly uttered. It is easy, I say, to understand what a difference there must indeed be between these; and yet how difficult it may be always to define it, or lay down laws for the discovery of it, except by the just instinct of minds set habitually in all things to discern right from wrong.

§ 11. Nevertheless, one good and characteristic instance may be of service in marking the leading directions in which the contrast is discernible. On the opposite page, Plate 1, I have put, beside each other, a piece of true grotesque, from the Lombard-Gothic, and of false grotesque from classical (Roman) architecture.¹ They are both griffins: the one on the left carries on his back one of the main

¹ [The griffin from Verona sustains the pillar on the north side of the western entrance; for other references to it, see *Stones of Venice*, vol. i. (Vol. IX. p. 439), and *Verona and its Rivers*, § 14. For further remarks on the naturalness of noble grotesque, see *Notes on the Turner Gallery* (1856), s. No. 477 *ad fin.*]

1. True and False Griffins.

Mediaeval

Classical.

pillars of the porch of the cathedral of Verona; the one on the right is on the frieze of the temple of Antoninus and Faustina at Rome, much celebrated by Renaissance and bad modern architects.

In some respects, however, this classical griffin deserves its reputation. It is exceedingly fine in lines of composition, and, I believe (I have not examined the original closely), very exquisite in execution. For these reasons, it is all the better for our purpose. I do not want to compare the worst false grotesque with the best true, but rather, on the contrary, the best false with the simplest true, in order to see how the delicately wrought lie fails in the presence of the rough truth; for rough truth in the present case it is, the Lombard sculpture being altogether untoward and imperfect in execution.*

§ 12. "Well, but," the reader says, "what do you mean by calling *either* of them true? There never were such beasts in the world as either of these?"

No, never: but the difference is, that the Lombard workman did really see a griffin in his imagination, and carved it from the life, meaning to declare to all ages that he had verily seen with his immortal eyes such a griffin as that; but the classical workman never saw a griffin at all, nor anything else; but put the whole thing together by line and rule.

§ 13. "How do you know that?"

Very easily. Look at the two, and think over them. You know a griffin is a beast composed of lion and eagle. The classical workman set himself to fit these together in the most ornamental way possible. He accordingly carves a sufficiently satisfactory lion's body, then attaches very gracefully cut wings to the sides: then, because he cannot get the eagle's head on the broad lion's shoulders, fits

* If there be any inaccuracy in the right-hand griffin, I am sorry, but am not answerable for it, as the plate has been faithfully reduced from a large French lithograph, the best I could find. The other is from a sketch of my own.

the two together by something like a horse's neck (some griffins being wholly composed of horse and eagle), then, finding the horse's neck look weak and unformidable, he strengthens it by a series of bosses, like vertebræ, in front, and by a series of spiny cusps, instead of a mane, on the ridge; next, not to lose the whole leonine character about the neck, he gives a remnant of the lion's beard, turned into a sort of griffin's whisker, and nicely curled and pointed; then an eye, probably meant to look grand and abstracted, and therefore neither lion's nor eagle's; and, finally, an eagle's beak, very sufficiently studied from a real one. The whole head being, it seems to him, still somewhat wanting in weight and power, he brings forward the right wing behind it, so as to enclose it with a broad line. This is the finest thing in the composition, and very masterly, both in thought, and in choice of the exactly right point where the lines of wing and beak should intersect (and it may be noticed in passing, that all men, who can compose at all, have this habit of encompassing or governing broken lines with broad ones, wherever it is possible, of which we shall see many instances hereafter). The whole griffin, thus gracefully composed, being, nevertheless, when all is done, a very composed griffin, is set to very quiet work, and raising his left foot, to balance his right wing, sets it on the tendril of a flower so lightly as not even to bend it down, though, in order to reach it, his left leg is made half as long again as his right.

§ 14. We may be pretty sure, if the carver had ever seen a griffin, he would have reported of him as doing something else than *that* with his feet. Let us see what the Lombardic workman saw him doing.

Remember, first, the griffin, though part lion and part eagle, has the united *power of both*. He is not merely a bit of lion and a bit of eagle, but whole lion incorporate with whole eagle. So when we really see one, we may be quite sure we shall not find him wanting in anything necessary to the might either of beast or bird.

Well, among things essential to the might of a lion, perhaps, on the whole, the most essential are his *teeth*. He could get on pretty well even without his claws, usually striking his prey down with a blow, woundless; but he could by no means get on without his teeth. Accordingly, we see that the real or Lombardic griffin has the carnivorous teeth bare to the root, and the peculiar hanging of the jaw at the back, which marks the flexible and gaping mouth of the devouring tribes.

Again; among things essential to the might of an eagle, next to his wings (which are of course prominent in both examples), are his *claws*. It is no use his being able to tear anything with his beak, if he cannot first hold it in his claws; he has comparatively no leonine power of striking with his feet, but a magnificent power of grip with them. Accordingly, we see that the real griffin, while his feet are heavy enough to strike like a lion's, has them also extended far enough to give them the eagle's grip with the back claw; and has, moreover, some of the bird-like wrinkled skin over the whole foot, marking this binding power the more: and that he has besides verily got something to hold with his feet, other than a flower; of which more presently.

§ 15. Now, observe, the Lombardic workman did not do all this because he had thought it out, as you and I are doing together; he never thought a bit about it. He simply saw the beast; saw it as plainly as you see the writing on this page, and of course could not be wrong in anything he told us of it.

Well, what more does he tell us? Another thing, remember, essential to an eagle is that it should fly *fast*. It is no use its having wings at all if it is to be impeded in the use of them. Now it would be difficult to impede him more thoroughly than by giving him two cocked ears to catch the wind.

Look, again, at the two beasts. You see the false griffin *has* them so set, and, consequently, as he flew, there would be a continual humming of the wind on each side of his

head, and he would have an infallible ear-ache when he got home. But the real griffin has his ears flat to his head, and all the hair of them blown back, even to a point, by his fast flying, and the aperture is downwards, that he may hear anything going on upon the earth, where his prey is. In the false griffin the aperture is upwards.

§ 16. Well, what more? As he is made up of the natures of lion and eagle, we may be very certain that a real griffin is, on the whole, fond of eating, and that his throat will look as if he occasionally took rather large pieces, besides being flexible enough to let him bend and stretch his head in every direction as he flies.

Look again at the two beasts. You see the false one has got those bosses upon his neck like vertebræ, which must be infinitely in his way when he is swallowing, and which are evidently inseparable, so that he cannot *stretch* his neck any more than a horse. But the real griffin is all loose about the neck, evidently being able to make it almost as much longer as he likes; to stretch and bend it anywhere, and swallow anything, besides having some of the grand strength of the bull's dewlap in it when at rest.

§ 17. What more? Having both lion and eagle in him, it is probable that the real griffin will have an infinite look of repose as well as power of activity. One of the notablest things about a lion is his magnificent *indolence*, his look of utter disdain of trouble when there is no occasion for it; as, also, one of the notablest things about an eagle is his look of inevitable vigilance, even when quietest. Look again at the two beasts. You see the false griffin is quite sleepy and dead in the eye, thus contradicting his eagle's nature, but is putting himself to a great deal of unnecessary trouble with his paws, holding one in a most painful position merely to touch a flower, and bearing the whole weight of his body on the other, thus contradicting his lion's nature.

But the real griffin is primarily, with his eagle's nature, wide awake; evidently quite ready for whatever may happen; and with his lion's nature, laid all his length on his belly,

prone and ponderous; his two paws as simply put out before him as a drowsy puppy's on a drawing-room hearth-rug; not but that he has got something to do with them, worthy of such paws; but he takes not one whit more trouble about it than is absolutely necessary. He has merely got a poisonous winged dragon to hold, and for such a little matter as that, he may as well do it lying down and at his ease, looking out at the same time for any other piece of work in his way. He takes the dragon by the middle, one paw under the wing, another above, gathers him up into a knot, puts two or three of his claws well into his back, crashing through the scales of it and wrinkling all the flesh up from the wound, flattens him down against the ground, and so lets him do what he likes. The dragon tries to bite him, but can only bring his head round far enough to get hold of his own wing, which he bites in agony instead; flapping the griffin's dewlap with it, and wriggling his tail up against the griffin's throat; the griffin being, as to these minor proceedings, entirely indifferent, sure that the dragon's body cannot drag itself one hair's breadth off those ghastly claws, and that its head can do no harm but to itself.

§ 18. Now observe how in all this, through every separate part and action of the creature, the imagination is *always* right. It evidently *cannot* err; it meets every one of our requirements respecting the griffin as simply as if it were gathering up the bones of the real creature out of some ancient rock. It does not itself know or care, any more than the peasant labouring with his spade and axe, what is wanted to meet our theories or fancies. It knows simply what is there, and brings out the positive creature, errorless, unquestionable. So it is throughout art, and in all that the imagination does; if anything be wrong it is not the imagination's fault, but some inferior faculty's, which would have its foolish say in the matter, and meddled with the imagination, and said, the bones ought to be put together tail first, or upside down.

§ 19. This, however, we need not be amazed at, because

the very essence of the imagination is already defined¹ to be the seeing to the heart; and it is not therefore wonderful that it should never err; but it is wonderful, on the other hand, how the composing legalism does *nothing else* than err. One would have thought that, by mere chance, in this or the other element of griffin, the griffin-composer might have struck out a truth; that he might have had the luck to set the ears back, or to give some grasp to the claw. But no; from beginning to end it is evidently impossible for him to be anything but wrong; his whole soul is instinct with lies; no veracity can come within hail of him; to him all regions of right and life are for ever closed.

§ 20. And another notable point is, that while the imagination receives truth in this simple way, it is all the while receiving statutes of composition also, far more noble than those for the sake of which the truth was lost by the legalist. The ornamental lines in the classical griffin appear at first finer than in the other; but they only appear so because they are more commonplace and more palpable. The subtlety of the sweeping and rolling curves in the real griffin, the way they waver and change and fold, down the neck, and along the wing, and in and out among the serpent coils, is incomparably grander, merely as grouping of ornamental line, than anything in the other; nor is it fine as ornamental only, but as massively useful, giving weight of stone enough to answer the entire purpose of pedestal sculpture. Note, especially, the insertion of the three plumes of the dragon's broken wing in the outer angle, just under the large coil of his body; this filling of the gap being one of the necessities, not of the pedestal block merely, but a means of getting mass and breadth, which all composers desire more or less, but which they seldom so perfectly accomplish.

So that, taking the truth first, the honest imagination gains everything; it has its griffinism, and grace, and usefulness, all at once: but the false composer, caring for nothing

¹ [In *Modern Painters*, vol. ii. (Vol. IV. p. 253). On knowledge deadening the imagination, compare *Stones of Venice*, vol. iii. (Vol. XI. p. 65).]

but himself and his rules, loses everything,—griffinism, grace, and all.

§ 21. I believe the reader will now sufficiently see how the terms “true” and “false” are in the most accurate sense attachable to the opposite branches of what might appear at first, in both cases, the merest wildness of inconsistent reverie. But they are even to be attached, in a deeper sense than that in which we have hitherto used them, to these two compositions. For the imagination hardly ever works in this intense way, unencumbered by the inferior faculties, unless it be under the influence of some solemn purpose or sentiment. And to all the falseness and all the verity of these two ideal creatures this farther falsehood and verity have yet to be added, that the classical griffin has, at least in this place, no other intent than that of covering a level surface with entertaining form; but the Lombardic griffin is a profound expression of the most passionate symbolism. Under its eagle’s wings are two wheels,* which mark it as connected, in the mind of him who wrought it, with the living creatures of the vision of Ezekiel: “When they went, the wheels went by them,” and “whithersoever the spirit was to go, they went; and the wheels were lifted up over against them, for the spirit of the living creatures was in the wheels.”¹ Thus signed, the winged shade becomes at once one of the acknowledged symbols of the divine power; and, in its unity of lion and eagle, the workmen of the Middle Ages always meant to set forth the unity of the human and divine natures.† In this unity it bears up the pillars of the Church, set for ever as the corner-stone. And the

* At the extremities of the wings,—not seen in the plate.²

† Compare the *Purgatorio*, canto xxix., etc.³

¹ [Ezekiel i. 19, 20.]

² [In his copy for revision, Ruskin marks this statement as wrong of the Veronese griffin, but refers to instances at Ferrara and Padua both with and without wheels.]

³ [The reference is to the griffin in the mystical procession in the terrestrial paradise (commonly understood to be symbolical of Christ, human and divine): see *Purgatorio*, xxix. 108; xxx. 8; xxxi. 80, 113, 120, 122; xxxii. 26, 43, 47, 89, 96.]

faithful and true imagination beholds it, in this unity, with everlasting vigilance and calm omnipotence, restrain the seed of the serpent crushed upon the earth; leaving the head of it free, only for a time, that it may inflict in its fury profounder destruction upon itself,—in this also full of deep meaning. The divine power does not slay the evil creature. It wounds and restrains it only. Its final and *deadly* wound is inflicted by itself.

CHAPTER IX OF FINISH¹

§ 1. I AM afraid the reader must be, by this time, almost tired of hearing about truth. But I cannot help this; the more I have examined the various forms of art, and exercised myself in receiving their differently intended impressions, the more I have found this truthfulness a final test, and the only test of lasting power; and, although our concern in this part of our inquiry is, professedly, with the beauty which blossoms out of truth, still I find myself

¹ [In the original draft, this chapter formed a further subdivision of the general division which comprises the last three chapters—thus “Of the True Ideal: the Executive Ideal”: a heading thus amplified in a note “or, what is agreeable in technical matters, or colour and composition,” a reference being supplied to the end of the first part in the first volume (Vol. III. p. 130). In correspondence with this arrangement, the chapter began with the following remarks:—

“It was noticed in the chapter on greatness of style in art [see above, ch. iii. §§ 10, 11], that one form of failing arose from the sacrifice of expression to technical excellence, another from that of technical excellence to expression. Now, strictly speaking, all merit displayed in this work is ‘artistic merit’; but the peculiar qualities meant by the expression in that place form a separate branch of the ideal which we have here to examine. Hitherto, it will be observed, we have been speaking of the thing conceived, and of ideal character as shown in its conception; now we have to speak of the thing executed, and of ideal character shown in its execution, or the ideas belonging to the language itself: see page 10 of vol. i. [in this edition Vol. III. p. 91]. Everything imperfectly realised (as, for an instance, by a mere outline of a tree) necessarily makes us think not only of the thing itself, but of the sort of stroke or mark which represents it. If art were perfect, so that it could not be distinguished from the reality, of course the idea of merit in execution would have no place in our minds; the picture would either deceive and be right, or not deceive and be wrong. But, imitation being necessarily imperfect, we habitually regard these means, by which it is effected, according to their success, and take pleasure in examining and inquiring into them. To do as much as possible with small means, and other such excellence, becomes therefore an ideal aim with respect to execution.”

The draft next outlines—in rough notes only—a second branch of “the executive ideal,” namely, “the intrinsic beauty of the colours and lines of the picture irrespective of what they represent,” and then passes on to a discussion of “Finish,” as in the text.]

compelled always to gather it by the stalk, not by the petals. I cannot hold the beauty, nor be sure of it for a moment, but by feeling for that strong stem.

We have, in the preceding chapters, glanced through the various operations of the imaginative power of man; with this almost painfully monotonous result, that its greatness and honour were always simply in proportion to the quantity of truth it grasped. And now the question, left undetermined some hundred pages back (Chap. II. § 6), recurs to us in a simpler form than it could before. How far is this true imagination to be truly represented? How far should the perfect conception of Pallas be so given as to look like Pallas herself, rather than like the picture of Pallas?

§ 2. A question, this, at present of notable interest, and demanding instant attention. For it seemed to us, in reasoning about Dante's views of art,¹ that he was, or might be, right in desiring realistic completeness; and yet, in what we have just seen of the grotesque ideal, it seemed there was a certain desirableness in incompleteness. And the schools of art in Europe are, at this moment, set in two hostile ranks,—not nobly hostile, but spitefully and scornfully; having for one of the main grounds of their dispute the apparently simple question, how far a picture may be carried forward in detail, or how soon it may be considered as finished.

I purpose, therefore, in the present chapter, to examine, as thoroughly as I can, the real signification of this word, Finish, as applied to art, and to see if in this, as in other matters, our almost tiresome test is not the only right one; whether there be not a *fallacious* finish and a *faithful* finish, and whether the dispute, which seems to be only about completion and incompleteness, has not therefore, at the bottom of it, the old and deep grounds of fallacy and fidelity.

§ 3. Observe, first, there are two great and separate

¹ [See above, p. 38.]

senses in which we call a thing finished, or well-finished. One, which refers to the mere neatness and completeness of the actual work, as we speak of a well-finished knife-handle or ivory toy (as opposed to ill-cut ones); and secondly, a sense which refers to the effect produced by the thing done, as we call a picture well-finished if it is so full in its details, as to produce the effect of reality on the spectator. And, in England, we seem at present to value highly the first sort of finish which belongs to *workmanship*, in our manufactures and general doings of any kind, but to despise totally the impressive finish which belongs to the *work*; and therefore we like smooth ivories better than rough ones,—but careless scrawls or daubs better than the most complete paintings. Now, I believe that we exactly reverse the fitness of judgment in this matter, and that we ought, on the contrary, to despise the finish of *workmanship*, which is done for vanity's sake, and to love the finish of *work*, which is done for truth's sake,—that we ought, in a word, to finish our ivory toys more roughly, and our pictures more delicately.

Let us think over this matter.

§ 4. Perhaps one of the most remarkable points of difference between the English and Continental nations is in the degree of finish given to their ordinary work.¹ It is enough to cross from Dover to Calais to feel this difference: and to travel farther only increases the sense of it. English windows for the most part fit their sashes, and their woodwork is neatly planed and smoothed: French windows are larger, heavier, and framed with wood that looks as if it had been cut to its shape with a hatchet; they have curious and cumbrous fastenings, and can only be forced asunder not properly. So with everything else—French, Italian, and German, and, as far as I know, Continental. Foreign drawers

¹ [This contrast occurred to Ruskin on returning from the Continent in 1854: compare the passage from his diary cited in the Introduction above, p. xxxv., and see *Modern Painters*, vol. iv. ch. i. § 4.]

do not slide as well as ours; foreign knives do not cut so well; foreign wheels do not turn so well; and we commonly plume ourselves much upon this, believing that generally the English people do their work better and more thoroughly, or as they say, "turn it out of their hands in better style," than foreigners. I do not know how far this is really the case. There may be a flimsy neatness as well as a substantial roughness; it does not necessarily follow that the window which shuts easiest will last the longest, or that the harness which glitters the most is assuredly made of the toughest leather. I am afraid, that if this peculiar character of finish in our workmanship ever arose from a greater heartiness and thoroughness in our ways of doing things, it does so only now in the case of our best manufactures; and that a great deal of the work done in England, however good in appearance, is but treacherous and rotten in substance. Still, I think that there is really in the English mind, for the most part, a stronger desire to do things as well as they can be done, and less inclination to put up with inferiorities or insufficiencies, than in general characterize the temper of foreigners. There is in this conclusion no ground for national vanity; for though the desire to do things as well as they can be done at first appears like a virtue, it is certainly not so in all its forms. On the contrary, it proceeds in nine cases out of ten more from vanity than conscientiousness; and that, moreover, often a weak vanity. I suppose that as much finish is displayed in the fittings of the private carriages of our young rich men as in any other department of English manufacture; and that our St. James's Street cabs, dogcarts, and liveries are singularly perfect in their way. But the feeling with which this perfection is insisted upon (however desirable as a sign of energy of purpose) is not in itself a peculiarly amiable or noble feeling; neither is it an ignoble disposition which would induce a country gentleman to put up with certain deficiencies in the appearance of his country-made carriage. It is true that such philosophy may degenerate into negligence, and that much

thought and long discussion would be needed before we could determine satisfactorily the limiting lines between virtuous contentment and faultful carelessness; but at all events we have no right at once to pronounce ourselves the wisest people because we like to do all things in the best way. There are many little things which to do admirably is to waste both time and cost; and the real question is not so much whether we have done a given thing as well as possible, as whether we have turned a given quantity of labour to the best account.

§ 5. Now, so far from the labour's being turned to good account which is given to our English "finishing," I believe it to be usually destructive of the best powers of our workmen's minds. For it is evident, in the first place, that there is almost always a useful and a useless finish; the hammering and welding which are necessary to produce a sword blade of the best quality, are useful finishing; the polish of its surface, useless.* In nearly all work this distinction will, more or less, take place between substantial finish and apparent finish, or what may be briefly characterized as "Make" and "Polish." And so far as finish is bestowed for purposes of "make," I have nothing to say against it. Even the vanity which displays itself in giving strength to our work is rather a virtue than a vice. But so far as finish is bestowed for purposes of "polish," there is much to be said against it; this first, and very strongly, that the qualities aimed at in common finishing, namely, smoothness, delicacy, or fineness, *cannot* in reality *exist*, in a degree worth admiring, in anything done by human hands. Our best finishing is but coarse and blundering work after all. We

* "With his Yemen sword for aid;
Ornament it carried none,
But the notches on the blade."¹

¹ [*The Death Feud: an Arab War Song*, anonymous translation from *Tait's Edinburgh Magazine*, July 1850. Ruskin perhaps came across the lines in Helps' *Companions of my Solitude*, p. 248, where they are quoted.]

may smooth, and soften, and sharpen till we are sick at heart; but take a good magnifying-glass to our miracle of skill, and the invisible edge is a jagged saw, and the silky thread a rugged cable, and the soft surface a granite desert. Let all the ingenuity and all the art of the human race be brought to bear upon the attainment of the utmost possible finish, and they could not do what is done in the foot of a fly, or the film of a bubble. God alone can finish;¹ and the more intelligent the human mind becomes, the more the infiniteness of interval is felt between human and divine work in this respect. So then it is not a little absurd to weary ourselves in struggling towards a point which we never can reach, and to exhaust our strength in vain endeavours to produce qualities which exist inimitably and inexhaustibly in the commonest things around us.

§ 6. But more than this: the fact is, that in multitudes of instances, instead of gaining greater fineness of finish by our work, we are only destroying the fine finish of nature, and substituting coarseness and imperfection. For instance, when a rock of any kind has lain for some time exposed to the weather, Nature finishes it in her own way; first, she takes wonderful pains about its forms, sculpturing it into exquisite variety of dint and dimple, and rounding or hollowing it into contours, which for fineness no human hand can follow; then she colours it; and every one of her touches of colour, instead of being a powder mixed with oil, is a minute forest of living trees, glorious in strength and beauty, and concealing wonders of structure which in all probability are mysteries even to the eyes of angels. Man comes, and digs up this finished and marvellous piece of work, which in his ignorance he calls a "rough stone." He proceeds to finish it in *his* fashion, that is, to split it in two, rend it into ragged blocks, and, finally, to chisel its surface into a large number of lumps and knobs, all equally

¹ [Compare *Modern Painters*, (vol. ii. (Vol. IV. p. 138), where Ruskin speaks of God's "infinite finish."]

shapeless, colourless, deathful, and frightful.* And the block thus disfigured he calls “finished,” and proceeds to build therewith, and thinks himself great, forsooth, and an intelligent animal. Whereas, all that he has really done is, to destroy with utter ravage a piece of divine art, which, under the laws appointed by the Deity to regulate His work in this world, it must take good twenty years to produce the like of again. This he has destroyed, and has himself given in its place a piece of work which needs no more intelligence to do than a pholas has, or a worm, or the spirit which throughout the world has authority over rending, rottenness, and decay. I do not say that stone must not be cut; it needs to be cut for certain uses; only I say that the cutting is not “finishing,” but *unfinishing*, it; and that so far as the mere fact of chiselling goes, the stone is ruined by the human touch. It is with it as with the stones of the Jewish altar: “If thou lift up thy tool upon it, thou hast polluted it.”¹ In like manner, a tree is a finished thing. But a plank, though ever so polished, is not. We need stones and planks, as we need food; but we no more bestow an additional admirableness upon stone in hewing it, or upon a tree in sawing it, than upon an animal in killing it.

§ 7. Well, but it will be said, there is certainly a kind of finish in stone-cutting, and in every other art, which *is* meritorious, and which consists in smoothing and refining as much as possible. Yes, assuredly there is a meritorious finish. First, as it has just been said, that which fits a thing for its uses,—as a stone to lie well in its place, or a cog of an engine-wheel to play well on another; and, secondly, a finish belonging properly to the arts; but *that* finish does not consist in smoothing or polishing, but in the *completeness of the expression of ideas*. For in painting

* See the base of the new Army and Navy Clubhouse.²

¹ [Exodus xx. 25.]

² [See Vol. IX. p. 348 *n.*; and for another criticism of the building, *Lectures on Architecture and Painting*, § 35 (Vol. XII. p. 58).]

there is precisely the same difference between the ends proposed in finishing that there is in manufacture. Some artists finish for the finish' sake;¹ dot their pictures all over, as in some kinds of miniature painting (when a wash of colour would have produced as good an effect); or polish their pictures all over, making the execution so delicate that the touch of the brush cannot be seen, for the sake of the smoothness merely, and of the credit they may thus get for great labour; which kind of execution, seen in great perfection in many works of the Dutch school, and in those of Carlo Dolci,² is that polished "language" against which I have spoken at length in various portions of the first volume; nor is it possible to speak of it with too great severity or contempt, where it has been made an ultimate end.

But other artists finish for the impression's sake, not to show their skill, nor to produce a smooth piece of work, but that they may, with each stroke, render clearer the expression of knowledge. And this sort of finish is not, properly speaking, so much *completing* the picture as *adding* to it. It is not that what is painted is more delicately done, but that infinitely *more* is painted. This finish is always noble, and, like all other noblest things, hardly ever understood or appreciated. I must here endeavour, more especially with respect to the state of quarrel between the schools of living painters, to illustrate it thoroughly.

§ 8. In sketching the outline, suppose of the trunk of a tree, as in Plate 2 (opposite), fig. 1, it matters comparatively little whether the outline be given with a bold or a delicate line, so long as it is *outline only*. The work is not more "finished" in one case than in the other; it is only prepared for being seen at a greater or less distance. The real refinement or finish of the line depends, not on its thinness, but on its truly following the contours of the tree, which it conventionally represents; conventionally, I say, because there is no such line round the tree in reality;

¹ [Compare *Stones of Venice*, vol. ii. (Vol. X. p. 197).]

² [Compare *Modern Painters*, vol. i. (Vol. III. p. 91).]

and it is set down not as an *imitation*, but a *limitation* of the form. But if we are to add shade to it, as in fig. 2, the outline must instantly be made proportionately delicate, not for the sake of delicacy, as such, but because the outline will now, in many parts, stand not for limitation of form merely, but for a portion of the *shadow* within that form. Now, as a limitation it was true, but as a shadow it would be false, for there is no line of black shadow at the edge of the stem. It must, therefore, be made so delicate as not to detach itself from the rest of the shadow where shadow exists, and only to be seen in the light where limitation is still necessary.

Observe, then, the “finish” of fig. 2 as compared with fig. 1 consists, not in its greater delicacy, but in the addition of a truth (shadow), and the removal, in a great degree, of a conventionalism (outline). All true finish consists in one or other of these things. Now, therefore, if we are to “finish” farther, we must *know* more or *see* more about the tree. And as the plurality of persons who draw trees know nothing of them, and will not look at them, it results necessarily that the effort to finish is not only vain, but unfinished—does mischief. In the lower part of the plate, figs. 3, 4, 5, and 6 are facsimiles of pieces of line engraving, meant to represent trunks of trees; 3 and 4 are the commonly accredited types of tree-drawing among engravers in the eighteenth century, 5 and 6 are quite modern; 3 is from a large and important plate by Boydell, from Claude’s *Molten Calf*, dated 1781; 4 by Boydell in 1776, from Rubens’s *Waggoner*; 5 from a bombastic engraving, published about twenty years ago by Meulemeester, of Brussels, from Raphael’s *Moses at the Burning Bush*; and 6 from the foreground of Miller’s *Modern Italy*, after Turner.*

* I take this example from Miller, because, on the whole, he is the best engraver of Turner whom we have.¹

¹ [William Miller (1796–1882) engraved several of Turner’s pictures, as well as many of his drawings for Scott, Campbell, Rogers, “*Rivers of France*,” and

All these represent, as far as the engraving goes, simply *nothing*. They are not “finished” in any sense but this,—that the paper has been covered with lines.¹ 4 is the best, because, in the original work of Rubens, the lines of the boughs, and their manner of insertion in the trunk, have been so strongly marked, that no engraving could quite efface them; and, inasmuch as it represents these facts in the boughs, that piece of engraving is more finished than the other examples, while its own network texture is still false and absurd: for there is no texture of this knitted-stockings-like description on boughs; and if there were, it would not be seen in the shadow, but in the light. Miller’s is spirited and looks lustrous, but has no resemblance to the original bough of Turner’s, which is pale, and does not glitter. The Netherlands work is, on the whole, the worst, because in its ridiculous double lines, it adds affectation and conceit to its incapacity. But in all these cases the engravers have worked in total ignorance both of what is meant by “drawing,” and of the form of a tree, covering their paper with certain lines, which they have been taught to plough in copper, as a husbandman ploughs in clay.

§ 9. In the next three examples we have instances of endeavours at finish by the hands of artists themselves, marking three stages of knowledge or insight, and three relative stages of finish. Fig. 7 is Claude’s (*Liber Veritatis*, No. 140, facsimile by Boydell).² It still displays an appealing ignorance of the forms of trees, but yet is, in mode of

“England and Wales.” The “Modern Italy” (exhibited 1838) was engraved by him for *The Turner Gallery*. John Boydell (1719–1804), well known as an engraver, and still better as a printseller and proprietor of “The Shakespeare Gallery”; Lord Mayor in 1790. Claude’s “Worship of the Golden Calf” was engraved by Daniel Larpiniere (1745–1785), and published by Boydell; the design is analysed in *Modern Painters*, vol. v. pt. ix. ch. v. § 14. Rubens’ “Waggoner” was engraved by John Browne (1719–1790), and published by Boydell. Raphael’s “Moses at the Burning Bush” is one of the frescoes in the Stanza d’Elidoro in the Vatican; engraved by Joseph Carl Meulemeester (*b.* 1775).]

¹ [In an earlier draft, Ruskin added:—

“Though much additional labour has been bestowed upon the work, it is no more finished than if the engraver had spent his time in dancing round the tree instead of scratching over it.”]

² [See, for another piece of this tree, *Lectures on Architecture and Painting*, § 127 and Plate xiii. (Vol. XII. p. 127).]

execution, better—that is, more finished—than the engravings, because not *altogether* mechanical, and showing some dim, far-away, blundering memory of a few facts in stems, such as their variations of texture and roundness, and bits of young shoots of leaves. 8 is Salvator's, facsimiled from part of his original etching of the Finding of (Edipus).¹ It displays considerable power of handling—not mechanical, but free and firm, and is just so much more finished than any of the others as it displays more intelligence about the way in which boughs gather themselves out of the stem, and about the varying character of their curves. Finally, fig. 9 is good work. It is the root of the apple-tree in Albert Dürer's Adam and Eve,² and fairly represents the wrinkles of the bark, the smooth portions emergent beneath, and the general anatomy of growth. All the lines used conduce to the representation of these facts; and the work is therefore highly finished. It still, however, leaves out, as not to be represented by such kind of lines, the more delicate gradations of light and shade. I shall now "finish" a little farther, in the next plate (3), the mere *insertion of the two boughs* outlined in fig. 1. I do this simply by adding assertions of more facts. First, I say that the whole trunk is dark, as compared with the distant sky. Secondly, I say that it is rounded by gradations of shadow, in the various forms shown. And, lastly, I say that (this being a bit of old pine stripped by storm of its bark) the wood is fissured in certain directions, showing its grain, or *muscle*, seen in complicated contortions at the insertion of the arm and elsewhere.

§ 10. Now this piece of work, though yet far from complete (we will better it presently), is yet more finished than any of the others, not because it is more delicate or more skilful, but simply because it tells more truth, and admits

¹ [Other pieces of this etching are reproduced in Plate 57 and Fig. 57 in *Modern Painters*, vol. v. pt. vi. ch. viii. § 7.]

² [For Dürer's "Adam and Eve," compare *Seven Lamps* (Vol. VIII. p. 149); *Stones of Venice*, vol. iii. (Vol. XI. p. 172 and *n.*); and *Ariadne Florentina*, §§ 128, 129, 169.]

J. Fowler.

J.H. Le Kern.
Allen & Co. Co.

3. Strength of old Pine.

fewer fallacies. That which conveys most information, with least inaccuracy, is always the highest finish; and the question whether we prefer art so finished, to art unfinished, is not one of taste at all. It is simply a question whether we like to know much or little; to see accurately or see falsely; and those whose *taste* in art (if they choose so to call it) leads them to like blindness better than sight, and fallacy better than fact, would do well to set themselves to some other pursuit than that of art.

§ 11. In the above place we have examined chiefly the grain and surface of the boughs; we have not yet noticed the finish of their curvature. If the reader will look back to the No. 7 (Plate 2), which, in this respect, is the worst of all the set, he will immediately observe the exemplification it gives of Claude's principal theory about trees; namely, that the boughs always parted from each other, two at a time, in the manner of the prongs of an ill-made table-fork. It may, perhaps, not be at once believed that this is indeed Claude's theory respecting tree-structure, without some farther examples of his practice. I have, therefore, assembled on the opposite page, Plate 4, some of the most characteristic passages of ramification in the *Liber Veritatis*; the plates themselves are sufficiently cheap (as they should be) and accessible to nearly every one, so that the accuracy of the facsimiles may be easily tested. I have given in Appendix I.¹ the numbers of the plates from which the examples are taken, and it will be found that they have been rather improved than libelled, only omitting, of course, the surrounding leafage, in order to show accurately the branch outlines, with which alone we are at present concerned. And it would be difficult to bring together a series more totally futile and foolish, more singularly wrong (as the false griffin was), every way at once: they are stiff, and yet have no strength; curved, and yet have no flexibility; monotonous, and yet disorderly; unnatural, and yet uninventive. They are, in fact, of that

¹ [See below, p. 422.]

Claude.

J. H. Le Koux.
Allen & Co. Ill.

4. Ramification, according to Claude.

commonest kind of tree bough which a child or beginner first draws experimentally; nay, I am well assured, that if this set of branches had been drawn by a schoolboy, “out of his own head,” his master would hardly have cared to show them as signs of any promise in him.

§ 12. “Well, but do not the trunks of trees fork, and fork mostly into two arms at a time?”

Yes; but under as stern anatomical¹ law as the limbs of an animal: and those hooked junctions in Plate 4 are just as accurately representative of the branching of wood as this (fig. 2) is of a neck and shoulders. We should object to such a representation of shoulders, because we have some interest in, and knowledge of, human form; we do not object to Claude’s trees, because we have no interest in, nor knowledge of, trees. And if it be still alleged that such work is nevertheless enough to give any one an “idea” of a tree, I answer that it never gave, nor ever will give, an idea of a tree to any one who loves trees; and that, moreover, no idea, whatever its pleasantness, is of the smallest value, which is not founded on simple facts. What pleasantness may be in *wrong* ideas we do not here inquire; the only question for us has always been, and must always be, What are the facts?

§ 13. And assuredly those boughs of Claude’s are not facts; and every one of their contours is, in the worst sense, unfinished, without even the expectation or faint hope of possible refinement ever coming into them. I do not mean to enter here into the discussion of the characters of ramification; that must be in our separate inquiry into tree-structure generally;² but I will merely give one piece of Turner’s tree-drawing as an example of what finished work really is, even in outline. In Plate 5, fig. 1 is the

¹ [For Ruskin’s explanation of this term, see the letter in Appendix iv. below, p. 432.]

² [See *Modern Painters*, vol. v. part vi.]

contour (stripped, like Claude's, of its foliage) of one of the distant tree-stems in the drawing of Bolton Abbey.¹ In order to show its perfectness better by contrast with bad work (as we have had, I imagine, enough of Claude), I will take a bit of Constable; fig. 2 is the principal tree out of the engraving of the Lock on the Stour (Leslie's *Life of Constable*).² It differs from the Claude outlines merely in being the kind of work which is produced by an uninventive person dashing about idly, with a brush, instead of dreaqing determinately wrong, with a pen: on the one hand worse than Claude's, in being lazier; on the other a little better, in being more free, but, as representative of tree form, of course still wholly barbarous. It is worth while to turn back to the description of the uninventive painter at work on a tree (Vol. II. chapter on Imaginative Association, § 11³), for this trunk of Constable's is curiously illustrative of it. One can almost see him, first bending it to the right; then, having gone long enough to the right, turning to the left; then, having gone long enough to the left, away to the right again; then dividing it; and "because there is another tree in the picture with two long branches (in this case there really is), he knows that this ought to have three or four, which must undulate or go backwards and forwards," etc., etc.

§ 14. Then study the bit of Turner work; note first its quietness, unattractiveness, apparent carelessness whether you look at it or not; next note the subtle curvatures within the narrowest limits, and, when it branches, the unexpected, out of the way things it does, just what nobody could have thought of its doing; shooting out like a letter Y, with a nearly straight branch, and then correcting its stiffness with a zig-zag behind, so that the boughs, ugly

¹ [This drawing was in Ruskin's collection; see Vol. XIII. The right-hand portion of it is etched in Plate 12 in this volume, and mezzotinted in Plate 12A in the next volume. The trees have already been mentioned in *Modern Painters*, vol. i. (Vol. III. p. 586).]

² [*Memoirs of the Life of John Constable*, 1843, p. 43 (the plates are in that, the first, edition only).]

³ [In this edition, Vol. IV. p. 238.]

Turner, Constable.

J. Corser.
Allen & Co. So.

individually, are beautiful in unison. (In what I have hereafter to say about trees, I shall need to dwell much on this character of *unexpectedness*.¹ A bough is never drawn rightly if it is not wayward, so that although, as just now said, quiet at first, not caring to be looked at, the moment it *is* looked at, it seems bent on astonishing you, and doing the last things you expect it to do.) But our present purpose is only to note the *finish* of the Turner *curves*, which, though they seem straight and stiff at first, are, when you look long, seen to be all tremulous, perpetually waving along every edge into endless melody of change. This is finish in line, in exactly the same sense that a fine melody is finished in the association of its notes.

§ 15. And now, farther, let us take a little bit of the Turnerian tree in light and shade. I said above I would better the drawing of that pine trunk, which, though it has incipient shade, and muscular action, has no texture, nor local colour. Now I take about an inch and a half of Turner's ash trunks (one of the nearer ones in this same drawing of Bolton Abbey) (fig. 3, Plate 5), and *this* I cannot better; this is perfectly finished; it is not possible to add more truth to it on that scale. Texture of bark, anatomy of muscle beneath, reflected lights in recessed hollows, stains of dark moss, and flickering shadows from the foliage above, all are there, as clearly as the human hand can mark them. I place a bit of trunk by Constable (fig. 5),* from another plate in Leslie's *Life of him* (a dell in Helmingham Park, Suffolk), for the sake of the same

* Fig. 5 is not, however, so lustrous as Constable's; I cannot help this, having given the original plate to my good friend Mr. Cousen, with strict charge to facsimile it faithfully; but the figure is all the fairer, as a representation of Constable's art, for those mezzotints in Leslie's *Life of him* have many qualities of drawing which are quite wanting in Constable's blots of colour. The comparison shall be made elaborately, between picture and picture, in the section on Vegetation.²

¹ [See especially in *Modern Painters*, vol. v. pt. vi. ch. viii. § 11.]

² [The plate, "Helmingham Park," faces p. 6 in Leslie's *Life of Constable*. The comparison here promised was not made; but see the further remarks on Constable's drawing of trees in *Modern Painters*, vol. iv. ch. v. § 19.]

comparison in shade that we have above in contour. You see Constable does not know whether he is drawing moss or shadow; those dark touches in the middle are confused in his mind between the dark stains on the trunk and its dark side; there is no anatomy, no cast shadow, nothing but idle sweeps of the brush, vaguely circular. The thing is much darker than Turner's, but it is not, therefore, finished; it is only blackened. And "to blacken" is indeed the proper word for all attempts at finish without knowledge. All true finish is *added fact*; and Turner's word for finishing a picture was always this significant one, "carry forward." But labour without added knowledge can only blacken or stain a picture, it cannot finish it.

§ 16. And this is especially to be remembered, as we pass from comparatively large and distant objects such as this single trunk, to the more divided and nearer features of foreground. Some degree of ignorance may be hidden, in completing what is far away; but there is no concealment possible in close work, and darkening instead of finishing becomes then the engraver's only possible resource. It has always been a wonderful thing to me to hear people talk of making foregrounds "vigorous," "marked," "forcible," and so on. If you will lie down on your breast on the next bank you come to¹ (which is bringing it *close* enough, I should think, to give it all the force it is capable of), you will see, in the cluster of leaves and grass close to your face, something as delicate as this, which I have actually so drawn, on the opposite page,² a mystery of soft shadow in the depths of the grass, with indefinite forms of leaves, which you cannot trace nor count, within it, and

¹ [Mrs. Arthur Severn, in a speech to the girls at Whitelands Training College, gave a reminiscence which is characteristic of Ruskin's own observation in this sort. "When I was very young, I was once walking through a garden with Mr. Ruskin, when I observed him to stoop low down and glance sidewise at the sky. Wondering at this movement of his, I heard him say, 'Do you put your head down here, and you will see what I see.' So I bent down also, and saw what he had discovered—the wondrous loveliness of a tree's buds against the sky" (*Standard*, May 3, 1886: "Mr. Ruskin's Queen of the May").]

² [For a note on this drawing, see *Modern Painters*, vol. iv. ch. iii. § 19 n.]

out of that, the nearer leaves coming in every subtle gradation of tender light and flickering form, quite beyond all delicacy of pencilling to follow; and yet you will rise up from that bank (certainly not making it appear coarser by drawing a little back from it), and profess to represent it by a few blots of “forcible” foreground colour. “Well, but I cannot draw every leaf that I see on the bank.” No, for as we saw, at the beginning of this chapter, that no human work could be finished so as to express the *delicacy* of nature, so neither can it be finished so as to express the *redundance* of nature. Accept that necessity; but do not deny it; do not call your work finished, when you have, in engraving, substituted a confusion of coarse black scratches, or in water-colour a few edgy blots, for ineffable organic beauty. Follow that beauty as far as you can, remembering that just as far as you see, know, and represent it, just so far your work is finished; as far as you fall short of it, your work is *unfinished*, and as far as you substitute any other thing for it, your work is spoiled.

§ 17. How far Turner followed it, is not easily shown; for his finish is so delicate as to be nearly uncopiable. I have just said it was not possible to finish that ash trunk of his, farther, on such a scale.* By using a magnifying-glass and giving the same help to the spectator, it might perhaps be possible to add and exhibit a few more details; but even as it is, I cannot by line engraving express all that there is in that piece of tree-trunk, on the same scale. I *have* therefore magnified the upper part of it in fig. 4 (Plate 5), so that the reader may better see the beautiful lines of curvature into which even its slightest shades and spots are cast. Every quarter of an inch of Turner’s drawings will bear magnifying in the same way; much of the finer work in them can hardly be traced, except by the

* It is of the exact size of the original, the whole drawing being about 15½ inches by 11 inches.¹

¹ [Reduced by about one-fourth in this edition.]

keenest sight, until it is magnified. In his painting of Ivy Bridge,* the veins are drawn on the wings of a butterfly, not above three lines in diameter; and in one of his smaller drawings of Scarborough,¹ in my own possession, the musselshells on the beach are rounded, and some shown as shut, some as open, though none are as large as one of the letters of this type; and yet this is the man who was thought to belong to the “dashing” school, literally because most people had not patience or delicacy of sight enough to trace his endless detail.

§ 18. “Suppose it was so,” perhaps the reader replies; “still I do not like detail so delicate that it can hardly be seen.” Then you like nothing in Nature (for you will find she always carries her detail too far to be traced). This point, however, we shall examine hereafter;² it is not the question now whether we *like* finish or not; our only inquiry here is, what finish *means*; and I trust the reader is beginning to be satisfied that it does indeed mean nothing but consummate and accumulated truth, and that our old monotonous test must still serve us here as elsewhere. And it will become us to consider seriously why (if indeed it be so) we dislike this kind of finish—dislike an accumulation of truth. For assuredly all authority is against us, and—*no truly great name can be named in the arts—but it is that of one who finished to his utmost*. Take Leonardo, Michael Angelo, and Raphael for a triad, to begin with. *They* all completed their detail with such subtlety of touch and gradation, that, in a careful drawing by any of the three, you cannot see where the pencil ceased to touch the paper;³

* An oil painting (about 3 ft. by 4 ft. 6 in.), and very broad in its masses. In the possession of E. Bicknell, Esq.⁴

¹ [For the “Scarboroughs” in Ruskin’s collection, see Vol. XIII.; and compare Vol. XII. p. 382.]

² [See, for instance, *Modern Painters*, vol. iv. ch. ii. §§ 7, 23.]

³ [See the appendix to *Two Paths* on “Subtlety of Hand,” and Ruskin’s letter to the *Literary Gazette* (November 13, 1858) in Vol. XIII.]

⁴ [Now in the collection of Mr. Pandeli Ralli, shown at the Guildhall in 1899 (No. 21). The detail of the butterfly is noticed more fully in *Modern Painters*, vol. i. (see Vol. III. p. 244 and *n.*.)]

the stroke of it is so tender, that, when you look close to the drawing you can see nothing; you only see the effect of it a little way back! Thus tender in execution, and so complete in detail, that Leonardo must needs draw *every several vein in the little agates* and pebbles of the gravel under the feet of the St. Anne in the Louvre.¹ Take a quartett after a triad—Titian, Tintoret, Bellini, and Veronese. Examine the vine-leaves of the Bacchus and Ariadne (Titian's), in the National Gallery; examine the borage blossoms, painted petal by petal, though lying loose on the table, in Titian's Supper at Emmaus, in the Louvre, or the snail-shells on the ground in his Entombment;* examine the separately designed patterns on every drapery of Veronese, in his Marriage in Cana; go to Venice and see how Tintoret paints the strips of black bark on the birch trunk that sustains the platform in his Adoration of the Magi,² how Bellini fills the rents of his ruined walls with the most exquisite clusters of the Erba della Madonna.† You will find them all in a tale. Take a quintett after the quartett—Francia, Angelico, Dürer, Memling, Perugino,—and still the witness is one, still the same striving in all to such utmost perfection as their knowledge and hand could reach.

Who shall gainsay these men? Above all, who shall gainsay them when they and Nature say precisely the same thing? for where does Nature pause in *her* finishing—that finishing which consists not in the smoothing of surface, but the filling of space, and the multiplication of life and thought?

* These snail-shells are very notable, occurring as they do in, perhaps, the very grandest and broadest of all Titian's compositions.

† *Linaria Cymbalaria*, the ivy-leaved toadflax of English gardens.³

¹ [For this detail, and others that follow, see the "Notes on the Louvre," Vol. XII. pp. 460, 473. For the detail in Titian's "Bacchus and Ariadne," see *Academy Notes*, 1855, No. 240, and *Elements of Drawing*, § 77; for Tintoret's "Adoration of the Magi," Vol. XI. p. 406.]

² [See above, ch. vii. § 2, p. 112.]

³ [For this plant, see Vol. XI. p. 336, and *Queen of the Air*, § 87.]

Who shall gainsay them? I, for one, dare not; but accept their teaching, with Nature's, in all humbleness.

“But is there, then, no good in any work which does not pretend to perfectness? Is there no saving clause from this terrible requirement of completion? And if there be none, what is the meaning of all you have said elsewhere about rudeness as the glory of Gothic work, and, even a few pages back,¹ about the danger of finishing, for our modern workmen?”

Indeed there are many saving clauses, and there is much good in imperfect work. But we had better cast the consideration of these drawbacks and exceptions into another chapter, and close this one, without obscuring, in any wise, our broad conclusion that “finishing” means in art simply “telling more truth”; and that whatever we have in any sort begun wisely, it is good to finish thoroughly.²

¹ [See p. 152; and for the rudeness of Gothic, *Stones of Venice*, vol. ii. (Vol. X. pp. 184–204).]

² [In his copy for revision, Ruskin here indicated that he meant to transfer § 5 of the next chapter to the end of ch. ix.]

CHAPTER X

OF THE USE OF PICTURES¹

§ 1. I AM afraid this will be a difficult chapter; one of drawbacks, qualifications, and exceptions. But the more I see of useful truths, the more I find that, like human beings, they are eminently biped; and, although, as far as apprehended by human intelligence, they are usually seen in a crane-like posture, standing on one leg, whenever they are to be stated so as to maintain themselves against all attack it is quite necessary they should stand on two, and have their complete balance on opposite fulcra.²

§ 2. I doubt not that one objection with which, as well as with another, we may begin, has struck the reader very forcibly, after comparing the illustrations above given from Turner, Constable, and Claude. He will wonder how it was that Turner, finishing in this exquisite way, and giving truths by the thousand, where other painters gave only one or two, yet, of all painters, seemed to obtain least acknowledgeable resemblance to nature, so that the world cried out upon him for a madman, at the moment when he was giving exactly the highest and most consummate truth that had ever been seen in landscape.

And he will wonder why still there seems reason for this outcry. Still, after what analysis and proof of his being right have as yet been given, the reader may perhaps be saying to himself: "All this reasoning is of no use to me. Turner does *not* give me the idea of nature; I do not feel before one of his pictures as I should in a real scene.

¹ [Here Ruskin wrote at the head, "I can't better this chapter"; he did, however, mark some intended rearrangements and add a few explanatory notes.]

² [Compare the passage from Ruskin's diary quoted above, Introduction, pp. liii.-liv.]

Constable takes me out into the shower,¹ and Claude into the sun; and De Wint makes me feel as if I were walking in the fields; but Turner keeps me in the house, and I know always that I am looking at a picture.”

I might answer to this: Well, what else *should* he do? If you want to feel as if you were in a shower, cannot you go and get wet without help from Constable? If you want to feel as if you were walking in the fields, cannot you go and walk in them without help from De Wint? But if you want to sit in your room and look at a beautiful picture, why should you blame the artist for giving you one? This *was* the answer actually made to me by various journalists, when first I showed that Turner was truer than other painters: “Nay,” said they, “we do not want truth, we want something else than truth; we would not have nature, but something better than nature.”²

§ 3. I do not mean to accept that answer, although it seems at this moment to make for me: I have never accepted it. As I raise my eyes from the paper, to think over the curious mingling in it, of direct error, and faraway truth, I see upon the room-walls,³ first, Turner’s drawing of the chain of the Alps from the Superga above Turin; then a study of a block of gneiss at Chamouni, with the purple Aiguilles Rouges behind it; another of the towers of the Swiss Fribourg, with a cluster of pine forest behind them; then another Turner, *Isola Bella*, with the

¹ [Compare Fuseli’s saying, Vol. III. p. 191. For De Wint, see Vol. I. p. 426, Vol. III. p. 199.]

² [A paraphrase of the criticisms in the *Athenæum* and *Blackwood’s Magazine* upon the first volume of *Modern Painters*: see Vol. III. p. 52.]

³ [The walls, that is, of his study, which was on the first floor of the house at Denmark Hill, at the back looking on to the garden. Turner’s drawing of the view from the Superga is described (No. 17) in Ruskin’s *Notes on his Drawings by Turner*; for another reference to it, see *Elements of Drawing*, § 220. A copy of it made for Ruskin by Mr. W. Hackstoun is in the Museum at Sheffield. The other Turner, “*Isola Bella*,” is described (No. 16) in the same *Notes*. The “study” at Chamouni and “the towers of Fribourg” are drawings by Ruskin—the latter is engraved as Plate 24 in the fourth volume of *Modern Painters*; for the former, see Nos. 57, 59 in the list on p. xxii. *n.*, above. The “bit of illumination” was a page which he had cut out and framed from one of his manuscripts (see Vol. XII. p. lxx.).]

blue opening to the St. Gothard in the distance; and then a fair bit of thirteenth-century illumination, depicting, at the top of the page, the Salutation; and beneath, the painter who painted it, sitting in his little convent cell, with a legend above him to this effect:—

“ego johes sepsi hunc librum.”

I, John, wrote this book.

None of these things are bad pieces of art; and yet,—if it were offered me to have, instead of them, so many windows, out of which I should see, first, the real chain of the Alps from the Superga; then the real block of gneiss, and Aiguilles Rouges; then the real towers of Fribourg, and pine forest; the real Isola Bella; and, finally, the true Mary and Elizabeth; and beneath them, the actual old monk at work in his cell,—I would very unhesitatingly change my five pictures for the five windows; and so, I apprehend, would most people, not, it seems to me, unwisely.

“Well, then,” the reader goes on to question me, “the more closely the picture resembles such a window, the better it must be?”

Yes.

“Then, if Turner does not give me the impression of such a window, that is, of Nature, there must be something wrong in Turner?”

Yes.

“And if Constable and De Wint give me the impression of such a window, there must be something right in Constable and De Wint?”

Yes.

“And something more right than in Turner?”

No.

“Will you explain yourself?”

I *have* explained myself, long ago, and that fully; perhaps too fully for the simple sum of the explanation to be remembered. If the reader will glance back to, and in the present state of our inquiry, reconsider in the first volume, Part I. Sec. I. Chap. v., and Part II. Sec. I. Chap. VII.,

he will find our present difficulties anticipated.¹ There are some truths, easily obtained, which give a deceptive resemblance to Nature; others only to be obtained with difficulty, which cause no deception, but give inner and deeper resemblance. These two classes of truths cannot be obtained together; choice must be made between them. The bad painter gives the cheap deceptive resemblance. The good painter gives the precious non-deceptive resemblance. Constable perceives in a landscape that the grass is wet, the meadows flat, and the boughs shady; that is to say, about as much as, I suppose, might in general be apprehended, between them, by an intelligent fawn, and a skylark. Turner perceives at a glance the whole sum of visible truth open to human intelligence. So Berghem perceives nothing in a figure, beyond the flashes of light on the folds of its dress; but Michael Angelo perceives every flash of thought that is passing through its spirit: and Constable and Berghem may imitate windows; Turner and Michael Angelo can by no means imitate windows. But Turner and Michael Angelo are nevertheless the best.

§ 4. “Well but,” the reader persists, “you admitted just now that because Turner did not get his work to look like a window there was something wrong in him.”

I did so; if he were quite right he would have *all* truth, low as well as high; that is, he would be Nature and not Turner, but that is impossible to man. There is much that is wrong in him; much that is infinitely wrong in all human effort. But, nevertheless, in some an infinity of Betterness above other human effort.

“Well, but you said you would change your Turners for windows; why not, therefore, for Constables?”

Nay, I did not say that I would change them for windows *merely*, but for windows which commanded the chain of the Alps and Isola Bella. That is to say, for all the truth that there is in Turner, and all the truth besides

¹ [The references in this edition are to Vol. III. pp. 108, 163–168.]

which is not in him; but I would not change them for Constables, to have a small piece of truth which is not in Turner, and none of the mighty truth which there is.

§ 5. Thus far, then, though the subject is one requiring somewhat lengthy explanation, it involves no real difficulty. There is not the slightest inconsistency in the mode in which, throughout this work, I have desired the relative merits of painters to be judged. I have always said, he who is closest to Nature is best. All rules are useless, all genius is useless, all labour is useless, if you do not give facts; the more facts you give, the greater you are; and there is no fact so unimportant as to be prudently despised, if it be possible to represent it. Nor, but that I have long known the truth of Herbert's lines,

“Some men are
Full of themselves, and answer their own notion,”¹

would it have been without intense surprise that I heard querulous readers asking, “how it was possible” that I could praise Pre-Raphaelitism and Turner also.² For, from the beginning of this book to this page of it, I have never praised Turner highly for any other cause than that he *gave facts* more *delicately*, more Pre-Raphaelitically, than other men. Careless readers, who dashed at the descriptions and missed the arguments, took up their own conceptions of the cause of my liking Turner, and said to themselves: “Turner cannot draw, Turner is generalizing, vague, visionary; and the Pre-Raphaelites are hard and distinct. How can any one like both?”* But *I* never said that Turner could not

* People of any sense, however, confined themselves to wonder. I think it was only in the *Art Journal* of September 1st, 1854, that any writer had the meanness to charge me with insincerity. “The pictures of Turner and the works of the Pre-Raphaelites are the very antipodes of each other; it is, therefore, impossible that one and the same individual can with any *show of sincerity* [Note, by the way, the Art Union has no idea that real

¹ [*The Church Porch*, liv.]

² [On this subject, see Introduction to Vol. XII. p. li.]

draw. *I* never said that he was vague or visionary. What *I* said was, that nobody had ever drawn so well: that nobody was so certain, so *un*-visionary; that nobody had ever given so many hard and downright facts. Glance back to the first volume, and note the expression now. “He is the only painter who ever drew a mountain or a stone;* the only painter who can draw the stem of a tree; the only painter who has ever drawn the sky, previous artists having only drawn it typically or partially, but he absolutely and universally.” Note how he is praised in his rock drawing for “not selecting a pretty or interesting morsel here or there, but giving the whole truth, with all the relations of its parts.”† Observe how the *great virtue* of the landscape of Cima da Conegliano and the early sacred painters is said to be giving “entire, exquisite, humble realization—a strawberry plant in the foreground with a blossom, *and a berry just set, and one half ripe, and one ripe*, all patiently and innocently painted from the *real thing, and therefore most*

sincerity is a thing existent or possible at all. All that it expects or hopes of human nature is, that it should have *show* of sincerity.] stand forth as the thick and thin [I perceive the writer intends to teach me English, as well as honesty.] eulogist of both. With a certain knowledge of art, such as may be possessed by the author of *English Painters*, [Note, farther, that the eminent critic does not so much as know the title of the book he is criticising.] it is not difficult to praise any bad or mediocre picture that may be qualified with extravagance or mysticism. This author owes the public a heavy debt of explanation, which a lifetime spent in ingenious reconciliations would not suffice to discharge. A fervent admiration of certain pictures by Turner, and, at the same time, of some of the severest productions of Pre-Raphaelites, presents an insuperable problem to persons whose taste in art is regulated by definite principles.”¹

* Part II. sec. i. chap. vii. § 46. [Vol. III. p. 252.]

† Part II. sec. iv. chap. iv. § 23, and Part II. sec. i. chap. vii. § 9. [Vol. III. pp. 488, 175.] The whole of the Preface to the Second Edition is written to maintain this one point of specific detail against the advocates of generalization.

¹ [This passage comes from an article in the *Art Journal* for September 1854, pp. 253–256, entitled “The Progress of Painting, The Author of English (*sic*) Painters, and Pre-Raffaelism” (*sic*). The writer notices Ruskin’s Letters to the *Times* on The Pre-Raphaelites (Vol. XII. pp. 319–335), and finally concludes that those painters and Ruskin alike would speedily be forgotten.]

divine.” Then re-read the following paragraph (§ 10), carefully, and note its conclusion, that the thoroughly great men are those who have done everything thoroughly, and who have never despised anything, however small, of God’s making; with the instance given of Wordsworth’s daisy casting its shadow on a stone; and the following sentence, “Our painters must come to this before they have done their duty.” And yet, when our painters *did* come to this, did do their duty, and did paint the daisy with its shadow (this passage having been written years before Pre-Raphaelitism was thought of), people wondered how I could possibly like what was neither more or less than the precise fulfilment of my own most earnest exhortations and highest hopes.

§ 6. Thus far, then, all I have been saying is absolutely consistent, and tending to one simple end. Turner is praised for his truth and finish; that truth of which I am beginning to give examples. Pre-Raphaelitism is praised for its truth and finish; and the whole duty inculcated upon the artist is that of being in all respects as like Nature as possible.

And yet this is not all I have to do. There is more than this to be inculcated upon the student, more than this to be admitted or established, before the foundations of just judgment can be laid.

For, observe, although I believe any sensible person would exchange his pictures, however good, for windows, he would not feel, and ought not to feel, that the arrangement was *entirely* gainful to him. He would feel it was an exchange of a less good of one kind, for a greater of another kind, but that it was definitely *exchange*, not pure gain, not merely getting more truth instead of less. The picture would be a serious loss; something gone which the actual landscape could never restore, though it might give something better in its place, as age may give to the heart something better than its youthful delusion, but cannot give again the sweetness of that delusion.

§ 7. What is this in the picture which is precious to us, and yet is not natural? Hitherto our arguments have tended, on the whole, somewhat to the depreciation of art; and the reader may every now and then, so far as he has been convinced by them, have been inclined to say, “Why not give up this whole science of Mockery at once, since its only virtue is in representing facts, and it cannot, at best, represent them completely, besides being liable to all manner of shortcomings and dishonesties,—why not keep to the facts, to real fields, and hills and men, and let this dangerous painting alone?”

No, it would not be well to do this. Painting has its peculiar virtues, not only consistent with, but even resulting from, its shortcomings and weaknesses. Let us see what these virtues are.

§ 8. I must ask permission, as I have sometimes done before, to begin apparently a long way from the point.¹

Not long ago, as I was leaving one of the towns of Switzerland, early in the morning, I saw in the clouds behind the houses an Alp which I did not know, a grander Alp than any I knew, nobler than the Schreckhorn or the Mönch; terminated, as it seemed, on one side by a precipice of almost unimaginable height; on the other, sloping away for leagues in one field of lustrous ice, clear and fair and blue, flashing here and there into silver under the morning sun. For a moment I received a sensation of as much sublimity as any natural object could possibly excite; the next moment, I saw that my unknown Alp was the glass roof of one of the work-shops of the town rising above its nearer houses and rendered aerial and indistinct by some pure blue wood smoke which rose from intervening chimneys.

It is evident, that so far as the mere delight of the eye was concerned, the glass roof was here equal, or at least equal for a moment, to the Alp. Whether the power of the object over the heart was to be small or great, depended altogether upon what it was understood for, upon

¹ [As, for instance, at the beginning of this volume, p. 17.]

its being taken possession of and apprehended in its full nature, either as a granite mountain or a group of panes of glass; and thus, always, the real majesty of the appearance of the thing to us, depends upon the degree in which we ourselves possess the power of understanding it,—that penetrating, possession-taking power of the imagination, which has been long ago defined* as the very life of the man, considered as a *seeing* creature. For though the casement had indeed been an Alp, there are many persons on whose minds it would have produced no more effect than the glass roof. It would have been to them a glittering object of a certain apparent length and breadth, and whether of glass or ice, whether twenty feet in length, or twenty leagues, would have made no difference to them; or, rather, would not have been in any wise conceived or considered by them. Examine the nature of your own emotion (if you feel it) at the sight of the Alp, and you find all the brightness of that emotion hanging, like dew on gossamer, on a curious web of subtle fancy and imperfect knowledge. First, you have a vague idea of its size, coupled with wonder at the work of the great Builder of its walls and foundations, then an apprehension of its eternity, a pathetic sense of its perpetualness, and your own transientness, as of the grass upon its sides; then, and in this very sadness, a sense of strange companionship with past generations in seeing what they saw. They did not see the clouds that are floating over your head: nor the cottage wall on the other side of the field; nor the road by which you are travelling. But they saw *that*. The wall of granite in the heavens was the same to them as to you. They have ceased to look upon it; you will soon cease to look also, and the granite wall will be for others. Then, mingled with these more solemn imaginations, come the understandings of the gifts and glories of the Alps, the fancying forth of all the fountains that well from its rocky walls,

* Vol. ii. Chapter on Penetrative Imagination. [Vol. IV. p. 251.]

and strong rivers that are born out of its ice, and of all the pleasant valleys that wind between its cliffs, and all the châteaux that gleam among its clouds, and happy farmsteads couched upon its pastures; while together with the thoughts of these, rise strange sympathies with all the unknown of human life, and happiness, and death, signified by that narrow white flame of the everlasting snow, seen so far in the morning sky.

These images, and far more than these, lie at the root of the emotion which you feel at the sight of the Alp. You may not trace them in your heart, for there is a great deal more in your heart, of evil and good, than you ever can trace; but they stir you and quicken you for all that. Assuredly, so far as you feel more at beholding the snowy mountain than any other object of the same sweet silvery grey, these are the kind of images which cause you to do so; and, observe, these are nothing more than a greater apprehension of the *facts* of the thing. We call the power "Imagination," because it imagines or conceives; but it is only noble imagination if it imagines or conceives *the truth*. And, according to the degree of knowledge possessed, and of sensibility to the pathetic or impressive character of the things known, will be the degree of this imaginative delight.

§ 9. But the main point to be noted at present is, that if the imagination can be excited to this its peculiar work, it matters comparatively little what it is excited by. If the smoke had not cleared partially away, the glass roof might have pleased me as well as an Alp, until I had quite lost sight of it; and if, in a picture, the imagination can be once caught, and, without absolute affront from some glaring fallacy, set to work in its own field, the imperfection of the historical details themselves is, to the spectator's enjoyment, of small consequence.

Hence it is, that poets, and men of strong feeling in general, are apt to be among the very worst judges of painting. The slightest hint is enough for them. Tell them

that a white stroke means a ship, and a black stain, a thunderstorm, and they will be perfectly satisfied with both, and immediately proceed to remember all that they ever felt about ships and thunderstorms, attributing the whole current and fulness of their own feelings to the painter's work; while probably, if the picture be really good, and full of stern fact, the poet, or man of feeling, will find some of its fact *in his way*, out of the particular course of his own thoughts,—be offended at it, take to criticizing and wondering at it, detect, at last, some imperfection in it, such as must be inherent in all human work,—and so finally quarrel with, and reject the whole thing. Thus, Wordsworth writes many sonnets to Sir George Beaumont and Haydon; none to Sir Joshua or to Turner.

§ 10. Hence, also, the error into which many superficial artists fall, in speaking of “addressing the imagination” as the only end of art. It is quite true that the imagination must be addressed; but it may be very sufficiently addressed by the stain left by an ink-bottle thrown at the wall. The thrower has little credit, though an imaginative observer may find, perhaps, more to amuse him in the erratic nigrescence than in many a laboured picture. And thus, in a slovenly or ill-finished picture, it is no credit to the artist that he has “addressed the imagination;” nor is the success of such an appeal any criterion whatever of the merit of the work. The duty of an artist is not only to address and awaken, but to *guide* the imagination; and there is no safe guidance but that of simple concurrence with fact. It is no matter that the picture takes the fancy of A. or B., that C. writes sonnets to it, and D. feels it to be divine. This is still the only question for the artist, or for us:—“Is it a fact? Are things really so?” Is the picture an Alp among pictures, full, firm, eternal; or only a glass house, frail, hollow, contemptible, demolishable; calling, at all honest hands, for detection and demolition?

§ 11. Hence it is also that so much grievous difficulty stands in the way of obtaining *real opinion* about pictures

at all. Tell any man, of the slightest imaginative power, that such and such a picture is good, and means this or that: tell him, for instance, that a Claude is good, and that it means trees, and grass, and water; and forthwith, whatever faith, virtue, humility, and imagination there are in the man, rise up to help Claude, and to declare that indeed it is all “excellent good, i’faith;”¹ and whatever in the course of his life he has felt of pleasure in trees and grass, he will begin to reflect upon and enjoy anew, supposing all the while it is the picture he is enjoying. Hence, when once a painter’s reputation is accredited, it must be a stubborn kind of person indeed whom he will not please, or seem to please; for all the vain and weak people pretend to be pleased with him, for their own credit’s sake, and all the humble and imaginative people seriously and honestly fancy they *are* pleased with him, deriving indeed, very certainly, delight from his work, but a delight which, if they were kept in the same temper, they would equally derive (and, indeed, constantly do derive) from the grossest daub that can be manufactured in imitation by the pawnbroker. Is, therefore, the pawnbroker’s imitation as good as the original? Not so. There is the certain test of goodness and badness, which I am always striving to get people to use. As long as they are satisfied if they find their feelings pleasantly stirred and their fancy gaily occupied, so long there is for them no good, no bad. Anything may please, or anything displease, them; and their entire manner of thought and talking about art is mockery, and all their judgments are laborious injustices. But let them, in the teeth of their pleasure or displeasure, simply put the calm question,—Is it so? Is that the way a stone is shaped, the way a cloud is wreathed, the way a leaf is veined? and they are safe. They will do no more injustice to themselves nor to other men; they will learn to whose guidance they may trust their imagination, and from whom they must for ever withhold its reins.

¹ [*Twelfth Night*, ii. 3.]

§ 12. “Well, but why have you dragged in this poor spectator’s imagination at all, if you have nothing more to say for it than this; if you are merely going to abuse it, and go back to your tiresome facts?”

Nay; I am not going to abuse it. On the contrary, I have to assert, in a temper profoundly venerant of it, that though we must not suppose everything is right when this is aroused, we may be sure that something is wrong when this is *not* aroused. The something wrong may be in the spectator or in the picture; and if the picture be demonstrably in accordance with truth, the odds are, that it is in the spectator; but there is wrong somewhere; for the work of the picture is indeed eminently to get at this imaginative power in the beholder, and all its facts are of no use whatever if it does not. No matter how much truth it tells if the hearer be asleep. Its first work is to wake him, then to teach him.

§ 13. Now, observe, while, as it penetrates into the nature of things, the imagination is pre-eminently a beholder of things, *as they are*, it is, in its creative function, an eminent beholder of things *when* and *where* they are NOT; a seer, that is, in the prophetic sense, calling “the things that are not as though they were,”¹ and for ever delighting to dwell on that which is not tangibly present. And its great function being the calling forth, or back, that which is not visible to bodily sense, it has of course been made to take delight in the fulfilment of its proper function, and pre-eminently to enjoy, and spend its energy on, things past and future, or out of sight, rather than things present, or in sight. So that if the imagination is to be called to take delight in any object, it will not be always well, if we can help it, to put the *real* object there, before it. The imagination would on the whole rather have it *not* there;—the reality and substance are rather in the imagination’s way; it would think a good deal more of the

¹ [See 1 Corinthians i. 28, and Revelation i. 19.]

thing if it could not see it. Hence, that strange and sometimes fatal charm, which there is in all things as long as we wait for them, and the moment we have lost them; but which fades while we possess them;—that sweet bloom of all that is far away, which perishes under our touch. Yet the feeling of this is not a weakness; it is one of the most glorious gifts of the human mind, making the whole infinite future, and imperishable past, a richer inheritance, if faithfully inherited, than the changeful, frail, fleeting present: it is also one of the many witnesses in us to the truth that these present and tangible things are not meant to satisfy us. The instinct becomes a weakness only when it is weakly indulged, and when the faculty which was intended by God to give back to us what we have lost, and gild for us what is to come, is so perverted as only to darken what we possess. But, perverted or pure, the instinct itself is everlasting, and the substantial presence even of the things which we love the best, will inevitably and for ever be found wanting in *one* strange and tender charm, which belonged to the dreams of them.

