**2022 POPULATION AND HOUSING CENSUS
PRELIMINARY RESULTS
V2**

1.0 Introduction

This brief presents preliminary results of the 2022 Population and Housing Census which was conducted in March 2022. Preliminary results of censuses are usually released as soon as possible following completion of enumeration as part of efforts to be responsive to user demands. Although these results have been checked and verified to the extent possible, they are based on data that has not yet been fully edited and processed and are therefore subject to change. However any changes that may occur following more extensive data processing are not expected to result in significant differences.

Many of the preliminary results in this brief are presented by Census Districts and as such it is important to indicate what these are. Generally, the boundaries of Census Districts are the same as the Administrative District boundaries for those Districts that have no sub-districts and are the same as sub-district boundaries for those Districts that have sub-districts. There are however two Census Districts being the CKGR and Delta which are not Administrative Districts but were created for census administrative and operational convenience due to peculiarities that exist in these areas.

2.0 Highlights of the Results

2.1 Population Size

The estimated population of Botswana from the 2022 Population and Housing Census is 2,346,179 as compared to 2,024,904 enumerated in the 2011 Population and Housing Census ([Appendix 1](#)).

2.2 Population Growth

Botswana's population continues to grow, albeit at a decreasing rate. The population increased from 2,024,904 in 2011 to 2,346,179 in 2022 constituting an increase of 15.9 percent over the period between the two censuses. The annual population growth rate between 2011 and 2022 is estimated at 1.4 percent, indicating a decline from the 1.9 percent estimated in 2011. The current growth rate follows the previous trend showing a decline starting from 4.6 percent in 1981, 3.5 percent in 1991, 2.4 percent in 2001 to 1.9 percent in 2011. At the current rate of growth, Botswana's population will take approximately 58 years to reach double the current figure.

A notable feature of this growth is the variations observed across the Districts. The Census District of Ngamiland East recorded the highest growth rate at 2.8 percent followed by Kgatleng and South East with 2.7 and 2.6 percent respectively. The high growth rates for Kgatleng and South East Districts may be attributed to their proximity to Gaborone. The notable growth in Ngamiland East Census District may be attributed to the tourism activities in that district. Worth noting also, is the 5.1 percent increase in population of the Ngwaketse West Census District which however is not due to growth but rather a result of a re-alignment of boundaries that annexed six villages previously (2011) located in the Kanye/Moshupa Census District, resulting in a surge in the population of Ngwaketse West.

On the reverse side of growth the Urban Districts of Sowa, Selebi Phikwe and Orapa recorded declines in their populations between the two census periods ([Appendix 1](#)). The reasons for these declines may generally be related to the current state of mining activity and access of some mining towns in Botswana. This would be the closure of copper-nickel mine in the case of Selebi-Phikwe and the reduced soda-ash mining activity in the case of Sowa. Limited access applies in the case of Orapa as it is a closed town, hence its potential for growth is curtailed. Further, the microcosm of Letlhakane acts as a proxy to individuals seeking accommodation and business opportunities related to diamond mining activities in areas near Orapa, explaining its rapid growth to be one of the ten largest villages in Botswana.

2.3 Average Household Size

The household size denotes the ratio of the total population to the total number of households. The national average household size is estimated to be 3.3 persons per household as opposed to 3.7 persons per household recorded in the 2011 Population and Housing Census. The results also depict a general decline in the average household size across districts when compared to the 2011 household sizes.

Across the census districts, the average household size ranges from 2.6 persons per household in Sowa to 4.0 persons per household in Ngamiland West . The mean average household size across the districts is 3.3 persons per household and the median is 3.8 persons per household. Cities and towns show an average household size which is less than 3.1 persons whereas for other districts it goes up to 4.0 persons.

Comparing the urban census districts, Selebi-Phikwe and Francistown tend to have larger average households, while those in Orapa and Jwaneng tend to be smaller with 2.8 persons per household each. Gaborone and Lobatse each have an average of 2.9 persons per households. However, the smallest household size as stated above is found in Sowa town ([Appendix 1](#)).

2.4 Citizens Outside Botswana

The preliminary results show a significant drop in persons outside Botswana, from 23,032 in 2011 to 8,279 in 2022 ([Appendix 1](#)). This is continuation of a declining trend which saw this population dropping from 28,210 in 2001 to 23,032 in 2011. The decline between 2011 and 2022 could also be attributed to global COVID-19 related issues as well as the declining numbers of Government sponsored students studying abroad.