§ 14. Another character of the imagination is equally constant, and, to our present inquiry, of yet greater importance. It is eminently a *wearable* faculty, eminently delicate, and incapable of bearing fatigue;¹ so that if we give it too many objects at a time to employ itself upon, or very grand ones for a long time together, it fails under the effort, becomes jaded, exactly as the limbs do by bodily fatigue, and incapable of answering any farther appeal till it has had rest. And this is the real nature of the weariness which is so often felt in travelling, from seeing too much. It is not that the monotony and number of the beautiful things seen have made them valueless, but that the imaginative power has been overtaxed; and, instead of letting it rest, the traveller, wondering to find himself dull,

¹ [Compare *Notes on the Turner Gallery*, No. 505, where Ruskin refers to this passage in connexion with a certain overfullness in some of Turner's pictures.]

and incapable of admiration, seeks for something more admirable, excites and torments, and drags the poor fainting imagination up by the shoulders: "Look at this, and look at that, and this more wonderful still!"—until the imaginative faculty faints utterly away, beyond all further torment, or pleasure, dead for many a day to come; and the despairing prodigal takes to horse-racing in the Campagna, good now for nothing else than that; whereas, if the imagination had only been laid down on the grass, among simple things, and left quiet for a little while, it would have come to itself gradually, recovered its strength and colour, and soon been fit for work again. So that, whenever the imagination is tired, it is necessary to find for it something, not *more* admirable but *less* admirable; such as in that weak state it can deal with; then give it peace, and it will recover.

§ 15. I well recollect the walk on which I first found out this; it was on the winding road from Sallenches, sloping up the hills towards St. Gervais, one cloudless Sunday afternoon.¹ The road circles softly between bits of rocky bank and mounded pasture; little cottages and chapels gleaming out from among the trees at every turn. Behind me, some leagues in length, rose the jagged range of the mountains of the Réposoir; on the other side of the valley, the mass of the Aiguille de Varens, heaving its seven thousand feet of cliff into the air at a single effort, its gentle gift of waterfall, the Nant d'Arpenaz, like a pillar of cloud at its feet; Mont Blanc and all its aiguilles, one silver flame, in front of me; marvellous blocks of mossy granite and dark glades of pine around me; but I could enjoy nothing, and could not for a long while make out what was the matter with me, until at last I discovered that if I confined myself to one thing,—and that a little thing,—a tuft of moss or a single crag at the top of the Varens, or a wreath or two of foam at the bottom of the Nant d'Arpenaz, I began to enjoy it directly, because then I had mind enough

¹ [It was in June 1849; see the passage from Ruskin's diary given above, in the Introduction, pp. xix.–xx.]

to put into the thing, and the enjoyment arose from the quantity of the imaginative energy I could bring to bear upon it; but when I looked at or thought of all together, moss, stones, Varens, Nant d'Arpenaz, and Mont Blanc, I had not mind enough to give to all, and none were of any value. The conclusion which would have been formed, upon this, by a German philosopher, would have been that the Mont Blanc *was* of no value; that he and his imagination only were of value; that the Mont Blanc, in fact, except so far as he was able to look at it, could not be considered as having any existence.¹ But the only conclusion which occurred to me as reasonable under the circumstances (I have seen no ground for altering it since) was, that I was an exceedingly small creature, much tired, and, at the moment, not a little stupid; for whom a blade of grass, or a wreath of foam, was quite food enough and to spare, and that if I tried to take any more, I should make myself ill. Whereupon, associating myself fraternally with some ants, who were deeply interested in the conveyance of some small sticks over the road, and rather, as I think they generally are, in too great a hurry about it, I returned home in a little while with great contentment; thinking how well it was ordered that, as Mont Blanc and his pine forests could not be everywhere, nor all the world come to see them, the human mind, on the whole, should enjoy itself most surely, in an ant-like manner, and be happy and busy with the bits of sticks and grains of crystal that fall in its way to be handled, in daily duty.

§ 16. It follows evidently from the first of these characters of the imagination, its dislike of substance and presence, that a picture has in some measure even an advantage with us in not being real. The imagination rejoices in having something to do, springs up with all its willing power, flattered and happy; and ready with its fairest colours and most tender pencilling, to prove itself worthy

¹ [See below, ch. xii. § 1, pp. 201–202.]

of the trust, and exalt into sweet supremacy the shadow that has been confided to its fondness. And thus, so far from its being at all an object to the painter to make his work look real, he ought to dread such a consummation as the loss of one of its most precious claims upon the heart. So far from striving to convince the beholder that what he sees is substance, his mind should be to what he paints as the fire to the body on the pile, burning away the ashes, leaving the unconquerable shade—an immortal dream. So certain is this, that the slightest local success in giving the deceptive appearance of reality—the imitation, for instance, of the texture of a bit of wood, with its grain in relief—will instantly destroy the charm of a whole picture; the imagination feels itself insulted and injured, and passes by with cold contempt; nay, however beautiful the whole scene may be, as of late in much of our highly wrought painting for the stage, the mere fact of its being deceptively real is enough to make us tire of it; we may be surprised and pleased for a moment, but the imagination will not on those terms be persuaded to give any of its help, and, in a quarter of an hour we wish the scene would change.

§ 17. “Well, but then, what becomes of all these long dogmatic chapters of yours about giving nothing but the truth, and as much truth as possible?”

The chapters are all quite right. “Nothing but the Truth,” I say still. “As much Truth as possible,” I say still. But truth so presented that it will need the help of the imagination to make it real.¹ Between the painter and the beholder, each doing his proper part, the reality should be sustained; and after the beholding imagination has come forward and done its best, then, with its help and in the full action of it, the beholder should be able to say, I feel as if I were at the real place, or seeing the real incident. But not without that help.

§ 18. Farther, in consequence of that other character of

¹ [In his copy for revision, Ruskin writes here in the margin—“I go beyond this now and say perfect reality.” See, for instance, *Aratra Pentelici*, §§ 10, 122.]

the imagination, fatigableness, it is a great advantage to the picture that it need not present too much at once, and that what it does present may be so chosen and ordered as not only to be more easily seized, but to give the imagination rest, and, as it were, places to lie down and stretch its limbs in; kindly vacancies, beguiling it back into action, with pleasant and cautious sequence of incident; all jarring thoughts being excluded, all vain redundance denied, and all just and sweet transition permitted.

And thus it is, that, for the most part, imperfect sketches, engravings, outlines, rude sculptures, and other forms of abstraction, possess a charm which the most finished picture frequently wants. For not only does the finished picture excite the imagination less, but, like nature itself, it *taxes* it more. None of it can be enjoyed till the imagination is brought to bear upon it; and the details of the completed picture are so numerous, that it needs greater strength and willingness in the beholder to follow them all out; the redundance, perhaps, being not too great for the mind of a careful observer, but too great for a casual or careless observer. So that, although the perfection of art will always consist in the utmost *acceptable* completion, yet, as every added idea will increase the difficulty of apprehension, and every added touch advance the dangerous realism which makes the imagination languid, the difference between a noble and ignoble painter is in nothing more sharply defined than in this,—that he first wishes to put into his work as much truth as possible, and yet to keep it looking *un-real*; the second wishes to get through his work lazily, with as little truth as possible, and yet to make it look real; and, so far as they add colour to their abstract sketch, the first realizes for the sake of the colour, and the second colours for the sake of the realization.*

§ 19. And then, lastly, it is another infinite advantage

* Several other points connected with this subject have already been noticed in *Stones of Venice*, vol. iii. chap. iv. § 21, etc. [Vol. XI. p. 214.]

possessed by the picture, that in these various differences from reality it becomes the expression of the power and intelligence of a companionable human soul. In all this choice, arrangement, penetrative sight, and kindly guidance, we recognize a supernatural operation, and perceive, not merely the landscape or incident as in a mirror; but, besides, the presence of what, after all, may perhaps be the most wonderful piece of divine work in the whole matter—the great human spirit through which it is manifested to us. So that, although with respect to many important scenes, it might, as we saw above, be one of the most precious gifts that could be given us to see them with *our own eyes*, yet also in many things it is more desirable to be permitted to see them with the eyes of others; and although, to the small, conceited, and affected painter displaying his narrow knowledge and tiny dexterities, our only word may be, “Stand aside from between that nature and me:” yet to the great imaginative painter—greater a million times in every faculty of soul than we—our word may wisely be, “Come between this nature and me—this nature which is too great and too wonderful for me; temper it for me, interpret it to me; let me see with your eyes, and hear with your ears, and have help and strength from your great spirit.”

All the noblest pictures have this character. They are true or inspired ideals, seen in a moment to *be* ideal; that is to say, the result of all the highest powers of the imagination, engaged in the discovery and apprehension of the purest truths, and having so arranged them as best to show their preciousness and exalt their clearness. They are always orderly, always one, ruled by one great purpose throughout, in the fulfilment of which every atom of the detail is called to help, and would be missed if removed; this peculiar oneness being the result, not of obedience to any teachable law, but of the magnificence of tone in the perfect mind, which accepts only what is good for its great purposes, rejects whatever is foreign or redundant, and

instinctively and instantaneously ranges whatever it accepts, in sublime subordination and helpful brotherhood.

§ 20. Then, this being the greatest art, the lowest art is the mimicry of it,—the subordination of nothing to nothing; the elaborate arrangement of sightlessness and emptiness: the order which has no object; the unity which has no life, and the law which has no love; the light which has nothing to illumine, and shadow which has nothing to relieve.*

§ 21. And then, between these two, comes the wholesome, happy, and noble—though not noblest—art of simple transcript from nature; into which, so far as our modern Pre-Raphaelitism falls, it will indeed do sacred service in ridding us of the old fallacies and componencies, but cannot itself rise above the level of simple and happy usefulness. So far as it is to be great, it must add,—and so far as it *is* great, has already added,—the great imaginative element to all its faithfulness in transcript. And for this reason, I said in the close of my Edinburgh Lectures,¹ that Pre-Raphaelitism, as long as it confined itself to the simple copying of nature, could not take the character of the highest class of art. But it has already, almost unconsciously, supplied the defect, and taken that character, in all its best results; and, so far as it ought, hereafter, it will assuredly do so, as soon as it is permitted to maintain itself in any other position than that of stern antagonism to the composition-teachers around it. I say “so far as it

* “Though my pictures should have nothing else, they shall have Chiaroscuro.”—CONSTABLE (in Leslie’s *Life* of him²). It is singular to reflect what that fatal Chiaroscuro has done to art, in the full extent of its influence. It has been not only shadow, but shadow of Death; passing over the face of the ancient art, as death itself might over a fair human countenance; whispering, as it reduced it to the white projections and lightless orbits of the skull, “Thy face shall have nothing else, but it shall have Chiaroscuro.”

¹ [See Vol. XII. p. 161, § 138, of the *Lectures on Architecture and Painting*.]

² [The saying occurs (slightly otherwise worded) at p. 226 of the 2nd (1845) ed. of Leslie’s *Life*. It is again quoted by Ruskin in *Academy Notes*, 1859 (*s.* “French Exhibition,” *ad fin.*), where he adds, “The sacrifice was accepted by the Fates, but the prayer denied. His pictures *had* nothing else; but they had *not* chiaroscuro.” For a note on other references to Constable, see Vol. III. p. 45.]

ought,” because, as already noticed in that same place, we have enough, and to spare, of noble *inventful* pictures: so many have we, that we let them moulder away on the walls and roofs of Italy without one regretful thought about them. But of simple transcripts from nature, till now we have had none; even Van Eyck and Albert Dürer having been strongly filled with the spirit of grotesque idealism; so that the Pre-Raphaelites have, to the letter, fulfilled Steele’s description of the author, who “determined to write in an entirely new manner, and describe things exactly as they took place.”¹

§ 22. We have now, I believe, in some sort answered most of the questions which were suggested to us during our statement of the nature of great art. I could recapitulate the answers; but perhaps the reader is already sufficiently wearied of the recurrence of the terms “Ideal,” “Nature,” “Imagination,” “Invention,” and will hardly care to see them again interchanged among each other, in the formalities of a summary. What difficulties may yet occur to him, will, I think, disappear as he either re-reads the passages which suggested them, or follows out the consideration of the subject for himself:—this very simple, but very precious conclusion being continually remembered by him as the sum of all; that greatness in art (as assuredly in all other things, but more distinctly in this than in most of them) is not a teachable² nor gainable thing, but *the expression of a mind of a God-made great man*; that teach, or preach, or labour as you will, everlasting difference is set between one man’s capacity and another’s;³ and that this God-given supremacy is the priceless thing, always just as rare in the world at one time as another. What you can manufacture or communicate, you can lower the price of, but this mental supremacy is incommunicable; you will never multiply its quantity, nor lower its price; and nearly

¹ [See No. 9 of *The Tatler*.]

² [Compare Vol. XII. p. 352.]

³ [Compare Vol. VIII. p. 167.]

the best thing that men can generally do is to set themselves, not to the attainment, but the discovery of this; learning to know gold, when we see it, from iron-glance, and diamonds from flint-sand, being for most of us a more profitable employment than trying to make diamonds out of our own charcoal. And for this God-made supremacy, I generally have used, and shall continue to use, the word Inspiration, not carelessly nor lightly, but in all logical calmness and perfect reverence. We English have many false ideas about reverence; we should be shocked, for instance, to see a market-woman come into church with a basket of eggs on her arm: we think it more reverent to lock her out till Sunday; and to surround the church with respectability of iron railings, and defend it with pacing inhabitation of beadles. I believe this to be *irreverence*; and that it is more truly reverent, when the market-woman, hot and hurried, at six in the morning, her head much confused with calculations of the probable price of eggs, can nevertheless get within church porch, and church aisle, and church chancel, lay the basket down on the very steps of the altar, and receive thereat so much of help and hope as may serve her for the day's work. In like manner we are solemnly, but I think not wisely, shocked at any one who comes hurriedly into church, in any figurative way, with his basket on his arm; and perhaps so long as we feel it so, it is better to keep the basket out. But, as for this one commodity of high mental supremacy, it cannot be kept out, for the very fountain of it is in the church wall, and there is no other right word for it but this of Inspiration; a word, indeed, often ridiculously perverted, and irreverently used of fledgling poets and pompous orators—no one being offended then: and yet cavilled at when quietly used of the spirit that is in a truly great man; cavilled at, chiefly, it seems to me, because we expect to know inspiration by the look of it. Let a man have shaggy hair, dark eyes, a rolling voice, plenty of animal energy, and a facility of rhyming

or sentencing, and—improvisatore or sentimentalist—we call him “inspired” willingly enough; but let him be a rough, quiet worker, not proclaiming himself melodiously in anywise, but familiar with us, unpretending, and letting all his littleness and feebleness be seen, unhindered,—wearing an ill-cut coat withal; and, though he be such a man as is only sent upon the earth once in five hundred years, for some special human teaching, it is irreverent to call him “inspired.” But, be it irreverent or not, this word I must always use; and the rest of what work I have here before me, is simply to prove the truth of it, with respect to the one among these mighty spirits whom we have just lost; who divided his hearers, as many an inspired speaker has done before now, into two great sects—a large and a narrow; these searching the Nature-scripture calmly, “whether those things were so,” and those standing haughtily on their Mars’ hill, asking, “What will this babbler say?”¹

¹ [Acts xvii. 11, 18.]

CHAPTER XI
OF THE NOVELTY OF LANDSCAPE

§ 1. HAVING now obtained, I trust, clear ideas, up to a certain point, of what is generally right and wrong in all art, both in conception and in workmanship, we have to apply these laws of right to the particular branch of art which is the subject of our present inquiry, namely, landscape-painting. Respecting which, after the various meditations into which we have been led on the high duties and ideals of art, it may not improbably occur to us first to ask,—whether it be worth inquiring about at all.

That question, perhaps the reader thinks, should have been asked and answered before I had written, or he read, two volumes and a half about it. So I *had* answered it in my own mind; but it seems time now to give the grounds for this answer. If, indeed, the reader has never suspected that landscape-painting was anything but good, right, and healthy work, I should be sorry to put any doubt of its being so into his mind; but if, as seems to me more likely, he, living in this busy and perhaps somewhat calamitous age, has some suspicion that landscape-painting is but an idle and empty business, not worth all our long talk about it, then, perhaps, he will be pleased to have such suspicion done away, before troubling himself farther with these disquisitions.

§ 2. I should rather be glad, than otherwise, that he *had* formed some suspicion on this matter. If he has at all admitted the truth of anything hitherto said respecting great art, and its choices of subject, it seems to me he ought, by this time, to be questioning with himself whether road-side weeds, old cottages, broken stones, and such other

materials, be worthy matters for grave men to busy themselves in the imitation of. And I should like him to probe this doubt to the deep of it, and bring all his misgivings out to the broad light, that we may see how we are to deal with them, or ascertain if indeed they are too well-founded to be dealt with.

§ 3. And to this end I would ask him now to imagine himself entering, for the first time in his life, the room of the Old Water-Colour Society:¹ and to suppose that he has entered it, not for the sake of a quiet examination of the paintings one by one, but in order to seize such ideas as it may generally suggest respecting the state and meaning of modern, as compared with elder, art. I suppose him, of course, that he may be capable of such a comparison, to be in some degree familiar with the different forms in which art has developed itself within the periods historically known to us; but never, till that moment, to have seen any completely modern work. So prepared, and so unprepared, he would, as his ideas began to arrange themselves, be first struck by the number of paintings representing blue mountains, clear lakes, and ruined castles or cathedrals, and he would say to himself: "There is something strange in the mind of these modern people! Nobody ever cared about blue mountains before, or tried to paint the broken stones of old walls." And the more he considered the subject, the more he would feel the peculiarity; and, as he thought over the art of Greeks and Romans, he would still repeat, with increasing certainty of conviction: "Mountains! I remember none. The Greeks did not seem, as artists, to know that such things were in the world. They carved, or variously represented, men, and horses, and beasts, and birds, and all kinds of living creatures,—yes, even down to cuttle-fish; and trees, in a sort of way; but not so much as the outline of a mountain; and as for lakes, they merely showed they knew the difference between salt and fresh

¹ [A favourite haunt of Ruskin's: see *Notes on Prout and Hunt*, Preface, § 28.]
v. N

water by the fish they put into each.” Then he would pass on to mediæval art; and still he would be obliged to repeat: “Mountains! I remember none. Some careless and jagged arrangements of blue spires or spikes on the horizon, and, here and there, an attempt at representing an overhanging rock with a hole through it; but merely in order to divide the light behind some human figure. Lakes! No, nothing of the kind,—only blue bays of sea put in to fill up the background when the painter could not think of anything else. Broken-down buildings! No; for the most part very complete and well-appointed buildings, if any; and never buildings at all, but to give place or explanation to some circumstance of human conduct.” And then he would look up again to the modern pictures, observing, with an increasing astonishment, that here the human interest had, in many cases, altogether disappeared.¹ That mountains, instead of being used only as a blue ground for the relief of the heads of saints, were themselves the exclusive subjects of reverent contemplation; that their ravines, and peaks, and forests, were all painted with an appearance of as much enthusiasm as had formerly been devoted to the dimples of beauty, or the frowns of asceticism; and that all the living interest which was still supposed necessary to the scene, might be supplied by a traveller in a slouched hat, a beggar in a scarlet cloak, or, in default of these, even by a heron or a wild duck.

§ 4. And if he could entirely divest himself of his own modern habits of thought, and regard the subjects in question with the feelings of a knight or monk of the Middle Ages, it might be a question whether those feelings would not rapidly verge towards contempt. “What!” he might perhaps mutter to himself, “here are human beings spending the whole of their lives in making pictures of bits of stone and runlets of water, withered sticks and flying

¹ [Compare the briefer account of the rise of landscape art in *Lectures on Architecture and Painting*, §§ 84 *seq.*, Vol. XII. pp. 109–123.]

fogs, and actually not a picture of the gods or the heroes! none of the saints or the martyrs! none of the angels and demons! none of councils or battles, or any other single thing worth the thought of a man! Trees and clouds indeed! as if I should not see as many trees as I cared to see, and more, in the first half of my day's journey tomorrow, or as if it mattered to any man whether the sky were clear or cloudy, so long as his armour did not get too hot in the sun!"

§ 5. There can be no question that this would have been somewhat the tone of thought with which either a Lacedæmonian, a soldier of Rome in her strength, or a knight of the thirteenth century, would have been apt to regard these particular forms of our present art. Nor can there be any question that, in many respects, their judgment would have been just. It is true that the indignation of the Spartan or Roman would have been equally excited against any appearance of luxurious industry; but the mediæval knight would, to the full, have admitted the nobleness of art; only he would have had it employed in decorating his church or his prayer-book, not in imitating moors and clouds. And the feelings of all the three would have agreed in this,—that their main ground of offence must have been the want of *seriousness* and *purpose* in what they saw. They would all have admitted the nobleness of whatever conduced to the honour of the gods, or the power of the nation; but they would not have understood how the skill of human life could be wisely spent in that which did no honour either to Jupiter or to the Virgin; and which in no wise tended, apparently, either to the accumulation of wealth, the excitement of patriotism, or the advancement of morality.

§ 6. And exactly so far forth their judgment would be just, as the landscape-painting could indeed be shown, for others as well as for them, to be art of this nugatory kind; and so far forth unjust, as that painting could be shown to depend upon, or cultivate, certain sensibilities which neither the Greek nor mediæval knight possessed, and which

have resulted from some extraordinary change in human nature since their time. We have no right to assume, without very accurate examination of it, that this change has been an ennobling one. The simple fact, that we are, in some strange way, different from all the great races that have existed before us, cannot at once be received as the proof of our own greatness; nor can it be granted, without any question, that we have a legitimate subject of complacency in being under the influence of feelings, with which neither Miltiades nor the Black Prince, neither Homer nor Dante, neither Socrates nor St. Francis, could for an instant have sympathized.

§ 7. Whether, however, this fact be one to excite our pride or not, it is assuredly one to excite our deepest interest. The fact itself is certain. For nearly six thousand years the energies of man have pursued certain beaten paths, manifesting some constancy of feeling throughout all that period, and involving some fellowship at heart, among the various nations who by turns succeeded or surpassed each other in the several aims of art or policy. So that, for these thousands of years, the whole human race might be to some extent described in general terms. Man was a creature separated from all others by his instinctive sense of an Existence superior to his own, invariably manifesting this sense of the being of a God more strongly in proportion to his own perfectness of mind and body; and making enormous and self-denying efforts, in order to obtain some persuasion of the immediate presence or approval of the Divinity. So that, on the whole, the best things he did were done as in the presence, or for the honour, of his gods; and, whether in statues, to help him to imagine them, or temples raised to their honour, or acts of self-sacrifice done in the hope of their love, he brought whatever was best and skilfullest in him into their service, and lived in a perpetual subjection to their unseen power. Also, he was always anxious to know something definite about them; and his chief books, songs, and pictures were filled

with legends about them, or specially devoted to illustration of their lives and nature.

§ 8. Next to these gods he was always anxious to know something about his human ancestors; fond of exalting the memory, and telling or painting the history of old rulers and benefactors; yet full of an enthusiastic confidence in himself, as having in many ways advanced beyond the best efforts of past time; and eager to record his own doings for future fame. He was a creature eminently warlike, placing his principal pride in dominion; eminently beautiful, and having great delight in his own beauty; setting forth this beauty by every species of invention in dress, and rendering his arms and accoutrements superbly decorative of his form. He took, however, very little interest in anything but what belonged to humanity; caring in no wise for the external world, except as it influenced his own destiny; honouring the lightning because it could strike him, the sea because it could drown him, the fountains because they gave him drink, and the grass because it yielded him seed; but utterly incapable of feeling any special happiness in the love of such things, or any earnest emotion about them, considered as separate from man; therefore giving no time to the study of them;—knowing little of herbs, except only which were hurtful and which healing; of stones, only which would glitter brightest in a crown, or last the longest in a wall: of the wild beasts, which were best for food, and which the stoutest quarry for the hunter;—thus spending only on the lower creatures and inanimate things his waste energy, his dullest thoughts, his most languid emotions, and reserving all his acuter intellect for researches into his own nature and that of the gods; all his strength of will for the acquirement of political or moral power; all his sense of beauty for things immediately connected with his own person and life; and all his deep affections for domestic or divine companionship.

Such, in broad light and brief terms, was man for five thousand years. Such he is no longer. Let us consider

what he is now, comparing the descriptions clause by clause.

§ 9. I. He *was* invariably sensible of the existence of gods, and went about all his speculations or works holding this as an acknowledged fact, making his best efforts in their service. *Now* he is capable of going through life with hardly any positive idea on this subject,—doubting, fearing, suspecting, analyzing,—doing everything, in fact, *but* believing; hardly ever getting quite up to that point which hitherto was wont to be the starting-point for all generations. And human work has accordingly hardly any reference to spiritual beings, but is done either from a patriotic or personal interest,—either to benefit mankind, or reach some selfish end, not (I speak of human work in the broad sense) to please the gods.¹

II. He *was* a beautiful creature, setting forth this beauty by all means in his power, and depending upon it for much of his authority over his fellows. So that the ruddy cheek of David, and the ivory skin of Atrides, and the towering presence of Saul, and the blue eyes of Cœur de Lion, were among chief reasons why they should be kings; and it was one of the aims of all education, and of all dress, to make the presence of the human form stately and lovely. *Now* it has become the task of grave philosophy partly to depreciate or conceal this bodily beauty; and even by those who esteem it in their hearts, it is not made one of the great ends of education; man has become, upon the whole, an ugly animal, and is not ashamed of his ugliness.

III. He *was* eminently warlike. He is *now* gradually becoming more and more ashamed of all the arts and aims of battle. So that the desire of dominion, which was once frankly confessed or boasted of as a heroic passion, is now sternly reprobated or cunningly disclaimed.

IV. He *used* to take no interest in anything but what immediately concerned himself. *Now*, he has deep interest

¹ [Here, again, compare *Lectures on Architecture and Painting*, §§ 113 *seq.*, Vol. XII. pp. 138–145.]

in the abstract nature of things, inquires as eagerly into the laws which regulate the economy of the material world, as into those of his own being, and manifests a passionate admiration of inanimate objects, closely resembling, in its elevation and tenderness, the affection which he bears to those living souls with which he is brought into the nearest fellowship.

§ 10. It is this last change only which is to be the subject of our present inquiry; but it cannot be doubted that it is closely connected with all the others, and that we can only thoroughly understand its nature by considering it in this connection. For, regarded by itself, we might, perhaps, too rashly assume it to be a natural consequence of the progress of the race. There appears to be a diminution of selfishness in it, and a more extended and heartfelt desire of understanding the manner of God's working; and this the more, because one of the permanent characters of this change is a greater accuracy in the statement of external facts. When the eyes of men were fixed first upon themselves, and upon nature solely and secondarily as bearing upon their interests, it was of less consequence to them what the ultimate laws of nature were, than what their immediate effects were upon human beings. Hence they could rest satisfied with phenomena instead of principles, and accepted without scrutiny every fable which seemed sufficiently or gracefully to account for those phenomena. But so far as the eyes of men are now withdrawn from themselves, and turned upon the inanimate things about them, the results cease to be of importance, and the laws become essential.

§ 11. In these respects, it might easily appear to us that this change was assuredly one of steady and natural advance. But when we contemplate the others above noted, of which it is clearly one of the branches or consequences, we may suspect ourselves of over-rashness in our self-congratulation, and admit the necessity of a scrupulous analysis both of the feeling itself and of its tendencies.

Of course a complete analysis, or anything like it, would

involve a treatise on the whole history of the world. I shall merely endeavour to note some of the leading and more interesting circumstances bearing on the subject, and to show sufficient practical ground for the conclusion, that landscape-painting is indeed a noble and useful art, though one not long known by man. I shall therefore examine, as best I can, the effect of landscape, 1st, on the Classical mind; 2ndly, on the Mediæval mind; and lastly, on the Modern mind. But there is one point of some interest respecting the effect of it on *any* mind, which must be settled first; and this I will endeavour to do in the next chapter.

CHAPTER XII

OF THE PATHETIC FALLACY

§ 1. GERMAN dulness, and English affectation, have of late much multiplied among us the use of two of the most objectionable words that were ever coined by the trouble-someness of metaphysicians,—namely, “Objective,” and “Subjective.”¹

No words can be more exquisitely, and in all points, useless; and I merely speak of them that I may, at once and for ever, get them out of my way, and out of my reader’s. But to get that done, they must be explained.

The word “Blue,” say certain philosophers, means the sensation of colour which the human eye receives in looking at the open sky, or at a bell gentian.

Now, say they farther, as this sensation can only be felt when the eye is turned to the object, and as, therefore, no such sensation is produced by the object when nobody looks at it, therefore the thing, when it is not looked at, is not blue; and thus (say they) there are many qualities of things which depend as much on something else as on themselves. To be sweet, a thing must have a taster; it is only sweet while it is being tasted, and if the tongue had not the capacity of taste, then the sugar would not have the quality of sweetness.

And then they agree that the qualities of things which thus depend upon our perception of them, and upon our

¹ [The words in the modern philosophical sense were “re-introduced” by Coleridge (*Biographia Literaria*, 1817, ch. x.); De Quincey, writing in the same year as Ruskin here (1856), remarks, in using the word “objective,” that “this term, so nearly unintelligible in 1821, so intensely scholastic, and, consequently, when surrounded by familiar and vernacular words, so apparently pedantic, yet, on the other hand, so indispensable to accurate thinking, and to wide thinking, has since 1821 become too common to need any apology” (*Confessions of an Opium Eater*).]

human nature as affected by them, shall be called Subjective; and the qualities of things which they always have, irrespective of any other nature, as roundness or squareness, shall be called Objective.

From these ingenious views the step is very easy to a farther opinion, that it does not much matter what things are in themselves, but only what they are to us; and that the only real truth of them is their appearance to, or effect upon, us. From which position, with a hearty desire for mystification, and much egotism, selfishness, shallowness, and impertinence, a philosopher may easily go so far as to believe, and say, that everything in the world depends upon his seeing or thinking of it, and that nothing, therefore, exists, but what he sees or thinks of.¹

§ 2. Now, to get rid of all these ambiguities and troublesome words at once, be it observed that the word “Blue” does *not* mean the *sensation* caused by a gentian on the human eye; but it means the *power* of producing that sensation: and this power is always there, in the thing, whether we are there to experience it or not, and would remain there though there were not left a man on the face of the earth. Precisely in the same way gunpowder has a power of exploding. It will not explode if you put no match to it. But it has always the power of so exploding, and is therefore called an explosive compound, which it very positively and assuredly is, whatever philosophy may say to the contrary.

In like manner, a gentian does not produce the sensation of blueness, if you don't look at it. But it has always the power of doing so; its particles being everlastingly so arranged by its Maker. And, therefore, the gentian and the sky are always verily blue, whatever philosophy may say to the contrary; and if you do not see them blue when you look at them, it is not their fault, but yours.*

* It is quite true, that in all qualities involving sensation, there may be a doubt whether different people receive the same sensation from the same

¹ [Compare p. 184, above.]

§ 3. Hence I would say to these philosophers: If, instead of using the sonorous phrase, "It is objectively so," you will use the plain old phrase, "It *is* so," and if instead of the sonorous phrase, "It is subjectively so," you will say, in plain old English, "It does so," or "It seems so to me," you will, on the whole, be more intelligible to your fellow-creatures; and besides, if you find that a thing which generally "does so" to other people (as a gentian looks blue to most men), does *not* so to you, on any particular occasion, you will not fall into the impertinence of saying, that the thing is not so, or did not so, but you will say simply (what you will be all the better for speedily finding out), that something is the matter with you. If you find that you cannot explode the gunpowder, you will not declare that all gunpowder is subjective, and all explosion imaginary, but you will simply suspect and declare yourself to be an ill-made match. Which, on the whole, though there may be a distant chance of a mistake about it, is, nevertheless, the wisest conclusion you can come to until further experiment.*

thing (compare Part II. sect. i. ch. v. § 6¹); but, though this makes such facts not distinctly explicable, it does not alter the facts themselves. I derive a certain sensation, which I call sweetness, from sugar. That is a fact. Another person feels a sensation, which *he* also calls sweetness, from sugar. That is also a fact. The sugar's power to produce these two sensations, which we suppose to be, and which are, in all probability, very nearly the same in both of us, and, on the whole, in the human race, is its sweetness.

* In fact (for I may as well, for once, meet our German friends in their own style), all that has been objected to us on the subject seems subject to this great objection; that the subjection of all things (subject to no exceptions) to senses which are, in us, both subject and object, and objects of perpetual contempt, cannot but make it our ultimate object to subject *ourselves* to the senses, and to remove whatever objections existed to such subjection. So that, finally, that which is the subject of examination or object of attention, uniting thus in itself the characters of subness and obness (so that, that which has no obness in it should be called sub-subjective, or a sub-subject, and that which has no subness in it should be called upper or ober-objective, or an ob-object); and we also, who suppose ourselves the objects of every arrangement, and are certainly the subjects of every sensual impression, thus uniting

¹ [In this edition, Vol. III. p. 160.]

§ 4. Now, therefore, putting these tiresome and absurd words quite out of our way, we may go on at our ease to examine the point in question,—namely, the difference between the ordinary, proper, and true appearances of things to us; and the extraordinary, or false appearances, when we are under the influence of emotion, or contemplative fancy;* false appearances, I say, as being entirely unconnected with any real power or character in the object, and only imputed to it by us.

For instance—

“The spendthrift crocus, bursting through the mould
Naked and shivering, with his cup of gold.”†

This is very beautiful, and yet very untrue. The crocus is not a spendthrift, but a hardy plant; its yellow is not gold, but saffron. How is it that we enjoy so much the having it put into our heads that it is anything else than a plain crocus?

It is an important question. For, throughout our past reasonings about art, we have always found that nothing could be good or useful, or ultimately pleasurable, which was untrue. But here is something pleasurable in written poetry, which is nevertheless *untrue*. And what is more, if we think over our favourite poetry, we shall find it full

in ourselves, in an obverse or adverse manner, the characters of obness and subness, must both become metaphysically dejected or rejected, nothing remaining in *us* objective, but subjectivity, and the very objectivity of the object being lost in the abyss of this subjectivity of the Human.

There is, however, some meaning in the above sentence, if the reader cares to make it out; but in a pure German sentence of the highest style there is often none whatever. See Appendix II., “German Philosophy” [p. 424.]¹

* Contemplative, in the sense explained in Part III. sec. ii. chap. iv. [Vol. IV. pp. 289 *seq.*]

† Holmes (Oliver Wendell), quoted by Miss Mitford in her *Recollections of a Literary Life*.²

¹ [See also for Ruskin’s dislike of such philosophising, *Præterita*, i. ch. xii. § 252.]

² [The lines are from *Astræa, a Poem delivered before the Phi Beta Kappa Society of Yale College*: Boston, 1850. They are quoted in vol. iii. ch. 2 of Miss Mitford’s *Recollections* (1852).]

of this kind of fallacy, and that we like it all the more for being so.

§ 5. It will appear also, on consideration of the matter, that this fallacy is of two principal kinds. Either, as in this case of the crocus, it is the fallacy of wilful fancy, which involves no real expectation that it will be believed; or else it is a fallacy caused by an excited state of the feelings, making us, for the time, more or less irrational. Of the cheating of the fancy we shall have to speak presently;¹ but in this chapter, I want to examine the nature of the other error, that which the mind admits when affected strongly by emotion. Thus, for instance, in *Alton Locke*,—

“They rowed her in across the rolling foam—
The cruel, crawling foam.”²

The foam is not cruel, neither does it crawl. The state of mind which attributes to it these characters of a living creature is one in which the reason is unhinged by grief. All violent feelings have the same effect. They produce in us a falseness in all our impressions of external things, which I would generally characterize as the “pathetic fallacy.”

§ 6. Now we are in the habit of considering this fallacy as eminently a character of poetical description, and the temper of mind in which we allow it, as one eminently poetical, because passionate. But I believe, if we look well into the matter, that we shall find the greatest poets do not often admit this kind of falseness,—that it is only the second order of poets who much delight in it.*

* I admit two orders of poets, but no third; and by these two orders I mean the creative (Shakspeare, Homer, Dante), and Reflective or Perceptive (Wordsworth, Keats, Tennyson). But both of these must be *first-rate* in their range, though their range is different; and with poetry second-rate

¹ [See below, ch. xiii. § 13, p. 231.]

² [Kingsley's song first appeared in ch. xxvi. of *Alton Locke* (1850); for another reference to the expression “crawling foam,” see *Val d'Arno*, § 170.]

Thus, when Dante describes the spirits falling from the bank of Acheron “as dead leaves flutter from a bough,”¹ he gives the most perfect image possible of their utter lightness, feebleness, passiveness, and scattering agony of despair, without, however, for an instant losing his own clear perception that *these* are souls, and *those* are leaves; he makes no confusion of one with the other. But when Coleridge speaks of

“The one red leaf, the last of its clan,
That dances as often as dance it can,”²

he has a morbid, that is to say, a so far false, idea about the leaf; he fancies a life in it, and will, which there are

in *quality* no one ought to be allowed to trouble mankind. There is quite enough of the best,—much more than we can ever read or enjoy in the length of a life; and it is a literal wrong or sin in any person to encumber us with inferior work. I have no patience with apologies made by young pseudo-poets, “that they believe there is *some* good in what they have written: that they hope to do better in time,” etc. *Some* good! If there is not *all* good, there is no good. If they ever hope to do better, why do they trouble us now? Let them rather courageously burn all they have done, and wait for the better days. There are few men, ordinarily educated, who in moments of strong feeling could not strike out a poetical thought, and afterwards polish it so as to be presentable. But men of sense know better than so to waste their time; and those who sincerely love poetry, know the touch of the master’s hand on the chords too well to fumble among them after him. Nay, more than this, all inferior poetry is an injury to the good, inasmuch as it takes away the freshness of rhymes, blunders upon and gives a wretched commonalty to good thoughts; and, in general, adds to the weight of human weariness in a most woful and culpable manner. There are few thoughts likely to come across ordinary men, which have not already been expressed by greater men in the best possible way; and it is a wiser, more generous, more noble thing to remember and point out the perfect words, than to invent poorer ones, wherewith to encumber temporarily the world.³

¹ [“Come d’autunno si levan le foglie”: *Inferno*, iii. 112.]

² [*Christabel*, part i.]

³ [In the MS. Ruskin adds an illustration:—

“That thought about streams and human life, for instance, which everybody must hit upon sometimes—here it is, expressed gravely by Metastasio, lightly by Tennyson. The man must think much of himself who dares meddle with it more.”

He adds a reference to the passages—“Aqua . . . fin che ritorna” in Metastasio, and “p. 104 of *Maud*,” *i.e.* the lines in “The Brook” (first published with *Maud* in 1855): “For men may come and men may go, But I go on for ever.”]

not; confuses its powerlessness with choice, its fading death with merriment, and the wind that shakes it with music. Here, however, there is some beauty, even in the morbid passage; but take an instance in Homer and Pope. Without the knowledge of Ulysses, Elpenor, his youngest follower, has fallen from an upper chamber in the Circean palace, and has been left dead, unmissed by his leader or companions, in the haste of their departure. They cross the sea to the Cimmerian land; and Ulysses summons the shades from Tartarus. The first which appears is that of the lost Elpenor. Ulysses, amazed, and in exactly the spirit of bitter and terrified lightness which is seen in Hamlet,* addresses the spirit with the simple, startled words:—

“Elpenor! How camest thou under the shadowy darkness? Hast thou come faster on foot than I in my black ship?”¹

Which Pope renders thus:—

“O, say, what angry power Elpenor led
To glide in shades, and wander with the dead?
How could thy soul, by realms and seas disjoined,
Outfly the nimble sail, and leave the lagging wind?”

I sincerely hope the reader finds no pleasure here, either in the nimbleness of the sail, or the laziness of the wind! And yet how is it that these conceits are so painful now, when they have been pleasant to us in the other instances?

§ 7. For a very simple reason. They are not a *pathetic* fallacy at all, for they are put into the mouth of the wrong passion—a passion which never could possibly have spoken them—agonized curiosity. Ulysses wants to know the facts of the matter; and the very last thing his mind could do at the moment would be to pause, or suggest in any wise what was *not* a fact. The delay in the first three lines, and

* “Well said, old mole! canst work i’ the ground so fast?”

¹ [*Odyssey*, xi. 56, 57; *Hamlet*, i. 5.]

conceit in the last, jar upon us instantly like the most frightful discord in music. No poet of true imaginative power could possibly have written the passage.*

Therefore we see that the spirit of truth must guide us in some sort, even in our enjoyment of fallacy. Coleridge's fallacy has no discord in it, but Pope's has set our teeth on edge. Without farther questioning, I will endeavour to state the main bearings of this matter.

§ 8. The temperament which admits the pathetic fallacy, is, as I said above, that of a mind and body in some sort too weak to deal fully with what is before them or upon them; borne away, or over-clouded, or over-dazzled by emotion; and it is a more or less noble state, according to the force of the emotion which has induced it. For it is no credit to a man that he is not morbid or inaccurate in his perceptions, when he has no strength of feeling to warp them; and it is in general a sign of higher capacity and stand in the ranks of being, that the emotions should be strong enough to vanquish, partly, the intellect, and make it believe what they choose. But it is still a grander condition when the intellect also rises, till it is strong enough to assert its rule against, or together with, the utmost efforts of the passions; and the whole man stands in an iron glow, white hot, perhaps, but still strong, and in no wise evaporating; even if he melts, losing none of his weight.

* It is worth while comparing the way a similar question is put by the exquisite sincerity of Keats:—

“He wept, and his bright tears
Went trickling down the golden bow he held.
Thus, with half-shut, suffused eyes, he stood;
While from beneath some cumbrous boughs hard by
With solemn step an awful goddess came,
And there was purport in her looks for him,
Which he with eager guess began to read
Perplex'd, the while melodiously he said,
‘How camest thou over the unfooted sea?’”¹

¹ [*Hyperion*, book iii.]

So, then, we have the three ranks: the man who perceives rightly, because he does not feel, and to whom the primrose is very accurately the primrose, because he does not love it. Then, secondly, the man who perceives wrongly, because he feels, and to whom the primrose is anything else than a primrose: a star, or a sun, or a fairy's shield, or a forsaken maiden. And then, lastly, there is the man who perceives rightly in spite of his feelings, and to whom the primrose is for ever nothing else than itself—a little flower apprehended in the very plain and leafy fact of it, whatever and how many soever the associations and passions may be that crowd around it. And, in general, these three classes may be rated in comparative order, as the men who are not poets at all, and the poets of the second order, and the poets of the first; only however great a man may be, there are always some subjects which *ought* to throw him off his balance; some, by which his poor human capacity of thought should be conquered, and brought into the inaccurate and vague state of perception, so that the language of the highest inspiration becomes broken, obscure, and wild in metaphor, resembling that of the weaker man, overborne by weaker things.

§ 9. And thus, in full, there are four classes: the men who feel nothing, and therefore see truly; the men who feel strongly, think weakly, and see untruly (second order of poets); the men who feel strongly, think strongly, and see truly (first order of poets); and the men who, strong as human creatures can be, are yet submitted to influences stronger than they, and see in a sort untruly, because what they see is inconceivably above them. This last is the usual condition of prophetic inspiration.

§ 10. I separate these classes, in order that their character may be clearly understood; but of course they are united each to the other by imperceptible transitions, and the same mind, according to the influences to which it is subjected, passes at different times into the various states. Still, the difference between the great and less man is, on

the whole, chiefly in this point of *alterability*. That is to say, the one knows too much, and perceives and feels too much of the past and future, and of all things beside and around that which immediately affects him, to be in any wise shaken by it. His mind is made up; his thoughts have an accustomed current; his ways are steadfast; it is not this or that new sight which will at once unbalance him. He is tender to impression at the surface, like a rock with deep moss upon it; but there is too much mass of him to be moved. The smaller man, with the same degree of sensibility, is at once carried off his feet; he wants to do something he did not want to do before; he views all the universe in a new light through his tears; he is gay or enthusiastic, melancholy or passionate, as things come and go to him. Therefore the high creative poet might even be thought, to a great extent, impassive (as shallow people think Dante stern), receiving indeed all feelings to the full, but having a great centre of reflection and knowledge in which he stands serene, and watches the feeling, as it were, from afar off.

Dante, in his most intense moods, has entire command of himself, and can look around calmly, at all moments, for the image or the word that will best tell what he sees to the upper or lower world.¹ But Keats and Tennyson, and the poets of the second order, are generally themselves subdued by the feelings under which they write, or, at least, write as choosing to be so; and therefore admit certain expressions and modes of thought which are in some sort diseased or false.

§ 11. Now so long as we see that the *feeling* is true, we pardon, or are even pleased by, the confessed fallacy of sight which it induces: we are pleased, for instance, with those lines of Kingsley's above quoted, not because they fallaciously describe foam, but because they faithfully describe sorrow. But the moment the mind of the speaker becomes cold, that moment every such expression becomes

¹ [See, for a characteristic instance, the smile of the tailor, *Paradiso*, xxxii. 110-111.]

untrue, as being for ever untrue in the external facts. And there is no greater baseness in literature than the habit of using these metaphorical expressions in cool blood. An inspired writer, in full impetuosity of passion, may speak wisely and truly of “raging waves of the sea foaming out their own shame”;¹ but it is only the basest writer who cannot speak of the sea without talking of “raging waves,” “remorseless floods,” “ravenous billows,” etc.; and it is one of the signs of the highest power in a writer to check all such habits of thought, and to keep his eyes fixed firmly on the *pure fact*, out of which if any feeling comes to him or his reader, he knows it must be a true one.

To keep to the waves, I forget who it is who represents a man in despair desiring that his body may be cast into the sea,

*“Whose changing mound, and foam that passed away,
Might mock the eyes that questioned where I lay.”*²

Observe, there is not here a single false, or even over-charged, expression. “Mound” of the sea wave is perfectly simple and true; “changing” is as familiar as may be; “foam that passed away,” strictly literal; and the whole line descriptive of the reality with a degree of accuracy which I know not any other verse, in the range of poetry, that altogether equals. For most people have not a distinct idea of the clumsiness and massiveness of a large wave. The word “wave” is used too generally of ripples and breakers, and bendings in light drapery or grass: it does not by itself convey a perfect image. But the word “mound” is heavy, large, dark, definite; there is no mistaking the kind of waves meant, nor missing the sight of it. Then the term “changing” has a peculiar force also. Most people think of waves as rising and falling. But if they look at the sea carefully, they will perceive that the waves do not rise and fall. They change. Change both place and form,

¹ [Jude 13.]

² [The editors have not been able to discover the authorship of these lines]

but they do not fall; one wave goes on, and on, and still on; now lower, now higher, now tossing its mane like a horse, now building itself together like a wall, now shaking, now steady, but still the same wave, till at last it seems struck by something, and changes, one knows not how,—becomes another wave.

The close of the line insists on this image, and paints it still more perfectly,—“foam that passed away.” Not merely melting, disappearing, but passing on, out of sight, on the career of the wave. Then, having put the absolute ocean fact as far as he may before our eyes, the poet leaves us to feel about it as we may, and to trace for ourselves the opposite fact,—the image of the green mounds that do not change, and the white and written stones that do not pass away; and thence to follow out also the associated images of the calm life with the quiet grave, and the despairing life with the fading foam—

“Let no man move his bones.”

“As for Samaria, her king is cut off like the foam upon the water.”¹

But nothing of this is actually told or pointed out, and the expressions, as they stand, are perfectly severe and accurate, utterly uninfluenced by the firmly governed emotion of the writer. Even the word “mock” is hardly an exception, as it may stand merely for “deceive” or “defeat,” without implying any impersonation of the waves.

§ 12. It may be well, perhaps, to give one or two more instances to show the peculiar dignity possessed by all passages, which thus limit their expression to the pure fact, and leave the hearer to gather what he can from it. Here is a notable one from the *Iliad*. Helen, looking from the Scæan gate of Troy over the Grecian host, and telling Priam the names of its captains, says at last:—

“I see all the other dark-eyed Greeks; but two I cannot see,—Castor and Pollux,—whom one mother bore with me. Have they not followed from

¹ [2 Kings xxiii. 18; Hosea x. 7.]

fair Lacedæmon, or have they indeed come in their sea-wandering ships, but now will not enter into the battle of men, fearing the shame and the scorn that is in Me?"

Then Homer:—

"So she spoke. But them, already, the life-giving earth possessed, there in Lacedæmon, in the dear fatherland."¹

Note, here, the high poetical truth carried to the extreme. The poet has to speak of the earth in sadness, but he will not let that sadness affect or change his thoughts of it. No; though Castor and Pollux be dead, yet the earth is our mother still, fruitful, life-giving. These are the facts of the thing. I see nothing else than these. Make what you will of them.

§ 13. Take another very notable instance from Casimir de la Vigne's² terrible ballad, "La Toilette de Constance." I must quote a few lines out of it here and there, to enable the reader who has not the book by him, to understand its close.

"Vite, Anna! vite; au miroir!
Plus vite, Anna. L'heure s'avance,
Et je vais au bal ce soir
Chez l'ambassadeur de France.

Y pensez-vous? ils sont fanés, ces nœuds;
Ils sont d'hier; mon Dieu, comme tout passe!

¹ [*Iliad*, iii. 243. In the MS. Ruskin notes, "the unsurpassably tender irony in the epithet—'life-giving earth'—of the grave"; and then adds another illustration:—

"Compare the hammer-stroke at the close of the [32nd] chapter of *Vanity Fair*—'The darkness came down on the field and city, and Amelia was praying for George, who was lying on his face, dead, with a bullet through his heart.' A great deal might have been said about it. The writer is very sorry for Amelia, neither does he want faith in prayer. He knows as well as any of us that prayer must be answered in some sort; but those are the facts. The man and woman sixteen miles apart—one on her knees on the floor, the other on his face in the clay. So much love in her heart, so much lead in his. Make what you can of it."

For a different view of this passage, at a later period, see *The Storm Cloud of the Nineteenth Century*. Matthew Arnold, in criticising (in the first of his lectures *On Translating Homer*) the passage in the text, isolates it from the context, terminating his citation with the words, "is our mother still, fruitful, life-giving"; he thus makes Ruskin attribute to Homer more "sentimentality" than is in fact suggested: see below, p. 222.]

² [The poem is from the *Œuvres Posthumes—Derniers Chants: Poèmes et Ballades sur l'Italie* (1855) of Casimir Delavigne (1793–1843): see again below, p. 224. The second refrain (omitted in previous editions) is here supplied. After the second stanza, three refrains and stanzas are omitted.]

Que du réseau qui retient mes cheveux
 Les glands d'azur retombent avec grâce.
 Plus haut! Plus bas! Vous ne comprenez rien!
 Que sur mon front ce saphir étincelle:
 Vous me piquez, maladroite. Ah, c'est bien,
 Bien,—chère Anna! Je t'aime, je suis belle.

Vite, j'en crois mon miroir,
 Et mon cœur bat d'espérance.
 Vite, Anna, je vais ce soir
 Chez l'ambassadeur de France.

Celui qu'en vain je voudrais oublier . . .
 (Anna, ma robe) il y sera, j'espère.
 (Ah, fi! profane, est-ce là mon collier?
 Quoi! ces grains d'or bénits par le Saint-Père!)
 Il y sera; Dieu, s'il pressait ma main,
 En y pensant à peine je respire:
 Frère Anselmo doit m'entendre demain,
 Comment ferai-je, Anna, pour tout lui dire? . . .

Vite! un coup d'œil au miroir,
 Le dernier.—J'ai l'assurance
 Qu'on va m'adorer ce soir
 Chez l'ambassadeur de France.”

Près du foyer, Constance s'admirait.
 Dieu! sur sa robe il vole une étincelle!
 Au feu! Courez! Quand l'espoir l'enivrait
 Tout perdre ainsi! Quoi! Mourir,—et si belle!
 L'horrible feu ronge avec volupté
 Ses bras, son sein, et l'entoure, et s'élève,
 Et sans pitié dévore sa beauté,
 Ses dix-huit ans, hélas, et son doux rêve!

Adieu, bal, plaisir, amour!
 On se dit, Pauvre Constance!
 Et l'on dansa, jusqu'au jour,
 Chez l'ambassadeur de France.”

Yes, that is the fact of it. Right or wrong, the poet does not say. What you may think about it, he does not know. He has nothing to do with that. There lie the ashes of the dead girl in her chamber. There they danced, till the morning, at the Ambassador's of France. Make what you will of it.

If the reader will look through the ballad, of which I

have quoted only about the third part, he will find that there is not, from beginning to end of it, a single poetical (so called) expression, except in one stanza. The girl speaks as simple prose as may be; there is not a word she would not have actually used as she was dressing. The poet stands by, impassive as a statue, recording her words just as they come. At last the doom seizes her, and in the very presence of death, for an instant, his own emotions conquer him. He records no longer the facts only, but the facts as they seem to him. The fire gnaws *with voluptuousness—without pity*. It is soon past. The fate is fixed for ever; and he retires into his pale and crystalline atmosphere of truth. He closes all with the calm veracity,

“They said, ‘Poor Constance!’ ”

§ 14. Now in this there is the exact type of the consummate poetical temperament. For, be it clearly and constantly remembered, that the greatness of a poet depends upon the two faculties, acuteness of feeling, and command of it. A poet is great, first in proportion to the strength of his passion, and then, that strength being granted, in proportion to his government of it; there being, however, always a point beyond which it would be inhuman and monstrous if he pushed this government, and, therefore, a point at which all feverish and wild fancy becomes just and true. Thus the destruction of the kingdom of Assyria cannot be contemplated firmly by a prophet of Israel. The fact is too great, too wonderful. It overthrows him, dashes him into a confused element of dreams. All the world is, to his stunned thought, full of strange voices. “Yea, the fir-trees rejoice at thee, and the cedars of Lebanon, saying, ‘Since thou art gone down to the grave, no feller is come up against us.’ ”¹ So, still more, the thought of the presence of Deity cannot be borne without this great astonishment.

¹ [Isaiah xiv. 8. The passage is commented on again in *Lectures on Architecture and Painting*, § 79 (Vol. XII. p. 105).]

“The mountains and the hills shall break forth before you into singing, and all the trees of the field shall clap their hands.”¹

§ 15. But by how much this feeling is noble when it is justified by the strength of its cause, by so much it is ignoble when there is not cause enough for it; and beyond all other ignobleness is the mere affectation of it, in hardness of heart. Simply bad writing may almost always, as above noticed, be known by its adoption of these fanciful metaphorical expressions as a sort of current coin; yet there is even a worse, at least a more harmful condition of writing than this, in which such expressions are not ignorantly and feelinglessly caught up, but, by some master, skilful in handling, yet insincere, deliberately wrought out with chill and studied fancy; as if we should try to make an old lava-stream look red hot again, by covering it with dead leaves, or white-hot, with hoar-frost.

When Young is lost in veneration, as he dwells on the character of a truly good and holy man, he permits himself for a moment to be overborne by the feeling so far as to exclaim—

“Where shall I find him? angels, tell me where.
You know him; he is near you; point him out.
Shall I see glories beaming from his brow,
Or trace his footsteps by the rising flowers?”²

This emotion has a worthy cause, and is thus true and right. But now hear the cold-hearted³ Pope say to a shepherd girl—

“Where’er you walk, cool gales shall fan the glade;
Trees, where you sit, shall crowd into a shade;⁴
Your praise the birds shall chant in every grove,
And winds shall waft it to the powers above.

¹ [Isaiah lv. 12.]

² [*Night Thoughts*, ii. 345.]

³ [“Cold-hearted” only in writing the *Pastorals*: see the qualification in *Modern Painters*, vol. v. pt. ix. ch. v. § 5 n.]

⁴ [See a reference to this line in *Præterita*, i. ch. viii. § 172.]

But would you sing, and rival Orpheus' strain,
 The wondering forests soon should dance again;
 The moving mountains hear the powerful call,
 And headlong streams hang, listening, in their fall."¹

This is not, nor could it for a moment be mistaken for, the language of passion. It is simple falsehood, uttered by hypocrisy; definite absurdity, rooted in affectation, and coldly asserted in the teeth of nature and fact. Passion will indeed go far in deceiving itself; but it must be a strong passion, not the simple wish of a lover to tempt his mistress to sing. Compare a very closely parallel passage in Wordsworth, in which the lover has lost his mistress:

“Three years had Barbara in her grave been laid,
 When thus his moan he made:—

 ‘Oh, move, thou cottage, from behind yon oak,
 Or let the ancient tree uprooted lie,
 That in some other way you smoke
 May mount into the sky.
 If still behind yon pine-tree's ragged bough,
 Headlong, the waterfall must come,
 Oh, let it, then, be dumb—
 Be anything, sweet stream, but that which thou art now.’ ”²

Here is a cottage to be moved, if not a mountain, and a waterfall to be silent, if it is not to hang listening: but with what different relation to the mind that contemplates them! Here, in the extremity of its agony, the soul cries out wildly for relief, which at the same moment it partly knows to be impossible, but partly believes possible, in a vague impression that a miracle *might* be wrought to give relief even to a less sore distress,—that nature is kind, and God is kind, and that grief is strong: it knows not well what *is* possible to such grief. To silence a stream, to move a cottage wall,—one might think it could do as much as that!

¹ [*Pastorals*: “Summer, or Alexis.” Four lines are omitted after the second in Ruskin's quotation.]

² [The piece beginning “’Tis said, That some have died for love.” Ruskin, as was his custom, quotes from memory. He runs together two stanzas, and several words are different in the poet's text.]

I believe these instances are enough to illustrate the main point I insist upon respecting the pathetic fallacy,—that so far as it *is* a fallacy, it is always the sign of a morbid state of mind, and comparatively of a weak one. Even in the most inspired prophet it is a sign of the incapacity of his human sight or thought to bear what has been revealed to it. In ordinary poetry, if it is found in the thoughts of the poet himself, it is at once a sign of his belonging to the inferior school; if in the thoughts of the characters imagined by him, it is right or wrong according to the genuineness of the emotion from which it springs; always, however, implying necessarily *some* degree of weakness in the character.

Take two most exquisite instances from master hands. The Jessy of Shenstone, and the Ellen of Wordsworth, have both been betrayed and deserted. Jessy, in the course of her most touching complaint, says:

“If through the garden’s flowery tribes I stray,
Where bloom the jasmynes that could once allure,
‘Hope not to find delight in us,’ they say,
‘For we are spotless, Jessy; we are pure.’ ”¹

Compare this with some of the words of Ellen:

“ ‘Ah, why,’ said Ellen, sighing to herself,
‘Why do not words, and kiss, and solemn pledge,
And nature, that is kind in woman’s breast,
And reason, that in man is wise and good,
And fear of Him Who is a righteous Judge,—
Why do not these prevail for human life,
To keep two hearts together, that began
Their springtime with one love, and that have need
Of mutual pity and forgiveness sweet
To grant, or be received; while that poor bird—
O, come and hear him! Thou who hast to me
Been faithless, hear him;—though a lowly creature,
One of God’s simple children that yet know not
The Universal Parent, *how* he sings!
As if he wished the firmament of heaven

¹ [Ruskin quotes these lines again in his description of Holman Hunt’s picture “The Awakening Conscience”: see Vol. XII. p. 335.]

Should listen, and give back to him the voice
Of his triumphant constancy and love;
The proclamation that he makes, how far
His darkness doth transcend our fickle light.' ”¹

The perfection of both these passages, as far as regards truth and tenderness of imagination in the two poets, is quite insuperable. But of the two characters imagined, Jessy is weaker than Ellen, exactly in so far as something appears to her to be in nature which is not. The flowers do not really reproach her. God meant them to comfort her, not to taunt her; they would do so if she saw them rightly.

Ellen, on the other hand, is quite above the slightest erring emotion. There is not the barest film of fallacy in all her thoughts. She reasons as calmly as if she did not feel. And, although the singing of the bird suggests to her the idea of its desiring to be heard in heaven, she does not for an instant admit any veracity in the thought. “As if,” she says,—“I know he means nothing of the kind; but it does verily seem as if.” The reader will find, by examining the rest of the poem, that Ellen’s character is throughout consistent in this clear though passionate strength.*

* I cannot quit this subject without giving two more instances, both exquisite, of the pathetic fallacy, which I have just come upon, in *Maud*:²—

“For a great speculation had fail’d;
And ever he mutter’d and madden’d, and ever wann’d with
despair;
And out he walk’d, when the wind like a broken worlding wail’d,
And the *flying gold of the ruin’d woodlands drove thro’ the air.*”

“There has fallen a splendid tear
From the passion-flower at the gate.
The red rose cries, ‘She is near, she is near!’
And the white rose weeps, ‘She is late.’
The larkspur listens, ‘I hear, I hear!’
And the lily whispers, ‘I wait.’ ”

¹ [*The Excursion*, book vi. (p. 494 of J. Morley’s edition).]

² [The passages are from Part i., i. 3, and Part i., xxii. 10. A letter from Ruskin to Tennyson in appreciation of *Maud* (November 12, 1855) is given in a later volume of this edition. Ruskin referred incidentally to another “pathetic fallacy” in the poem in *Sesame and Lilies*, §§ 93–94; see the note there for the poet’s reply to the criticism.]

It then being, I hope, now made clear to the reader in all respects that the pathetic fallacy is powerful only so far as it is pathetic, feeble so far as it is fallacious, and, therefore, that the dominion of Truth is entire, over this, as over every other natural and just state of the human mind, we may go on to the subject for the dealing with which this prefatory inquiry became necessary; and why necessary, we shall see forthwith.

CHAPTER XIII

OF CLASSICAL LANDSCAPE

§ 1. MY reason for asking the reader to give so much of his time to the examination of the pathetic fallacy was, that, whether in literature or in art, he will find it eminently characteristic of the modern mind; and in the landscape, whether of literature or art, he will also find the modern painter endeavouring to express something which he, as a living creature, imagines in the lifeless object, while the classical and mediæval painters were content with expressing the unimaginary and actual qualities of the object itself. It will be observed that, according to the principle stated long ago, I use the words painter and poet quite indifferently, including in our inquiry the landscape of literature, as well as that of painting; and this the more because the spirit of classical landscape has hardly been expressed in any other way than by words.

§ 2. Taking, therefore, this wide field, it is surely a very notable circumstance, to begin with, that this pathetic fallacy is eminently characteristic of modern painting. For instance, Keats, describing a wave breaking out at sea, says of it—

“Down whose green back the short-lived foam, all hoar,
Bursts gradual, with a wayward indolence.”¹

That is quite perfect, as an example of the modern manner. The idea of the peculiar action with which foam rolls down a long, large wave could not have been given by any other words so well as by this “wayward indolence.” But Homer would never have written, never thought of,

¹ [*Endymion*, book ii. 350.]

such words. He could not by any possibility have lost sight of the great fact that the wave, from the beginning to the end of it, do what it might, was still nothing else than salt water; and that salt water could not be either wayward or indolent. He will call the waves “over-roofed,” “full-charged,” “monstrous,” “compact-black,” “dark-clear,” “violet-coloured,” “wine-coloured,” and so on.¹ But every one of these epithets is descriptive of pure physical nature. “Over-roofed” is the term he invariably uses of anything—rock, house, or wave—that nods over at the brow; the other terms need no explanation; they are as accurate and intense in truth as words can be, but they never show the slightest feeling of anything animated in the ocean. Black or clear, monstrous or violet-coloured, cold salt water it is always, and nothing but that.

§ 3. “Well, but the modern writer, by his admission of the tinge of fallacy, has given an idea of something in the action of the wave which Homer could not, and surely, therefore, has made a step in advance? Also there appears to be a degree of sympathy and feeling in the one writer, which there is not in the other; and as it has been received for a first principle that writers are great in proportion to the intensity of their feelings, and Homer seems to have no feelings about the sea but that it is black and deep, surely in this respect also the modern writer is the greater?”

Stay a moment. Homer *had* some feeling about the sea; a faith in the animation of it much stronger than Keats’s. But all this sense of something living in it, he separates in his mind into a great abstract image of a Sea Power. He never says the waves rage, or the waves

¹ [“Over-roofed,” *kathrefhV* (*Od.* v. 367); “full-charged,” *trofoeiV* (*Il.* xi. 307; xv. 621); “monstrous,” *pelwrioV* (*Od.* iii. 290); “violet-coloured,” *ioeidhs* (*Il.* xi. 298); “wine-coloured,” *oinoj* (*Il.* ii. 613). It is not clear to what epithets Ruskin alluded in “compact-black;” “dark-clear.” In one of his diaries, he jots down the epithet *phgoV* (compact) (*Od.* v. 388); with regard to which word as applied to waves, Liddell and Scott note that old interpreters translate it either as “black” or as “white”; Ruskin puts against it in his diary, “icy clear black;” with a note of exclamation—on the uncertainty of its meaning. It seems not improbable that an “or” should be inserted between “compact-black” and “dark-clear,” both expressions referring to the uncertain *phgoV*.]

are idle. But he says there is somewhat in, and greater than, the waves, which rages, and is idle, and *that* he calls a god.

§ 4. I do not think we ever enough endeavour to enter into what a Greek's real notion of a god was. We are so accustomed to the modern mockeries of the classical religion, so accustomed to hear and see the Greek gods introduced as living personages, or invoked for help, by men who believe neither in them nor in any other gods, that we seem to have infected the Greek ages themselves with the breath, and dimmed them with the shade, of our hypocrisy; and are apt to think that Homer, as we know that Pope, was merely an ingenious fabulist; nay, more than this, that all the nations of past time were ingenious fabulists also, to whom the universe was a lyrical drama, and by whom whatsoever was said about it was merely a witty allegory, or a graceful lie, of which the entire upshot and consummation was a pretty statue in the middle of the court, or at the end of the garden.

This, at least, is one of our forms of opinion about Greek faith; not, indeed, possible altogether to any man of honesty or ordinary powers of thought; but still so venomously inherent in the modern philosophy that all the pure lightning of Carlyle¹ cannot as yet quite burn it out of any of us. And then, side by side with this mere infidel folly, stands the bitter short-sightedness of Puritanism, holding the classical god to be either simply an idol,—a block of stone ignorantly, though sincerely, worshipped—or else an actual diabolic or betraying power, usurping the place of God.

§ 5. Both these Puritanical estimates of Greek deity are of course to some extent true. The corruption of classical worship is barren idolatry; and that corruption was deepened, and variously directed to their own purposes, by the evil angels. But this was neither the whole, nor the principal part, of Pagan worship. Pallas was not, in the pure Greek

¹ [See the essay entitled "Biography" in the fourth volume of Carlyle's *Miscellanies*, p. 56 in the "Popular Edition" of 1872.]

mind, merely a powerful piece of ivory in a temple at Athens; neither was the choice of Leonidas between the alternatives granted him by the oracle, of personal death, or ruin to his country,¹ altogether a work of the Devil's prompting.

§ 6. What, then, was actually the Greek god? In what way were these two ideas of human form, and divine power, credibly associated in the ancient heart, so as to become a subject of true faith irrespective equally of fable, allegory, superstitious trust in stone, and demoniacal influence?

It seems to me that the Greek had exactly the same instinctive feeling about the elements that we have ourselves; that to Homer, as much as to Casimir de la Vigne, fire seemed ravenous and pitiless; to Homer, as much as to Keats, the sea-wave appeared wayward or idle, or whatever else it may be to the poetical passion. But then the Greek reasoned upon this sensation, saying to himself: "I can light the fire, and put it out; I can dry this water up, or drink it. It cannot be the fire or the water that rages, or that is wayward. But it must be something *in* this fire and *in* the water, which I cannot destroy by extinguishing the one, or evaporating the other, any more than I destroy myself by cutting off my finger; *I was in* my finger,—something of me at least was; I had a power over it and felt pain in it, though I am still as much myself when it is gone. So there may be a power in the water which is not water, but to which the water is as a body;—which can strike with it, move in it, suffer in it, yet not be destroyed with it. This something, this Great Water Spirit, I must not confuse with the waves, which are only its body. *They* may flow hither and thither, increase or diminish. *That* must be indivisible—imperishable—a god. So of fire also; those rays which I can stop, and in the midst of which I cast a shadow, cannot be divine, nor greater

¹ [Herodotus, vii. 220. For other references to Leonidas, see note on Vol. XII. p. 138. The meaning of Pallas in the Greek mind was worked out by Ruskin in *The Queen of the Air*.]

than I. They cannot feel, but there may be something in them that feels,—a glorious intelligence, as much nobler and more swift than mine, as these rays, which are its body, are nobler and swifter than my flesh;—the spirit of all light, and truth, and melody, and revolving hours.”

§ 7. It was easy to conceive, farther, that such spirits should be able to assume at will a human form, in order to hold intercourse with men, or to perform any act for which their proper body, whether of fire, earth, or air, was unfitted. And it would have been to place them beneath, instead of above, humanity, if, assuming the form of man, they could not also have tasted his pleasures. Hence the easy step to the more or less material ideas of deities, which are apt at first to shock us, but which are indeed only dishonourable so far as they represent the gods as false and unholy. It is not the materialism, but the vice, which degrades the conception; for the materialism itself is never positive, or complete. There is always some sense of exaltation in the spiritual and immortal body; and of a power proceeding from the visible form through all the infinity of the element ruled by the particular god. The precise nature of the idea is well seen in the passage of the *Iliad* which describes the river Scamander defending the Trojans against Achilles.¹ In order to remonstrate with the hero, the god assumes a human form, which nevertheless is in some way or other instantly recognized by Achilles as that of the river-god: it is addressed at once as a river, not as a man; and its voice is the voice of a river “out of the deep whirlpools.”* Achilles refuses to obey its commands; and from the human form it returns instantly into its natural or divine one, and endeavours to overwhelm him with waves. Vulcan defends

* Compare Lay of the Last Minstrel, canto i. stanza 15, and canto v. stanza 2. In the first instance, the river-spirit is accurately the Homeric god, only Homer would have believed in it,—Scott did not: at least not altogether.

¹ [*Iliad*, xxi. 212–360. The river-god in his wrath arises “out of the deep whirlpool” (βαρεῖν δ’ ἐκφρεγῶντο δίνην, 213); Achilles addresses him as the Scamander (223). Hephæstus sends fire against the river (349). The “strength,” or “nerve of the river” (ἰVpotamoio) feels the fire (356), and begs for respite (357–360).]

Achilles, and sends fire against the river, which suffers in its water-body, till it is able to bear no more. At last even the “nerve of the river,” or “strength of the river” (note the expression), feels the fire, and this “strength of the river” addresses Vulcan in supplications for respite. There is in this precisely the idea of a vital part of the river-body, which acted and felt, to which, if the fire reached, it was death, just as would be the case if it touched a vital part of the human body. Throughout the passage the manner of conception is perfectly clear and consistent; and if, in other places, the exact connection between the ruling spirit and the thing ruled is not so manifest, it is only because it is almost impossible for the human mind to dwell long upon such subjects without falling into inconsistencies, and gradually slackening its effort to grasp the entire truth; until the more spiritual part of it slips from its hold, and only the human form of the god is left, to be conceived and described as subject to all the errors of humanity. But I do not believe that the idea ever weakens itself down to mere allegory. When Pallas is said to attack and strike down Mars, it does not mean merely that Wisdom at that moment prevailed against Wrath. It means that there are, indeed, two great spirits, one entrusted to guide the human soul to wisdom and chastity, the other to kindle wrath and prompt to battle. It means that these two spirits, on the spot where, and at the moment when, a great contest was to be decided between all that they each governed in man, then and there (assumed) human form, and human weapons, and did verily and materially strike at each other, until the Spirit of Wrath was crushed. And when Diana is said to hunt with her nymphs in the woods, it does not mean merely, as Wordsworth puts it,¹ that the poet or shepherd saw the moon and stars glancing between the branches of the trees, and wished to say so figuratively. It means that there is a living spirit, to which the light of the moon is a body; which takes delight in glancing between the clouds and

¹ [The reference is to the *Excursion*, book iv. lines 847–887.]

following the wild beasts as they wander through the night; and that this spirit sometimes assumes a perfect human form, and in this form, with real arrows, pursues and slays the wild beasts, which with its mere arrows of moonlight it could not slay; retaining, nevertheless, all the while, its power and being in the moonlight, and in all else that it rules.

§ 8. There is not the smallest inconsistency or unspirituality in this conception. If there were, it would attach equally to the appearance of the angels to Jacob, Abraham, Joshua, or Manoah.¹ In all those instances the highest authority which governs our own faith requires us to conceive divine power clothed with a human form (a form so real that it is recognized for superhuman only by its “doing wondrously”), and retaining, nevertheless, sovereignty and omnipresence in all the world. This is precisely, as I understand it, the heathen idea of a God; and it is impossible to comprehend any single part of the Greek mind until we grasp this faithfully, not endeavouring to explain it away in any wise, but accepting, with frank decision and definition, the tangible existence of its deities;—blue-eyed—white-fleshed—human-hearted,—capable at their choice of meeting man absolutely in his own nature—feasting with him—talking with him—fighting with him, eye to eye, or breast to breast, as Mars with Diomed;² or else, dealing with him in a more retired spirituality, as Apollo sending the plague upon the Greeks, when his quiver rattles at his shoulders as he moves, and yet the darts sent forth of it strike not as arrows, but as plague; or, finally, retiring completely into the material universe which they properly inhabit, and dealing with man through that, as Scamander with Achilles, through his waves.

§ 9. Nor is there anything whatever in the various actions recorded of the gods, however apparently ignoble, to indicate weakness of belief in them. Very frequently

¹ [Genesis xxxii. 1, xxii. 11; Joshua v. 13; Judges xiii. 19 (“and the angel did wondrously; and Manoah and his wife looked on”).]

² [*Iliad*, v. 846; the next reference is *Iliad*, i. 43.]

things which appear to us ignoble are merely the simplicities of a pure and truthful age. When Juno beats Diana about the ears with her own quiver,¹ for instance, we start at first, as if Homer could not have believed that they were both real goddesses. But what should Juno have done? Killed Diana with a look? Nay, she neither wished to do so, nor could she have done so, by the very faith of Diana's goddess-ship. Diana is as immortal as herself. Frowned Diana into submission? But Diana has come expressly to try conclusions with her, and will by no means be frowned into submission. Wounded her with a celestial lance? That sounds more poetical, but it is in reality partly more savage and partly more absurd, than Homer. More savage, for it makes Juno more cruel, therefore less divine; and more absurd, for it only seems elevated in tone, because we use the word "celestial," which means nothing. What sort of a thing is a "celestial," lance? Not a wooden one. Of what then? Of moonbeams, or clouds, or mist. Well, therefore, Diana's arrows were of mist too; and her quiver, and herself, and Juno, with her lance, and all, vanish into mist. Why not have said at once, if that is all you mean, that two mists met, and one drove the other back? That would have been rational and intelligible, but not to talk of celestial lances. Homer had no such misty fancy; he believed the two goddesses were there in true bodies, with true weapons, on the true earth; and still I ask, what should Juno have done? Not beaten Diana? No; for it is unlady-like. Un-English-lady-like, yes; but by no means un-Greek-lady-like, nor even un-natural-lady-like. If a modern lady does *not* beat her servant or her rival about the ears, it is oftener because she is too weak, or too proud, than because she is of purer mind than Homer's Juno. She will not strike them; but she will overwork the one or slander the other without pity; and Homer would not have thought that one whit more goddess-like than striking them with her open hand.

¹ [*Iliad*, xxi. 489.]

§ 10. If, however, the reader likes to suppose that while the two goddesses in personal presence thus fought with arrow and quiver, there was also a broader and vaster contest supposed by Homer between the elements they ruled; and that the goddess of the heavens, as she struck the goddess of the moon on the flushing cheek, was at the same instant exercising omnipresent power in the heavens themselves, and gathering clouds, with which, filled with the moon's own arrows or beams, she was encumbering and concealing the moon; he is welcome to this outcarrying of the idea, provided that he does not pretend to make it an interpretation instead of a mere extension, nor think to explain away my real, running, beautiful beaten Diana, into a moon behind clouds.*

§ 11. It is only farther to be noted, that the Greek conception of Godhead, as it was much more real than we usually suppose, so it was much more bold and familiar than to a modern mind would be possible. I shall have something more to observe,¹ in a little while, of the danger of our modern habit of endeavouring to raise ourselves to something like comprehension of the truth of divinity, instead of simply believing the words in which the Deity reveals Himself to us. The Greek erred rather on the other side, making hardly any effort to conceive divine mind as above the human; and no more shrinking from frank intercourse with a divine being, or dreading its immediate presence, than that of the simplest of mortals. Thus Atrides, enraged at his sword's breaking in his hand upon the helmet of Paris, after he had expressly invoked the assistance

* Compare the exquisite lines of Longfellow on the sunset in *The Golden Legend*:—
“The day is done, and slowly from the scene
The stooping sun upgathers his spent shafts,
And puts them back into his golden quiver.”²

¹ [See in the next volume, ch. vi. §§ 6, 7, pp. 109–110.]

² [The lines occur in Part I., “The Castle of Vautsberg on the Rhine.” *The Golden Legend* was a favourite poem with Ruskin; see his quotations from it in the “Lectures on Colour” in Vol. XII. p. 485, and the reference in *Modern Painters*, vol. iv. ch. xx. § 32.]

of Jupiter, exclaims aloud as he would to a king who had betrayed him, "Jove, Father, there is not another god more evil-minded than thou!"¹ and Helen, provoked at Paris's defeat, and oppressed with pouting shame both for him and for herself, when Venus appears at her side, and would lead her back to the delivered Paris, impatiently tells the goddess to "go and take care of Paris herself."

§ 12. The modern mind is naturally, but vulgarly and unjustly, shocked by this kind of familiarity. Rightly understood, it is not so much a sign of misunderstanding of the divine nature as of good understanding of the human. The Greek lived, in all things, a healthy, and, in a certain degree, a perfect, life. He had no morbid or sickly feeling of any kind. He was accustomed to face death without the slightest shrinking, to undergo all kinds of bodily hardship without complaint, and to do what he supposed right and honourable, in most cases, as a matter of course. Confident of his own immortality, and of the power of abstract justice, he expected to be dealt with in the next world as was right, and left the matter much in his god's hands; but being thus immortal, and finding in his own soul something which it seemed quite as difficult to master, as to rule the elements, he did not feel that it was an appalling superiority in those gods to have bodies of water, or fire, instead of flesh, and to have various work to do among the clouds and waves, out of his human way; or sometimes, even in a sort of service to himself. Was not the nourishment of herbs and flowers a kind of ministering to his wants; were not the gods in some sort his husbandmen, and spirit-servants? Their mere strength or omnipresence did not seem to him a distinction absolutely terrific. It might be the nature of one being to be in two places at once, and of another to be only in one; but that did not seem of itself to infer any absolute lordliness of one nature above the other, any more than an insect must be a nobler creature than a man,

¹ [*Iliad*, iii. 365; the next reference is *Iliad*, iii. 406.]

because it can see on four sides of its head, and the man only in front. They could kill him or torture him, it was true; but even that not unjustly, or not for ever. There was a fate, and a Divine Justice, greater than they; so that if they did wrong, and he right, he might fight it out with them, and have the better of them at last. In a general way, they were wiser, stronger, and better than he; and to ask counsel of them, to obey them, to sacrifice to them, to thank them for all good, this was well: but to be utterly downcast before them, or not to tell them his mind in plain Greek if they seemed to him to be conducting themselves in an ungodly manner—this would not be well.

§ 13. Such being their general idea of the gods, we can now easily understand the habitual tone of their feelings towards what was beautiful in nature. With us, observe, the idea of the Divinity is apt to get separated from the life of nature; and imagining our God upon a cloudy throne, far above the earth, and not in the flowers or waters, we approach those visible things with a theory that they are dead; governed by physical laws, and so forth. But coming to them, we find the theory fail; that they are not dead; that, say what we choose about them, the instinctive sense of their being alive is too strong for us; and in scorn of all physical law, the wilful fountain sings, and the kindly flowers rejoice. And then, puzzled, and yet happy; pleased, and yet ashamed of being so; accepting sympathy from nature, which we do not believe it gives, and giving sympathy to nature, which we do not believe it receives,—mixing, besides, all manner of purposeful play and conceit with these involuntary fellowships,—we fall necessarily into the curious web of hesitating sentiment, pathetic fallacy, and wandering fancy, which form a great part of our modern view of nature. But the Greek never removed his god out of nature at all; never attempted for a moment to contradict his instinctive sense that God was everywhere. “The tree *is* glad,” said he, “I know it is; I can cut it down: no matter, there was a nymph in it. The water *does* sing,”

said he; "I can dry it up; but no matter, there was a naiad in it." But in thus clearly defining his belief, observe, he threw it entirely into a human form, and gave his faith to nothing but the image of his own humanity. What sympathy and fellowship he had, were always for the spirit *in* the stream, not for the stream; always for the dryad *in* the wood, not for the wood. Content with this human sympathy, he approached the actual waves and woody fibres with no sympathy at all. The spirit that ruled them, he received as a plain fact. Them, also, ruled and material, he received as plain facts; they, without their spirit, were dead enough. A rose was good for scent, and a stream for sound and coolness; for the rest, one was no more than leaves, the other no more than water; he could not make anything else of them; and the divine power, which was involved in their existence, having been all distilled away by him into an independent Flora or Thetis, the poor leaves or waves were left, in mere corporeality, to make the most of their being discernibly red and soft, clear and wet, and unacknowledged in any other power whatsoever.

§ 14. Then, observe farther, the Greeks lived in the midst of the most beautiful nature, and were as familiar with blue sea, clear air, and sweet outlines of mountain, as we are with brick walls, black smoke, and level fields. This perfect familiarity rendered all such scenes of natural beauty unexciting, if not indifferent to them, by lulling and over-wearying the imagination as far as it was concerned with such things; but there was another kind of beauty which they found it required effort to obtain, and which, when thoroughly obtained, seemed more glorious than any of this wild loveliness—the beauty of the human countenance and form. This, they perceived, could only be reached by continual exercise of virtue; and it was in Heaven's sight, and theirs, all the more beautiful because it needed this selfdenial to obtain it. So they set themselves to reach this, and having gained it, gave it their principal thoughts, and set it off with beautiful dress as best they might. But

making this their object, they were obliged to pass their lives in simple exercise and disciplined employments. Living wholesomely, giving themselves no fever fits, either by fasting or over-eating, constantly in the open air, and full of animal spirit and physical power, they became incapable of every morbid condition of mental emotion. Unhappy love, disappointed ambition, spiritual despondency, or any other disturbing sensation, had little power over the well-braced nerves, and healthy flow of the blood; and what bitterness might yet fasten on them was soon boxed or raced out of a boy, and spun or woven out of a girl, or danced out of both. They had indeed their sorrows, true and deep, but still, more like children's sorrows than ours, whether bursting into open cry of pain, or hid with shuddering under the veil, still passing over the soul as clouds do over heaven, not sullyng it, not mingling with it;—darkening it perhaps long or utterly, but still not becoming one with it, and for the most part passing away in dashing rain of tears, and leaving the man unchanged: in nowise affecting, as our sorrow does, the whole tone of his thought and imagination thence-forward.

How far our melancholy may be deeper and wider than theirs in its roots and view, and therefore nobler, we shall consider presently;¹ but at all events, they had the advantage of us in being entirely free from all those dim and feverish sensations which result from unhealthy state of the body. I believe that a large amount of the dreamy and sentimental sadness, tendency to reverie, and general patheticalness of modern life results merely from derangement of stomach; holding to the Greek life the same relation that the feverish night of an adult does to a child's sleep.

§ 15. Farther, the human beauty, which, whether in its bodily being or in imagined divinity, had become, for the reasons we have seen, the principal object of culture and sympathy to these Greeks, was, in its perfection, eminently orderly, symmetrical, and tender. Hence, contemplating it

¹ [See below, p. 352, and ch. xvii.]

constantly in this state, they could not but feel a proportionate fear of all that was disorderly, unbalanced, and rugged. Having trained their stoutest soldiers into a strength so delicate and lovely, that their white flesh, with their blood upon it, should look like ivory stained with purple;* and having always around them, in the motion and majesty of this beauty, enough for the full employment of their imagination, they shrank with dread or hatred from all the ruggedness of lower nature,—from the wrinkled forest bark, the jagged hill-crest, and irregular, inorganic storm of sky; looking to these for the most part as adverse powers, and taking pleasure only in such portions of the lower world as were at once conducive to the rest and health of the human frame, and in harmony with the laws of its gentler beauty.

§ 16. Thus, as far as I recollect, without a single exception, every Homeric landscape, intended to be beautiful, is composed of a fountain, a meadow, and a shady grove. This ideal is very interestingly marked, as intended for a perfect one, in the fifth book of the *Odyssey*; when Mercury himself stops for a moment, though on a message, to look at a landscape “which even an immortal might be gladdened to behold.”¹ This landscape consists of a cave covered with a running vine, all blooming into grapes, and surrounded by a grove of alder, poplar, and sweet-smelling cypress. Four fountains of white (foaming) water, springing *in succession* (mark the orderliness), and close to one another, flow away in different directions, through a meadow full of violets and parsley (parsley, to mark its moisture, being elsewhere called “marsh-nourished,” and associated with the lotus†); the air is perfumed not only by these violets, and by the sweet cypress, but by Calypso’s fire of finely chopped cedar-wood, which sends a smoke, as of incense, through the island; Calypso herself is singing; and finally, upon the trees are

* *Iliad*, iv. 141.

† *Iliad*, ii. 776.

¹ [*Odyssey*, v. 58–74.]

resting, or roosting, owls, hawks, and “long-tongued seacrows.” Whether these last are considered as a part of the ideal landscape, as marine singing birds, I know not; but the approval of Mercury appears to be elicited chiefly by the fountains and violet meadow.

§ 17. Now the notable things in this description are, first, the evident subservience of the whole landscape to human comfort, to the foot, the taste, or the smell; and, secondly, that throughout the passage there is not a single figurative word expressive of the things being in any wise other than plain glass, fruit, or flower. I have used the term “spring” of the fountains, because, without doubt, Homer means that they sprang forth brightly, having their source at the foot of the rocks (as copious fountains nearly always have); but Homer does not say “spring,” he says simply flow, and uses only one word for “growing softly,” or “richly,” of the tall trees, the vine, and the violets.¹ There is, however, some expression of sympathy with the sea-birds; he speaks of them in precisely the same terms, as in other places of naval nations, saying they “have care of the works of the sea.”²

§ 18. If we glance through the references to pleasant landscape which occur in other parts of the *Odyssey*, we shall always be struck by this quiet subjection of their every feature to human service, and by the excessive similarity in the scenes. Perhaps the spot intended, after this, to be most perfect, may be the garden of Alcinous, where the principal ideas are, still more definitely, order, symmetry, and fruitfulness;³ the beds being duly ranged between rows of vines, which, as well as the pear, apple, and fig-trees, bear fruit continually, some grapes being yet sour, while others are getting black; there are plenty of “orderly square beds of herbs,” chiefly leeks, and two fountains, one running

² [*thin te qalannia erga mhlen, Odyssey* v. 67. The same phrase is used of men *Iliad*, ii. 614.]

³ [*Odyssey*, vii. 112–135.]

through the garden, and one under the pavement of the palace, to a reservoir for the citizens. Ulysses, pausing to contemplate this scene, is described nearly in the same terms as Mercury pausing to contemplate the wilder meadow; and it is interesting to observe, that, in spite of all Homer's love of symmetry, the god's admiration is excited by the free fountains, wild violets, and wandering vine; but the mortal's, by the vines in rows, the leeks in beds, and the fountains in pipes.

Ulysses has, however, one touching reason for loving vines in rows. His father had given him fifty rows for himself, when he was a boy, with corn between them (just as it now grows in Italy). Proving his identity afterwards to his father, whom he finds at work in his garden, "with thick gloves on, to keep his hands from the thorns," he reminds him of these fifty rows of vines, and of the "thirteen peartrees and ten apple-trees" which he had given him: and Laertes faints upon his neck.¹

§ 19. If Ulysses had not been so much of a gardener, it might have been received as a sign of considerable feeling for landscape beauty, that, intending to pay the very highest possible compliment to the Princess Nausicaa (and having, indeed, the moment before gravely asked her whether she was a goddess or not), he says that he feels, at seeing her, exactly as he did when he saw the young palm-tree growing at Apollo's shrine at Delos.² But I think the taste for trim hedges and upright trunks has its usual influence over him here also, and that he merely means to tell the princess that she is delightfully tall and straight.

§ 20. The princess is, however, pleased by his address, and tells him to wait outside the town, till she can speak to her father about him. The spot to which she directs him is another ideal piece of landscape, composed of a "beautiful grove of aspen poplars, a fountain, and a meadow,"³ near the road-side: in fact, as nearly as possible such a scene as

¹ [*Odyssey*, xxiv. 340.]

² [*Odyssey*, vi. 149, 162.]

³ [*Odyssey*, vi. 292.]

meets the eye of the traveller every instant on the much-despised lines of road through lowland France; for instance, on the railway between Arras and Amiens;—scenes, to my mind, quite exquisite in the various grouping and grace of their innumerable poplar avenues, casting sweet, tremulous shadows over their level meadows and labyrinthine streams.¹ We know that the princess means aspen poplars, because soon afterwards we find her fifty maid-servants at the palace, all spinning and in perpetual motion, compared to the “leaves of the tall poplar;”² and it is with exquisite feeling that it is made afterwards* the chief tree in the groves of Proserpine; its light and quivering leafage having exactly the melancholy expression of fragility, faintness, and inconstancy which the ancients attributed to the disembodied spirit.† The likeness to the poplars by the streams of Amiens is more marked still in the *Iliad*, where the young Simois, struck by Ajax, falls to the earth “like an aspen that has grown in an irrigated meadow, smooth-trunked, the soft shoots springing from its top, which some coach-making

* *Odyssey*, x. 510.

† Compare the passage in Dante referred to above, chap. xii. § 6 [p. 206].

¹ [Ruskin had been specially struck by this scenery in 1854, as is shown by the following entry in his diary:—

“AMIENS, *May* 11.—Came round to-day by Lille, leaving Calais at 8 in the morning and arriving here at 2. The country for about twenty miles before arriving here is singularly lovely, to my mind; owing to its abundance of trees, tall aspens, ranged in all manner of groups among the fields; long double lines, with little ditches full of reeds between them, single lines, squares, circles—always definite arrangement of some sort, but full-crowded, covering acre after acre of meadowland, every tree lovely beyond expression—the commonest and poorest of them throwing out its branches more perfectly than Turner’s best work. I suppose they are grown for firing, for they occupy a vast quantity of the land; it is of course all pasture between them, and they form a kind of park-forest, quite unlike anything in England, or indeed any other country that I have seen—running up with undulating trunks fifty or sixty feet, then branching into light plummy heads; pollard willows, of course, mingled among them, and groups of lower trees, but somehow or other always *groups*; never patches and scattered as with us. I was impressed beyond measure with the beauty of their boughs even the moment I left Calais; not the meanest bush but was a study for its grace and inventive lines, I suppose growing faster than in England. But even allowing for this, it seems a mystery to me. Is it that in trees, as in drawing, the line drawn with the greatest swiftness is the best?”]

² [*Odyssey*, vii. 106.]

man has cut down with his keen iron, that he may fit a wheel of it to a fair chariot, and it lies parching by the side of the stream.”¹ It is sufficiently notable that Homer, living in mountainous and rocky countries, dwells thus delightedly on all the *flat* bits; and so I think invariably the inhabitants of mountain countries do, but the inhabitants of the plains do not, in any similar way, dwell delightedly on mountains. The Dutch painters are perfectly contented with their flat fields and pollards; Rubens, though he had seen the Alps, usually composes his landscapes of a hayfield or two, plenty of pollards and willows, a distant spire, a Dutch house with a moat about it, a windmill, and a ditch. The Flemish sacred painters are the only ones who introduce mountains in the distance, as we shall see presently;² but rather in a formal way than with any appearance of enjoyment. So Shakspeare never speaks of mountains with the slightest joy, but only of lowland flowers, flat fields, and Warwickshire streams.³ And if we talk to the mountaineer, he will usually characterise his own country to us as a “pays affreux,” or in some equivalent, perhaps even more violent, German term: but the lowland peasant does not think his country frightful; he either will have no ideas beyond it, or about it; or will think it a very perfect country, and be apt to regard any deviation from its general principle of flatness with extreme disfavour; as the Lincolnshire farmer in *Alton Locke*: “I’ll shaw’ee some’at like a field o’ beans, I wool—none o’ this here darned ups and downs o’ hills, to shake a body’s victuals out of his inwards—all so vlat as a barn’s vloor, for vorty mile on end—there’s the country to live in!”⁴

I do not say whether this be altogether right (though certainly not wholly wrong), but it seems to me that there

¹ [*Iliad*, iv. 482.]

² [See in the next volume, ch. xx. § 16.]

³ [On Shakespeare’s love of the meadows, see below, ch. xiv. § 51, p. 289; and compare *Modern Painters*, vol. iv. ch. xx. §§ 27–29, 37, 38.]

⁴ [Chapter xii. Some words are omitted after “some’at like” and also after “o’ hills.”]

must be in the simple freshness and fruitfulness of level land, in its pale upright trees, and gentle lapse of silent streams, enough for the satisfaction of the human mind in general; and I so far agree with Homer, that, if I had to educate an artist to the full perception of the meaning of the word “gracefulness” in landscape, I should send him neither to Italy nor to Greece, but simply to those poplar groves between Arras and Amiens.

§ 21. But to return more definitely to our Homeric landscape. When it is perfect, we have, as in the above instances, the foliage and meadows together; when imperfect, it is always either the foliage or the meadow; pre-eminently the meadow, or arable field. Thus, meadows of asphodel are prepared for the happier dead; and even Orion, a hunter among the mountains in his lifetime, pursues the ghosts of beasts in these asphodel meadows after death.* So the sirens sing in a meadow;¹ and throughout the *Odyssey* there is a general tendency to the depreciation of poor Ithaca, because it is rocky, and only fit for goats, and has “no meadows;”² for which reason Telemachus refuses Atrides’s present of horses, congratulating the Spartan king at the same time on ruling over a plain which has “plenty of lotus in it, and rushes,” with corn and barley. Note this constant dwelling on the marsh plants, or, at least, those which grow in flat and well-irrigated land, or beside streams: when Scamander, for instance, is restrained by Vulcan, Homer says, very sorrowfully, that “all his lotus, and reeds, and rushes were burnt;”³ and thus Ulysses, after being shipwrecked and nearly drowned, and beaten about the sea for many days and nights, on raft and mast, at last getting ashore at the mouth of a large river, casts himself down first upon its *rushes*, and then, in thankfulness, kisses the

* *Odyssey*, xi. 572, xxiv. 13. The couch of Ceres, with Homer’s usual faithfulness, is made of a *ploughed* field, v. 127.

¹ [*Odyssey*, xii. 45.]

² [*Odyssey*, iv. 601.]

³ [*Iliad*, xxi. 351.]

“corn-giving land,” as most opposed, in his heart, to the fruitless and devouring sea.*

§ 22. In this same passage, also, we find some peculiar expressions of the delight which the Greeks had in trees; for, when Ulysses first comes in sight of land, which gladdens him “as the reviving of a father from his sickness gladdens his children,” it is not merely the sight of the land itself which gives him such pleasure, but of the “land and *wood*.”¹ Homer never throws away any words, at least in such a place as this; and what in another poet would have been merely the filling up of the deficient line with an otherwise useless word, is in him the expression of the general Greek sense, that land of any kind was in nowise grateful or acceptable till there was *wood* upon it (or corn; but the corn, in the flats, could not be seen so far as the black masses of forest on the hill sides), and that, as in being rushy and corn-giving, the low land, so in being woody, the high land was most grateful to the mind of the man who for days and nights had been wearied on the engulfing sea. And this general idea of wood and corn, as the types of the fatness of the whole earth, is beautifully marked in another place of the *Odyssey*,[†] where the sailors in a desert island, having no flour of corn to offer as a meat offering with their sacrifices, take the leaves of the trees, and scatter them over the burnt offering instead.

§ 23. But still, every expression of the pleasure which Ulysses has in this landing and resting, contains uninterruptedly the reference to the utility and sensible pleasantness of all things, not to their beauty. After his first grateful kiss given to the corn-growing land, he considers immediately how he is to pass the night; for some minutes hesitating whether it will be best to expose himself to the misty chill from the river, or run the risk of wild beasts

* *Odyssey*, v. 398, 463.

† *Odyssey*, xii. 357.

¹ [*Odyssey*, v. 395, 398.]

in the wood. He decides for the wood, and finds in it a bower formed by a sweet and a wild olive tree, interlacing their branches, or—perhaps more accurately translating Homer’s intensely graphic expression—“changing their branches with each other” (it is very curious how often, in an entanglement of wood, one supposes the branches to belong to the wrong trees) and forming a roof penetrated by neither rain, sun, nor wind. Under this bower Ulysses collects the “*vain* (or *frustrate*) outpouring of the dead leaves”—another exquisite expression, used elsewhere of useless grief or shedding of tears;—and, having got enough together, makes his bed of them, and goes to sleep, having covered himself up with them, “as embers are covered up with ashes.”¹

Nothing can possibly be more intensely possessive of the *facts* than this whole passage; the sense of utter deadness and emptiness, and frustrate fall in the leaves; of dormant life in the human body,—the fire, and heroism, and strength of it, lulled under the dead brown heap, as embers under ashes, and the knitting of interchanged and close strength of living boughs above. But there is not the smallest apparent sense of there being *beauty* elsewhere than in the human being. The wreathed wood is admired simply as being a perfect roof for it; the fallen leaves only as being a perfect bed for it; and there is literally no more excitement of emotion in Homer, as he describes them, nor does he expect us to be more excited or touched by hearing about them, than if he had been telling us how the chambermaid at the Bull aired the four-poster, and put on two extra blankets.

§ 24. Now, exactly this same contemplation of subservience to human use makes the Greek take some pleasure in *rocks*, when they assume one particular form, but one only—that of a *cave*. They are evidently quite frightful things to him under any other condition, and most of all if they

¹ [*Odyssey*, v. 481–489; and for the “exquisite expression, used elsewhere,” see *Odyssey*, xiv. 215.]

are rough and jagged; but if smooth, looking “sculptured,”¹ like the sides of a ship, and forming a cave or shelter for him, he begins to think them enduring. Hence, associating the ideas of rich and sheltering wood, sea, becalmed and made useful as a port by projecting promontories of rock, and smoothed caves or grottoes in the rocks themselves, we get the pleasantest idea which the Greek could form of a landscape, next to a marsh with poplars in it; not, indeed, if possible, ever to be without these last; thus, in commending the Cyclops’ country as one possessed of every perfection, Homer first says: “They have soft *marshy* meadows near the sea, and good, rich, crumbling, ploughing-land, giving fine deep crops, and vines always giving fruit;” then, “a port so quiet, that they have no need of cables in it; and at the head of the port, a beautiful clear spring just *under a cave*, and *aspen poplars all round it*.”*

§ 25. This, it will be seen, is very nearly Homer’s usual “ideal;” but, going into the middle of the island, Ulysses comes on a rougher and less agreeable bit, though still fulfilling certain required conditions of endurableness; a “cave shaded with laurels,” which, having no poplars about it, is, however, meant to be somewhat frightful, and only fit to be inhabited by a Cyclops.² So in the country of the Læstrygons, Homer, preparing his reader gradually for something very disagreeable, represents the rocks as bare and “exposed to the sun;” only with some smooth and slippery roads over them, by which the trucks bring down wood from the higher hills. Any one familiar with Swiss slopes of hills must remember how often he has descended,

* *Odyssey*, ix. 132, etc. Hence Milton’s
 “From haunted spring, and dale,
 Edged with poplar pale.”³

¹ [glafqroV: *II*. ii. 88, etc.: see below, pp. 305–306.]

² [*Odyssey*, ix. 183; the next reference is *Odyssey*, x. 88.]

³ [*Hymn on Christ’s Nativity*, 184.]

sometimes faster than was altogether intentional, by these same slippery woodman's truck roads.

And thus, in general, whenever the landscape is intended to be lovely, it verges towards the ploughed land and poplars; or, at worst, to *woody* rocks; but, if intended to be painful, the rocks are bare and "sharp."¹ This last epithet, constantly used by Homer for mountains, does not altogether correspond, in Greek, to the English term, nor is it intended merely to characterize the sharp mountain summits; for it never would be applied simply to the edge or point of a sword, but signifies rather "harsh," "bitter," or "painful," being applied habitually to fate, death, and in *Od.* xi. 333 to a halter; and, as expressive of general objectionableness and unpleasantness, to all high, dangerous, or peaked mountains, as the Maleian promontory (a much dreaded one), the crest of Parnassus, the Tereian mountain, and a grim or untoward, though, by keeping off the force of the sea, protective, rock at the mouth of the Jordanus; as well as habitually to inaccessible or impregnable fortresses built on heights.

§ 26. In all this I cannot too strongly mark the utter absence of any trace of the feeling for what we call the picturesque, and the constant dwelling of the writer's mind on what was available, pleasant, or useful; his ideas respecting all landscape being not uncharacteristically summed, finally, by Pallas herself; when, meeting Ulysses, who after his long wandering does not recognize his own country, and meaning to describe it as politely and soothingly as possible, she says:—"This Ithaca of ours is, indeed, a rough country enough, and not good for driving in; but, still, things might be worse: it has plenty of corn, and good wine, and *always rain*, and soft nourishing dew, and it has good feeding for

* *Odyssey*, xiii. 236, etc.

¹ [αἰπυῦν: applied to the Maleian promontory, *Od.* iii. 287; Parnassus, *Od.* xix. 431; Tereian mountain, *II.* ii. 829; Jordanus, *Od.* iii. 293; and habitually, *II.* ii. 603, v. 367, etc.]

goats and oxen, and all manner of wood, and springs fit to drink at all the year round.”

We shall see presently¹ how the blundering, pseudo-picturesque, pseudo-classical minds of Claude and the Renaissance landscape-painters, wholly missing Homer’s practical common sense, and equally incapable of feeling the quiet natural grace and sweetness of his asphodel meadows, tender aspen poplars, or running vines,—fastened on his *ports* and *caves*, as the only available features of his scenery; and appointed the type of “classical landscape” thenceforward to consist in a bay of insipid sea, and a rock with a hole through it.*

§ 27. It may indeed be thought that I am assuming too hastily that this was the general view of the Greeks respecting landscape, because it was Homer’s. But I believe the true mind of a nation, at any period, is always best ascertainable by examining that of its greatest men; and that simpler and truer results will be attainable for us by simply comparing Homer, Dante, and Walter Scott than by attempting (what my limits must have rendered absurdly inadequate, and in which, also, both my time and knowledge must have failed me) an analysis of the landscape in the range of contemporary literature. All that I can do, is to state the general impression, which has been made upon me by my desultory reading, and to mark accurately the grounds for this impression in the works of the greatest men. Now it is quite true that in others of the Greeks, especially in Æschylus and Aristophanes, there is infinitely more of modern feeling, of pathetic fallacy, love of picturesque or beautiful form, and other such elements, than there is in

* Educated, as we shall see hereafter, first in this school, Turner gave the hackneyed composition a strange power and freshness, in his *Glaucus and Scylla*.²

¹ [See in the next volume, ch. xvi. §§ 36, 37.]

² [For the fondness of some painters for “rocks with holes,” see “Notes on the Louvre,” Vol. XII. p. 472. “Glaucus and Scylla” was a subject engraved for (but not published in) *Liber Studiorum*; the drawing is No. 882 in the National Gallery.]

Homer; but then these appear to me just the parts of them which were not Greek, the elements of their minds by which (as one division of the human race always must be with subsequent ones) they are connected with the mediævals and moderns. And without doubt, in his influence over future mankind, Homer is eminently the Greek of Greeks: if I were to associate any one with him it would be Herodotus, and I believe all I have said of the Homeric landscape will be found equally true of the Herodotean, as assuredly it will be of the Platonic;—the contempt, which Plato sometimes expresses by the mouth of Socrates, for the country in general, except so far as it is shady, and has cicadas and running streams to make pleasant noises in it, being almost ludicrous.¹ But Homer is the great type, and the more notable one because of his influence on Virgil, and, through him, on Dante, and all the after ages: and, in like manner, if we can get the abstract of mediæval landscape out of Dante, it will serve us as well as if we had read all the songs of the troubadours, and help us to the farther changes in derivative temper, down to all modern time.

§ 28. I think, therefore, the reader may safely accept the conclusions about Greek landscape which I have got for him out of Homer; and in these he will certainly perceive something very different from the usual imaginations we form of Greek feelings. We think of the Greeks as poetical, ideal, imaginative, in a way that a modern poet or novelist is; supposing that their thoughts about their mythology and world were as visionary and artificial as ours are: but I think the passages I have quoted show that it was not so, although it may be difficult for us to apprehend the strange minglings in them of the elements of faith, which, in our days, have been blended with other parts of human nature in a totally different guise. Perhaps the Greek mind may be best imagined by taking, as its groundwork, that of a good, conscientious, but illiterate Scotch Presbyterian Border farmer of a century or two back, having perfect

¹ [See, for instance, *Phædrus*, 230.]

faith in the bodily appearances of Satan and his imps; and in all kelpies, brownies, and fairies. Substitute for the indignant terrors in this man's mind, a general persuasion of the *Divinity*, more or less beneficent, yet faultful, of all these beings; that is to say, take away his belief in the demoniacal malignity of the fallen spiritual world, and lower, in the same degree, his conceptions of the angelical, retaining for him the same firm faith in both; keep his ideas about flowers and beautiful scenery much as they are,—his delight in regular ploughed land and meadows, and a neat garden (only with rows of gooseberry bushes instead of vines), being, in all probability, about accurately representative of the feelings of Ulysses; then, let the military spirit that is in him, glowing against the Border forager, or the foe of old Flodden and Chevy-Chase, be made more principal, with a higher sense of nobleness in soldiership, not as a careless excitement, but a knightly duty; and increased by high cultivation of every personal quality, not of mere shaggy strength, but graceful strength, aided by a softer climate, and educated in all proper harmony of sight and sound; finally, instead of an informed Christian, suppose him to have only the patriarchal Jewish knowledge of the Deity, and even this obscured by tradition, but still thoroughly solemn and faithful, requiring his continual service as a priest of burnt sacrifice and meat offering; and I think we shall get a pretty close approximation to the vital being of a true old Greek; some slight difference still existing in a feeling which the Scotch farmer would have of a pleasantness in blue hills and running streams, wholly wanting in the Greek mind; and perhaps also some difference of views on the subjects of truth and honesty. But the main points, the easy, athletic, strongly logical and argumentative, yet fanciful and credulous, characters of mind, would be very similar in both; and the most serious change in the substance of the stuff among the modifications above suggested as necessary to turn the Scot into the Greek, is that effect of softer climate and surrounding luxury,

inducing the practice of various forms of polished art,—the more polished, because the practical and realistic tendency of the Hellenic mind (if my interpretation of it be right) would quite prevent it from taking pleasure in any irregularities of form, or imitations of the weeds and wildnesses of that mountain nature with which it thought itself born to contend. In its utmost refinement of work, it sought eminently for orderliness; carried the principle of the leeks in squares, and fountains in pipes, perfectly out in its streets and temples; formalized whatever decoration it put into its minor architectural mouldings, and reserved its whole heart and power to represent the action of living men, or gods, though not unconscious, meanwhile, of

“The simple, the sincere delight;
The habitual scene of hill and dale;
The rural herds, the vernal gale;
The tangled vetches’ purple bloom;
The fragrance of the bean’s perfume,—
Theirs, theirs alone, who cultivate the soil,
And drink the cup of thirst, and eat the bread of toil.”¹

¹ [Shenstone: *Rural Elegance, an Ode to the late Duchess of Somerest*, written 1750, stanza 17. Ruskin does not give the *ipsissima verba*. The first line is “Adieu the simple,” etc.; in line 4, “vetch’s”; and line 6 is “Be theirs alone,” etc.]

CHAPTER XIV

OF MEDIÆVAL LANDSCAPE:—FIRST, THE FIELDS

§ 1. IN our examination of the spirit of classical landscape, we were obliged to confine ourselves to what is left to us in written description. Some interesting results might indeed have been obtained by examining the Egyptian and Ninevite landscape sculpture,¹ but in nowise conclusive enough to be worth the pains of the inquiry; for the landscape of sculpture is necessarily confined in range, and usually inexpressive of the complete feelings of the workman, being introduced rather to explain the place and circumstances of events, than for its own sake. In the Middle Ages, however, the case is widely different. We have written landscape, sculptured landscape, and painted landscape, all bearing united testimony to the tone of the national mind in almost every remarkable locality of Europe.

§ 2. That testimony, taken in its breadth, is very curiously conclusive. It marks the mediæval mind as agreeing altogether with the ancients, in holding that flat land, brooks, and groves of aspens, compose the pleasant places of the earth, and that rocks and mountains are, for inhabitation, altogether to be reprobated and detested; but as disagreeing with the classical mind totally in this other most important respect, that the pleasant flat land is never a ploughed field, nor a rich lotus meadow good for pasture, but *garden* ground covered with flowers, and divided by fragrant hedges, with a castle in the middle of it. The aspens are delighted in, not because they are good for

¹ [For a reference to Ninevite landscape sculpture, see *Seven Lamps*, Vol. VIII. p. 170.]

“coach-making men”¹ to make cart-wheels of, but because they are shady and graceful; and the fruit-trees, covered with delicious fruit, especially apple and orange, occupy still more important positions in the scenery. Singing birds—not “sea crows,”² but nightingales*—perched on every bough: and the ideal occupation of mankind is not to cultivate either the garden or the meadow, but to gather roses and eat oranges in the one, and ride out hawking over the other.

Finally, mountain scenery, though considered as disagreeable for general inhabitation, is always introduced as being proper to meditate in, or to encourage communion with higher beings; and in the ideal landscape of daily life, mountains are considered agreeable things enough, so that they be far enough away.

In this great change there are three vital points to be noticed.

§ 3. The first, the disdain of agricultural pursuits by the nobility; a fatal change, and one gradually bringing about the ruin of that nobility. It is expressed in the mediæval landscape by the eminently pleasurable and horticultural character of everything; by the fences, hedges, castle walls, and masses of useless, but lovely flowers, especially roses. The knights and ladies are represented always as singing, or making love, in these pleasant places. The idea of setting an old knight, like Laertes (whatever his state of fallen fortune), “with thick gloves on to keep his hands from the thorns,”⁴ to prune a row of vines, would have been regarded as the most monstrous violation of the decencies

*Three essential characters; 1. Pride in idleness.*³

* The peculiar dislike felt by the mediævals for the *sea*, is so interesting a subject of inquiry, that I have reserved it for separate discussion in another work, in present preparation, *Harbours of England*.⁵

¹ [armatophgoV anpr: *Iliad*, iv. 485.]

² [A reference to the sea-crows in Calypso’s cave, *Odyssey*, v. 66.]

³ [Ruskin here resumes the marginal summaries, as explained above, p. 12.]

⁴ [See above, p. 236.]

⁵ [See §§ 8–12 of that work, in Vol. XIII.]

of life; and a senator, once detected in the home employments of Cincinnatus, could, I suppose, thenceforward hardly have appeared in society.

§ 4. The second vital point is the evidence of a more sentimental enjoyment of external nature. A Greek, wishing really to enjoy himself, shut himself into a beautiful atrium, with an excellent dinner, and a society of philosophical or musical friends. But a mediæval knight went into his pleasance, to gather roses and hear the birds sing; or rode out hunting or hawking. His evening feast, though riotous enough sometimes, was not the height of his day's enjoyment; and if the attractions of the world are to be shown typically to him, as opposed to the horrors of death, they are never represented by a full feast in a chamber, but by a delicate dessert in an orange grove, with musicians under the trees; or a ride on a May morning, hawk on fist.

This change is evidently a healthy, and a very interesting one.

§ 5. The third vital point is the marked sense that this hawking and apple-eating are not altogether right; that there is something else to be done in the world than that; and that the mountains, as opposed to the pleasant garden-ground, are places where that other something may best be learned; which is evidently a piece of infinite and new respect for the mountains, and another healthy change in the tone of the human heart.

Let us glance at the signs and various results of these changes one by one.

§ 6. The two first named, evil and good as they are, are very closely connected. The more poetical delight in external nature proceeds just from the fact that it is no longer looked upon with the eye of the farmer; and in proportion as the herbs and flowers cease to be regarded as useful, they are felt to be charming. Leeks are not now the most important objects in the garden, but lilies and roses: the herbage which

2. Poetical observance of nature.

3. Disturbed conscience.

Derivative characters: 1. Love of flowers.

a Greek would have looked at only with a view to the number of horses it would feed, is regarded by the mediæval knight as a green carpet for fair feet to dance upon, and the beauty of its softness and colour is proportionally felt by him; while the brook, which the Greek rejoiced to dismiss into a reservoir under the palace threshold, would be, by the mediæval, distributed into pleasant pools, or forced into fountains; and regarded alternately as a mirror for fair faces, and a witchery to ensnare the sunbeams and the rainbow.

§ 7. And this change of feeling involves two others, very important. When the flowers and grass were regarded as means of life, and therefore (as the thoughtful labourer of the soil must always regard them) with the reverence due to those gifts of God which were most necessary to his existence; although their own beauty was less felt, their proceeding from the Divine hand was more seriously acknowledged, and the herb yielding seed, the fruit-tree yielding fruit, though in themselves less admired, were yet solemnly connected in the heart with the reverence of Ceres, Pomona, or Pan. But when the sense of these necessary uses was more or less lost, among the upper classes, by the delegation of the art of husbandry to the hands of the peasant, the flower and fruit, whose bloom or richness thus became a mere source of pleasure, were regarded with less solemn sense of the Divine gift in them; and were converted rather into toys than treasures, chance gifts for gaiety, rather than promised rewards of labour; so that while the Greek could hardly have trodden the formal furrow, or plucked the clusters from the trellised vine, without reverent thoughts of the deities of field and leaf, who gave the seed to fructify, and the bloom to darken, the mediæval knight plucked the violet to wreath in his lady's hair, or strewed the idle rose on the turf at her feet, with little sense of anything in the nature that gave them, but a frail, accidental, involuntary exuberance; while also the Jewish sacrificial system being now done away, as well

as the Pagan mythology, and, with it, the whole conception of meat offering or firstfruits offering, the chiefest seriousnesses of all the thoughts connected with the gifts of nature faded from the minds of the classes of men concerned with art and literature; while the peasant, reduced to serf level, was incapable of imaginative thought, owing to his want of general cultivation. But on the other hand, exactly in proportion as the idea of definite spiritual presence in material nature was lost, the mysterious sense of *unaccountable* life in the things themselves would be increased, and the mind would instantly be laid open to all those currents of fallacious, but pensive and pathetic sympathy, which we have seen to be characteristic of modern times.¹

§ 8. Farther: a singular difference would necessarily result from the far greater loneliness of baronial life, deprived as it was of all interest in agricultural pursuits. The palace of a Greek leader in early times might have gardens, fields, and farms around it, but was sure to be near some busy city or sea-port: in later times, the city itself became the principal dwelling-place, and the country was visited only to see how the farm went on, or traversed in a line of march. Far other was the life of the mediæval baron, nested on his solitary jut of crag; entering into cities only occasionally for some grave political or warrior's purpose, and, for the most part, passing the years of his life in lion-like isolation; the village inhabited by his retainers straggling indeed about the slopes of the rocks at his feet, but his own dwelling standing gloomily apart, between them and the uncompanionable clouds, commanding, from sunset to sunrise, the flowing flame of some calm unvoyaged river, and the endless undulation of the untraversable hills. How different must the thoughts about nature have been, of the noble who lived among the bright marble porticoes of the Greek groups of temple or palace,—in the midst of a

3. *Gloom, caused by enforced solitude.*

¹ [Above, § 4 and ch. xii.; with regard to § 7, see the note on § 40, below.]

plain covered with corn and olives, and by the shore of a sparkling and freighted sea,—from those of the master of some mountain promontory in the green recesses of Northern Europe, watching night by night, from amongst his heaps of storm-broken stone, rounded into towers, the lightning of the lonely sea flash round the sands of Harlech, or the mists changing their shapes for ever, among the changeless pines that fringe the crests of Jura.

§ 9. Nor was it without similar effect on the minds of men that their journeyings and pilgrimages became more frequent than those of the Greek, the extent of ground traversed in the course of them larger, and the mode of travel more companionless. To the Greek, a voyage to Egypt, or the Hellespont, was the subject of lasting fame and fable, and the forests of the Danube and the rocks of Sicily closed for him the gates of the intelligible world. What parts of that narrow world he crossed were crossed with fleets or armies; the camp always populous on the plain, and the ships drawn in cautious symmetry around the shore. But to the mediæval knight, from Scottish moor to Syrian sand, the world was one great exercise ground, or field of adventure; the staunch pacing of his charger penetrated the pathlessness of outmost forest, and sustained the sultriness of the most secret desert. Frequently alone,—or, if accompanied, for the most part only by retainers of lower rank, incapable of entering into complete sympathy with any of his thoughts, he must have been compelled often to enter into dim companionship with the silent nature around him, and must assuredly sometimes have talked to the wayside flowers of his love, and to the fading clouds of his ambition.

§ 10. But, on the other hand, the idea of retirement from the world for the sake of self-mortification, of combat with demons, or communion with angels, and with their King,—authoritatively commended as it was to all men by the continual practice of Christ Himself,—gave to all mountain solitude at once a sanctity and

a terror, in the mediæval mind, which were altogether different from anything that it had possessed in the unChristian periods. On the one side, there was an idea of sanctity attached to rocky wilderness, because it had always been among hills that the Deity had manifested Himself most intimately to men, and to the hills that His saints had nearly always retired for meditation, for especial communion with Him, and to prepare for death. Men acquainted with the history of Moses, alone at Horeb, or with Israel at Sinai,—of Elijah by the brook Cherith, and in the Horeb cave; of the deaths of Moses and Aaron on Hor and Nebo; of the preparation of Jephthah's daughter for her death among the Judæa mountains; of the continual retirement of Christ Himself to the mountains for prayer, His temptation in the desert of the Dead Sea, His sermon on the hills of Capernaum, His transfiguration on Mount Hermon, and His evening and morning walks over Olivet for the four or five days preceding His crucifixion,¹—were not likely to look with irreverent or unloving eyes upon the blue hills that girded their golden horizon, or drew down upon them the mysterious clouds out of the height of the darker heaven. But with this impression of their greater sanctity was involved also that of a peculiar terror. In all this,—their haunting by the memories of prophets, the presences of angels, and the everlasting thoughts and words of the Redeemer,—the mountains ranges seemed separated from the active world, and only to be fitly approached by hearts which were condemnatory of it. Just in so much as it appeared necessary for the noblest men to retire to the hill-recesses before their missions could be accomplished, or their spirits perfected, in so far did the daily world seem by comparison to be pronounced profane and dangerous; and to those who loved that world, and its

¹ [The Bible references here are—Exodus iii. 12; Deuteronomy xxxiii. 2; 1 Kings xvii. 5; Deuteronomy xxxiv. 5; Numbers xx. 28; Judges xi. 37; Matthew iv. 1–4, v.–vii. 27, xvii. 1, 2; Luke ix. 28–36; Matthew xxvi. 30; Luke xxii. 39.]

work, the mountains were thus voiceful with perpetual rebuke, and necessarily contemplated with a kind of pain and fear, such as a man engrossed by vanity feels at being by some accident forced to hear a startling sermon, or to assist at a funeral service. Every association of this kind was deepened by the practice and the precept of the time; and thousands of hearts, which might otherwise have felt that there was loveliness in the wild landscape, shrank from it in dread, because they knew that the monk retired to it for penance, and the hermit for contemplation. The horror which the Greek had felt for hills only when they were uninhabitable and barren, attached itself now to many of the sweetest spots of earth; the feeling was conquered by political interests, but never by admiration; military ambition seized the frontier rock, or maintained itself in the unassailable pass; but it was only for their punishment, or in their despair, that men consented to tread the crooked slopes of the Chartreuse,¹ or the soft glades and dewy pastures of Vallombrosa.

§ 11. In all these modifications of temper and principle there appears much which tends to a passionate, affectionate, or awe-struck observance of the features of natural scenery, closely resembling, in all but this superstitious dread of mountains, our feelings at the present day. But *one* character which the mediævals had in common with the ancients, and that exactly the most eminent character in both, opposed itself steadily to all the feelings we have hitherto been examining,—the admiration, namely, and constant watchfulness of human beauty. Exercised in nearly the same manner as the Greeks, from their youth upwards, their countenances were cast even in a higher mould; for, although somewhat less regular in feature, and affected by minglings of Northern bluntness and stolidity of general expression, together with greater thinness of lip and shaggy formlessness of brow, these less sculpturesque features were,

¹ [Compare *Modern Painters*, vol. v. pt. ix. ch. xi. § 17.]

nevertheless, touched with a seriousness and refinement proceeding first from the modes of thought inculcated by the Christian religion, and secondly from their more romantic and various life. Hence a degree of personal beauty, both male and female, was attained in the Middle Ages, with which classical periods could show nothing for a moment comparable; and this beauty was set forth by the most perfect splendour, united with grace, in dress, which the human race have hitherto invented. The strength of their art-genius was directed in great part to this object; and their best workmen and most brilliant fanciers were employed in wreathing the mail or embroidering the robe. The exquisite arts of enamelling and chasing metal enabled them to make the armour as radiant and delicate as the plumage of a tropical bird; and the most various and vivid imaginations were displayed in the alternations of colour, and fiery freaks of form, on shield and crest: so that of all the beautiful things which the eyes of men could fall upon, in the world about them, the most beautiful must have been a young knight riding out in morning sunshine, and in faithful hope.

“His broad, clear brow in sunlight glow’d;
 On burnished hooves his war-horse trode;
 From underneath his helmet flow’d
 His coal-black curls, as on he rode.
 All in the blue, unclouded weather,
 Thick-jewelled shone the saddle-leather;
 The helmet and the helmet-feather
 Burn’d like one burning flame together;
 The gemmy bridle glitter’d free,
 Like to some branch of stars we see
 Hung in the Golden Galaxy.”¹

§ 12. Now, the effect of this superb presence of human beauty on men in general was, exactly as it had been in Greek times, first to turn their thoughts and glances in great part away from all other

5. Care for human beauty.

¹ [Tennyson: *The Lady of Shalott*, part iii. (portions of verses 3, 2, and 1 strung together).]

beauty but that, and to make the grass of the field take to them always more or less the aspect of a carpet to dance upon, a lawn to tilt upon, or a serviceable crop of hay; and, secondly, in what attention they paid to this lower nature, to make them dwell exclusively on what was graceful, symmetrical, and bright in colour. All that was rugged, rough, dark, wild, untermated, they rejected at once, as the domain of “salvage men”¹ and monstrous giants: all that they admired was tender, bright, balanced, enclosed, symmetrical—only symmetrical in the noble and free sense: for what we moderns call “symmetry,” or “balance,” differs as much from mediæval symmetry as the poise of a grocer’s scales, or the balance of an Egyptian mummy with its hands tied to its sides, does from the balance of a knight on his horse, striking with the battle-axe, at the gallop; the mummy’s balance looking wonderfully perfect, and yet sure to be one-sided if you weigh the dust of it,—the knight’s balance swaying and changing like the wind, and yet as true and accurate as the laws of life.

§ 13. And this love of symmetry was still further enhanced by the peculiar duties required of art at the time; for, in order to fit a flower or leaf for inlaying in armour, or showing clearly in glass, it was absolutely necessary to take away its complexity, and reduce it to the condition of a disciplined and orderly pattern; and this the more, because, for all military purposes, the device, whatever it was, had to be distinctly intelligible at extreme distance. That it should be a good imitation of nature, when seen near, was of no moment; but it was of highest moment that when first the knight’s banner flashed in the sun at the turn of the mountain road, or rose, torn and bloody, through the drift of the battle dust, it should still be discernible what the bearing was.

¹ [The modern and different meaning of “salvage” has driven it out of use in its original meaning “savage,” as, for instance, in Scott (*Guy Mannering*, ch. xli.): “on either side stood as supporters, in full human size, or larger, a salvage man *proper*, to use the language of heraldry, *wreathed and cinctured*, and holding in his hand an oak tree *eradicated*.”]

"At length the freshening western blast
 Aside the shroud of battle cast;
 And first the ridge of mingled spears
 Above the brightening cloud appears;
 And in the smoke the pennons flew,
 As in the storm the white sea-mew;
 Then mark'd they, dashing broad and far,
 The broken billows of the war.
 Wide raged the battle on the plain;
 Spears shook, and falchions flashed amain;
 Fell England's arrow-flight like rain;
 Crests rose, and stoop'd, and rose again,
 Wild and disorderly.
 Amidst the scene of tumult, high,
They saw Lord Marmion's falcon fly,
And stainless Tunstall's banner white,
*And Edmund Howard's lion bright."*¹

It was needed, not merely that they should see it was a falcon, but Lord Marmion's falcon; not only a lion, but the Howard's lion. Hence, to the one imperative end of *intelligibility*, every minor resemblance to nature was sacrificed, and above all, the *curved*, which are chiefly the confusing lines; so that the straight, elongated back, doubly elongated tail, projected and separate claws, and other rectilinear unnaturalnesses of form, became the means by which the leopard was, in midst of the mist and storm of battle, distinguished from the dog, or the lion from the wolf; the most admirable fierceness and vitality being, in spite of these necessary changes (so often shallowly sneered at by the modern workman), obtained by the old designer.

Farther, it was necessary to the brilliant harmony of colour, and clear setting forth of everything, that all confusing shadows, all dim and doubtful lines should be rejected: hence at once an utter denial of natural appearances by the great body of workmen; and a calm rest in a practice of representation which would make either boar or lion blue, scarlet, or golden, according to the device of the knight, or the need of such and such a colour in that place of the pattern; and which wholly denied that any

¹ [*Marmion* canto vi. 26; three lines are omitted after "The broken billows of the war."]

substance ever cast a shadow, or was affected by any kind of obscurity.

§ 14. All this was in its way, and for its end, absolutely right, admirable, and delightful; and those who despise it, laugh at it, or derive no pleasure from it, are utterly ignorant of the highest principles of art, and are mere tyros and beginners in the practice of colour. But, admirable though it might be, one necessary result of it was a farther withdrawal of the observation of men from the refined and subtle beauty of nature; so that the workman who first was led to think *lightly* of natural beauty, as being subservient to human, was next led to think *inaccurately* of natural beauty, because he had continually to alter and simplify it for his practical purposes.

7. Therefore, in accurate rendering of nature.

§ 15. Now, assembling all these different sources of the peculiar mediæval feeling towards nature in one view, we have:

- 1st. Love of the garden instead of love of the farm, leading to a sentimental contemplation of nature, instead of a practical and agricultural one. (§§ 3, 4, 6.)
- 2nd. Loss of sense of actual Divine presence, leading to fancies of fallacious animation, in herbs, flowers, clouds, etc. (§ 7.)
- 3rd. Perpetual, and more or less undisturbed, companionship with wild nature. (§§ 8, 9.)
- 4th. Apprehension of demoniacal and angelic presence among mountains, leading to a reverent dread of them. (§ 10.)
- 5th. Principalness of delight in human beauty, leading to comparative contempt of natural objects. (§ 11.)
- 6th. Consequent love of order, light, intelligibility, and symmetry, leading to dislike of the wildness, darkness, and mystery of nature. (§ 12.)
- 7th. Inaccuracy of observance of nature, induced by the habitual practice of change on its forms. (§ 13.)

From these mingled elements, we should necessarily expect to find resulting, as the characteristic of mediæval landscape art, compared with Greek, a far higher sentiment about it, and affection for it, more or less subdued by still greater respect for the loveliness of man, and therefore subordinated entirely to human interests; mingled with curious traces of terror, piety, or superstition, and cramped by various formalisms,—some wise and necessary, some feeble, and some exhibiting needless ignorance and inaccuracy.

Under these lights, let us examine the facts.

§ 16. The landscape of the Middle Ages is represented in a central manner by the illuminations of the MSS. of Romances, executed about the middle of the fifteenth century. On one side of these stands the earlier landscape work, more or less treated as simple decoration; on the other, the later landscape work, becoming more or less affected with modern ideas and modes of imitation.

These central fifteenth century landscapes are almost invariably composed of a grove or two tall trees, a winding river, and a castle, or a garden: the peculiar feature of both these last being *trimness*; the artist always dwelling especially on the fences; wreathing the espaliers indeed prettily with sweetbriar, and putting pots of orange-trees on the tops of the walls, but taking great care that there shall be no loose bricks in the one, nor broken stake in the other,—the trouble and ceaseless warfare of the times having rendered security one of the first elements of pleasantness, and making it impossible for any artist to conceive Paradise but as surrounded by a moat, or to distinguish the road to it better than by its narrow wicket gate, and watchful porter.

§ 17. One of these landscapes is thus described by Macaulay:—“We have an exact square, enclosed by the rivers Pison, Gihon, Hiddekel, and Euphrates, each with a convenient bridge in the centre; rectangular beds of flowers; a long canal neatly bricked and railed in; the tree of knowledge, clipped like one of the limes behind the Tuileries,

standing in the centre of the grand alley; the snake turned around it, the man on the right hand, the woman on the left, and the beasts drawn up in an exact circle round them.”¹

All this is perfectly true; and seems in the description very curiously foolish. The only curious folly, however, in the matter is the exquisite *naïveté* of the historian, in supposing that the quaint landscape indicates in the understanding of the painter so marvellous an inferiority to his own; whereas, it is altogether his own wit that is at fault, in not comprehending that nations, whose youth had been decimated among the sands and serpents of Syria, knew probably nearly as much about Eastern scenery as youths trained in the schools of the modern Royal Academy; and that this curious symmetry was entirely symbolic, only more or less modified by the various instincts which I have traced above. Mr. Macaulay is evidently quite unaware that the serpent with the human head, and body twisted round the tree, was the universally-accepted symbol of the evil angel, from the dawn of art up to Michael Angelo; that the greatest sacred artists invariably place the man on the one side of the tree, the woman on the other, in order to denote the enthroned and balanced dominion about to fall by temptation; that the beasts are ranged (when they *are* so, though this is much more seldom the case,) in a circle round them, expressly to mark that they were then not wild, but obedient, intelligent, and orderly beasts; and that the four rivers are trenched and enclosed on the four sides, to mark that the waters which now wander in waste, and destroy in fury, had then for their principal office to “water the garden” of God.² The description is, however, sufficiently apposite and interesting as bearing upon what I have noted respecting the eminent *fence*-loving spirit of the mediævals.

§ 18. Together with this peculiar formality, we find an infinite delight in drawing pleasant flowers, always articulating

¹ [Macaulay's *Essays*: “Moore's Life of Lord Byron.”]

² [Genesis ii. 10.]

and outlining them completely; the sky is always blue, having only a few delicate white clouds in it, and in the distance are blue mountains, very far away, if the landscape is to be simply delightful; but brought near, and divided into quaint overhanging rocks, if it is intended to be meditative, or a place of saintly seclusion.¹ But the whole of it always,—flowers, castles, brooks, clouds, and rocks,—subordinate to the human figures in the foreground, and painted for no other end than that of explaining their adventures and occupations.

§ 19. Before the idea of landscape had been thus far developed, the representations of it had been purely typical: the objects which had to be shown in order to explain the scene of the event, being firmly outlined, usually on a pure golden or chequered colour background, not on sky. The change from the golden background (characteristic of the finest thirteenth century work) and the coloured chequer (which in like manner belongs to the finest fourteenth) to the blue sky, gradated to the horizon, takes place early in the fifteenth century, and is the *crisis* of change in the spirit of mediæval art. Strictly speaking, we might divide the art of Christian times into two great masses—Symbolic and Imitative;—the symbolic, reaching from the earliest periods down to the close of the fourteenth century, and the imitative from that close, to the present time; and then the most important circumstance indicative of the culminating point, or turn of tide, would be this of the change from chequered background to sky background. The uppermost figure in Plate 7 opposite, representing the tree of knowledge, taken from a somewhat late thirteenth century Hebrew manuscript (Additional 11, 639) in the British Museum,²

¹ [In the MS. Ruskin added here a reference to an illuminated missal:—

“Perhaps the most exquisite instance I remember of this kind of design in central landscape is the group of lilies in the garden in which Henry VI. is in prayer.”]

² [In Ruskin’s notes on the illuminated MSS. in the British Museum (see Vol. XII. p. lxviii.) is the following entry (1854):—

“Add. 11, 639. Glorious Hebrew one. See Trees at p. 330.”

The MS. is of the Pentateuch. For the other figure in Plate 7, see *Modern Painters*, vol. iv. ch. v. § 16 (Vol. VI. p. 98).]

J.J. Lang

W. G. & T. G. Ed. 1871

7. Botany of 13th Century.
(Apple tree and Cyclamen)

will at once illustrate Mr. Macaulay's "serpent turned round the tree," and the mode of introducing the chequered background, and will enable the reader better to understand the peculiar feeling of the period, which no more intended the formal walls or streams for an imitative representation of the Garden of Eden, than these chequers for an imitation of sky.

§ 20. The moment the sky is introduced (and it is curious how perfectly it is done *at once*, many manuscripts presenting in alternate pages, chequered backgrounds, and deep blue skies exquisitely gradated to the horizon)—the moment, I say, the sky is introduced, the spirit of art becomes for evermore changed, and thenceforward it gradually proposes imitation more and more as an end, until it reaches the Turnerian landscape. This broad division into two schools would therefore be the most true and accurate we could employ, but not the most convenient. For the great mediæval art lies in a cluster about the culminating point, including symbolism on one side, and imitation on the other, and extending like a radiant cloud upon the mountain peak of ages, partly down both sides of it, from the year 1200 to 1500; the brightest part of the cloud leaning a little backwards, and poising itself between 1250 and 1350. And therefore the most convenient arrangement is into Romanesque and barbaric art, up to 1200, mediæval art, 1200 to 1500,—and modern art, from 1500 downwards. But it is only in the earlier or symbolic mediæval art, reaching up to the close of the fourteenth century, that the peculiar modification of natural forms for decorative purposes is seen in its perfection, with all its beauty, and all its necessary shortcomings; the minds of men being accurately balanced between that honour for the superior human form which they shared with the Greek ages, and the sentimental love of nature which was peculiar to their own. The expression of the two feelings will be found to vary according to the material and place of the art; in painting, the conventional forms are more adopted, in order to obtain definition, and

brilliance of colour, while in sculpture the life of nature is often rendered with a love and faithfulness which put modern art to shame. And in this earnest contemplation of the natural facts, united with an endeavour to simplify, for clear expression, the results of that contemplation, the ornamental artists arrived at two abstract conclusions about form, which are highly curious and interesting.

§ 21. They saw, first, that a leaf might always be considered as a sudden expansion of the stem that bore it; an uncontrollable expression of delight, on the part of the twig, that spring had come, shown in a fountain-like exhalation of its tender green heart into the air. They saw that in this violent proclamation of its delight and liberty, whereas the twig had, until that moment, a disposition only to grow quietly forwards, it expressed its satisfaction and extreme pleasure in sunshine by springing out to right and left. Let *a b*, Fig. 1, Plate 8, be the twig growing forward in the direction from *a* to *b*. It reaches the point *b*, and then—spring coming,—not being able to contain itself, it bursts out in every direction, even springing backwards at first for joy; but as this backward direction is contrary to its own proper fate and nature, it cannot go on so long, and the length of each rib into which it separates is proportioned accurately to the degree in which the proceedings of that rib are in harmony with the natural destiny of the plant. Thus the rib *c*, entirely contradictory, by the direction of his life and energy, of the general intentions of the tree, is but a short-lived rib; *d*, not quite so opposite to his fate, lives longer; *e*, accommodating himself still more to the spirit of progress, attains a greater length still; and the largest rib of all is the one who has not yielded at all to the erratic disposition of the others when spring came, but, feeling quite as happy about the spring as they did, nevertheless took no holiday, minded his business, and grew straightforward.

§ 22. Fig. 6 in the same plate, which shows the disposition of the ribs in the leaf of an American Plane,

exemplifies the principle very accurately: it is indeed more notably seen in this than in most leaves, because the ribs at the base have evidently had a little fraternal quarrel about their spring holiday; and the more gaily-minded ones, getting together into trios on each side, have rather pooh-poohed and laughed at the seventh brother in the middle, who wanted to go on regularly, and attend to his work. Nevertheless, though thus starting quite by himself in life, this seventh brother, quietly pushing on in the right direction, lives longest, and makes the largest fortune, and the triple partnerships on the right and left meet with a very minor prosperity.

§ 23. Now if we enclose Fig. 1 in Plate 8 with two curves passing through the extremities of the ribs, we get Fig. 2, the central type of all leaves. Only this type is modified of course in a thousand ways by the life of the plant. If it be marsh or aquatic, instead of springing out in twigs, it is almost certain to expand in soft currents, as the liberated stream does at its mouth into the ocean, Fig. 3 (*Alisma Plantago*¹); if it be meant for one of the crowned and lovely trees of the earth, it will separate into stars, and each ray of the leaf will form a ray of light in the crown, Fig. 5 (*Horsechestnut*); and if it be a commonplace tree, rather prudent and practical than imaginative, it will not expand all at once, but throw out the ribs every now and then along the central rib, like a merchant taking his occasional and restricted holiday, Fig. 4 (*Elm*).

§ 24. Now in the bud, where all these proceedings on the leaf's part are first imagined, the young leaf is generally (always ?) doubled up in embryo, so as to present the profile of the half leaves, as Fig. 7, only in exquisite complexity of arrangement; Fig. 9, for instance, is the profile of the leaf-bud of a rose. Hence the general arrangement of line represented by Fig. 8 (in which the lower line is

¹ [Compare *Seven Lamps* (Vol. VIII. p. 168 and *n.*), and *Stones of Venice*, vol. i. (Vol. IX. pp. 268, 269); and for further studies of the horsechestnut, *Modern Painters*, vol. v. pt. vi. ch. iii. §§ 12, 13; ch. iv. §§ 9–11; ch. x. § 12.]

slightly curved to express the bending life in the spine) is everlastingly typical of the expanding power of joyful vegetative youth; and it is of all simple forms the most exquisitely delightful to the human mind. It presents itself in a thousand different proportions and variations in the buds and profiles of leaves; those being always the loveliest in which, either by accidental perspective of position, or inherent character in the tree, it is most frequently presented to the eye. The branch of bramble, for instance, Fig. 10, at the bottom of Plate 8,

Fig. 3

owes its chief beauty to this perpetual recurrence of this typical form; and we shall find presently the enormous importance of it, even in mountain ranges, though, in these, *falling* force takes the place of *vital* force.

§ 25. This abstract conclusion the great thirteenth century artists were the first to arrive at; and whereas, before their time, ornament had been constantly refined into intricate and subdivided symmetries, they were content with this simple form as the termination of its most important features. Fig. 3, which is a scroll out of a Psalter executed in the latter half of the thirteenth century, is a sufficient example of a practice at that time absolutely universal.

§ 26. The second great discovery of the Middle Ages in

floral ornament, was that, in order completely to express the law of subordination among the leaf-ribs, two ribs were necessary, *and no more*, on each side of the leaf, forming a series of three with the central one, because proportion is between three terms at least.

That is to say, when they had only three ribs altogether, as *a*, Fig. 4, no *law* of relation was discernible between the ribs, or the leaflets they bore; but by the addition of a third on each side, as at *b*, proportion

instantly was expressible, whether arithmetical or geometrical, or of any other or of any other kind. Hence the adoption of forms more or less approximating to that at *c* to that at *c* (young ivy), or *d* (wild geranium), as the favourite elements of their floral ornament,

Fig. 4

those leaves being, in their disposition of masses, the simplest which can express a perfect law of proportion just as the outline Fig. 7, Plate 8, is the simplest which can express a perfect law of growth.

Plate 9 opposite gives, in rude outline, the arrangement of the border of one of the pages of a missal in my own possession, executed for the Countess Yolande of Flanders,* in the latter half of the fourteenth century, and furnishing, in exhaustless variety, the most graceful examples I have ever seen of the favourite decoration at the period, commonly now known as the "Ivy-leaf" pattern.

§ 27. In thus reducing these two everlasting laws of

* Married to Philip, younger son of the King of Navarre, in 1352. She died in 1394.¹

Botany of the 14th Century.

From the Prayerbook of Yolande of Navarre.

beauty to their simplest possible exponents, the mediæval workmen were the first to discern and establish the principles of decorative art to the end of time, nor of decorative art merely, but of mass arrangement in general. For the members of any great composition, arranged about a centre, are always reducible to the law of the ivy leaf, the best cathedral entrances having five porches corresponding in proportional purpose to its five lobes (three being an imperfect, and seven a superfluous number); while the loveliest groups of lines attainable in any pictorial composition are always based on the section of the leaf-bud, Fig. 7, Plate 8, or on the relation of its ribs to the convex curve enclosing them.