2.5 Population Distribution

Population distribution describes how the national population is spread across a specific geographical area. In other words, population distribution shows the contribution of an area towards the total population. While the share of the population residing in cities and towns had been increasing between the previous census it has declined slightly between 2011 and 2022. The proportion of the total population living in the Capital Gaborone declined by a percent from 11.4 percent to 10.4 over the same period. The urban centres of Francistown, Lobatse, Selebi Phikwe, Orapa, Jwaneng and Sowa have also seen modest declines between the two censuses.

The declines in the share of the national population for some of these urban areas are likely explained by the accompanying increases in the share of the populations in the neighbouring localities. For example, the contribution towards the national population of Kweneng East, which borders Gaborone, increased significantly from 12.7 percent to 14.1 over the same period. The proximity of this district to Gaborone presents an ideal growth point for the city and provides alternative accommodation as well as business opportunities to city dwellers ([Appendix 2](#)). Similarly increases were recorded in the contributions towards the national population of the Census Districts of Kgatleng and South East which are also near Gaborone.

It is also worth noting that the predominantly tourist District of Ngamiland East recorded increases in its share of the national population.

Other Census Districts notably, Kweneng West, Chobe, Kgalagadi South and Kgalagadi North had their share of the national population remaining constant between the two census periods ([Appendix 2](#)).

2.6 Population Density

Population density is an estimation of the concentration of individuals within a specific geographic area. Population density data can be used to quantify demographic information and to assess relationships with ecosystems, human health, and infrastructure.

The overall density of the country increased from 2.9 persons per square kilometre in 2001 to 3.6 in 2011 and 4.1 in 2022. Compared to other countries in Southern Africa, Botswana remains a sparsely populated country given its vast size and small population, only comparable to Namibia with a population density of 3 persons per square kilometre.

Generally cities and towns have the highest population densities compared to predominantly rural districts. Gaborone has the highest density of 1,444.4 persons per square kilometre followed by Francistown with 1,296.8. Selebi-Phikwe, Orapa and Sowa Town have low population densities, with the lowest record of 18.2 persons per square kilometre in the latter.

Among the predominantly rural districts, substantial increases were noted in South East, which increased from 47.8 in 2011 to 62.6 persons per square kilometre followed by Kgatleng, which increased from 11.5 in 2011 to 15.3 in 2022; North East, increased from 11.8 persons per kilometre in 2011 to 13.5 in 2022; and Kweneng also increased from 9.8 to 12.5 over the same period (**Appendix 3**).

2.7 Population of Large Villages

The preliminary results show that a total of 61 villages have a population size of 5,000 or more in 2022 when compared to 46 villages in 2011 and 27 villages in 2001. The results further show that Mogoditshane is now the largest village in Botswana with an estimated population of 88,098 followed by Maun (85,293), Molepolole (74,719), Tlokweng (55,517) and Serowe (55,484).

During the 2011 Population and Housing Census, Molepolole was the largest village in Botswana, followed by Maun, Mogoditshane, Serowe and Tlokweng in that order (**Appendix 4**).

Some villages have registered significant growth rates between the two census periods. Among these are Sese, Modipane, Kazungula, Oodi and Shashe Mooke with 9.0, 7.2, 5.7 and 5.3 percent respectively. These are villages surrounding cities and towns except Kazungula. However, there are also villages that realised a decline in growth. These are Good Hope, Otse, Shoshong and Sefhophe with 1.1, 0.9 and 0.1 percent in that order (**Appendix 4.1**). Three of these villages are host to boarding schools. The decline could be attributed to the fact that students were enumerated at their usual place of residence even when they were not present during enumeration.

2.8 Overall Quality of Results

A population census is an exercise that involves lengthy planning and operational processes, extensive stakeholder engagement, and also depends largely on the goodwill of the respondents to provide the correct information during enumeration. How well all these factors turn to be and the quality of the data collectors contribute to the quality of the information collected and disseminated. The data consistency checks that have been done so far and the demography checks on the preliminary results point to quality data having been collected.

4.
2022 POPULATION AND HOUSING CENSUS
PRELIMINARY RESULTS

It is worth noting that the 2022 Population and Housing Census was the first in Botswana to use digital technology from the cartographic fieldwork stage up to enumeration stage. It is already evident from the data edits done towards the production of this brief that this digitization resulted in improved quality of data. The approach will also help ensure that all the results are released on a reduced time scale as compared to previous censuses.

Note that this brief replaces the original one released on the 10th May 2022 to effect minor editorial corrections of duplication of some villages that had appeared in **Appendix 4**; and correction in the projection figure for Ghanzi District in **Appendix 1**.