§ 28. These discoveries of ultimate truth are, I believe, never made philosophically, but instinctively; so that wherever we find a high abstract result of the kind, we may be almost sure it has been the work of the penetrative imagination, acting under the influence of strong affection. Accordingly, when we enter on our botanical inquiries, I shall have occasion to show¹ with what tender and loving fidelity to nature the masters of the thirteenth century always traced the leading lines of their decorations, either in missal-painting or sculpture, and how totally in this respect their methods of subduing, for the sake of distinctness, the natural forms they loved so dearly, differ from the iron formalisms to which the Greeks, careless of all that was not completely divine or completely human, reduced the thorn of the acanthus, and softness of the lily. Nevertheless, in all this perfect and loving decorative art, we have hardly any careful references to other landscape features than herbs and flowers; mountains, water, and clouds are introduced so rudely, that the representations of them can never be received for anything else than letters or signs. Thus the *sign* of clouds, in the thirteenth century, is an undulating band, usually, in painting, of blue edged with white, in sculpture, wrought so as to resemble very nearly

¹ [See in the next volume, ch. xvii. §§ 19, 20 (Vol. VI. pp. 333–334).]

the folds of a curtain closely tied, and understood for clouds only by its position, as surrounding angels or saints in heaven, opening to souls ascending at the Last Judgment, or forming canopies over the Saviour or the Virgin. Water is represented by zigzag lines, nearly resembling those employed for clouds, but distinguished, in sculpture, by having fish in it;¹ in painting, both by fish and a more continuous blue or green colour. And when these unvaried symbols are associated under the influence of that love of firm fence, moat, and every other means of definition which we have seen to be one of the prevailing characteristics of the mediæval mind, it is not possible for us to conceive, through the rigidity of the signs employed, what were the real feelings of the workman or spectator about the natural landscape. We see that the thing carved or painted is not intended in anywise to imitate the truth, or convey to us the feelings which the workman had in contemplating the truth. He has got a way of talking about it so definite and cold, and tells us with his chisel so calmly that the knight had a castle to attack, or the saint a river to cross dryshod, without making the smallest effort to describe pictorially either castle or river, that we are left wholly at fault as to the nature of the emotion with which he contemplated the real objects. But that emotion, as the intermediate step between the feelings of the Grecian and the modern, it must be our aim to ascertain as clearly as possible; and, therefore, finding it not at this period completely expressed in visible art, we must, as we did with the Greeks, take up the written landscape instead, and examine this mediæval sentiment as we find it embodied in the poem of Dante.

§ 29. The thing that must first strike us in this respect, as we turn our thoughts to the poem, is, unquestionably, the *formality* of its landscape.

Milton's effort, in all that he tells us of his Inferno, is

¹ [Compare *Stones of Venice*, vol. i. (Vol. IX. p. 272).]

to make it indefinite; Dante's, to make it *definite*. Both, indeed, describe it as entered through gates; but, within the gate, all is wild and fenceless with Milton, having indeed its four rivers,—the last vestige of the mediæval tradition,—but rivers which flow through a waste of mountain and moorland, and by “many a frozen, many a fiery Alp.”¹ But Dante's *Inferno* is accurately separated into circles drawn with well-pointed compasses; mapped and properly surveyed in every direction, trenched in a thoroughly good style of engineering from depth to depth, and divided in the “*accurate middle*” (*dritto mezzo*)² of its deepest abyss, into a concentric series of ten moats and embankments, like those about a castle, with bridges from each embankment to the next; precisely in the manner of those bridges over Hiddekel and Euphrates, which Mr. Macaulay thinks so innocently designed, apparently not aware that he is also laughing at Dante. These larger fosses are of rock, and the bridges also; but as he goes farther into detail, Dante tells us of various minor fosses and embankments, in which he anxiously points out to us not only the formality, but the neatness and perfectness, of the stonework. For instance, in describing the river Phlegethon, he tells us that it was “paved with stone at the bottom,³ and at the sides, and *over the edges of the sides*,” just as the water is at the baths of Bulicame; and for fear we should think this embankment at all *larger* than it really was, Dante adds, carefully, that it was made just like the embankments of Ghent or Bruges against the sea, or those in Lombardy which bank the Brenta, only “not so high, nor so wide,” as any of these.

¹ [*Paradise Lost*, ii. 620; *Inferno*, iii. 1–11.]

² [*Inferno*, xi. 16 *seq.*, xviii. 1 *seq.*]

³ [*Inferno*, xiv. 79:—

“Lo fondo suo, ed ambo le pendici

Fatt' eran pietra, e i margini da lato.”

In his copy for revision, Ruskin notes that his translation “paved with stones” is “Wrong. Petrified, encrusted with stone. This noble idea (he adds) of Phlegethon *petrifying* is very precious.” The other references in § 29 are *Inferno*, xv. 4–12; iv. 106 *seq.*; viii. 68 *seq.* Ecbatana is not Dante's simile, but refers to Herodotus, as cited in the *Stones of Venice*, vol. ii. (Vol. X. p. 175 and *n.*.)]

And besides the trenches, we have two well-built castles; one, like Ecbatana, with seven circuits of wall (and surrounded by a fair stream), wherein the great poets and sages of antiquity live; and another, a great fortified city with walls of iron, red-hot, and a deep fosse round it, and full of "grave citizens,"—the city of Dis.

§ 30. Now, whether this be in what we moderns call "good taste," or not, I do not mean just now to inquire—Dante having nothing to do with taste, but with the facts of what he had seen; only, so far as the imaginative faculty of the two poets is concerned, note that Milton's vagueness is not the sign of imagination, but of its absence, so far as it is significative in the matter. For it does not follow, because Milton did not map out his *Inferno* as Dante did, that he *could* not have done so if he had chosen; only, it was the easier and less imaginative process to leave it vague than to define it. Imagination is always the seeing and asserting faculty;¹ that which obscures or conceals may be judgment, or feeling, but not invention. The invention, whether good or bad, is in the accurate engineering, not in the fog and uncertainty.

§ 31. When we pass with Dante from the *Inferno* to Purgatory, we have indeed more light and air, but no more liberty; being now confined on various ledges cut into a mountain side, with a precipice on one hand and a vertical wall on the other; and, lest here also we should make any mistake about magnitudes, we are told that the ledges were eighteen feet wide,* and that the ascent from one to the other was by steps, made like those which go up from Florence to the Church of San Miniato.†

Lastly, though in the Paradise there is perfect freedom and infinity of space, though for trenches we have planets, and for cornices constellations, yet there is more cadence,

* "Three times the length of the human body."—*Purg.* x. 24.

† *Purg.* xii. 102.

¹ [See above, p. 177.]

procession, and order among the redeemed souls than any other; they fly, so as to describe letters and sentences in the air, and rest in circles, like rainbows, or determinate figures, as of a cross and an eagle; in which certain of the more glorified natures are so arranged as to form the eye of the bird, while those most highly blessed are arranged with their white crowds in leaflets, so as to form the image of a white rose in the midst of heaven.¹

§ 32. Thus, throughout the poem, I conceive that the first striking character of its scenery is intense definition; precisely the reflection of that definiteness which we have already traced in pictorial art. But the second point which seems noteworthy is, that the flat ground and embanked trenches are reserved for the Inferno: and that the entire territory of the Purgatory is a mountain, thus marking the sense of that purifying and perfecting influence in mountains which we saw the mediæval mind was so ready to suggest. The same general idea is indicated at the very commencement of the poem, in which Dante is overwhelmed by fear and sorrow in passing through a dark forest, but revives on seeing the sun touch the top of a hill, afterwards called by Virgil “the pleasant mount—the cause and source of all delight.”²

§ 33. While, however, we find this greater honour paid to mountains, I think we may perceive a much greater dread and dislike of woods. We saw³ that Homer seemed to attach a pleasant idea, for the most part, to forests; regarding them as sources of wealth and places of shelter; and we find constantly an idea of sacredness attached to them, as being haunted especially by the gods; so that even the wood which surrounds the house of Circe is spoken of as a sacred thicket,⁴ or rather, as a sacred glade, or labyrinth of

¹ [The references to the *Paradiso* are as follow: (letters and sentences) xviii. 70–96; (eagle) 97–114; (cross) xiv. 100 *seq.*; (circles like rainbow) xxviii. 23–33; (eye of bird) xxi. 31–72; (white rose) xxx. 117 *seq.*]

² [*Inferno*, i. 77, 78.]

³ [See above, pp. 240, 241.]

⁴ [*Odyssey*, x. 275: *ieraV ana bhssaV*; see below, p. 282.]

glades (of the particular word used I shall have more to say presently); and so the wood is sought as a kindly shelter by Ulysses, in spite of its wild beasts; and evidently regarded with great affection by Sophocles, for, in a passage¹ which is always regarded by readers of Greek tragedy with peculiar pleasure, the aged and blind Œdipus, brought to rest in “the sweetest resting-place” in all the neighbourhood of Athens, has the spot described to him as haunted perpetually by nightingales, which sing “in the green glades and in the dark ivy, and in the thousand-fruited, sunless, and windless thickets of the god” (Bacchus); the idea of the complete shelter from wind and sun being here, as with Ulysses, the uppermost one. After this come the usual staples of landscape,—narcissus, crocus, plenty of rain, olive trees; and last, and the greatest boast of all,—“it is a good country for horses, and conveniently by the sea;” but the prominence and pleasantness of the thick wood in the thoughts of the writer are very notable; whereas to Dante the idea of a forest is exceedingly repulsive, so that, as just noticed, in the opening of his poem, he cannot express a general despair about life more strongly than by saying he was lost in a wood so savage and terrible, that “even to think or speak of it is distress,—it was so bitter,—it was something next door to death;”² and one of the saddest scenes in all the *Inferno* is in a forest, of which the trees are haunted by lost souls: while (with only one exception), whenever the country is to be beautiful, we find ourselves coming out into open air and open meadows.³

It is quite true that this is partly a characteristic, not merely of Dante, or of mediæval writers, but of *southern* writers; for the simple reason that the forest, being with them higher upon the hills, and more out of the way than in the north, was generally a type of lonely and savage

¹ [*Œdipus Coloneus*, 668–711.]

² [See *Inferno*, i. 1–7. The following reference is to *Inferno*, xiii. 94 *seq.*; the “exception” being the wood in the terrestrial paradise, *Purgatorio*, xxviii. 1 *seq.*, referred to in the next paragraph of the text.]

³ [See, for example, *Inferno*, iv. 111, 116, 118; *Purgatorio*, xxvii. 98–99.]

places; while in England, the “greenwood,” coming up to the very walls of the towns, it was possible to be “merry in the good greenwood,”¹ in a sense which an Italian could not have understood. Hence Chaucer, Spenser, and Shakspeare send their favourites perpetually to the woods for pleasure or meditation; and trust their tender Canace,² or Rosalind, or Helena, or Silvia, or Belphebe, where Dante would have sent no one but a condemned spirit. Nevertheless, there is always traceable in the mediæval mind a dread of thick foliage, which was not present to that of a Greek; so that, even in the north, we have our sorrowful “children in the wood,” and black huntsman of the Hartz forests, and such other wood terrors; the principal reason for the difference being that a Greek, being by no means given to travelling, regarded his woods as so much valuable property; and if he ever went into them for pleasure, expected to meet one or two gods in the course of his walk, but no banditti; while a mediæval, much more of a solitary traveller, and expecting to meet with no gods in the thickets, but only with thieves, or a hostile ambush, or a bear, besides a great deal of troublesome ground for his horse, and a very serious chance, next to a certainty, of losing his way, naturally kept in the open ground as long as he could, and regarded the forests, in general, with anything but an eye of favour.

§ 34. These, I think, are the principal points which must strike us, when we first broadly think of the poem as compared with classical work. Let us now go a little more into detail.

As Homer gave us an ideal landscape, which even a god might have been pleased to behold, so Dante³ gives us, fortunately, an ideal landscape, which is specially intended for the terrestrial paradise. And it will doubtless be with some surprise, after our reflections above on the

¹ [*Lady of the Lake*, iv. 12.]

² [In *The Squire's Tale*.]

³ [In *Purgatorio*, xxviii., as mentioned on the last page; for Homer's ideal landscape, see p. 234.]

general tone of Dante's feelings, that we find ourselves here first entering a *forest*, and that even a *thick* forest. But there is a peculiar meaning in this. With any other poet than Dante, it might have been regarded as a wanton inconsistency. Not so with him: by glancing back to the two lines which explain the nature of Paradise, we shall see what he means by it. Virgil tells him, as he enters it, "Henceforward, take thine own pleasure for guide; thou art beyond the steep ways, and beyond all Art;"¹—meaning, that the perfectly purified and noble human creature, having no pleasure but in right, is past all effort, and past all *rule*. Art has no existence for such a being. Hence, the first aim of Dante, in his landscape imagery, is to show evidence of this perfect liberty, and of the purity and sinlessness of the new nature, converting pathless ways into happy ones. So that all those fences and formalisms which had been needed for him in imperfection, are removed in this paradise; and even the pathlessness of the wood, the most dreadful thing possible to him in his days of sin and shortcoming, is now a joy to him in his days of purity. And as the fencelessness and thicket of sin led to the fettered and fearful order of eternal punishment, so the fencelessness and thicket of the free virtue lead to the loving and constellated order of eternal happiness.

§ 35. This forest, then, is very like that of Colonos in several respects—in its peace and sweetness, and number of birds; it differs from it only in letting a light breeze through it, being therefore somewhat thinner than the Greek wood; the tender lines which tell of the voices of the birds mingling with the wind, and of the leaves all turning one way before it, have been more or less copied by every poet since Dante's time. They are, so far as I

¹ [*Purgatorio*, xxvii. 130: "Fuor se' dell' erte vie, fuor se' dell' arte." Ruskin, however, mis-translates the line, the last word of which is the adjective "narrow," and not the substantive "art": thus Cary: "Thou hast o'ercome the steeper way, O'ercome the straiter."]

know, the sweetest passage of wood description which exists in literature.¹

Before, however, Dante has gone far in this wood,—that is to say, only so far as to have lost sight of the place where he entered it, or rather, I suppose, of the light under the boughs of the outside trees, and it must have been a very thin wood indeed if he did not do this in some quarter of a mile's walk,—he comes to a little river,² three paces over, which bends the blades of grass to the left, with a meadow on the other side of it; and in this meadow

“A lady, graced with solitude, who went
Singing, and setting flower by flower apart,
By which the path she walked on was besprent.
'Ah, lady beautiful, that basking art
In beams of love, if I may trust thy face,
Which useth to bear witness of the heart,
Let liking come on thee,' said I, 'to trace
Thy path a little closer to the shore,
Where I may reap the hearing of thy lays.
Thou mindest me, how Proserpine of yore
Appeared in such a place, what time her mother
Lost her, and she the spring, for evermore.'
As, pointing downwards and to one another
Her feet, a lady bendeth in the dance,
And barely setteth one before the other,
Thus, on the scarlet and the saffron glance
Of flowers, with motion maidenlike she bent
(Her modest eyelids drooping and askance);
And there she gave my wishes their content,
Approaching, so that her sweet melodies
Arrived upon mine ear with what they meant.
When first she came amongst the blades, that rise,
Already wetted, from the goodly river,
She graced me by the lifting of her eyes.”—CAYLEY.³

§ 36. I have given this passage at length, because, for our purposes, it is by much the most important, not only in Dante, but in the whole circle of poetry. This lady, observe, stands on the opposite side of the little stream, which, presently, she explains to Dante is Lethe, having power to cause forgetfulness of all evil, and she stands just

¹ [*Purgatorio*, xxviii., the opening lines.]

² [See *ibid.*, 22 *seq.*]

³ [*Ibid.*, 40–63.]

among the bent blades of grass at its edge. She is first seen gathering flower from flower, then “passing continually the multitudinous flowers through her hands,”¹ smiling at the same time so brightly, that her first address to Dante is to prevent him from wondering at her, saying, “if he will remember the verse of the ninety-second Psalm, beginning ‘Delectasti,’ he will know why she is so happy.”²

And turning to the verse of this Psalm we find it written, “Thou, Lord, hast made me glad *through Thy works*. I will triumph *in the works of Thy hands*;” or in the very words in which Dante would read it,—

“Quia delectasti me, Domine, in factura Tua,
Et in operibus manuum Tuarum exultabo.”

§ 37. Now we could not for an instant have had any difficulty in understanding this, but that, some way farther on in the poem, this lady is called Matilda, and is with reason supposed by the commentators to be the great Countess Matilda of the eleventh century; notable equally for her ceaseless activity, her brilliant political genius, her perfect piety, and her deep reverence for the see of Rome.³ This Countess Matilda is therefore Dante’s guide in the terrestrial paradise, as Beatrice is afterwards in the celestial; each of them having a spiritual and symbolic character in their glorified state, yet retaining their definite personality.

The question is, then, what is the symbolic character of the Countess Matilda, as the guiding spirit of the terrestrial paradise? Before Dante had entered this paradise he had rested on a step of shelving rock, and as he watched the stars he slept, and dreamed, and thus tells us what he saw:—

“A lady, young and beautiful, I dreamed,
Was passing o’er a lea; and, as she came,
Methought I saw her ever and anon
Bending to cull the flowers; and thus she sang:
'Know ye, whoever of my name would ask,

¹ [*Purgatorio*, xxviii. 68, 69.]

² [*Ibid.*, 80, 81.]

³ [For another reference to the Countess Matilda of Tuscany (1046–1114), see *Val d’Arno*, § 20.]

That I am Leah; for my brow to weave
 A garland, these fair hands unwearied ply;
 To please me at the crystal mirror, here
 I decked me. But my sister Rachel, she
 Before her glass abides the livelong day,
 Her radiant eyes beholding, charmed no less
 Than I with this delightful task. Her joy
 In contemplation, as in labour mine.’¹

This vision of Rachel and Leah has been always, and with unquestionable truth, received as a type of the Active and Contemplative life, and as an introduction to the two divisions of the paradise which Dante is about to enter. Therefore the unwearied spirit of the Countess Matilda is understood to represent the Active life, which forms the felicity of Earth; and the spirit of Beatrice the Contemplative life, which forms the felicity of Heaven. This interpretation appears at first straightforward and certain; but it has missed count of exactly the most important fact in the two passages which we have to explain. Observe: Leah gathers the flowers to decorate *herself*, and delights in *Her Own Labour*. Rachel sits silent, contemplating herself, and delights in *Her Own Image*. These are the types of the Unglorified Active and Contemplative powers of Man. But Beatrice and Matilda are the same powers, Glorified. And how are they Glorified? Leah took delight in her own labour; but Matilda—“in operibus *manuum Tuarum*”—*in God’s labour*: Rachel in the sight of her own face; Beatrice in the sight of *God’s face*.

§ 38. And thus, when afterwards Dante sees Beatrice on her throne, and prays her that, when he himself shall die, she would receive him with kindness, Beatrice merely looks down for an instant, and answers with a single smile, then “towards the eternal fountain turns.”²

Therefore it is evident that Dante distinguishes in both cases, not between earth and heaven, but between perfect and imperfect happiness, whether in earth or heaven. The active life which has only the service of man for its end,

¹ [*Purgatorio*, xxvii. 97–110. The translation here is Cary’s.]

² [*Paradiso*, xxxi. 93 (Cary).]

and therefore gathers flowers, with Leah, for its own decoration, is indeed happy, but not perfectly so; it has only the happiness of the dream, belonging essentially to the dream of human life, and passing away with it. But the active life which labours for the more and more discovery of God's work, is perfectly happy, and is the life of the terrestrial paradise, being a true foretaste of heaven, and beginning in earth, as heaven's vestibule. So also the contemplative life which is concerned with human feeling and thought and beauty—the life which is in earthly poetry and imagery of noble earthly emotion—is happy, but it is the happiness of the dream; the contemplative life which has God's person and love in Christ for its object, has the happiness of eternity. But because this higher happiness is also begun here on earth, Beatrice descends to earth; and when revealed to Dante first, he sees the image of the twofold personality of Christ reflected in her eyes;¹ as the flowers, which are, to the mediæval heart, the chief work of God, are for ever passing through Matilda's hands.

§ 39. Now, therefore, we see that Dante, as the great prophetic exponent of the heart of the Middle Ages, has, by the lips of the spirit of Matilda, declared the mediæval faith,—that all perfect active life was “the expression of man's delight *in God's work*,”² and that all their political and warlike energy, as fully shown in the mortal life of Matilda, was yet inferior and impure,—the energy of the dream,—compared with that which on the opposite bank of Lethe stood “choosing flower from flower.”³ And what joy and peace there were in this work is marked by Matilda's being the person who draws Dante through the stream of Lethe, so as to make him forget all sin, and all sorrow; throwing her arms around him, she plunges his head under the waves of it; then draws him through, crying to him, “*hold me, hold me*” (tiemmi, tiemmi),⁴ and so presents him,

¹ [*Purgatorio*, xxxi. 118–123.]

² [See *Stones of Venice*, vol. i. (Vol. IX. p. 264), and *Purgatorio*, xxvii. 108.]

³ [See above, p. 276; *Purgatorio*, xxviii. 41.]

⁴ [*Purgatorio*, xxxi. 92; and see *Sesame and Lilies*, § 94.]

thus bathed, free from all painful memory, at the feet of the spirit of the more heavenly contemplation.

§ 40. The reader will, I think, now see, with sufficient distinctness, why I called this passage the most important, for our present purposes, in the whole circle of poetry. For it contains the first great confession of the discovery by the human race (I mean as a matter of experience, not of revelation), that their happiness was not in themselves, and that their labour was not to have their own service as its chief end. It embodies in a few syllables the *sealing* difference between the Greek and the mediæval, in that the former sought the flower and herb for his own uses, the latter for God's honour; the former, primarily and on principle, contemplated his own beauty and the workings of his own mind, and the latter, primarily and on principle, contemplated Christ's beauty and the working of the mind of Christ.¹

§ 41. I will not at present follow up this subject any farther; it being enough that we have thus got to the root of it, and have a great declaration of the central mediæval purpose, whereto we may return for solution of all future questions. I would only, therefore, desire the reader now to compare the *Stones of Venice*, vol. i. chap. xx. §§ 15, 16; the *Seven Lamps of Architecture*, chap. iv. § 3; and the second volume of this work, Sec. I. Chap. II. §§ 9, 10, and Chap. III. § 10;² that he may, in these several places, observe how gradually our conclusions are knitting themselves together as we are able to determine more and more of the successive questions that come before us: and, finally, to compare the two interesting passages in Wordsworth, which, without any memory of Dante, nevertheless, as if

¹ [There is an apparent contradiction between this § 40 and § 7 above. Here it is stated that by the Greek the flower and herb were sought for his own uses, and by the mediæval for God's honour; but above (§ 7 and § 15), it is stated that the Greek associated the flower and herb directly with the Divine gift, whereas the mediæval regarded them with a less solemn sense of that gift. In a reply to a correspondent, Ruskin cleared up the difficulty: see the letter given in Appendix iv., below, p. 431.]

² [The references in this edition are Vol. IX. p. 264; Vol. VIII. p. 142; Vol. IV. p. 50.]

by some special ordaining, describe in matters of modern life exactly the soothing or felicitous powers of the two active spirits of Dante—Leah and Matilda, *Excursion*, book v. line 608 to 625, and book vi. line 102 to 214.

§ 42. Having thus received from Dante this great lesson, as to the spirit in which mediæval landscape is to be understood, what else we have to note respecting it, as seen in his poem, will be comparatively straightforward and easy. And first, we have to observe the place occupied in his mind by *colour*. It has already been shown, in the *Stones of Venice*, vol. ii. chap. v. §§ 30–34, that colour is the most *sacred* element of all visible things.¹ Hence, as the mediæval mind contemplated them first for their sacredness, we should, beforehand, expect that the first thing it would seize would be the colour; and that we should find its expressions and renderings of colour infinitely more loving and accurate than among the Greeks.

§ 43. Accordingly, the Greek sense of colour seems to have been so comparatively dim and uncertain, that it is almost impossible to ascertain what the real idea was which they attached to any word alluding to hue: and above all, colour, though pleasant to their eyes, as to those of all human beings, seems never to have been impressive to their feelings. They liked purple, on the whole, the best;² but there was no sense of cheerfulness or pleasantness in one colour, and gloom in another, such as the mediævals had.

For instance, when Achilles goes, in great anger and sorrow, to complain to Thetis of the scorn done him by Agamemnon, the sea appears to him “wine-coloured.”³ One might think this meant that the sea looked dark and reddish-purple to him, in a kind of sympathy with his anger. But we turn to the passage of Sophocles, which has been quoted above,—a passage peculiarly intended to express peace and rest,—and we find that the birds sing

¹ [See also *Modern Painters*, vol. iv. ch. iii. § 23.]

² [Compare “Lectures on Colour,” § 38, Vol. XII. p. 504; and *Queen of the Air*, §§ 91, 95.]

³ [*Iliad*, i. 350, οἰνόπα πόντον (v. λ. ἀπειρόνα.)]

among “wine-coloured” ivy.¹ The uncertainty of conception of the hue itself, and entire absence of expressive character in the word, could hardly be more clearly manifested.

§ 44. Again: I said the Greek liked purple, as a general source of enjoyment, better than any other colour.² So he did; and so all healthy persons who have eye for colour, and are unprejudiced about it, do; and will to the end of time, for a reason presently to be noted.³ But so far was this instinctive preference for purple from giving, in the Greek mind, any consistently cheerful or sacred association to the colour, that Homer constantly calls death “purple death.”⁴

§ 45. Again: in the passage of Sophocles, so often spoken of, I said there was some difficulty respecting a word often translated “thickets.” I believe, myself, it means glades; literally, “going places” in the woods,—that is to say, places where, either naturally or by force, the trees separate, so as to give some accessible avenue. Now, Sophocles tells us the birds sang in these “*green* going places;”⁵ and we take up the expression gratefully, thinking the old Greek perceived and enjoyed, as we do, the sweet fall of the eminently *green* light through the leaves when they are a little thinner than in the heart of the wood. But we turn to the tragedy of Ajax, and are much shaken in our conclusion about the meaning of the word, when we are told that the body of Ajax is to lie unburied, and be eaten by sea-birds on the “*green* sand.” The formation, geologically distinguished by that title, was certainly not known to Sophocles; and the only conclusion which, it seems to me, we can come to under the circumstances,—assuming Ariel’s*

* “Come unto these *yellow* sands.”⁶

¹ [ton otnwp anxconsa kisson, *ædipus Coloneus*, 674.]

² [See above, p. 273, and compare “Lectures on Colour,” § 38, Vol. XII. p. 505.]

³ [See in the next volume, p. 69 (purple as an element in “the sacred chord of colour”), and pp. 140, 421 (prevalence of purple in natural scenery).]

⁴ [See, for instance, *Iliad*, v. 83; and compare the note in Vol. XII. p. 504.]

⁵ [*Ædipus Coloneus*, 673: clwraiV npo bassaiV; and below, the reference is to the *Ajax*, 1064: amfi clwran jamaqon.]

⁶ [See *Munera Pulveris*, § 134, where the same passage from the *Tempest* (i. 2) is cited in another connexion.]

authority as to the colour of pretty sand, and the Ancient Mariner's (or rather, his hearers'*) as to the colour of ugly sand, to be conclusive,—is that Sophocles really did not know green from yellow or brown.

§ 46. Now, without going out of the terrestrial paradise, in which Dante last left us, we shall be able at once to compare with this Greek incertitude the precision of the mediæval eye for colour. Some three arrowflights farther up into the wood we come to a tall tree, which is at first barren, but, after some little time, visibly opens into flowers, of a colour “less than that of roses, but more than that of violets.”¹

It certainly would not be possible, in words, to come nearer to the *definition* of the exact hue which Dante meant—that of the apple-blossom. Had he employed any simple colour-phrase, as a “pale-pink,” or “violet-pink,” or any other such combined expression, he still could not have completely got at the delicacy of the hue; he might perhaps have indicated its kind, but not its tenderness; but by taking the rose-leaf as a type of the delicate red, and then enfeebling this with the violet grey, he gets, as closely as language can carry him, to the complete rendering of the vision, though it is evidently felt by him to be in its perfect beauty ineffable; and rightly so felt, for of all lovely things which grace the spring-time in our fair temperate zone, I am not sure but this blossoming of the apple-tree is the fairest. At all events, I find it associated in my mind with four other kinds of colour, certainly principal among the gifts of the northern earth, namely:

- 1st. Bell gentians growing close together, mixed with lilies of the valley, on the Jura pastures.
- 2nd. Alpine roses with dew upon them, under low rays of morning sunshine, touching the tops of the flowers.

* “And thou art long, and lank, and *brown*,
As is the ribbed sea sand.”

¹ [*Purgatorio*, xxxii. 58.]

3rd. Bell heather in mass, in full light, at sunset.

4th. White narcissus (red-centred) in mass, on the Vevay pastures, in sunshine after rain.

And I know not where in the group to place the wreaths of apple-blossom, in the Vevay orchards, with the far-off blue of the lake of Geneva seen between the flowers.

A Greek, however, would have regarded this blossom simply with the eyes of a Devonshire farmer, as bearing on the probable price of cider, and would have called it red, cerulean, purple, white, hyacinthine, or generally "aglaos," agreeable, as happened to suit his verse.

§ 47. Again: we have seen how fond the Greek was of composing his paradises of rather damp grass;¹ but that in this fondness for grass there was always an undercurrent of consideration for his horses; and the characters in it which pleased him most were its depth and freshness; not its colour. Now, if we remember carefully the general expressions, respecting grass, used in modern literature, I think nearly the commonest that occurs to us will be that of "enamelled" turf or sward. This phrase is usually employed by our pseudo-poets, like all their other phrases, without knowing what it means, because it has been used by other writers before them,² and because they do not know what else to say of grass. If we were to ask them what enamel was, they could not tell us; and if we asked why grass was like enamel, they could not tell us. The expression *has* a meaning, however, and one peculiarly characteristic of mediæval and modern temper.

§ 48. The first instance I know of its right use, though very probably it had been so employed before, is in Dante. The righteous spirits of the pre-Christian ages are seen by him, though in the Inferno, yet in a place open, luminous, and high, walking upon the "green enamel."³

¹ [See above, p. 242.]

² [First by Milton, "O'er the smooth enamelled green": *Arcades*.]

³ [*Inferno*, iv. 118: "sopra 'l verde smalto."]

I am very sure that Dante did not use this phrase as we use it. He knew well what enamel was; and his readers, in order to understand him thoroughly, must remember what it is,—a vitreous paste, dissolved in water, mixed with metallic oxides, to give it the opacity and the colour required, spread in a moist state on metal, and afterwards hardened by fire, so as never to change. And Dante means, in using this metaphor of the grass of the Inferno, to mark, that it is laid as a tempering and cooling substance over the dark, metallic, gloomy ground; but yet so hardened by the fire, that it is not any more fresh or living grass, but a smooth, silent, lifeless bed of eternal green. And we know how *hard* Dante's idea of it was; because afterwards, in what is perhaps the most awful passage of the whole Inferno, when the three furies rise at the top of the burning tower, and catching sight of Dante, and not being able to get at him, shriek wildly for the Gorgon to come up too, that they may turn him into stone,—the word *stone* is not hard enough for them. Stone might crumble away after it was made, or something with life might grow upon it; no, it shall not be stone; they will make enamel of him; nothing can grow out of that; it is dead for ever.*

“Venga Medusa, sì lo farem di *Smalto*.”¹

§ 49. Now, almost in the opening of the Purgatory, as there at the entrance of the Inferno, we find a company of great ones resting in a grassy place. But the idea of the grass now is very different. The word now used is not “enamel,” but “herb,” and instead of being merely green, it is covered with flowers of many colours.² With the usual mediæval accuracy, Dante insists on telling us precisely what these colours were, and how bright; which he

* Compare parallel passage, making Dante hard or changeless in good, *Purg.* viii. 114.

¹ [*Inferno*, ix. 53; quoted also at Vol. XI. p. 169, and in *Fors Clavigera*, Letter 24.]

² [*Purgatorio*, vii. 73–76.]

does by naming the actual pigments used in illumination,—“Gold, and fine silver, and cochineal, and white lead, and Indian wood, serene and lucid, and fresh emerald, just broken, would have been excelled, as less is by greater, by the flowers and grass of the place.” It is evident that the “emerald” here means the emerald green of the illuminators; for a fresh emerald is no brighter than one which is not fresh, and Dante was not one to throw away his words thus.¹ Observe then, we have here the idea of the growth, life, and variegation of the “green herb,” as opposed to the “smalto” of the *Inferno*; but the colours of the variegation are illustrated and defined by the reference to actual pigments: and, observe, because the other colours are rather bright, the blue ground (Indian wood, indigo?) is sober; lucid, but serene: and presently two angels enter, who are dressed in green drapery, but of a paler green than the grass, which Dante marks, by telling us that it was “the green of leaves, just budded.”²

§ 50. In all this, I wish the reader to observe two things: first, the general carefulness of the poet in defining colour, distinguishing it precisely as a painter would (opposed to the Greek carelessness about it); and, secondly, his regarding the grass for its greenness and variegation, rather than, as a Greek would have done, for its depth and freshness. This greenness or brightness, and variegation, are taken up by later and modern poets, as the things intended to be chiefly expressed by the word “enamelled”; and, gradually, the term is taken to indicate any kind of bright and interchangeable colouring; there being always this much of propriety about it, when used of greensward, that such sward is indeed, like enamel, a coat of bright colour on a comparatively dark ground; and is thus a sort of natural jewellery and painter’s work, different from loose and large vegetation. The word is often awkwardly and falsely used,

¹ [On the subject of Dante’s definiteness in colour-notes, compare “Lectures on Colour,” § 5, Vol. XII. pp. 478–479.]

² [*Purgatorio*, viii. 28.]

by the later poets, of all kinds of growth and colour; as by Milton of the flowers of Paradise showing themselves over its wall;¹ but it retains, nevertheless, through all its jaded inanity, some half-unconscious vestige of the old sense, even to the present day.

§ 51. There are, it seems to me, several important deductions to be made from these facts. The Greek, we have seen, delighted in the grass for its usefulness; the mediæval, as also we moderns, for its colour and beauty. But both dwell on it as the *first* element of the lovely landscape; we saw its use in Homer,² we see also that Dante thinks the righteous spirits of the heathen enough comforted in Hades by having even the *image* of green grass put beneath their feet; the happy resting-place in Purgatory has no other delight than its grass and flowers; and, finally, in the terrestrial paradise, the feet of Matilda pause where the Lethe stream first bends the blades of grass. Consider a little what a depth there is in this great instinct of the human race. Gather a single blade of grass, and examine for a minute, quietly, its narrow sword-shaped strip of fluted green. Nothing, as it seems there, of notable goodness or beauty. A very little strength, and a very little tallness, and a few delicate long lines meeting in a point,—not a perfect point neither, but blunt and unfinished, by no means a creditable or apparently much cared-for example of Nature's workmanship; made, as it seems, only to be trodden on to-day, and to-morrow to be cast into the oven;³ and a little pale and hollow stalk, feeble and flaccid, leading down to the dull brown fibres of roots. And yet, think of it well, and judge whether of all the gorgeous flowers that beam in summer air, and of all strong and goodly trees, pleasant to the eyes or good for food,—stately palm and pine, strong ash and oak, scented citron, burdened vine,—there be any by man so deeply loved, by

¹ [*Paradise Lost*, iv. 149.]

² [For the Homeric meadows, see above, pp. 234, 239; for the Dante reference, *Inferno*, iv. 118.]

³ [Luke xii. 28.]

God so highly graced, as that narrow point of feeble green. It seems to me not to have been without a peculiar significance, that our Lord, when about to work the miracle which, of all that He showed, appears to have been felt by the multitude as the most impressive,—the miracle of the loaves,—commanded the people to sit down by companies “upon the green grass.”¹ He was about to feed them with the principal produce of earth and the sea, the simplest representations of the food of mankind. He gave them the *seed* of the herb; He bade them sit down upon the herb itself, which was as great a gift, in its fitness for their joy and rest, as its perfect fruit, for their sustenance; thus, in this single order and act, when rightly understood, indicating for evermore how the Creator had entrusted the comfort, consolation, and sustenance of man, to the simplest and most despised of all the leafy families of the earth. And well does it fulfil its mission. Consider what we owe merely to the meadow grass, to the covering of the dark ground by that glorious enamel, by the companies of those soft, and countless, and peaceful spears. The fields! Follow but forth for a little time the thoughts of all that we ought to recognize in those words. All spring and summer is in them,—the walks by silent, scented paths,—the rests in noonday heat,—the joy of herds and flocks,—the power of all shepherd life and meditation,—the life of sunlight upon the world, falling in emerald streaks, and failing in soft blue shadows, where else it would have struck upon the dark mould, or scorching dust,—pastures beside the pacing brooks,—soft banks and knolls of lowly hills,—thymy slopes of down overlooked by the blue line of lifted sea,—crisp lawns all dim with early dew, or smooth in evening warmth of barred sunshine, dented by happy feet, and softening in their fall the sound of loving voices; all these are summed in those simple words; and these are not all. We may not measure to the full the depth of this heavenly gift in our

¹ [Mark vi. 39.]

own land; though still, as we think of it longer, the infinite of that meadow sweetness, Shakspeare's peculiar joy,¹ would open on us more and more, yet we have it but in part. Go out, in the spring-time, among the meadows that slope from the shores of the Swiss lakes to the roots of their lower mountains. There, mingled with the taller gentians and the white narcissus, the grass grows deep and free; and as you follow the winding mountain paths, beneath arching boughs all veiled and dim with blossom,—paths that for ever droop and rise over the green banks and mounds sweeping down in scented undulation, steep to the blue water, studded here and there with new-mown heaps, filling all the air with fainter sweetness,—look up towards the higher hills, where the waves of everlasting green roll silently into their long inlets among the shadows of the pines; and we may, perhaps, at last know the meaning of those quiet words of the 147th Psalm, “He maketh grass to grow upon the mountains.”²

§ 52. There are also several lessons symbolically connected with this subject, which we must not allow to escape us. Observe, the peculiar characters of the grass, which adapt it especially for the service of man, are its apparent *humility*, and *cheerfulness*. Its humility, in that it seems created only for lowest service,—appointed to be trodden on, and fed upon. Its cheerfulness, in that it seems to exult under all kinds of violence and suffering. You roll it, and it is stronger the next day; you mow it, and it multiplies its shoots, as if it were grateful; you tread upon it, and it only sends up richer perfume. Spring comes, and it rejoices with all the earth,—glowing with variegated flame of flowers,—waving in soft depth of fruitful strength.

¹ [See, for instance, Sonnet xxxiii. (of the sun): “Kissing with golden face the meadows green”; and the song at the end of *Love's Labour's Lost*: “And cuckoobuds of yellow hue Do paint the meadows with delight.”]

² [The first thought of this passage (§ 51) came to Ruskin at Vevay in 1849; see the passage from his diary quoted in the Introduction above, p. xviii. The last sentences of § 51 are quoted by Matthew Arnold in his essay on “The Literary Influence of Academies” (*Essays in Criticism*).]

Winter comes, and though it will not mock its fellow plants by growing then, it will not pine and mourn, and turn colourless and leafless as they. It is always green; and is only the brighter and gayer for the hoar-frost.

§ 53. Now, these two characters—of humility, and joy under trial—are exactly those which most definitely distinguish the Christian from the Pagan spirit. Whatever virtue the pagan possessed was rooted in pride, and fruited with sorrow. It began in the elevation of his own nature; it ended but in the “verde smalto”—the hopeless green—of the Elysian fields. But the Christian virtue is rooted in self-debasement, and strengthened under suffering by gladness of hope. And remembering this, it is curious to observe how utterly without gladness the Greek heart appears to be in watching the flowering grass, and what strange discords of expression arise sometimes in consequence. There is one, recurring once or twice in Homer, which has always pained me. He says, “The Greek army was on the fields, as thick as flowers in the spring.”¹ It might be so; but flowers in spring-time are not the image by which Dante would have numbered soldiers on their path of battle. Dante could not have thought of the flowering of the grass but as associated with happiness. There is a still deeper significance in the passage quoted, a little while ago,² from Homer, describing Ulysses casting himself down on the *rushes* and the corn-giving land at the river shore,—the rushes and corn being to him only good for rest and sustenance,—when we compare it with that in which Dante tells us he was ordered to descend to the shore of the lake as he entered Purgatory, to gather a *rush*, and gird himself with it, it being to him the emblem not only of rest, but of humility under chastisement, the rush (or reed) being the only plant which can grow there;—“no

¹ [*Iliad*, ii. 468:—

εταν δ εν λειμwni Skamnadriw anqemoenti
mnrioi, ossa te fnlla kai anqea gignetai wrh.]

² [See above, p. 239.]

plant which bears leaves, or hardens its bark, can live on that shore, because it does not yield to the chastisement of its waves."¹ It cannot but strike the reader singularly how deep and harmonious a significance runs through all these words of Dante—how every syllable of them, the more we penetrate it, becomes a seed of farther thought! For, follow up this image of the girding with the reed, under trial, and see to whose feet it will lead us. As the grass of the earth, thought of as the herb yielding seed, leads us to the place where our Lord commanded the multitude to sit down by companies upon the green grass; so the grass of the waters, thought of as sustaining itself among the waters of affliction, leads us to the place where a stem of it was put into our Lord's hand for His sceptre; and in the crown of thorns, and the rod of reed,² was foreshown the everlasting truth of the Christian ages—that all glory was to be begun in suffering, and all power in humility.

Assembling the images we have traced, and adding the simplest of all, from Isaiah xl. 6, we find, the grass and flowers are types, in their passing, of the passing of human life, and, in their excellence, of the excellence of human life; and this in twofold way; first, by their Beneficence, and then, by their Endurance;—the grass of the earth, in giving the seed of corn, and in its beauty under tread of foot and stroke of scythe; and the grass of the waters, in giving its freshness to our rest, and in its bending before the wave.* But understood in the broad human and Divine sense, the "*herb yielding seed*" (as opposed to the fruit-tree yielding fruit) includes a third family of plants, and fulfils a third office to the human race. It includes the

* So also in Isa. xxxv. 7, the prevalence of righteousness and peace over all evil is thus foretold:

"In the habitation of dragons, where each lay, shall be *grass*, with *reeds* and *rushes*."

¹ [*Purgatorio*, i. 105.]

² [Matthew xxvii. 29, 48.]

great family of the lints and flaxes, and fulfils thus the *three* offices of giving food, raiment, and rest. Follow out this fulfilment; consider the association of the linen garment and the linen embroidery, with the priestly office, and the furniture of the Tabernacle; and consider how the rush has been, in all time, the first natural carpet thrown under the human foot. Then next observe the three virtues definitely set forth by the three families of plants; not arbitrarily or fancifully associated with them, but in all the three cases marked for us by Scriptural words:

1st. Cheerfulness, or joyful serenity; in the grass for food and beauty.—“Consider the lilies of the field, how they grow; they toil not, neither do they spin.”

2nd. Humility; in the grass for rest.—“A bruised reed shall He not break.”

3rd. Love; in the grass for clothing (because of its swift kindling).—“The smoking flax shall He not quench.”

And then, finally, observe the confirmation of these last two images in, I suppose, the most important prophecy, relating to the future state of the Christian Church, which occurs in the Old Testament, namely, that contained in the closing chapters of Ezekiel. The measures of the Temple of God are to be taken; and because it is only by charity and humility that those measures ever can be taken, the angel has “a line of *flax* in his hand, and a measuring *reed*.”¹ The use of the line was to measure the land, and of the reed to take the dimensions of the buildings; so the buildings of the church, or its labours, are to be measured by *humility*, and its territory or land, by *love*.

The limits of the Church have, indeed, in later days, been measured, to the world’s sorrow, by another kind of flaxen line, burning with the fire of unholy zeal, not with that of Christian charity; and perhaps the best lesson which we can finally take to ourselves, in leaving these sweet

¹ [The references are Genesis i. 11; Matthew vi. 28; Isaiah xlii. 3; Matthew xii. 20; Ezekiel xl. 3.]

fairly ^{on} obsca - but in all the three cases - marked
for us by scriptural words.

1st. Cheerfulness - ^{a joyful serenity - in the} with the Graft for food & beauty.

Consider the tribes of the field - how they grow - they
trod not - neither do they spin -

2ndly. Humility - with the Graft for rest.

A bruised seed shall not be break.

3rd. ^{Charity} Love - with the Graft for clothing -

The Smoking Flax shall not be greece.

And then - ^{I think} we shall see the meaning of and con-
firmally - observe the confirmation of these last two images
in the most important prophecy relating to the future
of the Christian Church which occurs in the old
Testament - ^{namely that contained in} the closing chapters of the books
of Ezekiel - The measures of the temple of God are
to be taken; therein - and because it is only in Charity
and Humility that those measures can be taken,

- the angel has "a line of flax in his hand, and
a measuring Reel." The use of the line - ^{to measure the land;} ^{and of the reel, to take the dimensions of the building.}

The limits of the Church have indeed ^{been} measured by another kind of Flax - the ^{fruit} of untold
good - ^{not reaching to knowledge -} ^{replacing that of} Christian charity: and the last lesson which we may
very take to ourselves - in leaving these sweet ^{fields} ^{of the} ^{meadow} landscape - is ^{to remember} that in spite of all the fenced ^{of} ^{fallen} ^{habits} of thought
eye - this great Saviour - this inspired exponent of the whole

deepest at ^{the} heart ^{of the early church:} placed his Paradise when the
had ceased to be fence - or division - and when the
Graft of earth was bent ^{down} ^{by} the
Forgetfulness of evil: in ^{unity of} ^{direction}, only by the
soft waves that bore with them the Forgetfulness of Evil

Vertical text on the right margin: "The line of flax is the fruit of charity."

fields of the mediæval landscape, is the memory that, in spite of all the fettered habits of thought of his age, this great Dante, this inspired exponent of what lay deepest at the heart of the early Church, placed his terrestrial paradise where there had ceased to be fence or division, and where the grass of the earth was bowed down, in unity of direction, only by the soft waves that bore with them the forgetfulness of evil.

CHAPTER XV

OF MEDIÆVAL LANDSCAPE:—SECONDLY, THE ROCKS

§ 1. I CLOSED the last chapter, not because our subject was exhausted, but to give the reader breathing time, and because I supposed he would hardly care to turn back suddenly from the subjects of thought last suggested, to the less pregnant matters of inquiry connected with mediæval landscape. Nor was the pause mistimed even as respects the order of our subjects; for hitherto we have been arrested chiefly by the beauty of the pastures and fields, and have followed the mediæval mind in its fond regard of leaf and flower. But now we have some hard hillclimbing to do; and the remainder of our investigation must be carried on, for the most part, on hands and knees, so that it is not ill done of us first to take breath.

§ 2. It will be remembered that in the last chapter, § 14, we supposed it probable that there would be considerable inaccuracies, in the mediæval mode of regarding nature. Hitherto, however, we have found none but, on the contrary, intense accuracy, precision, and affection. The reason of this is, that all floral and foliated beauty might be perfectly represented, as far as its form went, in the sculpture and ornamental painting of the period; hence the attention of men was thoroughly awakened to that beauty. But as mountains and clouds and large features of natural scenery could not be accurately represented, we must be prepared to find them not so carefully contemplated,—more carefully, indeed, than by the Greeks, but still in no wise as the things themselves deserve.

§ 3. It was besides noticed¹ that mountains, though regarded with reverence by the mediæval, were also the

¹ [See above, ch. xiv. §§ 2, 10, pp. 249, 253.]

subjects of a certain dislike and dread. And we have seen already¹ that in fact the place of the soul's purification, though a mountain, is yet by Dante subdued, whenever there is any pleasantness to be found upon it, from all mountainous character into grassy recesses, or slopes to rushy shore; and, in his general conception of it, resembles much more a castle mound, surrounded by terraced walks,—in the manner, for instance, of one of Turner's favourite scenes, the bank under Richmond Castle (Yorkshire); or, still more, one of the hill slopes divided by terraces, above the Rhine, in which the picturesqueness of the ground had been reduced to the form best calculated for the growing of costly wine, than any scene to which we moderns should naturally attach the term "Mountainous." On the other hand, although the Inferno is just as accurately measured and divided as the Purgatory, it is nevertheless cleft into rocky chasms which possess something of true mountain nature—nature which we moderns of the north should most of us seek with delight, but which, to the great Florentine, appeared adapted only for the punishment of lost spirits, and which, on the mind of nearly all his countrymen, would to this day produce a very closely correspondent effect; so that their graceful language, dying away on the north side of the Alps, gives its departing accents to proclaim its detestation of hardness and ruggedness; and is heard for the last time, as it bestows on the noblest defile in all the Grisons, if not in all the Alpine chain,² the name of the "evil way,"—"la Via Mala."

§ 4. This "evil way," though much deeper and more sublime, corresponds closely in general character to Dante's "Evilpits,"³ just as the banks of Richmond do to his mountain of Purgatory; and it is notable that Turner has been led to illustrate, with his whole strength, the character of both; having founded, as it seems to me, his early dreams

¹ [See above, pp. 272, 285, 290.]

² [So in *Præterita*, i. ch. vi. § 136, Ruskin calls the Via Mala "the grandest pass of the Alps." For his "placing" of some other passes, see *ibid.*, ii. ch. vii. § 131.]

³ [Malebolge, *Inferno*, xviii. 2.]

of mountain form altogether on the sweet banks of the Yorkshire streams,¹ and rooted his hardier thoughts of it in the rugged clefts of the Via Mala.

§ 5. Nor of the Via Mala only: a correspondent defile on the St. Gothard,—so terrible in one part of it, that it can, indeed, suggest no ideas but those of horror to minds either of northern or southern temper, and whose wild bridge, cast from rock to rock over a chasm as utterly hopeless and escapeless as any into which Dante gazed from the arches of Malebolge, has been, therefore, ascribed both by northern and southern lips to the master-building of the great spirit of evil,—supplied to Turner the elements of his most terrible thoughts in mountain vision, even to the close of his life. The noblest plate in the series of the *Liber Studiorum*,* one engraved by his own hand, is of that bridge; the last mountain journey he ever took was up the defile; and a rocky bank and arch, in the last mountain drawing which he ever executed with his perfect power, are remembrances of the path by which he had traversed in his youth this Malebolge of the St. Gothard.²

§ 6. It is therefore with peculiar interest, as bearing on our own proper subject, that we must examine Dante's conception of the rocks of the eighth circle. And first, as to general tone of colour: from what we have seen of the love of the mediæval for bright and variegated colour, we might guess that his chief cause of dislike to rocks would be, in Italy, their comparative colourlessness. With hardly an exception, the range of the Apennines is composed of a

* It is an unpublished plate. I know only two impressions of it.³

¹ [See on this subject, *Modern Painters*, vol. i. (Vol. III. p. 233); vol. iv. (Vol. VI. p. 300); and *Pre-Raphaelitism*, § 36 (Vol. XII. p. 371).]

² [Turner's "last mountain journey" was at some time between 1840 and 1845; see Ruskin's Epilogue to the *Notes on his Drawings by Turner*. "The last mountain drawing" is the "Pass of Faido," analysed in the next volume (ch. ii.); and see ch. xvii. § 24): compare *Modern Painters*, vol. v. pt. ix. ch. xi. § 30 n.]

³ [The "Swiss Bridge, Mont St. Gothard," called also "Via Mala." The drawing was in the collection of C. S. Bale. Of the very rare engraver's proofs, one was in Ruskin's possession: see *Notes on his Drawings by Turner*, No. 73.]

stone of which some special account is given hereafter in the chapters on Materials of Mountains,¹ and of which one peculiarity, there noticed, is its monotony of hue. Our slates and granites are often of very lovely colours; but the Apennine limestone is so grey and toneless, that I know not any mountain districts so utterly melancholy as those which are composed of this rock, when unwooded. Now, as far as I can discover from the internal evidence in his poem, nearly all Dante's mountain wanderings had been upon this ground. He had journeyed once or twice among the Alps, indeed, but seems to have been impressed chiefly by the road from Garda to Trent, and that along the Cornice, both of which are either upon those limestones, or a dark serpentine, which shows hardly any colour till it is polished. It is not ascertainable that he had ever seen rock scenery of the finely coloured kind, aided by the Alpine mosses: I do not know the fall at Forlì (*Inferno*, xvi. 99), but every other scene to which he alludes is among these Apennine limestones; and when he wishes to give the idea of enormous mountain size, he names Tabernicch and Pietra-pana,—the one clearly chosen only for the sake of the last syllable of its name, in order to make a sound as of cracking ice, with the two sequent rhymes of the stanza,—and the other is an Apennine near Lucca.²

§ 7. His idea, therefore, of rock colour, founded on these experiences, is that of a dull or ashen grey, more or less stained by the brown of iron ochre, precisely as the Apennine limestones nearly always are; they grey being peculiarly cold and disagreeable. As we go down the very hill which stretches out from Pietra-pana towards Lucca, the stones

¹ [See next volume, ch. xi. § 6.]

² [*Inferno*, xxxii. 28:—

“Non fece al corso suo sì grosso velo
Di verno la Danoia in Ostericchi,
Nè 'I Tanai là sotto 'I freddo cielo,
Com' era quivi; chè' se Tabernicchi
Vi fosse su caduto, o Pietrapana,
Non avria pur dall' orlo fatto cricchi.”

The geographical position of Mount Tambernich is unknown.]

laid by the road side to mend it are of this ashen grey, with efflorescences of manganese and iron in the fissures. The whole of Malebolge is made of this rock, "All wrought in stone of iron-coloured grain."*

Perhaps the iron colour may be meant to predominate in Evilpits; but the definite grey limestone colour is stated higher up, the river Styx flowing at the base of "malignant grey cliffs"† (the word malignant being given to the iron-coloured Malebolge also); and the same whitish grey idea is given again definitely in describing the robe of the purgatorial or penance angel, which is "of the colour of ashes, or earth dug dry."¹ Ashes necessarily mean *wood*-ashes in an Italian mind, so that we get the tone very pale; and there can be no doubt whatever about the hue meant, because it is constantly seen on the sunny sides of the Italian hills, produced by the scorching of the ground, a dusty and lifeless whitish grey, utterly painful and oppressive; and I have no doubt that this colour, assumed eminently also by limestone crags in the sun, is the quality which Homer means to express by a term he applies often to bare rocks, and which is usually translated "craggy," or "rocky."² Now Homer is indeed quite capable of talking of "rocky rocks," just as he talks sometimes of "wet water"; but I think he means more by this word: it sounds as if it were derived from another, meaning "meal," or "flour," and I have little doubt it means "mealy white"; the Greek limestones being for the most part brighter in effect than the Apennine ones.

§ 8. And the fact is, that the great and pre-eminent fault of southern, as compared with northern scenery, is this rock-whiteness, which gives to distant mountain ranges, lighted by the sun, sometimes a faint and monotonous glow,

* (Cayley.) "Tutto di pietra, e di color ferrigno."—*Inf.* xviii. 2.

† "Maligne piagge grige."—*Inf.* vii. 108.

¹ [*Purgatorio*, ix. 115.]

² [παῖπαλοιV—*Iliad*, xiii. 17, etc. The derivation suggested by Ruskin is from παῖπαλῃ (meal).]

hardly detaching itself from the whiter parts of the sky, and sometimes a speckled confusion of white light with blue shadow, breaking up the whole mass of the hills, and making them look near and small; the whiteness being still distinct at the distance of twenty or twenty-five miles. The inferiority and meagreness of such effects of hill, compared with the massive purple and blue of our own heaps of crags and morass, or the solemn grass-greens and pinepurples of the Alps, have always struck me most painfully; and they have rendered it impossible for any poet or painter studying in the south, to enter with joy into hill scenery. Imagine the difference to Walter Scott, if instead of the single lovely colour which, named by itself alone, was enough to describe his hills,—

“Their southern rapine to renew,
Far in the distant Cheviots’ *blue*,”¹—

a dusty whiteness had been the image which first associated itself with a hill range, and he had been obliged, instead of “blue” Cheviots, to say “barley-meal-coloured” Cheviots.

§ 9. But although this would cause a somewhat painful shock even to a modern mind, it would be as nothing when compared with the pain occasioned by absence of colour to a mediæval one. We have been trained, by our ingenious principles of Renaissance architecture, to think that meal-colour and ash-colour are the properest colours of all; and that the most aristocratic harmonies are to be deduced out of grey mortar and creamy stucco. Any of our modern classical architects would delightedly “face” a heathery hill with Roman cement; and any Italian sacristan would, but for the cost of it, at once whitewash the Cheviots. But the mediævals had not arrived at these abstract principles of taste. They liked fresco better than whitewash; and, on the whole, thought that Nature was in the right in painting her flowers yellow, pink, and blue;—not grey. Accordingly,

¹ [*Marmion*, Introduction to Canto iii.]

this absence of colour from rocks, as compared with meadows and trees, was in their eyes an unredeemable defect; nor did it matter to them whether its place was supplied by the grey neutral tint, or the iron-coloured stain; for both colours, grey and brown, were, to them, hues of distress, despair, and mortification, hence adopted always for the dresses of monks; only the word "brown" bore, in their colour vocabulary, a still gloomier sense than with us. I was for some time embarrassed by Dante's use of it with respect to dark skies and water.¹ Thus, in describing a simple twilight—not a Hades twilight, but an ordinarily fair evening—(*Inf.* ii. 1) he says, the "brown" air took the animals of earth away from their fatigues;—the waves under Charon's boat are "brown" (*Inf.* iii. 118); and Lethe, which is perfectly clear and yet dark, as with oblivion, is "bruna-bruna," "brown exceeding brown."² Now, clearly in all these cases, no *warmth* is meant to be mingled in the colour. Dante had never seen one of our bog-streams, with its porter-coloured foam; and there can be no doubt that, in calling Lethe brown, he means it was dark slate grey, inclining to black; as, for instance, our clear Cumberland lakes, which, looked straight down upon where they are deep, seem to be lakes of ink. I am sure this is the colour he means; because no clear stream or lake on the Continent ever looks brown, but blue or green; and Dante, by merely taking away the pleasant colour, would get at once to this idea of grave clear grey. So, when he was talking of twilight, his eye for colour was far too good to let him call it *brown*, in our sense. Twilight is not brown, but purple, golden, or dark grey; and this last was what Dante meant. Farther, I find that this negation of colour is always the means by which Dante subdues his tones. Thus the fatal inscription on the Hades gate is written in "obscure colour,"³ and the air which torments the

¹ [On the subject of the use of "bruno" in Italian in the general sense of "dark," see *The Poems of Milton*, with notes by Thomas Keightly, 1859, vol. i. p. 65, and a letter in W. M. Rossetti's *Rossetti Papers*, 1903, pp. 79–80.]

² [*Purgatorio*, xxviii. 31.]

³ [*Inferno*, iii. 10.]

passionate spirits is “aer nero,” *black* air (*Inf.* v. 51), called presently afterwards (line 86) malignant air, just as the grey cliffs are called malignant cliffs.

§ 10. I was not, therefore, at a loss to find out what Dante meant by the word; but I was at a loss to account for his not, as it seemed, acknowledging the existence of the colour of *brown* at all; for if he called dark neutral tint “brown,” it remained a question what term he would use for things of the colour of burnt umber. But one day, just when I was puzzling myself about this, I happened to be sitting by one of our best living modern colourists, watching him at his work, when he said, suddenly, and by mere accident, after we had been talking of other things, “Do you know I have found that there is no *brown* in Nature? What we call brown is always a variety either of orange or purple. It never can be represented by umber, unless altered by contrast.”

§ 11. It is curious how far the significance of this remark extends, how exquisitely it illustrates and confirms the mediæval sense of hue;—how far, on the other hand, it cuts into the heart of the old umber idolatries of Sir George Beaumont and his colleagues, the “where do you put your *brown* tree”¹ system; the code of Cremona-violin-coloured foregrounds, of brown varnish and asphaltum; and all the old night-owl science, which, like Young’s pencil of sorrow,

“In melancholy dipped, *embrowns* the whole.”²

Nay, I do Young an injustice by associating his words with the asphalt schools; for his eye for colour was true, and like Dante’s; and I doubt not that he means dark grey, as Byron purple-grey in that night piece of the Siege of Corinth, beginning

“’Tis midnight; on the mountains *brown*
The cold, round moon looks deeply down;”

¹ [See Vol. III. p. 45 *n.*]

² [*Night Thoughts*, v. 74.]

and, by the way, Byron's best piece of evening colour farther certifies the hues of Dante's twilight,—it

“Dies like the dolphin, . . . as it gasps away;
The last still loveliest; till—'tis gone—and all is *grey*.”¹

§ 12. Let not, however, the reader confuse the use of brown, as an expression of a natural tint, with its use as a means of *getting other tints*. Brown is often an admirable ground, just because it is the only tint which is *not* to be in the finished picture, and because it is the best basis of many silver greys and purples utterly opposite to it in their nature. But there is infinite difference between laying a brown ground as a representation of shadow,—and as a base for light: and also an infinite difference between using brown shadows, associated with coloured lights—always the characteristic of false schools of colour,—and using brown as a warm neutral tint for general study. I shall have to pursue this subject farther hereafter, in noticing how brown is used by great colourists in their studies, not as colour, but as the pleasantest negation of colour, possessing more transparency than black, and having more pleasant and sunlike warmth. Hence Turner, in his early studies, used blue for distant neutral tint, and brown for foreground neutral tint; while, as he advanced in colour science, he gradually introduced, in the place of brown, strange purples, altogether peculiar to himself, founded, apparently, on Indian red and vermilion, and passing into various tones of russet and orange.* But, in the meantime, we must go back to Dante and his mountains.

§ 13. We find, then, that his general type of rock colour was meant, whether pale or dark, to be a colourless grey—the most melancholy hue which he supposed to exist in

* It is in these subtle purples that even the more elaborate passages of the earlier drawings are worked; as, for instance, the Highland streams, spoken of in “Pre-Raphaelitism.”² Also, Turner could, by opposition, get what colour he liked out of a brown. I have seen cases in which he had made it stand for the purest *rose* light.

¹ [*Childe Harold*, iv. 29.]

² [See Vol. XII. p. 368.]

Nature (hence the synonym for it, subsisting even till late times, in mediæval appellatives of dress, “*sad-coloured*”)—with some rusty stain from iron; or perhaps the “color ferrigno”¹ of the *Inferno* does not involve even so much of orange, but ought to be translated “iron grey.”

This being his idea of the colour of rocks, we have next to observe his conception of their substance. And I believe it will be found that the character on which he fixes first in them is *frangibility*—breakableness to bits, as opposed to wood, which can be sawn or rent, but not shattered with a hammer, and to metal, which is tough and malleable.

Thus, at the top of the abyss of the seventh circle, appointed for the “violent,” or souls who had done evil by force, we are told, first, that the edge of it was composed of “great broken stones in a circle”;² then, that the place was “Alpine”; and, becoming hereupon attentive, in order to hear what an Alpine place is like, we find that it was “like the place beyond Trent, where the rock, either by earthquake, or failure of support, has broken down to the plain, so that it gives any one at the top some means of getting down to the bottom.”³ This is not a very elevated or enthusiastic description of an Alpine scene; and it is far from mended by the following verses, in which we are told that Dante “began to go down by this great *unloading* of stones,” and that they moved often under his feet by reason of the new weight. The fact is that Dante, by many expressions throughout the poem, shows himself to have been a notably bad climber,⁴ and being fond of sitting in the sun, looking at his fair Baptistery, or walking in a dignified manner on flat pavement in a long robe, it puts him seriously out of his way when he has to take to his hands and knees, or look to his feet; so that the first strong

¹ [*Inferno*, xviii. 2.]

² [*Ibid.*, xi. 2.]

³ [*Ibid.*, xii. 4 *seq.*; and below, see *ibid.*, xii. 28, 29. Compare *Modern Painters*, vol. iv. ch. xviii. § 25, where the former passage is cited in the Italian and in Cayley’s translation.]

⁴ [This has been doubted by some students of Dante: see *Inferno*, xxiii. 43–45, xxiv. 64, xxxiv. 86.]

impression made upon him by any Alpine scene whatever, is, clearly, that it is bad walking. When he is in a fright and hurry, and has a very steep place to go down, Virgil has to carry him altogether, and is obliged to encourage him, again and again, when they have a steep slope to go up,—the first ascent of the purgatorial mountain.¹ The similes by which he illustrates the steepness of that ascent are all taken from the Riviera of Genoa, now traversed by a good carriage road under the name of the Cornice; but as this road did not exist in Dante's time, and the steep precipices and promontories were then probably traversed by footpaths which, as they necessarily passed in many places over crumbling and slippery limestone, were doubtless not a little dangerous, and as in the manner they commanded the bays of sea below, and lay exposed to the full blaze of the south-eastern sun, they corresponded precisely to the situation of the path by which he ascends above the purgatorial sea, the image could not possibly have been taken from a better source for the fully conveying his idea to the reader: nor, by the way, is there reason to discredit, in *this* place, his powers of climbing; for, with his usual accuracy, he has taken the angle of the path for us, saying it was considerably more than forty-five.² Now a continuous mountain-slope of forty-five degrees is already quite unsafe either for ascent or descent, except by zigzag paths; and a greater slope than this could not be climbed, straightforward, but by help of crevices or jags in the rock, and great physical exertion besides.

§ 14. Throughout these passages, however, Dante's thoughts are clearly fixed altogether on the question of mere accessibility or inaccessibility. He does not show the smallest interest in the rocks, except as things to be conquered: and his description of their appearance is utterly meagre, involving no other epithets than "erto" (steep or

¹ [*Purgatorio*, iv. 36 *seq.*; and for Virgil carrying Dante, see *Inferno*, xxiii. 37 *seq.*]

² ["E la costa superba più assai,
Che da mezzo quadrante al centro lista."]

—*Purg.* iv. 41, 42.]

upright), *Inf.* xix. 131, *Purg.* iii. 47, etc.; “sconcio” (monstrous), *Inf.* xix. 131; “stagliata” (cut), *Inf.* xvii. 134; “maligno” (malignant), *Inf.* vii. 108; “duro” (hard), xx. 26; with “large” and “broken” (rotto) in various places.¹ No idea of roundness, massiveness, or pleasant form of any kind appears for a moment to enter his mind; and the different names which are given to the rocks in various places seem merely to refer to variations in size: thus a “rocco” is part of a “scoglio,” *Inf.* xx. 25 and xxvi. 17; a “scheggio” (xxi. 60 and xxvi. 17) is a less fragment yet; a “petrone,” or “sasso,” is a large stone or boulder (*Purg.* iv. 101, 104), and “pietra,” a less stone,—both of these last terms, especially “sasso,” being used for any large mountainous mass, as in *Par.* xxi. 106; and the vagueness of the word “monte” itself, like that of the French “montagne,” applicable either to a hill on a post-road requiring the drag to be put on,—or to the Mont Blanc, marks a peculiar carelessness in both nations, at the time of the formation of their languages, as to the sublimity of the higher hills; so that the effect produced on an English ear by the word “mountain,” signifying always a mass of a certain large size, cannot be conveyed either in French or Italian.

§ 15. In all these modes of regarding rocks we find (rocks being in themselves, as we shall see presently,² by no means monstrous or frightful things) exactly that inaccuracy in the mediæval mind which we had been led to expect, in its bearings on things contrary to the spirit of that symmetrical and perfect humanity which had formed its ideal; and it is very curious to observe how closely in the terms he uses, and the feelings they indicate, Dante here agrees with Homer. For the word *stagliata* (cut) corresponds very nearly to a favourite term of Homer’s respecting rocks “sculptured,” used by him also of ships’

¹ [For instance, *Inferno*, xi. 2, xxiii. 136; *Purgatorio*, iv. 31.]

² [See in the next volume, ch. xvi. (“Precipices”), ch. xviii. (“Stones”), etc.]
v. U

sides;¹ and the frescoes and illuminations of the Middle Ages enable us to ascertain exactly what this idea of “cut” rock was.

§ 16. In Plate 10 I have assembled some examples, which will give the reader a sufficient knowledge of mediæval rock-drawing, by men whose names are known. They are chiefly taken from engravings, with which the reader has it in his power to compare them,* and if, therefore, any injustice is done to the original paintings the fault is not mine; but the general impression conveyed is quite accurate, and it would not have been worth while, where work is so deficient in first conception, to lose time in insuring accuracy of facsimile. Some of the crags may be taller here, or broader there, than in the original paintings; but the character of the work is perfectly preserved, and that is all with which we are at present concerned.

Figs. 1 and 5 are by Ghirlandajo; 2 by Filippo Pesellino; 4 by Leonardo da Vinci; and 6 by Andrea del Castagno. All these are indeed workmen of a much later period than Dante, but the system of rock-drawing remains entirely unchanged from Giotto’s time to Ghirlandajo’s;—is then altered only by an introduction of stratification indicative of a little closer observance of nature, and so remains until Titian’s time. Fig. 1 is exactly representative of one of Giotto’s rocks, though actually by Ghirlandajo; and Fig. 2 is rather less skilful than Giotto’s ordinary work. Both these figures indicate precisely what Homer and Dante meant by “cut” rocks. They had observed the concave smoothness of certain rock fractures as eminently distinctive of rock from earth, and use the term “cut” or “sculptured” to distinguish the smooth surface from the knotty or sandy one, having observed nothing more respecting its real contours than is represented in Figs. 1 and 2, which

* See Appendix I. [p. 422.]

¹ [glafnoV: see above, p. 242; and for the application of the word to ships, see *Odyssey*, iii. 287, iv. 356. Compare also, in the next volume, ch. xvi. § 19.]

Allen & Co. Co.

look as if they had been hewn out with an adze. Lorenzo Ghiberti preserves the same type, even in his finest work.

Fig. 3, from an interesting sixteenth century MS. in the British Museum (Cotton, Augustus, A. 5), is characteristic of the best later illuminators' work;¹ and Fig. 5, from Ghirlandajo, is pretty illustrative of Dante's idea of terraces on the purgatorial mountain.² It is the road by which the Magi descend in his picture of their Adoration, in the Academy of Florence. Of the other examples I shall have more to say in the chapter on Precipices;³ meanwhile we have to return to the landscape of the poem.

§ 17. Inaccurate as this conception of rock was, it seems to have been the only one which, in mediæval art, had place as representative of mountain scenery. To Dante, mountains are inconceivable except as great broken stones or crags; all their broad contours and undulations seem to have escaped his eye. It is, indeed, with his usual undertone of symbolic meaning that he describes the great broken stones, and the fall of the shattered mountain, as the entrance to the circle appointed for the punishment of the violent;⁴ meaning that the violent and cruel, notwithstanding all their iron hardness of heart, have no true strength, but, either by earthquake, or want of support, fall at last into desolate ruin, naked, loose, and shaking under the tread. But in no part of the poem do we find allusion to mountains in any other than a stern light; nor the slightest evidence that Dante cared to look at them. From that hill of San Miniato, whose steps he knew so well, the eye commands, at the farther extremity of the Val d'Arno, the whole purple range of the mountains of Carrara, peaked and mighty, seen always against the sunset light in silent outline, the chief forms that rule

¹ [For further references to this MS., which, however, is of the fifteenth century, see Vol. VI. pp. 99, 309.]

² [*Purgatorio*, xvii. 137; xxii. 92, etc., etc.]

³ [See ch. xvi. §§ 35, 36, in the next volume.]

⁴ [As above (p. 303), the opening lines of *Inferno*, xi.]

the scene as twilight fades away. By this vision Dante seems to have been wholly unmoved, and, but for Lucan's mention of Aruns at Luna would seemingly not have spoken of the Carrara hills in the whole course of his poem:¹ when he does allude to them, he speaks of their white marble, and their command of stars and sea, but has evidently no regard for the hills themselves. There is not a single phrase or syllable throughout the poem which indicates such a regard. Ugolino, in his dream, seemed to himself to be in the mountains, "by cause of which the Pisan cannot see Lucca;"² and it is impossible to look up from Pisa to that hoary slope without remembering the awe that there is in the passage; nevertheless, it was as a hunting-ground only that he remembered those hills. Adam of Brescia, tormented with eternal thirst, remembers the hills of Romena, but only for the sake of their sweet waters:

"The rills that glitter down the grassy slopes
Of Casentino, making fresh and soft
The banks whereby they glide to Arno's stream,
Stand ever in my view."³

And, whenever hills are spoken of as having any influence on character, the repugnance to them is still manifest; they are always causes of rudeness or cruelty:

"But that ungrateful and malignant race,
Who in old times came down from Fesole,
Ay, and still smack of their rough mountain flint,
Will, for thy good deeds, show thee enmity.
Take heed thou cleanse thee of their ways."

So again—

"As one mountain-bred,
Rugged, and clownish, if some city's walls
He chance to enter, round him stares agape."

¹ [See *Inferno*, xx. 46. The reference in Lucan is *Pharsalia*, i. 575.]

² [*Inferno*, xxxiii. 30.]

³ [*Inferno*, xxx. 66; the translation here and in the following passages is Cary's. The other references in § 17 are *Inferno*, xv. 64 *seq.*, xv. 62 *seq.*; *Purgatorio*, xxvi. 67–69.]

§ 18. Finally, although the Carrara mountains are named as having command of the stars and sea, the *Alps* are never specially mentioned but in bad weather, or snow. On the sand of the circle of the blasphemers—

“Fell slowly wafting down
Dilated flakes of fire, as flakes of snow
On Alpine summit, when the wind is hushed.”¹

So the Paduans have to defend their town and castles against inundation,

“Ere the genial warmth be felt,
On Chiarentana’s top.”

The clouds of anger, in Purgatory, can only be figured to the reader who has

“On an Alpine height been ta’en by cloud,
Through which thou sawest no better than the mole
Doth through opacous membrane.”

And in approaching the second branch of Lethe, the seven ladies pause,—

“Arriving at the verge
Of a dim umbrage hoar, such as is seen
Beneath green leaves and gloomy branches oft
To overbrow a bleak and Alpine cliff.”

§ 19. Truly, it is unfair of Dante, that when he is going to use snow for a lovely image, and speak of it as melting away under heavenly sunshine, he must needs put it on the Apennines, not on the Alps:

“As snow that lies
Amidst the living rafters, on the back
Of Italy, congealed, when drifted high
And closely piled by rough Sclavonian blasts,
Breathe but the land whereon no shadow falls.
And straightway, melting, it distils away,
Like a fire-wasted taper; thus was I,
Without a sigh, or tear, consumed in heart.”²

¹ [*Inferno*, xiv. 30 (Cary’s translation). The other references in § 18 are *Inferno*, xv. 9; *Purgatorio*, xvii. 1–3, xxxiii. 109 *seq.*]

² [*Purgatorio*, xxx. 88.]

The reader will thank me for reminding him, though out of its proper order, of the exquisite passage of Scott which we have to compare with this:

“As wreath of snow on mountain-breast
Slides from the rock that gave it rest,
Poor Ellen glided from her stay,
And at the monarch’s feet she lay.”¹

Examine the context of this last passage, and its beauty is quite beyond praise; but note the northern love of rocks in the very first words I have to quote from Scott, “The rock that gave it rest.” Dante could not have thought of his “cut rocks” as giving rest even to snow. He must put it on the pine branches, if it is to be at peace.

§ 20. There is only one more point to be noticed in the Dantesque landscape; namely, the feeling entertained by the poet towards the sky. And the love of mountains is so closely connected with the love of clouds, the sublimity of both depending much on their association, that, having found Dante regardless of the Carrara mountains as seen from San Miniato, we may well expect to find him equally regardless of the clouds in which the sun sank behind them. Accordingly, we find that his only pleasure in the sky depends on its “white clearness,”—that turning into “bianco aspetto di cilestro” which is so peculiarly characteristic of fine days in Italy.² His pieces of pure pale light are always exquisite. In the dawn on the purgatorial mountain, first, in its pale white, he sees the “tremolar della marina”³—trembling of the sea; then it becomes vermilion; and at last, near sunrise, orange.⁴ These are precisely the changes of a calm and perfect dawn. The scenery of Paradise begins with “Day added to day,” the light of the sun so flooding the heavens, that “never rain nor river made lake so

¹ [*Lady of the Lake*, vi. 27.]

² [*Purgatorio*, xxvi. 6; on the white Italian skies compare *Modern Painters*, vol. i. (Vol. III. p. 144 and *n.*.)]

³ [*Purgatorio*, i. 117.]

⁴ [*Purgatorio*, ii. 7–9.]

wide;”¹ and throughout the Paradise all the beauty depends on spheres of light, or stars, never on clouds. But the pit of the Inferno is at first sight obscure, deep, and so *cloudy* that at its bottom nothing could be seen.² When Dante and Virgil reach the marsh in which the souls of those who have been angry and sad in their lives are for ever plunged, they find it covered with thick fog; and the condemned souls say to them,—

“We once were sad,
In the *sweet air made gladsome by the sun*.
Now in these murky settlings are we sad.”

Even the angel crossing the marsh to help them is annoyed by this bitter marsh smoke “*fummo acerbo*,” and continually sweeps it with his hand from before his face.³

Anger, on the purgatorial mountain, is in like manner imaged, because of its blindness and wildness, by the Alpine clouds. As they emerge from its mist they see the white light radiated through the fading folds of it; and, except this appointed cloud, no other can touch the mountain of purification.

“Tempest none, shower, hail, or snow,
Hoar-frost, or dewy moistness, higher falls,
Than that brief scale of threefold steps. Thick clouds,
Nor scudding rack, are ever seen, swift glance
Ne'er lightens, nor Thaumantian iris gleams.”⁴

Dwell for a little while on this intense love of Dante for light,—taught, as he is at last by Beatrice, to gaze on the sun itself like an eagle,⁵—and endeavour to enter into his equally intense detestation of all mist, rack of cloud, or dimness of rain; and then consider with what kind of temper he would have regarded a landscape of Copley

¹ [*Paradiso*, i. 61, 62, 80, 81.]

² [*Inferno*, iv. 10–12; for the next quotation (*ibid.*, vii. 121 *seq.*) see also *Stones of Venice*, vol. ii. (Vol. X. p. 381).]

³ [*Inferno*, ix. 82, 83.]

⁴ [*Purgatorio*, xxi. 46 *seq.*]

⁵ [*Paradiso*, i. 47, 48. Dante, however, does not say that he himself could gaze upon the sun, but only that Beatrice so gazed.]

Fielding's, or passed a day in the Highlands. He has, in fact, assigned to the souls of the gluttonous no other punishment in the Inferno than perpetuity of Highland weather:

"Showers
Ceaseless, accursed, heavy and cold, unchanged
For ever, both in kind and in degree,—
Large hail, discoloured water, sleety flaw,
Through the dim midnight air streamed down amain."¹

§ 21. However, in this immitigable dislike of clouds, Dante goes somewhat beyond the general temper of his age. For although the calm sky was alone loved, and storm and rain were dreaded by all men, yet the white horizontal clouds of serene summer were regarded with great affection by all early painters, and considered as one of the accompaniments of the manifestation of spiritual power; sometimes, for theological reasons which we shall soon have to examine, being received, even without any other sign, as the types of blessing or Divine acceptance; and in almost every representation of the heavenly paradise, these level clouds are set by the early painters for its floor, or for thrones of its angels; whereas Dante retains steadily, through circle after circle, his cloudless thought, and concludes his painting of heaven, as he began it, upon the purgatorial mountain, with the image of shadowless morning:

"I raised my eyes, and as at morn is seen
The horizon's eastern quarter to excel,
So likewise, that pacific Oriflamb
Glowed in the midmost, and toward every part,
With like gradation paled away its flame."²

But the best way of regarding this feeling of Dante's is as the ultimate and most intense expression of the love of light, colour, and clearness, which, as we saw above, distinguish the mediæval from the Greek on one side, and, as

¹ [*Inferno*, vi. 7 *seq.* (Cary).]

² [*Paradiso*, xxxi. 118, 119, 127–129 (seven lines being omitted in Ruskin's quotation after the first two). He here uses Cayley's translation, in which, however, "Auriflame" is read for "Oriflamb"—*i.e.* the Aurea flamma, a standard originally belonging to the monks of St. Denis, and assumed by the French kings in the field during the twelfth and following centuries.]

we shall presently see, distinguished him from the modern on the other. For it is evident that precisely in the degree in which the Greek was agriculturally inclined, in that degree the sight of clouds would become to him more acceptable than to the mediæval knight, who only looked for the fine afternoons in which he might gather the flowers in his garden, and in nowise shared or imagined the previous anxieties of his gardener. Thus, when we find Ulysses comforted about Ithaca, by being told it had “plenty of rain,” and the maids of Colonos boasting of their country for the same reason,¹ we may be sure that they had some regard for clouds; and accordingly, except Aristophanes, of whom more presently,² all the Greek poets speak fondly of the clouds, and consider them the fitting resting-places of the gods; including in their idea of clouds not merely the thin clear cirrus, but the rolling and changing volume of the thunder-cloud; nor even these only, but also the dusty whirlwind cloud of the earth, as in that noble chapter of Herodotus which tells us of the cloud, full of mystic voices, that rose out of the dust of Eleusis, and went down to Salamis.³ Clouds and rain were of course regarded with a like gratitude by the eastern and southern nations—Jews and Egyptians; and it is only among the northern mediævals, with whom fine weather was rarely so prolonged as to occasion painful drought, or dangerous famine, and over whom the clouds broke coldly and fiercely when they came, that the love of serene light assumes its intense character, and the fear of tempest its gloomiest; so that the powers of the clouds which to the Greek foretold his conquest at Salamis, and with whom he fought in alliance, side by side with their lightnings, under the crest of Parnassus,⁴ seemed, in the heart of the Middle Ages, to be

¹ [For Ithaca, see above, p. 243; and for the reference to the Chorus in the *ædipus Coloneus*, p. 273.]

² [See below, p. 318.]

³ [Herodotus, viii. 65. Compare Vol. IV. p. 330, where the passage is also referred to.]

⁴ [See again Vol. IV. p. 330 *n.*]

only under the dominion of the spirit of evil. I have reserved, for our last example of the landscape of Dante, the passage in which this conviction is expressed; a passage not less notable for its close description of what the writer feared and disliked, than for the ineffable tenderness, in which Dante is always raised as much above all other poets, as in softness the rose above all other flowers. It is the spirit of Buonconte da Montefeltro who speaks:

“Then said another: ‘Ah, so may thy wish,
That takes thee o’er the mountain, be fulfilled,
As thou shalt graciously give aid to mine!
Of Montefeltro I; Buonconte I:
Giovanna, nor none else, have care for me;
Sorrowing with these I therefore go.’ I thus:
‘From Campaldino’s field what force or chance
Drew thee, that ne’er thy sepulture was known?’
‘Oh!’ answered he, ‘at Casentino’s foot
A stream there courseth, named Archiano, sprung
In Apennine, above the hermit’s seat.
E’en where its name is cancelled, there came I,
Pierced in the throat, fleeing away on foot,
And bloodying the plain. Here sight and speech
Failed me; and finishing with Mary’s name,
I fell, and tenantless my flesh remained.

*That evil will, which in his intellect
Still follows evil, came;
 the valley, soon
As day was spent, he covered o’er with cloud,
From Pratomagno to the mountain range,
And stretched the sky above; so that the air,
Impregnate, changed to water. Fell the rain;
And to the fosses came all that the land
Contained not; and, as mightiest streams are wont,
To the great river, with such headlong sweep,
Rushed, that nought stayed its course. My stiffened frame,
Laid at its mouth, the fell Archiano found,
And dashed it into Arno; from my breast
Loosening the cross, that of myself I made
When overcome with pain. He hurled me on,
Along the banks and bottom of his course;
Then in his muddy spoils encircling wrapt.’ ”¹*

¹ [*Purgatorio*, v. 84–102, 112, 113, 115–129 (Cary’s translation).]

Observe, Buonconte, as he dies, crosses his arms over his breast, pressing them together, partly in his pain, partly in prayer. His body thus lies by the river shore, as on a sepulchral monument, the arms folded into a cross. The rage of the river, under the influence of the evil demon, *unlooses this cross*, dashing the body supinely away, and rolling it over and over by bank and bottom. Nothing can be truer to the action of a stream in fury than these lines. And how desolate is it all! The lonely flight,—the grisly wound, “pierced in the throat,”—the death, without help or pity,—only the name of Mary on the lips,—and the cross folded over the heart. Then the rage of the demon and the river,—the noteless grave,—and, at last, even she who had been most trusted forgetting him,—

“Giovanna, nor none else, have care for me.”

There is, I feel assured, nothing else like it in all the range of poetry; a faint and harsh echo of it, only, exists in one Scottish ballad, “The Twa Corbies.”¹

Here, then, I think, we may close our inquiry into the nature of the mediæval landscape; not but that many details yet require to be worked out; but these will be best observed by recurrence to them, for comparison with similar details in modern landscape,—our principal purpose, the getting at the governing tones and temper of conception, being, I believe, now sufficiently accomplished. And I think that our subject may be best pursued by immediately turning from the mediæval to the perfectly modern landscape; for although I have much to say respecting the transitional state of mind exhibited in the sixteenth and seventeenth centuries, I believe the transitions may be more easily explained after we have got clear sight of the extremes; and that by getting perfect and separate hold of the three great phases of art,—Greek, mediæval, and

¹ [For another reference to the ballad, see *Præterita*, i. ch. iii. § 68.]

modern,—we shall be enabled to trace, with least chance of error, those curious vacillations which brought us to the modern temper while vainly endeavouring to resuscitate the Greek. I propose, therefore, in the next chapter to examine the spirit of modern landscape, as seen generally in modern painting, and especially in the poetry of Scott.

CHAPTER XVI

OF MODERN LANDSCAPE

§ 1. WE turn our eyes, therefore, as boldly and as quickly as may be, from these serene fields and skies of mediæval art, to the most characteristic examples of modern landscape. And, I believe, the first thing that will strike us, or that ought to strike us, is their *cloudiness*.

Out of perfect light and motionless air, we find ourselves on a sudden brought under sombre skies, and into drifting wind; and, with fickle sunbeams flashing in our face, or utterly drenched with sweep of rain, we are reduced to track the changes of the shadows on the grass, or watch the rents of twilight through angry cloud. And we find that whereas all the pleasure of the mediæval was in *stability, definiteness, and luminousness*, we are expected to rejoice in darkness, and triumph in mutability; to lay the foundation of happiness in things which momentarily change or fade; and to expect the utmost satisfaction and instruction from what it is impossible to arrest, and difficult to comprehend.

§ 2. We find, however, together with this general delight in breeze and darkness, much attention to the real form of clouds, and careful drawing of effects of mist; so that the appearance of objects, as seen through it, becomes a subject of science with us; and the faithful representation of that appearance is made of primal importance, under the name of aerial perspective. The aspects of sunset and sunrise, with all their attendant phenomena of cloud and mist, are watchfully delineated; and in ordinary daylight landscape, the sky is considered of so much importance, that a principal mass of foliage, or a whole foreground, is unhesitatingly thrown into shade merely to bring out the form of a white

cloud. So that, if a general and characteristic name were needed for modern landscape art, none better could be invented than “the service of clouds.”

§ 3. And this name would, unfortunately, be characteristic of our art in more ways than one. In the last chapter, I said that all the Greeks spoke kindly about the clouds, except Aristophanes; and he, I am sorry to say (since his report is so unfavourable), is the only Greek who had studied them attentively. He tells us, first, that they are “great goddesses to idle men”; then, that they are “mistresses of disputings, and logic, and monstrosities, and noisy chattering”; declares that whoso believes in their divinity must first disbelieve in Jupiter, and place supreme power in the hands of an unknown god “Whirlwind”; and, finally, he displays their influence over the mind of one of their disciples, in his sudden desire “to speak ingeniously concerning smoke.”¹

There is, I fear, an infinite truth in this Aristophanic judgment applied to our modern cloud-worship. Assuredly, much of the love of mystery in our romances, our poetry, our art, and, above all, in our metaphysics, must come under that definition so long ago given by the great Greek, “speaking ingeniously concerning smoke.” And much of the instinct, which, partially developed in painting, may be now seen throughout every mode of exertion of mind,—the easily encouraged doubt, easily excited curiosity, habitual agitation, and delight in the changing and the marvellous, as opposed to the old quiet serenity of social custom and religious faith,—is again deeply defined in those few words, the “dethroning of Jupiter,” the “coronation of the whirlwind.”

§ 4. Nor of whirlwind merely, but also of darkness or ignorance respecting all stable facts. That darkening of the foreground to bring out the white cloud, is, in one aspect of it, a type of the subjection of all plain and positive fact,

¹ [*Clouds*, 316–318; 380; 320.]

to what is uncertain and unintelligible. And, as we examine farther into the matter, we shall be struck by another great difference between the old and modern landscape, namely, that in the old no one ever thought of drawing anything but as well *as he could*. That might not be *well*, as we have seen in the case of rocks; but it was as well as he *could*, and always distinctly. Leaf, or stone, or animal, or man, it was equally drawn with care and clearness, and its essential characters shown. If it was an oak tree, the acorns were drawn; if a flint pebble, its veins were drawn; if an arm of the sea, its fish were drawn; if a group of figures, their faces and dresses were drawn—to the very last subtlety of expression and end of thread that could be got into the space, far off or near. But now our ingenuity is all “concerning smoke.” Nothing is truly drawn but that; all else is vague, slight, imperfect; got with as little pains as possible. You examine your closest foreground, and find no leaves; your largest oak, and find no acorns; your human figure, and find a spot of red paint instead of a face; and in all this, again and again, the Aristophanic words come true, and the clouds seem to be “great goddesses to idle men.”

§ 5. The next thing that will strike us, after this love of clouds, is the love of liberty. Whereas the mediæval was always shutting himself into castles, and behind fosses, and drawing brickwork neatly, and beds of flowers primly, our painters delight in getting to the open fields and moors, abhor all hedges and moats; never paint anything but free-growing trees, and rivers gliding “at their own sweet will”;¹ eschew formality down to the smallest detail; break and displace the brickwork which the mediæval would have carefully cemented; leave unpruned the thickets he would have delicately trimmed; and, carrying the love of liberty even to license, and the love of wildness even to ruin, take pleasure at last in every aspect of age and desolation which

¹ [Wordsworth, *Miscellaneous Sonnets*, part ii. No. 36.]

emancipates the objects of nature from the government of men;—on the castle wall displacing its tapestry with ivy, and spreading, through the garden, the bramble for the rose.

§ 6. Connected with this love of liberty we find a singular manifestation of love of mountains, and see our painters traversing the wildest places of the globe in order to obtain subjects with craggy foregrounds and purple distances. Some few of them remain content with pollards and flat land; but these are always men of third-rate order; and the leading masters, while they do not reject the beauty of the low grounds, reserve their highest powers to paint Alpine peaks or Italian promontories. And it is eminently noticeable, also, that this pleasure in the mountains is never mingled with fear, or tempered by a spirit of meditation, as with the mediæval; but is always free and fearless, brightly exhilarating, and wholly unreflective; so that the painter feels that his mountain foreground may be more consistently animated by a sportsman than a hermit; and our modern society in general goes to the mountains, not to fast, but to feast, and leaves their glaciers covered with chicken-bones and egg-shells.

§ 7. Connected with this want of any sense of solemnity in mountain scenery, is a general profanity of temper in regarding all the rest of nature; that is to say, a total absence of faith in the presence of any deity therein. Whereas the mediæval never painted a cloud, but with the purpose of placing an angel in it; and a Greek never entered a wood without expecting to meet a god in it; *we* should think the appearance of an angel in the cloud wholly unnatural, and should be seriously surprised by meeting a god anywhere. Our chief ideas about the wood are connected with poaching. We have no belief that the clouds contain more than so many inches of rain or hail, and from our ponds and ditches expect nothing more divine than ducks and watercresses.

§ 8. Finally: connected with this profanity of temper is

a strong tendency to deny the sacred element of colour, and make our boast in blackness. For though occasionally glaring or violent, modern colour is on the whole eminently sombre, tending continually to grey or brown, and by many of our best painters consistently falsified, with a confessed pride in what they call chaste or subdued tints; so that, whereas a mediæval paints his sky bright blue and his foreground bright green, gilds the towers of his castles, and clothes his figures with purple and white, we paint our sky grey, our foreground black, and our foliage brown, and think that enough is sacrificed to the sun in admitting the dangerous brightness of a scarlet cloak or a blue jacket.

§ 9. These, I believe, are the principal points which would strike us instantly, if we were to be brought suddenly into an exhibition of modern landscapes out of a room filled with mediæval work. It is evident that there are both evil and good in this change; but how much evil, or how much good, we can only estimate by considering, as in the former divisions of our inquiry, what are the real roots of the habits of mind which have caused them.

At first, it is evident that the title "Dark Ages," given to the mediæval centuries, is, respecting art, wholly inapplicable. They were, on the contrary, the bright ages; ours are the dark ones. I do not mean metaphysically, but literally. They were the ages of gold; ours are the ages of umber.

*Distinctive
characters of
the modern
mind:*

This is partly mere mistake in us; we build brown brick walls, and wear brown coats, because we have been blunderingly taught to do so, and go on doing so mechanically. There is, however, also some cause for the change in our own tempers.

*1. Despond-
ency arising from
faithless-
ness.*

On the whole, these are much *sadder* ages than the early ones; not sadder in a noble and deep way, but in a dim wearied way,—the way of ennui, and jaded intellect, and uncomfortableness of soul and body.¹ The Middle Ages had their wars and agonies, but also intense delights.

¹ [Compare *Modern Painters*, vol. v. pt. ix. ch. xii. § 4.]

Their gold was dashed with blood; but ours is sprinkled with dust. Their life was inwoven with white and purple: ours is one seamless stuff of brown. Not that we are without apparent festivity, but festivity more or less forced, mistaken, embittered, incomplete—not of the heart. How wonderfully, since Shakspeare's time, have we lost the power of laughing at bad jests! The very finish of our wit belies our gaiety.

§ 10. The profoundest reason of this darkness of heart is, I believe, our want of faith. There never yet was a generation of men (savage or civilized) who, taken as a body, so wofully fulfilled the words "having no hope, and without God in the world,"¹ as the present civilized European race. A Red Indian or Otaheitan savage has more sense of a divine existence round him, or government over him, than the plurality of refined Londoners and Parisians: and those among us who may in some sense be said to believe, are divided almost without exception into two broad classes, Romanist and Puritan; who, but for the interference of the unbelieving portions of society, would, either of them, reduce the other sect as speedily as possible to ashes; the Romanist having always done so whenever he could, from the beginning of their separation, and the Puritan at this time holding himself in complacent expectation of the destruction of Rome by volcanic fire. Such division as this between persons nominally of one religion, that is to say, believing in the same God, and the same Revelation, cannot but become a stumbling-block of the gravest kind to all thoughtful and far-sighted men,—a stumbling-block which they can only surmount under the most favourable circumstances of early education. Hence, nearly all our powerful men in this age of the world are unbelievers; the best of them in doubt and misery; the worst in reckless defiance; the plurality, in plodding hesitation, doing, as well as they can, what practical work lies ready to their hands. Most

¹ [Ephesians ii. 12.]

of our scientific men are in this last class: our popular authors either set themselves definitely against all religious form, pleading for simple truth and benevolence, (Thackeray, Dickens,) or give themselves up to bitter and fruitless statement of facts, (De Balzac,) or surface-painting, (Scott,) or careless blasphemy, sad or smiling, (Byron, Beranger). Our earnest poets and deepest thinkers are doubtful and indignant, (Tennyson, Carlyle); one or two, anchored, indeed, but anxious or weeping, (Wordsworth, Mrs. Browning); and of these two, the first is not so sure of his anchor, but that now and then it drags with him, even to make him cry out,—

“Great God, I had rather be
A Pagan suckled in some creed outworn;
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn.”¹

In politics, religion is now a name; in art, a hypocrisy or affectation. Over German religious pictures the inscription, “See how Pious I am,” can be read at a glance by any clear-sighted person. Over French and English religious pictures the inscription, “See how Impious I am,” is equally legible. All sincere and modest art is, among us, profane.*

§ 11. This faithlessness operates among us according to our tempers, producing either sadness or levity, and being the ultimate root alike of our discontents and of our wantonnesses. It is marvellous how full of contradiction it makes us: we are first dull, and seek for wild and lonely places because we have no heart for the garden; presently we recover our spirits, and build an assembly-room among the mountains, because we have no

* Pre-Raphaelitism, of course, excepted, which is a new phase of art, in no wise considered in this chapter. Blake was sincere, but full of wild creeds, and somewhat diseased in brain.²

¹ [*Miscellaneous Sonnets*, part i. No. 33.]

² [For Blake, see above, p. 138.]

reverence for the desert. I do not know if there be game on Sinai, but I am always expecting to hear of some one's shooting over it.¹

§ 12. There is, however, another, and a more innocent root of our delight in wild scenery.

All the Renaissance principles of art tended, as I have before often explained, to the setting Beauty above Truth, and seeking for it always at the expense of truth. And the proper punishment of such pursuit—the punishment which all the laws of the universe rendered inevitable—was, that those who thus pursued beauty should wholly lose sight of beauty. All the thinkers of the age, as we saw previously, declared that it did not exist. The age seconded their efforts, and banished beauty, so far as human effort could succeed in doing so, from the face of the earth, and the form of man. To powder the hair, to patch the cheek, to hoop the body, to buckle the foot, were all part and parcel of the same system which reduced streets to brick walls, and pictures to brown stains. One desert of Ugliness was extended before the eyes of mankind; and their pursuit of the beautiful, so recklessly continued, received unexpected consummation in high-heeled shoes and periwigs—Gower Street,² and Gaspar Poussin.

§ 13. Reaction from this state was inevitable, if any true life was left in the races of mankind; and, accordingly, though still forced, by rule and fashion, to the producing and wearing all that is ugly, men steal out, half-ashamed of themselves for doing so, to the fields and mountains; and, finding among these the colour, and liberty, and variety, and power, which are for ever grateful to them, delight in these to an extent never before known; rejoice in all the wildest shattering of the mountain side, as an opposition to Gower Street, gaze in a rapt manner at

¹ [An expectation presently fulfilled: see Ruskin's description of a drawing by J. F. Lewis, *Academy Notes*, 1856 (s. Old Water-Colour Society).]

² [Compare *Stones of Venice*, vol. iii. (Vol. XI. p. 4).]

sunsets and sunrises, to see there the blue, and gold, and purple, which glow for them no longer on knight's armour or temple porch; and gather with care out of the fields, into their blotted herbaria, the flowers which the five orders of architecture have banished from their doors and casements.¹

§ 14. The absence of care for personal beauty, which is another great characteristic of the age, adds to this 4. Disdain of beauty in man. feeling in a twofold way: first, by turning all reverent thoughts away from human nature; and making us think of men as ridiculous or ugly creatures, getting through the world as well as they can, and spoiling it in doing so; not ruling it in a kingly way and crowning all its loveliness. In the Middle Ages hardly anything but vice could be caricatured, because virtue was always visibly and personally noble: now virtue itself is apt to inhabit such poor human bodies, that no aspect of it is invulnerable to jest; and for all fairness we have to seek to the flowers, for all sublimity, to the hills.

The same want of care operates, in another way, by lowering the standard of health, increasing the susceptibility to nervous or sentimental impressions, and thus adding to the other powers of nature over us whatever charm may be felt in her fostering the melancholy fancies of brooding idleness.

§ 15. It is not, however, only to existing inanimate nature that our want of beauty in person and dress has driven us. The imagination of it, as it was seen in 5. Romantic imagination of the past. our ancestors, haunts us continually; and while we yield to the present fashions, or act in accordance with the dullest modern principles of economy and utility, we look fondly back to the manners of the ages of chivalry, and delight in painting, to the fancy, the fashions we pretend to despise, and the splendours

¹ [Here is the point of connexion between *The Stones of Venice* and *Modern Painters* which Ruskin notes in a letter cited in Vol. X. pp. 207–208 n.]

we think it wise to abandon. The furniture and personages of our romance are sought, when the writer desires to please most easily, in the centuries which we profess to have surpassed in everything; the art which takes us into the present times is considered as both daring and degraded, and while the weakest words please us, and are regarded as poetry, which recall the manners of our forefathers, or of strangers, it is only as familiar and vulgar that we accept the description of our own.

In this we are wholly different from all the races that preceded us. All other nations have regarded their ancestors with reverence as saints or heroes; but have nevertheless thought their own deeds and ways of life the fitting subjects for their arts of painting or of verse. We, on the contrary, regard our ancestors as foolish and wicked, but yet find our chief artistic pleasure in descriptions of their ways of life.

The Greeks and mediævals honoured, but did not imitate their forefathers; we imitate, but do not honour.

§ 16. With this romantic love of beauty, forced to seek in history, and in external nature, the satisfaction it cannot find in ordinary life, we mingle a more rational passion, the due and just result of newly awakened powers of attention. Whatever may first lead us to the scrutiny of natural objects, that scrutiny never fails of its reward. Unquestionably they are intended to be regarded by us with both reverence and delight; and every hour we give to them renders their beauty more apparent, and their interest more engrossing. Natural science—which can hardly be considered to have existed before modern times—rendering our knowledge fruitful in accumulation, and exquisite in accuracy, has acted for good or evil, according to the temper of the mind which received it; and though it has hardened the faithlessness of the dull and proud, *6. Interest in science.* has shown new grounds for reverence to hearts which were thoughtful and humble. The neglect of the art of war, while it has somewhat weakened and *7. Fear of war.*

deformed the body,* has given us leisure and opportunity for studies to which, before, time and space were equally wanting; lives which once were early wasted on the battlefield are now passed usefully in the study; nations which exhausted themselves in annual warfare now dispute with each other the discovery of new planets;¹ and the serene philosopher dissects the plants, and analyses the dust, of lands which were of old only traversed by the knight in hasty march, or by the borderer in heedless rapine.

§ 17. The elements of progress and decline being thus strangely mingled in the modern mind, we might beforehand anticipate that one of the notable characters of our art would be its inconsistency; that efforts would be made in every direction, and arrested by every conceivable cause and manner of failure; that in all we did, it would become next to impossible to distinguish accurately the grounds for praise or for regret; that all previous canons of practice and methods of thought would be gradually overthrown, and criticism continually defied by successes which no one had expected, and sentiments which no one could define.

§ 18. Accordingly, while, in our inquiries into Greek and mediæval art, I was able to describe, in general terms, what all men did or felt, I find now many characters in many men; some, it seems to me, founded on the inferior and evanescent principles of modernism, on its recklessness, impatience, or faithlessness; others founded on its science, its new affection for nature, its love of openness and liberty. And among all these characters, good or evil, I see that some, remaining to us from old or transitional periods, do not properly belong to us, and will soon fade away, and

* Of course this is meant only of the modern citizen or country gentleman, as compared with a citizen of Sparta or old Florence. I leave it to others to say whether the "neglect of the *art* of war" may or may not, in a yet more fatal sense, be predicated of the English nation. War *without* art, we seem, with God's help, able still to wage nobly.

¹ [The reference here and in the author's note above is of course to the Crimean War, to the alliance of France and England therein, and to the discoveries of various minor planets in the two countries severally during the years 1854–1856.]

others, though not yet distinctly developed, are yet properly our own, and likely to grow forward into greater strength.

For instance: our reprobation of bright colour is, I think, for the most part, mere affectation, and must soon be done away with. Vulgarity, dulness, or impiety, will indeed always express themselves through art in brown and grey, as in Rembrandt, Caravaggio, and Salvator; but we are not wholly vulgar, dull, or impious; nor, as moderns, are we necessarily obliged to continue so in anywise. Our greatest men, whether sad or gay, still delight, like the great men of all ages, in brilliant hues. The colouring of Scott and Byron is full and pure; that of Keats and Tennyson rich even to excess. Our practical failures in colouring are merely the necessary consequences of our prolonged want of practice during the periods of Renaissance affectation and ignorance; and the only durable difference between old and modern colouring, is the acceptance of certain hues, by the modern, which please him by expressing that melancholy peculiar to his more reflective or sentimental character, and the greater variety of them necessary to express his greater science.

§ 19. Again: if we ever become wise enough to dress consistently and gracefully, to make health a principal object in education, and to render our streets beautiful with art, the external charm of past history will in great measure disappear. There is no essential reason, because we live after the fatal seventeenth century, that we should never again be able to confess interest in sculpture, or see brightness in embroidery; nor, because now we choose to make the night deadly with our pleasures, and the day with our labours, prolonging the dance till dawn, and the toil to twilight, that we should never again learn how rightly to employ the sacred trusts of strength, beauty, and time. Whatever external charm attaches itself to the past, would then be seen in proper subordination to the brightness of present life; and the elements of romance would exist, in the earlier ages, only in the attraction which must generally

belong to whatever is unfamiliar; in the reverence which a noble nation always pays to its ancestors; and in the enchanted light which races, like individuals, must perceive in looking back to the days of their childhood.

§ 20. Again: the peculiar levity with which natural scenery is regarded by a large number of modern minds cannot be considered as entirely characteristic of the age, inasmuch as it never can belong to its greatest intellects. Men of any high mental power must be serious, whether in ancient or modern days; a certain degree of reverence for fair scenery is found in all our great writers without exception,—even the one who has made us laugh oftenest, taking us to the valley of Chamouni, and to the sea beach, there to give peace after suffering, and change revenge into pity.* It is only the dull, the uneducated, or the worldly, whom it is painful to meet on the hill sides; and levity, as a ruling character, cannot be ascribed to the whole nation, but only to its holiday-making apprentices, and its House of Commons.

§ 21. We need not, therefore, expect to find any single poet or painter representing the entire group of powers, weaknesses, and inconsistent instincts which govern or confuse our modern life. But we may expect that in the man who seems to be given by Providence as the type of the age (as Homer and Dante were given, as the types of classical and mediæval mind), we shall find whatever is fruitful and substantial to be completely present, together with those of our weaknesses, which are indeed nationally characteristic, and compatible with general greatness of mind, just as the weak love of fences, and dislike of mountains, were found compatible with Dante's greatness in other respects.

§ 22. Farther: as the admiration of mankind is found, in our times, to have in great part passed from men to mountains, and from human emotion to natural phenomena, we may anticipate that the great strength of art will also

* See *David Copperfield*, chap. lv. and lviii.

be warped in this direction; with this notable result for us, that whereas the greatest painters or painter of classical and mediæval periods, being wholly devoted to the representation of humanity, furnished us with but little to examine in landscape, the greatest painters or painter of modern times will in all probability be devoted to landscape principally; and farther, because in representing human emotion words surpass painting, but in representing natural scenery painting surpasses words, we may anticipate also that the painter and poet (for convenience' sake I here use the words in opposition) will somewhat change their relations of rank in illustrating the mind of the age; that the painter will become of more importance, the poet of less; and that the relations between the men who are the types and first-fruits of the age in word and work,—namely, Scott and Turner,—will be, in many curious respects, different from those between Homer and Phidias, or Dante and Giotto.¹

It is this relation which we have now to examine.

§ 23. And, first, I think it probable that many readers may be surprised at my calling Scott the great representative of the mind of the age in literature. Those who can perceive the intense penetrative depth of Wordsworth, and the exquisite finish and melodious power of Tennyson, may be offended at my placing in higher rank that poetry of careless glance, and reckless rhyme, in which Scott poured out the fancies of his youth; and those who are familiar with the subtle analysis of the French novelists, or who have in anywise submitted themselves to the influence of German philosophy, may be equally indignant at my ascribing a principality to Scott among the literary men of Europe, in an age which has produced De Balzac and Goethe.²

¹ [See below, p. 388.]

² [The first paragraph of § 23 here is the first paragraph of § 13 in *Frondees Agrestes* (1875), where Ruskin added the following note:—

“I knew nothing of Goethe when I put him with Balzac; but the intolerable dulness which encumbers the depth of *Wilhelm Meister*, and the cruel reserve which conceals from all but the intensest readers the meaning of *Faust*, have made him, in a great degree, an evil influence in European literature; and evil is always second-rate.”

For other references to Goethe, see *Time and Tide*, § 96 (where *Wilhelm Meister* is

So also in painting, those who are acquainted with the sentimental efforts made at present by the German religious and historical schools, and with the disciplined power and learning of the French, will think it beyond all explanation absurd to call a painter of light water-colour landscapes, eighteen inches by twelve, the first representative of the arts of the age. I can only crave the reader's patience, and his due consideration of the following reasons for my doing so, together with those advanced in the farther course of the work.

§ 24. I believe the first test of a truly great man is his humility. I do not mean, by humility, doubt of his own power, or hesitation in speaking his opinions;¹ but a right understanding of the relation between what *he* can do and say, and the rest of the world's sayings and doings. All great men not only know their business, but usually know that they know it; and are not only right in their main opinions, but they usually know that they are right in them; only, they do not think much of themselves on that account. Arnolfo knows he can build a good dome at Florence; Albert Dürer writes calmly to one who had found fault with his work, "It cannot be better done;"² Sir Isaac Newton knows that he has worked out a problem or two that would have puzzled anybody else,—only they do not expect their fellow-men therefore to fall down and worship them; they have a curious under-sense of powerlessness, feeling that the greatness is not *in* them, but *through* them; that they could not do or be anything else than God made them. And they see something Divine and God-made in every other man they meet, and are endlessly, foolishly, incredibly merciful.

§ 25. Now, I find among the men of the present age, as far as I know them, this character in Scott and Turner

mentioned); *Munera Pulveris*, § 87; *Aratra Pentelici*, § 12 (*Faust*); and *Catalogue of the Educational Series* (where it is said that "Goethe has formed, directly or indirectly, the thoughts of all strong and wise men since his time".)]

¹ [Compare what is said on this subject in *Eagle's Nest*, § 30; *Crown of Wild Olive*, § 171; *Queen of the Air*, §§ 134, 135.]

² [Compare Vol. XI. p. 14 n.]

pre-eminently; I am not sure if it is not in them alone. I do not find Scott talking about the dignity of literature, nor Turner about the dignity of painting. They do their work, feeling that they cannot well help it; the story must be told, and the effect put down; and if people like it, well and good; and if not, the world will not be much the worse.

I believe a very different impression of their estimate of themselves and their doings will be received by any one who reads the conversations of Wordsworth or Goethe. The *slightest* manifestation of jealousy or self-complacency is enough to mark a second-rate character of the intellect; and I fear that, especially in Goethe, such manifestations are neither few nor slight.

§ 26. Connected with this general humility, is the total absence of affectation in these men,—that is to say, of any assumption of manner or behaviour in their work, in order to attract attention. Not but that they are mannerists both. Scott's verse is strongly mannered, and Turner's oil painting; but the manner of it necessitated by the feelings of the men, entirely natural to both, never exaggerated for the sake of show. I hardly know any other literary or pictorial work of the day which is not in some degree affected. I am afraid Wordsworth was often affected in his simplicity, and De Balzac in his finish. Many fine French writers are affected in their reserve, and full of stage tricks in placing of sentences. It is lucky if in German writers we ever find so much as a sentence without affectation. I know no painters without it, except one or two Pre-Raphaelites (chiefly Holman Hunt), and some simple water-colour painters, as William Hunt, William Turner of Oxford, and the late George Robson;¹ but these last have no invention, and therefore by our fourth canon, Chap. III. § 21, are excluded from the first rank of artists; and of the

¹ [For Holman Hunt, see Vol. XII. pp. 324–335. For William Hunt, see General Index; for Turner of Oxford, *Academy Notes*, 1856, 1858, 1859; for Robson, Vol. I. p. 193 *n.*]

Pre-Raphaelites there is here no question, as they in no wise represent the modern school.

§ 27. Again: another very important, though not infallible, test of greatness is, as we have often said, the appearance of Ease with which the thing is done.¹ It may be that, as with Dante and Leonardo, the finish given to the work effaces the evidence of ease; but where the ease is manifest, as in Scott, Turner, and Tintoret, and the thing done is very noble, it is a strong reason for placing the men above those who confessedly work with great pains. Scott writing his chapter or two before breakfast—not retouching; Turner finishing a whole drawing in a forenoon before he goes out to shoot² (providing always the chapter and drawing be good), are instantly to be set above men who confessedly have spent a day over the work, and think the hours well spent if it has been a little mended between sunrise and sunset. Indeed, it is no use for men to think to appear great by working fast, dashing, and scrawling; the thing they do must be good and great, cost what time it may; but if it *be* so, and they have honestly and unaffectedly done it with *no effort*, it is probably a greater and better thing than the result of the hardest efforts of others.

§ 28. Then, as touching the kind of work done by these two men, the more I think of it I find this conclusion more impressed upon me,—that the greatest thing a human soul ever does in this world is to *see* something, and tell what it *saw* in a plain way. Hundreds of people can talk for one who can think, but thousands can think for one who can see. To see clearly is poetry, prophecy, and religion,—all in one.

Therefore, finding the world of Literature more or less divided into Thinkers and Seers, I believe we shall find also that the Seers are wholly the greater race of the two. A true Thinker who has practical purpose in his thinking,

¹ [See, for instance, Vol. III. p. 122; Vol. IV. p. 283; Vol. XII. p. 344. And compare, with special reference to Scott, *Fiction, Fair and Foul*, § 23.]

² [See *Pre-Raphaelitism*, § 55, Vol. XII. p. 386.]

and is sincere, as Plato, or Carlyle, or Helps,¹ becomes in some sort a seer, and must be always of infinite use in his generation; but an affected Thinker, who supposes his thinking of any other importance than as it tends to work, is about the vainest kind of person that can be found in the occupied classes. Nay, I believe that metaphysicians and philosophers are, on the whole, the greatest troubles the world has got to deal with; and that while a tyrant or bad man is of some use in teaching people submission or indignation, and a thoroughly idle man is only harmful in setting an idle example, and communicating to other lazy people his own lazy misunderstandings, busy metaphysicians are always entangling *good* and *active* people, and weaving cobwebs among the finest wheels of the world's business; and are as much as possible, by all prudent persons, to be brushed out of their way, like spiders, and the meshed weed that has got into the Cambridgeshire canals, and other such impediments to barges and business. And if we thus clear the metaphysical element out of modern literature, we shall find its bulk amazingly diminished, and the claims of the remaining writers, or of those whom we have thinned by this abstraction of their straw stuffing, much more easily adjusted.*

§ 29. Again: the mass of sentimental literature, concerned with the analysis and description of emotion, headed by the poetry of Byron, is altogether of lower rank than the literature which merely describes what it saw. The true Seer always feels as intensely as any one else; but he does not much describe his feelings. He tells you whom he met, and what they said; leaves you to make

* Observe, I do not speak thus of metaphysics because I have no pleasure in them. When I speak contemptuously of philology, it may be answered me, that I am a bad scholar; but I cannot be so answered touching metaphysics, for every one conversant with such subjects may see that I have strong inclination that way, which would, indeed, have led me far astray long ago, if I had not learned also some use of my hands, eyes, and feet.

¹ [For Ruskin's admiration of Helps, see Vol. XI. p. 153 n.]

out, from that, what they feel, and what he feels, but goes into little detail. And, generally speaking, pathetic writing and careful explanation of passion are quite easy, compared with this plain recording of what people said and did, or with the right invention of what they are likely to say and do; for this reason, that to invent a story, or admirably and thoroughly tell any part of a story, it is necessary to grasp the entire mind of every personage concerned in it, and know precisely how they would be affected by what happens; which to do requires a colossal intellect: but to describe a separate emotion delicately, it is only needed that one should feel it oneself; and thousands of people are capable of feeling this or that noble emotion, for one who is able to enter into all the feelings of somebody sitting on the other side of the table. Even, therefore, where this sentimental literature is first-rate, as in passages of Byron, Tennyson, and Keats, it ought not to be ranked so high as the Creative; and though perfection, even in narrow fields, is perhaps as rare as in the wider, and it may be as long before we have another *In Memoriam* as another *Guy Mannering*, I unhesitatingly receive as a greater manifestation of power the right invention of a few sentences spoken by Pleydell and Mannering across their supper-table,¹ than the most tender and passionate melodies of the self-examining verse.

§ 30. Having, therefore, cast metaphysical writers out of our way, and sentimental writers into the second rank, I do not think Scott's supremacy among those who remain will any more be doubtful; nor would it, perhaps, have been doubtful before, had it not been encumbered by innumerable faults and weaknesses. But it is pre-eminently in these faults and weaknesses that Scott is the representative of the mind of his age; and because he is the greatest man born amongst us, and intended for the enduring type of us, all our principal faults must be laid on

¹ [Chapters xxxiv., xlix.]

his shoulders, and he must bear down the dark marks to the latest ages; while the smaller men, who have some special work to do, perhaps not so much belonging to this age as leading out of it to the next, are often kept providentially quit of the encumbrances which they had not strength to sustain, and are much smoother and pleasanter to look at, in their way: only that is a smaller way.

§ 31. Thus, the most startling fault of the age being its faithlessness, it is necessary that its greatest man should be faithless. Nothing is more notable or sorrowful in Scott's mind than its incapacity of steady belief in anything. He cannot even resolve hardily to believe in a ghost, or a water-spirit; always explains them away in an apologetic manner, not believing, all the while, even in his own explanation. He never can clearly ascertain whether there is anything behind the arras but rats; never draws sword, and thrusts at it for life or death; but goes on looking at it timidly, and saying, "It must be the wind." He is educated a Presbyterian, and remains one, because it is the most sensible thing he can do if he is to live in Edinburgh; but he thinks Romanism more picturesque, and profaneness more gentlemanly; does not see that anything affects human life but love, courage, and destiny; which are, indeed, not matters of faith at all, but of sight. Any gods but those are very misty in outline to him; and when the love is laid ghastly in poor Charlotte's coffin; and the courage is no more of use,—the pen having fallen from between the fingers; and destiny is sealing the scroll,—the God-light is dim in the tears that fall on it.¹

He is in all this the epitome of his epoch.

§ 32. Again: as another notable weakness of the age is its habit of looking back, in a romantic and passionate idleness, to the past ages, not understanding them all the while, nor really desiring to understand them, so Scott gives up nearly the half of his intellectual power to a fond, yet

¹ [For Scott's feelings on the death of his wife, in 1826, see Lockhart's *Life*, ch. 70.]

purposeless, dreaming over the past, and spends half his literary labours in endeavours to revive it, not in reality, but on the stage of fiction; endeavours which were the best of the kind that modernism made, but still successful only so far as Scott put, under the old armour, the everlasting human nature which he knew; and totally unsuccessful, so far as concerned the painting of the armour itself, which he knew *not*. The excellence of Scott's work is precisely in proportion to the degree in which it is sketched from present nature. His familiar life is inimitable; his quiet scenes of introductory conversation, as the beginning of *Rob Roy* and *Redgauntlet*, and all his living Scotch characters, mean or noble, from Andrew Fair-service to Jeanie Deans, are simply right, and can never be bettered. But his romance and antiquarianism, his knighthood and monkery, are all false, and he knows them to be false; does not care to make them earnest; enjoys them for their strangeness, but laughs at his own antiquarianism, all through his own third novel,—with exquisite modesty indeed, but with total misunderstanding of the function of an Antiquary. He does not see how anything is to be got out of the past but confusion, old iron on drawing-room chairs, and serious inconvenience to Dr. Heavysterne.¹

§ 33. Again: more than any age that had preceded it, ours had been ignorant of the meaning of the word "Art." It had not a single fixed principle, and what unfixed principles it worked upon were all wrong. It was necessary that Scott should know nothing of art. He neither cared for painting nor sculpture, and was totally incapable of forming a judgment about them. He had some confused love of Gothic architecture, because it was dark, picturesque, old, and like nature; but could not tell the worst

¹ [See ch. iii. of *The Antiquary*. For other references to Andrew Fair-service in *Rob Roy*, see *Fors Clavigera*, Letters 65 and 92; *Fiction, Fair and Foul*, §§ 29 *seq.*, 114 *seq.*; and *Præterita*, i. ch. iii. § 71 *n.*, iii. ch. iv. § 71 *n.* And for Jeanie Deans, *Fors*, Letters 42, 91, 92; *Fiction, Fair and Foul*, § 113; *Pleasures of England*, § 98; and *Præterita*, ii. ch. xii. § 231.]

from the best, and built for himself perhaps the most incongruous and ugly pile that gentlemanly modernism ever designed;¹ marking, in the most curious and subtle way, that mingling of reverence with irreverence which is so striking in the age; he reverences Melrose, yet casts one of its piscinas, puts a modern steel grate into it, and makes it his fireplace. Like all pure moderns, he supposes the Gothic barbarous, notwithstanding his love of it; admires, in an equally ignorant way, totally opposite styles; is delighted with the new town of Edinburgh; mistakes its dulness for purity of taste, and actually compares it, in its deathful formality of street, as contrasted with the rudeness of the old town, to Britomart taking off her armour.²

§ 34. Again: as in reverence and irreverence, so in levity and melancholy, we saw that the spirit of the age was strangely interwoven. Therefore, also, it is necessary that Scott should be light, careless, unearnest, and yet eminently sorrowful. Throughout all his work there is no evidence of any purpose but to while away the hour. His life had no other object than the pleasure of the instant, and the establishing of a family name. All his thoughts were, in their outcome and end, less than nothing, and vanity. And yet, of all poetry that I know, none is so sorrowful as Scott's. Other great masters are pathetic in a resolute and predetermined way, when they choose; but, in their own minds, are evidently stern or hopeful, or serene; never really melancholy. Even Byron is rather sulky and desperate than melancholy; Keats is sad because he is sickly; Shelley because he is impious; but Scott is inherently and consistently sad. Around all his power, and brightness, and enjoyment of eye and heart, the faraway Æolian knell is for ever sounding; there is not one of those loving or laughing glances of his but it is brighter for the film of tears; his mind is like one of his own hill

¹ [Compare on this subject Vol. I. p. 163 *n.*]

² [*Marmion*: Introduction to Canto v.]

rivers,—it is white, and flashes in the sun fairly, careless, as it seems, and hasty in its going, but

“Far beneath, where slow they creep
From pool to eddy, dark and deep,
Where alders moist, and willows weep,
You hear her streams repine.”¹

Life begins to pass from him very early; and while Homer sings cheerfully in his blindness, and Dante retains his courage, and rejoices in hope of Paradise, through all his exile, Scott, yet hardly past his youth, lies pensive in the sweet sunshine and among the harvests of his native hills.

“Blackford, on whose uncultured breast,
Among the broom, and thorn, and whin,
A truant boy, I sought the nest,
Or listed as I lay at rest,
While rose on breezes thin
The murmur of the city crowd,
And, from his steeple jangling loud,
St. Giles’s mingling din!
Now, from the summit to the plain,
Waves all the hill with yellow grain;
And on the landscape as I look,
Naught do I see unchanged remain,
Save the rude cliffs and chiming brook;
To me they make a heavy moan
Of early friendships past and gone.”²

§ 35. Such, then, being the weaknesses which it was necessary that Scott should share with his age, in order that he might sufficiently represent it, and such the grounds for supposing him, in spite of all these weaknesses, the greatest literary man whom that age produced, let us glance at the principal points in which his view of landscape differs from that of the mediævals.

I shall not endeavour now, as I did with Homer and Dante, to give a complete analysis of all the feelings which appear to be traceable in Scott’s allusions to landscape scenery,—for this would require a volume,—but only to

¹ [*Marmion*, iv. 10.]

² [*Ibid.*, iv. 24.]

indicate the main points of differing character between his temper and Dante's. Then we will examine in detail, not the landscape of literature, but that of painting, which must, of course, be equally, or even in a higher degree, characteristic of the age.

§ 36. And, first, observe Scott's habit of looking at nature neither as dead, or merely material, in the way that Homer regards it, nor as altered by his own feelings, in the way that Keats and Tennyson regard it, but as having an animation and pathos of *its own*, wholly irrespective of human presence or passion,—an animation which Scott loves and sympathises with, as he would with a fellow-creature, forgetting himself altogether, and subduing his own humanity before what seems to him the power of the landscape.

“Yon lonely Thorn,—would he could tell
The changes of his parent dell,
Since he, so grey and stubborn now,
Waved in each breeze a sapling bough:
Would he could tell, how deep the shade
A thousand mingled branches made,
How broad the shadows of the oak,
How clung the rowan to the rock,
And through the foliage show'd his head,
With narrow leaves and berries red!”¹

Scott does not dwell on the grey stubbornness of the thorn, because he himself is at that moment disposed to be dull or stubborn; neither on the cheerful peeping forth of the rowan, because he himself is at that moment cheerful or curious: but he perceives them both with the kind of interest that he would take in an old man or a climbing boy; forgetting himself, in sympathy with either age or youth.

“And from the grassy slope he sees
The Greta flow to meet the Tees;
Where issuing from her darksome bed,
She caught the morning's eastern red,

¹ [*Marmion*, Introduction to Canto ii.]

And through the softening vale below
Roll'd her bright waves in rosy glow,
All blushing to her bridal bed,
Like some shy maid, in convent bred;
While linnet, lark, and blackbird gay
Sing forth her nuptial roundelay."¹

Is Scott, or are the persons of his story, gay at this moment? Far from it. Neither Scott nor Risingham is happy, but the Greta is; and all Scott's sympathy is ready for the Greta, on the instant.

§ 37. Observe, therefore, this is not *pathetic* fallacy; for there is no passion in *Scott* which alters nature. It is not the lover's passion, making him think the larkspurs are listening for his lady's foot; it is not the miser's passion, making him think that dead leaves are falling coins;² but it is an inherent and continual habit of thought, which Scott shares with the moderns in general, being, in fact, nothing else than the instinctive sense which men must have of the Divine presence, not formed into distinct belief. In the Greek it created, as we saw, the faithfully believed gods of the elements;³ in Dante and the mediævals, it formed the faithfully believed angelic presence: in the modern, it creates no perfect form, does not apprehend distinctly any Divine being or operation; but only a dim, slightly credited animation in the natural object, accompanied with great interest and affection for it. This feeling is quite universal with us, only varying in depth according to the greatness of the heart that holds it; and in Scott, being more than usually intense, and accompanied with infinite affection and quickness of sympathy, it enables him to conquer all tendencies to the pathetic fallacy, and, instead of making Nature anywise subordinate to himself, he makes himself subordinate to *her*—follows her lead simply—does not venture to bring his own cares and thoughts

¹ [*Rockeby*, ii. 16.]

² [See above, p. 219 *n.*]

³ [See above, p. 224.]

into her pure and quiet presence—paints her in her simple and universal truth, adding no result of momentary passion or fancy, and appears, therefore, at first shallower than other poets, being in reality wider and healthier. “What am I?” he says continually, “that I should trouble this sincere nature with my thoughts. I happen to be feverish and depressed, and I could see a great many sad and strange things in those waves and flowers; but I have no business to see such things. Gay Greta! sweet harebells! *you* are not sad nor strange to most people; you are but bright water and blue blossoms; you shall not be anything else to me, except that I cannot help thinking you are a little alive,—no one can help thinking that.” And thus, as Nature is bright, serene, or gloomy, Scott takes her temper, and paints her as she is; nothing of himself being ever intruded, except that far-away Æolian tone, of which he is unconscious; and sometimes a stray syllable or two, like that about Blackford Hill,¹ distinctly stating personal feeling, but all the more modestly for that distinctness, and for the clear consciousness that it is not the chiming brook, nor the cornfields, that are sad, but only the boy that rests by them; so returning on the instant to reflect, in all honesty, the image of Nature, as she is meant by all men to be received; nor that in fine words, but in the first that come; nor with comment of far-fetched thoughts, but with easy thoughts, such as all sensible men ought to have in such places, only spoken sweetly; and evidently also with an undercurrent of more profound reflection, which here and there murmurs for a moment, and which, I think, if we choose, we may continually pierce down to, and drink deeply from, but which Scott leaves us to seek, or shun, at our pleasure.²

§ 38. And in consequence of this unselfishness and humility, Scott’s enjoyment of Nature is incomparably

¹ [See above, § 34.]

² [In looking back to this chapter in after years Ruskin rated more highly the influence of national scenery on Scott: see *Fors Clavigera*, Letter 92 (1883) *ad fin.*]

greater than that of any other poet I know. All the rest carry their cares to her, and begin maundering in her ears about their own affairs. Tennyson goes out on a furzy common, and sees it is calm autumn sunshine, but it gives him no pleasure. He only remembers that it is

“Dead calm in that noble breast
Which heaves but with the heaving deep.”¹

He sees a thundercloud in the evening, and *would* have “doted and pored” on it, but cannot, for fear it should bring the ship bad weather. Keats drinks the beauty of nature violently; but has no more real sympathy with her than he has with a bottle of claret. His palate is fine; but he “bursts joy’s grape against it,”² gets nothing but misery, and a bitter taste of dregs, out of his desperate draught.

Byron and Shelley are nearly the same, only with less truth of perception, and even more troublesome selfishness. Wordsworth is more like Scott, and understands how to be happy, but yet cannot altogether rid himself of the sense that he is a philosopher, and ought always to be saying something wise. He has also a vague notion that nature would not be able to get on well without Wordsworth; and finds a considerable part of his pleasure in looking at himself as well as at her. But with Scott the love is entirely humble and unselfish. “I, Scott, am nothing, and less than nothing; but these crags, and heaths, and clouds, how great they are, how lovely, how for ever to be beloved, only for their own silent, thoughtless sake!”

§ 39. This pure passion for nature in its abstract being, is still increased in its intensity by the two elements above taken notice of,—the love of antiquity, and the love of colour and beautiful form, mortified in our streets, and seeking for food in the wilderness and the ruin: both feelings,

¹ [*In Memoriam*, xi.; and for the next reference, see *ibid.* xv.]

² [*Ode to Melancholy*.]

observe, instinctive in Scott from his childhood, as everything that makes a man great is always.

“And well the lonely infant knew
Recesses where the wallflower grew,
And honeysuckle loved to crawl
Up the low crag and ruin'd wall.
I deem'd such nooks the sweetest shade
The sun in all its round survey'd.”¹

Not that these could have been instinctive in a child in the Middle Ages. The sentiments of a people increase or diminish in intensity from generation to generation,—every disposition of the parents affecting the frame of the mind in their offspring; the soldier's child is born to be yet more a soldier, and the politician's to be still more a politician; even the slightest colours of sentiment and affection are transmitted to the heirs of life; and the crowning expression of the mind of a people is given when some infant of highest capacity, and sealed with the impress of this national character, is born where providential circumstances permit the full development of the powers it has received straight from Heaven, and the passions which it has inherited from its fathers.

§ 40. This love of ancientness, and that of natural beauty, associate themselves also in Scott with the love of liberty, which was indeed at the root even of all his Jacobite tendencies in politics. For, putting aside certain predilections about landed property, and family name, and “gentlemanliness” in the club sense of the word,—respecting which I do not now inquire whether they were weak or wise,—the main element which makes Scott like Cavaliers better than Puritans is, that he thinks the former *free* and *masterful* as well as loyal: and the latter *formal* and *slavish*. He is loyal, not so much in respect for law, as in unselfish love for the king; and his sympathy is quite as ready for any active borderer who breaks the law, or fights the king, in

¹ [*Marmion*, Introduction to Canto iii.]

what Scott thinks a generous way, as for the king himself. Rebellion of a rough, free, and bold kind he is always delighted by; he only objects to rebellion on principle and in form: bareheaded and open-throated treason he will abet to any extent, but shrinks from it in a peaked hat and starched collar: nay, politically, he only delights in kingship itself, because he looks upon it as the head and centre of liberty; and thinks that, keeping hold of a king's hand, one may get rid of the cramps and fences of law; and that the people may be governed by the whistle, as a Highland clan on the open hill-side, instead of being shut up into hurdled folds or hedged fields, as sheep or cattle left masterless.

§ 41. And thus Nature becomes dear to Scott in a three-fold way; dear to him, first, as containing those remains or memories of the past, which he cannot find in cities, and giving hope of Prætorian mound or knight's grave, in every green slope and shade of its desolate places;—dear, secondly, in its moorland liberty, which has for him just as high a charm as the fenced garden had for the mediæval;

“For I was wayward, bold, and wild,
A self-will'd imp—a grandame's child:
But, half a plague, and half a jest,
Was still endured, beloved, caressed.
For me, thus nurtured, dost thou ask
The classic poet's well-conn'd task?
Nay, Erskine, nay. On the wild hill
Let the wild heathbell flourish still;
Cherish the tulip, prune the vine;
But freely let the woodbine twine,
And leave untrimm'd the eglantine.”¹

—and dear to him, finally, in that perfect beauty, denied alike in cities and in men, for which every modern heart had begun at last to thirst, and Scott's, in its freshness and power, of all men's, most earnestly.

§ 42. And in this love of beauty, observe, that (as I said

¹ [*Marmion*, Introduction to Canto iii.]

we might expect¹) the love of *colour* is a leading element, his healthy mind being incapable of losing, under any modern false teaching, its joy in brilliancy of hue. Though not so subtle a colourist as Dante, which, under the circumstances of the age, he could not be, he depends quite as much upon colour for his power or pleasure. And, in general, if he does not mean to say much about things, the *one* character which he will give is colour, using it with the most perfect mastery and faithfulness, up to the point of possible modern perception. For instance, if he has a sea-storm to paint in a single line, he does not, as a feebler poet would probably have done, use any expression about the temper or form of the waves; does not call them angry or mountainous. He is content to strike them out with two dashes of Tintoret's favourite colours:²

*"The blackening wave is edged with white,
To inch and rock the seamews fly."*³

There is no form in this. Nay, the main virtue of it is, that it gets rid of all form. The dark raging of the sea—what form has that? But out of the cloud of its darkness those lightning flashes of the foam, coming at their terrible intervals—you need no more.

Again: where he has to described tents mingled among oaks, he says nothing about the form of either tent or tree, but only gives the two strokes of colour:

*"Thousand pavilions, white as snow,
Chequered the borough moor below,
Oft giving way, where still there stood
Some relics of the old oak wood,
That darkly huge did intervene,
And tamed the glaring white with green."*⁴

¹ [See above, p. 328.]

² [See Vol. X. p. xxxv.; Vol. XI. p. 364; Vol. XII. p. 290.]

³ [*Lay of the Last Minstrel*, vi. 23.]

⁴ [*Marmion*, iv. 25.]

Again: of tents at Flodden:

“Next morn the Baron climbed the tower,
To view, afar, the Scottish power,
Encamped on Flodden edge.
The white pavilions made a snow,
Like remnants of the winter snow,
Along the dusky ridge.”¹

Again: of trees mingled with dark rocks:

“Until where Teith’s young waters roll
Betwixt him and a wooded knoll,
That graced the *sable* strath with *green*,
The chapel of St. Bride was seen.”²

Again: there is hardly any form, only smoke and colour. in his celebrated description of Edinburgh:

“The wandering eye could o’er it go,
And mark the distant city glow
With gloomy splendour red;
For on the smoke-wreaths, huge and slow,
That round her sable turrets flow,
The morning beams were shed,
And tinged them with a lustre proud,
Like that which streaks a thunder-cloud.
Such dusky grandeur clothed the height,
Where the huge Castle holds its state,
And all the steep slope down,
Whose ridgy back heaves to the sky,
Piled deep and massy, close and high,
Mine own romantic town!
But northward far, with purer blaze,
On Ochil mountains fell the rays,
And as each heathy top they kissed,
It gleamed a purple amethyst.
Yonder the shores of Fife you saw;
Here Preston Bay and Berwick Law:
And, broad between them, rolled
The gallant Frith the eye might note,
Whose islands on its bosom float,
Like emeralds chased in gold.”³

¹ [*Marmion*, vi. 18.]

² [*Lady of the Lake*, iii. 19.]

³ [*Marmion*, iv. 30.]

I do not like to spoil a fine passage by italicizing it; but observe, the only hints at form, given throughout, are in the somewhat vague words, “ridgy,” “massy,” “close,” and “high”; the whole being still more obscured by modern mystery, in its most tangible form of smoke. But the *colours* are all definite; note the rainbow band of them—gloomy or dusky red, sable (pure black), amethyst (pure purple), green, and gold—a noble chord throughout; and then, moved doubtless less by the smoky than the amethystine part of the group,

“Fitz Eustace’ heart felt closely pent,
The spur he to his charger lent,
And raised his bridle hand,
And making demivolte in air,
Cried, ‘Where’s the coward that would not dare
To fight for such a land?’ ”¹

I need not multiply examples: the reader can easily trace for himself, through verse familiar to us all, the force of these colour instincts. I will therefore add only two passages, not so completely known by heart as most of the poems in which they occur.

“’Twas silence all. He laid him down
Where purple heath profusely strown,
And throatwort with its azure bell,
And moss and thyme his cushion swell.
There, spent with toil, he listless eyed
The course of Greta’s playful tide;
Beneath her banks, now eddying dun,
Now brightly gleaming to the sun,
As, dancing over rock and stone,
In yellow light her currents shone,
Matching in hue the favourite gem
Of Albin’s mountain diadem.
Then tired to watch the currents play,
He turned his weary eyes away
To where the bank opposing show’d
Its huge, square cliffs through shaggy wood.
One, prominent above the rest,
Rear’d to the sun its pale grey breast;
Around its broken summit grew
The hazel rude and sable yew;

¹ [*Marmion*, iv. 30.]

A thousand varied lichens dyed
 Its waste and weather-beaten side;
 And round its rugged basis lay,
 By time or thunder rent away,
 Fragments, that, from its frontlet torn,
 Were mantled now by verdant thorn.”¹

§ 43. Note, first, what an exquisite chord of colour is given in the succession of this passage. It begins with purple and blue: then passes to gold, or cairngorm colour (topaz colour); then to *pale grey*, through which the yellow passes into black; and the black, through broken dyes of lichen, into green. Note, secondly—what is indeed so manifest throughout Scott’s landscape as hardly to need pointing out,—the love of rocks, and true understanding of their colours and characters, opposed as it is in every conceivable way to Dante’s hatred and misunderstanding of them.

I have already traced, in various places, most of the causes of this great difference; namely, first, the ruggedness of northern temper (compare § 8 of the chapter on the Nature of Gothic in the *Stones of Venice*); then the really greater beauty of the northern rocks, as noted when we were speaking of the Apennine limestone;² then the need of finding beauty among them, if it were to be found anywhere,—no well-arranged colours being any more to be seen in dress, but only in rock lichens; and, finally, the love of irregularity, liberty, and power springing up in glorious opposition to laws of prosody, fashion, and the five orders.

§ 44. The other passage I have to quote is still more interesting; because it has *no form* in it *at all* except in one word (chalice), but wholly composes its imagery either of colour, or of that delicate half-believed life which we have seen to be so important an element in modern landscape.

“The summer dawn’s reflected hue
 To purple changed Loch Katrine blue;
 Mildly and soft the western breeze
 Just kissed the lake, just stirred the trees;

¹ [*Rokeby*, iii. 8.]

² [See above, p. 297; and for the following references, p. 324, and *Stones of Venice*, Vol. X. pp. 207–208.]

*And the pleased lake, like maiden coy,
 Trembled but dimpled not for joy;
 The mountain-shadows on her breast
 Were neither broken nor at rest;
 In bright uncertainty they lie,
 Like future joys to Fancy's eye.
 The water-lily to the light
 Her chalice rear'd of silver bright;
 The doe awoke, and to the lawn,
 Begemm'd with dew-drops, led her fawn;
 The grey mist left the mountain side;
 The torrent show'd its glistening pride;
 Invisible in fleck'd sky,
 The lark sent down her revelry;
 The blackbird and the speckled thrush
 Good-morrow gave from brake and bush;
 In answer coo'd the cushat dove
 Her notes of peace, and rest, and love.”¹*

Two more considerations are, however, suggested by the above passage. The first, that the love of natural history, excited by the continual attention now given to all wild landscape, heightens reciprocally the interest of that landscape, and becomes an important element in Scott's description, leading him to finish, down to the minutest speckling of breast, and slightest shade of attributed emotion, the portraiture of birds and animals; in strange opposition to Homer's slightly named “sea-crows, who have care of the works of the sea,”² and Dante's singing-birds of undefined species. Compare carefully a passage too long to be quoted,—the 2nd and 3rd stanzas of Canto vi. of *Rokeby*.

§ 45. The second and the last point I have to note, is Scott's habit of drawing a slight *moral* from every scene, just enough to excuse to his conscience his want of definite religious feeling; and that this slight moral is almost always melancholy. Here he has stopped short without entirely expressing it—

“The mountain shadows .
 lie
 Like future joys to Fancy's eye.”

¹ [*Lady of the Lake*, iii. 2.]

² [See above, p. 235; and for “Dante's singing-birds,” *Purgatorio*, xxviii. 14–18.]

His completed thought would be, that those future joys, like the mountain shadows, were never to be attained. It occurs fully uttered in many other places. He seems to have been constantly rebuking his own worldly pride and vanity, but never purposefully:

“The foam-globes on her eddies ride,
Thick as the schemes of human pride
That down life’s current drive amain,
As frail, as frothy, and as vain.”

“Foxglove, and nightshade, side by side,
Emblems of punishment and pride.”

“Her dark eye flashed; she paused, and sighed;—
‘Ah what have I to do with pride!’ ”¹

And hear the thought he gathers from the sunset (noting first the Turnerian colour,—as usual, its principal element):

“The sultry summer day is done.
The western hills have hid the sun,
But mountain peak and village spire
Retain reflection of his fire.
Old Barnard’s towers are purple still,
To those that gaze from Toller Hill;
Distant and high, the tower of Bowes
Like steel upon the anvil glows;
And Stanmore’s ridge, behind that lay,
Rich with the spoils of parting day,
In crimson and in gold array’d,
Streaks yet awhile the closing shade:
Then slow resigns to darkening heaven
The tints which brighter hours had given.
Thus, aged men, full loath and slow,
The vanities of life forego,
And count their youthful follies o’er
Till Memory lends her light no more.”²

That is, as far as I remember, one of the most finished pieces of sunset he has given; and it has a woful moral; yet one which, with Scott, is inseparable from the scene.

Hark again:

“‘Twere sweet to mark the setting day
On Bourhope’s lonely top decay;

¹ [*Rokeby*, ii. 7; *Lady of the Lake*, i. 12; vi. 9.]

² [*Rokeby*, v. 1.]

And, as it faint and feeble died
 On the broad lake and mountain's side,
 To say, 'Thus pleasures fade away;
 Youth, talents, beauty, thus decay,
 And leave us dark, forlorn, and grey.' ”¹

And again, hear Bertram:

“Mine be the eve of tropic sun!
 With disk like battle-target red,
 He rushes to his burning bed,
 Dyes the wild wave with bloody light,
 Then sinks at once—and all is night.”²

In all places of this kind, where a passing thought is suggested by some external scene, that thought is at once a slight and sad one. Scott's deeper moral sense is marked in the *conduct* of his stories, and in casual reflections or exclamations arising out of their plot, and therefore sincerely uttered; as that of Marmion:

“Oh, what a tangled web we weave,
 When first we practise to deceive!”³

But the reflections which are founded, not on events, but on scenes, are, for the most part, shallow, partly insincere, and, as far as sincere, sorrowful. This habit of ineffective dreaming and moralizing over passing scenes, of which the earliest type I know is given in Jaques, is, as aforesaid,⁴ usually the satisfaction made to our modern consciences for the want of a sincere acknowledgment of God in nature: and Shakspeare has marked it as the characteristic of a mind “compact of jars” (Act II. Sc. VII., *As You Like It*). That description attaches but too accurately to all the moods which we have traced in the moderns generally, and in Scott as the first representative of them; and the question now is, what this love of landscape, so composed, is likely to lead us to, and what use can be made of it.

¹ [*Marmion*, Introduction to Canto ii.]

² [*Rokeby*, vi. 21.]

³ [*Marmion*, vi. 27.]

⁴ [See above, p. 252.]

We began our investigation, it will be remembered, in order to determine whether landscape-painting was worth studying or not. We have now reviewed the three principal phases of temper in the civilized human race, and we find that landscape has been mostly disregarded by great men, or cast into a second place, until now; and that now it seems dear to us, partly in consequence of our faults, and partly owing to accidental circumstances, soon, in all likelihood, to pass away: and there seems great room for question still, whether our love of it is a permanent and healthy feeling, or only a healthy crisis in a generally diseased state of mind. If the former, society will for ever hereafter be affected by its results; and Turner, the first great landscape-painter, must take a place in the history of nations corresponding in art accurately to that of Bacon in philosophy;¹—Bacon having first opened the study of the laws of material nature, when, formerly, men had thought only of the laws of human mind; and Turner having first opened the study of the aspect of material nature, when, before, men had thought only of the aspect of the human form. Whether, therefore, the love of landscape be trivial and transient, or important and permanent, it now becomes necessary to consider. We have, I think, data enough before us for the solution of the question, and we will enter upon it, accordingly, in the following chapter.

¹ [See below, p. 387, and compare *Lectures on Architecture and Painting*, § 101, Vol. XII. p. 128.]

CHAPTER XVII

THE MORAL OF LANDSCAPE

§ 1. SUPPOSING then the preceding conclusions correct, respecting the grounds and component *elements* of the pleasure which the moderns take in landscape, we have here to consider what are the probable or usual *effects* of this pleasure. Is it a safe or a seductive one? May we wisely boast of it, and unhesitatingly indulge it? or is it rather a sentiment to be despised when it is slight, and condemned when it is intense; a feeling which disinclines us to labour, and confuses us in thought; a joy only to the inactive and the visionary, incompatible with the duties of life, and the accuracies of reflection?

§ 2. It seems to me that, as matters stand at present, there is considerable ground for the latter opinion. We saw, in the preceding chapter, that our love of nature had been partly forced upon us by mistakes in our social economy, and led to no distinct issues of action or thought. And when we look to Scott—the man who feels it most deeply—for some explanation of its effect upon him, we find a curious tone of apology (as if for an involuntary folly) running through his confessions of such sentiment, and a still more curious inability to define, beyond a certain point, the character of this emotion. He has lost the company of his friends among the hills, and turns to these last for comfort. He says, “there is a pleasure in the pain” consisting in such thoughts

“As oft awake
By lone St. Mary’s silent lake;”

but when we look for some definition of these thoughts, all that we are told is, that they compose

“A mingled sentiment
'Twixt resignation and content;”*

a sentiment which, I suppose, many people can attain to on the loss of their friends, without the help of lakes or mountains; while Wordsworth definitely and positively affirms that *thought* has nothing whatever to do with the matter, and that though, in his youth, the cataract and wood “haunted him like a passion,” it was without the help of any “remoter charm, by thought supplied.”¹

§ 3. There is not, however, any question but that both Scott and Wordsworth are here mistaken in their analysis of their feelings. Their delight, so far from being without thought, is more than half made up of thought, but of thought in so curiously languid and neutralized a condition that they cannot trace it. The thoughts are beaten to a powder so small that they know not what they are; they know only that in such a state they are not good for much, and disdain to call them thoughts. But the way in which thought, even thus broken, acts in producing the delight will be understood by glancing back to §§ 9 and 10 of the tenth chapter, in which we observed the power of the imagination in exalting any visible object, by gathering round it, in farther vision, all the facts properly connected with it; this being, as it were, a spiritual or second sight, multiplying the power of enjoyment according to the fulness of the vision. For, indeed, although in all lovely nature there is, first, an excellent degree of simple beauty, addressed to the eye alone, yet often what impresses us most will form but a very small portion of that visible

* *Marmion*, Introduction to Canto II.

¹ [*Tintern Abbey*: see Vol. III. p. 671, and Vol. IV. p. 74, where the passage is also cited.]

beauty. That beauty may, for instance, be composed of lovely flowers and glittering streams, and blue sky and white clouds; and yet the thing that impresses us most, and which we should be sorriest to lose, may be a thin grey film on the extreme horizon, not so large, in the space of the scene it occupies, as a piece of gossamer on a near-at-hand bush, nor in any wise prettier to the eye than the gossamer; but, because the gossamer is known by us for a little bit of spider's work, and the other grey film is known to mean a mountain ten thousand feet high, inhabited by a race of noble mountaineers, we are solemnly impressed by the aspect of it; and yet, all the while, the thoughts and knowledge which cause us to receive this impression are so obscure that we are not conscious of them; we think we are only enjoying the visible scene; and the very men whose minds are fullest of such thoughts absolutely deny, as we have just heard, that they owe their pleasure to anything but the eye, or that the pleasure consists in anything else than "Tranquillity."

§ 4. And observe, farther, that this comparative Dimness and Untraceableness of the thoughts which are the sources of our admiration, is not a *fault* in the thoughts, at such a time. It is, on the contrary, a necessary condition of their subordination to the pleasure of Sight. If the thoughts were more distinct we should not *see* so well; and beginning definitely to think, we must comparatively cease to see. In the instance just supposed, as long as we look at the film of mountain or Alp, with only an obscure consciousness of its being the source of mighty rivers, that consciousness adds to our sense of its sublimity; and if we have ever seen the Rhine or the Rhone near their mouths, our knowledge, so long as it is only obscurely suggested, adds to our admiration of the Alp; but once let the idea define itself,—once let us begin to consider seriously *what* rivers flow from that mountain, to trace their source, and to recall determinately our memories of their distant aspect, —and we cease to behold the Alp; or, if we still behold it,

it is only as a point in a map which we are painfully designing, or as a subordinate object which we strive to thrust aside, in order to make room for our remembrances of Avignon or Rotterdam.

Again: so long as our idea of the multitudes who inhabit the ravines at the foot remains indistinct, that idea comes to the aid of all the other associations which increase our delight. But let it once arrest us, and entice us to follow out some clear course of thought respecting the causes of the prosperity or misfortune of the Alpine villagers, and the snowy peak again ceases to be visible, or holds its place only as a white spot upon the retina, while we pursue our meditations upon the religion or the political economy of the mountaineers.

§ 5. It is thus evident that a curiously balanced condition of the powers of mind is necessary to induce full admiration of any natural scene. Let those powers be themselves inert, and the mind vacant of knowledge, and destitute of sensibility; and the external object becomes little more to us than it is to birds or insects; we fall into the temper of the clown. On the other hand, let the reasoning powers be shrewd in excess, the knowledge vast, or sensibility intense, and it will go hard but that the visible object will suggest so much that it shall be soon itself forgotten, or become, at the utmost, merely a kind of keynote to the course of purposeful thought. Newton, probably, did not perceive whether the apple which suggested his meditations perceive whether the apple which suggested his meditations on gravity was withered or rosy; nor could Howard be affected by the picturesqueness of the architecture which held the sufferers it was his occupation to relieve.¹

§ 6. This wandering away in thought from the thing seen to the business of life, is not, however, peculiar to men of the highest reasoning powers, or most active benevolence. It takes place more or less in nearly all persons of average mental endowment. They see and love what

¹ [The reference is to John Howard, the prison reformer, who in the course of his travels inspected the Bastille and all the principal prisons both in Great Britain and in France, Italy, etc.: see his place in the list below, p. 360.]

is beautiful, but forget their admiration of it in following some train of thought which it suggested, and which is of more personal interest to them. Suppose that three or four persons come in sight of a group of pine-trees, not having seen pines for some time.¹ One, perhaps an engineer, is struck by the manner in which their roots hold the ground, and sets himself to examine their fibres, in a few minutes retaining little more consciousness of the beauty of the trees than if he were a rope-maker untwisting the strands of a cable: to another, the sight of the trees calls up some happy association, and presently he forgets them, and pursues the memories they summoned: a third is struck by certain groupings of their colours, useful to him as an artist, which he proceeds immediately to note mechanically for future use, with as little feeling as a cook setting down the constituents of a newly discovered dish; and a fourth, impressed by the wild coiling of boughs and roots, will begin to change them in his fancy into dragons and monsters, and lose his grasp of the scene in fantastic metamorphosis: while, in the mind of the man who has most the power of contemplating the thing itself, all these perceptions and trains of idea are partially present, not distinctly, but in a mingled and perfect harmony. He will not see the colours of the tree so well as the artist, nor its fibres so well as the engineer; he will not altogether share the emotion of the sentimentalist, nor the trance of the idealist; but fancy, and feeling, and perception, and imagination, will all obscurely meet and balance themselves in him, and he will see the pine-trees somewhat in this manner:

“Worthier still of note
Are those fraternal Four of Borrowdale,
Joined in one solemn and capacious grove;
Huge trunks! and each particular trunk a growth
Of interwisted fibres serpentine
Up-coiling, and inveterately convolved;
Nor uninformed with Phantasy, and looks
That threaten the profane; a pillared shade,

¹ [For the early draft of this passage, see Appendix v., pp. 438–439.]

Upon whose grassless floor of red-brown hue,
By sheddings from the pining umbrage tinged
Perennially,—beneath whose sable roof
Of boughs, as if for festal purpose decked
With unrejoicing berries, ghostly Shapes
May meet at noontide; Fear and trembling Hope,
Silence and Foresight; Death the Skeleton,
And Time the Shadow; there to celebrate,
As in a natural temple scattered o'er
With altars undisturbed of mossy stone,
United workship.”¹

§ 7. The power, therefore, of thus fully *perceiving* any natural object depends on our being able to group and fasten all our fancies about it as a centre, making a garland of thoughts for it, in which each separate thought is subdued and shortened of its own strength, in order to fit it for harmony with others; the intensity of our enjoyment of the object depending, first, on its own beauty, and then on the richness of the garland. And men who have this habit of clustering and harmonizing their thoughts are a little too apt to look scornfully upon the harder workers who tear the bouquet to pieces to examine the stems. This was the chief narrowness of Wordsworth's mind; he could not understand that to break a rock with a hammer in search of crystal may sometimes be an act not disgraceful to human nature, and that to dissect a flower may sometimes be as proper as to dream over it; whereas all experience goes to teach us, that among men of average intellect the most useful members of society are the dissectors, not the dreamers. It is not that they love nature or beauty less, but that they love result, effect, and progress more; and when we glance broadly along the starry crowd of benefactors to the human race, and guides of human thought, we shall find that this dreaming love of natural beauty—or at least its expression—has been more or less checked by them all, and subordinated either to hard work or watching of *human* nature. Thus in all the classical and mediæval periods, it was, as we have seen,

¹ [Wordsworth: *Yew Trees*; a portion of the passage is quoted at Vol. IV. p. 298.]

subordinate to agriculture, war, and religion; and in the modern period, in which it has become far more powerful, observe in what persons it is chiefly manifested.¹

(1.) It is subordinate in

Bacon.
Milton.
Johnson.
Richardson.
Goldsmith.
Young.
Newton.
Howard.
Fénelon.
Pascal.

(2.) It is intense in

Mrs. Radcliffe.
St. Pierre.
Shenstone.
Byron.
Shelley.
Keats.
Burns.
Eugene Sue.
George Sand.
Dumas.

§ 8. I have purposely omitted the names of Wordsworth, Tennyson, and Scott, in the second list, because, glancing at the two columns as they now stand, we may, I think, draw some useful conclusions from the high honourableness and dignity of the names on one side, and the comparative slightness of those on the other,—conclusions which may help us to a better understanding of Scott and Tennyson themselves. Glancing, I say, down those columns in their present form, we shall at once perceive that the intense love of nature is, in modern times, characteristic of persons not of the first order of intellect, but of brilliant imagination, quick sympathy, and undefined religious principle, suffering also usually under strong and ill-governed passions: while in the same individual it will be found to vary at different periods, being, for the most part, strongest in youth, and associated with force of emotion, and with indefinite and feeble powers of thought; also, throughout life, perhaps developing itself most at times when the mind is slightly unhinged by love, grief, or some other of the passions.

¹ [In his copy for revision Ruskin wrote against list No. (2)—“Add Rousseau, and say why I named Dumas (landscape of Monte Cristo), and quote a Frenchman’s comparison of Sand with Homer, and say why chosen, all.”]

§ 9. But, on the other hand, while these feelings of delight in natural objects cannot be construed into signs of the highest mental powers, or purest moral principles, we see that they are assuredly indicative of minds above the usual standard of power, and endowed with sensibilities of great preciousness to humanity; so that those who find themselves entirely destitute of them, must make this want a subject of humiliation, not of pride. The apathy which cannot perceive beauty is very different from the stern energy which disdains it; and the coldness of heart which receives no emotion from external nature, is not to be confounded with the wisdom of purpose which represses emotion in action. In the case of most men, it is neither acuteness of the reason, nor breadth of humanity, which shields them from the impressions of natural scenery, but rather low anxieties, vain discontents, and mean pleasures: and for one who is blinded to the works of God by profound abstraction or lofty purpose, tens of thousands have their eyes sealed by vulgar selfishness, and their intelligence crushed by impious care.

Observe, then: we have, among mankind in general, the three orders of being;—the lowest, sordid and selfish, which neither sees nor feels; the second, noble and sympathetic, but which sees and feels without concluding or acting; the third and highest, which loses sight in resolution, and feeling in work.*

* The investigation of this subject becomes, therefore, difficult beyond all other parts of our inquiry, since precisely the same sentiments may arise in different minds from totally opposite causes; and the extreme of frivolity may sometimes for a moment desire the same things as the extreme of moral power and dignity. In the following extract from *Marriage*,¹ the sentiment expressed by Lady Juliana (the ineffably foolish and frivolous heroine of the story,) is as nearly as possible what Dante would have felt under the same circumstances:—

“The air was soft and genial; not a cloud stained the bright azure of the heavens; and the sun shone out in all his splendour, shedding life and beauty even over the desolate health-clad hills of Glenfern. But, after they had

¹ [By Susan Edmondstone Ferrier (1782–1854), p. 88.]

Thus, even in Scott and Wordsworth themselves, the love of nature is more or less associated with their weaknesses. Scott shows it most in the cruder compositions of his youth, his perfect powers of mind being displayed only in dialogues with which description has nothing whatever to do. Wordsworth's distinctive work was a war with pomp and pretence, and a display of the majesty of simple feelings and humble hearts, together with high reflective truth in his analysis of the courses of politics and ways of men; without these, his love of nature would have been comparatively worthless.¹

§ 10. "If this be so, it is not well to encourage the observance of landscape, any more than other ways of dreamily and ineffectually spending time?"

Stay a moment. We have hitherto observed this love

journeyed a few miles, suddenly emerging from the valley, a scene of matchless beauty burst at once upon the eye. Before them lay the dark blue waters of Lochmarlie, reflecting, as in a mirror, every surrounding object, and bearing on its placid, transparent bosom a fleet of herring-boats, the drapery of whose black, suspended nets contrasted with picturesque effect with the white sails of the larger vessels, which were vainly spread to catch a breeze. All around, rocks, meadows, woods, and hills mingled in wild and lovely irregularity.

"Not a breath was stirring, not a sound was heard, save the rushing of the waterfall, the tinkling of some silver rivulet, or the calm rippling of a tranquil lake; now and then, at intervals, the fisherman's Gaelic ditty, chanted as he lay stretched on the sand in some sunny nook; or the shrill, distant sound of childish glee. How delicious to the feeling heart to behold so fair a scene of unsophisticated nature, and to listen to her voice alone, breathing the accents of innocence and joy! But none of the party who now gazed on it had minds capable of being touched with the emotions it was calculated to inspire.

"Henry, indeed, was rapturous in his expressions of admiration; but he concluded his panegyrics by wondering his brother did not keep a cutter, and resolving to pass a night on board one of the herring-boats, that he might eat the fish in perfection.

"Lady Juliana thought it might be very pretty, if, instead of those frightful rocks and shabby cottages, there could be villas, and gardens, and lawns, and conservatories, and summer-houses, and statues.

"Miss Bella observed, if it was hers, she would cut down the woods, and level the hills, and have races."

¹ [The MS. here adds:—

" . . . ; while Tennyson's keen enjoyment of visible beauty belongs to him entirely as a poet of the second or emotional, not the first or creative class, and if he could conceive more he would describe less."]

of natural beauty only as it distinguishes one man from another, not as it acts for good or evil on those minds to which it necessarily belongs. It may, on the whole, distinguish weaker men from stronger men, and yet in those weaker men may be of some notable use. It may distinguish Byron from St. Bernard, and Shelley from Sir Isaac Newton, and yet may, perhaps, be the best thing that Byron and Shelley possess—a saving element in them; just as a rush may be distinguished from an oak by its bending, and yet the bending may be the saving element in the rush, and an admirable gift in its place and way. So that, although St. Bernard journeys all day by the lake of Geneva, and asks at evening “where it is,”¹ and Byron learns by it “to love earth only for its earthly sake,”* it does not follow that Byron, hating men, was the worse for loving the earth, nor that St. Bernard, loving men, was the better or wiser for being blind to it. And this will become still more manifest if we examine somewhat farther into the nature of this instinct, as characteristic especially of youth.

§ 11. We saw above² that Wordsworth described the feeling as independent of thought, and, in the particular place then quoted, he *therefore* speaks of it depreciatingly. But in other places he does not speak of it depreciatingly, but seems to think the absence of thought involves a certain nobleness, as in the passage already quoted, Vol. II. p. 108:³

“In such high hour
Of visitation from the living God
Thought was not.”

And he refers to the intense delight which he himself felt, and which he supposes other men feel, in nature, during

* *Childe Harold*, Canto iii. st. 71.

¹ [For this reference, see Vol. XI. p. 51.]

² [Above, p. 355.]

³ [In this edition, Vol. IV. p. 180.]

their thoughtless youth, as an intimation of their immortality, and a joy which indicates their having come fresh from the hand of God.¹

Now, if Wordsworth be right in supposing this feeling to be in some degree common to all men, and most vivid in youth, we may question if it can be *entirely* explained as I have now tried to explain it. For if it entirely depended on multitudes of ideas, clustering about a beautiful object, it might seem that the youth could not feel it so strongly as the man, because the man knows more, and must have more ideas to make the garland of. Still less can we suppose the pleasure to be of that melancholy and languid kind, which Scott defines as “Resignation” and “Content”;² boys being not distinguished for either of those characters, but for eager effort and delightful discontent. If Wordsworth is at all right in this matter, therefore, there must surely be some other element in the feeling not yet detected.

§ 12. Now, in a question of this subtle kind, relating to a period of life when self-examination is rare, and expression imperfect, it becomes exceedingly difficult to trace, with any certainty, the movements of the minds of others, nor always easy to remember those of our own. I cannot, from observation, form any decided opinion as to the extent in which this strange delight in nature influences the hearts of young persons in general; and, in stating what has passed in my own mind, I do not mean to draw any positive conclusion as to the nature of the feeling in other children;³ but the inquiry is clearly one in which personal experience is the only safe ground to go upon, though a narrow one; and I will make no excuse for talking about

¹ [See the Ode on *Intimations of Immortality*, quoted below, p. 369.]

² [See above, p. 355.]

³ [In the MS. Ruskin here added:—

“I should not have attempted to write this book at all unless I had been myself strongly influenced by the sensation to which Wordsworth and other modern poets refer.”

See the passage in *Fors Clavigera* noted above, p. 342, and compare *Præterita*, i. §§ 41, 192, 244 *seq.*]

myself with reference to this subject, because, though there is much egotism in the world, it is often the last thing a man thinks of doing,—and, though there is much work to be done in the world, it is often the best thing a man can do,—to tell the exact truth about the movements of his own mind; and there is this farther reason, that whatever other faculties I may or may not possess, this gift of taking pleasure in landscape I assuredly possess in a greater degree than most men; it having been the ruling passion of my life, and the reason for the choice of its field of labour.

§ 13. The first thing which I remember, as an event in life, was being taken by my nurse to the brow of Friar's Crag on Derwent Water; the intense joy, mingled with awe, that I had in looking through the hollows in the mossy roots, over the crag, into the dark lake, has associated itself more or less with all twining roots of trees ever since.¹ Two other things I remember as, in a sort, beginnings of life;—crossing Shapfells (being let out of the chaise to run up the hills), and going through Glenfarg, near Kinross, in a winter's morning, when the rocks were hung with icicles;² these being culminating points in an early life of more travelling than is usually indulged to a child. In such journeyings, whenever they brought me near hills, and in all mountain ground and scenery, I had a pleasure, as early as I can remember, and continuing till I was eighteen or twenty, infinitely greater than any which has been since possible to me in anything; comparable for intensity only to the joy of a lover in being near a noble and kind mistress, but no more explicable or definable than that feeling of love itself. Only thus much I can remember, respecting it, which is important to our present subject.

§ 14. First: it was never independent of associated thought. Almost as soon as I could see or hear, I had got

¹ [Compare *Præterita*, i. ch. v. § 107, and see Ruskin's early verses (1830) on Friar's Crag, Vol. II. p. 294, where the monument to him, now erected on the spot, is described in a note.]

² [For these reminiscences see Introduction to Vol. XII. (p. xxi.), where, in a letter of 1853, Ruskin recalls some of his "baby verses"; see also *Queen of the Air*, § 112, and the early verses (1827) in Vol. II. p. 262.]

reading enough to give me associations with all kinds of scenery; and mountains, in particular, were always partly confused with those of my favourite book, Scott's *Monastery*: so that Glenfarg and all other glens were more or less enchanted to me, filled with forms of hesitating creed about Christie of the Clint Hill, and the monk Eustace; and with a general presence of White Lady everywhere.¹ I also generally knew, or was told by my father and mother, such simple facts of history as were necessary to give more definite and justifiable association to other scenes which chiefly interested me, such as the ruins of Lochleven and Kenilworth; and thus my pleasure in mountains or ruins was never, even in earliest childhood, free from a certain awe and melancholy, and general sense of the meaning of death, though, in its principal influence, entirely exhilarating and gladdening.

§ 15. Secondly, it was partly dependent on contrast with a very simple and unamused mode of general life; I was born in London, and accustomed, for two or three years, to no other prospect than that of the brick walls over the way;² had no brothers nor sisters, nor companions; and though I could always make myself happy in a quiet way, the beauty of the mountains had an additional charm of change and adventure which a country-bred child would not have felt.

§ 16. Thirdly: there was no definite religious feeling mingled with it. I partly believed in ghosts and fairies; but supposed that angels belonged entirely to the Mosaic dispensation, and cannot remember any single thought or feeling connected with them. I believed that God was in heaven, and could hear me and see me; but this gave me neither pleasure nor pain, and I seldom thought of it at all. I never thought of nature as God's work, but as a separate fact or existence.

¹ [See Ruskin's early metrical version of *The Monastery*, Vol. II. pp. 260 n., 276 n.]

² [See *Præterita*, i. ch. i. § 14, where Ruskin recalls his early years in Hunter Street, Brunswick Square.]

§ 17. Fourthly: it was entirely unaccompanied by powers of reflection or invention. Every fancy that I had about nature was put into my head by some book; and I never reflected about anything till I grew older; and then, the more I reflected, the less nature was precious to me: I could then make myself happy, by thinking, in the dark, or in the dullest scenery; and the beautiful scenery became less essential to my pleasure.

§ 18. Fifthly: it was, according to its strength, inconsistent with every evil feeling, with spite, anger, covetousness, discontent, and every other hateful passion; but would associate itself deeply with every just and noble sorrow, joy, or affection. It had not, however, always the power to repress what was inconsistent with it; and, though only after stout contention, might at last be crushed by what it had partly repressed. And as it only acted by setting one impulse against another, though it had much power in moulding the character, it had hardly any in strengthening it; it formed temperament but never instilled principle; it kept me generally good-humoured and kindly, but could not teach me perseverance or self-denial: what firmness or principle I had was quite independent of it; and it came itself nearly as often in the form of a temptation as of a safeguard, leading me to ramble over hills when I should have been learning lessons, and lose days in reveries which I might have spent in doing kindnesses.

§ 19. Lastly: although there was no definite religious sentiment mingled with it, there was a continual perception of Sanctity in the whole of nature, from the slightest thing to the vastest;—an instinctive awe, mixed with delight; an indefinable thrill, such as we sometimes imagine to indicate the presence of a disembodied spirit. I could only feel this perfectly when I was alone; and then it would often make me shiver from head to foot with the joy and fear of it, when after being some time away from hills, I first got to the shore of a mountain river, where

the brown water circled among the pebbles,¹ or when I first saw the swell of distant land against the sunset, or the first low broken wall, covered with mountain moss. I cannot in the least *describe* the feeling; but I do not think this is my fault, nor that of the English language, for I am afraid, no feeling *is* describable. If we had to explain even the sense of bodily hunger to a person who had never felt it, we should be hard put to it for words; and the joy in nature seemed to me to come of a sort of heart-hunger, satisfied with the presence of a Great and Holy Spirit. These feelings remained in their full intensity till I was eighteen or twenty, and then, as the reflective and practical power increased, and the “cares of this world”² gained upon me, faded gradually away, in the manner described by Wordsworth in his *Intimations of Immortality*.³

§ 20. I cannot, of course, tell how far I am justified in supposing that these sensations may be reasoned upon as common to children in general. In the same degree they are not of course common, otherwise children would be, most of them, very different from what they are in their choice of pleasures. But, as far as such feelings exist, I apprehend they are more or less similar in their nature and influence; only producing different characters according to the elements with which they are mingled. Thus, a very religious child may give up many pleasures to which its instincts lead it, for the sake of irksome duties; and an inventive child would mingle its love of nature with watchfulness of human sayings and doings; but I believe the feelings I have endeavoured to describe are the pure landscape-instinct; and the likelihoods of good or evil resulting from them may be reasoned upon as generally indicating the usefulness or danger of the modern love and study of landscape.

¹ [See *Præterita*, i. ch. iii. (“The Banks of Tay”) § 74.]

² [Mark iv. 19.]

³ [See in illustration of this fading away of the child’s “heart-hunger,” the passages from Ruskin’s letters and diaries cited in Vol. IV. p. xxvi., Vol. IX. p. xxiii., and above, p. xix.]

§ 21. And, first, observe that the charm of romantic association (§ 14) can be felt only by the modern European child. It rises eminently out of the contrast of the beautiful past with the frightful and monotonous present; and it depends for its force on the existence of ruins and traditions, on the remains of architecture, the traces of battle-fields, and the precursorship of eventful history. The instinct to which it appeals can hardly be felt in America, and every day that either beautifies our present architecture and dress, or overthrows a stone of mediæval monument, contributes to weaken it in Europe. Of its influence on the mind of Turner and Prout, and the permanent results which, through them, it is likely to effect, I shall have to speak presently.¹

§ 22. Again: the influence of surprise in producing the delight, is to be noted, as a suspicious or evanescent element in it. Observe, my pleasure was chiefly (§ 19) when I *first* got into beautiful scenery out of London. The enormous influence of novelty—the way in which it quickens observation, sharpens sensation, and exalts sentiment—is not half enough taken note of by us, and is to me a very sorrowful matter. I think that what Wordsworth speaks of as a glory in the child,² because it has come fresh from God's hands, is in reality nothing more than the freshness of all things to its newly opened sight. I find that by keeping long away from hills, I can in great part still restore the old childish feeling about them; and the more I live and work among them, the more it vanishes.

§ 23. This evil is evidently common to all minds; Wordsworth himself mourning over it in the same poem:

“Custom hangs upon us, with a weight
Heavy as frost, and deep almost as life.”

¹ [See ch. i. in the next volume (“Of the Turnerian Picturesque”); the passage about Prout (omitted on revision) is in this edition given in a note (Vol. VI. p. 24): compare also Vol. XII. pp. 310–315.]

² [“But trailing clouds of glory do we come
From God, who is our home:
Heaven lies about us in our infancy.”

Intimations of Immortality, viii. Ruskin alters the first line somewhat.]

And if we grow impatient under it, and seek to recover the mental energy by more quickly repeated and brighter novelty, it is all over with our enjoyment. There is no cure for this evil, any more than for the weariness of the imagination already described,¹ but in patience and rest: if we try to obtain perpetual change, change itself will become monotonous; and then we are reduced to that old despair, “If water chokes, what will you drink after it?” And the two points of practical wisdom in this matter are, first, to be content with as little novelty as possible at a time; and, secondly, to preserve, as much as possible in the world, the sources of novelty.

§ 24. I say, first, to be content with as little change as possible. If the attention is awake, and the feelings in proper train, a turn of a country road, with a cottage beside it, which we have not seen before, is as much as we need for refreshment; if we hurry past it, and take two cottages at a time, it is already too much: hence, to any person who has all his senses about him, a quiet walk along not more than ten or twelve miles of road a day, is the most amusing of all travelling; and all travelling becomes dull in exact proportion to its rapidity. Going by railroad I do not consider as travelling at all; it is merely “being sent” to a place, and very little different from becoming a parcel;² the next step to it would of course be telegraphic transport, of which, however, I suppose it has been truly said by Octave Feuillet,

“*Il y aurait des gens assez bêtes pour trouver ça amusant.*”*

If we walk more than ten or twelve miles, it breaks up the day too much; leaving no time for stopping at the stream sides or shady banks, or for any work at the end

* *Scènes et Proverbes*. La Crise; (Scène en calèche, hors Paris).³

¹ [See above, p. 183.]

² [Compare Vol. VIII. p. 159.]

³ [This was one of the books which Ruskin recommended to Miss Mitford; see his letter to her of July 29, 1854, in a later volume.]

of the day; besides that the last few miles are apt to be done in a hurry, and may then be considered as lost ground. But if, advancing thus slowly, after some days we approach any more interesting scenery, every yard of the changeful ground becomes precious and piquant; and the continual increase of hope, and of surrounding beauty, affords one of the most exquisite enjoyments possible to the healthy mind; besides that real knowledge is acquired of whatever it is the object of travelling to learn, and a certain sublimity given to all places, so attained, by the true sense of the spaces of earth that separate them. A man who really loves travelling would as soon consent to pack a day of such happiness into an hour of railroad, as one who loved eating would agree, if it were possible, to concentrate his dinner into a pill.

§ 25. And, secondly, I say that it is wisdom to preserve as much as possible the innocent *sources* of novelty;—not definite inferiorities of one place to another, if such can be done away; but differences of manners and customs, of language and architecture. The greatest effort ought specially to be made by all wise and far-sighted persons, in the present crisis of civilization, to enforce the distinction between wholesome reform, and heartless abandonment of ancestral custom; between kindly fellowship of nation with nation, and ape-like adoption, by one, of the habits of another. It is ludicrously woeful to see the luxurious inhabitants of London and Paris rushing over the Continent (as they say, to *see* it), and transposing every place, as far as lies in their power, instantly into a likeness of Regent Street and the Rue de la Paix, which they need not certainly have come so far to see. Of this evil I shall have more to say hereafter;¹ meantime I return to our main subject.

§ 26. The next character we have to note in the land-scape-instinct (and on this much stress is to be laid), is its

¹ [See in the next volume, ch. xx. § 41; and *Modern Painters*, vol. v. pt. ix. ch. xi. § 15.]

total inconsistency with all evil passions; its absolute contrariety (whether in the contest it were crushed or not), to all care, hatred, envy, anxiety, and moroseness. A feeling of this kind is assuredly not one to be lightly repressed, or treated with contempt.

But how, if it be so, the reader asks, can it be characteristic of passionate and unprincipled men, like Byron, Shelley, and such others, and not characteristic of the noblest and most highly principled men?

First, because it is itself a passion, and therefore likely to be characteristic of passionate men. Secondly, because it is (§ 18) wholly a separate thing from moral principle, and may or may not be joined to strength of will, or rectitude of purpose;* only, this much is always observable in the men whom it characterizes, that, whatever their faults or failings, they always understand and love noble qualities of character: they can conceive (if not certain phases of piety), at all events, self-devotion of the highest kind; they delight in all that is good, gracious, and noble; and, though warped often to take delight also in what is dark or degraded, that delight is mixed with bitter self-reproach; or else is wanton, careless, or affected, while their delight in noble things is constant and sincere.

§ 27. Look back to the two lists given above, § 7. I have not lately read anything by Mrs. Radcliffe or George Sand, and cannot, therefore, take instances from them.

* Compare the characters of Fleur de Marie and Rigolette, in the *Mystères de Paris*. I know no other instance in which the two tempers are so exquisitely delineated and opposed. Read carefully the beautiful pastoral, in the eighth chapter of the first Part, where Fleur de Marie is first taken into the fields under Montmartre, and compare it with the sixth of the second Part, its accurately traced companion sketch, noting carefully Rigolette's "Non, *je déteste la campagne*." She does not, however, dislike flowers or birds; "Cette caisse de bois, que Rigolette appellait le jardin de ses oiseaux, était rempli de terre recouverte de mousse, pendant l'hiver. Elle travaillait auprès de la fenêtre ouverte, à-demi-voilée par un verdoyant rideau de pois de senteur roses, de capucines oranges, de volubilis bleus et blancs."¹

¹ [Ruskin quotes the *Mystères de Paris* again in *Modern Painters*, vol. iv. ch. xix. § 16.]

Keats hardly introduced human character into his work; but glance over the others, and note the general tone of their conceptions. Take St. Pierre's Virginia, Byron's Myrrha, Angiolina, and Marina, and Eugène Sue's Fleur de Marie; and out of the other list you will only be able to find Pamela, Clementina, and, I suppose, Clarissa,* to put beside them; and these will not more than match Myrrha and Marina; leaving Fleur de Marie and Virginia rivalless. Then meditate a little, with all justice and mercy, over the two groups of names; and I think you will, at last, feel that there is a pathos and tenderness of heart among the lovers of nature in the second list, of which it is nearly impossible to estimate either the value or the danger; that the sterner consistency of the men in the first may, in great part, have arisen only from the, to them, most merciful, appointment of having had religious teaching or disciplined education in their youth; while their want of love for nature, whether that love be originally absent, or artificially repressed, is to none of them an advantage. Johnson's indolence, Goldsmith's improvidence, Young's worldliness, Milton's severity, and Bacon's servility, might all have been less, if they could in anywise have sympathized with Byron's lonely joy in a Jura storm,† or with Shelley's interest in floating paper boats down the Serchio.¹

§ 28. And then observe, farther, as I kept the names of Wordsworth and Scott out of the second list, I withdrew, also, certain names from the first; and for this reason, that in all the men who are named in that list, there is evidently *some* degree of love for nature, which may have

* I have not read *Clarissa*.²

† It might be thought that Young *could* have sympathized with it. He would have made better use of it, but he would not have had the same delight in it. He turns his solitude to good account; but this is because, to him, solitude is sorrow, and his real enjoyment would have been of amiable society, and a place at court.

¹ ["The Boat on the Serchio" (poem of 1821). For Byron's "joy in a Jura storm," see *Childe Harold*, iii. 92.]

² [But Ruskin became a great admirer of Richardson: see *Præterita*, ii. ch. iv. § 70; iii. ch. iv. § 66.]

been originally of more power than we suppose, and may have had an infinitely hallowing and protective influence upon them. But there also lived certain men of high intellect in that age who had *no* love of nature whatever. They do not appear ever to have received the smallest sensation of ocular delight from any natural scene, but would have lived happily all their lives in drawing-rooms or studies. And, therefore, in these men we shall be able to determine, with the greatest chance of accuracy, what the real influence of natural beauty is, and what the character of a mind destitute of its love. Take, as conspicuous instances, Le Sage and Smollett,¹ and you will find, in meditating over their works, that they are utterly incapable of conceiving a human soul as endowed with any nobleness whatever; their heroes are simply beasts endowed with some degree of human intellect;—cunning, false, passionate, reckless, ungrateful, and abominable, incapable of noble joy, of noble sorrow, of any spiritual perception or hope. I said, “beasts with human intellect;” but neither Gil Blas nor Roderick Random reaches, morally, anything near the level of dogs; while the delight which the writers themselves feel in mere filth and pain, with an unmitigated foulness and cruelty of heart, is just as manifest in every sentence as the distress and indignation with which pain and injustice are seen by Shelley and Byron.

§ 29. Distinguished from these men by *some* evidence of love for nature, yet an evidence much less clear than that for any of those named even in the first list, stand Cervantes, Pope, and Molière. It is not easy to say how much the character of these last depended on their epoch and education; but it is noticeable that the first two agree thus far in temper with Le Sage and Smollett,—that they delight in dwelling upon vice, misfortune, or folly, as subjects of amusement; while yet they are distinguished from

¹ [For an earlier reference to Smollett, in the same sense (though with recognition of his “magnificent wit and intellect”), see *Letters to a College Friend*, Vol. I. p. 418; see also *Lectures on Architecture and Painting*, § 90, Vol. XII. p. 119, and *Præterita*, i. ch. viii. § 166.]

Le Sage and Smollett by capacity of conceiving nobleness of character, only in a humiliating and hopeless way; the one representing all chivalry as insanity, the other placing the wisdom of man in a serene and sneering reconciliation of good with evil. Of Molière I think very differently. Living in the blindest period of the world's history, in the most luxurious city, and the most corrupted court, of the time, he yet manifests through all his writings an exquisite natural wisdom; a capacity for the most simple enjoyment; a high sense of all nobleness, honour, and purity, variously marked throughout his slighter work, but distinctly made the theme of his two perfect plays—the *Tartuffe* and *Misanthrope*; and in all that he says of art or science he has an unerring instinct for what is useful and sincere, and uses his whole power to defend it, with as keen a hatred of everything affected and vain. And, singular as it may seem, the first definite lesson read to Europe in that school of simplicity of which Wordsworth was the supposed originator among the mountains of Westmorland, was, in fact, given in the midst of the court of Louis XIV., and by Molière. The little canzonet "J'aime mieux ma mie," is, I believe, the first Wordsworthian poem brought forward on philosophical principles, to oppose the schools of art and affectation.¹

§ 30. I do not know if, by a careful analysis, I could point out any evidences of a capacity for the love of natural scenery in Molière stealing forth through the slightness of his pastorals; but, if not, we must simply set him aside as exceptional, as a man uniting Wordsworth's philosophy with

¹ [So in *Academy Notes*, 1875 (s. No. 218), Ruskin mentions Goldsmith and Molière as "having given the first general statements" of the Pre-Raphaelite principle; and in *The Three Colours of Pre-Raphaelitism*, § 21, he again cites Molière's song as the first expression in literature of the revolt against "the erudite and artificial schools." The song of Alceste—beginning "Si le Roi m'avait donné Paris, sa grande ville"—is in *Le Misanthrope*, Act i. sc. 2. Ruskin's references to Molière are numerous. See, for instance, *Lectures on Architecture and Painting*, § 90, where the other side of his attitude towards nature is noticed (Vol. XII. p. 119); *Ethics of the Dust*, § 109, where a "great sentence" of his is quoted; *Aratra Pentelici*, § 89, where *Le Misanthrope* is spoken of as his "most perfect work"; and *Fors Clavigera*, Letter 34, where his "reasoning and imaginative powers" are said to be "evenly balanced."]

Le Sage's wit, turned by circumstances from the observance of natural beauty to that of human frailty. And thus putting him aside for the moment I think we cannot doubt of our main conclusion, that, though the absence of the love of nature is not an assured condemnation, its presence is an invariable sign of goodness of heart and justness of moral *perception*, though by no means of moral *practice*; that in proportion to the degree in which it is felt, will *probably* be the degree in which all nobleness and beauty of character will also be felt; that when it is originally absent from any mind, that mind is in many other respects hard, worldly, and degraded; that where, having been originally present, it is repressed by art or education, that repression appears to have been detrimental to the person suffering it; and that wherever the feeling exists, it acts for good on the character to which it belongs, though, as it may often belong to characters weak in other respects, it may carelessly be mistaken for a source of evil in them.

§ 31. And having arrived at this conclusion by a review of facts, which, I hope it will be admitted, whether accurate or not, has at least been candid, these farther considerations may confirm our belief in its truth. Observe: the whole force of education, until very lately, has been directed in every possible way to the destruction of the love of nature.¹ The only knowledge which has been considered essential among us is that of words, and, next after it, of the abstract sciences; while every liking shown by children for simple natural history has been either violently checked, (if it took an inconvenient form for the housemaids,) or else scrupulously limited to hours of play: so that it has really been impossible for any child earnestly to study the works of God but against its conscience; and the love of nature has become inherently the characteristic of truants and idlers. While also the art of drawing, which is of more real importance to the human race than that of

¹ [Compare the Appendix on "Modern Education" in *Stones of Venice*, vol. iii. (Vol. XI. p. 258).]

writing (because people can hardly draw anything without being of some use both to themselves and others, and can hardly write anything without wasting their own time and that of others),—this art of drawing, I say, which on plain and stern system should be taught to every child, just as writing is,—has been so neglected and abused, that there is not one man in a thousand, even of its professed teachers, who knows its first principles; and thus it needs much illfortune or obstinacy—much neglect on the part of its teachers, or rebellion on his own—before a boy can get leave to use his eyes or his fingers; so that those who *can* use them are for the most part neglected or rebellious lads—runaways and bad scholars—passionate, erratic, self-willed, and restive against all forms of education; while your well-behaved and amiable scholars are disciplined into blindness and palsy of half their faculties. Wherein here is at once a notable ground for what difference we have observed between the lovers of nature and its despisers; between the somewhat immoral and unrespectable watchfulness of the one, and the moral and respectable blindness of the other.

§ 32. One more argument remains, and that, I believe, an unanswerable one. As, by the accident of education, the love of nature has been, among us, associated with *wilfulness*, so, by the accident of time, it has been associated with *faithlessness*. I traced, above, the peculiar mode in which this faithlessness was indicated; but I never intended to imply, therefore, that it was an invariable concomitant of the love. Because it happens that, by various concurrent operations of evil, we have been led according to those words of the Greek poet already quoted, to “dethrone the gods, and crown the whirlwind,”¹ it is no reason that we should forget there was once a time when “the Lord answered Job *out* of the whirlwind.”² And if we now take final and full view of the matter, we shall find

¹ [See above, p. 318.]

² [Job xxxviii. 1.]

that the love of nature, wherever it has existed, has been a faithful and sacred element of human feeling; that is to say, supposing all circumstances otherwise the same with respect to two individuals, the one who loves nature most will be *always* found to have more *faith in God* than the other. It is intensely difficult, owing to the confusion and counter influences which always mingle in the data of the problem, to make this abstraction fairly; but so far as we can do it, so far, I boldly assert, the result is constantly the same: the nature-worship will be found to bring with it such a sense of the presence and power of a Great Spirit as no mere reasoning can either induce or controvert; and where that nature-worship is innocently pursued, —*i.e.* with due respect to other claims on time, feeling, and exertion, and associated with the higher principles of religion,—it becomes the channel of certain sacred truths, which by no other means can be conveyed.

§ 33. This is not a statement which any investigation is needed to prove. It comes to us at once from the highest of all authority. The greater number of the words which are recorded in Scripture, as directly spoken to men by the lips of the Deity, are either simple revelations of His law, or special threatenings, commands, and promises relating to special events. But two passages of God's speaking, one in the Old and one in the New Testament, possess, it seems to me, a different character from any of the rest, having been uttered, the one to effect the last necessary change in the mind of a man whose piety was in other respects perfect; and the other, as the first statement to all men of the principles of Christianity by Christ Himself—I mean the 38th to 41st chapters of the book of Job, and the Sermon on the Mount. Now the first of these passages is, from beginning to end, nothing else than a direction of the mind which was to be perfected to humble observance of the works of God in nature. And the other consists only in the inculcation of *three* things: 1st, right conduct; 2nd, looking for eternal life; 3rd, trusting God,

through watchfulness of His dealings with His creation;¹ and the entire contents of the book of Job, and of the Sermon on the Mount, will be found resolvable simply into these three requirements from all men,—that they should act rightly, hope for heaven, and watch God’s wonders and work in the earth; the right conduct being always summed up under the three heads of *justice, mercy, and truth*, and no mention of any doctrinal point whatsoever occurring in either piece of divine teaching.

§ 34. As far as I can judge of the ways of men, it seems to me that the simplest and most necessary truths are always the last believed; and I suppose that well-meaning people in general would rather regulate their conduct and creed by almost any other portion of Scripture whatsoever, than by that Sermon on the Mount which contains the things that Christ thought it first necessary for all men to understand. Nevertheless, I believe the time will soon come for the full force of these two passages of Scripture to be accepted. Instead of supposing the love of nature necessarily connected with the faithlessness of the age, I believe it is connected properly with the benevolence and liberty of the age;² that it is precisely the most healthy element which distinctively belongs to us; and that out of it, cultivated no longer in levity or ignorance, but in earnestness, and as a duty, results will spring of an importance at present inconceivable; and lights arise, which, for the first time in man’s history, will reveal to him the true

¹ [On the landscape of the Book of Job, see *Lectures on Architecture and Painting*, § 79 (Vol. XII. pp. 105–106).]

² [The passage “Instead of supposing . . . his Maker” is § 63 in *Fronde Agrestes* (1875), where Ruskin added the following footnote:—

“I forget, now, what I meant by ‘liberty,’ in this passage; but I often used the word in my first writings, in a good sense, thinking of Scott’s moorland rambles, and the like. It is very wonderful to me, now, to see what hopes I had once; but Turner was alive, then; and the sun used to shine, and rivers to sparkle.”

See for a use of the word liberty “in a good sense,” *Modern Painters*, vol. v. pt. viii. ch. ii. § 15 and *n*. But there and always Ruskin associates freedom and authority, liberty and law: compare *Modern Painters*, vol. ii. (Vol. IV. p. 138), *Seven Lamps* (Vol. VIII. p. 249).]

nature of his life, the true field for his energies, and the true relations between him and his Maker.

§ 35. I will not endeavour here to trace the various modes in which these results are likely to be effected, for this would involve an essay on education, on the uses of natural history, and the probable future destiny of nations. Somewhat on these subjects I have spoken in other places;¹ and I hope to find time, and proper place, to say more. But one or two observations may be made merely to suggest the directions in which the reader may follow out the subject for himself.

The great mechanical impulses of the age, of which most of us are so proud, are a mere passing fever, half-speculative, half-childish. People will discover at last that royal roads to anything can no more be laid in iron than they can in dust; that there are, in fact, no royal roads to anywhere worth going to; that if there were, it would that instant cease to be worth going to,—I mean, so far as the things to be obtained are in any way estimable in terms of *price*. For there are two classes of precious things in the world: those that God gives us for nothing—sun, air, and life (both mortal life and immortal); and the secondarily precious things which He gives us for a price: these secondarily precious things, worldly wine and milk, can only be bought for definite money; they never can be cheapened. No cheating nor bargaining will ever get a single thing out of nature's "establishment" at half-price. Do we want to be strong?—we must work. To be hungry?—we must starve. To be happy?—we must be kind. To be wise?—we must look and think. No changing of place at a hundred miles an hour, nor making of stuffs a thousand yards a minute, will make us one whit stronger, happier, or wiser. There was always more in the world

¹ [See, for instance, *Seven Lamps* (Vol. VIII. pp. 159, 259), and *Stone of Venice*, vol. iii. ch. iv.; and for places where Ruskin returned to the thoughts here suggested, *Modern Painters*, vol. v., concluding chapter, his Oxford *Lectures on Art*, and, indeed, the greater part of his later writings.]

than men could see, walked they ever so slowly; they will see it no better for going fast. And they will at last, and soon too, find out that their grand inventions for conquering (as they think) space and time, do, in reality, conquer nothing; for space and time are, in their own essence, unconquerable, and besides did not want any sort of conquering; they wanted *using*. A fool always wants to shorten space and time: a wise man wants to lengthen both. A fool wants to kill space and kill time: a wise man, first to gain them, then to animate them. Your railroad, when you come to understand it, is only a device for making the world smaller: and as for being able to talk from place to place, that is, indeed, well and convenient; but suppose you have, originally, nothing to say.* We shall be obliged at last to confess, what we should long ago have known, that the really precious things are thought and sight, not pace. It does a bullet no good to go fast; and a man, if he be truly a man, no harm to go slow; for his glory is not at all in going, but in being.

§ 36. “Well; but railroads and telegraphs are so useful for communicating knowledge to savage nations.” Yes, if you have any to give them. If you know nothing *but* railroads, and can communicate nothing but aqueous vapour and gunpowder,—what then? But if you have any other thing than those to give, then the railroad is of use only because it communicates that other thing; and the question is—what that other thing may be. Is it religion? I believe if we had really wanted to communicate that, we could have done it in less than 1800 years, without steam. Most of the good religious communication that I remember, has been done on foot; and it cannot be easily done faster than at foot pace. Is it science? But what science—of

* “The light-outspeeding telegraph
Bears nothing on its beam.”—EMERSON.¹

See Appendix III., Plagiarism [p. 427].

¹ [“The World Soul,” in Emerson’s *Poems* (1847).]

motion, meat, and medicine? Well; when you have moved your savage, and dressed your savage, fed him with white bread, and shown him how to set a limb,—what next? Follow out that question. Suppose every obstacle over-come; give your savage every advantage of civilization to the full; suppose that you have put the Red Indian in tight shoes; taught the Chinese how to make Wedgwood's ware, and to paint it with colours that will rub off; and persuaded all Hindoo women that it is more pious to torment their husbands into graves than to burn themselves at the burial,—what next? Gradually, thinking on from point to point, we shall come to perceive that all true happiness and nobleness are near us, and yet neglected by us; and that till we have learned how to be happy and noble we have not much to tell, even to Red Indians. The delights of horse-racing and hunting, of assemblies in the night instead of the day, of costly and wearisome music, of costly and burdensome dress,¹ of chagrined contention for place or power, or wealth, or the eyes of the multitude; and all the endless occupation without purpose, and idleness without rest, of our vulgar world, are not, it seems to me, enjoyments we need be ambitious to communicate. And all real and wholesome enjoyments possible to man have been just as possible to him, since first he was made of the earth, as they are now; and they are possible to him chiefly in peace. To watch the corn grow, and the blossoms set; to draw hard breath over ploughshare or spade; to read, to think, to love, to hope, to pray,—these are the things that make men happy; they have always had the power of doing these, they never *will* have power to do more. The world's prosperity or adversity depends upon our knowing and teaching these few things: but upon iron, or glass, or electricity, or steam, in no wise.

§ 37. And I am Utopian and enthusiastic enough to

¹ [For other references to these features of modern life, see *Crown of Wild Olive*, § 26, and *Love's Meinie*, § 133 (hunting); *Lectures on Art*, § 112 (late hours); *Modern Painters*, vol. iv. ch. xix. § 6 n. (opera); and the General Index (dress).]

believe, that the time will come when the world will discover this.¹ It has now made its experiments in every possible direction but the right one: and it seems that it must, at last, try the right one, in a mathematical necessity. It has tried fighting, and preaching, and fasting, buying and selling, pomp and parsimony, pride and humiliation,—every possible manner of existence in which it could conjecture there was any happiness or dignity: and all the while, as it bought, sold, and fought, and fasted, and wearied itself with policies, and ambitions, and self-denials, God had placed its real happiness in the keeping of the little mosses of the wayside, and of the clouds of the firmament. Now and then a wearied king, or a tormented slave, found out where the true kingdoms of the world were, and possessed himself, in a furrow or two of garden ground, of a truly infinite dominion.² But the world would not believe their report, and went on trampling down the mosses, and forgetting the clouds, and seeking happiness in its own way, until, at last, blundering and late, came natural science; and in natural science not only the observation of things, but the finding out of new uses for them. Of course the world, having a choice left to it, went wrong as usual, and thought that these mere material uses were to be the sources of its happiness. It got the clouds packed into iron cylinders, and made them carry its wise self at their own cloud pace. It got weavable fibres out of the mosses, and made clothes for itself, cheap and fine,—here was happiness at last. To go as fast as the clouds, and manufacture everything out of anything,—here was paradise, indeed!

¹ [On Ruskin's Utopianism, see *Lectures on Architecture and Painting*, § 33 (Vol. XII. p. 56 and *n.*.)]

² [Ruskin was perhaps thinking of the abdication of the Emperor Charles V. and his cloister life, as described in Sir William Stirling-Maxwell's book; and of Epictetus—

“That halting slave, who in Nicopolis

Taught Arrian, when Vespasian's brutal son

Clear'd Rome of what most shamed him.”—MATTHEW ARNOLD.

For a reference to the cloister life of Charles V., see *Academy Notes*, 1856 (No. 175); to Epictetus, Vol. VI. p. 22.]

§ 38. And now, when, in a little while, it is unparadised again, if there were any other mistake that the world could make, it would of course make it. But I see not that there is any other; and, standing fairly at its wits' end, having found that going fast, when it is used to it, is no more paradisiacal than going slow; and that all the prints and cottons in Manchester cannot make it comfortable in its mind, I do verily believe it will come, finally, to understand that God paints the clouds and shapes the moss-fibres, that men may be happy in seeing Him at His work, and that in resting quietly beside Him, and watching His working, and—according to the power He has communicated to ourselves, and the guidance He grants,—in carrying out His purposes of peace and charity among all His creatures, are the only real happinesses that ever were, or will be, possible to mankind.

§ 39. How far art is capable of helping us in such happiness we hardly yet know; but I hope to be able, in the subsequent parts of this work, to give some data for arriving at a conclusion in the matter.¹ Enough has been advanced to relieve the reader from any lurking suspicion of unworthiness in our subject, and to induce him to take interest in the mind and work of the great painter who has headed the landscape school among us. What farther considerations may, within any reasonable limits, be put before him, respecting the effect of natural scenery on the human heart, I will introduce in their proper places either as we examine, under Turner's guidance, the different classes of scenery, or at the close of the whole work; and therefore I have only one point more to notice here, namely, the exact relation between landscape-painting and natural science, properly so called.

§ 40. For it may be thought that I have rashly assumed that the Scriptural authorities above quoted apply to that partly superficial view of nature which is taken by the land-landscape-painter, instead of to the accurate view taken by the

¹ [See, again, the last chapter of *Modern Painters*, vol. v.]

man of science. So far from there being rashness in such an assumption, the whole language, both of the book of Job and the Sermon on the Mount, gives precisely the view of nature which is taken by the uninvestigating affection of a humble, but powerful mind. There is no dissection of muscles or counting of elements, but the boldest and broadest glance at the apparent facts, and the most magnificent metaphor in expressing them. "His eyes are like the eyelids of the morning. In his neck remaineth strength, and sorrow is turned into joy before him." And in the often repeated, never obeyed, command, "Consider the lilies of the field," observe there is precisely the delicate attribution of life which we have seen to be the characteristic of the modern view of landscape,—“They toil not.” There is no science, or hint of science; no counting of petals, nor display of provisions for sustenance; nothing but the expression of sympathy, at once the most childish, and the most profound,—“They toil not.”¹

§ 41. And we see in this, therefore, that the instinct which leads us thus to attribute life to the lowest forms of organic nature, does not necessarily spring from faithlessness, nor the deducing a moral out of them from an irregular and languid conscientiousness. In this, as in almost all things connected with moral discipline, the same results may follow from contrary causes; and as there are a good and evil contentment, a good and evil discontent, a good and evil care, fear, ambition, and so on, there are also good and evil forms of this sympathy with nature, and disposition to moralize over it.* In general, active men, of strong sense and stern principle, do not care to see anything in

* Compare what is said before in various places of good and bad finish, good and bad mystery, etc.² If a man were disposed to system-making, he could easily throw together a counter-system to Aristotle's, showing that in all

¹ [The Bible references in § 40 are Job xli. 18, 22 (see also *Modern Painters*, vol. v. pt. ix. ch. x. § 17); Matthew vi. 28 (see also p. 292, above).]

² [See, for finish, ch. ix. p. 155, etc.; for mystery, ch. xvi. p. 318, with which passage contrast Vol. III. p. 123; and for the Aristotelian theory of virtue as a mean, *Modern Painters*, vol. iv. App. iii.]

a leaf, but vegetable tissue, and are so well convinced of useful moral truth, that it does not strike them as a new or notable thing when they find it in any way symbolized by material nature; hence there is a strong presumption, when first we perceive a tendency in any one to regard trees as living, and enunciate moral aphorisms over every pebble they stumble against, that such tendency proceeds from a morbid temperament, like Shelley's, or an inconsistent one, like Jaques's. But when the active life is nobly fulfilled, and the mind is then raised beyond it into clear and calm beholding of the world around us, the same tendency again manifests itself in the most sacred way: the simplest forms of nature are strangely animated by the sense of the Divine presence; the trees and flowers seem all, in a sort, children of God; and we ourselves, their fellows, made out of the same dust, and greater than they only in having a greater portion of the Divine power exerted on our frame, and all the common uses and palpably visible forms of things, become subordinate in our minds to their inner glory,—to the mysterious voices in which they talk to us about God, and the changeful and typical aspects by which they witness to us of holy truth, and fill us with obedient, joyful, and thankful emotion.

§ 42. It is in raising us from the first state of inactive reverie to the second of useful thought, that scientific pursuits are to be chiefly praised. But in restraining us at this second stage, and checking the impulses towards higher contemplation, they are to be feared or blamed. They may in certain minds be consistent with such contemplation; but only by an effort: in their nature they are always adverse to it, having a tendency to chill and subdue the feelings, and to resolve all things into atoms and numbers. For most men, an ignorant enjoyment is better than an informed one; it is better to conceive the

things there were two extremes which exactly resembled each other, but of which one was bad, the other good; and a mean, resembling neither, but better than the one, and worse than the other.

sky as a blue dome than a dark cavity, and the cloud as a golden throne than a sleety mist. I much question whether any one who knows optics, however religious he may be, can feel in equal degree the pleasure or reverence which an unlettered peasant may feel at the sight of a rainbow. And it is mercifully thus ordained, since the law of life, for a finite being, with respect to the works of an infinite one, must be always an infinite ignorance. We cannot fathom the mystery of a single flower, nor is it intended that we should; but that the pursuit of science should constantly be stayed by the love of beauty, and accuracy of knowledge by tenderness of emotion.

§ 43. Nor is it even just to speak of the love of beauty as in all respects unscientific; for there is a science of the aspects of things, as well as of their nature; and it is as much a fact to be noted in their constitution, that they produce such and such an effect upon the eye or heart (as, for instance, that minor scales of sound cause melancholy), as that they are made up of certain atoms or vibrations of matter.

It is as the master of this science of *Aspects*, that I said, some time ago,¹ Turner must eventually be named always with Bacon, the master of the science of *Essence*. As the first poet who has, in all their range, understood the grounds of noble emotion which exist in landscape, his future influence will be of a still more subtle and important character. The rest of this work will therefore be dedicated to the explanation of the principles on which he composed, and of the aspects of nature which he was the first to discern.

¹ [Above, p. 353; see also *Lectures on Architecture and Painting*, § 101 (Vol. XII. p. 128), and compare *Stones of Venice*, vol. iii. (Vol. XI. p. 48 n.).]

CHAPTER XVIII
OF THE TEACHERS OF TURNER

§ 1. THE first step to the understanding either the mind or position of a great man ought, I think, to be an inquiry into the elements of his early instruction, and the mode in which he was affected by the circumstances of surrounding life. In making this inquiry, with respect to Turner, we shall be necessarily led to take note of the causes which had brought landscape-painting into the state in which he found it; and, therefore, of those transitions of style which, it will be remembered, we overleaped (hoping for a future opportunity of examining them) at the close of the fifteenth chapter.

§ 2. And first, I said, it will be remembered, some way back,¹ that the relations between Scott and Turner would probably be found to differ very curiously from those between Dante and Giotto. They differ primarily in this, —that Dante and Giotto, living in a consistent age, were subjected to one and the same influence, and may be reasoned about almost in similar terms. But Scott and Turner, living in an inconsistent age, became subjected to inconsistent influences; and are at once distinguished by notable contrarities, requiring separate examination in each.

§ 3. Of these, the chief was, that Scott, having had the blessing of a totally neglected education, was able early to follow most of his noble instincts; but Turner, having suffered under the instruction of the Royal Academy, had to pass nearly thirty years of his life in recovering from its

¹ [See above, p. 330.]

consequences;* this permanent result following for both,—that Scott never was led into any fault foreign to his nature, but spoke what was in him, in rugged or idle simplicity; erring only where it was natural to err, and failing only where it was impossible to succeed. But Turner, from the beginning, was led into constrained and unnatural error; diligently debarred from every ordinary help to success. The one thing which the Academy *ought* to have taught him (namely, the simple and safe use of oil colour),¹ it never taught him; but it carefully repressed his perceptions of truth, his capacities of invention, and his tendencies of choice. For him it was impossible to do right but in a spirit of defiance; and the first condition of his progress in learning, was the power to forget.

§ 4. One most important distinction in their feelings throughout life was necessitated by this difference in early training. Scott gathered what little knowledge of architecture he possessed, in wanderings among the rocky walls of Crichtoun, Lochleven, and Linlithgow, and among the delicate pillars of Holyrood, Roslin, and Melrose. Turner acquired his knowledge of architecture at the desk, from academical elevations of the Parthenon and St. Paul's; and spent a large portion of his early years in taking views of gentlemen's seats, temples of the Muses, and other productions of modern taste and imagination; being at the same time directed exclusively to classical sources for all information as to the proper subjects of art. Hence, while Scott was at once directed to the history of his native land, and to the Gothic fields of imagination, and his mind was fed in a consistent, natural, and felicitous way from his youth up; poor Turner for a long time knew no inspiration but that

* The education here spoken of is, of course, that bearing on the main work of life. In other respects, Turner's education was more neglected than Scott's, and that not beneficently. See the close of the third of my Edinburgh Lectures. [Vol. XII. p. 133.]

¹ [Compare the Review of Eastlake, § 3, Vol. XII. p. 253.]

of Twickenham;¹ no sublimity but that of Virginia Water. All the history and poetry presented to him at the age when the mind receives its dearest associations, were those of the gods and nations of long ago; and his models of sentiment and style were the worst and last wrecks of the Renaissance affectations.

§ 5. Therefore (though utterly free from affectation), his early works are full of an *enforced* artificialness, and of things ill-done and ill-conceived, because foreign to his own instincts; and, throughout life, whatever he did, because he thought he *ought* to do it, was wrong; all that he planned on any principle, or in supposed obedience to canons of taste, was false and abortive: he only did right when he ceased to reflect; was powerful only when he made no effort, and successful only when he had taken no aim.

§ 6. And it is one of the most interesting things connected with the study of his art, to watch the way in which his own strength of English instinct breaks gradually through fetter and formalism; how from Egerian wells he steals away to Yorkshire streamlets; how from Homeric rocks, with laurels at the top and caves in the bottom, he climbs, at last, to Alpine precipices fringed with pine, and fortified with the slopes of their own ruins; and how from Temples of Jupiter and Gardens of the Hesperides, a spirit in his feet guides him, at last, to the lonely arches of Whitby, and the bleak sands of Holy Isle.

§ 7. As, however, is the case with almost all inevitable evil, in its effect on great minds, a certain good rose even out of this warped education; namely, his power of more completely expressing all the tendencies of his epoch, and sympathizing with many feelings and many scenes which must otherwise have been entirely profitless to him. Scott's mind was just as large and full of sympathy as Turner's; but, having been permitted always to take his own choice

¹ [For "Twickenham" in art, see *Pre-Raphaelitism*, § 37 (Vol. XII. p. 373 and *n.*). Turner for some years (1814–1826) had a house at Twickenham—"Sandycombe Lodge": see Ruskin's *Notes on his Drawings by Turner*, No. 101.]

among sources of enjoyment, Scott was entirely incapable of entering into the spirit of any classical scene. He was strictly a Goth and a Scot, and his sphere of sensation may be almost exactly limited by the growth of heather. But Turner had been forced to pay early attention to whatever of good and right there was even in things naturally distasteful to him. The charm of early association had been cast around much that to other men would have been tame; while making drawings of flower-gardens and Palladian mansions, he had been taught sympathy with whatever grace or refinement the garden or mansion could display, and to the close of life could enjoy the delicacy of trellis and parterre, as well as the wildness of the wood and the moorland; and watch the staying of the silver fountain at its appointed height in the sky, with an interest as earnest, if not as intense, as that with which he followed the crash of the Alpine cataract into its clouds of wayward rage.

§ 8. The distinct losses to be weighed against this gain are, first the waste of time during youth in painting subjects of no interest whatsoever,—parks, villas, and ugly architecture in general: secondly, the devotion of his utmost strength in later years to meaningless classical compositions, such as the *Fall and Rise of Carthage*, *Bay of Baiæ*, *Daphne and Leucippus*,¹ and such others, which, with infinite accumulation of material, are yet utterly heartless and emotionless, dead to the very root of thought, and incapable of producing wholesome or useful effect on any human mind, except only as exhibitions of technical skill and graceful arrangement: and, lastly, his incapacity, to the close of life, of entering heartily into the spirit of any elevated architecture; for those Palladian and classical buildings which he had been taught that it was right to admire, being wholly devoid of interest, and in their own formality and barrenness quite unmanageable, he was obliged to make them manageable in his pictures by disguising them, and

¹ [For Ruskin's criticism of Turner's classical compositions, see Vol. III. pp. 241–242, and compare *Notes on the Turner Gallery* (Third Period). The particular pictures here referred to are in the National Gallery, Nos. 498, 499, 505, 520.]

to use all kinds of playing shadows and glittering lights to obscure their ugly details; and as in their best state such buildings are white and colourless, he associated the idea of whiteness with perfect architecture generally, and was confused and puzzled when he found it grey. Hence he never got thoroughly into the feeling of Gothic;¹ its darkness and complexity embarrassed him; he was very apt to whiten by way of idealizing it, and to cast aside its details in order to get breadth of delicate light. In Venice, and the towns of Italy generally, he fastened on the wrong buildings, and used those which he chose merely as kind of white clouds, to set off his brilliant groups of boats, or burning spaces of lagoon. In various other minor ways, which we shall trace in their proper place,² his classical education hindered or hurt him; but I feel it very difficult to say how far the loss was balanced by the general grasp it gave his mind; nor am I able to conceive what would have been the result, if his aims had been made at once narrower and more natural, and he had been led in his youth to delight in Gothic legends instead of classical mythology; and, instead of the porticoes of the Parthenon, had studied in the aisles of Notre Dame.

§ 9. It is still more difficult to conjecture whether he gathered most good or evil from the pictorial art which surrounded him in his youth. What that art was, and how the European schools had arrived at it, it now becomes necessary briefly to inquire.

It will be remembered that, in the 14th chapter, we left our mediæval landscape (§ 18) in a state of severe formality, and perfect subordination to the interest of figure-subject. I will now rapidly trace the mode and progress of its emancipation.³

¹ [Compare, again, *Notes on the Turner Gallery* (s. No. 527, 535), and Ruskin's *Notes on his Drawings by Turner* (s. 12 R.).]

² [See, for instance, *Modern Painters*, vol. v. pt. vi. ch. x. § 21; but in a later chapter of that volume (pt. ix. ch. x. § 3 n.), Ruskin refers to the present passage, and somewhat modifies it.]

³ [For another sketch of this subject, see *Lectures on Architecture and Painting*, §§ 84–94, Vol. XII. pp. 109–123.]

§ 10. The formalized conception of scenery remained little altered until the time of Raphael, being only better executed as the knowledge of art advanced; that is to say, though the trees were still stiff, and often set one on each side of the principal figures, their colour and relief on the sky were exquisitely imitated, and all groups of near leaves and flowers drawn with the most tender care, and studious botanical accuracy. The better the subjects were painted, however, the more logically absurd they became: a background wrought in Chinese confusion of towers and rivers, was in early times passed over carelessly and forgiven for the sake of its pleasant colour; but it appealed somewhat too far to imaginative indulgence when Ghirlandajo drew an exquisite perspective view of Venice and her lagoons behind an Adoration of the Magi;* and the impossibly small boats which might be pardoned in a mere illumination, representing the miraculous draught of fishes, became, whatever may be said to the contrary, inexcusably absurd in Raphael's fully realized landscape; so as at once to destroy the credibility of every circumstance of the event.

§ 11. A certain charm, however, attached itself to many forms of this landscape, owing to their very unnaturalness, as I have endeavoured to explain already in the last chapter of the second volume, §§ 9 to 12;¹ noting, however, there, that it was in no wise to be made a subject of imitation; a conclusion which I have since seen more and more ground for holding finally. The longer I think over the subject, the more I perceive that the pleasure we take in such unnatural landscapes is intimately connected with our

* The picture is in the Uffizii of Florence.²

¹ [In this edition, Vol. IV. pp. 320–323.]

² [For another reference to this background, see Vol. IV. p. 323 *n.* Ruskin describes the picture in his diary of 1845:—

“Mentioned by Rio [*Poetry of Christian Art*, p. 105], and all that he says about the distance is not too much. It is a wonderful bit of clear and clever Dutch painting, far in advance of all other distances up to Ghirlandajo's time, as far as mere power of imitation goes; the sky is sweet in colour and infinitely clear and far away, but the whole is a mere piece of Daguerreotype, totally feelingless and unpromising.”]

habit of regarding the New Testament as a beautiful poem, instead of a statement of plain facts. He who believes thoroughly that the events are true will expect, and ought to expect, real olive copse behind real Madonna, and no sentimental absurdities in either.

§ 12. Nor am I at all sure how far the delight which we take (when I say *we*, I mean, in general, lovers of old sacred art) in such quaint landscape, arises from its peculiar *falsehood*, and how far from its peculiar *truth*. For as it falls into certain errors more boldly, so, also, what truth it states, it states more firmly, than subsequent work. No engravings, that I know, render the backgrounds of sacred pictures with sufficient care to enable the reader to judge of this matter unless before the works themselves. I have, therefore, engraved on the opposite page, a bit of the background of Raphael's Holy Family, in the Tribune of the Uffizii, at Florence.¹ I copied the trees leaf for leaf, and the rest of the work with the best care I could; the engraver, Mr. Armytage,² has admirably rendered the delicate atmosphere which partly veils the distance. Now I do not know how far it is necessary to such pleasure as we receive from this landscape, that the trees should be both so straight and formal in stem, and should have branches no thicker than threads; or that the outlines of the distant hills should approximate so closely to those on any ordinary Wedgwood china pattern. I know that, on the contrary, a great part of the pleasure arises from the sweet expression of air and sunshine; from the traceable resemblance of the city and tower to Florence and Fésolle; from the fact that, though the boughs are too thin, the lines of ramification are true and beautiful; and from the expression of continually varied form in the clusters of leafage. And although all lovers of sacred art would shrink in horror from the idea of substituting for such a landscape a bit of Cuyp or Rubens, I do not think that the horror

¹ [The Madonna del Cardellino; see Vol. IV. p. 85.]

² [See Vol. IX. p. 1.]

J. Bunker, after Raphael.

Allen & Co. Sc.*

II . Latest Purism .

they feel is because Cuyp and Rubens's landscape is *truer*, but because it is *coarser* and more vulgar in associated idea than Raphael's; and I think it possible that the true forms of hills, and true thicknesses of boughs, might be tenderly stolen into this background of Raphael's without giving offence to any one.

§ 13. Take a somewhat more definite instance. The rock in Fig. 5, at the side, is one put by Ghirlandajo into the background of his Baptism of Christ.¹ I have no doubt Ghirlandajo's own rocks and trees are better, in several respects, than those here represented, since I have copied them from one of Lasinio's execrable engravings;² still, the harsh outline and generally stiff and uninventful blankness of the design are true enough and characteristic of all rock-painting of the period. In the plate opposite I have etched* the outline of a fragment of one of Turner's cliffs, out of his drawing of Bolton Abbey; and it does not seem

Fig. 5

* This etching is prepared for receiving mezzotint in the next volume;³ it is therefore much heavier in line, especially in the water, than I should have made it, if intended to be complete as it is.

¹ [One of the frescoes in S. Maria Novella at Florence, for which generally see *Mornings in Florence*, §§ 17 seq.]

² [Conte Carlo Lasinio (1757–1839), a prolific engraver of works by the earlier Tuscan painters, and curator of the gallery at Pisa. For other references to his engravings, see Vol. VI. p. 10 n., Vol. XII. p. 245. n.]

to me that, supposing them properly introduced in the composition, the substitution of the soft natural lines for the hard unnatural ones would make Ghirlandajo's background one whit less sacred.¹

§ 14. But, be this as it may, the fact is, as ill luck would have it, that profanity of feeling, and skill in art, increased together; so that we do not find the backgrounds rightly painted till the figures become irreligious and feelingless; and hence we associate necessarily the perfect landscape with want of feeling. The first great innovator was either Masaccio or Filippino Lippi; their works are so confused together in the Chapel of the Carmine, that I know not to whom I may attribute,—or whether, without being immediately quarrelled with, and contradicted, I may attribute to anybody,—the landscape background of the fresco of the Tribute Money.² But that background, with one or two other fragments in the same chapel, is far in advance of all other work I have seen of the period, in expression of the rounded contours and large slopes of hills, and the association of their summits with the clouds. The opposite engraving will give some better idea of its character than can be gained from the outlines commonly published; though the dark spaces, which in the original are deep blue, come necessarily somewhat too harshly on the eye when translated into light and shade. I shall have occasion to speak with greater speciality of this background in examining the forms of hills;³ meantime, it is only as an isolated work that it can be named in the history of pictorial progress, for Masaccio died too young to carry out his purposes;⁴ and the men

¹ [In the MS. Ruskin gives the Ghirlandajo rock one piece of credit:—

“One truth there is in the thing which seems to me the source of what pleasurable it possesses, the way the trees stand on the top of the rock, and the grass hangs over it. Nothing is more remarkable of mountain cliffs in general than the way the trees seem to like to look over the edge, and to stretch their branches as far down as they can, more or less following the line of the brow, like hair falling over a forehead. All the early painters seem to have been struck by this, and it is rare with them to draw a rock without some expression of the fact.”]

15. St. George of the Seaweed.

around him were too ignorant of landscape to understand or take advantage of the little he had done. Raphael, though he borrowed from him in the human figure, never seems to have been influenced by his landscape, and retains either, as in Plate 11, the upright formalities of Perugino; or, by way of being natural, expands his distances into flattish flakes of hill, nearly formless, as in the backgrounds of the Charge to Peter and Draught of Fishes; and thenceforward the Tuscan and Roman schools grew more and more artificial, and lost themselves finally under round-headed niches and Corinthian porticoes.

§ 15. It needed, therefore, the air of the northern mountains and of the sea to brace the hearts of men to the development of the true landscape schools. I sketched by chance one evening the line of the Apennines from the ramparts of Parma, and I have put the rough note of it, and the sky that was over it, in Plate 14, and next to this (Plate 15) a moment of sunset, behind the Euganean hills at Venice. I shall have occasion to refer to both here-after:¹ but they have some interest here as types of the kind of scenes which were daily set before the eyes of Correggio and Titian, and of the sweet free spaces of sky through which rose and fell, to them, the coloured rays of the morning and evening.

§ 16. And they are connected, also, with the forms of landscape adopted by the Lombardic masters, in a very curious way. We noticed that the Flemings, educated entirely in flat land, seemed to be always contented with the scenery it supplied; and we should naturally have expected that Titian and Correggio, living in the midst of the levels of the lagoons, and of the plain of Lombardy, would also have expressed, in their background, some pleasure in such level scenery, associated, of course, with the sublimity of the far-away Apennine, Euganean, or Alp. But not a whit. The plains of mulberry and maize, of sea and

¹ [See *Modern Painters*, vol. iv. pref. § 3, ch. xx. § 21 (Parma); Plate 15 is not again referred to.]

shoal, by which they were surrounded, never occur in their backgrounds but in cases of necessity; and both of them, in all their important landscapes, bury themselves in wild wood; Correggio delighting to relieve with green darkness of oak and ivy the golden hair and snowy flesh of his figures; and Titian, whenever the choice of a scene was in his power, retiring to the narrow glens and forests of Cadore.

§ 17. Of the vegetation introduced by both, I shall have to speak at length in the course of the chapters on Foliage;¹ meantime, I give in Plate 16 one of Titian's slightest bits of background, from one of the frescoes in the little chapel behind St. Antonio, at Padua,² which may be compared more conveniently than any of his more elaborate landscapes with the purist work from Raphael. For in both these examples the trees are equally slender and delicate, only the formality of mediæval art is, by Titian, entirely abandoned, and the old conception of the aspen grove and meadow done away with for ever. We are now far from cities: the painter takes true delight in the desert; the trees grow wild and free; the sky also has lost its peace, and is writhed into folds of motion, closely impendent upon earth, and somewhat threatening, through its solemn light.

§ 18. Although, however, this example is characteristic of Titian in its wildness, it is not so in its *looseness*. It is only in the distant backgrounds of his slightest work, or when he is in a hurry, that Titian is vague: in all his near and studied work he completes every detail with scrupulous care. The next Plate, 17, a background of Tintoret's, from his picture of the Entombment at Parma, is more entirely characteristic of the Venetians. Some mistakes made in the reduction of my drawing during the

¹ [See, for instance, vol. v. pt. vi. ch. v. §§ 5, 8.]

² [The Scuola del Santo; for the neglect of these frescoes, see Vol. XII. p. 301. They are among the master's earlier works. The fresco from which Ruskin's drawing is taken represents "St. Anthony of Padua causing a new-born infant to speak"; see illustration of the whole subject at p. 43 of *The Earlier Work of Titian*, by Claude Phillips.]

17. Advanced Naturalism.

course of engraving have cramped the curves of the boughs and leaves, of which I will give the true outline farther on;¹ meantime the subject, which is that described in § 16 of the chapter on Penetrative Imagination, Vol. II.,² will just as well answer the purpose of exemplifying the Venetian love of gloom and wildness, united with perfect definition of detail. Every leaf and separate blade of grass is drawn; but observe how the blades of grass are broken, how completely the aim at expression of faultlessness and felicity has been withdrawn, as contrary to the laws of the existent world.

§ 19. From this great Venetian school of landscape Turner received much important teaching,—almost the only healthy teaching which he owed to preceding art. The designs of the *Liber Studiorum* are founded first on nature, but in many cases modified by *forced* imitation of Claude, and *fond* imitation of Titian. All the worst and feeblest studies in the book—as the pastoral with the nymph playing the tambourine, that with the long bridge seen through trees, and with the flock of goats on the walled road—owe the principal part of their imbecilities to Claude; another group (Solway Moss, Peat Bog, Lauffenbourg, etc.) is taken, with hardly any modification by pictorial influence, straight from nature; and the finest works in the book—the Grande Chartreuse, Rizpah, Jason, Cephalus, and one or two more—are strongly under the influence of Titian.³

§ 20. The Venetian school of landscape expired with Tintoret, in the year 1594; and the sixteenth century closed,

¹ [This, however, was not done.]

² [In this edition, Vol. IV. p. 262.]

³ [The drawing for the “Woman and Tambourine” is No. 468 in the National Gallery; those for the two bridges are Nos. 463 and 464; for the Peat Bog is No. 498, and Lauffenbourg, No. 473; for a notice of the careful symmetry in the last mentioned drawing, see *Modern Painters*, vol. v. pt. viii. ch. ii. § 12. For the Chartreuse (drawing, National Gallery, No. 866), see *Modern Painters*, vol. iv. ch. xvi. § 41; vol. v. pt. ix. ch. xi. § 28; and *Lectures on Landscape*, § 98. For Rizpah (drawing, National Gallery, No. 864), see *Pre-Raphaelitism*, § 35, Vol. XII. p. 370. For the Jason (drawing, National Gallery, No. 461), see Vol. IV. p. 259. For the Cephalus (drawing, National Gallery, No. 465), see Vol. IV. p. 245, where further references to it are given.]

like a grave, over the great art of the world. There is *no* entirely sincere or great art in the seventeenth century. Rubens and Rembrandt are its two greatest men, both deeply stained by the errors and affectations of their age. The influence of the Venetians hardly extended to them; the tower of the Titianesque art fell southwards, and on the dust of its ruins grew various art-weeds, such as Domenichino and the Carraccis. Their landscape, which may in few words be accurately defined as "Scum of Titian," possesses no single merit, nor any ground for the forgiveness of demerit; they are to be named only as a link through which the Venetian influence came dimly down to Claude and Salvator.

§ 21. Salvator possessed real genius, but was crushed by misery in his youth, and by fashionable society in his age. He had vigorous animal life, and considerable invention, but no depth either of thought or perception. He took some hints directly from nature, and expressed some conditions of the grotesque of terror with original power; but his baseness of thought, and bluntness of sight, were unconquerable; and his works possess no value whatsoever for any person versed in the walks of noble art. They had little, if any, influence on Turner; if any, it was in blinding him for some time to the grace of tree trunks, and making him tear them too much into splinters.

§ 22. Not so Claude, who may be considered as Turner's principal master. Claude's capacities were of the most limited kind; but he had tenderness of perception, and sincerity of purpose, and he affected a revolution in art. This revolution consisted mainly in setting the sun in heaven.* Till Claude's time no one had seriously thought of painting the sun but conventionally; that is to say, as a red or yellow star, (often) with a face in it, under which

* Compare Vol. I. Part II. Sec. I. Chapter VII. I repeat here some things that were then said; but it is necessary now to review them in connection with Turner's education, as well as for the sake of enforcing them by illustration.

type it was constantly represented in illumination; else it was kept out of the picture, or introduced in fragmentary distances, breaking through clouds with almost definite rays. Perhaps the honour of having first tried to represent the real effect of the sun in landscape belongs to Bonifazio, in his pictures of the camps of Israel.* Rubens followed in a kind of bravado, sometimes making the rays issue from anything but the orb of the sun;—here, for instance, Fig. 6, is an outline of the position of the sun (at *s*) with respect

Fig. 6

to his own rays, in a sunset behind a tournament in the Louvre:¹ and various interesting effects of sunlight issuing from the conventional face-filled orb occur in contemporary missal-painting; for instance, very richly in the Harleian MS. Brit. Mus. 3469.² But all this was merely indicative of the tendency to transition which may always be traced in any age before the man comes who is to *accomplish* the transition. Claude took up the new idea seriously, made the sun his subject, and painted the effects of misty

* Now in the old library of Venice.³

¹ [See Vol. XII. p. 456.]

² ["A Book on the Philosopher's stone in the old German Language: finely written, and most beautifully painted, A.D. 1582. It contains 48 leaves and 22 finely executed paintings. . . . A book of uncommon style and beauty, executed on vellum" (*Catalogus librorum manuscriptorum Bibliothecæ Harleianæ*).]

³ [For these pictures see also Vol. XI. p. 390.]

shadows cast by his rays over the landscape, and other delicate aerial transitions, as no one had ever done before, and, in some respects, as no one has done in oil colour since.

§ 23. "But, how, if this were so, could his capacities be of the meanest order?" Because doing *one* thing well, or better than others have done it, does not necessarily imply large capacity. Capacity means breadth of glance, understanding of the relations of things, and invention, and these are rare and precious; but there are very few men who have not done *something*, in the course of their lives, better than other people. I could point out many engravers, draughtsmen, and artists, who have each a particular merit in their manner, or particular field of perception, that nobody else has, or ever had. But this does not make them great men, it only indicates a small special capacity of some kind: and all the smaller if the gift be very peculiar and single; for a great man never so limits himself to one thing, as that we shall be able to say, "That is all he can do." If Claude had been a great man he would not have been so steadfastly set on painting effects of sun: he would have looked at all nature, and at all art, and would have painted sun effects somewhat worse, and nature universally much better.

§ 24. Such as he was, however, his discovery of the way to make pictures look warm was very delightful to the shallow connoisseurs of the age. Not that they cared for sunshine; but they liked seeing jugglery. They could not feel Titian's noble colour, nor Veronese's noble composition; but they thought it highly amusing to see the sun brought into a picture: and Claude's works were bought and delighted in by vulgar people then, for their real-looking suns, as pictures are now by vulgar people for having real timepieces in their church towers.

§ 25. But when Turner arose, with an earnest desire to paint the whole of nature, he found that the existence of the sun was an important fact, and by no means an easily

manageable one. *He* loved sunshine for its own sake; but he could not at first paint it. Most things else, he would more or less manage without much technical difficulty; but the burning orb and the golden haze could not, somehow, be got out of the oil paint. Naturally he went to Claude, who really had got them out of oil paint; approached him with great reverence, as having done that which seemed to Turner most difficult of all technical matters, and he became his faithful disciple. How much he learned from him of manipulation, I cannot tell; but one thing is certain, that he never quite equalled him in that particular forte of his. I imagine that Claude's way of laying on oil colour was so methodical that it could not possibly be imitated by a man whose mechanism was interfered with by hundreds of thoughts and aims totally different from Claude's; and, besides, I suppose that certain useful principles in the management of paint, of which our schools are now wholly ignorant, had come down as far as Claude, from the Venetians. Turner at last gave up the attempt, and adopted a manipulation of his own, which indeed effected certain objects attainable in no other way, but which still was in many respects unsatisfactory, dangerous, and deeply to be regretted.

§ 26. But meantime his mind had been strongly warped by Claude's futilities of conception. It was impossible to dwell on such works for any length of time without being grievously harmed by them; and the style of Turner's compositions was for ever afterwards weakened or corrupted. For, truly, it is almost beyond belief into what depth of absurdity Claude plunges continually in his most admired designs. For instance; undertaking to paint Moses at the Burning Bush, he represents a graceful landscape with a city, a river, and a bridge, and plenty of tall trees, and the sea, and numbers of people going about their business and pleasure in every direction; and the bush burning quietly upon a bank in the corner; rather in the dark, and not to be seen without close inspection. It would take

some pages of close writing to point out, one by one, the inanities of heart, soul, and brain which such a conception involves; the ineffable ignorance of the nature of the event, and of the scene of it; the incapacity of conceiving anything, even *in* ignorance, which should be impressive; the dim, stupid, serene, leguminous enjoyment of his sunny afternoon—burn the bushes as much as they liked—these I leave the reader to think over at his leisure, either before the picture in Lord Ellesmere's gallery, or the sketch of it in the *Liber Veritatis*. But all these kinds of fallacy sprung more or less out of the vices of the time in which Claude lived; his own peculiar character reaches beyond these, to an incapacity of understanding the *main point* in anything he

Fig. 7

had to represent, down to the minutest detail, which is quite unequalled, as far as I know, in human nugatoriness. For instance; here, in Fig. 7, is the head, with half the body, of Æneas drawing his bow, from No. 180 of the

Liber Veritatis.¹ Observe the string is too long by half; for if the bow were unbent, it would be two feet longer than the whole bow. Then the arrow is too long by half, has too heavy a head by half, and finally, it actually is *under* the bow hand, instead of above it. Of the ideal and heroic refinement of the head and drapery I will say nothing; but look only at the wretched archery, and consider if it would be possible for any child to draw the thing with less understanding, or to make more mistakes in the given compass.*

* My old friend Blackwood² complains, bitterly, in his last number, of my having given this illustration at one of my late lectures, saying, that I "have a disagreeable knack of finding out the joints in my opponent's armour," and that "I never fight for love." I never do. I fight for truth, earnestly, and

¹ [Compare "Lectures on Colour," Vol. XII. p. 495 and Fig. 29, where another outline of this figure is given for comparison with an archer from an early illuminated manuscript.]

² [*Blackwood's Magazine*, December 1855, vol. 78; an article entitled "Modern Light Literature—Art," containing a notice of Ruskin's *Academy Notes* for 1855; the words cited by Ruskin are at pp. 707, 708 of the magazine.]

§ 27. And yet, exquisite as is Claude's instinct for blunder, he has not strength of mind enough to blunder in a wholly original manner, but must needs falter out of his way to pick up other people's puerilities, and be absurd at second-hand. I have been obliged to laugh a little—though I hope reverently—at Ghirlandajo's landscapes, which yet we saw had a certain charm of quaintness in them when contrasted with his grand figures; but could any one have believed that Claude, with all the noble landscapes of Titian set before him, and all nature round about him, should yet go back to Ghirlandajo for types of form? Yet such is the case. I said that the Venetian influence came dimly down to Claude: but the old Florentine influence came clearly. The Claudesque landscape is not, as so commonly supposed, an idealized abstract of the nature about Rome. It is an ultimate condition of the Florentine conventional landscape, more or less softened by reference to nature. Fig. 8, from No. 145 of the *Liber Veritatis*, is sufficiently characteristic of Claude's rock-drawing; and compared with Fig. 5 (p. 395) above, will show exactly the kind of modification he made on old and received types. We shall see other instances of it hereafter.¹

Imagine this kind of reproduction of whatever other people had done worst, and this kind of misunderstanding of all that he saw himself in nature, carried out in Claude's trees, rocks, ships,—in everything that he touched,—and then consider what kind of school this work was for a young

in no wise for jest; and against all lies, earnestly, and in no wise for love. They complain that a "noble adversary is not in Mr. Ruskin's way." No; a noble adversary never was, never will be. With all that is noble I have been, and shall be, in perpetual peace; with all that is ignoble and false everlastingly at war. And as for these Scotch *bourgeois gentilshommes*, with their "Tu n'as pas la patience que je pare,"² let them look to their fence. But truly, if they will tell me where Claude's strong points are I will strike there, and be thankful.

¹ [See in the next volume, ch. i. § 1, and Plate 18; and ch. xvi. § 35.]

² [For Ruskin's references to Molière, see above, p. 375 *n.*; this particular quotation (from a speech of M. Jourdain in act iii. sc. 3 of *Le Bourgeois Gentilhomme*) is made again in *Ethics of the Dust*, § 106.]

and reverent disciple. As I said, Turner never recovered the effects of it; his compositions were always mannered, lifeless, and even foolish; and he only did noble things when the immediate presence of nature had overpowered the reminiscences of his master.

Fig. 8

§ 28. Of the influence of Gaspar and Nicolo Poussin on Turner, there is hardly anything to be said, nor much respecting that which they had on landscape generally. Nicolo Poussin had noble powers of design, and might have been a thoroughly great painter had he been trained in Venice; but his Roman education kept him tame; his trenchant severity was contrary to the tendencies of the age, and had few imitators compared to the dashing of Salvator, and the mist of Claude. Those few imitators adopted his manner without possessing either his science or invention; and the Italian school of landscape soon expired. Reminiscences of

him occur sometimes in Turner's compositions of sculptured stones for foreground; and the beautiful Triumph of Flora, in the Louvre,¹ probably first showed Turner the use of definite flower, or blossom-painting, in landscape. I doubt if he took anything from Gaspar; whatever he might have learned from him respecting masses of foliage and golden distances, could

¹ [See "Notes on the Louvre," Vol. XII. p. 470.]

Engraved by J.H. Le Kreuz

have been learned better, and, I believe, *was* learned, from Titian.¹

§ 29. Meantime, a lower, but more living school had developed itself in the North; Cuyp had painted sunshine as truly as Claude, gilding with it a more homely, but far more honestly conceived landscape; and the effects of light of De Hooghe and Rembrandt presented examples of treatment to which southern art could show no parallel. Turner evidently studied these with the greatest care, and with great benefit in every way; especially this, that they neutralized the idealisms of Claude, and showed the young painter what power might be in plain truth, even of the most familiar kind. He painted several pictures in imitation of these masters; and those in which he tried to rival Cuyp are healthy and noble works, being, in fact, just what most of Cuyp's own pictures are—faithful studies of Dutch boats in calm weather, on smooth water. De Hooghe² was too precise, and Rembrandt too dark, to be successfully or affectionately followed by him; but he evidently learned much from both.

§ 30. Finally, he painted many pictures in the manner of Vanderveelde (who was the accepted authority of his time in sea painting), and received much injury from him. To the close of his life, Turner always painted the sea too grey, and too opaque, in consequence of his early study of Vanderveelde. He never seemed to perceive colour so truly in the sea as he saw it elsewhere. But he soon discovered the poorness of Vanderveelde's forms of waves, and raised their meanly divided surfaces into massive surge, effecting rapidly other changes, of which more in another place.³

Such was the art to which Turner, in early years, devoted his most earnest thoughts. More or less respectful

¹ [See *Pre-Raphaelitism*, § 37, Vol. XII. p. 373.]

² [For other references to De Hooghe, always considered by Ruskin among the best of the Dutch masters, see *Modern Painters*, vol. v. pt. ix. ch. viii. § 11; *Academy Notes*, 1859, No. 329; *Ariadne Florentina*, § 256; *St. Mark's Rest*, § 200.]

³ [See *Harbours of England*, §§ 29 *seq.* (Vol. XIII.). For Turner's study of Vanderveelde, see again *Pre-Raphaelitism*, § 37, Vol. XII. p. 372; and for his study of Morland, *Notes on the Turner Gallery*, Nos. 468, 477 (Vol. XIII.).]

contemplation of Reynolds, Louthembourg, Wilson, Gainsborough, Morland, and Wilkie, was incidentally mingled with his graver study; and he maintained a questioning watchfulness of even the smallest successes of his brother artists of the modern landscape school. It remains for us only to note the position of that living school when Turner, helped or misled, as the case may be, by the study of the older artists, began to consider what remained for him to do, or design.

§ 31. The dead schools of landscape, composed of the works we have just been examining, were broadly divisible into northern and southern: the Dutch schools, more or less natural, but vulgar; the Italian, more or less elevated, but absurd. There was a certain foolish elegance in Claude, and a dull dignity in Gaspar; but then their work resembled nothing that ever existed in the world. On the contrary, a canal or cattle piece of Cuyp's had many veracities about it; but they were, at best, truths of the ditch and diary. The grace of Nature, or her gloom, her tender and sacred seclusions, or her reach of power and wrath, had never been painted; nor had *anything* been painted yet in true *love* of it; for both Dutch and Italians agreed in this, that they always painted for the *picture's* sake, to show how well they could imitate sunshine, arrange masses, or articulate straws,—never because they loved the scene, or wanted to carry away some memory of it.

And thus, all that landscape of the old masters is to be considered merely as a struggle of expiring skill to discover some new direction in which to display itself. There was no love of nature in the age; only a desire for something new. Therefore those schools expired at last, leaving a chasm of nearly utter emptiness between them and the true moderns, out of which chasm the new school rises, not engrafted on that old one, but from the very base of all things, beginning with mere washes of Indian ink, touched upon with yellow and brown; and gradually feeling its way to colour.

But this infant school differed inherently from that ancients one, in that its motive was love. However feeble its efforts might be, they were *for the sake of the nature*, not of the picture, and therefore, having this germ of true life, it grew and throve. Robson¹ did not paint purple hills because he wanted to show how he could lay on purple; but because he truly loved their dark peaks. Fielding did not paint downs to show how dexterously he could sponge out mists; but because he loved downs.

This modern school, therefore, became the only true school of landscape which has yet existed; the artificial Claude and Gaspar work may be cast aside out of our way, as I have said in my Edinburgh lectures,² under the general title of “pastoralism,”—and from the last landscape of Tintoret, if we look for *life*, we must pass at once to the first of Turner.

§ 32. What help Turner received from this or that companion of his youth is of no importance to any one now. Of course every great man is always being helped by everybody,* for his gift is to get good out of all things and all persons; and also there were two men associated with him in early study, who showed high promise in the same field, Cozens and Girtin (especially the former), and there is no saying what these men might have done had they lived; there might, perhaps, have been a struggle between one or other of them and Turner, as between Giorgione and Titian.³ But they lived not; and Turner is the only great man whom the school has yet produced,—quite great enough, as we shall see, for all that needed to be done.

* His first drawing-master was, I believe, that Mr. Lowe, whose daughters, now aged and poor, have, it seems to me, some claim on public regard, being connected distantly with the memory of Johnson, and closely with that of Turner.⁴

¹ [For Robson, see Vol. III. p. 193.]

² [See Vol. XII. pp. 117–120.]

³ [For Cozens and Girtin, see Vol. XII. p. 309. “Had Tom Girtin lived,” said Turner, “I should have starved” (Thornbury’s *Life*, 1877, p. 71).]

⁴ [Mauritius Lowe (1746–1793), one of the first students of the Royal Academy, enjoyed the friendship and protection of Dr. Samuel Johnson, who left him a small legacy.]

To him, therefore, we now finally turn, as the sole object of our inquiry. I shall first reinforce, with such additions as they need, those statements of his general principles which I made in the first volume, but could not then demonstrate fully, for want of time to prepare pictorial illustration; and then proceed to examine, piece by piece, his representations of the facts of nature, comparing them, as it may seem expedient, with what had been accomplished by others.

§ 33. I cannot close this volume without alluding briefly to a subject of different interest from any that have occupied us in its pages. For it may, perhaps, seem to a general reader heartless and vain to enter zealously into questions about our arts and pleasures, in a time of so great public anxiety as this.

But he will find, if he looks back to the sixth paragraph of the opening chapter of the last volume, some statement of feelings, which, as they made me despondent in a time of apparent national prosperity, now cheer me in one which, though of stern trial, I will not be so much a coward as to call one of adversity. And I derive this encouragement first from the belief that the war itself, with all its bitterness, is, in the present state of the European nations, productive of more good than evil; and, secondly, because I have more confidence than others generally entertain, in the justice of its cause.¹

I say, first, because I believe the war is at present productive of good more than of evil.² I will not argue this hardly and coldly, as I might, by tracing in past history

¹ [Ruskin often expressed this view, to which his admiration at this time for Napoleon III. in part inclined him (see Vol. XII. p. 55 and *n.*). For other references to the Crimean War, see *Modern Painters*, vol. iv. Appendix i., § 5; *Academy Notes*, 1856, No. 398; *Love's Meinie*, § 133; *Fors Clavigera*, Letter 83; and *Præterita*, iii. ch. iv. § 79.]

² [Compare above, ch. xi. § 8; ch. xvi. § 16 *n.*; pp. 197, 198, 327 *n.* The ethics of war is the one subject on which Ruskin admitted that he had spoken with an uncertain and inconsistent sound; his writings abound alike in praise and in blame of war (see General Index). He explains his dilemma in *The Crown of Wild Olive*, § 161, and *Præterita*, ii. ch. viii. § 151.]

some of the abundant evidence that nations have always reached their highest virtue, and wrought their most accomplished works, in time of straitening and battle; as, on the other hand, no nation ever yet enjoyed a protracted and triumphant peace without receiving in its own bosom ineradicable seeds of future decline. I will not so argue this matter; but I will appeal at once to the testimony of those whom the war has cost the dearest. I know what would be told me, by those who have suffered nothing; whose domestic happiness has been unbroken; whose daily comfort undisturbed; whose experience of calamity consists, at its utmost, in the incertitude of a speculation, the dearness of a luxury, or the increase of demands upon their fortune which they could meet fourfold without inconvenience. From these, I can well believe, be they prudent economists, or careless pleasure-seekers, the cry for peace will rise alike vociferously, whether in street or senate. But I ask *their* witness, to whom the war has changed the aspect of the earth, and imagery of heaven, whose hopes it has cut off like a spider's web, whose treasure it has placed, in a moment, under the seals of clay. Those who can never more see sunrise, nor watch the climbing light gild the Eastern clouds, without thinking what graves it has gilded, first, far down behind the dark earth-line,—who never more shall see the crocus bloom in spring, without thinking what dust it is that feeds the wild flowers of Balaclava. Ask *their* witness, and see if they will not reply that it is well with them and with theirs; that they would have it no otherwise; would not, if they might, receive back their gifts of love and life, nor take again the purple of their blood out of the cross on the breastplate of England. Ask them: and though they should answer only with a sob, listen if it does not gather upon their lips into the sound of the old Seyton war-cry—"Set on."

§ 34. And this not for pride—not because the names of their lost ones will be recorded to all time, as of those who held the breach and kept the gate of Europe against the

North, as the Spartans did against the East; and lay down in the place they had to guard, with the like home message, "Oh, stranger, go and tell the English that we are lying here, having obeyed their words;"¹—not for this, but because, also, they have felt that the spirit which has discerned them for eminence in sorrow—the helmed and sworded skeleton that rakes with its white fingers the sands of the Black Sea beach into grave-heap after grave-heap, washed by everlasting surf of tears—has been to them an angel of other things than agony; that they have learned, with those hollow, undeceivable eyes of his, to see all the earth by the sunlight of death-beds;—no inch-high stage for foolish griefs and feigned pleasures; no dream, neither, as its dull moralists told them;—*Anything* but that: a place of true, marvellous, inextricable sorrow and power; a question-chamber of trial by rack and fire, irrevocable decision recording continually; and no sleep, nor folding of hands, among the demon-questioners; none among the angel-watchers, none among the men who stand or fall beside those hosts of God. They know now the strength of sacrifice, and that its flames can illumine as well as consume; they are bound by new fidelities to all that they have saved,—by new love to all for whom they have suffered; every affection which seemed to sink with those dim life-stains into the dust, has been delegated, by those who need it no more, to the cause for which they have expired; and every mouldering arm, which will never more embrace the beloved ones, has bequeathed to them its strength and its faithfulness.

§ 35. For the cause of this quarrel is no dim, half-avoidable involution of mean interests and errors, as some would have us believe. There never was a great war caused by such things. There never can be. The historian may trace it, with ingenious trifling, to a courtier's jest or a woman's glance; but he does not ask—(and it is the sum

¹ [Quoted in the Greek at *Modern Painters*, vol. v. pt. viii. ch. i. § 18; and compare *Crown of Wild Olive*, § 48 (ed. 1 only).]

of questions)—how the warring nations had come to found their destinies on the course of the sneer, or the smile. If they have so based them, it is time for them to learn, through suffering, how to build on other foundations;—for great, accumulated, and most righteous cause, their foot slides in due time; and against the torpor, or the turpitude, of their myriads, there is loosed the haste of the devouring sword and the thirsty arrow. But if they have set their fortunes on other than such ground, then the war must be owing to some deep conviction or passion in their own hearts,—a conviction which, in resistless flow, or reckless ebb, or consistent stay, is the ultimate arbiter of battle, disgrace, or conquest.

§ 36. Wherever there is war, there *must* be injustice on one side or the other, or on both. There have been wars which were little more than trials of strength between friendly nations, and in which the injustice was not to each other, but to the God who gave them life. But in a malignant war of these present ages there is injustice of ignobler kind, at once to God and man, which *must* be stemmed for both their sakes. It may, indeed, be so involved with national prejudices, or ignorances, that neither of the contending nations can conceive it as attaching to their cause; nay, the constitution of their governments, and the clumsy crookedness of their political dealings with each other, may be such as to prevent either of them from knowing the actual cause for which they have gone to war. Assuredly this is, in a great degree, the state of things with *us*; for I noticed that there never came news by telegraph of the explosion of a powder-barrel, or of the loss of thirty men by a sortie, but the Parliament lost confidence immediately in the justice of the war; reopened the question whether we ever should have engaged in it, and remained in a doubtful and repentant state of mind until one of the enemy's powder-barrels blew up also; upon which they were immediately satisfied again that the war was a wise and necessary one. How far, therefore, the calamity may

have been brought upon us by men whose political principles shoot annually like the leaves, and change colour at every autumn frost:—how loudly the blood that has been poured out round the walls of that city, up to the horse-bridles, may now be crying from the ground against men who did not know, when they first bade shed it, exactly what war was, or what blood was, or what life was, or truth, or what anything else was upon the earth; and whose tone of opinions touching the destinies of mankind depended entirely upon whether they were sitting on the right or left side of the House of Commons:—this, I repeat, I know not, nor (in all solemnity I say it) do I care to know. For if it be so, and the English nation could at the present period of its history be betrayed into a war such as this by the slipping of a wrong word into a protocol, or bewitched into unexpected battle under the budding hallucinations of its sapling senators, truly it is time for us to bear the penalty of our baseness, and learn, as the sleepless steel glares close upon us, how to choose our governors more wisely, and our ways more warily. For that which brings swift punishment in war, must have brought slow ruin in peace; and those who have now laid down their lives for England, have doubly saved her; they have humbled at once her enemies and herself; and have done less for her, in the conquest they achieve, than in the sorrow that they claim.

§ 37. But it is not altogether thus: we have not been cast into this war by mere political misapprehensions, or popular ignorances. It is quite possible that neither we nor our rulers may clearly understand the nature of the conflict; and that we may be dealing blows in the dark, confusedly, and as a soldier suddenly awakened from slumber by an unknown adversary. But I believe the struggle was inevitable, and that the sooner it came, the more easily it was to be met, and the more nobly concluded. France and England are both of them, from shore to shore, in a state of intense progression, change, and experimental life. They

are each of them beginning to examine, more distinctly than ever nations did yet in the history of the world, the dangerous question respecting the rights of governed, and the responsibilities of governing, bodies; not, as heretofore, foaming over them in red frenzy, with intervals of fetter and straw crown, but in health, quietness, and daylight, with the help of a good Queen and a great Emperor;¹ and to determine them in a way which, by just so much as it is more effective and rational, is likely to produce more permanent results than ever before on the policy of neighbouring States, and to force, gradually, the discussion of similar questions into their places of silence. To force it,—for true liberty, like true religion, is always aggressive or persecuted; but the attack is *generally* made upon it by the nation which is to be crushed,—by Persian on Athenian, Tuscan on Roman, Austrian on Swiss;² or, as now, by Russia upon us and our allies: her attack appointed, it seems to me, for confirmation of all our greatness, trial of our strength, purging and punishment of our futilities, and establishment for ever, in our hands, of the leadership in the political progress of the world.

§ 38. Whether this its providential purpose be accomplished, must depend on its enabling France and England to love one another, and teaching these, the two noblest foes that ever stood breast to breast among the nations, first to decipher the law of international charities; first to discern that races, like individuals, can only reach their true strength, dignity, or joy, in seeking each the welfare, and exulting each in the glory, of the other. It is strange how far we still seem from fully perceiving this. We know that two men, cast on a desert island, could not thrive in dispeace; we can understand that four, or twelve, might still find their account in unity; but that a multitude should

¹ [For Ruskin's opinion of Napoleon III., see above, p. 410 *n.*]

² [Ruskin frequently refers to the attacks of the House of Hapsburg on the Forest Cantons, and to the victories of the latter at Morgarten (1315) and Sempach (1386); see, for instance, *Modern Painters*, vol. v., pt. ix. ch. xi. § 31 *n.*; *Crown of Wild Olive*, § 95; *Eagle's Nest*, § 199; and *Præterita*, i. ch. vi. § 131.]

thrive otherwise than by the contentions of its classes, or *two* multitudes hold themselves in anywise bound by brotherly law to serve, support, rebuke, rejoice in one another, this seems still as far beyond our conception, as that clearest of commandments, "Let no man seek his own, but every man another's wealth,"¹ is beyond our habitual practice. Yet, if once we comprehend that precept in its breadth, and feel that what we now call jealousy for our country's honour, is, so far as it tends to other countries' dishonour, merely one of the worst, because most complacent and self-gratulatory, forms of irreligion,—a newly breathed strength will, with the newly interpreted patriotism, animate and sanctify the efforts of men. Learning, unchecked by envy, will be accepted more frankly, throned more firmly, guided more swiftly; charity, unchilled by fear, will dispose the laws of each State, without reluctance to advantage its neighbour by justice to itself; and admiration, unwrapped by prejudice, possess itself continually of new treasure in the arts and the thoughts of the stranger.

§ 39. If France and England fail of this, if again petty jealousies or selfish interests prevail to unknit their hands from the armoured grasp, then, indeed, their faithful children will have fallen in vain; there will be a sound as of renewed lamentation along those Euxine waves, and a shaking among the bones that bleach by the mounds of Sebastopol. But if they fail not of this,—if we, in our love of our queens and kings, remember how France gave to the cause of early civilization, first the greatest, then the holiest, of monarchs;* and France, in her love of liberty, remembers how *we* first raised the standard of Commonwealth, trusted to the grasp of one good and strong hand,² witnessed for by victory; and so join in perpetual compact of our different strengths, to contend for justice, mercy, and truth throughout the world,

* Charlemagne and St. Louis.

¹ [1 Corinthians x. 24.]

² [For Ruskin's estimate of Cromwell, see *Fors Clavigera*, Letters 15, 16.]

—who dares say that one soldier has died in vain? The scarlet of the blood that has sealed this covenant will be poured along the clouds of a new aurora, glorious in that Eastern heaven; for every sob of wreck-fed breaker round those Pontic precipices, the floods shall clap their hands¹ between the guarded mounts of the Prince-Angel; and the spirits of those lost multitudes, crowned with the olive and rose among the laurel, shall haunt, satisfied, the willowy brooks and peaceful vales of England, and glide, triumphant, by the poplar groves and sunned coteaux of Seine.

I

CLAUDE'S TREE-DRAWING

THE reader may not improbably hear it said, by persons who are incapable of maintaining an honest argument, and, therefore, incapable of understanding or believing the honesty of an adversary, that I have caricatured, or unfairly chosen, the examples I give of the masters I depreciate. It is evident, in the first place, that I could not, if I were even cunningly disposed, adopt a worse policy than in so doing; for the discovery of caricature or falsity in my representations, would not only invalidate the immediate statement, but the whole book; and invalidate it in the most fatal way, by showing that all I had ever said about "truth" was hypocrisy, and that in my own affairs I expected to prevail by help of lies. Nevertheless it necessarily happens, that in endeavours to facsimile any work whatsoever, bad or good, some changes are induced from the exact aspect of the original. These changes are, of course, sometimes harmful, sometimes advantageous; the bad thing generally gains; the good thing *always* loses: so that I am continually tormented by finding, in my plates of contrasts, the virtue and vice I exactly wanted to talk about, eliminated from *both* examples. In some cases, however, the bad thing will lose also, and then I must either cancel the plate, or increase the cost of the work by preparing another (at a similar risk), or run the chance of incurring the charge of dishonest representation. I desire, therefore, very earnestly, and once for all, to have it understood that whatever I say in the text, bearing on questions of comparison, refers *always* to the *original* works; and that, if the reader has it in his power, I would far rather he should look at those works than at my plates of them; I only give the plates for his immediate help and convenience: and I mention this, with respect to my plate of Claude's ramification, because, if I have such a thing as a prejudice at all (and, although I do not myself think I have, people certainly say so), it is against Claude; and I might, therefore, be sooner suspected of some malice in this plate than in others. But I simply gave the original engravings from the *Liber Veritatis* to Mr. Le Keux, earnestly requesting that the portions selected might be faithfully copied; and I think he is

much to be thanked for so carefully and successfully accomplishing the task. The figures are from the following plates:—

No.	1. Part of the Central tree in	No. 134 of the Liber Veritatis.
	2. From the largest tree	" 158
	3. Bushes at root of tree	" 134
	4. Tree on the left	" 183
	5. Tree on the left	" 95
	6. Tree on the left	" 172
	7. Principal tree	" 92
	8. Tree on the right	" 32

If, in fact, any change be effected in the examples in this plate, it is for the better; for, thus detached, they all look like small boughs, in which the faults are of little consequence; in the original works they are seen to be intended for large trunks of trees, and the errors are therefore pronounced on a much larger scale.

The plate of mediæval rocks (10) has been executed with much less attention in transcript, because the points there to be illustrated were quite indisputable, and the instances were needed merely to show the *kind of thing* spoken of, not the skill of particular masters. The example from Leonardo was, however, somewhat carefully treated. Mr. Cuff copied it accurately from the only engraving of the picture which, I believe, exists, and with which, therefore, I suppose the world is generally content. That engraving, however, in no respect seems to me to give the look of the light behind Leonardo's rocks; so I afterwards darkened the rocks, and put some light into the sky and lily; and the effect is certainly more like that of the picture than it is in the same portion of the old engraving.

Of the other masters represented in the plates of this volume, the noblest, Tintoret, has assuredly suffered the most (Plate 17); first, in my too hasty drawing from the original picture; and, secondly, through some accidental errors of outline which occurred in the reduction to the size of the page; lastly, and chiefly, in the withdrawal of the heads of the four figures underneath, in the shadow, on which the composition entirely depends. This last evil is unavoidable. It is quite impossible to make *extracts* from the great masters without partly spoiling every separated feature; the very essence of a noble composition being, that none should bear separation from the rest.

The plate from Raphael (11) is, I think, on the whole, satisfactory. It cost me much pains, as I had to facsimile the irregular form of every leaf; each being, in the original picture, executed with a somewhat wayward pencil-stroke of vivid brown on the clear sky.

Of the other plates it would be tedious to speak in detail. Generally, it will be found that I have taken most pains to do justice to the masters of whom I have to speak depreciatingly; and that, if there be calumny at all, it is always of Turner, rather than of Claude.

The reader might, however, perhaps suspect me of ill-will towards Constable, owing to my continually introducing him for depreciatory comparison. So far from this being the case, I had, as will be seen in various passages of the first volume, considerable respect for the feeling with which he worked;¹ but I was compelled to do harsh justice upon him now, because Mr. Leslie, in his unadvised and unfortunate *réchauffé* of the fallacious art-maxims of the last century,² had suffered his personal regard for Constable so far to prevail over his judgment as to bring him forward as a great artist, comparable in some kind with Turner. As Constable's reputation was, even before this, most mischievous, in giving countenance to the blotting and blundering of Modernism, I saw myself obliged, though unwillingly, to carry the suggested comparison thoroughly out.

¹ [See particularly Vol. III. p. 45.]

² [The reference is to *A Handbook for Young Painters*, by C. R. Leslie, R.A., 1855. Leslie's account of Constable in that book (pp. 273–279) was expressly directed to counteract Ruskin's criticisms in the first volume of *Modern Painters*. The book contained also other criticisms of Ruskin, who replied to them with some asperity in the "Supplement" to his *Academy Notes* of 1855.]

II

GERMAN PHILOSOPHY

THE reader must have noticed that I never speak of German art, or German philosophy, but in depreciation.¹ This, however, is not because I cannot feel, or would not acknowledge, the value and power, within certain limits, of both; but because I also feel that the immediate tendency of the English mind is to rate them too highly; and, therefore, it becomes a necessary task, at present, to mark what evil and weakness there are in them, rather than what good. I also am brought continually into collision with certain extravagances of the German mind, by my own steady pursuit of Naturalism as opposed to Idealism; and, therefore, I become unfortunately cognizant of the evil, rather than of the good; which evil, so far as I feel it, I am bound to declare. And it is not to the point to protest, as the Chevalier Bunsen and other German writers have done, against the expression of opinions respecting their philosophy by persons who have not profoundly or carefully studied it; for the very resolution to study any system of metaphysics profoundly, must be based, in any prudent man's mind, on some preconceived opinion of its worthiness to be studied; which opinion of German metaphysics the naturalistic English cannot be let to form. This is not to be murmured against,—it is in the simple necessity of things. Men who have other business on their hands must be content to choose what philosophy they have occasion for, by the sample; and when, glancing into the second volume of *Hippolytus*,² we find the Chevalier Bunsen himself talking of a “finite realization of the infinite” (a phrase considerably less rational than “a black realization of white”), and of a triad composed of God, Man, and

¹ [See, for instance, in this volume, pp. 54, 57, 90, 100, 109, 184, 201, 204 *n.*, 323, 330, 332; and *Modern Painters*, vol. i. (Vol. III. pp. 230, 351); vol. ii. (Vol. IV. pp. 57 *n.*, 325); *Stones of Venice*, vol. iii. (Vol. XI. p. 180 *n.*.)]

² [See *Hippolytus and his Age*, vol. ii., “The Philosophic Research,” 1852, p. 38. For another reference to the phrase, see above, Introduction, p. 1.; and vol. iv. ch. iii. § 2 *n.* In one draft Ruskin gives another illustration:—

“It is impossible to write purer or directer Nonsense. The infinite may be either real or unreal; but to realize it cannot make it finite; if it is realized it must be more infinite than it was before. It would be far more rational to talk of a ‘Short Realization of the long,’ which, with respect to German sentences, is indeed impossible, but in some sense, when there is anything at all in a long thing to be realized, is more or less possible.”]

Humanity* (which is a parallel thing to talking of a triad composed of man, dog, and canineness), knowing those expressions to be pure, definite, and highly finished nonsense, we do not in general trouble ourselves to look any farther. Some one will perhaps answer that if one always judged thus by the sample,—as, for instance, if one judged of Turner's pictures by the head of a figure cut out of one of them,—very precious things might often be despised. Not, I think, often. If any one went to Turner, expecting to learn figure-drawing from him, the sample of his figure-drawing would accurately and justly inform him that he had come to the wrong master.¹ But if he came to be taught landscape, the smallest fragment of Turner's work would justly exemplify his power. It may sometimes unluckily happen that, in such short trial, we strike upon an accidentally failing part of the thing to be tried, and then we may be unjust; but there is, nevertheless, in multitudes of cases, no other way of judging or acting; and the necessity of occasionally being unjust is a law of life,—like that of sometimes stumbling, or being sick. It will not do to walk at snail's pace all our lives for fear of stumbling, nor to spend years in the investigation of everything, which, by specimen, we must condemn. He who seizes all that he plainly discerns to be valuable, and never is unjust but when he honestly cannot help it, will soon be enviable in his possessions, and venerable in his equity.

Nor can I think that the risk of loss is great in the matter under discussion. I have often been told that any one who will read Kant, Strauss, and the rest of the German metaphysicians and divines, resolutely through, and give his whole strength to the study of them, will, after ten or twelve years' labour, discover that there is very little harm in them; and this I can well believe; but I believe also that the ten or twelve years may be better spent; and that any man who honestly wants philosophy not for show, but for *use*, and, knowing the Proverbs of Solomon, can, by way of commentary, afford to buy, in convenient editions, Plato, Bacon, Wordsworth, Carlyle, and Helps, will find that he has got as much as will be sufficient for him and his household during life, and of as good quality as need be.

It is also often declared necessary to study the German controversialists, because the grounds of religion "must be inquired into." I am sorry to hear they have not been inquired into yet; but if it be so, there are two ways of pursuing that inquiry: one for scholarly men, who have leisure on their hands, by reading all that they have time to read, for and

* I am truly sorry to have to introduce such words in an apparently irreverent way. But it would be a guilty reverence which prevented us from exposing fallacy, precisely where fallacy was most dangerous, and shrank from unveiling an error, just because that error existed in parlance respecting the most solemn subjects to which it could possibly be attached.

¹ [For a full discussion of Turner's figure-drawing, see *Notes on the Turner Gallery*, No. 522 (Vol. XIII.); and compare *Modern Painters*, vol. i. (Vol. III. p. 325).]

against, and arming themselves at all points for controversy with all persons; the other,—a shorter and simpler way,—for busy and practical men, who want merely to find out how to live and die. Now for the learned and leisurely men I am not writing; they know what and how to read better than I can tell them. For simple and busy men, concerned much with art, which is eminently a practical matter, and fatigues the eyes, so as to render much reading inexpedient, I *am* writing; and such men I do, to the utmost of my power, dissuade from meddling with German books; not because I fear inquiry into the grounds of religion, but because the only inquiry which is *possible* to them must be conducted in a totally different way. They have been brought up as Christians, and doubt if they should remain Christians. They cannot ascertain, by investigation, if the Bible be true; but *if it be*, and Christ ever existed, and was God, then certainly, the Sermon which He has permitted for 1800 years to stand recorded as first of all His own teaching in the New Testament, must be true. Let them take that Sermon and give it fair practical trial: act out every verse of it, with no quibbling, nor explaining away, except the reduction of such *evidently* metaphorical expressions as “cut off thy foot,” “pluck the beam out of thine eye,” to their effectively practical sense.¹ Let them act out, or obey, every verse literally for a whole year, so far as they can,—a year being little enough time to give to an inquiry into religion; and if, at the end of the year, they are not satisfied, and still need to prosecute the inquiry, let them try the German system if they choose.

¹ [Matthew v. 29, 30, vii. 5.]

III

PLAGIARISM

SOME time after I had written the concluding chapter of this work, the interesting and powerful poems of Emerson¹ were brought under my notice by one of the members of my class at the Working Men's College. There is much in some of these poems so like parts of the chapter in question, even in turn of expression, that though I do not usually care to justify myself from the charge of plagiarism, I felt that a few words were necessary in this instance.

I do not, as aforesaid, justify myself, in general, because I know there is internal evidence in my work of its originality, if people care to examine it; and if they do not, or have not skill enough to know genuine from borrowed work, my simple assertion would not convince them, especially as the charge of plagiarism is hardly ever made but by plagiarists, and persons of the unhappy class who do not believe in honesty but on evidence. Nevertheless, as my work is so much out of doors, and among pictures, that I have time to read few modern books, and am therefore in more danger than most people of repeating, as if it were new, what others have said, it may be well to note, once for all, that any such apparent plagiarism results in fact from my writings being more original than I wish them to be, from my having worked out my whole subject in unavoidable, but to myself hurtful, ignorance of the labours of others. On the other hand, I should be very sorry if I had *not* been continually taught and influenced by the writers whom I love; and am quite unable to say to what extent my thoughts have been guided by Wordsworth, Carlyle, and Helps; to whom (with Dante and George Herbert, in olden time) I owe more than to any other writers;—most of all, perhaps to Carlyle, whom I read so constantly, that, without wilfully setting myself to imitate him, I find myself perpetually falling into his modes of expression, and saying many things in a “quite other,” and, I hope, stronger, way, than I should have adopted some years ago; as also there are things which I hope are said more clearly and simply than before, owing to the influence upon me of the beautiful *quiet* English of Helps.² It would be both foolish and wrong to struggle to cast off

¹ [Quoted above, p. 381. For a similar reference to Emerson's Essays, see *Modern Painters*, vol. v. pt. ix. ch. vii. § 23 n. So in *Time and Tide*, § 67, Emerson is classed with Carlyle among “our great teachers”; for a criticism of his *English Traits*, see *Fors Clavigera*, Letter 26.]

² [For other references to Helps, see note at Vol. XI. p. 153; and for Carlyle, Vol. XII. p. 507.]

influences of this kind; for they consist mainly in a real and healthy help;—the master, in writing as in painting, showing certain methods of language which it would be ridiculous, and even affected, not to employ, when once shown; just as it would have been ridiculous in Bonifazio to refuse to employ Titian's way of laying on colour, if he felt it the best, because he had not himself discovered it. There is all the difference in the world between this receiving of guidance, or allowing of influence, and wilful imitation, much more, plagiarism; nay, the guidance may even innocently reach into local tones of thought, and must do so to some extent; so that I find Carlyle's stronger thinking colouring mine continually; and should be very sorry if I did not; otherwise I should have read him to little purpose. But what I have of my own is still all there, and I believe, better brought out, by far, than it would have been otherwise. Thus, if we glance over the wit and satire of the popular writers of the day, we shall find that the *manner* of it, so far as it is distinctive, is always owing to Dickens; and that out of his first exquisite ironies branched innumerable other forms of wit, varying with the disposition of the writers; original in the matter and substance of them, yet never to have been expressed as they now are, but for Dickens.

Many people will suppose that for several ideas in the chapters on landscape I was indebted to Humboldt's *Kosmos*, and Howitt's *Rural Scenery*.¹ I am indebted to Mr. Howitt's book for much pleasure, but for no suggestion, as it was not put into my hands till the chapters in question were in type. I wish it had been; as I should have been glad to have taken farther note of the landscape of Theocritus, on which Mr. Howitt dwells with just delight. Other parts of the book will be found very suggestive and helpful to the reader who cares to pursue the subject. Of Humboldt's *Kosmos*² I heard much talk when it first came out, and looked through it cursorily; but thinking it contained no material (connected with my subject)* which I had not already possessed myself of, I have never since referred to the work. I may be mistaken in my estimate of it, but certainly owe it absolutely nothing.

It is also often said that I borrow from Pugin.³ I glanced at Pugin's

* See the Fourth Volume.

¹ [William Howitt: *The Rural Life of England*, 2 vols., 1838. The special reference is to ch. i. of part i. of vol. ii., where the author discusses the love of nature in modern and in classical literature; the landscape of Theocritus is noticed at pp. 7–11.]

² [Alexander von Humboldt: *Kosmos, Entwurf einer physischen Weltbeschreibung*, 5 vols., Stuttgart and Tübingen, 1845–1862. Twice translated into English (1846 and 1849) as *Cosmos, a Sketch of a Physical Description of the Universe*. Part i. of vol. ii. contains some cursory pages on descriptions of nature in Greek, Roman, and other literatures.]

³ [As, for instance, in a review of the first volume of *The Stones of Venice*, in *The Ecclesiologist*, August 1851, vol. xi. p. 276: "Mr. Pugin himself might learn from Mr. Ruskin, had not (as is not improbable) Mr. Ruskin learnt it from him, to loathe all that is false and mean and meretricious in art." For Ruskin's views on Pugin, see Vol. IX. pp. 436–439.]

Contrasts once, in the Oxford architectural reading-room, during an idle forenoon. His "Remarks on Articles in the *Rambler*" were brought under my notice by some of the reviews. I never read a word of any other of his works, not feeling, from the style of his architecture, the smallest interest in his opinions.¹

I have so often spoken, in the preceding pages, of Holman Hunt's picture of the Light of the World,² that I may as well, in this place, glance at the envious charge against it of being plagiarized from a German print.

It is indeed true that there was a painting of the subject before; and

¹ [The "Remarks on Articles in the *Rambler*" are noticed in Appendix 12 to *Stones of Venice*, vol. i. (Vol. IX. p. 437). The following letter bearing on the subject of the present Appendix is reprinted from the privately-printed *Letters from John Ruskin to Frederick J. Furnivall*, 1897, pp. 47-49:—

"LONDON, April 3rd, 1855.

"DEAR FURNIVALL,—Thursday will do excellently for me. I shall be most happy to see both Mrs. Wedgwood and Mrs. Gaskell. It may be that Kingsley may choose that day too, as I sent him another note yesterday with a *carte-blanche*. I think he must have missed one of my notes. Come to lunch at half-past one, if you have time so to arrange it with your friends.

"Faithfully yours,

"J. RUSKIN.

"I have found a book of yours on Mormonism: please put me in mind if I don't return your books. I wish you would explain something to the Wedgwoods for me; I have never been quite at ease with them since it happened, and yet it was so absurdly trifling that I never liked to write about it. One day at their dinner-table Mr. Wedgwood said to me across it, 'So you have taken up Pugin's idea of comparisons!' I could not at the instant determine with myself whether Mr. Wedgwood really supposed that I never could have had the idea of putting an ugly and a pretty thing side by side, and saying, 'Which is best?' unless I had borrowed it from Pugin, or whether he merely meant that I had been carrying out the same idea; and as I never like to appear sensitive on the point of originality, and did not like to enter into a long assertion of my own independence across a dinner-table, I simply bowed, in a very confused manner, which I have often thought since must have appeared to all the company like the confusion of a person detected in a plagiarism—whereas it was, in fact, the confusion of a person not knowing whether it was worth while, or a proper occasion, to assert his non-plagiarism. I do not know what Mr. Wedgwood's impression was, but I wish you would now explain this to him, and assure him that whatever I owe—and it is at least two-thirds of what I am—to other people, I certainly owe nothing to Pugin,—except two *facts*, one about Buttresses, and one about ironwork. I owe, I know not how much, to Carlyle, and after him to Wordsworth, Hooker, Herbert, Dante, Tennyson, and about another dozen of people. But assuredly *Nothing* to Pugin.

"Always yours,

"J. RUSKIN."]

² [See above, pp. 52, 65, 86, 109, and Vol. XII. pp. 328-332. Holman Hunt thus refers to the subject here noted: "When the subject of Christ knocking at the door first was undertaken by me, I thought it had never been treated before. I knew Longfellow's volume fairly well, but I had no memory of having read the

there were, of course, no paintings of the Nativity before Raphael's time, nor of the Last Supper before Leonardo's, else those masters could have laid no claim to originality. But what was still more singular (the verse to be illustrated being, "Behold, I stand at the door and knock"), the principal figure in the antecedent picture was knocking at a door, knocking with its right hand, and had its face turned to the spectator! Nay, it was even robed in a long robe, down to its feet. All these circumstances were the same in Mr. Hunt's picture; and as the chances evidently were a hundred to one that if he had not been helped to the ideas by the German artist, he would have represented the figure as *not* knocking at any door, as turning its back to the spectator, and as dressed in a short robe, the plagiarism was considered as demonstrated. Of course no defence is possible in such a case. All I can say is, that I shall be sincerely grateful to any unconscientious persons who will adapt a few more German prints in the same manner.

Finally, touching plagiarism in general, it is to be remembered that all men who have sense and feeling are being continually helped: they are taught by every person whom they meet, and enriched by everything that falls in their way. The greatest is he who has been oftenest aided; and, if the attainments of all human minds could be traced to their real sources, it would be found that the world had been laid most under contribution by the men of most original power, and that every day of their existence deepened their debt to their race, while it enlarged their gifts to it. The labour devoted to trace the origin of any thought, or any invention, will usually issue in the blank conclusion that there is nothing new under the sun: yet nothing that is truly great can ever be altogether borrowed; and he is commonly the wisest, and is always the happiest, who receives simply, and without envious question, whatever good is offered him, with thanks to its immediate giver.

beautiful sonnet from 'Lope de Vega.' On coming to town I went to see the German prints of the subject, spoken of to me by a friend as forestalling my picture, but they were such meaningless vapidities that I became more content with my theme" (*Contemporary Review*, June 1886, p. 827). The sonnet, of which Longfellow's translation appeared first in the volume entitled *Coplas de Manrique* (1833), begins—

"Lord, what am I, that, with unceasing care,
Thou should'st seek after me—that Thou should'st wait,
Wet with unhealthy dews, before my gate,
And pass the gloomy nights of winter there?"

Two German prints of the subject were in the shop-windows at the time when Hunt's picture was in progress.]

[Added in this Edition.]

IV
A LETTER ON “MODERN PAINTERS,”
VOL. III

[A reader of the third volume of *Modern Painters*, Miss M. S. Lockwood, was puzzled by what seemed a contradiction between paragraphs 7 and 40 of chapter xiv. (see above, p. 280 *n.*). She wrote to the author explaining her difficulty, and asking him further to explain the use of the word “anatomical” as applied to trees in chapter ix., § 12 (p. 161). Ruskin (mistaking his correspondent for a man) wrote the following letter in reply, the postmark being dated Dec. 13, 1856:—]

“MY DEAR SIR,—I am much obliged to you for reading so carefully, and pointing out to me the discrepancy in question, very carelessly left unexplained. The first paragraph is speaking of the *habitual* mood of casual everyday contemplation, which was light with the mediæval and deep with the Greek. The other paragraph (40), of the sealing difference in the hard work and thought of the two. The flower was honoured by the Greek as God’s gift to *him*; by the mediæval as God’s work for God’s self, beautiful in itself and venerable, irrespective of its being a gift to *him* at all, so that —though the mediæval when he was at play in the fields was far less serious than the Greek (not expecting to meet Pan or Diana)—when he set himself to *work* he was far *more* serious than the Greek, carving the flower for its own sake and God’s sake, not merely for a conventional ornament of vase—or hair—undelighted in, except as connected with himself.

“But the two passages require expanding and explaining; and, in part, they *are* contradictory, describing two contradictory aspects of both minds; just as, if you divide two balls into red and blue—look at them from one side—and one is blue and the other red; and look at them from the other, and the first is red and the second blue. There are many subjects which involve this species of reversed light before you can work them out thoroughly.

“Anatomical laws in trees are, of course, the laws of their cellular growth —angles of branches, etc., which are just as *stern* as *laws* as those of the growth of animals. A law may be that you go into two, or three, or into an indefinite number of fields, but so long as it says positively, you must go into houses, or must do *something*, the law is as stern law, whether it says two, or three, or indefinite number. So the laws about vegetable growth are vague, admitting of *more alternatives* than in animal growth. But they

are just as stern. The law that a branch branches into its own quantity of wood, and no more, is as stern as that our hands shall branch only into five fingers.

“Truly yours,

“J. RUSKIN.

“‘Anatomical’ means, I believe, only ‘cutting up’ law. You may cut up a tree as well as a beast. Laws of *structure* would be a better word, or of organisms.”¹

¹ [This letter is reprinted from *St. George* (the Journal of the Ruskin Union), April 1902, vol. v. p. 166.]

V

ADDITIONAL PASSAGES FROM THE MSS.

[THE manuscript of the third volume of *Modern Painters* is among the Pierpont Morgan (formerly Allen) MSS. referred to in Vol. III. p. 682, and Vol. IV. p. 361. It represents two stages of the author's work:—

(1) An early draft, in three different volumes. The first of these (numbered by Ruskin "19") contains portions of the early chapters, and also *The Harbours of England*. The second (numbered "15 A") contains portions of some of the later chapters, and also *The Opening of the Crystal Palace*. The third contains portions of chapters in different parts of the volume, and also several chapters of the fourth volume.

(2) On 390 foolscap leaves, the MS., at a later stage of composition, of the Preface and Chapters i. to xviii. (down to the end of § 32). There is no MS. of the conclusion of that chapter or of the appendices. This MS. was that sent to the compositors; but the text was very heavily corrected in proof.

The early draft includes a good deal of additional matter, not incorporated in the text. The chapters were, it seems, to have been differently arranged, and allowed of discussions which had afterwards to be omitted or only briefly glanced at. Two such passages, dealing respectively with Magnitude and Moderation in art, are here given. Each was to have formed the subject of a separate chapter. The first, dealing with Magnitude, is briefly referred to in ch. iii. §§ 18, 19 (pp. 61–62) of the text]:¹—

MAGNITUDE

"In order to receive an accurate idea of what is meant by greatness of style, we must consider what greatness itself consists in; and this in its two great orders—material and moral. For a truly great

¹ [The subject is also treated by Ruskin in *The Poetry of Architecture*, §§ 221 *seq.* (Vol. I. pp. 164–165); *Modern Painters*, vol. ii. (Vol. IV. pp. 309–311); vol. v. pt. viii. ch. iii.; *Seven Lamps of Architecture*, Vol. VIII. pp. 103–107; *Stones of Venice*, vol. iii. (Vol. XI. p. 79); *Mornings in Florence*, § 72; and *Notes on Prout and Hunt*, Preface, § 41.]

style is that which unites the representation of material greatness with a moral greatness in the mode of regarding it.

“We have first to examine in what material greatness consists; that is to say, what are the qualities of objects which impress us with the idea of their being Large.

“In ordinary parlance, we call objects large or small after comparing them with the average size which such objects attain. We call a moth large, if it be larger than moths usually are; and a mountain small, if it be smaller than the others in its neighbourhood. But a more essential idea of largeness is derived from our comparison of things with ourselves. We naturally call things small which are smaller than a man, and large which are larger than a man; we look upon wrens and sparrows, for instance, as small creatures, and upon elephants and rhinoceroses as large creatures; and we derive ideas of sublimity from the bulk of these latter which we could not receive from a wren or a sparrow, however large of its species.

“In order to produce these peculiar impressions of sublimity on the human mind, certain degrees of this material largeness are absolutely necessary. No beauty of design in architecture, or of form in mountains, will entirely take the place of what may be called ‘brute largeness.’ That is to say, of the actual superiority in feet and inches, over the size of Humanity, our constant standard, the general truth being that—*ceteris paribus*—the greatest effect of sublimity will be produced by the largest truth which can be clearly manifested to us. When bulk reaches certain limits, it becomes incomprehensible and immeasurable; and this uncomprehended bulk is, of course, useless—as far as regards any effect to be produced on the human mind. A space of sea, reaching to the horizon (say, perhaps, twenty miles square of water), and covered with large waves, will produce as great an effect of sublimity on most minds as anything can: the surface of the moon, though three thousand miles across, produces no such impression, because its size is not comprehended.

“The power of comprehending size is one of those which is most capable of cultivation; and—*ceteris paribus*—the mind which can measure the largest bulks, can receive the highest impressions of sublimity. Up to a certain point, the apprehension of size is indeed instructive, but this is only within very narrow limits; and as soon as those limits are past—that is to say, as soon as any object is more than about a hundred feet wide or high—the understanding of its magnitude depends on careful observation and accurate comparison of part with part, more and more difficult in proportion as the size increases; and however the power of such estimate may be increased by cultivation, the human mind never can quite comprehend the full size of distant things; so that universally all very large objects look smaller than they really are, and are more and more under-estimated in proportion to their magnitude—so that a mountain is always less justly estimated than a cathedral, and a great mountain always less justly than a small one. I do not mean that it is thought less than the small one—but it is not thought so much

greater as it really is. The wall of a cathedral, 150 feet high, produces an impression of magnitude nearly true,* but a cliff 500 feet high will not produce much more than twice the impression of the cathedral wall; and a mountain 3000 feet high will not produce much more than twice the impression of the cliff of 500. I have observed that, for the most part, the human mind seems most distinctly addressed by magnitudes under a thousand feet, brought well into the sphere of sight; so that with advantages of form, colour, and position, I think nearly as great an impression would be made by a bold precipice of 800 or 900 feet in height as is generally received from the Mont Blanc itself. For partly from the want of attention, and partly from the want of experience (objects of so great size having been seldom seen), with respect to heights above a thousand feet the ordinary observer is quite incapable of comparison. He is impressed by merely accidental circumstances of form and atmospheric effect, and is rarely more affected by a slope of 9000 or 10,000 feet, than by one of 1200.

“And the frequent comparisons made between the mountain scenery of our own island and that of Switzerland, as if they were in any wise capable of comparison, are a very sufficient proof of this. When once the eye has been taught to estimate magnitude justly, mountains in Scotland or Wales cease to exist, after a month spent among the Alps. Our own best scenery then becomes nothing more than pretty rocky country, rising here and there into a cairn of dark slate—or a heap of morass. But most travellers pass through the Alps without the slightest understanding of the scale of the objects around them, and derive their principal impressions not from the actual magnitude, but from the bolder forms of the Alpine rocks, and their various phenomena of snow and glacier; so that, putting these phenomena (which to many persons are more curious than sublime) out of the question, they are able to return to lower mountains without any very painful sense of their inferiority.

“Now there are two principal reasons for this insensibility: one based on a great power, the other on a great fault, of human nature. The feeling of magnificence or sublimity in the bulk of any object depends always in a great degree on the exertion of imagination. Upon torpid or prosaic temper, bulk produces hardly any effect, and in proportion as men decline towards the rank of animals, they are capable of less and less wonder at it. A dull peasant, entirely uneducated, seems to be little more impressible by the size of the mountain on which he dwells than an ant is by the size of the tree at whose root it has its nest. While, on the other hand, the emotions which educated men feel at magnitude appear to be very complicated, involving many subtle processes of the imagination, and many strange half-unconscious apprehensions of divine power or natural force. I cannot analyze the feeling, but one thing is certain, that before it

* But not quite true, for I suppose no one, however accurate his eye, ever ascended to the roof of a cathedral without finding the upper pinnacles larger than he thought them.

can take place the imagination must be excited, and the mind must take a kind of spiritual possession of the object, which, when once it is in the temper to do it, matters little whether that object be really of great magnitude or not. If it has had influence enough to put the imagination into train, or if the spectator have the will to raise himself into the mood of reverence, hundreds or thousands of feet are comparatively of small importance, and in a healthy tone of thought he will find more sublimity in a pretty crag of Derbyshire limestone than in a coldness and languor he could see in fifty leagues of Alps.

“Nor is this feeling false—though it is imagination. Imagination in this sense is nothing more than the complete perception of the inner truth of the thing; there are, in verity, in the humblest scenery, powers in operation vast enough, and masses of material existence large enough, to excite the full sensation of sublimity; and it is necessary to be very careful how we deaden this faculty of finding sublimity in things comparatively small by over-indulgence in the excitement of greater magnificence. For though it is the nature of the imagination to rouse itself with little help, yet it will never start but from the highest point it can reach; its ambition is insatiable; it always fixes on the largest thing it has in sight; and if, presently, anything still greater be offered to it, it flies to that, and instantly spurns what it before thought majestic. And this avarice of the imagination increases with the stimulus; and the more it obtains, the more it conceives it possible to obtain; and it may be pushed at last into a morbid hunger, in which it has nearly lost its own inherent power, but continually craves an increase of external excitement—and at last dies of pure repletion.”

MODERATION

[The second and more fragmentary passage is related to the text in ch. x. § 14 (p. 182), and (in the last paragraphs) with ch. xvii. § 6 (p. 358); but it connects also, as will be seen, with what is said under the head of “Magnitude”]:¹—

“The more experience men have of life (provided it be wisely used), the more they will come to look upon it in the light of a continual combat and Government. A combat against distinct principles of evil; a Government, in its dealings with things in themselves good, but which become evil when they are mismanaged. So that there is hardly a moment of existence but we have in it something to resist, or something to guide, which unresisted, or ill-guided, will assuredly turn to evil. And as this Guidance again divides itself into two great branches—one consisting in Restraint, when things good in themselves become evil in excess; and the other in Direction, when things good

¹ [On the subject of moderation and restraint in art, see also *Modern Painters*, vols. ii. and iv. (Vol. IV. pp. 135 *seq.*; Vol. VI. p. 327; and *Seven Lamps*, Vol. VIII. pp. 134, 259.]

in themselves becomes evil if misapplied—personal virtue has in all ages been resolved into three great branches of Fortitude, or resistance to pure evil; Temperance, or restraint in things capable of excess; and Prudence, or right judgment in things capable of error.

“Among these three virtues, it seems to me, that men in general least feel the full scope and bearing of Temperance; that Courage and judgment are commoner than mere self-restraint; and that men can oftener go where they ought, or stand where they ought, than stop where they ought. At least, in the particular branches of study into which I have been led, I find that Providence seems through various symbols and in various ways to insist upon the need of temperance far more than of the other virtues. I find in art, power and success depending continually upon a ‘Not too much,’—and I find in nature, the enjoyments of the finest and highest kind, liable to perpetual loss from over-covetousness of them. So that the explanation of what is right in art, or lovely in scenery, resolve themselves almost tiresomely into sections of an essay on Temperance; and whether we have to treat of beautiful form, or beautiful colour, or sublimity of effect, or grace of gesture, we shall find ourselves always driven back into the same insistence upon the habit of self-control. It will perhaps be less tiresome to point out at once the various modes in which this virtue is either demanded or illustrated in the matters before us; and afterwards to trace by themselves the elements of right which it modifies.

“And first, it is of singular importance in regulating the quantity of work which we give to the imagination. I mean here by the imagination that faculty which takes possession with the heart of what is seen by the eyes. For without a certain mental exertion, made as it were in sympathy with sight, it does not matter how beautiful the things may be which pass before us; we shall receive no pleasure from them. There are indeed certain forms and colours which please the eye as certain sounds do the ear; but when the heart is pre-occupied, or exhausted, these forms and colours have no longer any power, they pass before us as ineffectively as it may be supposed they do before animals. In an ordinary healthy state of mind the imagination exerts itself instinctively; and that which appears beautiful to the eye is fed upon by the heart, suggesting all kinds of pleasant and fruitful thoughts, and becoming in us a source of perpetual newness of life. But the form of this visible food, to nourish us, depends absolutely on the force of the Imagination by which it is received—and that force is limited. The quantity of Imagination which the mind can give forth is just as fixed as the muscular power which can be developed by the body; the Imagination may be as easily overtaxed as the limbs, and the moment it is exhausted, all the occupation which we give to the bodily sight is a weariness, and I think has even a tendency to destroy the spring of the Imagination for the future. Temperance, therefore, in the use of the imagination, is one of the most important means of enjoying nature truly, and one of the greatest powers of art is that of supplying the imagination with exactly the food it requires—and no more. It is therefore very necessary that we

should thoroughly understand the modes in which the mind operates, and can be addressed in these respects.

“And first, let me make my meaning as clear as possible in the use of the word “Imagination.”* I do not use it here in the limited, though accurate sense, in which it is defined in the second volume of this work. I mean by it here the entire operation of the Humanity within us, the sum of the mental powers which, at the sight of any object, are set to work to take possession of it; which contemplate its nature, perceive and admire its peculiar virtues, or which refresh it with wonder, sanctify it with association, and gild or darken it with the subtle dyes of hope and memory, and I understand this power to be operating altogether, like notes of music, but all forming a perfect harmony.

“For instance, suppose that several persons are looking at a pine tree, not having seen one for some time. To one, it will perhaps bring back some happy or painful association, and then he will forget the pine tree, and follow the train of thought it has called up. In him the note of memory has been struck too hard for harmony. Another will be impressed by the uprightness of the tree, and by the way in which it holds the rocks with its roots, and presently he will set himself to examine their fibres, and discover the process of its growth. In him the note of wonder has been struck too hard for harmony. Another will be impressed by the splendour of its dark green, and beauty of the lines of its branches, and will set himself to enjoy these without any further thought about the matter. In him the note of pleasure has been struck too hard for harmony.

* I have always felt this so important a matter, that I devoted the whole second volume of this work to an investigation of the faculties of mind which were chiefly concerned in our admiration of nature; and though, on looking back to this second volume after the lapse of nine years, I find it disfigured by affectations and encumbered by obscurities, and heartily wish I had it to write over again, still the main statements of it are all true, and I think its meaning may be got at with as little pains as that of metaphysical works in general. It contains what I intended it to contain for future reference; and though I am sorry to have to refer to anything so difficult to read, I do not think it would be wise to give up the time necessary to rewrite it; for there are perhaps some qualities in the writing of a young man which, though we may despise in more advanced life, are yet useful to persons in the same temper of mind in which the writer was at the time. Therefore, begging the sensible reader to pardon the involutions of language, the imitations of Hooker, and the tiresome length of sentences, I shall permit myself to refer to the book as if it had been better written, especially as I may be able now with a few words so to explain its contents as to spare the reader a good deal of trouble in analyzing them.

It divides the faculties of mind concerned in the contemplation of Nature into two great branches—one passive, the other active; one receiving delight from external things, the other so modifying and regarding external things as to increase this delight. The passive power I called *Theoria*, and the active, *Imagination*. The adoption of the term *Theoria* was pure pedantry.¹

¹ [But see Vol. IV. pp. xlviiii.-xlix.]

ADDITIONAL PASSAGES FROM THE MSS. 439

And a fourth will be impressed by the coiling and fantastic labyrinth of its roots, and will begin to fancy them Dragons, or arms of demons, and the hair of a transformed Dryad fastened to the earth. And in him the note of fancy has been struck too hard for harmony. And most people in looking at nature, according to their profession and turn of mind, have of course some tendency to overbalance themselves in one direction or another, taking out of the thing that only which they are in the habit of seeking in their ordinary life. And this is so far a healthy and happy tendency, for we can thus go on without fatigue continually.”

PART V

OF MOUNTAIN BEAUTY

BY

JOHN RUSKIN

*“Accuse me not
Of arrogance,
If, having walked with Nature,
And offered, far as frailty would allow,
My heart a daily sacrifice to Truth,
I now affirm of Nature and of Truth,
Whom I have served, that their Divinity
Revolts, offended at the ways of men,
Philosophers, who, though the human soul
Be of a thousand faculties composed,
And twice ten thousand interests, do yet prize
This soul, and the transcendent universe,
No more than as a mirror that reflects
To proud Self-love her own intelligence.”*

 ADDED IN THIS EDITION

(*From Drawings by the Author*)

A.	THE KAPPELLBRÜCKE, LUCERNE (<i>Photogravure</i>)	394
B.	THE MOUNTAIN GLOOM: AT ST. JEAN DE MAURIENNE (<i>Photogravure</i>)	416

Note.—Plates Nos. 20–24, 28, 40, 41, and 48 are printed from the originals; the rest are reduced (by about one-fourth) by photogravure from early impressions of the originals. It should be noted that Plates 12A and 49, though lettered (by inadvertence) as engraved by G. Allen and C. A. Tomkins respectively, are in reality reproduced from early impressions of the original Plates by Thomas Lupton.

Of the Plates added in this edition, A has previously appeared (in autotype) in the large-paper edition of *Studies in Ruskin*, 1890, Plate iv.

Several of the drawings from which the Plates were engraved have been exhibited at the Coniston Exhibition, 1900; the Ruskin Exhibition at the Royal Society of Painters in Water Colours, 1901; and the Ruskin Exhibition at Manchester, 1904. The frontispiece was at Manchester, No. 151. No. 20 was at Coniston, No. 104; at the Society of Painters in Water Colours, No. 320; at Manchester, No. 150. No. 26 was at the Society of Painters in Water Colours, No. 381; at Manchester, No. 233. No. 28 was at Manchester, No. 75. No. 31 was at Coniston, No. 72; at the Society of Painters in Water Colours, No. 228; at Manchester, No. 333. No. 34 was at the Society of Painters in Water Colours, No. 3; at Manchester, No. 237. No. 35 was at the Society of Painters in Water Colours, No. 79. No. 37 was at Coniston, No. 105; at the Society of Painters in Water Colours, No. 86; at Manchester, No. 146. No. 40 was at Manchester, No. 50. No. 12A was at Coniston, No. 102; at Manchester, No. 168. No. 46 was at Coniston, No. 110; at the Society of Painters in Water Colours, No. 194. A was at the Society of Painters in Water Colours, No. 362.

FACSIMILES

TWO PAGES OF THE MS. OF *Modern Painters*, VOL. IV. (ch. vii. § 4,
and ch. xvi. § 22) pp. 120–121, and 296–297

INTRODUCTION TO VOL. VI

THE Fourth Volume of *Modern Painters* was, as already explained, written and published much at the same time as the Third. It has, therefore, been dealt with generally in the preceding Introduction. Some particular remarks remain, however, to be made as usual under the heads of *Text*, *Manuscripts*, and *Illustrations*.

The *Text* of this volume will be found to differ considerably from that of any preceding edition, and for the first time stands as the author finally intended. The alterations now made come from three sources: (1) Ruskin's own copy for revision; (2) a copy formerly belonging to Ruskin, and now to Mr. R. H. Edmundson, of Byerswood, Windermere, in which the author had made some notes and corrections; (3) the published text of *Coeli Enarrant* and *In Montibus Sanctis*, and a proof which Ruskin had carefully revised for an intended further chapter in the latter work (see below, p. 135 *n.*).

The bibliographical particulars of these two series of reprints from *Modern Painters* have already been given (Vol. III. pp. lxii., lxiii.). The portions of the reprints which attach themselves to the present volume are (1) the Preface to *Coeli Enarrant*. This contains some general remarks by the author on the style and substance of volume iv., and is accordingly here reprinted in an appendix (pp. 486, 487). (2) The first chapter of *Coeli Enarrant*, being a reprint of ch. vi. of volume iv. Here the author made no revision. (3) Chapters ii. and iii. of *In Montibus Sanctis*, being respectively ch. vii. and the first portion of ch. viii. of volume iv.; it is the rest of ch. viii. which was put into print and revised by Ruskin for an intended later part of the same book. These portions of volume iv. were considerably revised; and notes and postscripts were added. The notes will here be found in their several places (*e.g.*, pp. 116, 121, 128, 130, 131);¹

¹ For the notes added from *Fronde Agrestes*, see the explanation (which applies to this volume also) given in Vol. V. p. lxi.

for the postscripts, see pp. 127, 144. The textual revisions are all enumerated, or referred to, in the usual list of *Variae Lectiones* (pp. xxix.-xxxi.).

These textual revisions and explanatory notes occur in chapters of *Modern Painters* to which the author attached particular importance. He considered the mountain-chapters in this volume to be, as we have seen,¹ among the most valuable of all his writings. He here suggests that some of the passages in question "should be read to young people by their tutors as an introduction to geological study."² Fortunate are the young people who are allowed so attractive a guide; for apart from all questions of geological theory, Ruskin's chapters have the unquestionable interest and value which attach to the direct observations of a singularly acute eye. "Precisely the same faculties of eye and mind are concerned," he says elsewhere,³ "in the analysis of natural and of pictorial forms." Ruskin, as Mr. Collingwood observes, knew "more about scenery than most geologists, and more about geology than most artists."⁴ Ruskin's classification of rocks into "crystallines" and "coherents" was adopted, it may be remarked, by Professor Bonney in his *Alpine Regions of Switzerland* (1868); in quoting many passages from the present volume, he truly describes it as "a book that no lover of the Alps should be without." In an obituary notice of Ruskin in 1900, the President of the Geological Society referred in like manner to "his services to our science in directing the attention of artists and others to the effect of geological structure and of the characters of rocks on scenery," and instanced the fourth volume of *Modern Painters* as a work that "might be read with advantage by many geologists."⁵ Ruskin, it should be remembered, was here also, as in much else of his work, somewhat of a pioneer. Professor Alphonse Favre's study of the Savoy mountains⁶ did not appear till 1867, and Professor Heim's *Mechanismus der Gebirgsbildung* (on which Lord Avebury's *Scenery of Switzerland*, 1896, is founded) not till 1878.

Here, as in some other subjects of inquiry, Ruskin's study was not specialised and systematic; but in this case it was sustained and never absent from his mind. Many passages from his diaries, already cited,

¹ Vol. V. p. lviii., and see below, p. 486.

² See p. 128, author's note of 1885.

³ Postscript to chapter i. of *In Montibus Sanctis*, reprinted in a later volume of this edition.

⁴ *Life of Ruskin*, 1900, p. 205.

⁵ Annual Address by the President, William Whitaker, F.R.S., May 1900; *Quarterly Journal of the Geological Society*, vol. 56, pp. lx.-lxi.

⁶ For some references by Ruskin to this work, see his Introduction to W. G. Collingwood's *Limestone Alps of Savoy*.

show how constant was his interest in geology,¹ and it should here be added that the diaries, to which he referred in writing the present volume, contain innumerable memoranda, calculations, diagrams, and sketches.² He was also, as in later volumes we shall have further occasion to remark, a great collector of mineralogical specimens. The hammer was as inseparable a companion of his mountain rambles as the note-book and the paint-box. There is hardly a page of his diaries in Switzerland which does not contain, each day, notes of specimens collected.

Ruskin's geological speculations are noticed in the Introduction to a later volume in which his papers on geology and mineralogy are collected. Here, however, it should be observed that while the present chapters contain some theoretical remarks to which he afterwards came to attach particular importance—as, for instance, his contention with regard to the stability of existing rock structure (see p. 486 *n.*), in other respects they show adherence, in some measure, to current views which he afterwards very emphatically controverted. This is especially the case with regard to the erosive power both of water and of glaciers; see the author's notes on pp. 116, 122, 127.

The *manuscripts* of this volume to which the editors have had access are those now in the possession of Mr. Pierpont Morgan (formerly in that of Mr. G. Allen). They consist of (1) a volume containing, with several chapters of volume iii. (see Vol. V. p. 433), an early draft of the following chapters: ch. xvii., §§ 39 to end; ch. ii. §§ 5–9; ch. i. §§ 2 to end; ch. iii.; ch. iv.; ch. v.; ch. iii. §§ 1–22; ch. iv. §§ 3 to end; ch. v.; ch. iv. §§ 2–4; ch. v. §§ 1–5. These contents are here enumerated in the order in which the MS. sheets were bound up, and the reader will observe that some portions are duplicated; the enumeration thus illustrates the extensive process of rewriting and rearranging which the book went through. (2) On 200 foolscap leaves, the MS. at a later stage of chs. i., vi.–xii., xiv.–xvi., xix. (3) Annotated proofs of chs. iii., iv., v.; portions of chs. xi. and xii.; ch. xiii.–xix. (with some omissions), and the appendices. The first draft contains a good deal of matter which was ultimately discarded; the author included a portion of a discarded chapter in an appendix (see below, p. 479), in which also he explains his reasons for omitting

¹ See, for instance, Vol. V. p. xxviii.

² Some of his numerous geological drawings were shown in the Ruskin Exhibition at Manchester, 1904.

much that he had written. Of some portions of the book (notably of chs. xiii. and xx.) there is no MS.

An examination of these various MSS. and proofs shows that the present volume, which contains many of Ruskin's finest passages, was also among the writings which gave him most trouble, and were most carefully polished and revised. As has been already said, the author had the two volumes (iii. and iv.) in hand at once, and at first they were to have been but one. It may be interesting, as showing how the theme grew under treatment, to give from the first draft his list of proposed contents:—

- “Ch. 1. Greatness of Style.
 2. Realization.
 3. Of Great Art.
 4. Of False Religious Ideal.
 5. Of False Profane Ideal.
 6. Of True Purist Ideal.
 7. Of True Naturalist Ideal.
 8. Of True Grotesque Ideal.
 9. Of Finish.
 10. Of Imitation.
 11. Of Landscape Purist Ideal.
 12. Of Landscape Naturalist Ideal.
 13. Of Landscape Grotesque Ideal.
 14. Of Turner's Colour.
 15. Of Turner's Chiaroscuro.
 16. Of Turner's Drawing, as dependent on Effects of Distance.
 17. Of Turner's Drawing, as dependent on Love of Mystery.
 18. Of the Meaning of Landscape.
 19. The Firmament.
 20. The Dry Land.
 21. The Utilities of Mountains.
 22. The Moral of Mountains.
 23. The Materials of Mountains.
 24. The Sculpture of Mountains.
 25. Corollaries.”

It would be tedious to trace the author's revisions from page to page; but it will be instructive perhaps to select a few well-known passages and exemplify his processes of what he calls “working up.”¹ We take first the description of the old tower of Calais Church, to

¹ See Vol. XII. p. xxxi.

which reference has already been made.¹ The following was the first draft of § 2:—

“The large neglect, the noble unsightliness of it; the decay and record of its years written so visibly upon it, yet without danger, sign of weakness, or decay; the stern, meagre massiveness and quiet gloom of its poverty; gnawed away by the channel winds, and overgrown with the black and bitter sea grasses; stripped of all comeliness as if by a blight; its slates and tiles all shaken and rent, and yet not falling; its brickwork full of bolts and holes and grisly fissures, and yet stable like a bare brown rock; its stripped barrenness and desertness; its utter carelessness of what regards it or thinks of it in passing by; putting forth no claim upon us; having no beauty, nor desirableness, nor pride, nor grace, and yet asking for no pity, neither; it is not like ruins, pensive, piteous, feebly or fondly garrulous of its better days and yet useless; but useful still, going through its own daily work, as some old fisherman beaten grey by storm, yet drawing his daily net; so it stands with no memory of its youth, nor sweetness, tenderness of age, complaint of its past nor wofulness; but in blanched and meagre massiveness and serviceableness, gathering souls together beneath it; the sound of its bells for prayer still rolling through its rents; and the grey peak of it seen far across the sea, principal of the three that rise above the waste of surfy sand and hillocked shore—the lighthouse, for Life and Death; and the Hall belfry, for Labour and Rest; and this Church Tower, for Praise.”

The passage went through many intermediate shapes before its final form was arrived at; but comparing this first form, with the last, the reader will note how the author omitted superfluous words, pared down alliterations, and knit the sounds together into closer harmony with the sense. Mr. Frederic Harrison, in a careful analysis of Ruskin's literary *technique*, has observed how much the author relies upon *assonance* for his effect; meaning by assonance, as distinct from alliteration, “the recurrence of the same, or of cognate sounds, not merely in the first letter of words, but where the stress comes, in any part of a word, and that in sounds whether vowel or consonant.”² The passage just given is cited in illustration, and it is interesting to note that, while some of the effects in question—as, for instance, the expressive phrase “the sound . . . rolling through its rents”—were written down at once, others were obtained after many retouchings—

¹ Vol. V. p. xxxi.

² “Ruskin as Master of Prose,” in *Tennyson, Ruskin, Mill, and other Literary Estimates*, 1899, p. 62.

as, for instance, in the last words, with the triple alliteration, the second of them being inverted (“*belfry* for *labour*”). To such analysis as this—most instructive to the student, and similar to that which the critic himself applied to Turner’s compositions—Ruskin would perhaps have remarked, in the words which, as he mentions, were used by Tennyson when some one pointed out to the poet various laws deducible from his versification: “It’s all true; I do observe them, but I never knew it.”¹

Another passage in this volume is cited by the same critic for its majestic effect as a whole, and for its incidental felicities—the account of the peasants of the Valais, in the chapter on “The Mountain Gloom” (ch. xix. § 4, pp. 388–389, below). Here, again, the first draft will repay careful comparison with the final version in the text:—

“They know not the name of beauty nor of knowledge. They know dimly that of virtue. Love, patience, hospitality, truth, faith,—these things they know so far as they can be known. To glean their meadows side by side, so happier; to bear the bitter frost and burden up the breathless mountain side, without murmuring; to bid the stranger drink from their vessel of milk; to look dimly forward; to see at the foot of their low death-beds the form of a pale figure upon a cross, dying patiently as they; all this separates them from the cattle and the stones; of all this they are capable; but in all this unrewarded as far as concerns this present life. For them there is neither hope nor action of spirit; for them no progress or joy. Hard roof, dark night, laborious day, thirst, weary arms at sunset; these are their life. No books, no thoughts, no change of passion. Only sometimes a day of rest and a little sitting in the sun under the church wall as the bell tolls thin and far in the mountain air; a pattering of a few prayers, not understood, in the dark chapel; an evening spent by the more sober in a vague act of adoration, and so back to the sombre home, with the cloud upon them still unbroken—a strange cloud of rocky gloom, heavy and hopeless, born out of the wild torrents and shapeless stones, and unlightened, even in their religion, except by the hope of some better thing unknown, mingled with threatening, and obscured by an unspeakable horror,—a feverish scent as it were of martyrdom and torture mingled with the incense, a perpetual memory of shattered bodies and warped wills, and lamenting spirits and hurtling flames—the very cross, for them, bedragged more deeply with gout of blood than for others.”

The words here printed in italics were either omitted, altered, or transposed in the ultimate text; and if the reader will compare the

¹ See Vol. XII. p. 500.

latter with this early draft, he will perceive how much the total effect was enhanced, and how many of the felicities by the way were introduced, during the author's revision. Some of these—the onomatopœic line, for instance, “as the bell tolls thin and far in the mountain air”—were thought of at once; but observe how different and more simple is the effect of “to bear the burden up the mountain flank, un murmuringly,” than in the first version; or note how the closing words—“the very cross, for them, dashed more deeply than for others, with gout of blood”—have gained by a simple transposition, and the alteration of the word “bedragged.” Ruskin spared no labour, to assist his mastery of language and intuitive sense for melody; it is one of the purposes of the notes in this edition to illustrate his labour; but no less do they illustrate the fact that the style was the man, that his words came from the heart, that what some imagine to be mere literary artifice was the expression of acute and sympathetic observation.¹

Two *facsimiles* of Ruskin's MS. (in its final form) are given in this volume. The first (pp. 120–121) is from ch. vii. § 4; the second (pp. 296–297) from ch. xvi. § 22; the latter is here included as having appeared in the supplement (October 1893) of *Illustrations to the Bibliography of the Writings in Prose and Verse of John Ruskin, LL.D.*, edited by T. J. Wise.

The *illustrations* prepared by Ruskin for this volume were especially numerous and important. They consisted of thirty-five engraved plates, and 116 woodcuts. A list of the woodcuts is for the first time given in this edition. Here, more than in any previous volume, illustrations and text were, in many chapters, inter-dependent. “All my half-volume,” he says in ch. xviii. (§ 23), “is abstracted” in two drawings by Turner, which he included in his illustrations. He refers to the “Goldau,” and more especially to the “Pass of Faido,”² from which the frontispiece, among other illustrations, was engraved. So much in the volume turns upon this drawing, that it may be useful here to describe its history in relation to Ruskin's many and varied studies in it. Turner's first sketch of the scene was made in 1842; it is now among the sketches lent by the Trustees of the National Gallery to the Ruskin Drawing School at Oxford (see Vol. XIII.). The drawing from it was executed in 1843 as a commission from Ruskin (see Epilogue to Ruskin's *Notes on his Drawings by Turner* in the same volume).

¹ Compare Ruskin's Preface to *Coeli Enarrant*, below, p. 486.

² See, in this connexion, ch. xvii. § 43, pp. 354–355.

Ruskin was full of admiration for it, and one of his principal purposes in his Continental journey in 1845, was to find the scene depicted by the artist. (See Introduction to Vol. IV. pp. xxiv. *n.*, xxv., xxxv.). He spent some days at Faido, sketching the spot and noting the processes of selection and invention followed by Turner (see Introduction to Vol. V. pp. xvi., xvii.). One of Ruskin's sketches of the actual scene was shown in the Ruskin Exhibition at Manchester in 1904 (No. 150). In 1852, on his way back from Venice, Ruskin again visited the scene (Vol. X. p. xlii.). And now observe the quantity of study which, founded on these personal observations, he put into his analysis of Turner's drawing. He had sketched the spot. From these sketches he etched a topographical outline (Plate 20 in this volume, between pp. 34 and 35). He made "a careful translation into black and white" of the left-hand upper part of Turner's drawing; this was also exhibited at Manchester (No. 146, upper drawing). He etched the same portion for this volume (Plate 37, opposite p. 269, "Crests of the Slaty Crystallines"). Again, he traced the leading lines in this portion of the drawing (Fig. 70, p. 272). He made a reduced outline of the whole drawing, exhibited at Manchester (No. 146, lower drawing), and etched it (Plate 21, between pp. 34 and 35). Finally, he copied the central portion of the drawing to be engraved as the frontispiece to this volume ("The Gates of the Hills"); Ruskin's drawing for this engraving was also exhibited at Manchester (No. 151).¹

The reader should note, in view of frequent references to the drawing in Ruskin's books, that it is sometimes called "The Gates of the Hills," sometimes "The Pass of Faido," but more often "The St. Gothard." The detailed study given to this drawing is very characteristic of him. What he preached, he had practised. "Foolish and ambitious persons," he says, "think they can form their judgment by seeing much art of all kinds. . . . To have well studied one picture by Tintoret, one by Luini, one by Angelico, and a couple of Turner's drawings, will teach a man more than to have catalogued all the galleries of Europe."²

The labour in preparing so many illustrations as this volume contained was, as will readily be understood, very great. But there was much more of it than appears on the surface. It was only after

¹ Ruskin also commissioned Mr. Arthur Severn to make a copy of Turner's drawing (Manchester Exhibition, No. 147), "made under the direction of Mr. Ruskin, who paid the artist a hundred guineas for it, and declared when the original and the copy were placed together that he should never know them apart."

² *Notes on his Drawings by Turner*, 17-19 R. (Vol. XIII.).

experiments in another kind that Ruskin decided to go to the expense of so many steel-plates. This appears from a note by Mr. Allen which was printed in the *Bibliography* (ii. 33), above referred to:—

“I recollect in 1858 Mr. Ruskin asking me to dispose of a large number of plain wood blocks for which he no longer had any use; at the same time telling me that he had obtained them for *Modern Painters*, intending to illustrate that work mainly by woodcuts. He also gave me some blocks drawn upon by himself, which I have to this day. One of these was the subject of Plate 31, vol. iv., “The Aiguille Blaitière” from the same point of view.”¹

Having once decided on steel-engravings, Ruskin spared no trouble and expense in making them as perfect as possible. Some remarks by Mr. J. H. Le Keux, the engraver of many of the best plates, illustrate this point:—

“Mr. Ruskin never fixed a price; I charged what I liked; he never complained—in fact, offered more. One Plate, ‘The Tree Stump of Claude,’ he said I had made *too good*, having put in too much touch. I promised to alter it. On my next visit I took him another proof which is the Plate printed. He asked me how I had altered it so well. I told him I had not altered the Plate, but had engraved another, as it was much less trouble than scraping out and altering. ‘Then charge me for both plates,’ was his request. I did so. Mr. Ruskin was especially pleased with ‘The Moat of Nuremberg.’ The tree stem of Albert Dürer, reproduced line for line in the Plate of tree stems, he thought a marvel.”²

In the present edition it has been necessary, owing to the size of the page, to reduce most of the original plates by photogravure; the scale of reduction is about one-fourth. The following plates are, however, printed from the originals:—Nos. 20, 24, 28, 40, 41, and 48.

The *figures* are printed from the original wood-blocks, with the exception of *Fig. 17* (p. 193), which has been necessarily reduced to fit the page.

Two additional plates are introduced, being photogravures from drawings by Ruskin, which illustrate the chapter on “The Mountain Gloom.”

¹ These blocks, drawn on by Ruskin, were exhibited at Manchester in 1904 (Nos. 528–534); they were never cut.

² Again from the *Bibliography*, ii. 34. “The Tree Stump of Claude” is Plate 4 in vol. iii. (“Ramification according to Claude”); the “Moat of Nuremberg” is Plate 76 in vol. v.; the “tree stem of Dürer,” Fig. 9 in Plate 2 in vol. iii.

Plate A is of one of the old bridges—the Kapellbrücke—at Lucerne (see p. 394). The drawing, which is in water colours ($7\frac{3}{8}$ x $11\frac{1}{2}$), is at Oxford (Educational Series, No. 116).

Plate B is from a drawing in the collection of Sir John Simon, K.C.B.; called by Ruskin “Mountain Gloom: near St. Jean de Maurienne, on the Cenis route.” The drawing is in wash and body-colour on buff paper (18x13).

E. T. C.

[*Bibliographical Note*.—Enumeration is here made of the separate editions of *Modern Painters*, vol. iv. For the bibliography of the complete work, and of selections from it, see Vol. III. pp. lviii.–lxiii.

First Edition (1856).—The title-page was as follows:—

Modern Painters. | Volume IV. | Containing Part V. | of Mountain Beauty.
| By John Ruskin, M.A. | Author of “The Stones of Venice,” “The Seven
Lamps of Architecture,” etc., etc. | [*Quotation* from Wordsworth, as in vols.
i., ii., and iii.] | London: | Smith, Elder, & Co., 65, Cornhill. | 1856.
| [*The Author reserves the right of translation.*]

Imperial 8vo, pp. xii. +411. The Preface occupied pp. v.–viii.; Contents, pp. ix., x.; List of Plates, pp. xi., xii.; Text, pp. 1–393; Appendix, 395–411. The imprint at the foot of the last page, and of the reverse of the half-title, is “London: Printed by Spottiswoode & Co., New Street Square.” Issued on April 14, 1856, in green ornamental cloth boards, uniform with vol. iii. Price, 50s.

Second Edition (1868).—This was an exact reprint of the First, except for the alteration of the date, and the addition of the words “Second Edition” on the title-page. It was issued on April 2, 1868.

No other editions of the volume were issued separately. “Edition 3” below means the first edition of the volume in the complete book (1873).

Varia Lectiones.—This volume was not, as a whole, revised for the press by the author after its first appearance; but portions of it were revised for and reprinted in *In Montibus Sanctis* and *Coeli Enarrant* (see above, p. xix.). The following is a list of all the variations. Alterations consequent on different pagination are not included, except where something more than the mere number of a page is affected.

List of Plates. Called “List of Plates to Vol. IV.” in previous editions. The list here (pp. xi.–xiii.) is modelled on the list as published in the first edition. In some of the earlier copies of ed. 1, Plate 47 was wrongly numbered “49.” In ed. 3, Plate 31, “Blaitière” was misprinted “Blatière,” and No. 36 was misprinted “63.” In the 1888 edition, Plate 12A was re-engraved by Mr. George Allen, and 49 by Mr. C. A. Tomkins; the list was altered accordingly. In the small complete edition the list was reprinted from that in the 1888 edition, the words “Reproduced from engravings by” being substituted for “engraved by.” The list of woodcuts is added in this edition.

Preface, § 4, line 6, page 226, “at the first line” is an alteration in this edition to suit the rearrangement of the text; in the original editions

“page 184 at the fourth line from the bottom”; which words were retained in the small complete edition, though the reference was then erroneous.

Ch. i. § 11, line 11, eds. 1 and 2 read “illumine” for “illumine”; § 13, line 18, ed. 3 omits “not” before “utterly injurious”; § 17, line 22, “juvenile tricks” here put in inverted commas as marked by Ruskin in his copy.

Ch. iv. § 1, line 11, “referring” here substituted, as marked by Ruskin in his copy, for “but with reference”; § 3, line 8, “their” before “blue” here omitted, for the same reason; § 4, line 24, “a quarter” here substituted for “half,” for the same reason; § 7, line 1, ed. 3 omits “not” before “this only.”

Ch. v. §§ 19, 20, ed. 3 reads “Fig. 4” for “Fig. 6,” and *vice versa*.

Ch. vi. § 2, line 5, see p. 106 *n.*; § 8, line 9, see p. 111 *n.*

Ch. vii. § 6, line 7, the new paragraph here, and the “(I.)” (as below “(II.)” and “(III.)”) § 8, 9, are introduced from the revised reprint in *In Montibus Sanctis*; so in § 7, line 2, the italicising of “surface”; and in the Bible quotation at the end of the chapter, the substitution of “justice” for “righteousness” (this latter correction was made also in 1888 and in the small complete edition).

Ch. viii. § 1, line 18, ed. 3 reads “is” for “it”; § 2, line 7, eds. 1–3 read “if he has any opportunity,” altered to “when there is opportunity” in *In Montibus Sanctis*; § 3, last line but one, the word “distributive” here added in accordance with Ruskin’s copy for revision; § 4, lines 20 and 21, eds. 1–3 read “a different shade of colour, and a different character of form”; the alteration in the text here was made also in 1888, and in the small complete edition, following *In Montibus Sanctis*; § 4, end (see author’s note of 1885, p. 131); § 6, line 10, the words “though all of one kind” are here transposed from after “each other,” as marked by Ruskin in his copy for revision; line 14 (see p. 132 *n.*); § 8, line 1, “all these orders of substance” here substituted for “all these substances,” in accordance with *In Montibus Sanctis*; so also in line 4, the italicising of “flint;” § 13, last sentences (see p. 139 *n.*); § 14, line 48, the italicising of “pure dark blue” here introduced in accordance with Ruskin’s revision in the proof for *In Montibus Sanctis*; § 15, author’s note (see p. 141 *n.*) § 18, line 19, the words “among them” are here added from Ruskin’s revision in the proof for *In Montibus Sanctis*.

Ch. xi. § 3, line 19, eds. 1–3 read “coteau,” and later editions “côteau,” for “coteaux.”

Ch. xii. § 5, line 30, “human” before “dust” here added from Ruskin’s copy for revision.

Ch. xiii. § 1, last line but two, “Lime” for “Lyme” in all previous editions; § 17, line 14, the word “opposite” is in this edition omitted after “Fig. 24.”

Ch. xiv. § 4, second line from bottom of page, see p. 218 *n.*; § 13, line 5, “Fig. 35 (on the next page)” is an alteration in this edition (owing to rearrangement) for “the above figure.”

Ch. xv. § 3, line 2, all previous editions read “in mountain”; a misprint (as the MS. shows) for “in the mountain”; § 28, line 11, “on p. 270” is an alteration in this edition for “over leaf.”

Ch. xvi. § 7, line 3, “next” is an alteration in this edition for “opposite”; § 14, line 10, the reference to “e” in Fig. 33 was wrongly given as “i” in the 1888 and small complete edition; § 19, line 16, the words “is seen” (in all

previous editions) are here omitted from before “than,” as marked by Ruskin in his copy for revision; § 37, line 17, the word “(kathrefhV)” was misplaced in previous editions between “and” and “laurel”; § 37, last word, small complete edition misprinted “Veritas” for “Veritatis”; § 39, line 13, see p. 314 *n*.

Ch. xvii. § 3, line 2, all previous editions have “chapters” for “chapter”; § 11, author’s note, eds. 1 and 2 read “Fig. 95” for “Fig. 96”; § 49, line 9, “observed” here substituted for “known,” in accordance with Ruskin’s copy for revision; and similarly, two lines lower, the words “but one” added.

Ch. xix. § 1, line 19, “seek” substituted for “acknowledge” in accordance with Ruskin’s copy for revision; § 3, line 5, “Valorsine” in previous editions; § 4, line 27, “dying also, patiently,” in previous editions is here corrected to “dying, also patiently” as in *Fronde Agrestes*; § 6, line 8, “lay down” is here altered to “give” in accordance with Ruskin’s copy for revision; so also the dashes before and after “poetically minded” are removed, and a dash inserted before “that nightly”; § 6, note, “but well chosen” altered to “and consistent,” again in accordance with Ruskin’s copy for revision; § 31, towards the end of the penultimate paragraph, he altered “its . . . it . . . its” to “their . . . them . . . their”; § 32, six lines from end, he altered “biding” to “abiding.”

Ch. xx. § 13, line 3, this is altered in accordance with Ruskin’s revision; hitherto “. . . exciting the poetical and inventive faculties, in peculiarly solemn tones of mind”; § 17, line 3, 1873, ed. 3 reads “Bergham”; § 29, line 13, “Lances” in all previous editions for “Launces.”

Appendix ii. § 5, line 17, see p. 481 *n*.

The *headlines* in this edition have been altered in order to fit the page and preserve uniformity in the edition. In previous editions the headlines on left-hand pages were the subjects of the chapters, and these were repeated on the right-hand pages in chs. i.–iii., vi., vii., xix. and xx. In the other chapters, the full title ran across the two pages; thus, ch. iv. had on the left-hand pages “Of Turnerian Mystery,” and on the right-hand pages “I. As Essential”; ch. xiv. had similarly “Resulting Forms,” “I. Aiguilles,” and so on throughout.]

MODERN PAINTERS

VOLUME IV

VI.

A

P R E F A C E

1. I was in hopes that this volume might have gone its way without preface; but as I look over the sheets, I find in them various fallings short of old purposes which require a word of explanation.

Of which shortcomings, the chief is the want of reference to the landscape of the Poussins and Salvator; my original intention having been to give various examples of their mountain-drawing, that it might be compared with Turner's. But the ten years intervening between the commencement of this work and its continuation have taught me, among other things, that Life is shorter and less availably divisible than I had supposed: and I think now that its hours may be better employed than in making facsimiles of bad work. It would have required the greatest care, and prolonged labour, to give uncaricatured representations of Salvator's painting, or of any other work depending on the free dashes of the brush, so as neither to mend nor mar it. Perhaps in the next volume I may give one or two examples associated with vegetation;¹ but in general, I shall be content with directing the reader's attention to the facts in nature, and in Turner; leaving him to carry out for himself whatever comparisons he may judge expedient.

2. I am afraid, also, that disappointment may be felt at not finding plates of more complete subject illustrating these chapters on mountain beauty. But the analysis into

¹ [See in that volume Figs. 41, 57, 62; pt. vi. ch. vi. §§ 10, 12; ch. viii. § § 7, 9, 11.]

which I had to enter required the dissection of drawings, rather than their complete presentation; while, also, on the scale of any readable page, no effective presentation of large drawings could be given. Even my vignette, the frontispiece to the third volume, is partly spoiled by having too little white paper about it; and the fiftieth plate, from Turner's Goldau, necessarily omits, owing to its reduction, half the refinements of the foreground. It is quite waste of time and cost to reduce Turner's drawings at all; and I therefore consider these volumes only as *guides* to them, hoping hereafter to illustrate some of the best on their own scale.¹

3. Several of the plates appear, in their present position, nearly unnecessary; 14 and 15, for instance, in Vol. III. These are illustrations of the chapters on the Firmament in the fifth volume; but I should have had the plates disproportionately crowded at last, if I had put all that it needed in that volume; and as these two bear somewhat on various matters spoken of in the third, I placed them where they are first alluded to. The frontispiece² has chief reference to the same chapters; but seemed, in its three divisions, properly introductory to our whole subject. It is a simple sketch from nature, taken at sunset from the hills near Como, some two miles up the eastern side of the lake, and about a thousand feet above it, looking towards Lugano. The sky is a little too heavy for the advantage of the landscape below; but I am not answerable for the sky. It was *there*.*

* Persons unacquainted with hill scenery are apt to forget that the sky of the mountains is often close to the spectator. A black thundercloud may literally be dashing itself in his face, while the blue hills seen through its rents may be thirty miles away. Generally speaking, we do not enough understand the nearness of many clouds, even in level countries, as compared with the land horizon. See also the close of § 12 in Chap. III. of this volume.

¹ [For a note on this scheme of Ruskin's, see Vol. V. p. 9.]

² [*i.e.*, to vol. iii.; for the frontispiece to the present volume, see below, p. 355.]

4. In the multitudinous letterings and references of this volume there may possibly be one or two awkward errata;¹ but not so many as to make it necessary to delay the volume while I look it over again in search of them. The reader will perhaps be kind enough to note at once that in page 226, at the first line of the text, the words “general truth” refer to the angle-measurements, not to the diagrams; which latter are given merely for reference, and might cause some embarrassment if the statement of measured accuracy were supposed to refer to them.

One or two graver misapprehensions I had it in my mind to warn the reader against; but on the whole as I have honestly tried to make the book intelligible, I believe it will be found intelligible by any one who thinks it worth a careful reading; and every day convinces me more and more that no warnings can preserve from misunderstanding, those who have no desire to understand.

DENMARK HILL, *March* 1856.

¹ [The editors have discovered only three mistakes of the kind: see below, pp. 218 *n.*, 314 *n.*, 481 *n.*]

PART V
OF MOUNTAIN BEAUTY

CHAPTER I

OF THE TURNERIAN PICTURESQUE

§ 1. THE work which we proposed to ourselves, towards the close of the last volume,¹ as first to be undertaken in this, was the examination of those peculiarities of system in which Turner either stood alone, even in the modern school, or was a distinguished representative of modern, as opposed to ancient, practice.

And the most interesting of these subjects of inquiry, with which, therefore, it may be best to begin, is the precise form under which he has admitted into his work the modern feeling of the picturesque, which, so far as it consists in a delight in ruin, is perhaps the most suspicious and questionable of all the characters distinctively belonging to our temper, and art.

It is especially so, because it never appears, even in the slightest measure, until the days of the decline of art in the seventeenth century. The love of neatness and precision, as opposed to all disorder, maintains itself down to Raphael's childhood without the slightest interference of any other feeling; and it is not until Claude's time, and owing in great part to his influence, that the new feeling distinctly establishes itself.

Plate 18 shows the kind of modification which Claude used to make on the towers and backgrounds of Ghirlandajo; the old Florentine giving his idea of Pisa, with its leaning tower, with the utmost neatness and precision, and handsome youths riding over neat bridges on beautiful

¹ [See pp. 409–410 of that volume.]

horses;¹ Claude reducing the delicate towers and walls to unintelligible ruin, the well-built bridge to a rugged stone one, the handsome rider to a weary traveller, and the perfectly drawn leafage to confusion of copsewood or forest.*

How far he was right in doing this; or how far the moderns are right in carrying the principle to greater excess, and seeking always for poverty-stricken rusticity or pensive ruin, we must now endeavour to ascertain.

The essence of picturesque character has been already defined[†] to be a sublimity not inherent in the nature of the thing, but caused by something external to it; as the ruggedness of a cottage roof possesses something of a mountain aspect, not belonging to the cottage as such. And this sublimity may be either in mere external ruggedness, and other visible character, or it may lie deeper, in an expression of sorrow and old age, attributes which are both sublime; not a dominant expression, but one mingled with

* Ghirlandajo is seen to the greatest possible disadvantage in this plate, as I have been forced again to copy from Lasinio, who leaves out all the light and shade, and vulgarizes every form; but the points requiring notice here are sufficiently shown, and I will do Ghirlandajo more justice hereafter.²

† *Seven Lamps of Architecture*, chap. vi. § 12. [Vol. VIII. p. 236.]

¹ [In the first draft, this plate and passage were intended for vol. iii. ch. xviii. § 27. After mentioning at that place Claude's reversion to Ghirlandajo's types, the MS. continues:—

“ . . . types of form; and taking whatever he [Ghirlandajo] had done childishly enough to fit Claude's capacity away from all the associations which gave it value, dress it up in his newly invented sunshine, and palm it upon the public for his own. Yet so it verily is. Compare the two bits of landscape in the opposite plate. The upper one is Ghirlandajo's, out of the background of his [blank not filled in]; the other, part of this landscape of Moses and the Burning Bush of which we have been speaking, out of Claude's *Liber Veritatis*. Now observe: Ghirlandajo had really gone to nature for most of his materials; his city is Pisa, with its leaning tower; the mountains beyond are bold and not ill-formed, and the leafage above quite well drawn and perfect. But Claude, borrowing this passage, denaturalises Pisa, and turns it into one of his impossible cities, made of nothing but round towers, lowers the mountains, turns the grand and simple leafage above into ignoble and indistinct trees, but has not wit enough to invent another figure, only shifts the horseman and his guide off the bridge to the river shore, and puts ill-built and ridiculous arches of stone for Ghirlandajo's timber.”

The Ghirlandajo is from his fresco (in the Church of Santa Trinità, Florence) of “St. Francis receiving the Stigmata”; the engraving was published in 1824.]

² [For Lasinio, see *Modern Painters*, vol. iii. ch. xviii. § 13 (Vol. V. p. 395); no further illustration from Ghirlandajo was given; Ruskin alludes to the want of good engravings from him and other Italian masters in the *Cestus of Aglaia*, § 46.]

18. The Transition from Ghirlandajo to Claude.

such familiar and common characters as prevent the object from becoming perfectly pathetic in its sorrow, or perfectly venerable in its age.

§ 2. For instance, I cannot find words to express the intense pleasure I have always in first finding myself, after some prolonged stay in England, at the foot of the old tower of Calais church.¹ The large neglect, the noble unsightliness of it; the record of its years written so visibly, yet without sign of weakness or decay; its stern wasteness and gloom, eaten away by the Channel winds, and overgrown with the bitter sea grasses; its slates and tiles all shaken and rent, and yet not falling; its desert of brickwork full of bolts, and holes, and ugly fissures, and yet strong, like a bare brown rock; its carelessness of what any one thinks or feels about it, putting forth no claim, having no beauty or desirableness, pride, nor grace; yet neither asking for pity; not, as ruins are, useless and piteous, feebly or fondly garrulous of better days; but useful still, going through its own daily work,—as some old fisherman beaten grey by storm, yet drawing his daily nets: so it stands, with no complaint about its past youth, in blanched and meagre massiveness and serviceableness, gathering human souls together underneath it; the sound of its bells for prayer still rolling through its rents; and the grey peak of it seen far across the sea, principal of the three that rise above the waste of surfy sand and hillocked shore,—the lighthouse for life, and the belfry for labour, and this for patience and praise.

§ 3. I cannot tell the half of the strange pleasures and thoughts that come about me at the sight of that old tower; for, in some sort, it is the epitome of all that makes the Continent of Europe interesting, as opposed to new countries; and, above all, it completely expresses that agedness in the midst of active life which binds the old and the new into harmony. We, in England, have our

¹ [With this passage compare *Notes on Prout and Hunt* (Prout, No. 2, and see above, Introduction, p. xxiii.)] The passage from “The essence of picturesque character” (p. 10) to the end of § 3 was printed as Appendix ii. to the *Notes on Prout and Hunt*.]

new street, our new inn, our green shaven lawn, and our piece of ruin emergent from it,—a mere *specimen* of the Middle Ages put on a bit of velvet carpet to be shown, which, but for its size, might as well be on a museum shelf at once, under cover. But, on the Continent, the links are unbroken between the past and present, and, in such use as they can serve for, the grey-headed wrecks are suffered to stay with men; while, in unbroken line, the generations of spared buildings are seen succeeding each in its place. And thus in its largeness, in its permitted evidence of slow decline, in its poverty, in its absence of all pretence, of all show and care for outside aspect, that Calais tower has an infinite of symbolism in it, all the more striking because usually seen in contrast with English scenes expressive of feelings the exact reverse of these.¹

§ 4. And I am sorry to say that the opposition is most distinct in that noble carelessness as to what people think of it.² Once, on coming from the Continent, almost the first inscription I saw in my native English was this:

“To Let, a Genteel House, up this road.”

And it struck me forcibly, for I had not come across the idea of gentility, among the upper limestones of the Alps, for seven months; nor do I think that the Continental nations in general *have* the idea. They would have advertised a “pretty” house, or a “large” one, or a “convenient” one; but they could not, by any use of the terms afforded by their several languages, have got at the English “genteel.” Consider, a little, all the meanness that there is in that epithet, and then see, when next you cross the Channel, how scornful of it that Calais spire will look.

§ 5. Of which spire the largeness and age are also

¹ [§§ 2 and 3 are § 20 in *Fronde Agrestes* (1875), where, at this point, Ruskin added the following note:—

“My friend won’t write out the reverse! Our book is to be all jelly, and no powder, it seems! Well, I’m very thankful she likes the jelly;—at any rate, it makes me sure that *it* is well made.”

“My friend” was the compiler of *Fronde Agrestes*, Miss Susan Beever.]

² [For the first notes of the following passage, see the extract from Ruskin’s diary given in the Introduction to Vol. V. p. xxxv.]

opposed exactly to the chief appearances of modern England, as one feels them on first returning to it; that marvellous smallness both of houses and scenery, so that a ploughman in the valley has his head on a level with the tops of all the hills in the neighbourhood; and a house is organized into complete establishment,—parlour, kitchen, and all, with a knocker to its door, and a garret window to its roof, and a bow to its second story,* on a scale of 12 feet wide by 15 high, so that three such at least would go into the granary of an ordinary Swiss cottage: and also our serenity of perfection, our peace of conceit, everything being done that vulgar minds can conceive as wanting to be done; the spirit of well-principled housemaids everywhere, exerting itself for perpetual propriety and renovation, so that nothing is old, but only “old-fashioned,” and contemporary, as it were, in date and impressiveness only with last year’s bonnets. Abroad, a building of the eighth or tenth century stands ruinous in the open street; the children play round it, the peasants heap their corn in it, the buildings of yesterday nestle about it, and fit their new stones into its rents, and tremble in sympathy as it trembles. No one wonders at it, or thinks of it as separate, and of another time; we feel the ancient world to be a real thing, and one with the new: antiquity is no dream; it is rather the children playing about the old stones that are the dream. But all is continuous; and the words, “from generation to generation,” understandable there. Whereas here we have a living present, consisting merely of what is “fashionable” and “oldfashioned”; and a past, of which there are no vestiges; a past which peasant or citizen can no more conceive; all equally far away; Queen Elizabeth as old as Queen Boadicea, and both incredible. At Verona we look out of Can Grande’s window to his tomb;¹ and if he does not stand beside us,

* The principal street of Canterbury has some curious examples of this *tininess*.

¹ [So in *Verona and its Rivers*, § 18, Ruskin speaks of “side by side, the presence chambers of the living and the dead”; and compare in *Seven Lamps*, the last words of the chapter on “The Lamp of Memory,” Vol. VIII. p. 247.]

we feel only that he is in the grave instead of the chamber,—not that he is *old*, but that he might have been beside us last night. But in England the dead are dead to purpose. One cannot believe they ever were alive, or anything else than what they are now—names in school-books.

§ 6. Then that spirit of trimness. The smooth paving stones; the scraped, hard, even, rutless roads; the neat gates and plates, and essence of border and order, and spikiness and spruceness.¹ Abroad, a country-house has some confession of human weakness and human fates about it. There are the old grand gates still, which the mob pressed sore against at the Revolution, and the strained hinges have never gone so well since; and the broken greyhound on the pillar—still broken—better so: but the long avenue is gracefully pale with fresh green, and the courtyard bright with orange-trees; the garden is a little run to waste—since Mademoiselle was married nobody cares much about it; and one range of apartments is shut up—nobody goes into them since Madame died. But with us, let who will be married or die, we neglect nothing. All is polished and precise again next morning; and whether people are happy or miserable, poor or prosperous, still we sweep the stairs of a Saturday.*

§ 7. Now, I have insisted long on this English character, because I want the reader to understand thoroughly the opposite element of the noble picturesque: its expression, namely, of *suffering*, of *poverty*, or *decay*, nobly endured by unpretending strength of heart. Nor only unpretending, but unconscious. If there be visible pensiveness in the building, as in a ruined abbey, it becomes, or claims

* This, however, is of course true only of insignificant duties, necessary, for appearance' sake. Serious duties, necessary for kindness' sake, must be permitted in any domestic affliction, under pain of shocking the English public.

¹ [With this passage may be compared the description of a typical Cathedral Close in *The Stones of Venice*, vol. ii. (Vol. X. p. 78). In one of his copies of the volume Ruskin here refers on the subject of neatness to the next volume, pt. ix. ch. vii. § 21.]

to become, beautiful; but the picturesqueness is in the unconscious suffering,—the look that an old labourer has, not knowing that there is anything pathetic in his grey hair, and withered arms, and sunburnt breast; and thus there are the two extremes, the consciousness of pathos in the confessed ruin, which may or may not be beautiful, according to the kind of it; and the entire denial of all human calamity and care, in the swept proprieties and neatnesses of English modernism: and, between these, there is the unconscious confession of the facts of distress and decay, in by-words; the world's hard work being gone through all the while, and no pity asked for, nor contempt feared. And this is the expression of that Calais spire, and of all picturesque things, in so far as they have mental or human expression at all.

§ 8. I say, in so far as they have mental expression, because their merely outward delightfulness—that which makes them pleasant in painting, or, in the literal sense, picturesque—is their actual variety of colour and form. A broken stone has necessarily more various forms in it than a whole one; a bent roof has more various curves in it than a straight one; every excrescence or cleft involves some additional complexity of light and shade, and every stain of moss on eaves or wall adds to the delightfulness of colour. Hence, in a completely picturesque object, as an old cottage or mill, there are introduced, by various circumstances not essential to it, but, on the whole, generally somewhat detrimental to it as cottage or mill, such elements of sublimity—complex light and shade, varied colour, undulatory form, and so on—as can generally be found only in noble natural objects, woods, rocks, or mountains. This sublimity, belonging in a parasitical manner to the building, renders it, in the usual sense of the word, “picturesque.”

§ 9. Now, if this outward sublimity be sought for by the painter, without any regard for the real nature of the thing, and without any comprehension of the pathos of character

hidden beneath, it forms the low school of the surface-picturesque; that which fills ordinary drawing-books and scrap-books, and employs, perhaps, the most popular living landscape painters of France, England, and Germany. But if these same outward characters be sought for in subordination to the inner character of the object, every source of pleasurable being refused which is incompatible with that, while perfect sympathy is felt at the same time with the object as to all that it tells of itself in those sorrowful by-words, we have the school of true or noble picturesque; still distinguished from the school of pure beauty and sublimity, because, in its subjects, the pathos and sublimity are all *by the way*, as in Calais old spire,—not inherent, as in a lovely tree or mountain; while it is distinguished still more from the schools of the lower picturesque by its tender sympathy, and its refusal of all sources of pleasure inconsistent with the perfect nature of the thing to be studied.

§ 10. The reader will only be convinced of the broad scope of this law by careful thought, and comparison of picture with picture; but a single example will make the principle of it clear to him.

On the whole, the first master of the lower picturesque, among our living artists, is Clarkson Stanfield; his range of art being, indeed, limited by his pursuit of this character. I take, therefore, a windmill, forming the principal subject in his drawing of Brittany near Dol (engraved in the *Coast Scenery*), Fig. 1, Plate 19, and beside it I place a windmill, which forms also the principal subject in Turner's study of the Lock, in the *Liber Studiorum*.¹ At first sight I dare say the reader may like Stanfield's best; and there is, indeed, a great deal more in it to attract liking. Its roof is nearly as interesting in its ruggedness as a piece of the stony peak of a mountain, with a *châlet* built on its side; and it

¹ [*Stanfield's Coast Scenery, a Series of Views in the British Channel*, 1836. The "Coast of Brittany" is at p. 25. Turner's "Windmill and Lock" was No. 27 in the *Liber*; the mill is said to have been taken from one which formerly existed at Hanwell, not far from the site of the present Lunatic Asylum.]

Stanfield and Turner.

19. The Picturesque of Windmills .

1. Pure Modern .

2. Turnerian .

is exquisitely varied in swell and curve. Turner's roof, on the contrary, is a plain, ugly gable,—a windmill roof, and nothing more. Stanfield's sails are twisted into most effective wrecks, as beautiful as pine bridges over Alpine streams; only they do not look as if they had ever been serviceable windmill sails; they are bent about in cross and awkward ways, as if they were warped or cramped; and their timbers look heavier than necessary. Turner's sails have no beauty about them like that of Alpine bridges; but they have the exact switchy sway of the sail that is always straining against the wind; and the timbers form clearly the lightest possible framework for the canvas,—thus showing the essence of windmill sail. Then the clay wall of Stanfield's mill is as beautiful as a piece of chalk cliff, all worn into furrows by the rain, coated with mosses, and rooted to the ground by a heap of crumbled stone, embroidered with grass and creeping plants. But this is not a serviceable state for a windmill to be in. The essence of a windmill, as distinguished from all other mills, is, that it should turn round, and be a spinning thing, ready always to face the wind; as light, therefore, as possible, and as vibratory; so that it is in no wise good for it to approximate itself to the nature of chalk cliffs.

Now observe how completely Turner has chosen his mill so as to mark this great fact of windmill nature; how high he has set it; how slenderly he has supported it; how he has built it all of wood; how he has bent the lower planks so as to give the idea of the building lapping over the pivot on which it rests inside; and how, finally, he has insisted on the great leverage of the beam behind it, while Stanfield's lever looks more like a prop than a thing to turn the roof with. And he has done all this fearlessly, though none of these elements of form are pleasant ones in themselves, but tend, on the whole, to give a somewhat mean and spider-like look to the principal feature in his picture; and then, finally, because he could not get the windmill dissected, and show us the real heart and centre of the whole, behold, he

has put a pair of old millstones,¹ *lying outside*, at the bottom of it. These—the first cause and motive of all the fabric—laid at its foundation; and beside them the cart which is to fulfil the end of the fabric's being, and take home the sacks of flour.

§ 11. So far of what each painter chooses to draw. But do not fail also to consider the spirit in which it is drawn. Observe, that though all this ruin has befallen Stanfield's mill, Stanfield is not in the least sorry for it. On the contrary, he is delighted, and evidently thinks it the most fortunate thing possible. The owner is ruined, doubtless, or dead; but his mill forms an admirable object in our view of Brittany. So far from being grieved about it, we will make it our principal light;—if it were a fruit-tree in spring-blossom, instead of a desolate mill, we could not make it whiter or brighter; we illumine our whole picture with it, and exult over its every rent as a special treasure and possession.

Not so Turner. *His* mill is still serviceable; but, for all that, he feels somewhat pensive about it. It is a poor property, and evidently the owner of it has enough to do to get his own bread out from between its stones. Moreover, there is a dim type of all melancholy human labour in it,—catching the free winds, and setting them to turn grindstones. It is poor work for the winds; better, indeed, than drowning sailors or tearing down forests, but not their proper work of marshalling the clouds, and bearing the wholesome rains to the place where they are ordered to fall, and fanning the flowers and leaves when they are faint with heat. Turning round a couple of stones, for the mere pulverization of human food, is not noble work for the winds. So, also, of all low labour to which one sets human souls. It is better than no labour; and, in a still higher degree, better than destructive wandering of imagination; but yet that grinding in the darkness, for

¹ [In one of his own copies, Ruskin here notes "Compare Deuteronomy xxiv. 6"—"No man shall take the nether or the upper millstone to pledge."]

mere food's sake, must be melancholy work enough for many a living creature. All men have felt it so; and this grinding at the mill, whether it be breeze or soul that is set to it, we cannot much rejoice in. Turner has no joy of his mill. It shall be dark against the sky, yet proud, and on the hill-top; not ashamed of its labour, and brightened from beyond, the golden clouds stooping over it, and the calm summer sun going down behind, far away, to his rest.

§ 12. Now in all this observe how the higher condition of art (for I suppose the reader will feel, with me, that Turner *is* the highest) depends upon largeness of sympathy. It is mainly because the one painter has communion of heart with his subject, and the other only casts his eyes upon it feelinglessly, that the work of the one is greater than that of the other. And, as we think farther over the matter, we shall see that this is indeed the eminent cause of the difference between the lower picturesque and the higher. For, in a certain sense, the lower picturesque ideal is eminently a *heartless* one; the lover of it seems to go forth into the world in a temper as merciless as its rocks. All other men feel some regret at the sight of disorder and ruin. He alone delights in both; it matters not of what. Fallen cottage—desolate villa—deserted village—blasted heath—mouldering castle—to him, so that they do but show jagged angles of stone and timber, all are sights equally joyful. Poverty, and darkness, and guilt, bring in their several contributions to his treasury of pleasant thoughts. The shattered window, opening into black and ghastly rents of wall, the foul rag or straw wisp stopping them, the dangerous roof, decrepit floor and stair, ragged misery, or wasting age of the inhabitants,—all these conduce, each in due measure, to the fulness of his satisfaction. What is it to him that the old man has passed his seventy years in helpless darkness and untaught waste of soul? The old man has at last accomplished his destiny, and filled the corner of a sketch, where something of an

unshapely nature was wanting. What is it to him that the people fester in that feverish misery in the low quarter of the town, by the river? Nay, it is much to him. What else were they made for? what could they have done better? The black timbers, and the green water, and the soaking wrecks of boats, and the torn remnants of clothes hung out to dry in the sun;—truly the fever-struck creatures, whose lives have been given for the production of these materials of effect, have not died in vain.*

§ 13. Yet, for all this, I do not say the lover of the lower picturesque is a monster in human form. He is by no means this, though truly we might at first think so, if we came across him unawares, and had not met with any such sort of person before. Generally speaking, he is

* I extract from my private diary a passage bearing somewhat on the matter in hand:¹—

“AMIENS, 11th May, 18—. I had a happy walk here this afternoon down among the branching currents of the Somme; it divides into five or six,—shallow, green, and not over-wholesome; some quite narrow and foul, running beneath clusters of fearful houses, reeling masses of rotten timber; and a few mere stumps of pollard willow sticking out of the banks of soft mud, only retained in shape of bank by being shored up with timbers; and boats like paper boats, nearly as thin at least, for the costermongers to paddle about in among the weeds, the water soaking through the lath bottoms, and floating the dead leaves from the vegetable-baskets with which they were loaded. Miserable little back yards, opening to the water, with steep stone steps down to it, and little platforms for the ducks; and separate duck staircases, composed of a sloping board with cross bits of wood leading to the ducks’ doors; and sometimes a flower-pot or two on them, or even a flower,—one group, of wallflowers and geraniums, curiously vivid, being seen against the darkness of a dyer’s back yard, who had been dyeing black all day, and all was black in his yard but the flowers, and they fiery and pure; the water by no means so, but still working its way steadily over the weeds, until it narrowed into a current strong enough to turn two or three mill-wheels, one working against the side of an old flamboyant Gothic church, whose richly traceried buttresses sloped into the filthy stream;—all exquisitely picturesque, and no less miserable. We delight in seeing the figures in these boats pushing them about the bits of blue water, in Prout’s drawings; but as I looked to-day at the unhealthy face and melancholy mien of the man in the boat pushing his load of peats along the ditch, and of the people, men as well as women, who sat spinning gloomily at the cottage doors, I could not help feeling how many suffering persons must pay for my picturesque subject and happy walk.”

¹ [The passage is in Ruskin’s diary of 1854, though it is somewhat altered for use here.]

kind-hearted, innocent of evil, but not broad in thought; somewhat selfish, and incapable of acute sympathy with others; gifted at the same time with strong artistic instincts and capacities for the enjoyment of varied form, and light, and shade, in pursuit of which enjoyment his life is passed, as the lives of other men are for the most part, in the pursuit of what *they* also like,—be it honour, or money, or indolent pleasure,—very irrespective of the poor people living by the stagnant canal.¹ And, in some sort, the hunter of the picturesque is better than many of these; inasmuch as he is simple-minded and capable of unostentatious and economical delights, which, if not very helpful to other people, are at all events not utterly injurious, even to the victims or subjects of his picturesque fancies; while to many others his work is entertaining and useful. And, more than all this, even that delight which he *seems* to take in misery is not altogether unvirtuous. Through all his enjoyment there runs a certain under-current of tragical passion,—a real vein of human sympathy;—it lies at the root of all those strange morbid hauntings of his; a sad excitement, such as other people feel at a tragedy, only less in degree, just enough, indeed, to give a deeper tone to his pleasure, and to make him choose for his subject the broken stones of a cottage wall rather than of a roadside bank, the picturesque beauty of form in each being supposed precisely the same: and, together with this slight tragical feeling, there is also a humble and romantic sympathy; a vague desire, in his own mind, to live in cottages rather than in palaces; a joy in humble things, a contentment and delight in make-shifts, a secret persuasion (in many respects a true one) that there is in these ruined cottages a happiness often quite as great as in kings' palaces, and a virtue and nearness to God infinitely greater and holier than can commonly be found in any other kind of place; so that the misery

¹ [The passage "And, in some sort, . . ." to the end of § 13 was printed as Appendix iii. to *Notes on Prout and Hunt.*]

in which he exults is not, as he sees it, misery, but nobleness,—“poor and sick in body, and beloved by the Gods.”* And thus, being nowise sure that these things can be mended at all, and very sure that he knows not how to mend them, and also that the strange pleasure he feels in them *must* have some good reason in the nature of things, he yields to his destiny, enjoys his dark canal without scruple, and mourns over every improvement in the town, and every movement made by its sanitary commissioners, as a miser would over a planned robbery of his chest; in all this being not only innocent, but even respectable and admirable, compared with the kind of person who has *no* pleasure in sights of this kind, but only in fair façades, trim gardens, and park palings, and who would thrust all poverty and misery out of his way, collecting it into back alleys, or sweeping it finally out of the world, so that the street might give wider play for his chariot-wheels, and the breeze less offence to his nobility.

§ 14. Therefore, even the love for the lower picturesque ought to be cultivated with care, wherever it exists: not with any special view to artistic, but to merely humane, education. It will never really or seriously interfere with practical benevolence; on the contrary, it will constantly lead, if associated with other benevolent principles, to a truer sympathy with the poor, and better understanding of the right ways of helping them; and, in the present stage of civilization, it is the most important element of character, not directly moral, which can be cultivated in youth; since it is mainly for the want of this feeling that we destroy so many ancient monuments, in order to erect “handsome” streets and shops instead, which might just as well have been erected elsewhere, and whose effect on

* Epitaph on Epictetus.¹

¹ [In the MS. Ruskin gives the epitaph in the Greek—swm anaphroV kai penihn IroV kai filoV aqanatoiV. The epitaph (of unknown authorship) is in the Greek Anthology, vii. 676. The first line is Doulos EpiphthoV genomhn kai sjm, etc. Iros is the beggar of the *Odyssey* (xviii. 25). Ruskin came across the epitaph in the *Idler*: see a letter reprinted in *Arrows of the Chace*, 1880, ii. 144, and in a later volume of this edition.]

our minds, so far as they have any, is to increase every disposition to frivolity, expense, and display.

These, and such other considerations not directly connected with our subject, I shall, perhaps, be able to press farther at the close of my work;¹ meantime, we return to the immediate question, of the distinction between the lower and higher picturesque, and the artists who pursue them.

§ 15. It is evident, from what has been advanced, that there is no definite bar of separation between the two; but that the dignity of the picturesque increases from lower to higher, in exact proportion to the sympathy of the artist with his subject. And in like manner, his own greatness depends (other things being equal) on the extent of this sympathy. If he rest content with narrow enjoyment of outward forms, and light sensation of luxurious tragedy, and so goes on multiplying his sketches of mere picturesque material, he necessarily settles down into the ordinary “clever” artist, very good and respectable, maintaining himself by his sketching and painting in an honourable way, as by any other daily business, and in due time passing away from the world without having, on the whole, done much for it. Such has been the necessary, not very lamentable, destiny of a large number of men in these days, whose gifts urged them to the practice of art, but who possessing no breadth of mind, nor having met with masters capable of concentrating what gifts they had towards nobler use, almost perforce remained in their small picturesque circle; getting more and more narrowed in range of sympathy as they fell more and more into the habit of contemplating the one particular class of subjects that pleased them, and recomposing them by rules of art.

I need not give instances of this class, we have very few painters who belong to any other; I only pause for a moment to *except* from it a man too often confounded with the draughtsmen of the lower picturesque;—a very

¹ [See in the next volume, pt. ix. ch. xi. §§ 15 to end, and ch. xii.]

great man, who, though partly by chance, and partly by choice, limited in range of subject, possessed for that subject the profoundest and noblest sympathy,—Samuel Prout. His renderings of the character of old buildings, such as that spire of Calais, are as perfect and as heartfelt as I can conceive possible;¹ nor do I suppose that any one else will ever hereafter equal them.* His early works show that he possessed a grasp of mind which could have entered into almost any kind of landscape subject; that it was only chance—I do not know if altogether evil chance—which fettered him to stones; and that in reality he is to be numbered among the true masters of the nobler picturesque.²

* I believe when a thing is once *well done* in this world, it never can be done *over again*.

¹ [See *Notes on Prout and Hunt*, No. 1.]

² [In Ruskin's diary of 1854 there is an earlier draft of portions of this chapter, and in the course of it a further illustration of Prout's picturesqueness:—

“In one of the numbers of Prout's Rhine, published long ago by Ackerman, there is a plate of ‘St. Ouen, Strassbourg.’ It represents two common German houses, with a few crossed timbers in the wall of one, beside some stagnant water, with a half-ruined church behind. I name it, in preference to any other of Prout's works, because it contains absolutely *no* point of graceful interest; there is no ornament about the houses, none but a few rude crosses and some arcades of the rudest pointed arches in the church. And yet there is some strange charm in it, which commended it to the artist, and recommends it still to thousands of minds besides. The place is ugly, poor, unhealthy. Doubtless those houses are not fit to be lived in; that water is not fit to wash in; the nets which are being hung beside the cottage door are too ragged to catch fish; the church is utterly unfit for church service, if not actually dangerous. And yet it has its charm in all that visible stagnancy and foulness of the pool, in the tottering timbers of the shed under which the women are washing; in their own rude figures and awkward arms and gestures, in every scar of bare brick on the plastered wall, in the various choking of windows with wooden bar, or shattered glass, or fluttering cloth, fading plant, or pure blackness of darkness; but chiefly of all in that mossy, wasted weariness of ungainly tower, pierced with gaunt scaffolding holes, and rent through and through by zigzag seams; naked to all the winds; bound together with old iron bars and cranks, gnawed away at its angles by frost and rain, stained with dark rust and moss, and silver grey of years; blocked up with moulding planks; in all ways unregarded, unrevered, unhelped in its old age,—in all this, and chiefly where it is saddest, there is some strange fascination which many a spectator would not exchange for all the order and freshness which the most zealous sanitary commissioners or pious churchwardens could give either to household or to church.

“How is this? Are we inhuman monsters? Is it the venom of that old delight in ugliness, decay, and death which has infected us? Was Samuel Prout (forgive me, kind and happy spirit, as I write)—was Samuel Prout

§ 16. Of these, also, the ranks rise in worthiness, according to their sympathy. In the noblest of them that sympathy seems quite unlimited; they enter with their whole heart into all nature; their love of grace and beauty keeps them from delighting too much in shattered stones and stunted trees, their kindness and compassion from dwelling by choice on any kind of misery, their perfect humility from avoiding simplicity of subject when it comes in their way, and their grasp of the highest thoughts from seeking a lower sublimity in cottage walls and penthouse roofs. And, whether it be home of English village thatched with straw and walled with clay, or of Italian city vaulted with gold and roofed with marble; whether it be stagnant stream under ragged willow, or glancing fountain between arcades of laurel, all to them will bring equal power of happiness, and equal field for thought.
